

Map Resource Guide for Teachers

New York City's Water Story: From Mountain Top to Tap

What does this map tell us?

New York City's Water Story: From Mountain Top to Tap (see addendum) has been created to help young people explore the New York City Water Supply System and how the water cycle affects their everyday lives. Maps are also tools for finding our way. Students can locate places and natural and human-made features within the watersheds and New York City that relate to their study of water; they can examine and compare different features by exploring their physical and cultural characteristics and how they function in our interdependent world.

The map can complement multi-disciplinary lessons. It can foster an understanding of the geography of the region during past times and how today it has played important roles in the life cycle of people, their ideas, and living environments.

Graphic symbols, place names, lines, shapes, colors, patterns, elevations, and scale are just some of the valuable map-reading skills that can be developed while students are engaged in cooperative learning activities.

Background

Encompassing almost 2,000 square miles, the New York City Water Supply System consists of the Croton, Catskill, and Delaware Watersheds. Within these three watersheds, rain and snow are captured and stored in 19 reservoirs and three controlled lakes, with a capacity to hold approximately 580 billion gallons of fresh water. One billion gallons of water is delivered each day to 9 million people completely by gravity.

Objectives

- To help students understand where their water comes from and the implications of building, operating, and maintaining a water supply system.
- To learn about watersheds as a living, working, natural landscape.
- To identify the natural and constructed features of the New York City Water supply system.
- To encourage discussion about many relevant topics, including geography, topography, climate change, land use, engineering, scale, economics, water quality, eminent domain, watershed protection, forestry, technology, conservation, stewardship, and careers.

Suggested Activities

- 1) Use **New York City's Water Story: From Mountain Top to Tap** to explore the New York City water supply system. Ask your students: If a raindrop fell within a watershed, how would it get to consumers? What path could water take if it were to spill over a dam instead of going through an aqueduct?
- 2) Map scavenger hunt: Identify the largest and smallest reservoir, the highest and lowest reservoir elevations, the legend, compass, etc.
- 3) Using the map's photographs and captions, create a storyline for water travelling from a reservoir to NYC.
- 4) Design your own map that features your environment.

- 5) Create a folktale about the water system and its history.
- 6) Create a reservoir timeline.
- 7) Research the history of the water supply system, its impact on local communities, agricultural and recreational activities, watershed protection, and other topics.
- 8) Research the Watershed Memorandum of Agreement (1997) and the Filtration Avoidance Determination (2007).
- 9) Use the [Watershed Activity](#) to familiarize students with watersheds.
- 10) Discuss this quote from naturalist and Catskill Mountain resident, John Burroughs:

“ To find the universal elements enough; to find the air and the water exhilarating; to be refreshed by a morning walk or an evening saunter . . . to be thrilled by the stars at night; to be elated over a bird's nest or a wildflower in spring - these are some of the rewards of the simple life.”

- 11) Introduce vocabulary in the Glossary.
- 12) This map can spark conversation about many other themes. Follow-up lessons can cover topics such as:
 - a. [Stream ecology](#)
 - b. [Forest management](#)
 - c. [History of the water supply](#)
 - d. [Drinking Water quality](#)
 - e. [Wastewater treatment](#)
 - f. [Harbor Water Quality](#)
 - g. [Water Conservation](#)
 - h. [Careers](#)
- 13) Introduce and discuss some of the essential questions listed below.
- 14) Compare the [1938 Water Supply of New York City](#) map with the new Water Story map. (See addendum)

Essential Questions

History/Social Studies:

- Before looking at this map, where did you think your water came from? How does this map shift the way you view your environment?
- How is water a part of New York City history?
- How has the history of our water supply system shaped our traditions and ideas about water as a society?
- What is the historical timeline of the NYC water supply system?
- Where else might NYC have gone to get water? What challenges would this alternative have presented?
- Why do you think NYC had to look for water outside of the city? What is eminent domain?
- Who are some of the key figures in the creation of NYC's water supply system?
- What other primary and secondary sources could we use to learn more from this map?
- What is the value of maps?

