

Accessible Pedestrian Signals

Program Status Report

December 2020

Program Overview

The New York City Department of Transportation (NYC DOT) installs Accessible Pedestrian Signals (APSs) to assist pedestrians who are blind or have low vision in crossing the street. These devices provide information in non-visual formats, such as audible tones, speech messages, and vibrating surfaces, to alert vision-impaired pedestrians when the “walk” phase is available at a given intersection.

As of December 31, 2020, there were APS units installed at 749 intersections citywide. A list of these locations is included in this report and is available on NYC DOT’s website at www.nyc.gov/dot.

Pursuant to Local Law 21 of 2012 (as codified in NYC Administrative Code Section 19-188), NYC DOT was installing APS units at each corner of 25 intersections each year. Effective January 1, 2016, Local Law 60 of 2014 required NYC DOT to install APS units at 75 intersections each year. Starting in 2019, DOT has worked to double the Local Law commitment to 150 intersections annually. The agency works closely with the Mayor’s Office for People with Disabilities (MOPD) and the visually impaired community, such as the group Pedestrians for Accessible and Safe Streets (PASS), to identify intersections which present a crossing difficulty for persons with visual impairments, such as intersections with Leading Pedestrian Intervals (LPI), delayed turns (split LPI) and Exclusive Pedestrian Phases (EPP) such as Barnes Dance and mid-block locations. NYC DOT also considers all applicable accessibility laws and regulations as well as locations that are recommended by constituents and elected officials.

NYC DOT establishes a ranked priority list of intersections for the installation of APSs based on established criteria, including but not limited to off-peak traffic presence, current traffic-signal patterns and the complexity of the intersection’s geometry, including crossing distance. These criteria are set forth by the National Cooperative Highway Research Program (NCHRP) and the most recent version of the federal Manual on Uniform Traffic Control Devices (MUTCD). Final scores are based on the individual crosswalk and intersection scores for each location, and ultimately determine priority for installation. This report includes the list of the one hundred fifty (150) top-ranked intersections as of December 31, 2020.

Cost and Funding Sources

For 2020 installations, the cost per intersection averaged approximately \$63,500 with a median cost of \$56,250. When extrapolated over the 150 intersection target, the total cost would be approximately \$9,525,000.

The baseline estimated cost to furnish and install an APS unit on an existing pole is about \$1,700. A standard four-legged intersection would require eight units (2 per corner quadrant), meaning that the minimum estimated cost per intersection is at least \$14,000. In actuality, however, an intersection typically requires additional work that increases the cost of the installation, bringing the average cost to approximately \$63,500 per location. For example, most intersections do not have pedestrian signal poles at the location required for APS installation (i.e., adjacent to a

pedestrian ramp) requiring the construction of new poles at additional cost. However, there are many other factors that significantly impact the construction schedule and cost of APS at each intersection, including:

- The unique geometric characteristics and complexities of each intersection,
- The existing subsurface conditions (i.e., utilities, subway vents, sidewalk vaults, etc.),
- The type of work permits issued to the contractor stipulating when and for how long work can occur at each intersection,
- Unforeseen field conditions requiring the additional installation of traffic signal conduits/cables, traffic signal/street light pole foundations, poles and other existing signal infrastructure equipment,
- Stricter and more expensive roadway restoration requirements,
- Protected street segments or intersections that have been resurfaced or reconstructed within the last five years,
- The extensive coordination of utility companies and agencies (Con Ed, FDNY, National Grid, Verizon, DEP, etc.),
- FDNY fire alarm post relocations,
- Coordination with other nearby capital and private development projects,
- The removal and restoration of distinctive sidewalk material and pavers,
- Holiday embargoes that prohibit construction activity at heavily trafficked intersections and along corridors during the holiday season (primarily between the end of November and January 1st),
- Weather conditions.

Taking all of these factors into account, the cost of installing APS at an intersection can range greatly depending on complexity, and thus the average cost of installation for a year is a statistical reflection of the types of intersections where work occurred. Costs for installations in 2020 ranged between a low of approximately \$16,000 (at a simple “T” intersection) and a high of over \$150,000 (at a complex intersection such as along Queens Boulevard).

