Delete Section 6.14 in its entirety.
SECTION 6.15
SLAT CONVEYORS AND ROLLER SLAT CONVEYORS

Delete Section 6.15 in its entirety.

SECTION 6.16
SUSPENDED VERTICAL TRAY CONVEYORS

Delete Section 6.16 in its entirety.

SECTION 6.17
TOW CONVEYORS

Delete and revise the title of Section 6.17 to read as follows:

SECTION 6.17
TOW CONVEYORS (SHOPPING CAR CONVEYORS)

6.17.2 Tow Conveyors: Public use intended.

Delete and revise Section 6.17.2.2 and add new Section 6.17.2.3 to Section 6.17.2 read as follows:

6.17.2.2 Guarding. Where a parted chain, cable, belt, tow pin, or other linkage would permit a runaway condition on an incline or decline, anti-runway/backstop devices shall be provided.

6.17.2.3 Periodic inspections and tests. Tow conveyors shall be subject to periodic inspections and tests including acceptance, category 1 and category 5.

SECTION 6.18
TROLLEY CONVEYORS AND POWER AND FREE CONVEYORS

Delete Section 6.18 in its entirety.

SECTION 6.19
VERTICAL ARTICULATED CONVEYORS

Delete Section 6.19 in its entirety.

SECTION 6.20
VERTICAL CHAIN-OPPOSED SHELF TYPE CONVEYORS

Delete Section 6.20 in its entirety.

SECTION 6.21
VERTICAL RECIPROCATING CONVEYORS

6.21.1 Safety considerations.
Add new Subsections (d), (e), (f), (g), (h), (i), (j) and (k) to Section 6.21.1 to read as follows:

(d) Travel distance shall be limited to less than 22 860 mm (75 ft) with a maximum of four landings served.

(e) Where fire-resistant construction is required by the Building Code, conveyor(s) shall be enclosed in a fire-rated hoistway.

(f) Access at landings shall be a restricted area for authorized personnel with no public access.

(g) Where there is accessible space under the hoistway, the conveyor and counterweight shall be equipped with a safety device designed to stop and hold the conveyor and counterweight independent of the hoisting or driving mechanism and shall comply with A17.1 rules 2.6 and 2.1.2.3.

(h) The operating device shall not be located inside the conveyor enclosure and must be external to the hoistway at each landing served.

(i) The system shall incorporate a position indicator at each floor landing to register the location of the conveyor.

(j) The rated-load capacity shall not be less than 239 kg/m² (49 lbs. per sq ft).

(k) The rated speed shall not exceed 406 mm/sec (80 FPM).

6.21.2 Guarding.

6.21.2 Delete and revise Subsections (b), (c) and (d) of Section 6.21.2 to read as follows:

(b) The conveyor housing shall be equipped with doors or an equivalent means at each manual landing and unloading station, arranged so that they can be opened only when the carrier is present and stopped at that level and such that the carrier cannot be actuated until they are closed. This requirement is typically satisfied by use of a mechanical locking device, which is actuated by the motion of the carrier, and an electrical switch indicating that the door is closed and locked.

(1) The unlocking mechanism must be mounted on the carrier.

(2) This requirement shall be satisfied by the use of an interlock as required by ASME A17.1, Section 2.12.2.

(c) Vertical reciprocating conveyors designed to automatically receive and discharge material shall have interlocked doors as in (b) or, as an alternative,
be guarded by a suitable enclosure extending from the path of the moving carrier.

(d) Where the application requires that personnel walk onto the carrier to load or unload material, the carriers shall be provided with a conveyor enclosure securely fastened to the conveyor platform. The enclosure walls shall be of solid, grille or perforated construction; and shall be of such strength and support that when subjected to a leaning or falling rated load on the conveyor, the enclosure walls will not deflect or deform in a way that reduces running clearances to less than 13 mm (0.5 in.). Enclosure entrance(s) shall be provided with solid doors or gates; and shall guard the full width opening with a minimum height of 2030 mm (80 in.). Grille or perforated portions of conveyor enclosures and entrance gates shall reject a ball 38 mm (1.5 in.) in diameter.

Add new Section 6.21.3 to read as follows:

6.21.3 Periodic testing.

(a) All conveyors shall be inspected and tested as per Table N1 of ASME A17.1 as modified by Chapter K1 of this appendix.

(b) All safety devices shall be tested on all tests. A static full load shall be performed every five years to ensure that the conveyor holds the load.

SECTION 6.22
MATERIAL ENCAPSULATING CONVEYORS

Delete Section 6.22 in its entirety.

Delete and revise the title of “Mandatory Appendix I” to read as follows:

NON-MANDATORY APPENDIX I
SPECIFICATIONS FOR DESIGN, INSTALLATION, COMMISSIONING, AND PERIODIC INSPECTION OF VERTICAL RECIPROCATING CONVEYORS

CHAPTER K3
MODIFICATIONS TO ASME A17.3-2015, SAFETY CODE FOR EXISTING ELEVATORS AND ESCALATORS

K301.1 Retroactive requirements for existing elevators and escalators. As referenced in Section 3001.2 of this code, the provisions of ASME A17.3-2015 shall be modified in accordance with this appendix and are applicable to all existing elevators and escalators. The section numbers correlate to those in the referenced ASME standard. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.
PART I
INTRODUCTION

SECTION 1.1
SCOPE

1.1.2 Equipment not covered by this code.

Delete and revise subsection (ee) to read as follows:

Equipment not covered by this code. Equipment not covered by this code includes, but is not limited to, the following:

(ee) limited-use/limited-application elevators within the scope of ASME A17.1, except for section 3.10.12 of this code, where such limited-use/limited-application elevators shall achieve compliance by January 1, 2027

SECTION 1.5
ALTERATIONS, MAINTENANCE, AND INSPECTIONS AND TESTS

1.5 Delete and revise Section 1.5 to read as follows:

Existing installations shall conform to the following requirements of ASME A17.1–2013:

(a) Requirements 8.10, Acceptance Inspections and Tests; and 8.11, Periodic Inspections and Tests

(b) Requirements 8.6, Maintenance, Repair, and Replacement; and 8.7, Alterations

In addition, existing installations shall conform to Sections 1007.4, 1607.8.1, 3001.2, 3001.4, 3002.5, and 3003.2 of the New York City Building Code.

PART II
HOISTWAYS AND RELATED CONSTRUCTION FOR ELECTRIC ELEVATORS

SECTION 2.1
HOISTWAYS

2.1.1 Hoistway construction.

Delete Section 2.1.1 in its entirety.

2.1.2 Windows in hoistway enclosures.
Delete and revise Section 2.1.2 to read as follows:

2.1.2 Windows in hoistway enclosures. Every hoistway-window opening ten (10) stories or fewer above a thoroughfare, and every such window opening three (3) stories or fewer above the roof of an adjacent building, shall be guarded by one of the following:

(a) Vertical bars at least 5/8 inch (16 mm) in diameter or equivalent, spaced not more than 10 inches (254 mm) apart, permanently and securely fastened in place; or

(b) Metal-sash windows having solid-section steel muntins of not less than 1/8 inch (3.2 mm) thickness, spaced not more than 8 inch (203 mm) apart.

Exterior hoistway-windows shall be marked with the word “SHAFTWAY” in red letters at least 6 inches (152 mm) high on a white background.

2.1.4 Pipes, air ducts, and wiring.
Delete Section 2.1.4 in its entirety.

2.1.5 Counterweight guards.
Delete Section 2.1.5 in its entirety.

SECTION 2.2
MACHINE ROOMS AND MACHINERY SPACES

2.2.5 Pipes, air ducts, and wiring.
Delete Section 2.2.5 in its entirety.

SECTION 2.4
CLEARANCES AND RUNBYS
Delete Section 2.4 in its entirety.

SECTION 2.5
PROTECTION OF SPACES BELOW HOISTWAYS
Delete and revise Section 2.5 to read as follows:

Where the space below the hoistway is not permanently secured against access, the following requirements shall be conformed to:

(a) The cars and counterweights shall be provided with spring or oil buffers.

(b) Car and counterweight buffer supports shall be of sufficient strength to withstand without permanent deformation the impact resulting from buffer engagement of the car plus the rated load or the counterweight with an empty car at the following speeds:
(1) Governor tripping speed where the safety is governor operated;

(2) One hundred and twenty-five (125) percent of the rated speed where the safety is not governor operated.

SECTION 2.6
HOISTWAY ENTRANCES

2.6.3 Hoistway-door vision panels.

Delete and revise Section 2.6.3 to read as follows:

2.6.3 Hoistway-door vision panels. Hoistway-door vision panels must be protected by protective grills made of number sixteen (16) gage stainless or galvanized steel in accordance with the following specifications:

(a) Grills shall be sized to fit within or over the vision panel frame and completely cover the vision panel opening in the elevator, car doors and hoistway doors.

(b) Grills and vision panel frames shall be secured by means of non-reversible screws or other tamper proof fasteners.

(c) Grills shall contain openings that shall reject a ball 0.75 inch (19 mm) in diameter.

(d) All cut edges shall be deburred.

(e) The provisions of this section shall apply to both new and existing passenger cars. Requirements for such grills may be waived if certification is submitted that such elevator is operated manually or twenty-four (24) hour doorman service is provided. A security guard shall not be considered doorman service.

(f) For the purpose of this subparagraph, a vandal resistant 0.25 inch (6 mm) polycarbonate sheet, such as Lexan, in two (2) layers, one (1) on each side of the required wire glass, may be used in lieu of the metal protective.

2.6.4 Door hangers.

Delete Section 2.6.4 in its entirety.

2.6.7 Bottom guides.

Delete and revise Section 2.6.7 to read as follows:

2.6.7 Bottom guides. Existing elevators in occupancy groups R-1, R-2 and E shall comply with the following requirements:

(a) The bottom of each horizontally sliding hoistway elevator door panel shall be equipped with bottom guiding members and bottom safety retainers.
(1) The bottom of each horizontally sliding hoistway door panel shall be guided by two or more members as described in ASME A17.1 Section 2.11.11.6.

(2) Safety Retainers - The bottom of each horizontally sliding hoistway elevator door panel shall be provided with a means of retaining the door panel in position if the primary guiding means fail, and preventing displacement of the bottom of the door panel by not more than 0.75 inch (19 mm) into the hoistway. Such retainers shall be installed on the bottom, shaft-side of each door panel, shall be fabricated of at least twelve (12) gage stainless or galvanized steel, and shall engage the corresponding sill member by not less than 0.375 inch (9.5 mm).

Exception: New elevator doors installed under the 1996/1997 or later editions of ASME A17.1 as modified by Chapter K1 of this Appendix.

(b) The door panels shall be structurally sound and in such condition that the guide(s) and retainer(s) may be securely attached.

(1) At least one (1) bottom guide shall be installed near each end of every door panel.

(2) A safety retainer(s) totaling at least 8 inches (203 mm) in length shall be installed between the two (2) outermost guides.

(3) On smaller sized door panels, where due to the width of the door panel, the space between the two (2) outermost bottom guides would be less than 8 inches (203 mm), then either:

(i) The length of the retainer may be reduced to a minimum of 4 inches (102 mm); or

(ii) When only one (1) bottom guide is provided near the center of the door, a 4 inches (102 mm) retainer shall be installed on each side of the bottom guide. If the space between the bottom guide and the edge of the door is less than four inches, the length of the retainer may be reduced to the amount of the space between the bottom guide and the edge of the door.

Exception: New elevator entrance frames and doors installed under the 1996/1997 or later editions of ASME A17.1 as modified by Chapter K1 of this appendix.

SECTION 2.7
HOISTWAY-DOOR LOCKING DEVICES, PARKING DEVICES, AND ACCESS

2.7.4 Access to hoistway.

Delete Section 2.7.4 in its entirety.
2.7.5 Restricted opening of hoistway doors and/or car doors on passenger elevators.

Delete and revise the title of Section 2.7.5 to read as follows:

2.7.5 Restricted opening of hoistway doors and/or car doors on automatic passenger elevators. Automatic passenger elevators shall comply by January 1, 2027.

Add new Section 2.7.7 to read as follows:

2.7.7 Locks on elevators and elevator hoistway doors. All elevators shall comply by January 1, 2027.

In all buildings, no switch, lock or device of any kind shall be installed on any floor on or above the street floor on any passenger elevator car or hoistway sliding door. Freight elevators, and passenger elevators with swing-type hoistway doors, are permitted to have locks provided that they are openable by the city-wide standard key 2642 and the New York City Fire Department Standard 1620 key.

SECTION 2.8
POWER OPERATION OF DOORS AND GATES

2.8.1 Kinetic energy and force limitations for power-operated horizontally sliding doors.

Add new Subsection (3) to Section 2.8.1(a):

(3) See Nonmandatory Appendix G of A17.2-204 for door closing time guidelines.

PART III
MACHINERY AND EQUIPMENT FOR ELECTRIC ELEVATORS

SECTION 3.3
CAR FRAMES AND PLATFORMS

3.3.1 Car platforms.

Delete Section 3.3.1 in its entirety.

SECTION 3.4
CAR ENCLOSURES

3.4.1 Car enclosures.

Delete Section 3.4.1 in its entirety.

3.4.2 Car doors and gates.

Delete and revise Section 3.4.2 to read as follows:
3.4.2 Car doors and gates. Passenger and loft elevators shall comply with subsections (a) and (b) of this section.

(a) Doors, gates, and electric contacts. Cars shall have a car door or gate provided at each entrance equipped with a car door or gate electric contact. Car doors and/or gates shall conform to the following requirements:

(1) Be positively opened by a lever or other device attached to and operated by the door or gate.

(2) Be maintained in the open position by the action of gravity or by a restrained compression spring, or both, or by positive mechanical means.

(3) Not be readily accessible.

(b) Car-door interlock. A car-door interlock shall be required for

(1) Car doors of elevators where the clearance between the loading side of the car platform and hoistway enclosure exceeds the maximum specified in 2.4.1.

(2) Car doors of elevators that face an unenclosed portion of the hoistway during the travel of the car.

(c) Closed position of car doors or gates. Car doors or gates shall be considered to be in the closed position under the following conditions:

(1) For horizontally sliding doors or gates, when the clear open space between the leading edge of the door or gate and the nearest face of the jamb does not exceed 2 in. (51 mm) except where car doors are provided with a car-door interlock(s), 0.375 in. (10 mm)

(2) For vertically sliding counterweighted doors or gates, when the clear open space between the leading edge of the door or gate and the car platform sill does not exceed 2 in. (51 mm)

(3) For horizontally sliding center-opening doors, or vertically sliding biparting counterbalanced doors, when the door panels are within 2 in. (51 mm) of contact with each other, except where horizontally sliding center-opening car doors are provided with a car-door interlock(s), 0.375 in. (10 mm)

(d) Collapsible gates. Collapsible car gates shall conform to the following requirements:

(1) Collapsible car gates shall not be power opened to a distance exceeding one-third (1/3) of the clear gate opening, and in no case more than 10 inches (254 mm).
(2) When fully closed (extended position), gates shall reject a ball 3 inches (76 mm) in diameter for passenger elevators and 4.5 inches (114 mm) for freight elevators.

(3) Gates shall have at least every fourth vertical member guided at the top and every second vertical member guided at the bottom.

(4) Handles of manually operated collapsible gates nearest the car operating device on elevators operated from the car only shall be so located that the nearest handle is not more than 48 inches (1.22 m) from the car operating device when the gate is closed (extended position), and not more than 48 inches (1.22 m) above the car floor. Gate handles shall be provided with finger guards.

3.4.4 Emergency exits.

Delete Section 3.4.4 in its entirety.

3.4.5 Car illumination.

Delete and revise Section 3.4.5 to read as follows:

3.4.5 Car illumination.

(a) Interiors of cars shall be provided with an electric light or lights. Not less than two (2) lamps shall be provided.

(b) The minimum illumination at the car threshold, with the door closed, shall not be less than:

(1) For passenger elevators: 5 fc (54 lux).

(2) For freight elevators: 2½ fc (27 lux).

(c) Light control switches are not required, but if provided they shall be located in or adjacent to the operating device in the car. In elevators having automatic operation, they shall be of the key-operated type or located in a fixture with a locked cover.

(d) Top of car light fixtures shall be provided with a non-key-operated switch in or adjacent to the fixture.

SECTION 3.5 SAFETIES

3.5.1 Car safeties.

Delete Section 3.5.1 in its entirety.

3.5.2 Counterweight safeties.
Delete Section 3.5.2 in its entirety.

3.5.3 Safeties to stop ascending cars or counterweights prohibited.

Delete Section 3.5.3 in its entirety.

3.5.4 Application and release of safeties.

Delete Section 3.5.4 in its entirety.

3.5.5 Maximum permissible movement of governor rope to operate the safety mechanism.

Delete Section 3.5.5 in its entirety.

3.5.6 Rail lubricants and lubrication plate.

Delete and revise Section 3.5.6 to read as follows:

3.5.6 Rail lubricants. Rail lubricants or coatings that will reduce the holding power of the safety or prevent its functioning as required shall not be used.

SECTION 3.6
SPEED GOVERNORS

Delete Section 3.6 in its entirety.

SECTION 3.8
DRIVING MACHINES AND SHEAVES

3.8.1 General requirement.

Delete Section 3.8.1 in its entirety.

3.8.2 Winding drum machines.

Delete and revise Subsection (b) of Section 3.8.2 to read as follows:

(b) Final terminal stopping devices for winding drum machines shall consist of a stopping switch located on the driving machine (machine final) and a stopping switch located in the hoistway and operated by cams attached to the car.

(1) Stopping switches, located on and operated by the driving machine, shall not be driven by chains, ropes, or belts. The opening of these contacts shall occur before or concurrent with the opening of the final terminal stopping switch.

(2) Driving machines equipped with an alternating current motor and alternating current brake or a direct current motor and direct-current brake shall have the final terminal stopping and machine stop device contacts installed in the operating
circuits. The occurrence of a single ground or the failure of any single magnetically operated switch, contactor, or relay shall not render any final terminal stopping device ineffective.

Add new Subsection 3.8.4.1 to read as follows:

3.8.4.1 Single plunger brakes.

(a) All existing traction elevators with single plunger brakes must comply with either of the following by January 1, 2027:

(1) Alteration of single plunger assemblies to dual-plunger type, or

(2) Compliance with Unintended Car Movement Protection as specified by Section 2.19.2 of ASME A17.1.

(b) Notwithstanding any inconsistent provision of chapter 1 of title 28 of the Administrative Code, the work required to comply with this section may not be performed without a permit from the department.

SECTION 3.9 TERMINAL STOPPING DEVICES

3.9.1 Normal terminal stopping devices.

Delete Section 3.9.1 in its entirety.

3.9.2 Final terminal stopping devices.

Delete and revise Section 3.9.2 to read as follows:

3.9.2 Final terminal stopping devices. Upper and lower final terminal electro-mechanical stopping devices shall be provided and arranged to prevent movement of the car by the normal operating devices in either direction of travel after the car has passed a terminal landing. Final terminal stopping devices shall be located as follows:

(a) Winding drum driving machines. Elevators having winding drum machines shall have stopping switches on the machines and also installed in the hoistway and operated by cams attached to the car. Final limit switches and brackets shall be permanently secured and pinned.

(b) Traction driving machines. Elevators having traction driving machines shall have stopping switches installed in the hoistway and operated by cams attached to the car. Final limit switches and brackets shall be permanently secured and pinned.
SECTION 3.10
OPERATING DEVICES AND CONTROL EQUIPMENT

3.10.1 Types of operating devices.
Delete Section 3.10.1 in its entirety.

3.10.3 Top-of-car operating devices.
Delete Section 3.10.3 in its entirety.

3.10.4 Electrical protective devices.
Delete and revise Section 3.10.4 to read as follows:

3.10.4 Electrical protective devices.

Electrical protective devices shall be provided in accordance with the following:

(a) Slack-rope switch. Winding drum machines shall be provided with a slack-rope device equipped with a slack-rope switch of the enclosed manually reset type that shall cause the electric power to be removed from the elevator driving machine motor and brake if the suspension ropes become slack.

(b) Compensating rope sheave switch. Compensating rope sheaves shall be provided with a compensating rope sheave switch or switches mechanically opened by the compensating rope sheave before the sheave reaches its upper or lower limit of travel to cause the electric power to be removed from the elevator driving machine motor and brake.

(c) Broken rope, tape, or chain switches used in connection with machine room normal terminal stopping switches. Broken rope, tape, or chain switches conforming to the requirements of Section 3.6.1 shall be provided in connection with normal terminal stopping devices located in machine rooms of traction elevators. Such switches shall be opened by a failure of the rope, tape or chain.

(d) Car-safety mechanism switch. A switch shall be required where a car safety is provided.

(e) Final terminal stopping devices. Final terminal stopping devices shall be provided for every elevator.

(f) Emergency terminal speed limiting device. Where reduced stroke oil buffers are provided, emergency terminal speed limiting devices are required.

(g) Motor generator overspeed protection. Means shall be provided to cause the electric power to be removed automatically from the elevator driving machine
motor and brake should a motor generator set, driven by a direct current motor, overspeed excessively.

(h) **Motor field sensing means.** Where direct current is supplied to an armature and shunt field of an elevator driving machine motor, a motor field current sensing means shall be provided, which shall cause the electric power to be removed from the motor armature and brake unless current is flowing in the shunt field of the motor.

A motor field current sensing means is not required for static control elevators provided with a device to detect an overspeed condition prior to, and independent of, the operation of the governor overspeed switch. This device shall cause power to be removed from the elevator driving machine motor armature and machine brake.

(i) **Buffer switches for oil buffers used with type C car safeties.** Oil level and compression switches shall be provided for all oil buffers used with Type C safeties.

(j) **Hoistway door interlocks or hoistway door electric contacts.** Hoistway door interlocks or hoistway door electric contacts shall be provided for all elevators.

(k) **Car door or gate electric contacts.** Car door or gate electric contacts shall be provided for all elevators with car doors or gates.

(l) **Normal terminal stopping devices.** Normal terminal stopping devices shall be provided for every elevator.

(m) **Car side emergency exit electric contact.** An electric contact shall be provided on every car side emergency exit door.

(n) **Electric contacts for hinged car platform sills.** Hinged car platform sills, where provided, shall be equipped with electric contacts.

(o) **Emergency stop switch.** On all elevators, an emergency stop switch shall be provided in the car, and located in or adjacent to each car operating panel. When open (i.e. the “stop position”), this switch shall cause the electric power to be removed from the elevator driving-machine motor and brake. Emergency stop switches shall:

1. Be of the manual open and close type;
2. Have a red operating handle or buttons;
3. Be conspicuously and permanently marked “STOP” and indicate the “STOP” and “RUN” positions; and
4. When open, cause an audible signaling device to sound.
(p) STOP switch in pit. A stop switch, conforming to the following requirements shall be provided in the pit of every elevator. The switch shall be located adjacent to the normal pit access. The switch shall cause the electric power to be removed from the elevator driving machine motor and brake and shall:

(1) Be of the manual open and close type;

(2) Have a red operating handle or buttons;

(3) Be conspicuously and permanently marked “STOP” and indicate the “STOP” and “RUN” positions; and

(4) Be positively opened mechanically and its opening shall not be solely dependent on a spring.

(q) Buffer switches for gas spring return oil buffers. A buffer switch shall be provided for gas spring return oil buffers that will cause electric power to be removed from the elevator driving machine motor and brake if the plunger is not within 0.5 inch (13 mm) of the fully extended position.

3.10.5 Power supply line disconnecting means.

Delete Section 3.10.5 in its entirety.

3.10.11 Reserved for Future Use.

Delete and revise Section 3.10.11 to read as follows:

3.10.11 Signal System on Car Switch Elevators.

3.10.11 Signal systems on car switch elevators. Elevators with car switch operations shall be provided with a signal system by means of which signals can be given from any landing whenever the elevator is desired at the landing.

Delete and revise Section 3.10.12 to read as follows:

3.10.12 System to monitor and prevent automatic operation of passenger and freight elevators with faulty door contact circuits.

All automatic passenger and freight elevators shall comply with this section by January 1, 2020. Means shall be provided to monitor the position of power-operated car doors that are mechanically coupled with the landing doors or power-operated car doors with manually operated swing-type hall doors, while the car is in the landing zone, in order
(a) to prevent the operation of the car if the car door is not closed (see Section 3.4.2(c) of ASME A17.3), regardless whether the portion of the circuits incorporating the car-door contact or the interlock contact of the landing door coupled with car door, or both, are closed or open, except as permitted under any of the following conditions:

(1) by a car-leveling or truck-leveling device;

(2) when a hoistway access switch is operated;

(3) when the top-of-car inspection operation utilizing a car door by-pass or hoistway-door bypass switch is activated;

(4) when on any mode of inspection operation; and

(b) to prevent, except as permitted by inspection operation, the power closing of the doors if the car door is fully open and any of the following conditions exist:

(1) the car-door contact is closed or the portion of the circuit, incorporating this contact is bypassed;

(2) the interlock contact of the landing door that is coupled to the opened car door is closed or the portion of the circuit, incorporating this contact is bypassed, except when operating during Firefighters’ Service Phase II;

Exception: For swing-type door operation, the locking (secondary) contacts shall be monitored.

(3) the car-door contact and the interlock contact of the door that is coupled to the opened car door are closed, or the portions of the circuits incorporating these contacts are bypassed.

SECTION 3.11
EMERGENCY OPERATION AND SIGNALING DEVICES

3.11.1 Car emergency signaling devices.

Delete and revise Section 3.11.1 to read as follows:

3.11.1 Car emergency signaling devices. In all buildings, the elevator(s) shall be provided with the following:

(a) If installed, altered, or both under ASME A17.1–2003 or earlier edition, as modified by Chapter K, Appendix K1

(1) An audible signaling device, operable from the emergency stop switch, when provided, and from a switch marked “ALARM” that is located in or adjacent to each car operating panel. The signaling device shall be located inside the
building and audible inside the car and outside the hoistway. One signaling device shall be permitted to be used for a group of elevators.

(2) If the audible signaling device, or the means of two-way communication, or both, are normally connected to the building power supply, they shall automatically transfer to a source of emergency power within 10 seconds after the normal power supply fails. The power source shall be capable of providing for the operation of the audible signaling device for at least 1 hour, and the means of two-way communication for at least 4 hours.

(3) In buildings in which a building attendant (building employee, watchman, etc.) is not continuously available to take action when the required emergency signal is operated, the elevators shall be provided with a means within the car for communicating with or signaling to a service that is capable of taking appropriate action when a building attendant is not available.

(4) An emergency power system shall be provided conforming to the requirements of (a)(3) of this section.

(b) If installed, altered, or both under ASME A17.1–2013 or later editions as modified by Chapter K, Appendix K1, the emergency communications system shall comply with Section 2.27 of the ASME A17.1 Code under which it was installed or altered.

3.11.3 Firefighters’ service.

Delete and revise Section 3.11.3 to read as follows:

3.11.3 Firefighters' service operation in existing elevators. Firefighters’ service operation shall be installed in accordance with the New York City Building Code in all existing elevators serving any of the following:

(a) High rise buildings or buildings classified in Occupancy Group M except existing R-2.

(b) All buildings or buildings classified in Occupancy Group A, B, E, I, or R-1 (except for "residential hotels," as such term is defined by the commissioner pursuant to rules and regulations).

SECTION 3.12
SUSPENSION MEANS AND THEIR CONNECTIONS

3.12.1 Suspension means.

Delete Section 3.12.1 in its entirety.
Delete Section 4.2 in its entirety.

SECTION 4.3 DRIVING MACHINES

4.3.2 Plunger stops.

Delete and revise Section 4.3.2 to read as follows:

**4.3.2 Plunger stops.** Plungers shall be provided with solid metal stops and/or other means to prevent the plunger from traveling beyond the limits of the cylinder. Stops shall be so designed and constructed as to stop the plunger from maximum speed in the up direction under full pressure without damage to the connection to the driving machine, plunger, plunger connection, couplings, plunger joints, cylinder, cylinder connecting couplings or any other parts of the hydraulic system.

4.3.3 Hydraulic elevators.

Delete and revise Section 4.3.3 to read as follows:

**4.3.3 Hydraulic elevators.** Hydraulic elevators that have any portion of the cylinder buried in the ground and that do not have a double cylinder or a cylinder with a safety bulkhead shall:

(a) Have the cylinder replaced with a double cylinder or a cylinder with a safety bulkhead protected from corrosion by one or more of the following methods:

1. Monitored cathodic protection;
2. A coating to protect the cylinder from corrosion that will withstand the installation process;
3. By a protective plastic casing immune to galvanic or electrolytic action, salt water, and other known underground conditions; or

(b) Be provided with a device meeting the requirements of Section 3.5 or a device arranged to operate in the down direction at an overspeed not exceeding one hundred twenty-five (125) percent of rated speed. The device shall mechanically act to limit the maximum car speed to the buffer striking speed, or stop the elevator car with rated load with a deceleration not to exceed 32.2 ft/s² (9.8 m/s²), and shall not automatically reset. Actuation of the device shall cause power to be removed from the pump motor and control valves until manually reset; or
(c) Have other means acceptable to the department to protect against unintended movement of the car as a result of uncontrolled fluid loss.

SECTION 4.5
TANKS

4.5.2 Pressure tanks.

SECTION 4.7
OPERATING DEVICES AND CONTROL EQUIPMENT

4.7.2 Top-of-car operating devices.
Delete Section 4.7.2 in its entirety.

4.7.3 Anticreep leveling devices.
Delete Section 4.7.3 in its entirety.

4.7.4 Electrical protective devices.
Delete and revise Section 4.7.4 to read as follows:

4.7.4 Electrical protective devices. Electrical protective devices conforming to the requirements of Section 3.10.4, where they apply to hydraulic elevators, shall be provided and operate as follows:

(a) The following devices shall prevent operation of the elevator by the normal operating device and also the movement of the car in response to the anticreep leveling device:

(1) stop switches in the pit

(2) stop switches on top of the car

(3) car side emergency exit door electric contacts, where such doors are provided

(b) The following devices shall prevent the operation of the elevator by the normal operating device, but the anticreep leveling device where provided, shall remain operative:

(1) emergency stop switches in the car

(2) broken rope, tape, or chain switches on normal terminal stopping devices when such devices are located in the machine room or overhead space

(3) hoistway-door interlocks or hoistway-door electric contacts
(4) car door or gate electric contacts

(5) hinged car platform sill electric contacts

(6) in-car stop switch, where permitted by subsection 3.10.4(t)

4.7.5 Power supply line disconnecting means.

Delete Section 4.7.5 in its entirety.

4.7.7 Control and operating circuit requirements.

Delete and revise Section 4.7.7 to read as follows:

4.7.7 Control and operating circuit requirements. Control and operating circuits shall conform to the requirements of Sections 3.10.9 and 3.10.12.

SECTION 4.8
ADDITIONAL REQUIREMENTS FOR COUNTERWEIGHTED HYDRAULIC ELEVATORS

Delete Section 4.8 in its entirety.

SECTION 4.9
ADDITIONAL REQUIREMENTS FOR ROPED HYDRAULIC ELEVATORS

Delete Section 4.9 in its entirety.