Water Cycle

- Why is water important?
- How do you use water?
- How much of our Earth is covered in water? How much is fresh water?
- How is water recycled by natural processes on Earth?
- What other organisms and ecosystems depend upon the water cycle?
- How do the properties of water affect living things and the natural environment?

- How does seasonal change affect temperature and weather conditions over time?
- How can you describe the properties of water?
- Why are there different climates on Earth and how can climate be altered?

Watersheds

- What is a watershed?
- How does land-use differ across the watersheds? How do air, water, and land interact? How do plants and animals interact?
- How do people interact within the watersheds?
- How are plants, animals, and water in an ecosystem connected? What organisms thrive in Croton, Catskill and Delaware Watersheds? How does this compare to the organisms found thriving in New York City?
- What are the processes that help shape the land?
- How do plants, animals, and people respond to environmental changes?

Water Supply

- How were communities impacted by the building of reservoirs?
- How do we gather data about our water supply system?
- How do natural events impact our water supply?
- What force allows water to travel naturally from watersheds to NYC?
- What are dams and how are they constructed? What are spillways and how do they connect to natural systems?

- How do plants, animals, and landforms differ within the watersheds and New York City?
- How do living and nonliving things interact in this system?
- What investigations do scientists perform? How do scientists gather, use, and share water quality information?
- What role does the government play in regulating water? How is New York City water regulated? How is bottled water regulated?
- How has technology changed the way water systems are designed, constructed, operate, and are maintained? What are some current local, national and global water supply issues?

Drinking Water Quality

- How do forests influence water quality? What is the value of trees (and how do their many parts function)?
- Which forms of energy affect our water supply system (heat, electric, sound, chemical, mechanical, light)?
- How do the properties of water affect living things and the natural environment?
- How does weather impact water quality?
- How is water tested? What parameters are used? Who performs these tests?
- How is water quality protected?
- What is climate change and how does it impact water supplies and water quality?

Water Use and Wastewater Treatment

- How is water used at home and school?
- How much water do you use?
- What is wastewater? Where is your wastewater treated? How is your wastewater treated? What other processes are used for treating wastewater?
- What are sewers and how do the different types of sewers function? What are storm drains?
- What is the proper way of disposing of cooking grease? Why?
- How does water waste and the improper disposal of waste (such as cat litter and sanitary-wipes) impact wastewater treatment and harbor water quality?
- How can climate change and severe rain events impact wastewater treatment and harbor water quality? How can increased population impact wastewater treatment?
- How is stormwater managed in your community and in other watershed and New York City communities? What is green-infrastructure?
- Where does wastewater go after treatment? Where does it go in other parts of the watershed and NYC?
- Why is New York City harbor water quality monitored? What parameters are tested and why?
- What chemical and biological tests can you perform on drinking water, streams, and harbor water? What observations are also scientifically useful? What do these tests indicate about water quality?

- How can you help ensure that wastewater treatment works effectively? How can you help protect stream and harbor water quality?

Our Role in the Community

- How were our reservoirs created? How were local communities impacted? Are these impacts still apparent today? How does this relate to economics?
- Do you think that the lives of students who live in the watershed or New York City are very different than yours? If so, how?
- How do we pay for water?
- What does conservation mean? How can we conserve water?
- What rights and responsibilities do we have as consumers and stewards of water?
- How would you attempt to solve a water conflict in the community (Scarcity, pollution etc.)?
- What other questions come to mind when you look at this map?
- How can we best inform the community about the importance of stewardship?
- What stewardship activities already exist?
- How can we best inform the community about the value of creating and sustaining natural habitats?
- What jobs and careers are available in water-related fields? How can you take advantage of these opportunities?

