Imagine your child’s excitement at suddenly being able to hear what people are saying... Or to stand up for the first time... Or to play with a toy, even though it’s hard to hold things.

Assistive Technology is the name for tools and equipment that help children in the New York City Early Intervention Program play, learn, and interact with others.

Your child may benefit from tools and equipment designed to improve skills in the following areas:

- **Daily Living.** Adaptive seating and bath systems for children who need support for positioning.

- **Communication.** Devices to help children express their needs, specialized light and sound toys for children with visual impairments, and devices to improve hearing, such as hearing aids and FM listening systems.

- **Mobility.** Special strollers, standers, walkers, and custom bracing for children with motor delays.

Ask your Therapist and Service Coordinator if your child could benefit from Assistive Technology.