PART V
ESCALATORS

SECTION 5.1
CONSTRUCTION

5.1.4 Antislide device.

Delete and revise Section 5.1.4 to read as follows:

5.1.4 Antislide device.

On high deck balustrades, antislide devices shall be provided on decks or combination of decks when the outer edge of the deck is greater than 12 inches (305 mm) from the centerline of the handrail or on adjacent escalators when the distance between centerline of the handrails is greater than 16 inches (406 mm).

These devices shall consist of raised objects fastened to the decks, not closer than 4 inches (102 mm) to the handrail and spaced not greater than 78 inches (2000 mm) apart. The height shall be not less than .75 inches (19 mm). There shall be no sharp corners or edges.
5.1.7 Step risers.
Delete Section 5.1.7 in its entirety.

5.1.8 Slotting of step treads.
Delete Section 5.1.8 in its entirety.

5.1.11 Step/skirt performance index.
Delete Section 5.1.11 in its entirety.

SECTION 5.3
OPERATING AND SAFETY DEVICES

5.3.1 Starting switches.
Delete and revise Section 5.3.1 to read as follows:

5.3.1 Starting devices. In every new and existing escalator, starting devices shall be provided with the combination of a starting switch and a starting button. The escalator shall be started only after the activation of both the switch and the button.

(a) Starting switch. Starting switches shall be of continuous pressure spring return type and shall be operated by a cylinder-type lock having five-pin, five-disc or five-tumbler combination. Starting switches shall be of three-position type and shall be clearly marked as follows:

NORMAL. A central position for the key entry and spring return position.

START-UP. A right side position for starting the escalator in the upward direction.

START-DOWN. A left side position for starting the escalator in the downward direction.

(b) Starting Button. Starting buttons shall be of the constant pressure type and located within 6 inches (152 mm) from the starting switch. They shall be clearly marked "Starting Button".

(c) Cover Plate. A locked, transparent cover plate that can be opened by the starting key and clearly marked “For Start Only” shall protect the starting devices.

(d) Location of starting devices. Starting devices shall be located at the top and bottom of the escalator on the right side-facing newel.

NOTE: The starting key shall be kept on the premises at all times and shall only be accessible to persons authorized to start escalators. It shall also be made available to the commissioner or the commissioner’s representatives.
5.3.2 Emergency stop buttons.

Delete and revise Section 5.3.2 to read as follows:

**5.3.2 Emergency stop buttons location.** A red stop button shall be visibly located at the top and bottom landings on the right side-facing the escalator. Remote stop buttons are prohibited, except that any escalator connected to an automatic fire alarm system shall gradually stop the escalator at a rate not greater than 3 ft per sec² (0.91 m/s²) upon the activation of such system.

5.3.7 Skirt obstruction device.

Delete and revise the title of Section 5.3.7 to read as follows:

**5.3.7 Skirt obstruction and deflector devices.**

Add new Section 5.3.7.1 to read as follows:

**5.3.7.1 Means shall be provided to cause the electric power to be removed from the escalator driving machine motor and brake if an object becomes caught between the step and the skirt as the step approaches the upper combplate, intermediate device or lower combplate.** On units having a run of 20 feet (6.1 m) or more, intermediate devices shall be provided on both sides of the escalator with devices located at intervals of 10 feet (3.05 m) or less. The activation of intermediate devices shall stop the escalator at a rate not greater than 3 ft per sec² (0.91 m/s²) in the direction of travel. The upper and lower skirt obstruction device shall be located so that the escalator will stop before that object reaches the combplate. The activation of any skirt device shall stop the escalator with any load up to full brake rated load with the escalator running.

Add new Section 5.3.7.2 to read as follows:

**5.3.7.2 Skirt deflector devices, in accordance with 6.1.3.3.10 of A17.1, 2013, shall be provided no later than January 1, 2025.**

Add new Section 5.3.13 to read as follows:

**5.3.13 Comb-step stop device.** A device shall be provided that will cause the opening of the power circuit to the escalator driving machine motor and brake where a resultant vertical force not greater than 60 lbf (268 N) in the upward direction is applied at the center of the front of the comb-plate.

PART VI
DUMBWAITERS

Delete Part VI in its entirety.
PART VII
HAND ELEVATORS

Add new Section 7.0 to read as follows:

SECTION 7.0
EXISTING HAND POWERED FREIGHT ELEVATORS

Existing hand powered freight elevators shall not be subject to the provisions of this section. However, adequate protection of landing openings shall be provided by hinged or sliding doors which shall remain locked at all times except when the freight elevator is in use. Auxiliary gates not less than 36 inches (914 mm) in height, substantially constructed and secured in place, of wood or metal, or equivalent metal chains shall be installed. Such gates or chains may be arranged to lift vertically, to slide horizontally, or to swing. No part of any gate or chain shall project into the freight elevator shaft. Gates may be operated automatically or manually.

8.2.4 Car frames and platforms.

Delete Section 8.2.4 in its entirety.
8.2.5 Bow-irons and stanchions.
Delete Section 8.2.5 in its entirety.

8.2.6 Car enclosures and car doors and gates.
Delete Section 8.2.6 in its entirety.

8.2.7 Car and counterweight safeties and governors.
Delete Section 8.2.7 in its entirety.

8.2.8 Capacity and loading.
Delete Section 8.2.8 in its entirety.

8.2.9 Driving machines and sheaves.
Delete Section 8.2.9 in its entirety.

8.2.10 Terminal stopping devices.
Delete Section 8.2.10 in its entirety.

8.2.11 Locking devices for hinged swinging doors or vertically lifting covers in sidewalks or other areas exterior to the building.
Delete Section 8.2.11 in its entirety.

8.2.12 Requirements for electrical wiring and electrical equipment.
Delete Section 8.2.12 in its entirety.

8.2.13 Clearance between loading side of car platforms and hoistway enclosures.
Delete Section 8.2.13 in its entirety.

8.2.14 Operating devices and control equipment of sidewalk elevator.
Delete and revise Section 8.2.14 to read as follows:

8.2.14 Operating devices and control equipment of sidewalk elevator. The operation of power sidewalk elevators through openings in the sidewalk, or through openings in other exterior areas that are accessible to the public, and that are protected by hinged doors or vertically lifting covers, shall conform to the following:
(a) The elevator shall be operated in both the up and down directions through the opening, only from the sidewalk or other exterior area. The operation shall be by means of:

(1) Key-operated continuous-pressure type up and down switches; or

(2) Continuous-pressure-type up-and-down operating buttons on the free end of a detachable, flexible cord 5 feet (1.52 m) or less in length.

(b) Key-operated switches shall be of continuous pressure spring return type, and shall be operated by a cylinder-type lock having not less than a five-pin or five-disk combination with the key removable only when the switch is in the "OFF" position.

(c) Key-operated switches and plug receptacles for flexible cords shall be mounted in weatherproof boxes with covers installed above the sidewalk or other area on the side of the building wall, located 18 inches (457 mm) or less horizontally from one side of the opening.

(d) Operating buttons may be provided in the elevator car and at any landing below the top landing, provided that such buttons shall operate the car only when the bow-iron or stanchions are not in contact with the doors or covers in the sidewalk of other exterior area.

(e) When the bow-iron or stanchions are in contact with the doors or covers at the sidewalk or other exterior area, it shall be possible to operate the car only by means of either the key switches or the continuous-pressure type up-and-down buttons on the free end of the flexible cord specified in Section 8.2.14(a)(1).

(f) Flexible cords and operating keys shall not be left where they are accessible to unauthorized persons for operation of the elevator.

PART IX
MOVING WALKS

SECTION 9.2
PROTECTION OF SUPPORTS AND MACHINE SPACES AGAINST FIRE

Delete and revise the title of Section 9.2.2 to read as follows:

9.2.1 Protection required.
SECTION 9.3
CONSTRUCTION REQUIREMENTS

Delete and revise subsection (a) of Section 9.3.3.4 to read as follows:

9.3.3.4 Skirt panels. Where skirt panels are provided

(a) the clearance between each side of the treadway and the adjacent skirt panel shall be not more than 0.188 inches (4.8 mm).

SECTION 9.6
OPERATING AND SAFETY DEVICES

9.6.2 Starting switch.

Delete and revise Section 9.6.2 to read as follows:

9.6.2 Starting devices. In every new and existing moving walk, starting devices shall be provided with the combination of a starting switch and a starting button. The moving walk shall be started only after the activation of both the switch and the button.

(a) Starting Switch. Starting switches shall be of continuous pressure spring return type and shall be operated by a cylinder-type lock having five-pin, five-disc or five-tumbler combination. Starting switches shall be of three-position type and shall be clearly marked as follows:

NORMAL. A central position for the key entry and spring return position.

START-UP. A right-side position for starting the moving walks in the upward direction.

START-DOWN. A left-side position for starting the moving walks in the downward direction.

(b) Starting Button. Starting buttons shall be of the constant pressure type and located within 6 inches (152 mm) from the starting switch. They shall be clearly marked “Starting Button”.

(c) Cover Plate. A locked, transparent cover plate that can be opened by the starting key and clearly marked “For Start Only” shall protect the starting devices.

(d) Location of starting devices. Starting devices shall be located at top and bottom of the moving walk on the right-side facing newel.
NOTE: The starting key shall be kept on the premises at all times and shall only be accessible to persons authorized to start moving walks. It shall also be made available to the commissioner or the commissioner’s representatives.

9.6.3 Emergency stop buttons.

Delete and revise Section 9.6.3 to read as follows:

9.6.3 Emergency stop buttons location. A red stop button shall be visibly located at the top and bottom landings on the right side facing the moving walk. Remote stop buttons are prohibited, except that any moving walk connected to an automatic fire alarm system shall gradually stop the moving walk at a rate not greater than 3 ft/sec² (0.91 m/s²) upon the activation of such system.

Add new Section 9.6.14 to read as follows:

9.6.14 Comb-plate stop device. A device shall be provided that will cause the opening of the power circuit to the moving walk driving-machine motor and brake when a resultant vertical force not greater than 60 lbf (268 N) in the upward direction is applied at the center of the front of the comb-plate.

PART X
PRIVATE RESIDENCE ELEVATORS

Delete and revise Part X Scope to read as follows:

SCOPE

This Part applies to power elevators that are limited in size, capacity, rise, and speed and are installed in or at a private residence. This Part also applies to similar elevators installed in buildings as a means of access to private residences within such buildings provided the elevators are so installed that they are not accessible to the general public or to other occupants in the building.

NOTE: This Part has been developed to provide a minimum standard of safety for private residence elevators. These elevators are installed for the convenience of those persons who are unable to use stairways. Private residence elevators, while they are usually installed in single-family dwellings, may be installed within a separate apartment in a multiple dwelling where they are not accessible to the general public or to other occupants of the building. It is frequently necessary to install such elevators in open stairwells, as the construction of the building may not provide space for an enclosed hoistway.

Since the size, speed, load, rise, and use are limited, it is possible to provide an adequate level of safety without requiring the equipment to meet the standards in other parts of the Code. Equipment installed for use by the general public is subjected to much more severe and frequent service.
Although private residences are usually exempt from routine inspections, this Code will provide a basis for evaluation of existing equipment during resale or exchange of property. It will also be useful when an “installation placed out of service” is returned to use.

It should be noted that the rules of this Part of the Code do not apply to all power elevators installed in private residences, but only to those that meet the definition for “private residence elevator.” All other elevators in private residences are required to comply with all the rules of the other parts of this Code.

All residential elevators shall comply with the following by January 1, 2021.

SUSPENSION MEANS

Delete Section 10.13 in its entirety.

§61. Appendix M of the New York city building code is REPEALED and a new appendix M is added to read as follows:
APPENDIX M
SUPPLEMENTARY REQUIREMENTS FOR
ONE- AND TWO-FAMILY DWELLINGS

SECTION BC M101
GENERAL

M101.1 General. The provisions of this appendix contain supplementary requirements for the design and construction of one- and two-family dwellings not more than three stories in height.

SECTION BC M102
DEFINITIONS

M102.1 Definitions. The following terms are defined in Chapter 2:

DWELLING, ONE-FAMILY.

DWELLING, TWO-FAMILY.

SECTION BC M103
FIRE WALL SEPARATION

M103.1 General. A fire wall shall be provided between buildings in accordance with Chapter 7. However, attached one- and two-family dwellings of construction Type IIIA, IIIB, VA and VB, where permitted and where each building is not more than three stories in height and not more than 2,100 square feet (195 m²) on a story, may be separated by party walls constructed in accordance with the following and as illustrated in Figures M103(1) and M103(2):

1. If there are three or fewer contiguous attached one- or two-family dwellings, such fire wall shall consist of a solid 1-inch (25 mm) Type X gypsum wall board core covered on each side by a ½-inch (12.7 mm) exterior-grade Type X gypsum wall board, followed by a 1-inch (25 mm) air gap on one side. Such assembly shall be constructed between two independently supported load-bearing stud walls. See Figure M103(1).

2. If there are in excess of three contiguous attached one or two-family dwellings, the fire wall shall be made of concrete and masonry, and constructed in accordance with Section 706.

3. Such wall shall be continuous between foundations and roofs.

4. When roof construction on the same level is combustible on both sides of the party wall, the party wall shall extend through the roof construction to a height of at least 4 inches (102 mm) above the high point of the roof framing unless a minimum of 18 inches (457 mm) of non-combustible roof construction is provided on each side of the party wall.
5. Such party wall shall be made smoke-tight at junctions with exterior walls. In buildings of construction Type VA or VB, exterior walls shall be constructed of noncombustible materials for a distance of at least 18 inches (457 mm) on each side of the party wall, or the party wall shall project at least 12 inches (305 mm) through the exterior wall.

§ 62. Section BC N102 of appendix N of the New York city building code is REPEALED and a new section N102 is added to read as follows:

**SECTION BC N102**

**INDUCTION LOOP SYSTEM**

### N102.1 Induction loop system specifications.

1. Where induction-loop systems are provided for hearing aid purposes, the system performance shall be in accordance with IEC 60118-4:2014.

2. The methods of measuring and specifying the performance of system components shall be in accordance with IEC 62489-1:2010, as specified in IEC 60118-4:2014.

3. All electrical wiring installations shall be in accordance with the *New York City Electrical Code*.

### N102.2 Capital projects.

City funded projects shall provide induction-loop systems pursuant to Section 224.3 of the New York City Charter.

§ 63. Items 9 and 10 of Section N103.1 of appendix N of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

9. All input electrical wiring installations shall be in accordance with the *New York City Electrical Code*.

[10. The installation of all stand-alone components of the system must comply with the *New York City Electrical Code*.]

§ 64. Items 9, 10 and 11 of Section N104.1 of appendix N of the New York city building code, as added by local law number 33 for the year 2007, are amended to read as follows:

9. All input and output electrical wiring installations shall be in accordance with the New York City Electrical Code.

10. The installation of all stand-alone components of the system must comply with the New York City Electrical Code.

11. The frequencies used by the transmitter should be in compliance with applicable FCC rules.
§65. Appendix P of the New York city building code is REPEALED and a new appendix P is added to read as follows:

**APPENDIX P**

**RESERVED**

§66. Appendix Q of the New York city building code is REPEALED and a new appendix Q is added to read as follows:

**APPENDIX Q**

MODIFIED NATIONAL STANDARDS FOR AUTOMATIC SPRINKLER, STANDPIPE, FIRE PUMP, FIRE ALARM, AND SMOKE CONTROL SYSTEMS

**SECTION BC Q101 SCOPE**

**Q101.1 Scope.** This appendix provides the modifications to the nationally recognized standards NFPA 13, NFPA 13D, NFPA 13R, NFPA 14, NFPA 20, NFPA 72, and NFPA 92, governing the installation and maintenance requirements of automatic sprinkler systems, standpipe and hose systems, fire pumps, fire alarms, and smoke control systems. Where a referenced publication has been modified for the City of New York as by the New York City Building Code and the New York City Fire Code, every reference to such publication shall be deemed to include all such modifications.

**SECTION BC Q102 INSTALLATION OF SPRINKLER SYSTEMS**

**Q102.1 General.** Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13, *Standard for the Installation of Sprinkler Systems*, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

**Chapter 1 Administration** No changes.

**Chapter 2 Referenced Publications**

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

**Chapter 3 Definitions** No changes.
Chapter 4 General Requirements No changes.

Chapter 5 Classification of Occupancies and Commodities No changes.

Chapter 6 System Components and Hardware

6.3.1.1 Delete after the word wall and replace with the following: “in accordance with the New York City Plumbing Code.”

Add the following at the end of section 6.3.9.1.1: “The use of pipe or tube other than that described above must involve consideration of many factors, including but not limited to the following:

1. Pressure rating.
2. Beam strength (hangers).
3. Corrosion (chemical and electrolytic).
4. Resistance to failure when exposed to elevated temperatures.
5. Methods of joining (strength, permanence, fire hazard).
6. Availability of fittings (for sprinkler outlets and proper routings).
7. Physical characteristics relating to integrity during earthquakes.
8. Toxicity.
9. Combustibility.
10. Movement during sprinkler operation (water distribution).”

Add Section 6.3.9.9 Non-metallic piping and fittings are permitted to be used only in Group R occupancies 6 stories or less in height.

6.7.1.3 Delete.

6.7.3 Delete.

Add Section 6.8.2.2.3 The alarm apparatus for a dry-pipe system shall also consist of approved low and high air pressure alarm attachments to the dry-pipe valve.

6.8.5 Change “8.16.2.6” to “8.17.1.9”.

Chapter 7 System Requirements

7.1.5 Delete.

7.1.5.1 Delete.
Add **7.2.6.3.4** to read as follows: “High/Low air pressure in the system shall be monitored so that either condition sends a supervisory signal. Such signal shall trigger an audible notification signal and shall report to a supervising station if the system is required otherwise to do so.”

**7.2.6.8.3** Delete and replace with the following: “High / Low air pressure in the system shall be monitored so that either condition sends a supervisory signal. Such signal shall trigger an audible notification signal and shall report to a supervising station if the system is required otherwise to do so.”

**7.6.3.1** Delete.

**Figure 7.6.3.1** Delete.

**7.6.3.2** Add the following sentence at the end: “Backflow prevention device relief discharge shall be piped to a safe location.

**7.9** Delete entire section, including subsections.

**Chapter 8 Installation Requirements**

**8.2.1** Delete the first sentence and replace with the following: “The maximum floor area on any one floor to be protected by a single riser from a control and alarm device shall be as follows:”

**8.15.3.2.1** Delete the words after “is” and replace with the following: “permanently blocked off so that storage cannot occur.”

**8.15.4.1** Delete the reference to 8.15.4.4 and add the following at the end: “when required by other sections of this standard or the New York City Building Code.”

**8.15.4.4** Delete.

**8.15.5.3** Delete the words “in NFPA 101, or the applicable building code” and replace with the following: “in accordance with the New York City Building Code.”

**8.15.5.4** Delete the words “in elevator machine rooms or”.

**8.15.7.4** Delete.

**8.15.7.5** Delete.

**8.15.8.1.2** Delete all words after and including “as defined”.

**8.15.8.2** Delete and replace with the following: “Closets and Pantries. Sprinklers are not required in clothes closets, linen closets, and pantries within:

1. Dwelling units in hotels and motels where the area of the closet or pantry does not exceed 24 square feet (2.2 m), the least dimension does not exceed 3 feet (0.9 m), and the walls and ceilings are surfaced with noncombustible or limited-combustible materials; and
(2) Dwelling units in Group R occupancies other than hotels and motels where the area of the
closet or pantry does not exceed 12 square feet (1.1 m), the room or space upon which the
closet or pantry opens is equipped with sprinklers designed to afford protection to the opening
of the closet or pantry, and the walls and ceilings of the closet or pantry are surfaced with
noncombustible or limited-combustible materials.”

8.15.9 Add the following after the word “closets”: “without solid doors”.

8.15.16 Delete.

8.15.20.4.4 Delete and replace with the following: “In altering existing sprinkler systems which
contain ¾-inch (19 mm) pipe, the existing ¾-inch (19 mm) pipe shall be removed and replaced with
pipe having a minimum diameter of 1-inch (25 mm) except as provided for in 8.15.20.4.1, 8.15.20.4.2,
8.15.20.4.3 and 8.15.20.4.5.”

Add 8.15.20.4.5 “Where nipples used are less than 1 in. (25 mm) diameter, nipples shall be schedule
80 and no longer than shoulder length.”

8.15.20.5.4 Delete and replace with the following: “Where nipples used are less than 1 in. (25 mm)
diameter, nipples shall be schedule 80 and no longer than shoulder length.”

8.15.23.3 Delete.

8.15.26 Delete and replace with the following: “Sprinkler Interior Protected Glazing. Where
sprinklers are used in combination with glazing as an alternative to a required fire-rated wall or
window assembly, the sprinkler-protected assembly shall be approved by the commissioner and shall
comply with the following:

“(1) Sprinklers shall be listed as specific application window sprinklers unless standard spray
sprinklers are specifically permitted by the commissioner.”

“(2) Sprinklers shall be supplied by a wet-pipe system.”

“(3) Where the assembly is required to be protected from both sides, sprinklers shall be installed
on both sides of the glazing.”

“(4) The use of sprinkler protected glazing shall be limited to non-load-bearing walls.”

“(5) The water supply duration for the design area that includes the window sprinklers shall not
be less than the required rating of the assembly.”

Add 8.16.1.1.1.4 to read as follows: “An approved indicating shutoff valve may be used in lieu of an
O.S.&Y. gate valve wherever referred to in these modifications except such valve shall not be part of
the pressure reducing valve. The indicator shall be readily visible from the floor.”

Add 8.16.1.1.1.5 to read as follows: “A connection from public water system shall not extend into or
through a building unless such connection is under the control of an outside indicator post or O.S.&Y.
gate or under the control of an inside O.S.&Y. gate valve located near the outside wall of the
building.”
Add 8.16.1.1.6 to read as follows: “All gate valves controlling water supplied for sprinklers shall be located where readily accessible and when necessary, permanent ladders, clamped treads on risers, chains and wheels, or other accepted means shall be provided.”

Add 8.16.1.1.7 to read as follows: “Floor control valves shall be provided where required or in special cases where area or height or number of tenants is excessive, both in manufacturing and mercantile buildings, or where contents are more than ordinarily susceptible to damage. Floor valves shall be located where they are readily accessible. They are to be O.S.&Y. or indicating type located ahead of the inlet of any pressure reducing valve.”

Add 8.16.1.1.8 to read as follows: “Valves controlling sprinkler supplied from the standpipe system shall be listed for standpipe service in the pressure zone in which it is installed. They shall be O.S.&Y. or indicating valves, and shall be located ahead of the inlet of any pressure reducing valve installed.”

8.16.1.1.2.2 Delete and replace with the following: “Floor control valves in high-rise buildings shall comply with 8.16.1.1.2.1(1) or 8.16.1.1.2.1(2).”

8.16.1.1.2.5 Delete.

8.16.1.1.3.5 Delete and replace with the following: “Where there is one water supply connection a check valve shall be installed. Such check valve may be a swing check, alarm check, an approved fire meter or an approved detector check.”

Add 8.16.1.1.3.6 to read as follows: “Where a system having only one dry-pipe valve is supplied with city water and Fire Department connection, it will be satisfactory to install the main check valve in the water supply connection in a vertical position immediately inside of the building after the main indicating valve.”

Add 8.16.1.1.3.7 to read as follows: “Check valves on tank or pump connections, when located underground, may be placed inside of buildings and at a safe distance from the tank riser or pump, except in cases where the building is entirely of one fire area, in which case the check valve may be located over-head in the lowest level.”

Add 8.16.1.1.4.5 to read as follows: “Where either a wet or dry pipe sprinkler system is supplied by city water and a Fire Department connection and has more than one riser with O.S.&Y. gate valve in each, and the whole system is controlled by one outside post indicator valve, the main check valve in the water supply connection may be installed immediately inside building. If the supply is controlled by an underground gate valve with a Department of Environmental Protection standard curb, roadway or sidewalk flush box, the main check valve in the water supply connection shall be installed immediately after the O.S.&Y. gate valve inside the building.”

Add 8.16.1.1.4.6 to read as follows: “A gate valve shall be installed on each side of each check valve under conditions other than described in 8.16.1.1.4.1, 8.16.1.1.4.2, 8.16.1.1.4.3 and 8.16.1.1.4.4. However, this shall not apply to two-way Fire Department check valves.”

Add 8.16.1.1.4.7 to read as follows: “In a city connection serving as one source of supply, the city valve in the connection may serve as one of the required gate valves. An O.S.&Y. valve or an indicator post valve shall be installed on the systems (water supply) side of the check valve.”
Delete and replace with the following: “Where a gravity tank is located on a tower in the yard, the gate valve on the tank side of the check valve shall be of O.S.&Y. type; the other shall be either an O.S.&Y. valve or other listed indicating valve. Where a gravity tank is located on a building, both gate valves shall be the O.S.&Y. type; and all fittings inside the buildings, except the drain tee fill line, and heater connections, shall be under the control of a gate valve.”

Delete all words after and including the word “unless.”

Delete all words after and including the word “at.”

Add 8.16.1.3.4 to read as follows: “Where sprinklers are supplied from a yard main, a listed outside indicator post gate valve shall be placed in the connecting pipe at a safe distance from the building. Indicator post valves shall be located not less than 40 feet (12 192 mm) from buildings; but where necessary to place a valve close to a building, it shall be located at a blank part of the wall.”

Add 8.16.1.3.5 to read as follows: “When a building has no basement, and an outside post indicator control cannot be furnished, a short post indicator may be installed in a horizontal position in riser with handwheel projecting outside of wall.”

Add 8.16.1.4.2.7 to read as follows: “Pits for underground valves, except those located at the base of a tank riser, are described in the Standard for Outside Protection (ANSI/NFPA No. 24-2010). For pits protecting valves located at the base of a tank riser, refer to 8.15.1.4.2.6.”

Add at the end the following: “unless the system is installed utilizing schedule 40 steel piping for sizes 1” to 6” and a minimum of schedule 30 steel piping for sizes 8” and larger.”

Table 8.16.2.4.2 Delete and replace with the following:

<table>
<thead>

Delete 8.16.4.1.5.

Delete 8.16.6.

Add 8.17.1.5.3 to read as follows: “Identification signs shall be provided for outside alarm devices. The sign shall be located near the device in a conspicuous position and shall be worded as follows: “SPRINKLER FIRE ALARM –WHEN BELL RINGS NOTIFY FIRE DEPARTMENT OR POLICE”.”

Add at end a new item 4 as follows: “(4) Refer to NFPA 72 for further requirements.”
Add 8.17.1.8 to read as follows: “Dry Pipe System Alarms.”

Add 8.17.1.8.1 to read as follows: “The alarm apparatus for a dry-pipe system shall consist of approved low and high air pressure alarm attachments as well as workflow pressure type alarm attachments to the dry-pipe valve. When a dry-pipe valve is located on the system side of an alarm valve, the actuating device of the alarms for the dry-pipe valve may be connected to the alarms on the wet-pipe system.”

Add 8.17.1.9.1 to read as follows: “Drains for Alarm Devices.”

Add 8.17.1.9.1 to read as follows: “Where vents are necessary for satisfactory electric alarm switch operations, such vents shall be properly piped to a drain.”

Add 8.17.1.9.2 to read as follows: “Drains from alarm devices shall be so arranged that there will be no danger of freezing, and so that there will be no overflowing at the alarm apparatus, at domestic connections or elsewhere with the sprinkler drains wide open and under pressure.”

Add 8.17.1.9.3 to read as follows: “Drain from retarding chamber and electric alarm switch shall be permitted to discharge through an open cone and be run separate from main system drains to a safe and visible point of free discharge or to sewer or ground drain. Drain from water-motor-operated alarm device may run separately to sewer or ground drain or may be connected to drain from retarding chamber at a point between such sewer and a check valve on this drain, a union or plug being inserted in the drain from the alarm device to permit inspection. Where checks are used, they shall be so located as to have the equivalent of at least a four-foot (1219 mm) head and shall not be installed in a vertical position.”

Add 8.17.1.9.4 to read as follows: “Where drains are conveyed to a sewer, a proper trap shall be provided.”

Add 8.17.1.9.5 to read as follows: “Where it is necessary to drain alarm valves outside the wall, an open discharge cone shall be provided inside to break the pipe line so that cold air will not conduct directly into the retarding chamber. Alternately, all drains shall have at least 4 feet (1219 mm) of pipe beyond the valves, in a warm area.”

8.17.2.2 Delete items 1–3 and add the following:

“(1) Systems with sprinklered areas not exceeding 2000 square feet (186 m²).”

“(2) Systems containing 36 or fewer sprinkler heads except as otherwise required by other sections of this referenced standard.”

8.17.2.3 Delete items 1–3 and add the following:

“(1) Minimum size of two-way Fire Department connection is 5 inches (127 mm) except for two-way Fire Department connections supplying a single system with a riser smaller than 5 inches (127 mm) where a 4 inch (102 mm) two-way Fire Department connection may be used.”

8.17.2.4.6 Delete.
Add 8.17.4.2.1.1 to read as follows: “This test pipe shall be not less than 1-inch in diameter, located in the upper story, and the connection shall be permitted to be piped from the end of the most remote branch line. The discharge shall be at a point where it can be readily observed. In locations where it is not practical to terminate the test pipe outside the building, the test pipe may terminate in a drain. In such case, the test connection shall be made using a sight test connection containing a smooth bore corrosion resistant orifice giving a flow equivalent to one sprinkler. The test valve shall be located at an accessible point, and not over seven feet above the floor. The control valve on the test connection shall be located at a point not exposed to freezing.”

8.17.5 Delete.

Chapter 9 Hanging, Bracing, and Restraint of System Piping

9.2.1.3.3 Delete all subsections and replace with the following:

“9.2.1.3.3.1 Listed flexible hose fittings and their anchoring components intended for use in installations connecting the sprinkler system piping to sprinklers shall be rigidly fixed to the building structure at the sprinkler end of the flexible hose, independent of the ceiling suspension and support system in accordance with ASTM C 635, Section 3.1.1.10, as modified by Appendix R of the New York City Building Code.”

9.3.4.11 Delete.

10.10.1 Delete and replace with the following: “The installing contractor shall perform all required inspections and acceptance tests in accordance with this chapter prior to scheduling an inspection.”

Figure 10.10.1 Delete.

Chapter 11 Design Approaches

11.1.4.2* Delete and replace with the following: “The minimum water supply requirements for a pipe schedule designed sprinkler system shall be per the requirements of 11.2.2. The minimum water supply requirement for a hydraulically calculated sprinkler system shall be the calculated sprinkler system demand only, for the duration indicated in Table 11.2.3.1.2. Where gravity tanks are used as the supply or a portion of the supply to a hydraulically designed sprinkler system, it shall not be required to balance the calculated sprinkler flow and pressure demand to the outlet pressure of the gravity tank for the calculation of the water supply duration. The total water supply required shall be the product of the calculated system flow only, multiplied by the required water supply duration.”

Add 11.1.4.2.1 to read as follows: “In fully sprinklered buildings, where an Automatic Wet Standpipe System is not required by Section 905 of the New York City Building Code, the storage capacity of the fire reserve in the tank supplying water to the sprinkler system shall be as required for the sprinkler demand, at a minimum.”