Our Water Supply System

Croton System-Collecting Reservoirs and Lakes

Amawalk Reservoir

- 6.7 billion gallons

Bog Brook Reservoir

- 4.4 billion gallons

Boyd's Corners Reservoir

- 1.7 billion gallons

Cross River Reservoir

- 10.3 billion gallons

Croton Falls Main Reservoir

- 14.2 billion gallons

Diverting Reservoir

- 900 million gallons

East Branch Reservoir

- 3.9 billion gallons

Middle Branch Reservoir

- 3 billion gallons

Muscot Reservoir

- 4.9 billion gallons

New Croton Reservoir

- 19 billion gallons

Titicus Reservoir

- 7.2 billion gallons

Lake Gilead

- 380 million gallons

Lake Gleneida

- 165 million gallons

Kirk Lake

- 565 million gallons

Catskill System-Collecting Reservoirs

Ashokan Reservoir

- 128 billion gallons

Schoharie Reservoir

- 17.6 billion gallons

Delaware System-Collecting Reservoirs

Cannonsville Reservoir

- 95.7 billion gallons

Neversink Reservoir

- 34.9 billion gallons

Pepacton Reservoir

- 140.2 billion gallons

Rondout Reservoir

- 49.6 billion gallons

West Branch Reservoir

- 8 billion gallons

Catskill/Delaware Systems-Storage, Balancing and Distribution Reservoirs

Hillview Reservoir*

- 900 million gallons

Kensico Reservoir

- 30.6 billion gallons

Croton System-Distributing Reservoirs

Jerome Park Reservoir*

- 800 million gallons

Central Park Reservoir*

- 1 billion (no longer in service)

Silver Lake Reservoir (tanks)*

- 100 million gallons

* The Hillview, Jerome, Central Park and Silver Lake Reservoirs are fed by water flowing through aqueducts and water pipes. This is unlike New York City's 19 other reservoirs that are fed by creeks, streams and rivers.

Glossary

These terms appear on the water supply map:

Aqueduct: Conduit, or structure, used to carry water over a long distance.

Dam: Barrier used to obstruct the flow of water.

Ecosystem: System formed by the interaction of a group of organisms and their environment.

Evaporation: Process of liquid water becoming water vapor.

Erosion: Process in which a material is worn away by water or air, often due to the presence of rough particles.

Evapotranspiration: The sum of evaporation from land surface plus transpiration from plants.

Filtration: Using a filter, the process of removing substances from water, soil, and air.

Groundwater: Water found underground in the cracks and spaces in soil, sand and rock.

Hydrological Cycle (Water Cycle): The exchange of water through Earth's land, ocean, and atmosphere including the cyclic transfer of water vapor from the Earth's surface through evaporation and transpiration into the atmosphere, from the atmosphere to precipitation back to earth, and through run-off into streams, rivers, lakes, and oceans, and natural recycling continues.

Reservoir: Natural or artificial place where water is collected and stored for use.

Wastewater: Used water and solids from homes, businesses, and schools, and stormwater.

Wastewater Treatment Plant: Facility designed to receive and treat used water and stormwater to effectively improve water quality before being discharged into receiving waterbodies.

Watershed: Area of land where all water drains into the same region, such as a lake, river, or reservoir.

Important Resources

Find additional information about the New York City Water Supply System by researching these important watershed and New York City sites.

You may also want to locate them on your map and plan a visit, if possible.

New York City's Water Story: From Mountain Top to Tap

The water we use today is the same water that fell as rain when dinosaurs roamed the earth. In its endless cycle, water is the only substance that naturally exists as a solid, liquid or gas.

Water's journey from mountain top to tap begins when rain and snow fall on watersheds, the areas of land that catch, absorb, and carry water downhill to gently and swiftly flowing streams.

Streams provide life-cycle needs for fish and other aquatic organisms. Oxygen is trapped in the fresh water as it tumbles over rocks into deep pools. Overhanging tree branches keep water cool as fresh water continues its journey.

Water is naturally filtered by the soil and tree roots in dense forests as it travels toward reservoirs. The sun's heat energy releases some water molecules back into the atmosphere as gas, continuing the hydrologic cycle.

Thousands of skilled workers constructed dams and reservoirs to store large amounts of clean water and aqueducts to carry it great distances by gravity from watersheds to New York City.

The 41-mile Old Croton Aqueduct was the first to deliver a clean and plentiful supply of water to New York City. This high bridge, completed in 1842 and hailed as an engineering masterpiece, carried the aqueduct across the Harlem River on large stone arches.