City funding is used to procure contracts for the installation of all APS devices.

Recommendations for Improvements and Availability of New Technology

NYC DOT is continuously researching new technologies and instituting updates to enhance the APS program. The agency in recent years replaced the last remaining older types of APSs, which provided “birdcalls” from overhead speakers mounted on the pedestrian signal to alert visually impaired pedestrians when it is safe to cross. These older devices were louder, emitted a noise with every walk display regardless of pedestrian demand, and used a different bird call for each crossing, which confused the user. In addition, the older devices did not provide crossing information as new types of APS units do.

The new type of APS unit used by NYC DOT was tested and approved for use in New York City in 2011, and features a distinct rapid ticking tone that can be adjusted based on the needs of a

specific intersection. They also feature a raised vibrating tactile arrow at the pedestrian pushbutton location, which a user can find by a locator tone. These units are installed in close proximity to each pedestrian crossing ramp so that there is no confusion which APS unit is for which crossing. In order to further clarify each pedestrian crossing and reduce confusion, locations where pushbuttons are within 10 feet of one another will have audible speech messages which verbally announce the name of its respective street. Upon pushing the button, the arrow will vibrate and there will be a rapid percussive tone or audible message when the “walk” signal is displayed. In response to the ongoing COVID-19 pandemic, NYC DOT is currently exploring potential “contact-less” APS units that can detect a nearby user’s presence and/or hand waving motion to activate the pushbuttons’ features in providing pedestrian signal information.

NYC DOT is also constantly evaluating new technologies for use in the APS program. We currently have a contract with the University Transportation Research Center (UTRC). This multi-year contract provides NYC DOT ongoing research and development programs pertaining to urban Intelligent Transportation Systems (ITS) deployment. One of the tasks under this contract is to research “**Pedestrians and Cyclists Safety Using ITS Technologies in NYC**”. The purpose of this task is to gather knowledge about all new and innovative technologies and methodologies and determine the most useful countermeasures that could be used in NYC to reduce pedestrian/cyclist injuries, conflicts, crashes and fatalities to meet the goals of the Mayor’s “Vision Zero” Action Plan.

Specific attention will be given to the smartphone technologies associated with APS units. Research will be conducted to determine the latest and most innovative technologies currently being implemented nationally and internationally and under what conditions these new technologies are most beneficial for New York City.

The final outcome of this task will be a report providing a method to objectively look at each potential measure and come up with a recommendation to decide under what conditions each countermeasure should be used. NYC DOT will continue to evaluate the potential uses of new technologies on the market to assist blind and low vision individuals in navigating the city’s roadways.

NYCDOT is also working with three companies in an initiative titled “Call to Innovation” to develop technologies that provide mobility guidance for the visually impaired and make it easier and safer for them to navigate the streets of New York City. The objective of the project is to create a solution that will guide blind and low vision pedestrians through an intersection utilizing an intelligent transportation system (ITS) solution. NYCDOT will first test the solution on the intersection of West 25th Street and 6th Avenue, in Manhattan. This intersection was chosen due to its diverse street geometrics and proximity to several facilities that work with the blind and low-vision community. The goals of the project are listed below:

- Provide information on street geography, including obstacles, street names, number of lanes, and presence of bus and bicycle lanes.
- Sync in real-time and with 100% accuracy to the signal timing of the pedestrian signal head.
- Operate at sub-meter geographic precision.

- Operate properly in the direction of travel. The technology must operate correctly in the intended direction of travel and must clearly announce the name of the street being crossed.

Some recommendations for enhancing NYC DOT's APS program include, but are not limited to:

- Continued evaluation of the structure of the APS program for possible improvements to staffing and funding levels and sources.
- Further research of new technologies to enhance the APS program.
- Continued dialogue with blind and low vision advocacy groups.
- Participation in any future USDOT Vehicle-to-Infrastructure testing opportunities that will offer positioning and computing capabilities to a traveler and the ability to interact with infrastructure, utilizing systems that communicate with roadside equipment using many tools, including dedicated short range communications (DSRC), 3G, 4G, Wi-Fi and Bluetooth.