11.1.6 Delete.
Add 11.2.2.10 to read as follows: “Where the water supply to a system sized in accordance with the pipe sizing schedules is taken from a water storage tank, the adequacy of the tank capacity shall be verified with a hydraulic calculation.”

Table 11.2.3.1.2 Delete hose stream allowances.

11.2.3.1.5.2 (10) Delete.

Add 11.2.3.2.3.4 to read as follows: “Reductions in the size of the calculated area of operation shall not be taken for the use of quick response sprinklers in the design of systems in existing buildings employing fixed duration stored water supplies of less than 5,000 gallons.”

Chapter 22 Special Occupancy Requirements
Add 22.1.1.3 to read as follows: “The application of the requirements of this chapter are subject to the approval of the Fire Commissioner.”

22.12.1.2 Delete.

22.12.1.3 Delete the following: “to augment hand hose streams”.

22.13.1 Delete the following: “plus an allowance of 1000 gpm (63 L/sec) for hand hose streams for not less than 2 hours”.

22.15.2.2.1 Gravity Waste and Linen Chutes. Add the following after the heading: “Sprinklers shall be provided in chute vestibules on all floors; if no vestibule exists, sprinklers shall be provided above chute doors and shall be located no more than 1-foot (25 mm) horizontally from face of chute door. All building service chute sprinkler systems shall be provided with a local water flow and valve supervisory alarm with supervising station annunciation. In high rise buildings where sprinklers in chutes are supplied by a chute riser(s), such riser(s) shall be zoned to coincide with the zoning of the standpipe riser(s).”

22.15.2.2.1.5 Delete.

22.21 Delete.

22.21.1.7.3 Delete.

22.21.7.4 Delete the following: “plus the hose stream demand specified in 22.21.1.7.3”.

22.25.1.4 Delete the following: “plus a minimum of 500 gpm (1893 L/min) for hose streams”.

22.26.1.2 Delete the following: “plus hose stream demand”.

22.26.1.2.1 Delete.

22.27.1.1(1) Delete the following: “500 gpm (1892.5 L/min) for manual hose streams plus”.

22.28.1(2)(a) Delete the following: “500 gpm (1892.5 L/min) for manual hose streams plus”.

Table 22.37.1.4.4.1(B) Remove the row titled “hose stream demand” and all of its corresponding requirements.

Table 22.37.1.4.4.3 Remove the row titled “hose stream demand” and all of its corresponding requirements.

Chapter 23 Plans and Calculations

23.1.3(35) Delete the following: “and the water required for hose streams both inside and outside.”

23.3.2(9) Delete “inside hose”.

23.3.4(3) Delete and renumber (4) to (3).

23.3.5.2(16) Delete “inside hose.”
23.3.5.3(3) Delete and renumber (4) and (5) to (3) and (4), respectively.

23.3.5.5(4) Delete.

23.4.4.2.5 Delete “not including hose stream allowance”.

Chapter 24 Water Supplies

24.1.1 Add the following at the end of the section:

“(a) Two automatic sources of water supply shall be provided for sprinklers in:”

“(1) Buildings classified in occupancy group H.”

“(2) Buildings classified in occupancy group M when the area on one floor exceeds 20,000 square feet (1858 m²).”

“(3) Buildings classified in occupancy group A1 with stages larger than 1,000 square feet (93 m²) in floor area or with a stage height greater than 40 feet (15 240 mm).”

“(b) The domestic water supply may be used to supply any sprinklers required by Section 903 of the New York City Building Code when installed in buildings classified in occupancy groups B, E, I and R, and not classified as a high-rise building, provided that all the requirements stated in subdivision (d) of this section are met.”

“(c) The domestic water supply may be used to supply water to sprinklers in cooling towers if provision is made to automatically stop the use of water through the domestic supply lines and provided that all of the requirements stated in subdivision (d) of this section are met.”

“(d) When the domestic water is used to supply sprinklers as permitted in subdivisions (b) and (c) of this section, all of the following conditions shall be met:”

“(1) The domestic water supply line from the tank or street supply shall be at least the size of the sprinkler line and the capacity available shall be at least equal to the capacity required for the sprinklers.”

“(2) The domestic water supply line from the tank or street shall have the required pressure as provided in this referenced standard.”

“(3) The domestic water supply line shall be of non ferrous material except when the domestic water supply is four inches (102 mm) or more.”

“(4) An O.S.&Y. valve or other listed valve having visual indication, and sealed open, shall be installed in the sprinkler supply branch, or such other valve arrangement as may be provided in this referenced standard and in referenced standards NFPA-13R or NFPA 13-D as modified for New York City, as applicable.”

“(5) The pipe connecting the domestic water supply and the sprinkler control valve shall be of nonferrous material and not less than twelve inches (305 mm) long.”
“(6) The number of heads in each fire section shall not exceed six, except that the number of heads in each fire section may exceed six in buildings classified in occupancy group R-2, or R-3 not exceeding six stories or 75 feet (22 860 mm) in height and in spaces classified in occupancy group R-2, or R-3 in buildings not exceeding six stories or 75 feet (22 860 mm) in height, provided that no more than three heads are supplied from any one domestic water riser.”

“(7) The connection shall be made at the supply or riser side of any domestic branch control valves.”

“(8) In connection with the above conditions, the number of fire sections having 6 or fewer heads may be unlimited; and the installation of alarms in branches supplying fire sections shall be at the option of the owner, except that such alarms shall be provided where required by referenced standards NFPA-13R and NFPA-13D as modified for New York City.”

“(9) A check valve shall be installed on the sprinkler supply branch.”

24.1.3.2(1) Delete the words “or Class II Standpipes”.

Add 24.2.3.1 to read as follows: “Combined Use. In light hazard occupancies with only limited ordinary hazard areas, an automatic fire pump serving the lower 300 feet (91 440 mm) of the standpipe system may be used as the primary supply to the sprinkler system, provided that an automatic switching secondary power supply is available to drive the pump, where secondary power is required by other provisions of this code, and that the pump is fully supervised as to pump running and power loss. The supervisory attachments shall be directly connected to an office where maintenance personnel are in attendance twenty-four hours a day; or, in lieu thereof, the supervisory attachment may be directly connected to the supervising station of an approved operating fire alarm company.”

Add 24.2.3.2 to read as follows: “In hydraulically designed sprinkler systems supplied from a gravity tank, the pressure may be increased by means of an automatic, special service fire pump. The pump shall be sized to satisfy the water supply requirements of this section and the New York City Building Code and shall be arranged with a bypass to permit the portion of the system so supplied to be served by the system’s two-way Fire Department connections.

If the pump is not supplied from the street side of the building service switch, the electrical service and pump operation shall be fully supervised and an automatic switching secondary power supply provided to drive the pumps, where secondary power is required by other provisions of this code.”

Add 24.2.3.3 to read as follows: “Wiring for Fire Pumps. When the fire pump feeder conductors are routed through the building(s), they shall be enclosed by 2 inches (51 mm) of concrete or an assembly that has a minimum of 2-hour fire resistive rating. Wiring for all fire and sprinkler pumps shall be in accordance with the New York City Electrical Code.”

Add 24.2.3.4 to read as follows: “Sprinkler Booster Pumps. Where the pressure from the city water main is insufficient to comply with the requirements of this referenced standard, but is sufficient to provide at least 5 PSI (34 kPa) at the highest level of sprinklers as determined by test, an automatic,
electrically driven pump installed for the purpose of boosting or increasing the city water pressure in the sprinkler system may be used subject to the following requirements:

“(a) Pumps shall be of approved centrifugal type, capable of delivering at least 200 gpm (757 L/m), and shall be capable of supplying the calculated flow and pressure demand of the sprinkler system.”

“(b) Pumps shall be maintained under approved automatic control with closed circuit supervisory attachment. The supervisory attachments shall be directly connected to an office where maintenance personnel are in attendance twenty-four hours a day; or, in lieu thereof, the supervisory attachment may be directly connected to the supervising station of an approved operating fire alarm company. The supervisory alarm services shall be arranged so as to provide positive indication at an approved central office or sprinkler alarm panel board that the pump has operated or that the source of electrical supply has failed.”

“(c) Such pumps shall also comply with the applicable provisions of this referenced standard and the New York City Building Code pertaining to fire pumps, except that only one water supply shall be required.”

“(d) Power to such pumps shall be supplied from the street side of the building service switch. Secondary power shall be provided where required by other provisions of this code.”

“(e) If a secondary power supply is provided to drive the pump and such power supply is automatic switching, the 5 psi (34 kPa) requirement in 23.2.2.4 and the requirements of paragraph (d), for power to be supplied from the street side of the building service switch, may be waived.”

24.2.4.1 through 24.2.4.3, including all subsections Delete.

Add 24.2.4.1 to read as follows: “A pressure tank providing water supply in accordance with Table 11.2.2.1 or section 11.2.3 is an acceptable water supply source. The total available quantity of water in pressure tanks need not exceed 15,000 gallons (56 781 L) when there is a secondary source of water supply available from a gravity tank or a street connection. The maximum gross capacity of a single pressure tank shall be 9,000 gallons (34 069 L) and shall include the needed extra capacity to fill dry-pipe or preaction systems when installed.”

Add 24.2.4.1.1 to read as follows: “Each tank shall be kept at a maximum of 2/3 full of water and a minimum of 1/3 full of air maintained under a minimum pressure of 75 psig (517 kPa). The water-to-air ratio shall be so proportioned and the tank so located that a minimum pressure of 15 psig (103 kPa) will be available on the highest line of sprinklers below the main roof when all the water has been discharged from the tank.”

Add 24.2.4.1.2 to read as follows: “The tank supports shall be designed on the basis of a full tank. The tanks shall be supplied with water through a fixed pipe, independent of the sprinkler piping and at least 2 inch (51 mm) in size. The water supply shall be capable of supplying the tank at a rate of at least 65 gpm (4 L/s) without decreasing the pressure in the tank. The tank shall have a fixed water level plate on the end of the tank opposite the gage glass, or equivalent devices, to indicate the level of the water in the tank.”
Add **24.2.4.1.3** to read as follows: “The air compressor shall be provided with automatic controls for maintaining the air pressure. The capacity of the compressor shall be sufficient to build up the tank pressure to 75 psig (517 kPa) within 3 hr. or less.”

Add **24.2.4.1.4** to read as follows: “Pressure tanks shall be provided with closed circuit high and low water and high and low air pressure alarms.”

Add **24.2.4.1.5** to read as follows: “Pressure tanks shall be located at or above the top level of sprinklers.”

**24.2.5** Add at end the following: “If any of the sprinkler heads are supplied from domestic water tanks, the combined water supply in the tank shall be at least 5,000 gallons (18 927 L). Further, the sprinkler water supply shall be taken from the lowest level of the tank.”

Add **24.2.5.1** to read as follows: “Combined Use. In A, B, E, I and R Occupancies, with only limited ordinary hazard areas, the sprinkler and standpipe reserve may be common to both. The Reserve shall be sized for the greater demand, in accordance with NFPA 14, 7.10.1.3. For purposes of this section, limited shall be defined as less than 30 percent of the floor area on the given floor. Buildings whose occupancies are more than 85 percent light hazard may have a light hazard water supply, provided the ordinary hazard areas are designed for ordinary hazard requirements with respect to sprinkler spacing and pipe sizing.”

Add **24.2.5.2** to read as follows: “Combined standpipe and sprinkler systems may be used in Occupancies A, B, E, F, I, M, R and S. If an automatic fire pump is used as the primary supply, the requirements of 23.2.2.1 shall apply.”

**Chapter 25 Systems Acceptance**

**25.1** Delete and replace with the following: “The installing contractor shall inspect and test the installation in accordance with the procedures of this chapter prior to scheduling an inspection.”

**25.2.1.1** Delete the words “2 hours” and replace with “1 hour”.

**25.2.1.4.1** Delete the words “2 hours” and replace with “1 hour”.

**25.2.1.7** Delete the words “150 psi (10.3 bar)” and replace with “200 psi (13.8 bar)”.

**25.3** Delete entire section, including subsections.

**25.3.1** Delete.

**25.3.2** Delete.

**25.3.3** Delete.

**25.3.4** Delete.

**25.5.2(5)** Delete.
25.6.2 (13) Delete item 13 and renumber remainder of items accordingly.

Chapter 26 Marine Systems. No changes.

Chapter 27 System Inspection, Testing, and Maintenance

27.1 Delete and replace with the following: “General. A sprinkler system installed in accordance with this standard shall be properly inspected, tested, and maintained in accordance with NFPA 25, Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems and the New York City Fire Code, to provide at least the same level of performance and protection as designed.”

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A Explanatory Material

Annex B Miscellaneous Topics

Annex C Explanation of Test Data and Procedures for Rack Storage

Annex E Development of the Design Approach to Conform with SEI/ASCE 7

Annex F Informational References

SECTION BC Q103
INSTALLATION OF SPRINKLER SYSTEMS IN ONE- AND TWO-FAMILY DWELLINGS AND MANUFACTURED HOMES

Q103.1 General. Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13D, Standard for the Installation of Sprinkler Systems in One- and Two-Family Dwellings and Manufactured Homes, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration No changes.

Chapter 2 Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every
reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the \textit{New York City Building Code}, the edition provided for in Chapter 35 of the \textit{New York City Building Code} shall govern.”

\textbf{Chapter 3 Definitions}

3.3.11.3 Delete.

3.3.11.7 Delete.

\textbf{Chapter 4 General Requirements} No changes.

\textbf{Chapter 5 System Components}

5.2.2 Add at end the following: “Non-metallic pipe shall be used in wet systems only.”

5.2.2.3 Delete.

5.4 Delete.

\textbf{Chapter 6 Water Supply}

6.2 Add the following as item (6):

\( (6) \) A common supply main to the building, serving both sprinklers and domestic uses, may be used if provision is made to prevent flow on the domestic water system upon operation of sprinklers, and closure of the main sprinkler control valve (the house control valve) will shut off the domestic water supply.”

6.3 Delete.

\textbf{Chapter 7 Installation}

7.1.1 Delete the words “unless a separate shutoff valve for the sprinkler system is installed in accordance with 7.1.2.”

7.1.2 \textbf{Delete and replace with the following:} “Except for the meter set controlling combined domestic water and fire sprinkler systems, sectional control valves and other valves if provided in supply pipes to sprinklers shall be locked open and supervised open by one of the following methods:”

\( (a) \) Supervising station, proprietary or remote station signaling service, or”

\( (b) \) Local signaling service that will cause the sounding of an audible signal.”

\textbf{Exception:} Underground gate valves with roadway boxes need not be supervised.”

7.1.3 Delete the words “other than those complying with Section 6.3.”

7.6 Add at the end the following: “as modified for New York City.”
Chapter 8 Sprinkler Position and Location

8.3.4 Add the following after the word “garages”: “provided that at least one sprinkler head is located within 3 feet (914 mm) of any communicating opening between the garage and the dwelling.”

8.3.5 Add after the word “attics”, the words “without floors”.

Chapter 9 Protection from Freezing

9.2.3.1.1 Delete and replace with the following: “Arrangement of supply piping to an anti-freeze system shall be in accordance with NFPA-13-2016 as modified for New York City.”

9.2.3.1.2 Delete.

9.2.3.1.3 Delete.

9.2.3.1.4 Delete.

9.2.3.2 Delete.

9.2.3.2.1 Delete.

9.2.3.2.2 Delete.

9.2.3.2.3 Delete.

Chapter 10 Discharge and Hydraulic Calculations

10.4.2.2 Delete the words “unless smaller sizes are permitted by 10.4.2.3.”

10.4.2.3 Delete.

Chapter 11 System Acceptance

11.2.1.1 Delete and replace with the following: “Where a Fire Department pumper connection is not provided, the system shall be hydrostatically tested for leakage at 50 psi (344 kPa) above normal system operating pressure and checked visually for leakage at each joint or coupling.”

11.2.1.2 Add the following to the end: “As modified for New York City, Dry systems shall also be tested by placing the system under 40 pounds (2.8 bar) air pressure. Any leak that results in a drop in system pressure greater than 2 psi (0.14 bar) in 24 hours shall be corrected. Check for leaks using soapy water brushed on each joint or coupling. Leaks will be shown by the presence of bubbles. This test shall be made prior to concealing of piping.”

Chapter 12 Inspection, Testing, and Maintenance

12.1 Add at end the following: “The owner is responsible for the maintenance of the system.”
ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Figure A.10.4.2.3(1) Delete.

Annex B Informational References No changes.

SECTION BC Q104
INSTALLATION OF SPRINKLER SYSTEMS IN RESIDENTIAL OCCUPANCIES

Q104.1 General. Sprinkler systems, where required by this code, shall be installed in accordance with NFPA 13R, Standard for the Installation of Sprinkler Systems in Low-Rise Residential Occupancies, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration

1.1 Delete after the word “including” and replace with the following: “six stories in height in buildings not exceeding 60 ft (18.3 m) in height above grade plane.”

1.2.3 Add at end the following: “in accordance with the New York City Building Code.”

Chapter 2 Referenced Publications
2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

Chapter 3 Definitions

3.3.6 Delete after the word “walls.”

3.3.9 Delete (Use definitions contained in New York City Building Code).

Chapter 4 General Requirements No changes.

Chapter 5 System Components

5.2.1 Add at the end the following: “Non-metallic pipe shall be used in wet systems only when standpipe is not present.”

5.2.11 Add at the end the following: “in accordance with the New York City Plumbing Code.”

5.3.2(1) Delete and replace with the following: “Antifreeze systems – Only glycerin type anti-freeze is permitted for use in systems containing non-metallic pipe or fittings.”

Chapter 6 Installation

6.5.4 Delete and replace with the following: “Sprinkler Interior Protected Glazing. Where sprinklers are used in combination with glazing as an alternative to a required fire-rated wall or window assembly, the sprinkler-protected assembly shall be approved by the commissioner and shall comply with the following:

“(1) Sprinklers shall be listed as specific application window sprinklers unless standard spray sprinklers are specifically permitted by the commissioner.”

“(2) Sprinklers shall be supplied by a wet pipe system.”

“(3) Where the assembly is required to be protected from both sides, sprinklers shall be installed on both sides of the glazing.”

“(4) The use of sprinkler protected glazing shall be limited to non-load-bearing walls.”

“(5) The water supply duration for the design area that includes the window sprinklers shall not be less than the required rating of the assembly.”

6.6.6* After the word “attics” add the words: “without floors”.

Add 6.6.10 to read as follows: “Location of sprinklers installed in buildings classified in occupancy group R-1 shall be in accordance with the requirements of the New York City Building Code and NFPA-13-2016 as modified for New York City.”

6.8.2 Delete and replace with the following: “Except for the meter set controlling combined domestic water and fire sprinkler systems, sectional control valves and other valves if provided in supply pipes to sprinklers shall be locked open and supervised open by one of the following methods:”

“(a) Supervising station, proprietary or remote station signaling service, or”

“(b) Local signaling service that will cause the sounding of an audible signal at a constantly attended point.”

“Exception: Underground gate valves with roadway boxes need not be supervised.”

6.11 Delete and replace with the following: “Fire Department Connection. Except in buildings classified in occupancy group R-1, at least one 3 in. (76 mm) single inlet Fire Department connection shall be provided and located in accordance with the New York City Building Code. Buildings classified in occupancy group R-1 shall be provided with two-way Fire Department connections in accordance with the referenced standard NFPA-13-2016 as modified for New York City. A Fire Department connection is not required in one-and two-family dwellings.”

6.11.1 Delete.

6.11.2 Delete.

6.11.5 Delete.

Chapter 7 Discharge Criteria No changes.

Chapter 8 Plans and Calculations No changes.

Chapter 9 Water Supply

9.3 Add the following as item (5):

“(5) A common supply main to the building, serving both sprinklers and domestic uses, may be used if provision is made to prevent flow on the domestic water system upon operation of sprinklers, and closure of the main sprinkler control valve (the house control valve) will shut off the domestic water supply.”

9.6 Delete.

Chapter 10 System Acceptance

10.1.2 Delete.

Figure 10.1.2 Delete.

10.1.3 Delete.
Chapter 11 Care and Maintenance

11.3 Delete and replace with the following: “Sprinkler systems shall be inspected, tested, and maintained in accordance with the New York City Fire Code and with the rules of the Fire Department.”

11.4 Delete.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A Explanatory Material

A.1.1 Delete the words “four stories” and replace with the words: “six stories”.

A.5.2.12.2 Delete.

A.9.6 Delete.

Table A.9.6(a) Delete.

Table A.9.6(b) Delete.

Annex B Informational References No changes.

SECTION BC Q105
INSTALLATION OF STANDBOARD AND HOSE SYSTEMS

Q105.1 General. Standpipe and hose systems, where required by this code, shall be installed in accordance with NFPA 14, Standard for the Installation of Standpipe and Hose Systems, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration No changes.

Chapter 2 Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same
standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

**Chapter 3 Definitions**

3.3.3.1 Delete and replace with the following: “Fire Department Connection (FDC).”

3.3.3.1.1 Delete and replace with the following: “Standpipe System Fire Department Connection (Standpipe FDC). A connection through which the fire department can pump water to a standpipe system at the required system demand. Supplemental water can also be provided into the sprinkler system or other system furnishing water for fire extinguishment to supplement existing water supplies. Unless otherwise allowed in the New York City Building Code, FDCs shall be 2-way connections.”

3.3.3.1.2 Delete.

3.3.5.1 Delete the words ‘NFPA 101’ and replace with ‘the New York City Building Code’.

3.3.6 Delete and replace with the following: “Fire Department. The New York City Fire Department (FDNY).”

3.3.7 Add at end the following: “For the purposes of this section, a penthouse of any area with an occupant load greater than 10 shall be considered a story.”

3.3.8 Delete the words “or reel”.

3.3.9.1.1 Delete.

3.3.18 Delete.

3.3.19.2 Delete the words “trained personnel” and replace with “building occupants”.

3.3.19.3 Delete the words “trained personnel” and replace with “building occupants”. Add at end the following: “The hose stations shall be attached to the hose connections by a reducing coupling.”

3.3.21 Delete the words ‘and exclusive of pressure from the fire department connection’.

Add 3.3.24 to read as follows: “3.3.24 Zones”

Add 3.3.24.1 to read as follows: “Standpipe System Zone. A vertical subdivision of a standpipe system limited or determined by the pressure limitations of the system components. Standpipe System Zones shall not exceed 300 feet (91.4 m) in height.”

Add 3.3.24.2 to read as follows: “Fire Department Connection (FDC) Zone. A vertical subdivision of a standpipe system in buildings with more than two standpipe system zones arranged so that the Fire Department will pump through express FDC risers to upper zones.”

**Chapter 4 System Components and Hardware**
4.2.2 Delete and replace with the following: “Pipe for buried portions of the standpipe system, whether inside or outside of the building, shall be red brass, ductile iron, hard tempered type “K” copper tubing, galvanized steel or other approved corrosion resistant material. All such pipe, other than ductile iron, shall be adequately wrapped or otherwise protected against corrosion.”

Add 4.2.2.1 as follows: “Where ductile iron pipe is installed in accordance with Table 4.2.1, it shall be lined in accordance with AWWA C 104, Cement-Mortar Lining for Ductile-Iron Pipe and Fittings.”

4.2.3 Add at end the following: “Piping conforming to the specifications contained in this section may only be used in buildings with floor heights not exceeding 300 feet (91.4 m) above grade plane or in the highest 300 feet (91.4 m) portion of other buildings. Otherwise, piping conforming to the wall thicknesses specified in 4.2.4 shall be used.”

4.4.1.2 Delete.

4.4.2.2 Replace “NFPA 51B” with “the New York City Fire Code”.

4.4.2.3 Replace “NFPA 51B” with “the New York City Fire Code”.

4.5.1 Add at end the following: “6 inch (152 mm) and larger sectional and riser control valves shall have a minimum ¾ inch (197 mm) valved bypass.”

4.6.2.1 Delete and replace with the following: “Class III Standpipe Hose Stations. Class III standpipe systems shall have 2½” (64 mm) hose connections located as required for Class I standpipes. At each hose connection there shall be a hose station. The hose stations shall be equipped with a minimum of 125 feet (38.1 m), or a maximum of 150 feet (45.7 m), of 1½” (38 mm) fire hose, connected to an adjustable fog nozzle. The hose shall be attached to the hose connection by a 2½” x 1½” (64 mm x 38 mm) non-swivel reducing coupling. A pressure restricting device shall be installed on the 2½” hose connection when required by Appendix Q of the New York City Building Code. The hose shall be mounted on a rack and may be located in a cabinet, in accordance with Section 905.7 of the New York Building Code. The hose, pressure restricting device (when required) and reducing coupling shall be installed in such a manner that they can be readily removable by the Fire Department.”

4.6.2.2 Delete.

4.6.3.2 Delete.

4.6.4 Delete “for Class II service”.

4.6.5 Delete and replace with the following: “Label. Each rack or storage facility for 1½-in. (40-mm) hose shall be provided with a label that shall include operating instructions.”

4.7.2. Delete and replace with the following: “Hose connections shall have nominal 2½ inch (64 mm) threads conforming to FDNY standards.”

4.7.3 Add at end the following: “Caps are not required to be listed and shall be brass upon completion of construction and are permitted to be impact-resistant plastic during construction.”
4.7.4 Delete.

Add 4.7.6 to read as follows: “Pressure-reducing valves shall not be installed as hose valves or installed downstream of hose valves.”

4.8 Delete entire section, including all subsections and replace with the following: “Fire Department Connections (FDCs). (See Figure A.6.4.)”

Add 4.8.1 to read as follows: “FDCs shall be listed or approved for a working pressure equal to or greater than the pressure requirement of the system demand.”

Add 4.8.2 to read as follows: “Each FDC shall have at least two 3-inch (76 mm) internally threaded swivel fittings having threads conforming to FDNY standards and be of a minimum size of 5 inches (127 mm) except where supplying a single 4-inch (102 mm) standpipe riser, in which case the minimum size shall be 4 inches (102 mm).”

Add 4.8.2.1 to read as follows: “FDCs shall be provided as follows:”

“(a) One FDC shall be provided for each 300 feet (91.4 m) of exterior building wall or fraction thereof facing upon each street or public space.”

“(b) Where buildings face upon two parallel streets or public spaces without an intersecting street or public space, one FDC shall be provided for each 300 feet (91.4 m) of exterior building wall or fraction thereof facing upon each such parallel street or public space.”

“(c) Where a building faces upon two intersecting streets or public spaces and the total length of the exterior building walls facing upon such streets or public spaces does not exceed 300 feet (91.4 m) only one FDC need be installed provided the FDC is located within 15 feet (4.6 m) of the corner and on the street with the longest building frontage.”

“(d) Where a building faces on three streets or public spaces, one FDC shall be provided for each 300 feet (91.4 m) of building wall or fraction thereof facing upon such streets or public spaces provided that at least one FDC is installed on each of the parallel streets or public spaces, and further provided that the FDCs shall be located so that the distance between them does not exceed 300 feet (91.4 m).”

“(e) Where a building faces upon four streets or public spaces, at least one FDC shall be provided on each street front or public space; however, only one FDC need be provided at the corner of two intersecting streets or public spaces if the FDC is located within 15 feet (4.6 m) of the corner and on the street with the longest building frontage or public space, and if the distances between FDCs, in all cases, do not exceed 300 feet (91.4 m).”

“(f) In any case where the exterior building walls of a building facing a street or public space are obstructed in part by another building, one FDC shall be provided for each clear three hundred feet of exterior building wall or fraction thereof facing upon such street or public space.”
“(g) High-rise buildings shall have at least two remotely located fire department connections. In high-rise buildings with multiple FDC zones, each FDC zone shall have two remotely located fire department connections.”

“(h) Location.”

“(1) FDCs shall be placed between 18 inches (457 mm) and 36 inches (914 mm) above the sidewalk level.”

“(2) FDCs shall be of the flush, free standing or exposed type, and with the exception of the swivels, caps, and plugs, shall not project beyond the street property line. The riser pipe to a free standing FDC shall be red brass. When FDCs are installed in wall recesses, the recesses shall be of ample size to permit convenient hose attachment.”

“(i) Check valves. Each FDC shall be provided with a swing-type check valve inside of the building or in a valve pit outside of the building.”

“(j) FDC Express Riser Check Valves. In addition to the check valve required in (h), each FDC express riser supplying an upper FDC zone shall be provided with a swing-type check valve located at the connection between the express riser and the high zone standpipe system and located at the level of such connection.”

“(k) Drip valves. A ¾ inch (19 mm) automatic ball drip valve shall be placed between the FDC and the check valve, except that on a fireboat FDC, a ½ inch (13 mm) open drip without a shutoff may be used. Automatic ball drips shall be placed in the horizontal position.”

“(l) Fire Department Connection Zones. FDCs shall be arranged in maximum FDC zone heights of 600 feet (15 240 mm), supplying no more than two standpipe system zones. A normally closed valved interconnect shall be provided at the highest point between each FDC zone interconnecting the zones. FDC express riser piping shall not be installed in stairway enclosures but may be installed in any other protected shaft.”

“(m) Sectional Valves. Sectional valves shall be provided in all standpipe risers at 100 foot (30 480 mm) vertical intervals. This does not apply to FDC express risers.”

Add 4.8.3 to read as follows: “FDCs shall be equipped with approved plugs or caps, properly secured, and arranged for easy removal by fire departments. Caps shall be painted red, except that the caps for combination standpipe and sprinkler systems shall be painted yellow, and caps for sprinkler systems only shall be painted green.”

Add 4.8.4 to read as follows: “FDCs shall be of an approved type.”

4.10 Add at end the following: “All interior signage shall have a red background with minimum 1-inch high white letters. All exterior signage shall have a white background with minimum 1 inch (25 mm) high red letters.”

Chapter 5 System Requirements

5.1.3 Add at end the following: “and Section 905 of the New York City Building Code.”

5.3.2.1 Delete and replace with the following: “Class II systems are not allowed.”
5.3.2.2 Delete.

5.3.3 Delete and replace with the following: “Class III Systems. Class III standpipe systems shall have 2½” (64 mm) hose connections located as required for Class I standpipes in Section 905.4 of the New York City Building Code. At each hose connection there shall be a hose station. The hose stations shall be equipped with a minimum of 125 feet (38.1 m), or a maximum of 150 feet (45.7 m), of 1½” (38 mm) fire hose, connected to an adjustable fog nozzle. The hose shall be attached to the hose connection by a 2½” x 1½” (64 mm x 38 mm) non-swivel reducing coupling. A pressure restricting device shall be installed on the 2½” hose connection when required by Appendix Q of the New York City Building Code. The hose shall be mounted on a rack, and may be located in a cabinet, in accordance with Section 905.7 of the New York City Building Code. The hose, pressure restricting device (when required) and reducing coupling shall be installed in such a manner that they can be readily removable by the Fire Department.”

5.3.3.1 Delete.

5.3.3.2 Delete.

5.3.3.2.1 Delete.

5.4.1.1 Delete the words “automatic dry,” and delete the words “semiautomatic dry, manual dry,” and add at end the following: “unless otherwise permitted in the code.”

5.4.1.2 Delete the words “automatic or semiautomatic” and replace with “automatic wet”.

5.4.2.1 Delete.

5.5.2.1 Add at end the following: “, except for pressure-restricting devices supplying hose outlets.”

5.5.2.2 Add at end the following: “, except for pressure-restricting devices supplying hose outlets.”

Chapter 6 Installation Requirements

6.1.2.1 Add at end the following: “and in accordance with the requirements of Section 905 of the New York City Building Code.”