Water flowed through the Croton Aqueduct, filling reservoirs where the Great Lawn in Central Park and the New York Public Library on Fifth Avenue now stand. New Yorkers rejoiced in 1882 when another reservoir was built in Central Park to support the needs of a growing city.

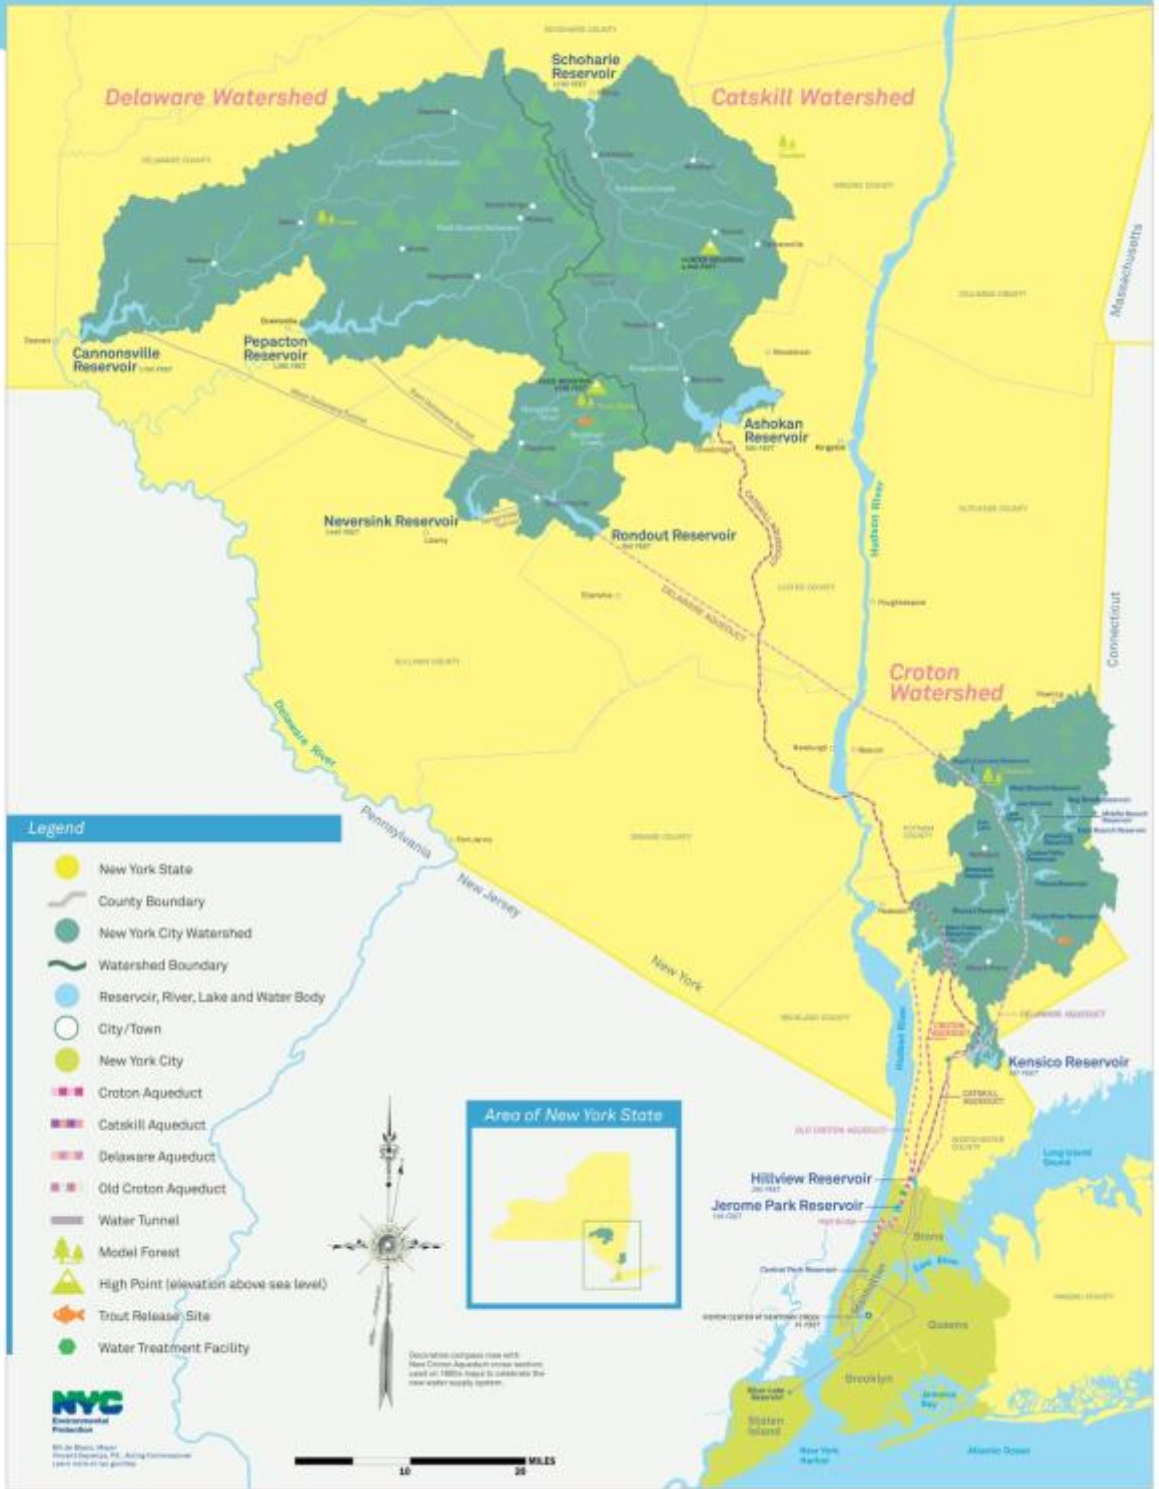

Today, thousands of miles of tunnels and pipes deliver one billion gallons of water each day from the Croton, Catskill, and Delaware watersheds to more than 8 million people. How do you use water? How much water do you think you use?