6.1.2.2 Delete the words “in accordance with Table 6.1.2.2” and replace with “in accordance with the requirements of Section 905 of the New York City Building Code.”

6.1.2.2.4 Add the following at the end: “in accordance with the New York City Building Code.”

Table 6.1.2.2 Delete.

6.1.2.3.1 Add at end the following: “All parts of the standpipe systems that may be exposed to frost shall be protected from freezing by any one of the following methods:”

“(1) The piping shall be frost proofed with insulation having a thermal conductance of 0.1 Btu/hr. per square foot of surface per degree F at a mean temperature of 70 to 75 degrees F (21°C to 24°C). Insulation shall be protected to prevent water infiltration, and when exposed to the
weather the insulation shall be covered with a 45-pound (20 kg) roofing felt jacket or equivalent.”

“(2) Steam or listed heat tracing may be used in conjunction with the insulation.”

“(3) Tanks subject to freezing temperatures shall be protected.”

6.2 Delete the words “NFPA 24” and replace with “the New York City Building Code”.

6.3.1.1 Add at end the following: “Check valves other than those in Fire Department and fire pump line shall be provided with an O.S.&Y. or indicating shutoff valve (with indicator readily visible from the floor) that is flanged, mechanically coupled or wafer type and connected to the inlet and outlet of such check valves. The valves on the suction and discharge of the fire pump, in accordance with NFPA 20, shall be deemed to comply with this requirement when the discharge valve is placed on the discharge side of the check valve. One of the shutoff valves placed on each side of the tank check valve may be of the remote-control type, and when used, shall be on the downstream side of such check valve.”

6.3.2 Add at end the following:

“(1) “Riser control valves. Riser control valves shall, where practical, be located within a required stair enclosure serving the entrance floor. Where the stair enclosure extends to the basement or cellar, the riser control valve may be located within the stair enclosure at or in the basement or cellar ceiling, providing that a sign indicating the valve location is installed within the stair enclosure at the entrance floor. The hose outlet valve for the entrance floor shall be located on the riser side of the riser control valve. Riser control valves shall not be required on a standpipe that supplies only one or two hose outlet valves.”

“(2) Sectional valves. Sectional valves shall be provided in all standpipe risers at 100 foot (30.5 m) vertical intervals. This does not apply to FDC express risers.”

“(3) Operation. Each valve shall be so designed and installed as to permit its manual operation at the valve location. Pressure ratings and the name of the manufacturer shall be cast raised or depressed on each valve used in the system.”

“(4) Remotely Controlled Valves. Where riser control or section valves are located outside of a required stair enclosure, the valves shall be of such type and so installed so as to be remotely operated by either electric motors or hydraulic means. The remote control shall be from either the entrance floor or from a fire pump room. Operating devices shall be grouped, suitably housed, and kept locked with a Fire Department lock and key. The door of the housing shall be embossed to indicate the purpose of the device. Instructions for operating the remote valves by the control device shall be legible, detailed, and complete, and shall be permanently secured to the inner face of the door. The position of each remotely controlled valve, whether opened or closed, shall be indicated at its remote-control point and also at the valve.”
“(5) Access. Valves shall be readily accessible for inspection, repair, and use. If the valve is placed so that its operating mechanism is more than 7 feet (2.1 m) above a floor or stair landing, a 12 inch (305 mm) wide wrought iron, steel or equivalent ladder securely fastened shall be provided for access to the valve. In lieu of a ladder, chain operated mechanisms are permissible and shall be padlocked securely in place.”

“(6) Marking. Each control valve shall be conspicuously marked with the number assigned to it on the riser diagram for the standpipe system. Metal numbered tags at least 2 inches (51 mm) in diameter shall be securely attached to the valve. Each valve shall have a metal sign stating “STANDPIPE CONTROL VALVE” securely hung from the valve.”

“(7) Supervision. Each control valve not remotely controlled shall be electrically supervised in its normal position. If the normal position is the closed position, a metal placard stating such fact shall be conspicuously attached to the valve.”

6.3.4 Add at end the following: “Wafer type control valves may not be used in pump suction piping.”

6.3.7.1 Replace the words “isolation control valves” with “sectional valves”.

6.3.7.1(3) Add at end the following: “only permissible when no fire alarm system is present.”

6.3.7.1(4) Delete.

Add 6.4.2.3 to read as follows: “In addition, each high zone FDC zone shall be provided with a swing-type check valve located at each connection between the high zone FDC express riser and the high zone standpipe system and located at the level of such connection.”

6.4.5.2 Delete and replace with the following: “Marking. Each fire department connection shall be marked as follows:”

“(1) Each FDC shall be provided with caps painted red, and shall have the word “STANDPIPE” in letters 1 inch (25 mm) high and ⅛ inch (3.2 mm) deep cast in the body or on a nonferrous metal plate secured to the connection or mounted on the wall in a visible location.”

“(2) Caps of each FDC used for combination standpipe and sprinkler systems shall be painted yellow and the words shall read “COMBINATION STANDPIPE AND SPRINKLER SYSTEMS”.”

“(3) Where FDCs serve other than the entire building, the connections shall be marked in accordance with the specifications of this section “LOW ZONE” or “HIGH ZONE” and indicate the floors served. If there are more than two FDC zones, they the marking shall be approved by the Fire Department.”

“(4) For manual systems, the sign shall also indicate that the system is manual and that it is either wet or dry.”

6.4.5.2.1 Delete.

6.4.5.2.2 Delete.
6.4.6 Delete “48 in. (1219 mm)” and replace with “36 in. (914 mm).”

Chapter 7 Design

7.1.1 After the word “used,” insert the following: “in accordance with 7.9.3.1.”

7.2.1 Add at the end the following: “Maximum height of each standpipe system zone is limited to 300 feet (91.4 m).”

7.2.2 Delete and replace with the following: “FDC express riser piping shall be permitted to be designed with pressures in excess of 350 psi (24 bar) in accordance with their materials listings or as approved.”

7.2.2.1 Delete.

7.2.3.1 Delete and replace with the following: “Where the residual pressure at the 1½” outlet of a Class III hose station exceeds 100 psi (6.9 bar), an approved pressure restricting device shall be provided to limit the residual pressure at the flow required by Section 7.10 to 100 psi (6.9 bar). This pressure-restricting device shall be installed on the 2½” hose connection outlet between the connection and the hose.”

7.2.3.1.1 Delete and replace with the following: “7.2.3.1 shall not apply to Class I outlets without hose installed.”

7.2.3.2 Delete and replace with: “Reserved.”

7.2.3.3 Delete the words “pressure-regulating device” and replace with “pressure-restricting device”.

7.2.4 Delete and replace with the following: “Hose connections shall not be located downstream of pressure-reducing valves, except when allowed by Section 7.9.3.1 or when approved by the commissioner.”

7.3.2 Delete and replace with the following: “Class I Systems. Where required to be provided, hose connections shall be located in accordance with the requirements of Section 905 of the New York City Building Code. Class I standpipe hose connections shall be provided in all of the following locations:”

“(1) In every required stairway, a hose connection shall be provided for each floor level. Hose connections shall be readily accessible and located at the riser on each floor-level landing and on the entrance floor above the standpipe riser control valve. Nonrequired enclosed stairways that do not serve as a means of egress are not required to have hose connections. Stairways without hose connections shall have a sign on the door to the stairway stating, “No standpipe connections in stairway.”

“(2) On each side of the wall adjacent to the exit opening of a horizontal exit.”

“Exception: Where floor areas adjacent to a horizontal exit are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the horizontal exit.”
“(3) In every exit passageway at the entrance from the exit passageway to the other areas of a building.”

“Exception: Where floor areas adjacent to an exit passageway are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.”

“(4) In covered mall buildings, in accordance with Section 905.3.3.2.”

“(5) Where the roof has a slope of less than four units vertical in 12 units horizontal (33.3-percent slope), each standpipe shall be provided with a hose connection located either on the roof or at the highest landing of stairways with stair access to the roof. An additional hose connection shall be provided at the top of the most hydraulically remote standpipe for testing purposes. This additional hose connection shall be not be required when a roof manifold is installed in accordance with 7.3.2.1.”

“(6) Where the most remote portion of a floor or story is more than 150 feet (45 720 mm) from a hose connection, additional hose connections shall be provided in approved locations. For the purposes of this section, a penthouse with an occupant load greater than 10 shall be considered a story.”

“(7) In any staircase where the change in elevation between floor landings is more than 25 feet (7.6 m), in addition to the hose connections required by paragraph 1, a hose connection shall be installed at the first intermediate stair landing below the higher floor level.”

7.3.2.1 Delete and replace with the following: “Roof Manifold. At the top of the highest riser there shall be provided, above the main roof level, a three-way manifold equipped with three 2½ inch (63.5 mm) hose valves with hose valve caps. The lowest valve shall be located with the hose end at least 18 inches (457 mm) above the roof and the highest valve with the hose end not more than 60 inches (1524 mm) above the roof. The manifold may be set in a horizontal or vertical position, provided the hose outlets are set back between 18 inches (457 mm) and 60 inches (1524 mm) above the roof level. Where the manifold is located other than within a heated stair enclosure, the control valve shall be located in a horizontal run of piping below the roof, with a long stem extending through the roof and equipped with a wheel handle at its upper end at least 12 inches (304.8 mm) above the roof. Between the control valve and the manifold there shall be provided within the heated space a ½ inch (12.7 mm) open drip or a ¾ inch (19 mm) automatic ball drip, with the drip pipe extended to spill over a plumbing fixture or drain.”

7.3.2.1.1 Delete.

7.3.2.2 through 7.3.2.12 Delete.

7.3.3.1 Delete and replace with the following: “Class II systems are not permitted.”

7.3.3.2 Delete.
7.3.4 Delete and replace with the following: “Class III Systems. Class III systems shall be provided with hose connections as required for Class I systems.”

7.3.4.1 Delete and replace with the following: “Where a building is protected throughout by an approved automatic sprinkler system in accordance with NFPA 13 or NFPA 13R, hose stations shall not be required provided that the requirements of Section 905.3 of the New York City Building Code are complied with.”

7.3.4.1.1 Delete.

7.3.4.1.2 Delete.

7.4 Replace the words “Separate standpipes” with “Separate standpipe risers”.

7.5.1 Delete and replace with the following: “Where two or more standpipes are installed in the same building or section of building, they shall be interconnected as follows:”

“(1) Standpipe systems that include more than one riser shall have all risers cross-connected at, or below, the lowest level of fire department access, except as otherwise provided in this section.

“(2) Standpipe systems that have one or more standpipe system zone shall be so designed and installed that the risers supplied from each zone will be cross-connected below, or in, the story of the lowest hose outlets from the water source in each zone. Horizontal intermediate check valves shall be installed in the run of each riser continuing into a higher zone in such manner as to permit all upper zones of the system within each FDC zone provided in accordance with 4.8.2.1 to be fed through one riser from the zone below and to prevent any lower zone of the system from being supplied from a zone above, except as otherwise required by this referenced standard. FDC zones shall be interconnected in accordance with 4.8.2.1(l).”

“(3) Risers supplied by an upper level cross connection shall be provided with manual control valves or remote-control valves, so arranged that risers supplied by the upper level cross connections may independently be shut off from the tank supplies.”

“(4) Cross connections shall be at least as large as the largest riser supplied by the cross connection. However, when supplying two, but not more than four 4-inch (102 mm) risers, the cross connection shall not be less than 5 inches (123 mm). The cross connection shall not be less than 6 inches (152 mm) for all other riser combinations.”

“(5) Where there is no cellar, cross connections may be hung from the ceiling of the lowest story.”

“(6) Each FDC shall be connected to a riser or to a cross connection connecting other Fire Department hose connections or risers within each Fire Department zone provided in accordance with 4.8.2.1. The pipe from the FDC to the riser or cross connection shall be five-inch (123 mm) I.P.S., except that a 4-inch (102 mm) pipe shall be sufficient when such
pipe supplies a single 4-inch (102 mm) riser system. The pipe from the FDC shall be run as directly as practicable to the riser or cross connection.”

“(7) When tanks are used for the primary water supply, the standpipe systems may use separate riser systems serving, respectively, low and high parts of the building. Separate gravity tanks or pressure tanks may supply each zone, but in every case the standpipe system shall be so designed that every hose outlet of the entire system can be supplied through the required cross connections from every FDC within each FDC zone provided in accordance with 4.8.2.1.”

7.5.3 Delete.

7.6.1 Delete and replace with the following: “Class I and Class III standpipes in buildings with floor heights less than 150 feet (45.7 m) above grade plane shall be at least 4 inches (100 mm) in size. All standpipes in buildings with floor heights greater than 150 (45.7 m) feet above grade plane shall be no less than 6 inches (150 mm) in diameter.”

7.6.2.1 Delete and replace with the following: “In fully sprinklered buildings having a combined standpipe system that is hydraulically calculated, the minimum standpipe size in buildings with floor heights less than 150 feet (45.7 m) above the lowest level of Fire Department vehicle access shall be at least 4 inches (102 mm).”

7.7.2* Delete and replace with the following: “Where an automatic water supply is required for a Class I or Class III standpipe system by 5.4, the standpipe system shall be designed so that the system demand can be independently supplied by the attached water supply and each fire department connection provided on the system.”

7.7.4 Delete.

7.8.1 Replace the words “100 psi (6.9 bar)” with “65 psi (4.5 bar).”

7.9.1 Delete and replace with the following: “Maximum Standpipe System Zone Height. The maximum standpipe system zone height for any building shall be 300 feet (91.4 m). Floors below grade plane shall be included in the lowest standpipe system zone, provided that the maximum FDC zone height for the FDC zone that includes the lowest zone is not exceeded and the maximum hose connection outlet working pressure in the FDC zone does not exceed 205 pounds per square inch. Each standpipe system zone requiring pumps or tanks, shall be provided with a separate pump or tank.”

7.9.1.1 Delete.

7.9.1.2 Delete.

7.9.2 Delete and replace with the following: “Building Height 300 Feet or Less. In buildings with occupied floors less than 300 feet (91.4 m) in height above the lowest level of Fire Department vehicle access, water supplies shall be provided by a public waterworks system in accordance with 9.1.4(1), by automatic fire pumps in accordance with 9.1.4(2), or by gravity tanks in accordance with 9.1.4(4).”

7.9.2.1 Delete.
7.9.3 Delete and replace with the following: “Building Height More Than 300 Feet (91.4 m). All standpipe system zones servicing occupied floors located higher than 300 feet (91.4 m) above the lowest level of Fire Department vehicle access shall be equipped with a water supply provided by gravity tanks supplemented by pumps where necessary in accordance with 9.1.4.”

Add 7.9.3.1 to read as follows: “Building Heights More Than 300 Feet (91.4 m) but No More Than 500 Feet (152.4 m). All standpipe system zones servicing occupied floors located higher than 300 feet (91.4 m) above the lowest level of Fire Department vehicle access but not higher than 500 feet (152.4 m) above grade plane, shall be supplied by a gravity tank equipped with a special service fire pump, in accordance with 9.1.4(4)(l), to boost supply to pressures as required by 7.8. This tank shall also be used to supplement the water supply in the lower standpipe system zone in the building. A pressure-reducing valve bypass shall be provided, where necessary, and arranged to provide water supply from the upper zone to the lower zone at the required pressures. Where a pressure-reducing valve is not necessary to provide required pressures, a normally open bypass shall be provided. Where a pressure-reducing valve is necessary, an additional pressure-reducing valve shall be provided, in parallel, with isolation valves located on the inlet and outlet of each pressure-reducing valve.”

Add 7.9.3.2 to read as follows: “Building Heights More Than 500 Feet (152.4 m). Where portions of a standpipe system service floors located higher than 500 feet (152.4 m) above the lowest level of Fire Department vehicle access, each of the building’s standpipe system zones shall be provided with dual water supplies consisting of a gravity supply down-feeding from above the highest outlet in the zone and an automatic fire pump up-feeding from below the lowest outlet in the zone. The gravity tanks and automatic fire pumps shall be in accordance with 9.1.4 and the following:

“(1) Gravity tanks shall serve as the gravity supply for one standpipe system zone only. The gravity tank supply for one standpipe system zone may be used as the automatic fire pump suction supply for no more than one other standpipe system zone.”

“(2) Gravity tanks shall be located so as to provide the water supply for its standpipe system zone at the required pressures by gravity only. The pressure from this supply may exceed the minimum pressures required by 7.8.1 at the top hose connection in the zone by up to 15 percent.”

“(3) The gravity supply for the topmost standpipe system zone of the building shall be provided by a gravity tank in accordance with 9.1.4(4) and shall be equipped with a special service fire pump, in accordance with 9.1.4(4)(l), to boost supply to pressures as required by 7.8.”

“(4) The topmost standpipe system zone shall have a minimum height of 150 feet (45.7 m) so as to provide a water supply to the next lower standpipe system zone at the pressures required by 7.8 by gravity only. Pressures provided by this supply may exceed the minimum pressures required by 7.8.1 at the topmost hose connection in the next lower zone by up to 15 percent.”

“(5) Gravity tanks may serve as the suction source for the automatic fire pumps serving the next higher standpipe system zone located above the standpipe system zone served by the gravity tank.”

7.10.1.3.1.1 Delete the words “(including any hose stream demand)"
7.11.1 Delete.

7.11.2.4 Delete.

7.11.2.5(3) Delete.

7.12.1 Delete and replace with the following: “Fire department connections shall be installed in accordance with 4.8.”

7.12.1.1 Delete.

7.12.2 Delete.

7.12.2.1 Delete.

7.12.3 Delete entire section, including all subsections.

Chapter 8 Plans and Calculations. No changes.

Chapter 9 Water Supply

9.1.1 Delete the words “and semiautomatic.”

9.1.2 Add at the end the following: “Where manual combination standpipe systems are provided in accordance with the provisions of 5.4.1.1 of this referenced standard, an automatic water supply sufficient to provide the required sprinkler system demand shall be provided. Where such supply is provided by an automatic fire pump, the minimum pump capacity shall be as required by the sprinkler system demand in accordance with Section 903 of the New York City Building Code and NFPA 13. Where such water supply is provided by pressure or gravity tanks, the minimum water supply shall also be as required in accordance with the above.”

9.1.3 Delete the words “and semiautomatic.”

9.1.4 Delete and replace with the following: “Water supplies from the following sources shall be permitted:”

“(1) Public Water Connection. A public waterworks system where pressure and flow rate are adequate as confirmed by a statement by the Bureau of Water Supply of the Department of Environmental Protection.”

“(a) Each service directly supplying a standpipe system, or a fire pump shall be equipped with a control valve located under the sidewalk in a flush sidewalk box located within two feet (610 mm) of the street line, or in such other locations as may be approved by the Department of Environmental Protection. The purpose of each such control valve shall be clearly indicated by the words “Standpipe Supply Control” cast in the cover of such flush sidewalk box or, in lieu thereof, a metal sign with 1-inch lettering shall be located on the exterior building wall indicating the use and location of the valve.”
“(2) Automatic Fire Pumps. Automatic fire pumps connected to an approved water source in accordance with NFPA 20 and the following:”

“(a) Water Supply. Any required automatic fire pump shall draw from two independent street water mains in different streets, except that:

“(1) any automatic fire pump serving a building classified in occupancy group R-2 that is fully protected by a system of automatic sprinklers may draw from a single water main; and

“(2) an automatic fire pump may draw from a single water main if augmented by a suction tank or tanks, and if the valves at the meter and pump are provided with tamper switches that are wired to an approved supervising station of an operating fire alarm company. Where two services are installed, one service from the street water main shall be run directly to the pump, and the other service may be used for domestic water supply. The connection from water to the mains to the pumps shall be at least 6-inch (152 mm) pipe size and shall be flushed before connection is made to the system. Connections shall be in accordance with the provisions of the New York City Plumbing Code and applicable referenced standards.”

“(b) In the event that two separate and distinct water mains are not available as a supply or the street mains cannot produce the required supply, there shall be provided a suction tank, or tanks suitably located and of sufficient capacity to furnish the fire pump with at least a one-half hour supply at the rated capacity of such pump. Suction tanks shall be filled by a 6-inch (152 mm) connection to the water main, controlled by an automatic ball float valve in the suction tank. A 6-inch (152 mm) bypass shall be provided so that pumps may be fed directly from the street water main.”

“(c) When a water service supplies both the domestic service and the fire pump, a remote-control valve shall be placed on the domestic service connection at the point where such connection is taken from the city supply or service main. Such remote-control valve shall be controlled from a point near the pump control panel. In lieu of a remote-control valve, a manually operated valve may be installed to shut off the entire domestic water supply to the building, provided such valve is located in the fire pump room and is properly tagged for identification.”

“(d) Building Groups. Where a group of two or more buildings, whether connected or separated, are operated under a single ownership, one fire pump may be accepted as the water supply for the group. The pump shall be installed in the building where the maintenance personnel are located, and a metal sign with 1-inch (25 mm) lettering shall be installed in each building at all of the hose outlets on the entrance floor indicating the location of the fire pump.”

“(3) Pressure Tanks. Pressure tanks installed in accordance with NFPA 22 and the following:”

“(a) Tank Size. The tank volume shall be the water storage quantity required and an additional air space volume equivalent to one-half of the required water storage space.”
“(b) Air-To-Water Ratio. Air-to-water ratio shall be 1 to 2 by volume and may be maintained by automatic electrical controls.”

“(c) Air Pressure. An air compressor is provided with suitable automatic control and of sufficient capacity to build up air pressure of at least 75 psig (517 kPa) in the tank within three hours and to maintain thereafter an air pressure between 70 and 80 psig (482 to 552 kPa). The automatic control shall also maintain the proper air-to-water ratio in the pressure tank.”

“(d) Water Supply. Pressure tanks shall be supplied with water through a fixed pipe, independent of the standpipe riser and at least two inches (51 mm) in size. The water supply and connection shall be capable of supplying the tank at a rate of at least 75 gpm (5 L/s) without reducing the pressure in the tank. The tank shall have a fixed water level plate on the end opposite the gauge glass, or other equivalent indicating device.”

“(e) Level Supervision. All pressure tanks used to provide the required primary water supply of a standpipe system shall be equipped with a high and low air pressure and a high and low water level electrical alarm system.”

“(4) Gravity Tanks. Gravity tanks installed in accordance with NFPA 22 and the following:

“(a) Construction and support of tanks. Tanks for the standpipe system supply shall be constructed and supported in accordance with the provisions of NFPA 22 and applicable provisions of the New York City Building Code for loads and structural work. Tanks with a total capacity of 15,000 gallons (56 775 L) or greater shall be multi-compartment type such that no compartment is larger than one half of the required standpipe water supply reserve plus the domestic water reserve in combination tanks. In the alternative, multiple tanks may be provided, provided that the above criteria are met.”

“(b) Combination tanks. Gravity tanks may be used to provide the required primary water supply to the standpipe system and may also be used to supply automatic sprinkler and/or domestic water in a building provided all the following conditions are met:

“(1) The connections to the tank are made in such a manner as to provide the required sprinkler and/or fire standpipe reserve. The domestic supply is above the sprinkler and/ or standpipe reserve. Where a standpipe riser is used to supply water to a combination sprinkler and standpipe system as permitted, the connection to the tank shall be made in such a manner as to provide the required sprinkler or standpipe reserve, whichever is greater.”

“(2) The connections to the system are made outside of the tank. When connections or piping are installed inside the tank, the piping shall be assembled without couplings and shall be of red brass or approved equivalent material in accordance with the New York City Plumbing Code and applicable referenced standards.”
“(3) The tank is filled by means of an automatic pump at a rate of not less than 65 gpm (4 L/s).”

“(c) Filling of tanks.”

“(1) Gravity tanks shall be filled at the rate of at least 65 gpm (4 L/s). Pipes used to fill the tanks shall not be used for any other purpose; nor shall required fire pumps be used for filling purposes.”

“(2) Where there is sufficient pressure in the city water main to fill tanks at the required rate during all hours of each day, and a filling pump is not provided, the connection to the city water supply shall be made near the point where the city water service enters the building.”

“(3) A combined fire standpipe reserve and domestic water tank shall only be filled by direct public water connection or separate fill pumps, or direct connection to equipment, or pumps used to supply domestic water systems in accordance with the New York City Plumbing Code and applicable referenced standards.”

“(d) Emergency drains on tanks. Each tank shall be provided with a drain of at least 4 inches (102 mm). National Pipe Thread. Each drain pipe shall be controlled by a manually operated gate valve located so as to be readily accessible. The drain shall be installed in accordance with the New York City Plumbing Code and applicable referenced standards.”

“(e) Heating of tanks.”

“(1) Where the water in the tank is subject to freezing, the tank shall be equipped with a tank heater in accordance with the provisions of NFPA 22.”

“(2) Where the standpipe supply and domestic water supply are combined in a single tank, heating of such tank shall not be required in hotels, multiple dwellings, hospitals, or other occupancies where the domestic supply is drawn upon during all hours of every day of the week.”

“(f) Strainer.”

“(1) Every standpipe gravity or suction tank shall be provided with a brass or bronze strainer at the discharge to risers or to pump supply lines.”

“(2) Each strainer shall have clear openings with an aggregate area equal to, or more than, the required area of the pipe into which the tank discharges. Openings shall be not more than 1 in. (25 mm) nor less than ½ in. (13 mm) in diameter.”

“(g) Overflow pipe for tanks. Each gravity tank shall be provided with an overflow in accordance with the New York City Plumbing Code and applicable referenced standards.”
“(h) Access to tanks. Access to the top of each gravity tank shall be by means of a steel, wrought iron or approved equivalent material gooseneck ladder, constructed of flat side bars at least 2 in. by ¾ in (51 mm by 10 mm), or equivalent, spaced at least 14 in. (356 mm) apart, with round or square rungs at least ⅝ in. (16 mm) thick spaced not more than 12 in. (305 mm) on centers. The ladder shall be rigidly braced and shall not tip outward from the vertical at any point. When ladders exceed 25 ft. (6.1 m) in height, body irons spaced not more than 2 ft. (610 mm) on center and a metal platform at least 14 in. (356 mm) square, rigidly secured to the stringers of the ladder or other type of enclosed safe access, shall be provided near the top of the tank.”

“(i) Level Supervision. Gravity tanks shall be equipped with a high and low water level electrical alarm system.”

“(j) Where a group of two or more buildings, connected or separated, is operated under a single control, a single gravity tank may be accepted as the primary water supply for the several standpipe systems of such group, provided a dead riser is carried from the bottom of the tank to an underground header or cross connection system and provided each building unit has a post indicator type control valve outside or an O.S.&Y. control valve inside the building at a readily accessible location. The underground cross-connection may not cross any public street without the approval of the city departments having jurisdiction.”

“(k) The bottom of the topmost zone gravity tanks shall be located above the highest hose outlet in the zone that such tank supplies, excepting the roof manifold and those hose outlets in a penthouse enclosing mechanical equipment. Pressures may be boosted by use of automatic special service or other fire pump(s) to provide the hose outlet pressures required by 7.8 of this referenced standard. Tanks in intermediate zones may be sufficiently elevated to provide the pressures required by 7.8 provided that they are also installed in accordance with 7.9.”

“(l) The special service pump, as required by this standard, may be located anywhere in the zone served, provided that an express piped suction supply is installed from the gravity tank(s) that supply such pump, and such pump is located at a lower elevation than the gravity tank. Special service pumps are to be installed in accordance with the requirements of 9.1.4(2) - (d), (e), (f) and (h).”

9.1.4.1 Delete.

9.1.5 Delete.

9.2 Delete the words “Class II”.

9.3 Delete and replace with the following: “Minimum Supply for Group R-2 Occupancies. The water supply servicing standpipe systems in Group R-2 occupancies shall be 500 gpm (32 L/s) per zone. If provided with a stored water supply, any gravity tank or intermediate tank shall be a minimum of 15,000 gallons. Water supplies shall comply with the requirements of 7.9.”

Chapter 10 Water Supply Testing No Changes.
Chapter 11 System Acceptance

11.4.1 Delete and replace with: “*General. All new systems, including yard piping and fire department connection piping, shall be tested hydrostatically at not less than 300 psi (20.7 bar) or 50 psi (3.5 bar) in excess of the system working pressure, whichever is greater, for 1 hour.”

Add 11.4.1.1 to read as follows: “Individual FDC zones shall be treated as a separate system in determining the hydrostatic test pressures. Standpipe systems being installed in buildings under construction shall be tested in sections up to 100 feet (31 m) in length provided a final test is conducted of the entirely completed system at 115 psi (7.9 bar) at the most remote hose connection.”

11.4.2 Delete and replace with: “The 115 psi (7.9 bar) hydrostatic test pressure shall be measured at the elevation of the highest hose valve in the section being tested.”

**Exception:** The 200 psi (13.8 bar) test pressure for the topmost 100 feet (31 m) standpipe section in each FDC zone may be measured at the lowest point of the topmost 100 feet (31 m) section.”

11.5.5.1 Delete and replace with the following: “Pressure regulating devices on sprinkler branch line shall be tested according to NFPA 13.”

11.5.5.1.1 Delete.

11.5.5.2 Delete.

Chapter 12 Buildings Under Construction

12.1 Add at end the following: “During construction, alteration or demolition operations, standpipe systems shall comply with this section and Chapter 33 of the New York City Building Code.”

12.2 Delete and replace with the following: “Fire Department Connections. FDCs shall be provided as per 4.8. The location of the FDC(s) shall be placarded, kept free from obstruction, and identified by a red light.”

Add 12.2.1 to read as follows: “Fire Department Connection Zones. FDCs shall be arranged in maximum FDC zone heights of 600 feet (183 m). FDC express risers shall be provided when necessary.”

12.3 Delete and replace with the following: “Other System Features. The pipe sizes, hose valves, hose, water supply, and other details for new construction shall be in accordance with this standard and Chapter 33 of the New York City Building Code. Temporary risers shall be at least 4 inches in (102 mm) diameter for structures less than 450 feet high (137 m) and at least 6 inches (152 mm) in diameter for structures 450 feet (137 m) high or more. There shall be as many risers as will be, or were, required for the permanent system. Each such riser shall be connected to a cross connection that is supplied through FDC(s) at the street level and shall be equipped on each floor with a 2½ inch (64 mm) hose outlet valve. The installations shall be made so that each riser, cross connection, and branch line can be plugged or capped when work is not being done on the system.”

12.5.1 Delete and replace with the following: “At least one approved 2½ inch (64 mm) hose connection for attaching Fire Department hose shall be provided at each floor level in the exit
stairways. In any stairway where the length of travel between floor landings is more than 25 feet (7.6 m), a 2½ inch (64 mm) hose connection shall be installed at the first intermediate stair landing below the higher floor level.”

12.5.2 Add at the end the following: “and provided with caps according to 4.7.3.”

12.8 Delete entire section, including all subsections.

Chapter 13 System Testing, Inspection, and Maintenance No changes.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A Explanatory Material No changes.

Annex B Informational References No changes.

SECTION BC Q106
INSTALLATION OF STATIONARY FIRE PUMPS

Q106.1 General. Fire pump systems, where required by this code, shall be installed in accordance with NFPA 20, Standard for the Installation of Stationary Pumps for Fire Protection, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration No changes.