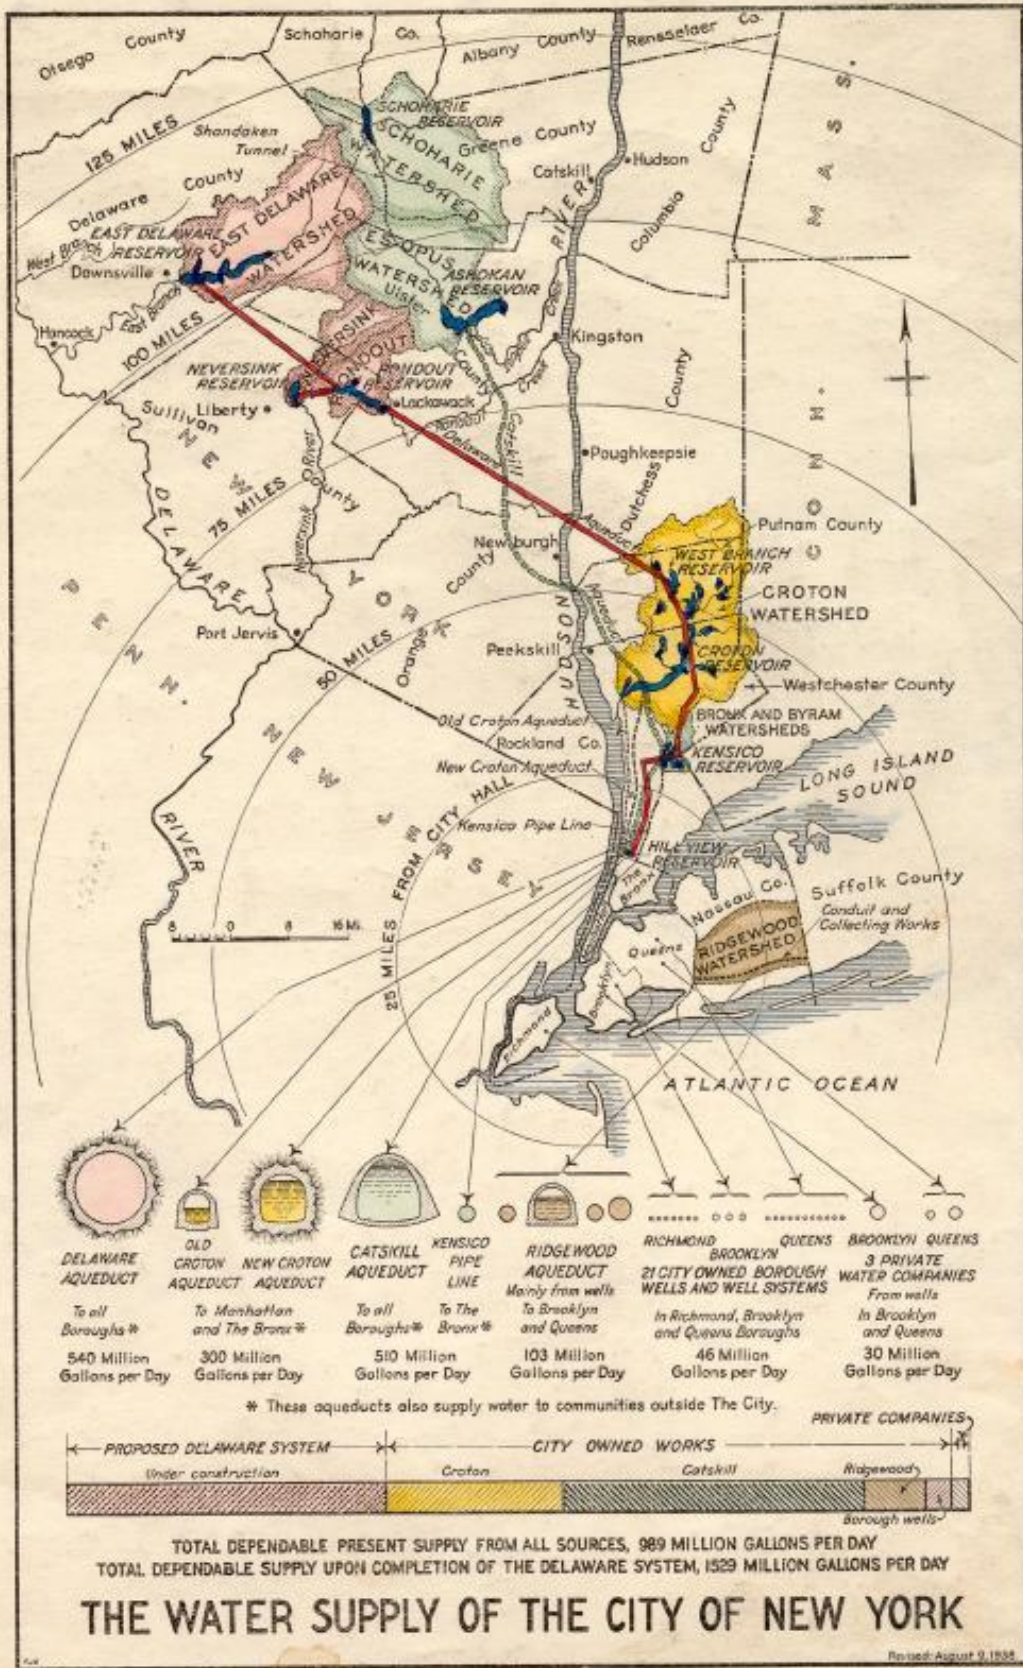

After water is used for cooking, bathing, and other activities, it travels down the drain and through sewer pipes to wastewater treatment plants where it is cleaned and returned safely to the waterways surrounding New York City.

Water is all around us. We experience it in many different ways using all of our senses. As water cycles through its endless journey, we appreciate that it will continue to nourish us and all living things.