Chapter 2 Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

Chapter 3 Definitions

3.3.40 Delete and replace with the following: “‘On-Site Standby Generator’ as per the New York City Electrical Code.”

3.3.44.5 Add the following sentence at the end: “This definition is for use with this referenced standard only.”
3.3.44.11 Add the following sentence at the end: “Multistage, Multiport (fire) Pumps are prohibited in the City of New York.”

Chapter 4 General Requirements

4.5.1.2 Delete.

Add 4.6.2.1.1 to read as follows: “Number of sources shall be as required by the New York City Building Code.”

Add 4.6.2.1.2 to read as follows: “Water drained and/or supplied from fire pump shall not discharge into a potable water source.”

4.8 Delete.

4.8.1 Delete.

4.8.2 Delete.

4.12.1.3.1 Delete.

4.13.1.1.2 Delete “fire-rated construction in accordance with Table 4.13.1.1.2” and replace with the following: “a minimum of 2-hour fire-rated construction unless otherwise noted in the New York City Building Code.”

Table 4.13.1.1.2 Delete.

Add 4.13.1.1.8 to read as follows: “Fire pumps shall be placed on concrete pads at least 12 inches (305 mm) above the pump room floor with a clearance of at least 3 feet (914 mm) maintained on all sides from walls or from other equipment in the pump room. In the event of the use of a vertical shaft centrifugal fire pump, the 12 inches (305 mm) high concrete pad may be omitted, provided the bottom of the electric driving motor and all electrical appurtenances are raised at least 12 inches (305 mm) above the pump room floor.”

Add 4.13.1.1.9 to read as follows: “Each automatic fire pump shall be equipped with a 3 inches (76 mm) National Pipe Thread pressure relief valve installed in the pump discharge. Such relief valve shall be set to relieve below the shutoff head of the pump, but above the pressure required to maintain the operating pressure at the highest hose valve. The discharge from the relief valve may be piped back into the suction side of the pump on the pump side of the suction valve provided a visual sight glass is installed in the discharge of the relief valve.”

4.13.2.1.2 Delete “not less than the fire-resistance rating of the fire pump room.” and replace with the following: “of 2 hours unless otherwise noted in the New York City Building Code.”

4.13.5.2 Delete.

4.13.7.2 Add at the end the following “Floor drain shall have a minimum outlet size of 4 inches (102 mm).”
4.14.1.2 Delete “or painted on the inside prior to installation with a paint recommended for submerged surfaces.”

4.14.2.2 Delete.

4.14.6 Add at the end the following “and the New York City Fire Code.”

4.15.4.2 Delete.

4.15.6.5 Delete.

4.16.2 Delete.

4.16.5 Delete.

4.16.7 Delete and replace with the following: “A listed swing- or spring loaded-type check valve shall be installed in the pump discharge assembly.”

4.16.10 Delete.

4.17.1 Delete “by one of the following methods” and replace with the following: “in accordance with the requirements of Sections 903, 905 and 907 of the New York City Building Code. Delete Items (1) through (4).”

Add 4.19.8.1 to read as follows: “The drainage shall not discharge into a potable water supply.”

4.20.2.10 Delete.

4.30.2 Delete “applicable NFPA 70 articles” and replace with “New York City Electrical Code.”

4.31.1.1 Delete.

4.31.1.1.1 Delete.

Chapter 5 Fire Pumps for High-Rise Buildings

5.3.1 Add at the end following “the New York City Building Code and the New York City Plumbing Code.”

5.4 Delete the phrase “or a test header discharging back into the tank with a calibrated nozzle(s) arranged for the attachment of a pressure gauge to determine pitot pressure” and add the following after “shall be required.”; “See Section 14.2.1.5 for additional fire pump testing arrangements.”

5.6.1.1 Delete and replace with the following: “Water supplies for buildings over 300 feet (91 m) above the lowest level of Fire Department vehicle access shall comply with Section Q105 of the New York City Building Code.”

5.6.1.1.1 Delete.

5.6.1.1.2 Delete.
5.6.1.3 Delete.
5.6.1.2 Delete.
5.6.1.3 Delete.
5.6.1.4 Delete.
5.6.1.5 Delete.
5.6.1.5.1 Delete.
5.6.2 Delete.

Chapter 6 Centrifugal Pumps

6.2.1.1 Delete.
6.2.2.1 Delete.

Chapter 7 Vertical Shaft Turbine-Type Pumps No changes.

Chapter 8 Positive Displacement Pumps No changes.

Chapter 9 Electric Drive for Pumps

9.1.3 Delete: “NFPA 70, Article 695, and all other applicable articles” and add the following sentence at the end: “and the requirements of the New York City Electrical Code.”

9.2.2*(5) Delete “of Article 695 of NFPA 70” and add the following sentence at the end: “and the requirements of the New York City Electrical Code.”

9.2.3 Add the following sentence at the end: “Overcurrent protection shall comply with the requirements of the New York City Electrical Code.”

9.2.3.1 Delete all words after and including “all the following requirements:” and replace with the following: “the requirements of the New York City Electrical Code.”

9.3.1 Delete and replace with the following: “Where required by the New York City Building Code, an alternate power source shall be provided in accordance with the requirements of the New York City Electrical Code.”

9.6.1.1 Delete and replace with the following: “As per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”

9.6.1.2 Delete.

9.6.2.1 Delete and replace with the following: “As per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”
9.6.2.2 Delete.

9.6.2.3 Delete.

9.6.5.1 Delete and replace with the following: “As per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”

9.6.5.2 Delete.

9.6.5.3 Delete.

9.7 Delete and replace with the following: “Junction Boxes. Where fire pump wiring to or from a fire pump controller is routed through a junction box, such wiring shall be installed as per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”

9.8.1 Delete and replace with the following: “As per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”

9.8.1.1 Delete.

9.8.1.2 Delete.

9.8.2 Delete.

9.8.3 Delete.

9.9 Delete and replace with the following: “As per the New York City Electrical Code and Chapter 27 of the New York City Building Code.”

9.9.1 Delete.

9.9.2 Delete.

9.9.3 Delete.

9.9.4 Delete.

Chapter 10 Electric-Drive Controllers and Accessories

10.1.2.2.2 Add the following sentence at the end: “A placard shall be placed adjacent to the fire pump controller in accordance with the New York City Electrical Code.”

10.5.2.1.2 Delete.

10.5.2.1.3 Delete.

10.5.2.5 Delete.

10.5.2.7 Delete.
10.5.3 Delete.

10.5.4 Delete and replace with the following: “Shutdown shall be accomplished by the method in 10.5.4.1.”

10.5.4.2 Delete.

10.5.4.2.1 Delete.

10.5.4.2.2 Delete.

Chapter 11 Diesel Engine Drive

11.4.1 Add the following sentence at the end: “Fuel supply shall comply with applicable sections of the New York City Building Code, the New York City Mechanical Code and the New York City Fire Code.”

11.4.3.1 Delete and replace with the following: “Diesel fuel supplies shall be located in accordance with applicable sections of the New York City Building Code, the New York City Mechanical Code and the New York City Fire Code.”

11.5 Add the following sentence at the end: “Exhaust system shall comply with applicable sections of the New York City Mechanical Code.”

Chapter 12 Engine Drive Controllers

12.1.1 Delete “nonautomatic”.

12.7.2.1.1.2 Delete.

12.7.2.1.1.3 Delete.

12.7.2.1.1.4 Delete.

12.7.2.3 Delete.

12.7.2.4 Delete.

12.7.2.5 Delete.

12.7.2.7 Delete

12.7.5.2 Delete.

12.7.5.2.1 Delete.

12.7.5.2.2 Delete.

Chapter 13 Steam Turbine Drive No changes.
Chapter 14 Acceptance Testing, Performance, and Maintenance

Add **14.2.1.1** to read as follows: “Testing shall comply with the manufacturer’s requirements.”

Add **14.2.1.2** to read as follows: “Testing shall also comply with the *New York City Fire Code*, where applicable.”

Add **14.2.1.3** to read as follows: “Fire pump shall be equipped with a listed flowmeter.”

Add **14.2.1.4** to read as follows: “Water used in fire pump testing shall not discharge into any source containing potable water.”

Add **14.2.1.5** to read as follows: “Acceptance flow testing shall be performed by one of the following four methods:”

“(1) Use of pump discharge via hose streams”

“(2) Use of pump discharge via bypass flowmeter to drain line or suction reservoir. The flowmeter shall be sized per 4.21.2 and the drain line shall be sized at a minimum as per 4.21.3.4.”

“(3) Use of pump discharge via bypass flowmeter to pump suction (closed-loop metering)”

“(4) Use of pump discharge to a suction reservoir with a calibrated nozzle(s) arranged for attachment of a pressure gauge to determine pitot pressure.”

**14.2.4.1.2 Delete.**

**14.2.6.4 Delete.**

**14.2.6.4.1 Delete.**

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

**Annex A Explanatory Material** No changes.

**Annex B Possible Causes of Pump Troubles** No changes.

**Annex C Fire Pump Controller Connectivity** No changes.

**Annex D Informational Resources** Delete.

**Annex E Material Extracted by NFPA 70, Article 695** Delete.
SECTION BC Q107
INSTALLATION OF FIRE ALARMS

Q107.1 General. Fire alarm system design, installation, testing, and maintenance, where required by this code, shall be conducted and documented in accordance with NFPA 72, National Fire Alarm and Signaling Code, 2016 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration No changes.

Chapter 2 Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

Chapter 3 Definitions No changes.

Chapter 4 Reserved

Chapter 5 Reserved

Chapter 6 Reserved

Chapter 7 Documentation No changes.

Chapter 8 Reserved

Chapter 9 Reserved

Chapter 10 Fundamentals

10.5.1.1 Delete and replace with the following: “Fire alarm system and emergency communication system plans and specifications shall be developed in accordance with the New York City Building Code by persons licensed and registered to practice the profession of engineering under the Education Law of the State of New York, who are also experienced in the proper design, application, installation, and testing of the system.”

10.5.1.2 Delete.

10.5.2.1 Add at beginning the following: “Fire alarm installations shall be performed by a New York City licensed electrical contractor.”

10.5.3.1 Add at beginning the following: “Fire alarm inspection, testing and maintenance shall be performed by a New York City licensed electrical contractor holding a New York State registration
for ‘Business of Installing, Servicing or Maintaining Security or Fire Alarm Systems’ or those fire alarm companies holding a New York State registration for ‘Business of Installing, Servicing or Maintaining Security or Fire Alarm Systems,’ and in accordance with rules and regulations promulgated by the Fire Commissioner.”

10.6.3.1 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.3.2 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.3.3 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.3.4 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.4.1 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.4.2 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.4.3 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.5.1 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.5.2 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.5.3 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.5.4 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.6.1 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.6.2 Delete and replace with the following: “Refer to the *New York City Electrical Code* for requirements.”

10.6.7.2.1 Delete and replace with the following: “The secondary power supply for fire alarm systems and supervising station facilities shall have sufficient capacity to operate the system in accordance with the *New York City Electrical Code*. The secondary power supply for other systems shall have sufficient capacity to operate the system under quiescent load (system operating in a nonalarm condition) for a minimum of 24 hours and, at the end of that period, shall be capable of
operating all alarm notification appliances used for evacuation or to direct aid to the location of an emergency for 5 minutes, unless otherwise permitted or required by 10.6.7.2.1.1 through 10.6.7.2.2.

10.6.7.2.1.2 Reserved.

10.6.7.2.1.3 Reserved.

10.6.7.2.1.4 Delete and replace with the following: “The secondary power supply for high-power speaker arrays used for wide-area mass notification systems shall be in accordance with 24.6.5.2.”

Add 10.6.7.2.1.8 to read as follows: “The secondary power supply for two-way voice radio communication enhancement system shall be in accordance with 24.9.5.3.1.”

Chapter 11 Reserved

Chapter 12 Circuits and Pathways

Add 12.3.6.1 to read as follows: “Class-N circuits shall not be installed unless approved by the Fire Department.”

Chapter 13 Reserved

Chapter 14 Inspection, Testing, and Maintenance

14.1.1 Delete and replace with the following: “The inspection, testing and maintenance of systems, their initiating devices, and notification appliances shall comply with the requirements of this chapter and the New York City Fire Code.”

14.1.2 Delete and replace with the following: “The inspection, testing and maintenance of single- and multiple-station smoke and heat alarms and household fire alarm systems shall comply with the requirements of this chapter and the New York City Fire Code.”

14.4.9 Delete and replace with the following: “In-building auxiliary radio communication systems (ARCS) shall be inspected and operationally tested in accordance with the requirements of the New York City Fire Code and rules promulgated by the Fire Department.”

14.6.3 Delete and replace with the following: “Supervising Station Records. For supervising station alarm systems, records pertaining to signals received at the supervising station that result from maintenance, inspection, and testing shall be maintained in accordance with the New York City Fire Code.”

14.6.3.1 Delete.

14.6.3.2 Delete.

14.6.4 Delete.

Chapter 15 Reserved
Chapter 16 Reserved

Chapter 17 Initiating Devices

Add 17.5.3.2.1 to read as follows: “Partial coverage smoke detection shall be located in common areas and work spaces such as corridors, lobbies, storage rooms, equipment rooms, and other tenantless spaces, where required.”

Add 17.5.3.2.2 to read as follows: “Selective coverage smoke detection shall be located as follows:”

“(1) In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms, and in elevator lobbies.”

“(2) In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.”

17.10.2.4 Delete and replace with the following: “The selection and placement of the gas detectors shall be based on an engineering evaluation including, but not limited to, the following:

(1) Structural features, size, and shape of the rooms and bays

(2) Occupancy and uses of areas

(3) Ceiling heights

(4) Ceiling shape, surface, and obstructions

(5) Ventilation

(6) Ambient environment

(7) Gas characteristics of the gases present

(8) Configuration of the contents in the area to be protected

(9) Response time(s)”

Chapter 18 Notification Appliances No changes.

Chapter 19 Reserved

Chapter 20 Reserved

Chapter 21 Emergency Control Function Interfaces

21.3.3 Delete and replace with the following: “Unless otherwise required by the authority having jurisdiction, only the elevator lobby, elevator hoistway, and elevator machine room smoke detectors, sprinkler waterfall alarm-initiating devices, or other automatic fire detection as permitted by 21.3.9, and initiating devices used to initiate shutdown of elevator power in accordance with 21.4 shall be used to recall elevators for fire fighters’ service.”
21.3.13 Delete and replace with the following: “Separate outputs from the fire alarm systems to the elevator controller(s) shall be provided to implement elevator Phase 1 Emergency Recall Operation in accordance with ANSI/ASME A17.1a/CSA B44a, Safety Code for Elevators and Escalators.”

21.3.13.1 Delete and replace with the following: “See ANSI/ASME A17.1a/CSA B44a, Safety Code for Elevators and Escalators, for designated and alternate levels of elevator recall.”

21.3.13.2 Delete and replace with the following: “See ANSI/ASME A17.1a/CSA B44a, Safety Code for Elevators and Escalators, for designated and alternate levels of elevator recall.”

21.3.13.3 Delete and replace with the following: “See ANSI/ASME A17.1a/CSA B44a, Safety Code for Elevators and Escalators, for designated and alternate levels of elevator recall.”

21.4.2 Delete and replace with the following: “If heat detectors are used to shut down elevator power prior to sprinkler operation, they shall be placed within 24 in. (610 mm) of each sprinkler head and be installed in accordance with the requirements of Chapter 17. Upon activation of the heat detector used for elevator power shutdown, there shall be permitted to be a delay in the activation of the power shunt trip. This delay should be the time that it takes the elevator cab to travel from the top of the hoist way to the lowest recall level. Alternatively, engineering methods, such as those specified in Annex B, shall be permitted to be used to select and place heat detectors to ensure response priority to any sprinkler head operation under a variety of the growth rate scenarios.”

21.4.3 Delete and replace with the following: “Pressure or water flow switches shall not be used to shut down elevator power.”

21.6 Delete section, including all subsections, and replace with the following:

“21.6 Occupant Evacuation Elevators.”

“21.6.1 Elevator Status. Any elevator specifically designated and marked for use by occupants for evacuation during fires shall comply with all of the provisions of 21.5 and 21.6.”

“21.6.2 Elevator Occupant Evacuation Operation (OEO). Outputs from the fire alarm system to the elevator controller(s) shall be provided to implement elevator occupant evacuation operation in accordance with section 2.27 of ASME A17.1/CSA B44 as modified by Chapter K1 of Appendix K of the New York City Building Code, as required in 21.6.2.1 and 21.6.2.2.”

“21.6.2.1 Partial Evacuation. Where an elevator or group of elevators is designed for use by occupants for evacuation, the provisions of 21.6.2.1.1 through 21.6.2.1.4 shall apply for partial evacuation.”

“21.6.2.1.1 Initiation. Output signal(s) shall be provided to initiate elevator occupant evacuation operation upon automatic or manual detection of a fire on a specific floor or floors as a result of either or both of the following:

(1) Activation of any automatic fire alarm initiating device in the building, other than an initiating device used for elevator Phase I Emergency Recall Operation in accordance with Chapter K1 of Appendix K of the New York City Building Code.”
(2)* Activation of manual means at the fire command center by authorized or emergency personnel."

“21.6.2.1.2* Floor Identification.

(A) The output signal(s) shall identify each floor to be evacuated.

(B) The identified floors shall be a contiguous block of floors including the following:

(1) The floor with the first activated automatic initiating device.

(2) Floors with any subsequently activated automatic initiating device(s).

(3) Floors identified by manual means from the fire command center.

(4) One floor above the highest floor identified by 21.6.2.1.2(B)(1) through 21.6.2.1.2(B)(3).

(5) One floor below the lowest floor identified by 21.6.2.1.2(B)(1) through 21.6.2.1.2(B)(3).

(C) The identified floors shall be displayed on a standard emergency services interface along with the other elevator status information required by 21.6.1.”

“21.6.2.1.3 Manual Floor Selection.

(A) A means shall be provided at the fire command center to allow the manual selection of floors.

(B) The floors shall be selected on the basis of information from authorized or emergency personnel.”

“21.6.2.1.4* Occupant Notification. The in-building fire emergency voice/alarm communications system shall transmit coordinated messages throughout the building.

(A) Live voice evacuation messages shall be transmitted to the floors identified in 21.6.2.1.2 to indicate the need to evacuate and that elevator service is available.

(B) Live voice messages shall be transmitted to the floors not being evacuated to inform occupants of evacuation status and shall include an indication that elevator service is not available.

(C)* Live voice messages shall be transmitted to the floors identified in 21.6.2.1.2 to indicate that elevator service is not available when all elevators have been recalled on Phase I Emergency Recall Operation.

(D) All live voice messages shall be coordinated with the text displays provided separately by the elevator management system.”
“21.6.2.2 Total Evacuation. Where an elevator or group of elevators is designated for use by occupants for evacuation, the provisions of 21.6.2.2.1 through 21.6.2.2.3 shall apply for total evacuation.”

“21.6.2.2.1 Output(s) to signal elevator occupant evacuation operation for total evacuation shall be manually activated from the fire command center by a means labeled “ELEVATOR TOTAL BUILDING EVACUATION.””

“21.6.2.2.2 The output(s) shall identify that all floors are to be evacuated.”

“21.6.2.2.3 A live voice evacuation message shall be transmitted from the in-building fire emergency voice/alarm communication system throughout the entire building to indicate the need to evacuate.”

21.7.3* Delete and replace with the following: “Fan Shutdown and Restart.”

Add 21.7.3.1 to read as follows: “Connections between fire alarm systems and the HVAC systems for the purpose of monitoring and control shall be arranged such that primary control (the control that all other controls are secondary or subservient to) capability rests with the fire alarm control unit(s) under all circumstances and in addition shall operate and be monitored in accordance with the New York City Building Code.

Exception: Primary control of HVAC systems may rest with approved smoke control systems.”

Add 21.7.3.2 to read as follows: “HVAC fans or fan systems which have been automatically shut down by the activation of any fire alarm control unit or device shall be arranged and equipped not to automatically restart when the fire alarm control unit or device is reset. At least two manual means of restarting the fans or fan systems shall be required, such as manually resetting the fire alarm control unit or device and subsequently manually resetting the fan or fan system controls.”

Add 21.7.3.3 to read as follows: “Fans or fan systems that were automatically shut down by the fire alarm control unit or device in high rise fire alarm systems shall be manually enabled to start by means of overriding the fan shut down through the use of city-wide standard key (#2642) located at the Fire Command Center and/or Fire Fighters’ Smoke Control Station. The actual start of the fans shall be accomplished manually through HVAC controls at the Fire Command Center, Fire Fighters’ Smoke Control Station and locally at the fan rooms.”

Add 21.7.3.4 to read as follows: “Smoke Exhaust control means shall be enabled through the use of city-wide standard key (#2642) located at the Fire Command Center, Fire Fighters’ Smoke Control Station, fire alarm control unit or, in the entrance lobby of the building adjacent to the fire alarm remote annunciator, when provided.”

21.9.1 Delete and replace with the following: “Where permitted by the New York City Building Code, any device or system intended to electrically lock a required means of egress door in the direction of egress shall be connected to the fire alarm system serving the protected premises and shall automatically unlock upon any activation from the fire alarm system.”
21.9.3 Delete and replace with the following: “Where permission is obtained from the commissioner, for all means of egress doors connected in accordance with 21.9.1, and where batteries are used in accordance with 10.6.7 as the secondary power supply, the batteries shall not be utilized to maintain these doors in the locked condition, unless the fire alarm control unit is arranged with circuitry and sufficient secondary power to ensure the exits will unlock within 10 minutes of loss of primary power.”

Chapter 22 Reserved

Chapter 23 Protected Premises Fire Alarm Systems

23.3.2 Delete and replace with the following: “Nonrequired (Voluntary Systems) and Components. The features for a nonrequired system shall be established by the system designer on the basis of the goals and objectives intended by the system owner and subject to the approval of the Fire Department.”

23.8.1.1.2(3) Delete and replace with the following: “(3) Subsequent system operation shall be subject to approval of the Fire Department.”

Add 23.8.1.1.3 to read as follows: “Group A Occupancies. Presignal systems in Group A occupancies required by Section 907.2.1.1 of the New York City Building Code shall operate in the “Event/Non-Event Mode,” as follows:

“(1) For the purposes of this section, Event Mode is defined when an assembly space and is occupied by public members with an occupant load in accordance with Section 907.2.1.1 of the New York City Building Code. Each assembly space within a structure that meets the occupant load as required in the Section 907.2.1.1 of the New York City Building Code shall be equipped with a separate In-Building Fire Emergency Voice/Alarm Communications System.”

“(2) The In-Building Fire Emergency Voice/Alarm Communications System shall consist of the following:

- One-way voice communication”
- Event/Non-Event #2642 Key switch”
- Remote Annunciator if the building fire alarm control panel is not installed in the assembly space”
- “Warden phone to communicate to the base building Fire Alarm Control Panel or Fire Command Center”

“(3) The Event Mode and Non-Event Mode shall be selectable positions in a two-position key switch at the In-Building Fire Emergency Voice/Alarm Communications System operated by city wide standard key (#2642) with visual indication of mode status at the fire alarm control panel or Fire Command Center. A log record shall be maintained for all mode operations identifying the operator, time and date of each such operation of mode and the selected duration of time for Event Mode.”

“(4) In the Event Mode, no automatic alarm audible or visual notification signals shall be transmitted to the public or occupants of the place of assembly only. Manual live voice
announcements shall be made by the designated Certificate of Fitness holder (F-53) for manual live voice announcements supervising the In-Building Fire Emergency Voice/Alarm Communications System to direct and implement emergency procedures including evacuation.”

“(5) The Event Mode shall be adjustable up to a maximum time period duration of eight hours, and shall automatically revert to Non-Event Mode at the expiration of the time period unless manually switched to Non-Event Mode prior to such expiration time. A supervisory signal in addition to the foregoing is not prohibited.”

“(6) In the Non-Event Mode, all speakers, horns and visual appliances shall emit alarm notification signals for public notification purposes – the audible signal shall comply with the base building approved fire alarm sequence of operation.”

“(7) In the Event Mode, an unacknowledged alarm actuation shall, after the expiration of 180 seconds (3 minutes), automatically revert to Non-Event Mode and cause all alarm appliances to emit notification signals throughout the entire premises without exception, including publicly occupied assembly and support areas. Prerecorded or synthesized voice messages are prohibited.”

“(8) The In-Building Fire Emergency Voice/Alarm Communications System shall be accessible within the assembly space to permit the assigned Certificate of Fitness holder (F-53) for manual live voice announcements to assess conditions and effectively direct evacuation of the admitted public.”

“(9) The In-Building Fire Emergency Voice/Alarm Communications System shall be manned by a Certificate of Fitness holder (F-53) for manual live voice announcements issued by the Fire Department, during all times that the fire alarm system is in Event Mode.”

“(10) A central station connection for manual, automatic and waterflow valve alarm and trouble shall be provided for the fire alarm system, activated automatically in either Event or Non-event Mode.”

“(11) The Certificate of Fitness holder (F-53) for manual live voice announcements shall have the ability at the In-Building Fire Emergency Voice/Alarm Communications System to stop any conflicting or confusing sounds and visual distractions, and to illuminate the assembly space.”

“(12) In buildings that are not required to have a Fire and Life Safety Director person, a Certificate of Fitness holder (F-01) shall be assigned at the main fire alarm control panel to investigate any alarm conditions and report back to the Certificate of Fitness Holder (F-53) supervising the In-Building Fire Emergency Voice/Alarm Communications System.”

“(13) A Certificate of Fitness for Place of Assembly Safety Personnel (F-03/F-04) shall be provided as per the New York City Fire Code.”

“(14) All Certificate of Fitness holders on duty during Event Mode shall be equipped with a personal communication device that will allow for two-way communications.”
23.8.5.1.2* Delete and replace with the following: “Where connected to a supervising station, fire alarm systems employing automatic fire detectors or waterflow detection devices shall include a manual fire alarm box to initiate a signal to the supervising station.”

Chapter 24 Emergency Communication Systems (ECS)

Add 24.4.10 to read as follows: “One-Way Emergency Voice Communication System.”

Add 24.4.10.1 to read as follows: “One-way emergency voice communications equipment shall be installed in accordance with 24.4.10.”

Add 24.4.10.2 to read as follows: “Fire Department Use. One-way emergency voice communications service, where provided, shall be for use only by the Fire Department or by building personnel authorized to use such service who have obtained a Certificate of Fitness from the Fire Department.”

Add 24.4.10.2.1 to read as follows: “Activation. The voice communication panel at the annunciator panel shall be operated only by the Fire Department with activation of city wide standard key (#2642).”

Add 24.4.10.2.2 to read as follows: “Building Personnel Use. If requested by a building owner, building personnel who have obtained a FDNY Certificate of Fitness shall be permitted to utilize the system from a panel at the concierge or security desk.”

Add 24.4.10.2.3 to read as follows: “Permitted Variation. Any variation of equipment and system operation, if permitted by the Fire Commissioner, provided in order to facilitate additional uses of any one-way emergency voice communications service shall not adversely affect performance when used by those authorized pursuant to 24.4.1.10.2.”

Add 24.4.10.2.4 to read as follows: “Speaker Stations. Speaker stations shall be installed in each dwelling unit and on at least every other story in every required vertical exit enclosure.”

Add 24.4.11 to read as follows: “One-way Emergency Voice Communications Circuits in Group R-2 Occupancies. Where a one-way voice communications circuit is provided, such system shall comply with provisions for notification appliance integrity monitoring including 10.19, 12.6, 23.4 and 23.7 and the notification appliance circuits serving the apartments and stairway speakers shall meet the classifications for Class “X” Pathway Designation per 12.3.6. Additionally, outgoing and return conductors feeding the same circuit may not be run in the same stairwell.”

Add the following at the end of 24.5: “In-building mass notification systems shall not be installed unless approved by the Fire Department.”

Add 24.6 to read as follows: “Wide-Area Mass Notification Systems.”

Add 24.6.1 to read as follows: “Wide-area mass notification systems shall not be installed unless approved by the Fire Department.”

24.8.11 Delete and replace with the following: “In buildings provided with a two-way telephone communications system, at least one telephone station shall be provided where required by the New York City Building Code.”
24.8.15 Delete and replace with the following: “Telephone jacks are prohibited in new buildings and new fire alarm systems in existing buildings.”

24.9* Delete and replace with the following: “Two-way Radio Communications Enhancement Systems (In-Building Auxiliary Radio Communication System (ARCS)).”

Add 24.9.1.3 to read as follows: “Definitions. The following definitions are applicable to this section only.”

**Delivered Audio Quality (DAQ).** A measure of audio quality over a transmission medium as defined in standards published in TIA/TSB-88C. The following table shows the DAQ descriptions as published in the document:

<table>
<thead>
<tr>
<th>Delivered Audio Quality (DAQ)</th>
<th>Faded Subjective Performance Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unusable, speech present but unreadable.</td>
</tr>
<tr>
<td>2</td>
<td>Understandable with considerable effort. Frequent repetition due to noise/distortion.</td>
</tr>
<tr>
<td>3</td>
<td>Speech understandable with slight effort. Occasional repetition required due to noise/distortion.</td>
</tr>
<tr>
<td>3.4</td>
<td>Speech understandable with repetition only rarely required. Some noise/distortion.</td>
</tr>
<tr>
<td>4</td>
<td>Speech easily understood. Occasional noise/distortion.</td>
</tr>
<tr>
<td>4.5</td>
<td>Speech easily understood. Infrequent noise/distortion.</td>
</tr>
<tr>
<td>5</td>
<td>Speech easily understood.</td>
</tr>
</tbody>
</table>

**Dedicated Radio Console (DRC).** A fixed location console that contains at least the following components:

1. A handset or headset to broadcast and/or receive voice communications from/to ARCS.

2. A visual display to identify all signals transmitted from the Firefighter handheld units and supervisory signals.

3. Fire Department city wide standard key (#2642) to enable/disable radio transmission.

**In-Building Auxiliary Radio Communication System (ARCS).** Wireless two-way radio communication enhancement system installed in buildings to propagate Fire Department wireless frequencies for the use of the Fire Department in case of an emergency.

**Repeater Channel System.** A repeater system utilizing channels with paired receive and transmit frequencies. When a user within the building transmits on a repeater channel, the repeater system rebroadcasts the users’ signal to the DRC and all users within the building on that channel. This transmission increases the distance from which users can directly talk with each other. A user at the DRC must enable repeater channel for users to communicate.
**Simplex Channel System.** A simplex system utilizing channels with the same frequencies for transmit and receive. Users communicate on simplex channels radio-to-radio without going through infrastructure. However, their radios need to be within a certain distance to be picked up by one another. A simplex system allows a user at the DRC to communicate with a user on a simplex channel anywhere in the building, even though the distance between the DRC and the user would typically be prohibitive. A simplex system only extends the transmission’s reach for the DRC. It does not improve coverage between individual user radios.

Add 24.9.2.1 to read as follows: “Critical Areas. Critical areas, such as the fire/emergency command center(s), the fire pump room(s), exit stairs, exit passageways, elevator lobbies, standpipe cabinets, sprinkler sectional valve locations, and other areas deemed critical by the authority having jurisdiction at the time of plan examination, shall be provided with 100 percent floor area radio coverage.”

Add 24.9.2.2 to read as follows: “General Building Areas. General building areas shall be provided with 95 percent floor area radio coverage in accordance with rules promulgated by the Fire Department.”

Add 24.9.2.3 to read as follows: “System Types. Buildings and structures that cannot support the required level of radio coverage shall be equipped with either a repeater channel system or a simplex channel system.”

Add 24.9.3 to read as follows: “Signal Strength.”

Add 24.9.3.1 to read as follows: “Inbound. A minimum inbound signal strength of -95 dBm, or other signal strength as required by the authority having jurisdiction, shall be provided throughout the coverage area and provide a minimum intelligible DAQ of 3.4.”

Add 24.9.3.2 to read as follows: “Outbound. A minimum outbound signal strength of -95 dBm at the donor site, or other signal strength as required by the authority having jurisdiction, shall be provided from the coverage area and provide a minimum intelligible DAQ of 3.4.”

Add 24.9.4 to read as follows: “System Radio Frequencies. The ARCS shall be capable of transmitting all public safety radio frequencies assigned by the Fire Department and be capable of using any modulation technology.”

Add 24.9.4.1 to read as follows: “List of Assigned Frequencies. The Fire Department shall maintain a list of all inbound/outbound frequency pairs for distribution to system designers and installers.”

Add 24.9.4.2 to read as follows: “Frequency Changes. Systems shall be capable of upgrade, to allow for instances where the Fire Department changes or adds system frequencies, in order to maintain radio system coverage as originally designed.”

Add 24.9.4.3 to read as follows: “Perimeter Coverage. The design of the ARCS shall minimize RF radiation beyond the intended building’s limits so as to avoid interference, in compliance with FCC regulations.”

Add 24.9.5 to read as follows: “Components and Equipment.”
Add 24.9.5.1 to read as follows: “Component Approval. Components utilized in the installation of the public safety radio enhancement system, such as repeaters, transmitters, receivers, signal boosters, cabling, and fiber-distributed antenna systems, shall be FCC compliant, listed by a Nationally Recognized Testing Laboratory (NRTL) and shall be compatible with the Fire Department radio system.”

Add 24.9.5.2 to read as follows: “Component Enclosures. All active components including but not limited to repeater, transmitter, receiver, and signal booster components remotely located from the Fire Command Center shall be contained in a listed UL 50E enclosure(s).”

Add 24.9.5.2.1 to read as follows: “The enclosure shall be painted Fire Department Red.”

Add 24.9.5.2.2 to read as follows: “A tamper switch shall monitor all active components in non-secure locations located remotely from the Fire Command Center such as amplifiers and repeaters. The notification for the tamper switch shall be monitored at the DRC.”

Add 24.9.5.3 to read as follows: “Power Supply. Power supply to the ARCS shall be in accordance with Section 760.41 of the New York City Electrical Code.

   Exception: Where power supply for the building fire alarm system has adequate capacity to support the ARCS power requirements, connection to the fire alarm system power supply via dedicated branch circuits with appropriate overcurrent protection is permitted.”

Add 24.9.5.3.1 to read as follows: “Battery Backup. The ARCS shall be provided with supervisory operations for 24 hours followed by full load operation for 6 hours.”

Add 24.9.5.4 to read as follows: “External filters. Permanent external filters and attachments shall not be permitted.”

Add 24.9.5.5 to read as follows: “Labeling.”

Add 24.9.5.5.1 to read as follows: “Cables.”

Add 24.9.5.5.1.1 to read as follows: “Cables utilized in the ARCS shall be labeled as “FDNY Communications Use”.”

Add 24.9.5.5.1.2 to read as follows: “Where continuously accessible, the cable shall be marked every 8 feet (2438 mm).”

Add 24.9.5.5.1.3 to read as follows: “Wherever the cable is intermittently accessible, each accessible point shall be labeled.”

Add 24.9.5.5.1.4 to read as follows: “Field labeling of the cables shall be acceptable.”

Add 24.9.5.5.2 to read as follows: “Dedicated Radio Console Enclosure. The DRC shall be enclosed and the outside of the enclosure shall be labeled the following in white lettering contrasted against a Fire Department Red background:

   AUXILIARY RADIO COMMUNICATIONS
Add **24.9.5.3** to read as follows: “Cable Rating. All ARCS cables shall be protected such that the circuit shall maintain its electrical function during fire conditions for at least a 2-hour period and the protection shall not interfere with the normal operation of the system as a whole.

**Exception:** Radiating ARCS cables running horizontally that are not part of the main trunk connecting to a vertical riser shall have a plenum rating with a minimum temperature of 125°C (257 °F).”

Add **24.9.5.4** to read as follows: “Cable Installation and Rating.”

Add **24.9.5.4.1** to read as follows: “All ARCS vertical and horizontal risers, and all cabling from the dedicated radio console and from radio amplification units up to such risers, shall be installed to withstand fire conditions for at least a 2-hour period.

**Exception:** Where such risers are installed in 2-hour rated exit stairway, 2-hour rated elevator shafts or 2-hour rated inaccessible shafts that contain only non-combustible materials.”

Add **24.9.5.4.1.1** to read as follows: “All ARCS vertical and horizontal risers shall be plenum rated with a minimum temperature rating of 85°C (185°F).”

Add **24.9.5.4.2** to read as follows: “If horizontal non-riser ARCS cables are not installed in a 2-hour rated enclosure, antennas shall be installed on every floor as to allow RF (radio frequency) propagation to overlap from floors above or below, and design criteria that all antennae on any one floor would fail, and that the DAQ and RSSI meet the requirements of 24.9.3.1 and 24.9.3.2 within a building fully protected by an automatic sprinkler system.”

Add **24.9.6** to read as follows: “Supervisory Signals.”

Add **24.9.6.1** to read as follows: “Supervisory signals shall be provided in the form of visual indications (e.g., LED, alpha-numeric display) at the DRC with at minimum for the following system functions:

1. The integrity of the circuit monitoring signal booster(s) and power supply(ies) shall comply with 10.17.1.

2. Base Station Failure.
   (a) Low transmit power
   (b) Over temperature
   (c) High Voltage Standing Wave Ratios (VSWR)

3. Supervisory Signals.
   (a) Loss of alternating-current power source
   (b) Overall base-station failure
(c) Low battery capacity, alarming at 70 percent of battery capacity
(d) Antenna malfunction, where applicable
(e) Signal amplification failure, where applicable
(f) Tamper switch as required.”

Add 24.9.7 to read as follows: “Technical Criteria. The Fire Department shall maintain a document of technical information specific to its requirements. This document shall contain, at a minimum, the following:

(1) Frequencies required
(2) Maximum time domain interference
(3) Unit ID and emergency alert signaling
(4) DRC specifications
(5) Installation specifications
(6) Test equipment specifications
(7) Other supporting technical information necessary to direct system design.”

Add 24.9.8 to read as follows: “Inspection and Testing. Inspection and testing shall be performed in accordance with testing frequencies and methods set forth in the rules of the Fire Department.”

Chapter 25 Reserved

Chapter 26 Supervising Station Alarm Systems

26.3.9.2 Delete and replace with the following: “Testing and maintenance records shall be retained as required by the New York City Fire Code.”

26.3.10 Delete and replace with the following: “Testing and maintenance for central station service shall be performed in accordance with the New York City Fire Code and the Rules of the City of New York.”

26.4.1 Delete and replace with the following: “Application. Where permitted by the Fire Department, supervising facilities of proprietary alarm systems shall comply with the operating procedures of 26.4. The facilities, equipment, personnel, operation, testing, and maintenance of the proprietary supervising station shall also comply with 26.4.”

26.6.7 Delete and replace with the following: “Testing and maintenance of communication methods shall be in accordance with the requirements of the New York City Fire Code.”

26.6.3.3 Delete and replace with the following: “A single transmission path shall not be permitted.”
26.6.4.1.4 Delete and replace with the following: “Transmission Channels. A system employing a DACT may employ any two of the following transmission means:

   (1) A cellular telephone connection

   (2) A one-way radio system

   (3) A one-way private radio alarm system

   (4) A private microwave radio system

   (5) A two-way RF multiplex system

   (6) An IP connection

   (7) A telephone line

   (8) A transmission means complying with 26.6.3.1.

Exception: Where access to two technologies in the preceding list is not available at the protected premises, with the approval of the Fire Department, a telephone line (number) shall be permitted to be used as the second transmission means. Each DACT shall be programmed to call a second DACR line (number) when the signal transmission sequence to the first called line (number) is unsuccessful. The DACT shall be capable of selecting the operable means of transmission in the event of failure of the other means. Where two telephone lines (numbers) are used, it shall be permitted to test each telephone line (number) at alternating 6-hour intervals.”

Chapter 27 Public Emergency Alarm Reporting Systems No changes.

Chapter 28 Reserved

Chapter 29 Single- and Multiple-Station Alarms and Household Fire Alarm Systems

29.1.4 Delete and replace with the following: “The requirements of this chapter shall not apply to one- and two-family manufactured homes.”

29.5 Delete section, including all subsections, and replace with the following: “Smoke alarm detection and notification requirements shall be in accordance with Section 907 of the New York City Building Code.”

29.6.3, Item 2 Delete Item 2 of 29.6.3 and replace with the following: “(2) All electrical systems shall be installed by a New York City licensed electrical contractor.”

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the
Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A Explanatory Material No changes.

Annex C System Performance and Design Guide No changes.

Annex D Speech Intelligibility No changes.

Annex E Sample Ordinance Adopting NFPA 72 No changes.

Annex H Informational References No changes.

SECTION BC Q108
INSTALLATION OF SMOKE CONTROL SYSTEMS

Q108.1 General. Smoke control systems, where required by this code, shall be installed in accordance with NFPA 92, Standard for Smoke Control Systems, 2018 edition, modified for New York City as follows. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Chapter 1 Administration

1.1* Delete and replace with the following: “This standard shall apply to the design of smoke control systems.”

1.2.1 Delete and replace with the following: “The purpose of this standard shall be to establish requirements for smoke control systems using either the airflow design method or the exhaust method to accomplish one of more of the following:”

“(1) Inhibit smoke from entering stairwells, means of egress, smoke refuge areas, elevator shafts, or similar areas”

“(2) Maintain a tenable environment in smoke refuge areas and means of egress during the time required for evacuation”

“(3) Inhibit the migration of smoke from the smoke zone”

“(4) Provide conditions outside the smoke zone that enable emergency response personnel to conduct search and rescue operations and to locate and control the fire”
“(5) Contribute to the protection of life and to the reduction of property loss”

1.2.2 Delete the words “other codes and standards”.

1.2.3 Delete the words “other codes and standards”.

Add 1.2.4 to read as follows: “The requirements for pressurization systems are provided in the New York City Building Code.”

1.3 Delete entire sections, including subsections.

1.4 Delete entire sections, including subsections.

Chapter 2 Referenced Publications

2.1 Add at end the following: “Where a referenced publication has been modified for the City of New York by the New York City Building Code or the rules of the Department of Buildings, every reference to such publication shall be deemed to include all such modifications. Where the edition of a publication referenced within this standard differs from the edition provided for the same standard in Chapter 35 of the New York City Building Code, the edition provided for in Chapter 35 of the New York City Building Code shall govern.”

Chapter 3 Definitions

3.3.1 Delete definition of Atrium and replace with the following: “See the New York City Building Code.”

3.3.12 Delete definition of Smoke and replace with the following: “See the New York City Building Code.”

3.3.13* Delete definition of Smoke Barrier and replace with the following: “See the New York City Building Code definition of ‘Smoke Partition’. Where the term ‘Smoke Barrier’ is utilized throughout this referenced standard, it shall be amended to read ‘Smoke Partition.’”

3.3.15* Delete definition of Smoke Control Mode and replace with the following: “See the New York City Building Code.”

3.3.16* Delete definition of Smoke Damper and replace with the following: “See the New York City Building Code.”

3.3.22 Delete definition of Stack Effect and replace with the following: “See the New York City Building Code.”

3.3.24* Delete definition of Tenable Environment and replace with the following: “See the New York City Building Code.”

3.3.25 Delete definition of Smoke Control Zone and replace with the following: “See the New York City Building Code.”
Chapter 4 Design Fundamentals

4.1.1* Delete Item (1).

4.2.3 Delete entire sections, including subsections.

4.4.2 Delete entire sections, including subsections.

Table 4.4.2.1.1 Delete.

4.6 Delete entire sections, including subsections.

4.7 Delete.

4.8.1.2 Delete.

4.8.3 Delete entire sections, including subsections.

Chapter 5 Smoke Management Calculation Procedures No changes.

Chapter 6 Building Equipment and Controls Delete entire chapter including all sections and subsections.

Chapter 7 Smoke Control System Documentation

7.1 Delete the words “by the designer during the design process”.

7.3.1 Delete the words “(see Chapter 8)” from Item (2).

Chapter 8 Testing Delete entire chapter including all sections and subsections.

ANNEXES

The annexes are not a part of the requirements of this Referenced Standard but are included for informational purposes only. These annexes contain explanatory material, numbered to correspond with the applicable text paragraphs. In the event of any conflict between the Annexes and the body of the Referenced Standard, particularly where modifications have been made for New York City, the body of the Referenced Standard will govern.

Annex A Explanatory Material No changes.

Annex B Predicting the Rate of Heat Release of Fires No changes.

Annex C Computer-Based Models for Atria and Malls No changes.

Annex D Additional Design Objectives No changes.

Annex E Stratification of Smoke No changes.

Annex F Types of Stairwell Pressurization Systems No changes.
Annex G HVAC Air-Handling System Types No changes.

Annex H Fire Fighters’ Smoke Control Station (FSCS) Considerations Delete entire Annex including all sections and subsections.

Annex I Information on Testing for Leakage Between Smoke Zones No changes.

Annex J Advisory Information on Acceptance Testing No changes.

Annex K Example Problems Illustrating the Use of Equations No changes.

Annex L Comparison of Equations No changes.

Annex N Information References No changes.

§ 67. Figure 1A of section R103.3 of appendix R of the New York city building code is REPEALED and a new figure 1A is added to read as follows:
FIGURE 1A
HANGER CONNECTION DETAILS FOR CONSTRUCTION GROUPS I AND I
§ 68. Figure 1B of section R103.3 of appendix R of the New York city building code is REPEALED and a new figure 1B is added to read as follows:

**FIGURE 1B**

**HANGER CONNECTION DETAILS FOR CONSTRUCTION GROUPS I AND II**

§ 69. Section R103.4 of appendix R of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:
R103.4 ASTM C 636, Section 2.1.5. Delete Section 2.1.5 and replace as follows:

2.1.5 Each connection of a hanger to a structural member of the building shall be in accordance with [Sections] Section 2.1.5.1 or 2.1.5.2 as applicable.

§ 70. Section R103.8 of appendix R of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

R103.8 ASTM C 636, Section 2.2.4. Delete Section 2.2.4 and replace as follows:

2.2.4 Carrying channels shall be designed to support the suspended loads, and shall be a minimum 1½ inches deep (38 mm) cold-rolled steel channel weighing \[0.457 \times 0.440\] pounds per linear foot \((0.707 \times 0.681 \text{ kg/m})\) and shall be given an electro-galvanized, hot dipped galvanized cadmium coating, or zinc coating.

§ 71. Section R103.10 of appendix R of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

R103.10 ASTM C 636, Section 2.3.2. Delete Section 2.3.2 and replace as follows:

2.3.2 Main runners shall be supported from the carrying channels. Direct hung suspension systems where the main runners are supported directly to the existing structure shall not be permitted. Indirect hung or furring bar suspension systems designed and installed in accordance with this code and utilizing carrying channels shall be permitted.

§ 72. Section S101.1 of Appendix S of the New York city building code, as added by local law number 141 for the year 2013, is amended to read as follows:

S101.1 Scope. The figures of this appendix shall supplement the provisions of luminous egress path markings in Section [1024] 1025 and are intended for illustrative purposes. Where there is a conflict between the figures and the provisions in Section [1024] 1025, the provisions in Section [1024] 1025 shall govern.

§2. Chapter 1 of the New York city mechanical code, as amended by local law number 141 for the year 2013, item 5 of section 106.8 as amended by local law number 195 for the year 2018, is amended to read as follows:
CHAPTER 1
ADMINISTRATION

SECTION MC 101
GENERAL

101.1 Title. This code shall be known and may be cited as the “New York City Mechanical Code,” “NYC MC” or “MC.” All section numbers in this code shall be deemed to be preceded by the designation “MC.”

101.2 Scope. This code shall regulate the design, installation, maintenance, alteration and inspection of mechanical systems that are permanently installed and utilized to provide control of environmental conditions and related processes within buildings. This code shall also regulate those mechanical systems, system components, equipment and appliances specifically addressed herein. The installation of fuel gas distribution piping and equipment, fuel gas-fired appliances and fuel gas-fired appliance venting systems shall be regulated by the New York City Fuel Gas Code.

101.3 Intent. The purpose of this code is to provide minimum standards to safeguard life or limb, health, property, public welfare and the environment by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of mechanical systems.

101.4 Severability. If a section, subsection, sentence, clause or phrase of this code is, for any reason, held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this code.

SECTION MC 102
APPLICABILITY

102.1 General. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern. Where, in a specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern.

102.2 Existing installations. Except as otherwise provided for in this chapter or elsewhere in this code, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, a mechanical system lawfully in existence on the effective date of this code.

102.3 Maintenance. Mechanical systems, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe and sanitary condition. Devices or safeguards that are required by this code shall be maintained in compliance with the applicable provisions under which they were installed.

102.3.1 Owner responsibility. The owner shall be responsible for maintenance of mechanical systems. To determine compliance with this provision, the commissioner shall have the authority to require existing mechanical systems to be inspected.
**102.4 Additions, alterations or repairs.** Additions, alterations, renovations or repairs to a mechanical system shall conform to requirements for a new mechanical system without requiring the existing mechanical system to comply with all of the requirements of this code. Additions, alterations or repairs shall not cause an existing mechanical system to become unsafe, hazardous or overloaded.

**102.4.1 Minor additions, alterations, renovations and repairs.** Minor additions, alterations, renovations and repairs to existing mechanical systems shall meet the provisions for new construction, unless such work is done in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

**102.4.2 Special provisions for prior code buildings.** In addition to the requirements of Sections 102.4 and 102.4.1, the provisions of Sections 102.4.2.1 through 102.4.2.6 shall apply to prior code buildings.

**102.4.2.1 Fire and smoke dampers.** In cases where the building’s passive fire-resistance protection design, including rated construction, corridors and fire separations, complies with 1968 or prior codes, the determination as to whether a fire or smoke damper is required shall be permitted to be made pursuant to the *1968 Building Code*, or at the election of the applicant, the *New York City Mechanical Code*.

**102.4.2.2 Guards and access to roofs and elevated structures.** The provisions of Section [304.10] 304.11 relating to guards and Section 306.5 relating to permanent means of access shall not apply where the equipment or appliances replace existing equipment or appliances in the same location.

**102.4.2.3 Vibration isolators for cooling towers.** Where a replacement cooling tower is installed and physical limitations prohibit compliance with the vibration isolator requirements of Section [928.3.7] 313.3.7, such isolators may be omitted provided the devices shall comply with the *New York City Noise Control Code*.

**102.4.2.4 Noncombustible fill for cooling towers.** Where an existing exterior cooling tower with combustible fill within 15 feet (4572 mm) of the lot line is replaced, such replacement shall be permitted to have combustible fill, notwithstanding the provisions of Section 908.3.2.

**102.4.2.5 Seismic supports.** The determination as to whether seismic requirements apply to an alteration shall be made in accordance with the *1968 Building Code* and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements shall be permitted to be determined in accordance with Chapter 16 of the *New York City Building Code* or the *1968 Building Code* and Reference Standard RS 9-6 of such code.

**102.4.2.6 Wind resistance.** Equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with Chapter 16 of the *New York City Building Code*.

**102.5 Change in occupancy.** Refer to Chapter 1 of Title 28 of the *Administrative Code*. 
102.6 Reserved.

102.7 Reserved.

102.8 Referenced standards. The standards referenced herein shall be those that are listed in Chapter 15 and in the rules of the department and such standards shall be considered as part of the requirements of this code to the prescribed extent of each such reference. Where differences occur between provisions of this code and the referenced standards, the provisions of this code shall apply. Refer to Article 103 of Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to referenced standards.

102.8.1 Editions of referenced standards. References to standards in this code shall be to the editions of those standards provided for in Chapter 15 of this code, or as otherwise provided by rule.

102.9 Requirements not covered by this code. Requirements necessary for the strength, stability or proper operation of an existing or proposed mechanical system, or for the public safety, health and general welfare, not specifically covered by this code, shall be determined by the commissioner.

SECTION MC 103
DEPARTMENT OF BUILDINGS

103.1 General. Refer to the New York City Charter and Chapter 1 of Title 28 of the Administrative Code.

SECTION MC 104
DUTIES AND POWERS OF THE COMMISSIONER OF BUILDINGS

104.1 General. The commissioner shall have the authority to render interpretations of this code, adopt rules, and establish policies and procedures in order to clarify and implement its provisions. Such interpretations, policies, procedures, and rules shall be in compliance with the intent and purpose of this code. See the New York City Charter and Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to the authority of the Commissioner of Buildings.

SECTION MC 105
APPROVALS

105.1 Approvals. Refer to Chapter 1 of Title 28 of the Administrative Code.

SECTION MC 106
PERMITS

106.1 General. Permits shall comply with this section, with Article 105 of Chapter 1 of Title 28 of the Administrative Code, and with requirements found elsewhere in this code.

106.2 Required. Any owner or authorized agent who intends to construct, add to, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, install, add
to, alter, repair, remove, convert or replace any gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application for construction document approval in accordance with Chapter 1 of Title 28 of the Administrative Code and this chapter and obtain the required permit.

106.3 Work exempt from permit. Exemptions from permit requirements of this code as authorized in Chapter 1 of Title 28 of the Administrative Code and the rules of the department shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or rules.

106.4 Validity of permit. The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of any other law. Permits presuming to give authority to violate or cancel the provisions of this code or other law shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the commissioner from requiring the correction of errors in the construction documents and other data. The commissioner is also authorized to prevent occupancy or use of a structure where in violation of this code or of any other law.

106.5 Permits with respect to limited alteration applications. For permits with respect to limited alteration applications refer to Sections 28-101.5 and 28-104.6, Exception 1 of the Administrative Code.

SECTION MC 107
CONSTRUCTION DOCUMENTS

107.1 General. Construction documents shall comply with Article 104 of Chapter 1 of Title 28 of the Administrative Code and other applicable provisions of this code and its referenced standards. Such construction documents shall be coordinated with architectural, structural and means of egress plans.

107.2 Required documents. The applicant shall submit all of the documents specified in Sections 107.3 through 107.10 as appropriate to the nature and extent of the work proposed. Construction documents shall indicate the heating, ventilation, refrigeration, and other mechanical work to be performed, so drawn as to conform to the architectural and structural aspects of the building and to show in detail compliance with this code.

107.2.1 Composite plans. Composite plans showing compliance of architectural, structural, and mechanical parts of a building may be submitted provided that a clear understanding of each part is not impaired.

107.3 Lot diagram. The lot diagram shall be provided where applicable to the work proposed, including but not limited to the installation of exterior or rooftop equipment.

107.4 Building classification statement. Where applicable to the proposed work, the statement shall identify:

1. The occupancy group or groups that apply to parts of the building in accordance with Section 302 of the New York City Building Code;
2. The occupancy group of the main use or dominant occupancy of the building;

3. The construction class type of the building in accordance with Section 602 of the New York City Building Code;

4. The structural occupancy/risk category in accordance with Table 1604.5 of the New York City Building Code;

5. The height of the building as defined in Section [502.1] 202 of the New York City Building Code;

6. The applicable measurements to the highest and lowest level of [fire department] Fire Department access; [and]

7. Whether the building is inside or outside of the fire districts [ ]; and

8. Whether the building is inside or outside a flood hazard area as such term is defined in Chapter 2 of the New York City Building Code.

[106.5] 107.5 Fuel-burning and fuel-oil storage equipment plans. Construction documents for fuel-burning and fuel-oil storage equipment shall contain plans that include the following data and information:

1. Diagrams of all distribution piping, including vent and fill piping for oil systems, and all safety cut-off and relief devices and valves in piping; indications of the sizes of distribution piping to be used and the fire-resistive ratings of the shafts or spaces containing distribution piping where required to be fire rated.

2. Diagrammatic floor plans showing the size, location, material for all fuel oil and transfer distribution piping and related equipment.

3. Floor plans or partial floor plans showing the location, operating pressure, layout, size, and listing information for all fuel-burning equipment, tanks, vents, and chimneys. The plans shall also indicate the method or means of providing air to the equipment space, including duct and opening sizes or means of direct venting.

4. Plans indicating the location and type of any relevant smoke and heat detectors, alarm and fire extinguishing systems.

5. Seismic protection and restraint details for piping and equipment as required by Chapter 16 of the New York City Building Code.

6. Details indicating the location, size and materials for all breechings; the thickness and type of insulation materials; and the clearances from combustible walls, partitions, and ceiling; and the fire-resistive ratings of rooms and spaces containing the equipment.

7. Details describing the type, material, listing information, height, and termination distances to adjacent properties and structures for chimneys and vents.
8. Details showing structural supports for fuel-burning equipment where required.

9. A statement as to the kind or grade of fuel to be used.

10. Plans indicating the location, arrangement, size, load, and maximum capacity of the burning, storage and fuel-pumping equipment.

11. In areas of special flood hazard areas, construction documents shall comply with Appendix G of the New York City Building Code.

[106.6] **107.6 Heating systems.** Construction documents for heating systems shall include the temperature to be maintained in every room and the output capacity in BTU per hour of the central heating source.

[106.7] **107.7 Boilers.** Construction documents for boiler installations shall indicate the output capacity in BTU per hour, the operating weight of each boiler, the pressure setting of the relief valves, and such other data and information as required by this code.

[106.8] **107.8 Air-conditioning and ventilating systems.** Construction documents for air-conditioning and ventilating systems shall contain plans that include the following data and information:

1. The location and sizes of all ducts; the location of all fire and smoke dampers, motors, fans, and filters; the type, air capacity, and size of all equipment; and where not shown on accompanying structural plans, the operating weight and manner of support of equipment.

2. The locations of smoke detecting devices.

3. The location and size of the fresh air intake, the design population, and the required ventilation for each room or space.

4. The amount of air to be exhausted or supplied from each outlet for each room or space.

5. In the case of ventilating or exhaust systems for ranges, fryers, ovens, and other similar types of restaurant or bakery equipment, for which a hood is required, the plans shall also show the type of extinguishing system, the location of heat detection devices, nozzles, piping, gas controls, manual and automatic control valves, method of joining ducts, method and location of discharging exhaust from building, the location of break-glass controls, and the quantity in cfm designed for each hood.

6. The safety group classification of refrigerant utilized, if any.

7. The refrigerant concentration limit calculations and routing of all refrigerant piping for any air-conditioning system that contains more than 6.6 pounds (3.0 kg) of refrigerant. Refer to Chapter 11 for refrigerant piping requirements.

[106.9] **107.9 Refrigerating systems.** Construction documents for refrigerating systems shall contain plans that include the following data and information:
1. The location of all machinery; the horsepower of compressors; the type and number of pounds of refrigerant to be used; and the air quantities for, and means of, ventilating the machinery space.

2. The location of refrigerant detectors and emergency switches for compressors and for ventilation in the machinery rooms.

3. The location of pressure relief piping and any city water connections and water-saving devices.

4. The tonnage capacity of the machine and the suction and discharge pressures at which the machine is rated.

5. The operating weight of the equipment.

6. The safety group classification of refrigerant utilized.

7. The refrigerant concentration limit calculations and routing of all refrigerant piping for any refrigerating system that contains more than 6.6 pounds (3.0 kg) of refrigerant. Refer to Chapter 11 for refrigerant piping requirements.

[106.10] 107.10 Energy efficiency. Construction documents shall include compliance documentation as required by the New York City Energy Conservation Code.

107.11 Retention of construction and submittal documents. Refer to Section 28-104.12 of the Administrative Code.

SECTION MC [107] 108 INSPECTIONS AND TESTING

[107.4] 108.1 General. Except as otherwise specified, inspections required by this code or by the department during the progress of work may be performed on behalf of the owner by approved agencies or, if applicable, by special inspectors. However, in the interest of public safety, the commissioner may direct that any of such inspections be performed by the department. All inspections shall be performed at the sole cost and expense of the owner. Refer to Article 116 of Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to inspections.

[107.2] 108.2 Required inspections and testing. In addition to any inspections otherwise required by this code or applicable rules, the following inspections shall be required:

1. Progress inspections.

   1.1. Underground inspection and/or testing of installed piping, valves, fittings, support structures, anti-corrosion equipment and associated underground components shall be made after trenches or ditches are excavated and bedded, piping installed, and before backfill is put in place. When excavated soil contains rocks, broken concrete, frozen chunks and other rubble that would damage or break the piping or cause corrosive action, clean backfill shall be on the job site ready for use in backfilling.
**Exception:** Ground-source heat pump loop systems tested and backfilled in accordance with Section [1208.1.1] 1210 shall be permitted to be backfilled prior to inspection.

1.2. Rough-in inspection shall be made after the roof, framing, fireblocking and bracing are in place and all ducting and other components to be concealed are complete, and prior to the installation of wall or ceiling membranes.

1.3. Inspections required by the *New York City Energy Conservation Code* shall be made in accordance with the rules of the department, as applicable.

2. **Special inspections.** Special inspections shall be performed in accordance with this code and Chapter 17 of the *New York City Building Code*.

3. **Final inspection.** Refer to Article 116 of Chapter 1 of Title 28 of the *Administrative Code*.

4. **Issuance of certificate of compliance.** Upon satisfactory inspection of service equipment and the satisfaction of all the requirements for sign-off, the department shall issue a certificate of compliance as applicable for the following service equipment:

   4.1. Air-conditioning and ventilation systems,

   4.2. Fuel-burning and fuel-oil storage equipment, including generators,

   4.3. Refrigeration systems,

   4.4. Heating systems, and

   4.5. Boilers.

   The requirements of Section [107.2] 108.2 shall not be considered to prohibit the operation of any heating equipment or appliances installed to replace existing heating equipment or appliances serving an occupied portion of a structure provided that a request for inspection of such heating equipment or appliances has been filed with the department not more than 48 hours after such replacement work is completed, and all required inspections are performed before any portion of such equipment or appliances is concealed by any permanent portion of the structure.

   [107.2.1] 108.2.1 **Approved inspection agencies.** Refer to Articles 114 and 115 of Chapter 1 of Title 28 of the *Administrative Code*.

   [107.2.2] 108.2.2 **Inspection of prefabricated construction assemblies.** Prior to the approval of a prefabricated construction assembly having concealed mechanical work and the issuance of a permit, the department shall require the submittal of an evaluation report by an approved agency on each prefabricated construction assembly, indicating the complete details of the mechanical system, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information, and other data as necessary for the commissioner to determine conformance to this code.
108.2.2.1 Test and inspection records. Required test and inspection records shall be available to the commissioner at all times during the fabrication of the mechanical system and the erection of the building; or such records as the commissioner designates shall be filed.

108.2.3 Exposure of work. The work shall remain accessible and exposed for inspection purposes. Neither the commissioner nor the city shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.

108.3 Testing. Mechanical systems shall be tested as required in this code and in accordance with Sections 108.3.1 through 108.3.3. Tests shall be made by the permit holder and witnessed by the department or an approved agency.

108.3.1 New, altered, extended or repaired systems. New mechanical systems and parts of existing systems, that have been altered, extended, renovated or repaired, shall be tested as prescribed herein to disclose leaks and defects.

108.3.2 Apparatus, material and labor for tests. Apparatus, material and labor required for testing a mechanical system or part thereof shall be furnished by the permit holder.

108.3.3 Reinspection and testing. Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made to comply with this code. The work or installation shall then be resubmitted to the department for inspection and testing.

108.4 Sign-off of completed work. Refer to Article 116 of Chapter 1 of Title 28 of the Administrative Code.

108.5 Temporary connection. The commissioner shall have the authority to authorize the temporary connection of a mechanical system to the sources of energy for the purpose of testing mechanical systems or for use under a temporary certificate of occupancy.

SECTION MC 109 VIOLATIONS

109.1 General. Refer to Chapters 2 and 3 of Title 28 of the Administrative Code.

§ 3. Chapter 2 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 2
DEFINITIONS
SECTION MC 201 GENERAL

201.1 Scope. Unless otherwise expressly stated, the following words and terms shall, for the purposes of this code, have the meanings indicated in this chapter.
201.2 **Interchangeability.** Words used in the present tense include the future; words in the masculine gender include the feminine and neuter; the singular number includes the plural and the plural, the singular.

201.3 **Terms defined in other codes.** Where terms are not defined in this code and are defined in the *New York City Building Code*, the *New York City Electrical Code*, the *New York City Fire Code*, the *New York City Fuel Gas Code* [or], the *New York City Plumbing Code*, or the *New York City Energy Conservation Code*, such terms shall have meanings ascribed to them as in those codes.

201.3.1 **Terms defined in the general administrative provisions.** The following terms are defined in Section 28-101.5 of the *Administrative Code*:

**1968 BUILDING CODE.**

**1968 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS).**

**ACCEPTANCE OR ACCEPTED.**

**ADDITION.**

**ADMINISTRATIVE CODE.**

**ALTERATION.**

**APPROVAL OR APPROVED.**

**APPROVED AGENCY.**

**APPROVED FABRICATOR.**

**APPROVED INSPECTION AGENCY.**

**APPROVED TESTING AGENCY.**

**ARCHITECT.**

**BUILDING.**

**CHARTER.**

**CERTIFICATE OF COMPLIANCE.**

**CITY.**

**COMMISSIONER.**

**CONSTRUCTION DOCUMENTS.**

**DAY.**
DEFERRED SUBMITTAL.

DEMOLITION.

DEMOLITION, FULL.

DEMOLITION, PARTIAL.

DEPARTMENT.

ENGINEER.

ENLARGEMENT.

ENVIRONMENTAL CONTROL BOARD or ECB.

EXISTING BUILDING OR STRUCTURE.

FABRICATED ITEM.

FIRE PROTECTION PLAN.

HEREAFTER.

HERETOFORE.

INSPECTION CERTIFICATE.

INTERIM CERTIFICATE OF OCCUPANCY.

LABEL.

Labeled.

LAND SURVEYOR.

LANDSCAPE ARCHITECT.

LETTER OF COMPLETION.

LIMITED ALTERATION APPLICATION.

LIMITED PLUMBING ALTERATIONS.

LIMITED SPRINKLER ALTERATIONS.

LIMITED STANDPIPE ALTERATIONS.

LISTED.

MAIN USE OR DOMINANT OCCUPANCY (OF A BUILDING).
USE (USED).

UTILITY COMPANY OR PUBLIC UTILITY COMPANY.

UTILITY CORPORATION OR PUBLIC UTILITY CORPORATION.

WORK NOT CONSTITUTING MINOR ALTERATIONS OR ORDINARY REPAIRS.

WRITING (WRITTEN).

WRITTEN NOTICE.

ZONING RESOLUTION.

201.4 Terms not defined. Where terms are not defined through the methods authorized by this section, such terms shall have ordinarily accepted meanings such as the context implies.

SECTION MC 202
GENERAL DEFINITIONS

[1968 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS). See Section 28-101.5 of the Administrative Code.]

ABRASIVE MATERIALS. Moderately abrasive particulate in high concentrations, and highly abrasive particulate in moderate and high concentrations, such as alumina, bauxite, iron silicate, sand and slag.

ABSORPTION SYSTEM. A refrigerating system in which refrigerant is pressurized by pumping a chemical solution of refrigerant in absorbent, and then separated by the addition of heat in a generator, condensed (to reject heat), expanded, evaporated (to provide refrigeration), and reabsorbed in an absorber to repeat the cycle; the system may be single or multiple effect, the latter using multiple stages or internally cascaded use of heat to improve efficiency.

ACCESS (TO). That which enables a device, fixture, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door or similar obstruction (see also “Ready access (to)”).

AIR. All air supplied to mechanical equipment and appliances for combustion, ventilation, cooling [etc] and similar purposes. Standard air is air at standard temperature and pressure, namely, 70°F (21°C) and 29.92 inches of mercury (101.3 kPa).

AIR CONDITIONING. The treatment of air so as to control simultaneously the temperature, humidity, cleanliness and distribution of the air to meet the requirements of a conditioned space.

AIR-CONDITIONING SYSTEM. A system that consists of heat exchangers, blowers, filters, supply, exhaust and return ducts, and shall include any apparatus installed in connection therewith.
AIR DISPERSION SYSTEM. Any diffuser system designed to both convey air within a room, space or area and diffuse air into that space while operating under positive pressure. Systems are commonly constructed of, but not limited to, fabric or plastic film.

AIR DISTRIBUTION SYSTEM. Any system of ducts, plenums and air-handling equipment that circulates air within a space or spaces and includes systems made up of one or more air-handling units.

AIR, EXHAUST. Air being removed from any space, appliance or piece of equipment and conveyed directly to the atmosphere by means of openings or ducts.

AIR, INTAKE. Air supplied from the outdoors to any space, appliance or piece of equipment.

AIR-HANDLING UNIT. A blower or fan used for the purpose of distributing supply air to a room, space or area.

AIR, MAKEUP. [Air that is provided] Any combination of outdoor and transfer air intended to replace exhaust air [being exhausted] and exfiltration.

AIR, OUTDOOR. Ambient air that enters a building through a ventilation system, through intentional openings for natural ventilation, or by infiltration.

AIR, RELIEF. Air removed from any space, appliance or piece of equipment that serves to balance building pressurization due to introduction of outdoor air. Exhaust air shall not be considered relief air.

AIR, RETURN. Air removed from a conditioned space or location and recirculated or relieved to the outdoors.

AIR, TRANSFER. Air moved from one indoor space to another.

AIR TRANSFER OPENING. An opening designed to allow the movement of environmental air between two contiguous spaces.

[ALTERATION. Any construction, addition, change of use or occupancy, or renovation to a building or structure in existence. See Section 28-101.5 of the Administrative Code.]

APPLIANCE. A device or apparatus that is manufactured and designed to utilize energy and for which this code provides specific requirements.

APPLIANCE, EXISTING. Any appliance regulated by this code [which] that was legally installed prior to the effective date of this code, or for which a permit to install has been issued.

APPLIANCE, FUEL-FIRED. An appliance that burns solid, liquid and/or gaseous fuel, including but not limited to wood stoves, household cooking ranges, furnaces, boilers, water heaters, clothes dryers and gas-fired refrigerators.

APPLIANCE, GAS (EQUIPMENT). Any apparatus or equipment that uses gas as a fuel or raw material to produce light, heat, power, refrigeration or air conditioning.
APPLIANCE TYPE.

**High-heat appliance.** Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature greater than 2,000°F ([\(4093\) 1093.3°C]).

**Low-heat appliance (residential appliance).** Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of 1,000°F ([\(538\) 537.8°C]) or less.

**Medium-heat appliance.** Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of more than 1,000°F ([\(538\) 537.8°C]), but not greater than 2,000°F ([\(4093\) 1093.3°C]).

**APPLIANCE, VENTED.** An appliance designed and installed in such a manner that all of the products of combustion are conveyed directly from the appliance to the outdoor atmosphere through an approved chimney or vent system.

[**APPROVED.** In reference to construction documents, the determination by the department after full examination that submitted construction documents comply with this code and other applicable laws and rules. In reference to materials, the determination by the commissioner that material is acceptable for its intended use. See Section 28-101.5 of the Administrative Code.]

[**APPROVED AGENCY.** An established and recognized agency, or other qualified person, engaged in conducting tests or furnishing inspection services, when approved pursuant to department rules as qualified to perform or witness identified testing or inspection services. See Chapter 1 of Title 28 of the Administrative Code.]

[**APPROVED INSPECTION AGENCY.** An approved agency that is approved by the department as qualified to perform one or more of the inspections required by this code. See Chapter 1 of Title 28 of the Administrative Code.]

[**APPROVED TESTING AGENCY.** An approved agency that is approved by the department as qualified to test and evaluate the performance of one or more of the materials regulated in their use by this code. Such term shall include, when approved pursuant to department rules, a third party testing or certification agency, evaluation agency, testing laboratory, testing service, licensed concrete testing laboratory, or other entity concerned with product evaluation. See Chapter 1 of Title 28 of the Administrative Code.]

[**ARCHITECT.** A person licensed and registered to practice the profession of architecture under the Education Law of the State of New York.]

**AUTOMATIC BOILER.** Any class of boiler that is equipped with the controls and limit devices specified in Chapter 10.

**BATHROOM.** A room containing a bathtub, shower, spa or similar bathing fixture.

**BOILER, HIGH-PRESSURE.** An appliance (equipment) for supplying steam or hot water that, for a steam boiler, operates at a pressure of more than 15 psig ([\(103\) 103.4 kPa gauge], and for a
hot water boiler, operates at a pressure exceeding 160 psig (1103.2 kPa gauge) or at a temperature exceeding 250°F (121.1°C).

**BOILER, LOW-PRESSURE.** A self-contained appliance for supplying steam or hot water as follows:

**Hot water heating boiler.** A boiler in which no steam is generated, from which hot water is circulated for heating purposes and then returned to the boiler, and that operates at water pressures not exceeding 160 pounds per square inch gauge (psig) (1103.2 kPa gauge) and at water temperatures not exceeding 250°F (121.1°C) at or near the boiler outlet.

**Hot water supply boiler.** A boiler, completely filled with water, which furnishes hot water to be used externally to itself, and that operates at water pressures not exceeding 160 psig (1103.2 kPa gauge) and at water temperatures not exceeding 250°F (121.1°C) at or near the boiler outlet.

**Steam heating boiler.** A boiler in which steam is generated and that operates at a steam pressure not exceeding 15 psig (103.4 kPa gauge).

**BOILER ROOM.** A room primarily utilized for the installation of a boiler.

**BRAZED JOINT.** A gas-tight joint obtained by the joining of metal parts with metallic mixtures or alloys that melt at a temperature above 1,000°F (538°C), but lower than the melting temperature of the parts to be joined.

**BRAZING.** A metal-joining process wherein coalescence is produced by the use of a nonferrous filler metal having a melting point above 1,000°F (538°C), but lower than that of the base metal being joined. The filler material is distributed between the closely fitted surfaces of the joint by capillary attraction.

**BREATHING ZONE.** The region within an occupied space between planes 3 and 72 inches (76.2 and 1828.8 mm) above the floor and more than 2 feet (609.6 mm) from the walls of the space or from fixed air-conditioning equipment.

**BTU.** Abbreviation for British thermal unit, which is the quantity of heat required to raise the temperature of 1 pound (453.6 g) of water 1°F (0.56°C) (1 Btu = 1055 J).

**[BUILDING.** Any structure used or intended for supporting or sheltering any use or occupancy. The term shall be construed as if followed by the phrase “structure, premises, lot or part thereof” unless otherwise indicated by the text. See Section 28-101.5 of the Administrative Code.]

**CEILING RADIATION DAMPER.** A listed device installed in a ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly to limit automatically the radiative heat transfer through an air inlet/outlet opening. [-]
**CHIMNEY.** A primarily vertical structure containing one or more flues [for the purpose of carrying gaseous products of combustion and air] used to remove products of combustion from [a] fuel-burning appliance to the outdoor atmosphere appliances, refuse incineration, or industrial processes.

**Factory-built chimney.** A listed and labeled chimney composed of factory-made components, assembled in the field in accordance with the manufacturer’s instructions and the conditions of the listing.

**Masonry chimney.** A field-constructed chimney composed of solid masonry units, bricks, stones or concrete.

**Metal chimney.** A field-constructed chimney composed of metal.

**CHIMNEY CONNECTOR.** A pipe that connects a fuel-burning appliance to a chimney.

**CLEARANCE.** The minimum distance through air measured between the heat-producing surface of the mechanical appliance, device or equipment and the surface of the combustible material or assembly.

**CLOSED COMBUSTION [SOLID-FUEL-BURNING—APPLIANCE]** SOLID FUEL-BURNING APPLIANCE. A heat-producing appliance that employs a combustion chamber that [has no] does not have openings other than the flue collar, fuel charging door and adjustable openings provided to control the amount of combustion air that enters the combustion chamber.

**CLOTHES DRYER.** An appliance used to dry wet laundry by means of heat. [Dryer classifications are as follows:]

[Type 1. Factory built package, multiple production. Primarily used in family living environment. Usually the smallest unit physically and in function output.]

[Type 2. Factory built package, multiple production. Used in business with direct intercourse of the function with the public. Not designed for use in individual family living environment.]

**COMBINATION FIRE/SMOKE DAMPER.** A listed device installed in ducts and air transfer openings designed to close automatically upon the detection of heat and resist the passage of flame and smoke. The device is installed to operate automatically, be controlled by a smoke detection system, and where required, is capable of being positioned from a fire command center.

**COMBUSTIBLE ASSEMBLY.** Wall, floor, ceiling or other assembly constructed of one or more component materials that are not defined as noncombustible.

**COMBUSTIBLE [LIQUIDS] LIQUID.** [Any liquids having a closed cup flash point at or above 100°F (38°C), and that are divided into the following classifications] For the purposes of transportation, a combustible liquid as defined in the regulations of the United States Department of Transportation, as set forth in 49 CFR 173.120. For all other purposes, a liquid, other than a compressed gas or cryogenic fluid, having a closed cup flash point at or above 100°F (37.8°C) classified as follows:
Class II. Liquids having a closed cup flash point at or above 100°F (38.3°C) and below 140°F (60°C). 

Class IIIA. Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93.3°C).

Class IIIB. Liquids having a closed cup flash point at or above 200°F (93.3°C).

COMBUSTIBLE MATERIAL. Any material not defined as noncombustible.

COMBUSTION. In the context of this code, refers to the rapid oxidation of fuel accompanied by the production of heat or heat and light.

COMBUSTION AIR. Air necessary for complete combustion of a fuel, including theoretical air and excess air.

COMBUSTION CHAMBER. The portion of an appliance within which combustion occurs.

COMBUSTION PRODUCTS. Constituents resulting from the combustion of a fuel with the oxygen of the air, including the inert gases, but excluding excess air.

COMMERCIAL COOKING APPLIANCES. Appliances used in a commercial food service establishment for heating or cooking food and which produce grease vapors, steam, fumes, smoke or odors that are required to be removed through a local exhaust ventilation system. Such appliances include deep fat fryers; upright broilers; griddles; broilers; steam-jacketed kettles; hot-top ranges; under-fired broilers (charbroilers); ovens; barbeques; rotisseries; and similar appliances. For the purpose of this definition, a food service establishment shall include any building or a portion thereof used for the preparation and serving of food.

COMMERCIAL COOKING RECIRCULATING SYSTEM. Self-contained system consisting of the exhaust hood, the cooking equipment, the filters and the fire suppression system. The system is designed to capture cooking vapors and residues generated from commercial cooking equipment. The system removes contaminants from the exhaust air and recirculates the air to the space from which it was withdrawn.

COMMERCIAL KITCHEN EXHAUST HOODS.

Backshelf [Hood] hood. A backshelf hood is also referred to as a low-proximity hood, or as a sidewall hood where wall mounted. Its front lower lip is low over the appliance(s) and is “set back” from the front of the appliance(s). It is always closed to the rear of the appliances by a panel where free-standing, or by a panel or wall where wall mounted, and its height above the cooking surface varies. (This style of hood can be constructed with partial end panels to increase its effectiveness in capturing the effluent generated by the cooking operation).

Double island canopy hood. A double island canopy hood is placed over back to back appliances or appliance lines. It is open on all sides and overhangs both fronts and the sides of the appliance(s). It could have a wall panel between the backs of the appliances. (The fact that exhaust air is drawn from both sides of the double canopy to meet in the center causes each side of this hood to emulate a wall canopy hood, and thus it functions much the same with or without an actual wall panel between the backs of the appliances).
Eyebrow hood. An eyebrow hood is mounted directly to the face of an appliance, such as an oven and dishwasher, above the opening(s) or door(s) from which effluent is emitted, extending past the sides and overhanging the front of the opening to capture the effluent.

Pass-over hood. A pass-over hood is a free-standing form of a backshelf hood constructed low enough to pass food over the top.

Single island canopy hood. A single island canopy hood is placed over a single appliance or appliance line. It is open on all sides and overhangs the front, rear [], and sides of the appliance(s). A single island canopy is more susceptible to cross drafts and requires a greater exhaust air flow than an equivalent sized wall-mounted canopy to capture and contain effluent generated by the cooking operation(s).

Wall canopy hood. A wall canopy hood is mounted against a wall above a single appliance or line of appliance(s), or it could be free-standing with a back panel from the rear of the appliances to the hood. It overhangs the front and sides of the appliance(s) on all open sides. The wall acts as a back panel, forcing the makeup air to be drawn across the front of the cooking equipment, thus increasing the effectiveness of the hood to capture and contain effluent generated by the cooking operation(s).

[COMMISSIONER. The Commissioner of Buildings of the City of New York or his or her duly authorized representative. See Section 28–101.5 of the Administrative Code.]

COMPENSATING HOODS. Compensating hoods are those having integral (built-in) makeup air supply. The makeup air supply for such hoods is generally supplied from: short-circuit flow from inside the hood, air curtain flow from the bottom of the front face, and front face discharge from the outside front wall of the hood. The compensating makeup airflow can also be supplied from the rear or side of the hood, or the rear, front or sides of the cooking equipment. The makeup air flow can be one or a combination of methods.

COMPRESSOR. A specific machine, with or without accessories, for compressing a gas.

COMPRESSOR, POSITIVE DISPLACEMENT. A compressor in which increase in pressure is attained by changing the internal volume of the compression chamber.

COMPRESSOR UNIT. A compressor with its prime mover and accessories.

CONCEALED LOCATION. A location that cannot be accessed without damaging permanent parts of the building structure or finished surface. Spaces above, below or behind readily removable panels or doors shall not be considered as concealed.

CONDENSATE. The liquid that condenses from a gas (including flue gas) caused by a reduction in temperature or increase in pressure.

CONDENSER. A heat exchanger designed to liquefy refrigerant vapor by removal of heat.

CONDENSING UNIT. A specific refrigerating machine combination for a given refrigerant, consisting of one or more power-driven compressors, condensers and, where required, liquid receivers [when required] , and the regularly furnished accessories.
CONDITIONED SPACE. [An area, room or space being heated or cooled by any equipment or appliance] An area or room within a building that is within the thermal envelope of a building that is directly or indirectly heated or cooled using fossil fuel or electricity as the energy source. Spaces that are indirectly heated or cooled where they communicate through openings with conditioned spaces, where they are separated from conditioned spaces by uninsulated walls, floors or ceilings, or where they contain uninsulated ducts, piping or other sources of heating or cooling using fossil fuel or electricity.

CONFINED SPACES. A space having a volume less than 50 cubic feet per 1,000 British thermal units per hour (Btu/h) (4.8 m\(^3\)/kW) of the aggregate input rating of all appliances installed in that space.

CONSTRUCTION DOCUMENTS. Plans and specifications and other written, graphic and pictorial documents, prepared or assembled for describing the design, location, physical characteristics and other elements of the project necessary for obtaining a building permit. See Section 28-101.5 of the Administrative Code]

CONTROL. A manual or automatic device designed to regulate the gas, air, water or electrical supply to, or operation of, a mechanical system.

CONVERSION BURNER. A burner designed to supply gaseous fuel to an appliance originally designed to utilize another fuel.

COOKING APPLIANCE. See “Commercial cooking appliances.”

DAMPER. A manually or automatically controlled device to regulate draft or the rate of flow of air or combustion gases.

Volume damper. A device that [when installed] will restrict, retard or direct the flow of air in a duct, or the products of combustion in a heat-producing appliance, its vent connector, vent or chimney therefrom.

DECORATIVE SHROUD. A listed, partial, noncombustible enclosure for aesthetic purposes that is installed at the termination of a venting system that surrounds or conceals [the] a factory-built chimney system or vent cap.

DESIGN FLOOD ELEVATION. Refer to Section G201.2 of Appendix G of the New York City Building Code.

DESIGN WORKING PRESSURE. The maximum allowable working pressure for which a specific part of a system is designed.

DIRECT REFRIGERATION SYSTEM. A system in which the evaporator or condenser of the refrigerating system is in direct contact with the air or other substances to be cooled or heated.

DIRECT-VENT APPLIANCES. Appliances that are constructed and installed so that all air for combustion is derived directly from the outdoor atmosphere and all flue gases are discharged directly to the outdoor atmosphere.
DISCRETE PRODUCT. Products that are non-continuous, individual, distinct pieces such as, but not limited to, electrical, plumbing and mechanical products and duct straps, duct fittings, duct registers and pipe hangers.

DRAFT. The pressure difference existing between the appliance or any component part and the atmosphere, that causes a continuous flow of air and products of combustion through the gas passages of the appliance to the atmosphere.

- **Induced draft.** The pressure difference created by the action of a fan, blower or ejector, that is located between the appliance and the chimney or vent termination.

- **Natural draft.** The pressure difference created by a vent or chimney because of its height, and the temperature difference between the flue gases and the atmosphere.

DRIP. The container placed at a low point in a system of piping to collect condensate and from which the condensate is removable.

DRY CLEANING SYSTEMS. Dry cleaning plants or systems are classified as follows:

- **Type I.** Those systems using Class I flammable liquid solvents having a flash point below 100°F ([38]37.8°C).

- **Type II.** Those systems using Class II combustible liquid solvents having a flash point at or above 100°F ([38] 37.8°C ) and below 140°F (60°C).

- **Type III.** Those systems using Class III combustible liquid solvents having a flash point at or above 140°F (60°C).

- **Types IV and V.** Those systems using Class IV nonflammable liquid solvents.

DUCT. A tube or conduit utilized for conveying air. The air passages of self-contained systems are not to be construed as air ducts.

DUCT FURNACE. A warm-air furnace or heater normally installed in an air distribution duct to supply warm air for heating. This definition shall apply only to a warm-air heating appliance that, for air circulation, depends on a blower not furnished as part of the furnace.

DUCT SYSTEM. A continuous passageway for the transmission of air that, in addition to ducts, includes duct fittings, dampers, plenums, fans and accessory air-handling equipment and appliances.

DUCTLESS MINI-SPLIT SYSTEM. A heating and cooling system that is comprised of one or multiple indoor evaporator/air-handling units and an outdoor condensing unit that is connected by refrigerant piping and electrical wiring. A ductless mini-split system is capable of cooling or heating one or more rooms without the use of a traditional ductwork system.

DWELLING. A building or structure [which] that is occupied in whole or in part as the home, residence or sleeping place of one or more families.
**DWELLING UNIT.** A single unit consisting of one or more habitable rooms and occupied or arranged to be occupied as a unit separate from all other units within a dwelling.

**ELECTRIC HEATING APPLIANCE.** An appliance that produces heat energy to create a warm environment by the application of electric power to resistance elements, refrigerant compressors or dissimilar material junctions.

**ENERGY RECOVERY VENTILATION SYSTEM.** Systems that employ air-to-air heat exchangers to recover energy from or reject energy to exhaust air for the purpose of preheating, precooling, humidifying or dehumidifying outdoor ventilation air prior to supplying such air to a space, either directly or as part of an HVAC system.

**ENGINEER.** A person licensed and registered to practice the profession of engineering under the Education Law of the State of New York.

**ENGINEERED SMOKE CONTROL SYSTEM.** Refer to Smoke Control System in Section 909 of the New York City Building Code.

**ENVIRONMENTAL AIR.** Air that is supplied, returned, recirculated, or exhausted from a space for the purpose of modifying the existing atmosphere within a building conveyed to or from occupied areas through ducts that are not part of the heating or air-conditioning system, such as ventilation for human usage, domestic kitchen range exhaust, bathroom exhaust, and domestic clothes dryer exhaust.

**EQUIPMENT.** All piping, ducts, vents, control devices and other components of systems other than appliances that are permanently installed and integrated to provide control of environmental conditions for buildings. This definition shall also include other systems specifically regulated in this code.

**EQUIPMENT, EXISTING.** Any equipment regulated by this code that was legally installed prior to the effective date of this code, or for which a permit to install has been issued.

**EVAPORATIVE COOLER.** A device used for reducing the sensible heat of air for cooling by the process of evaporation of water into an airstream.

**EVAPORATIVE COOLING SYSTEM.** The equipment and appliances intended or installed for the purpose of environmental cooling by an evaporative cooler from which the conditioned air is distributed through ducts or plenums to the conditioned area.

**EVAPORATOR.** That part of the system in which liquid refrigerant is vaporized to produce refrigeration.

**EXCESS AIR.** The amount of air provided in addition to theoretical air to achieve complete combustion of a fuel, thereby preventing the formation of dangerous products of combustion.

**EXFILTRATION.** Uncontrolled outward air leakage from conditioned spaces through unintentional openings in ceilings, floors and walls to unconditioned spaces or the outdoors caused by pressure differences across these openings resulting from wind, the stack effect created by temperature
differences between indoors and outdoors, and imbalances between supply, return and exhaust airflow rates.

**EXHAUST SYSTEM.** An assembly of connected ducts, plenums, fittings, registers, grilles and hoods through which air is conducted from a space or spaces and exhausted to the outdoor atmosphere.

**EXTRA-HEAVY-DUTY COOKING APPLIANCE.** Extra-heavy-duty cooking appliances [include appliances utilizing] are those utilizing open flame combustion of solid fuel such as wood, charcoal, briquettes, and mesquite to provide all or part of the heat source for cooking at any time.

**FIELD ERECTED BOILER.** A boiler where the pressure vessel is constructed partially or totally in the field. Field erected boilers do not include cast iron sectional boilers [which] that are considered factory built since each section is a separate pressure vessel.

**FIRE DAMPER.** A listed device installed in ducts and air transfer openings designed to close automatically upon detection of heat and to restrict the passage of flame. Fire dampers are classified for use in either static systems that will automatically shut down in the event of a fire, or in dynamic systems that continue to operate during a fire. A dynamic fire damper is tested and rated for closure under elevated temperature airflow.

**FIREPLACE.** An assembly consisting of a hearth and fire chamber of noncombustible material and provided with a chimney, for use with solid fuels. A fireplace shall be considered an appliance.

  - **Factory-built fireplace.** A listed and labeled fireplace and chimney system composed of factory-made components, and assembled in the field in accordance with manufacturer’s instructions and the conditions of the listing.
  - **Masonry fireplace.** [A field-constructed fireplace composed of solid masonry units, bricks, stones or concrete.] A hearth and fire chamber of solid masonry units such as bricks, stones, listed masonry units or reinforced concrete, provided with a suitable chimney.

**FIREPLACE STOVE.** A free-standing chimney-connected solid-fuel-burning heater, designed to be operated with the fire chamber doors in either the open or closed position.

**FLAME SAFEGUARD.** A device that will automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative, and when flame failure occurs on theburner or group of burners.

**FLAME SPREAD INDEX.** [The numerical value assigned to] A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E 84 or UL 723.

**FLAMMABILITY CLASSIFICATION.** Refrigerants shall be assigned to one of the three classes—1, 2 or 3—in accordance with ASHRAE 34.

**FLAMMABLE LIQUIDS.** Any liquid that has a closed cup flash point below 100°F ([38] 37.8°C), and has a vapor pressure not exceeding 40 [psia] psi ([276] 275.8 kPa) at 100°F ([38] 37.8°C).
Flammable liquids shall be known as Class I liquids and shall be divided into the following classifications:

**Class IA.** Liquids having a closed cup flash point below 73°F ([23] 22.8°C) and a boiling point below 100°F ([38] 37.8°C).

**Class IB.** Liquids having a closed cup flash point below 73°F ([23] 22.8°C) and a boiling point at or above 100°F ([38] 37.8°C).

**Class IC.** Liquids having a closed cup flash point at or above 73°F ([23] 22.8°C) and below 100°F ([38] 37.8°C).

**FLAMMABLE VAPOR OR FUMES.** Mixtures of gases in air at concentrations equal to or greater than the LFL and less than or equal to the upper flammability limit (UFL).

**FLASH POINT.** The minimum temperature at which the application of a test flame causes the vapors of a portion of the sample to ignite under the conditions specified by the test procedures and apparatus. The flash point of a liquid shall be determined in accordance with ASTM D 56, ASTM D 93 or ASTM D 3278.

**FLEXIBLE AIR CONNECTOR.** A conduit for transferring air between an air duct or plenum and an air terminal unit or between an air duct or plenum and an air inlet or air outlet. Such conduit is limited in its use, length and location.

**FLOOR AREA, NET.** The actual occupied area, not including unoccupied accessory areas or thicknesses of walls.

**FLOOR FURNACE.** A completely self-contained furnace suspended from the floor of the space being heated, taking air for combustion from outside such space and with means for observing flames and lighting the appliance from such space.

- **Fan type.** A floor furnace equipped with a fan that provides the primary means for circulating air.
- **Gravity type.** A floor furnace depending primarily on circulation of air by gravity. This classification shall also include floor furnaces equipped with booster-type fans that do not materially restrict free circulation of air by gravity flow when such fans are not in operation.

**FLUE.** A passageway within a chimney or vent through which gaseous combustion products pass.

**FLUE CONNECTION (BREECHING).** A passage for conducting the products of combustion from a fuel-fired appliance to the vent or chimney (see also “Chimney connector” and “Vent connector”).

**FLUE GASES.** Products of combustion [and] plus excess air in fireplace and appliance flues, or heat exchangers.

**FLUE LINER (LINING).** A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and conveying combustion products without leakage to the atmosphere.
FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or a mixture of these gases.

FUEL OIL. Kerosene or any hydrocarbon oil having a flash point not less than 100°F ([38] 37.8°C).

FUEL-OIL PIPING SYSTEM. A closed piping system that connects a combustible liquid from a source of supply to a fuel-oil-burning appliance.

FURNACE. A completely self-contained heating unit that is designed to supply heated air to spaces remote from or adjacent to the appliance location.

FURNACE ROOM. A room primarily utilized for the installation of fuel-burning, space-heating and water-heating appliances other than boilers (see also “Boiler room”).

FUSIBLE PLUG. A device arranged to relieve pressure by operation of a fusible member at a predetermined temperature.

GROUND SOURCE HEAT PUMP LOOP SYSTEM. Piping buried in horizontal or vertical excavations or placed in a body of water for the purpose of transporting heat transfer liquid to and from a heat pump. Included in this definition are closed loop systems in which the liquid is recirculated and open loop systems in which the liquid is drawn from a well or other source.

HAZARDOUS LOCATION. Any location considered to be a fire hazard for flammable vapors, dust, combustible fibers or other highly combustible substances. The location is not necessarily categorized in the New York City Building Code as a high-hazard use group classification.

HEAT EXCHANGER. A device that transfers heat from one medium to another.

HEAT PUMP. A refrigeration system that extracts heat from one substance and transfers it to another portion of the same substance or to a second substance at a higher temperature for a beneficial purpose.

HEAT TRANSFER LIQUID. The operating or thermal storage liquid in a mechanical system, including water or other liquid base, and additives at the concentration present under operating conditions used to move heat from one location to another. Refrigerants are not included as heat transfer liquids.

HEAVY-DUTY COOKING APPLIANCE. Heavy-duty cooking appliances include electric under-fired broilers, electric chain (conveyor) broilers, gas under-fired broilers, gas chain (conveyor) broilers, gas open-burner ranges (with or without oven), electric and gas wok ranges, smokers, smoker ovens, and electric and gas over-fired (upright) broilers and salamanders.

HIGH-PROBABILITY SYSTEMS. A refrigeration system in which the basic design or the location of components is such that a leakage of refrigerant from a failed connection, seal or component will enter an occupancy classified area, other than the machinery room.

HIGH-SIDE PRESSURE. The parts of a refrigerating system subject to condenser pressure.

HOOD. An air-intake device used to capture by entrapment, impingement, adhesion or similar means, grease, moisture, heat and similar contaminants before they enter a duct system.
**Type I.** A kitchen hood for collecting and removing grease vapors and smoke. Such hoods are equipped with a fire suppression system.

**Type II.** A general kitchen hood for collecting and removing steam, vapor, heat, odors and products of combustion.

**HOOD, FUME.** A hood used for hazardous exhaust systems.

**HYDROGEN GENERATING APPLIANCE.** A self-contained package or factory-matched packages of integrated systems for generating gaseous hydrogen. Hydrogen generating appliances utilize electrolysis, reformation, chemical, or other processes to generate hydrogen.

**IGNITION SOURCE.** A flame, spark or hot surface capable of igniting flammable vapors or fumes. Such sources include appliance burners, burner ignitors and electrical switching devices.

**IMMEDIATELY DANGEROUS TO LIFE OR HEALTH (IDLH).** The concentration of airborne contaminants that poses a threat of death, immediate or delayed permanent adverse health effects, or effects that could prevent escape from such an environment. This contaminant concentration level is established by the National Institute of Occupational Safety and Health (NIOSH) based on both toxicity and flammability. It is generally expressed in parts per million by volume (ppm v/v) or milligrams per cubic meter (mg/m$^3$).

**INDIRECT REFRIGERATION SYSTEM.** A system in which a secondary coolant cooled or heated by the refrigerating system is circulated to the air or other substance to be cooled or heated. Indirect systems are distinguished by the following methods of application:

- **Closed system.** A system in which a secondary fluid is either cooled or heated by the refrigerating system and then circulated within a closed circuit in indirect contact with the air or other substance to be cooled or heated.

- **Double-indirect open-spray system.** A system in which the secondary substance for an indirect open-spray system is heated or cooled by an intermediate coolant circulated from a second enclosure.

- **Open-spray system.** A system in which a secondary coolant is cooled or heated by the refrigerating system and then circulated in direct contact with the air or other substance to be cooled or heated.

- **Vented closed system.** A system in which a secondary coolant is cooled or heated by the refrigerating system and then passed through a closed circuit in the air or other substance to be cooled or heated, except that the evaporator or condenser is placed in an open or appropriately vented tank.

**INTEGRAL VENT APPLIANCES.** Appliances designed for outdoor installation that have built-in natural or mechanical venting means and are constructed and installed so that all air for combustion is derived from the outdoor atmosphere and all flue gases are discharged to the outdoor atmosphere through an integral vent termination.
INFILTRATION. Uncontrolled inward air leakage to conditioned spaces through unintentional openings in ceilings, floors and walls from unconditioned spaces or the outdoors caused by pressure differences across these openings resulting from wind, the stack effect created by temperature differences between indoors and outdoors, and imbalances between supply, return and exhaust airflow rates.

INTERLOCK. A device actuated by another device with which it is directly associated, to govern succeeding operations of the same or allied devices. A circuit in which a given action cannot occur until after one or more other actions have taken place.

JOINT, FLANGED. A joint made by bolting together a pair of flanged ends.

JOINT, FLARED. A metal-to-metal compression joint in which a conical spread is made on the end of a tube that is compressed by a flare nut against a mating flare.

JOINT, MECHANICAL. [A general form of gas-tight joints obtained by the joining of metal parts through a positive holding mechanical construction, such as flanged joint, screwed joint or flared joint.] A connection between pipes, fittings, or pipes and fittings, which is neither screwed, caulked, threaded, soldered, solvent cemented, brazed nor welded. Also, a joint in which compression is applied along the centerline of the pieces being joined. Some joints are part of a coupling, fitting or adapter. These joints include both the press-type and push-fit joining systems.

JOINT, PLASTIC ADHESIVE. A joint made in thermoset plastic piping by the use of an adhesive substance [which] that forms a continuous bond between the mating surfaces without dissolving either one of them.

JOINT, PLASTIC HEAT FUSION. A joint made in thermoplastic piping by heating the parts sufficiently to permit fusion of the materials when the parts are pressed together.

JOINT, PLASTIC SOLVENT CEMENT. A joint made in thermoplastic piping by the use of a solvent or solvent cement [which] that forms a continuous bond between the mating surfaces.

JOINT, SOLDERED. A gas-tight joint obtained by the joining of metal parts with metallic mixtures of alloys [which] that melt at temperatures between 400°F ([204] 204.4°C) and 1,000°F ([538] 537.8°C).

JOINT, WELDED. A gas-tight joint obtained by the joining of metal parts in molten state.

[Label. Identification applied to material by the manufacturer or an approved agency that contains the name of the manufacturer, the function and performance characteristics of the material, and the name and identification of the approved agency that conducted the evaluation of a representative sample of such material.]

[Labeled. Material or product to which has been attached a label, symbol or other identifying mark of the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an approved agency and that indicates that a representative sample of the material has been tested and evaluated by an]
approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner. See Section 28-101.5 of the Administrative Code.

**LIGHT-DUTY COOKING APPLIANCE.** Light-duty cooking appliances include gas and electric ovens (including standard, bake, roasting, revolving, retherm, convection, combination convection/steamer, countertop conveyerized baking/finishing, deck and pastry), electric and gas steam-jacketed kettles, electric and gas pasta cookers, electric and gas compartment steamers (both pressure and atmospheric) and electric and gas cheesemelters.

**LIMIT CONTROL.** A device responsive to changes in pressure, temperature or level for turning on, shutting off or throttling the gas supply to an appliance.

**LIMITED CHARGE SYSTEM.** A system in which, with the compressor idle, the design pressure will not be exceeded when the refrigerant charge has completely evaporated.

**LIMITED COMBUSTIBLE MATERIAL.** A building construction material not complying with the definition of noncombustible material, which, in the form in which it is used, has a potential heat value not exceeding 3,500 Btu/lb (8141 kj/kg) and complies with the following: Materials, in the form and thickness used, having neither a flame spread index/rating greater than 25 nor evidence of continued combustion, and of such composition that surfaces that would be exposed by cutting through the material on any place would have neither a flame spread index/rating greater than 25 nor evidence of continued progressive combustion. Materials subject to increase in combustibility or flame spread index/rating beyond the limits herein established through the effects of age, moisture, or other atmospheric condition shall be considered combustible.

[Listed. Material identified in a list published by an approved agency that maintains periodic inspection of production of listed material or periodic evaluation services and whose listing states either that the material meets identified nationally recognized standards or has been tested and found suitable for a specified purpose when installed in accordance with the manufacturer’s installation instructions. See Section 28-101.5 of the Administrative Code.]

**LIVING SPACE.** Space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes.

**LOWER EXPLOSIVE LIMIT (LEL).** See “LFL.”

**LOWER FLAMMABLE LIMIT (REFRIGERANT) (LFL).** The minimum concentration of refrigerant that is capable of propagating a flame through a homogeneous mixture of refrigerant and air.

**LOWER FLAMMABLE LIMIT (LFL).** The minimum concentration of vapor in air at which propagation of flame will occur in the presence of an ignition source. The LFL is sometimes referred to as LEL or lower explosive limit.

[LOW-PRESSURE HOT-WATER HEATING BOILER. A boiler furnishing hot water at pressures not exceeding 160 psig (1103 kPa) and at temperatures not exceeding 250°F (121°C).]
LOW-PRESSURE STEAM HEATING BOILER. A boiler furnishing steam at pressures not exceeding 15 psig (103 kPa).

LOW-PROBABILITY SYSTEMS. A refrigeration system in which the basic design or the location of components is such that a leakage of refrigerant from a failed connection, seal or component will not enter an occupancy-classified area, other than the machinery room.

LOW-SIDE PRESSURE. The parts of a refrigerating system subject to evaporator pressure.

MACHINERY ROOM. A room meeting prescribed safety requirements and in which refrigeration systems or components thereof are located (see Sections 1105 and 1106 of this code, and Section [1015.4] 1006.2.2.2 of the New York City Building Code).

MECHANICAL DRAFT SYSTEM. A venting system designed to remove flue or vent gases by mechanical means that consists of an induced-draft portion under nonpositive static pressure or a forced-draft portion under positive static pressure.

Forced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static pressure.

Induced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under nonpositive static vent pressure.

Power venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static vent pressure.

MECHANICAL EQUIPMENT/APPLIANCE ROOM. A room or space in which nonfuel-fired mechanical equipment and appliances are located.

MECHANICAL EXHAUST SYSTEM. A system for removing air from a room or space by mechanical means.

MECHANICAL JOINT. A connection between pipes, fittings, or pipes and fittings, which is neither screwed, caulked, threaded, soldered, solvent cemented, brazed nor welded. Also, a joint in which compression is applied along the centerline of the pieces being joined. Some joints are part of a coupling, fitting or adapter. These joints include both the press-type and push-fit joining systems.

MECHANICAL SYSTEM. A system specifically addressed and regulated in this code and composed of components, devices, appliances and equipment that become part of the building.

MEDIUM-DUTY COOKING APPLIANCE. Medium-duty cooking appliances include electric discrete element ranges (with or without oven), electric and gas hot-top ranges, electric and gas griddles, electric and gas double-sided griddles, electric and gas fryers (including open deep fat fryers, donut fryers, kettle fryers and pressure fryers), electric and gas conveyor pizza ovens, electric and gas tilting skillets (braising pans) and electric and gas rotisseries.

MODULAR BOILER. A steam or hot-water-heating assembly consisting of a group of individual boilers called modules intended to be installed as a unit without intervening stop valves.
Modules are under one jacket or are individually jacketed. The individual modules shall be limited to a maximum input rating of 400,000 Btu/h (117 228 W) gas, 3 gallons per hour (gph) (11.4 L/h) oil, or 115 kW (electric).

**NATURAL DRAFT SYSTEM.** A venting system designed to remove flue or vent gases under nonpositive static vent pressure entirely by natural draft.

**NATURAL VENTILATION.** The movement of air into and out of a space through intentionally provided openings, such as windows and doors, or through nonpowered ventilators.

**NET OCCUPIABLE FLOOR AREA.** The floor area of an occupiable space defined by the inside surfaces of its walls but excluding shafts, column enclosures and other permanently enclosed, inaccessible and unoccupiable areas. Obstructions in the space such as furnishings, display or storage racks and other obstructions, whether temporary or permanent, shall not be deducted from the space area.

**NONABRASIVE/ABRASIVE MATERIALS.** Nonabrasive particulate in high concentrations, moderately abrasive particulate in low and moderate concentrations, and highly abrasive particulate in low concentrations, such as alfalfa, asphalt, plaster, gypsum and salt.

**NONCOMBUSTIBLE MATERIALS.** Materials that, when tested in accordance with ASTM E 136, have at least three of four specimens tested meeting all of the following criteria:

1. The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54°F ([30]12.2°C) above the furnace temperature at the beginning of the test.
2. There shall not be flaming from the specimen after the first 30 seconds.
3. If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.

**OCCUPANCY.** The purpose or activity for which a building or space is used or is designed, arranged or intended to be used.

**OCCUPATIONAL EXPOSURE LIMIT (OEL).** The time-weighted average (TWA) concentration for a normal eight-hour workday and a 40-hour workweek to which nearly all workers can be repeatedly exposed without adverse effect, based on the OSHA PEL, ACGIH TLV-TWA, AIHA WEEL, or consistent value.

**OCCUPIABLE SPACE.** An enclosed space intended for human activities, excluding those spaces intended primarily for other purposes, such as storage rooms and equipment rooms, that are only intended to be occupied occasionally and for short periods of time.

**OFFSET (VENT).** A combination of approved bends that make two changes in direction bringing one section of the vent out of line but into a line parallel with the other section.
OUTDOOR AIR. Air taken from the outdoors, and therefore not previously circulated through the system.

OUTDOOR OPENING. A door, window, louver or skylight openable to the outdoor atmosphere.

OUTLET, GAS. A threaded connection or bolted flange in a piping system to which a gas-burning appliance is attached.

PANEL HEATING. A method of radiant space heating in which heat is supplied by large heated areas of room surfaces. The heating element usually consists of warm water piping, warm air ducts, or electrical resistance elements embedded in or located behind ceiling, wall or floor surfaces.

PELLET FUEL-BURNING APPLIANCE. A closed-combustion, vented appliance equipped with a fuel-feed mechanism for burning processed pellets of solid fuel of a specified size and composition.

PIPING. Where used in this code, “piping” refers to either pipe or tubing, or both.

   Pipe. A rigid conduit of iron, steel, copper, brass or plastic.

   Tubing. Semirigid conduit of copper, aluminum, plastic or steel.

PLASTIC, THERMOPLASTIC. A plastic that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.

PLASTIC, THERMOSETTING. A plastic that is capable of being changed into a substantially infusible or insoluble product when cured under application of heat or chemical means.

PLENUM. A compartment or chamber located in one story only to which one or more air ducts are connected and [which] that forms part of the air supply or return system and may be part of the building construction, such as the concealed space above a ceiling.

PORTABLE FUEL CELL APPLIANCE. A fuel cell generator of electricity, which is not fixed in place. A portable fuel cell appliance utilizes a cord and plug connection to a grid-isolated load and has an integral fuel supply.

POWER BOILER. See “Boiler.”

PREMISES. Land, improvements thereon, or any part thereof.

PRESSURE, FIELD TEST. A test performed in the field to prove system tightness.

PRESSURE-LIMITING DEVICE. A pressure-responsive mechanism designed to stop automatically the operation of the pressure-imposing element at a predetermined pressure.

PRESSURE RELIEF DEVICE. A pressure-actuated valve or rupture member designed to relieve excessive pressure automatically.

PRESSURE RELIEF VALVE. A pressure-actuated valve held closed by a spring or other means and designed to relieve pressure automatically in excess of the device’s setting.
PRESSURE VESSELS. Closed containers, tanks or vessels that are designed to contain liquids or gases, or both, under pressure.

PRESSURE VESSELS—REFRIGERANT. Any refrigerant-containing receptacle in a refrigerating system. This does not include evaporators where each separate section does not exceed 0.5 cubic foot (0.014 m$^3$) of refrigerant-containing volume, regardless of the maximum inside dimensions, evaporator coils, controls, headers, pumps and piping.

PROTECTIVE ASSEMBLY (REDUCED CLEARANCE). Any noncombustible assembly that is labeled or constructed in accordance with Table 308.6 and is placed between combustible materials or assemblies and mechanical appliances, devices or equipment, for the purpose of reducing required airspace clearances. Protective assemblies attached directly to a combustible assembly shall not be considered as part of that combustible assembly.

PURGE. To clear of air, water or other foreign substances.

PUSH-FIT JOINTS. A type of mechanical joint consisting of elastomeric seals and corrosion-resistant tube grippers. [Such joints are permanent or removable depending on the design.] The joint is made by pushing the pipe into the joint and allowing the grippers to secure the connection.

QUICK-OPENING VALVE. A valve that opens completely by fast action, either manually or automatically controlled. A valve requiring one-quarter round turn or less is considered to be quick opening.

RADIANT HEATER. A heater designed to transfer heat primarily by direct radiation.

READY ACCESS (TO). That which enables a device, fixture, appliance or equipment to be directly reached, without requiring the removal or movement of any panel, door or similar obstruction (see “Access (to)”).

RECEIVER, LIQUID. A vessel permanently connected to a refrigeration system by inlet and outlet pipes for storage of liquid refrigerant.

RECIRCULATED AIR. Air removed from a conditioned space and intended for reuse as supply air.

RECLAIMED REFRIGERANTS. Refrigerants reprocessed to the same specifications as for new refrigerants by means including distillation. Such refrigerants have been chemically analyzed to verify that the specifications have been met. Reclaiming usually implies the use of processes or procedures that are available only at a reprocessing or manufacturing facility.

RECOVERED REFRIGERANTS. Refrigerants removed from a system in any condition without necessarily testing or processing them.

RECYCLED REFRIGERANTS. Refrigerants from which contaminants have been reduced by oil separation, removal of noncondensable gases, and single or multiple passes through devices that reduce moisture, acidity and particulate matter, such as replaceable core filter dryers. These procedures usually are performed at the field job site or in a local service shop.
REFRIGERANT. A substance used for heat transfer in a refrigerating system; the refrigerant absorbs heat and transfers it at a higher temperature and higher pressure, usually with a change of state.

REFRIGERANT SAFETY CLASSIFICATIONS. Groupings that indicate the toxicity and flammability classes in accordance with ASHRAE 34.

REFRIGERATED ROOM OR SPACE. A room or space in which an evaporator or brine coil is located for the purpose of reducing or controlling the temperature within the room or space to below 68°F (20°C).

REFRIGERATING SYSTEM. A combination of interconnected refrigerant-containing parts constituting one closed refrigerant circuit in which a refrigerant is circulated for the purpose of extracting heat.

REFRIGERATION MACHINERY ROOM. See “Machinery room.”

REFRIGERATION SYSTEM, ABSORPTION. A heat-operated, closed-refrigeration cycle in which a secondary fluid (the absorbent) absorbs a primary fluid (the refrigerant) that has been vaporized in the evaporator.

- Direct system. A system in which the evaporator is in direct contact with the material or space refrigerated, or is located in air-circulating passages communicating with such spaces.

- Indirect system. A system in which a brine coil cooled by the refrigerant is circulated to the material or space refrigerated, or is utilized to cool the air so circulated. Indirect systems are distinguished by the type or method of application.

REFRIGERATION SYSTEM CLASSIFICATION. Refrigeration systems are classified according to the degree of probability that leaked refrigerant from a failed connection, seal or component will enter an occupied area. The distinction is based on the basic design or location of the components.

REFRIGERATION SYSTEM, MECHANICAL. A combination of interconnected refrigeration-containing parts constituting one closed refrigerant circuit in which a refrigerant is circulated for the purpose of extracting heat and in which a compressor is used for compressing the refrigerant vapor.

REFRIGERATION SYSTEM, SELF-CONTAINED. A complete factory-assembled and tested system that is shipped in one or more sections and [has no refrigerant-containing] that does not have refrigerant-containing parts that are joined in the field by other than companion or block valves.

REGISTERED DESIGN PROFESSIONAL. Refer to Chapter 1 of Title 28 of the New York City Administrative Code.

RETURN AIR. Air removed from an approved conditioned space or location and recirculated or exhausted outdoors.
RETURN AIR SYSTEM. An assembly of connected ducts, plenums, fittings, registers and grilles through which return air from the space or spaces to be heated or cooled is conducted back to the supply unit or relieved to the outdoors (see also “Supply air system”).

ROOM HEATER, VENTED. A free-standing heating unit burning solid or liquid fuel for direct heating of the space in and adjacent to that in which the unit is located.

SAFETY VALVE. A valve that relieves pressure in a steam boiler by opening fully at the rated discharge pressure. The valve is of the spring-pop type.

SELF-CONTAINED EQUIPMENT. Complete, factory-assembled and tested, heating, air-conditioning or refrigeration equipment installed as a single unit, and having all working parts, complete with motive power, in an enclosed unit of said machinery.

SHAFT. An enclosed space extending through one or more stories of a building, connecting vertical openings in successive floors, or floors and the roof.

SHAFT ENCLOSURE. The walls or construction forming the boundaries of a shaft.

SLEEPING UNIT. A dwelling unit, which may contain either toilet or kitchen facilities but not both. Any sleeping unit housing more than one family shall also be classified as a congregate living unit. The creation of or conversion to sleeping units shall be limited by Section 27-2077 of the New York City Housing Maintenance Code.

SMOKE DAMPER. A listed device [is] installed in ducts and air transfer openings designed to resist the passage of air and smoke. The device is installed to operate automatically, controlled by a smoke detection system, and where required, is capable of being positioned from a fire command center.

SMOKE-DEVELOPED INDEX. [A numerical value assigned to] A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E 84.

SOLID FUEL (COOKING APPLICATIONS). Applicable to commercial food service operations only, solid fuel is any bulk material such as hardwood, mesquite, charcoal or briquettes that is combusted to produce heat for cooking operations.

SOURCE CAPTURE SYSTEM. A mechanical exhaust system designed and constructed to capture air contaminants at their source and to exhaust such contaminants to the outdoor atmosphere.

STATIONARY FUEL CELL POWER PLANT. A self-contained package or factory-matched package [which] that constitute an automatically operated assembly of integrated systems for generating useful electrical energy and recoverable thermal energy that is permanently connected and fixed in place.

STOP VALVE. A shutoff valve for controlling the flow of liquid or gases.

STORY. That portion of a building included between the upper surface of a floor and the upper surface of the floor next above, except that the topmost story shall be that portion of a building included between the upper surface of the topmost floor and the ceiling or roof above.
STRENGTH, ULTIMATE. The highest stress level that the component will tolerate without rupture.

SUPPLY AIR. That air delivered to each or any space supplied by the air distribution system or the total air delivered to all spaces supplied by the air distribution system, which is provided for ventilating, heating, cooling, humidification, dehumidification and other similar purposes.

SUPPLY AIR SYSTEM. An assembly of connected ducts, plenums, fittings, registers and grilles through which air, heated or cooled, is conducted from the supply unit to the space or spaces to be heated or cooled (see also “Return air system”).

THEORETICAL AIR. The exact amount of air required to supply oxygen for complete combustion of a given quantity of a specific fuel.

THERMAL RESISTANCE (R). A measure of the ability to retard the flow of heat. The R-value is the reciprocal of thermal conductance.

THIRD-PARTY CERTIFICATION AGENCY. An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer’s quality control system.

THIRD-PARTY CERTIFIED. Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

THIRD-PARTY TESTED. Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

[TLV-TWA (THRESHOLD LIMIT VALUE-TIME WEIGHTED AVERAGE)] (TLV-TWA). The time-weighted average concentration of a refrigerant or other chemical in air for a normal 8-hour workday and a 40-hour workweek, to which nearly all workers are repeatedly exposed, day after day, without adverse effects, as adopted by the American Conference of Government Industrial Hygienists (ACGIH).

TOILET ROOM. A room containing a water closet and, frequently, a lavatory, but not a bathtub, shower, spa or similar bathing fixture.

TOXICITY CLASSIFICATION. Refrigerants shall be classified for toxicity in one of two classes in accordance with ASHRAE 34.

TRANSITION FITTINGS, PLASTIC TO STEEL. An adapter for joining plastic pipe to steel pipe. The purpose of this fitting is to provide a permanent, pressure-tight connection between two materials that cannot be joined directly one to another.

UNCONFINED SPACE. A space having a volume not less than 50 cubic feet per 1,000 Btu/h (4.8m³/kW) of the aggregate input rating of all appliances installed in that space. Rooms
communicating directly with the space in which the appliances are installed, through openings not furnished with doors, are considered a part of the unconfined space.

UNIT HEATER. A self-contained appliance of the fan type, designed for the delivery of warm air directly into the space in which the appliance is located.

UNUSUALLY TIGHT CONSTRUCTION. Construction meeting all of the following requirements:

1. Walls exposed to the outside atmosphere having a continuous water vapor retarder with a rating of 1 perm (57 ng/s·m²·Pa) or less with openings gasketed or sealed; and
2. Openable windows and doors meeting the air leakage requirements of the New York City Energy Conservation Code, Section 502.4.1; and
3. Caulking or sealants are applied to areas, such as joints around window and door frames, between sole plates and floors, between wall-ceiling joints, between wall panels, at penetrations for plumbing, electrical and gas lines, and at other openings.

VENT. A pipe or other conduit composed of factory-made components, containing a passageway for conveying combustion products and air to the atmosphere, listed and labeled for use with a specific type or class of appliance.

Pellet vent. A vent listed and labeled for use with listed pellet-fuel-burning appliances.

Type L vent. A vent listed and labeled for use with the following:

[1.] Oil-burning appliances that are listed for use with Type L vents.

[2.] Gas-fired appliances that are listed for use with Type B vents.

VENT CONNECTOR. The pipe that connects an approved fuel-fired appliance to a vent.

VENT DAMPER DEVICE, AUTOMATIC. A device intended for installation in the venting system, in the outlet of an individual automatically operated fuel-burning appliance that is designed to open the venting system automatically when the appliance is in operation and to close off the venting system automatically when the appliance is in a standby or shutdown condition.

VENTED ROOM HEATER. A vented self-contained, free-standing, nonrecessed appliance for furnishing warm air to the space in which it is installed, directly from the heater without duct connections.

VENTILATION. The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from, any space.

VENTILATION AIR. That portion of supply air that comes from the outside (outdoors), plus any recirculated air that has been treated to maintain the desired quality of air within a designated space.
VENTING SYSTEM. A continuous open passageway from the flue collar of an appliance to the outside atmosphere for the purpose of removing flue or vent gases. A venting system is usually composed of a vent or a chimney and vent connector, if used, assembled to form the open passageway.

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

ZONE. One occupiable space or several occupiable spaces with similar occupancy classification (see Table [403.3] 403.3.1.1), occupant density, zone air distribution effectiveness and zone primary airflow rate per unit area.

§ 4. Chapter 3 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 3
GENERAL REGULATIONS

SECTION MC 301
GENERAL

301.1 Scope. This chapter shall govern the approval and installation of all equipment and appliances that comprise parts of the building mechanical systems regulated by this code in accordance with Section 101.2.

301.2 Energy utilization. Heating, ventilating, [and] air-conditioning, and refrigeration systems of all structures shall be designed and installed for efficient utilization of energy in accordance with the New York City Energy Conservation Code.

301.3 Identification. All pipe and tubing and each pipe fitting utilized in a mechanical system shall bear the identification of the manufacturer.

301.4 Plastic pipe, fittings and components. Plastic pipe, fittings and components shall be third-party certified.

301.5 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 301.3. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

301.6 Fuel gas appliances and equipment. The approval and installation of fuel gas distribution piping and equipment, fuel gas-fired appliances and fuel gas-fired appliance venting systems shall be in accordance with the New York City Fuel Gas Code.

301.7 Listed and labeled. Appliances regulated by this code shall be listed and labeled for the application in which they are installed.

Exception: Listing and labeling of equipment and appliances used for refrigeration shall be in accordance with Section 1101.2.
[301.5] **301.8 Testing of materials.** Refer to Section 28-113 of the *Administrative Code*.

[301.6] **301.9 Label information.** A permanent factory-applied name-plate(s) shall be affixed to appliances on which shall appear in legible lettering, the manufacturer’s name or trademark, the model number, serial number and the seal or mark of the approved agency. A label shall also include the following:

1. Electrical equipment and appliances: Electrical rating in volts, amperes and motor phase; identification of individual electrical components in volts, amperes or watts, motor phase; Btu/h (W) output; and required clearances.

2. Absorption units: Hourly rating in Btu/h (W); minimum hourly rating for units having step or automatic modulating controls; type of fuel; type of refrigerant; cooling capacity in Btu/h (W); and required clearances.

3. Fuel-burning units: Hourly rating in Btu/h (W); type of fuel approved for use with the appliance; and required clearances.

4. Electric comfort heating appliances: [Name and trademark of the manufacturer; the model number or equivalent; the electric] Electric rating in volts, [ampacity] amperes and phase; Btu/h (W) output rating; individual marking for each electrical component in amperes or watts, volts and phase; and required clearances from combustibles [; and a seal indicating approval of the appliance by an approved agency].

[301.7] **301.10 Electrical.** Electrical wiring, controls and connections to equipment and appliances regulated by this code shall be in accordance with the *New York City Electrical Code*.

[301.8] **301.11 Plumbing connections.** Potable water supply and building drainage system connections to equipment and appliances regulated by this code shall be in accordance with the *New York City Plumbing Code*.

[301.9] **301.12 Fuel types.** Fuel-fired appliances shall be designed for use with the type of fuel to which they will be connected and the altitude at which they are installed. Appliances that comprise parts of the building mechanical system shall not be converted for the usage of a different fuel, except where approved and converted in accordance with the manufacturer’s instructions. The fuel input rate shall not be increased or decreased beyond the limit rating for the altitude at which the appliance is installed.

[301.10 Vibration isolation.** Where vibration isolation of equipment and appliances is employed, supplemental restraint shall be used to accomplish the support and restraint.**

**301.13 Reserved.**

[301.14 Repair.** Defective material or parts shall be replaced or repaired in such a manner so as to preserve the original approval or listing.**

[301.15 Wind resistance.** Mechanical equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with the *New York City Building Code*.**
301.13  **Flood hazard.** For structures located in areas of special flood hazard, and buildings that include I-2 occupancies that are hospitals located in shaded X Zones flood hazard areas, mechanical systems, equipment and appliances shall comply with the additional requirements of Appendix G of the *New York City Building Code*.

301.16.1  **High-velocity wave action.** For buildings in coastal high-hazard areas and coastal A-zones as established in Section G102 of the *New York City Building Code*, mechanical systems and equipment shall not be mounted on or penetrate through breakaway walls.

301.17  **Rodentproofing.** Buildings or structures and the walls enclosing habitable or occupiable rooms and spaces in which persons live, sleep or work, or in which feed, food or foodstuffs are stored, prepared, processed, served or sold, shall be constructed to protect against the entrance of rodents in accordance with Appendix F of the *New York City Building Code*.

301.18  **Seismic resistance.** Where earthquake loads are applicable in accordance with the *New York City Building Code*, mechanical system supports shall be designed and installed for the seismic forces in accordance with the *New York City Building Code*.

**SECTION MC 302**

[PROTECTION OF STRUCTURE]  **STRUCTURAL SAFETY**

302.1  **Structural safety.** The building or structure shall not be weakened by the installation of mechanical systems. Where floors, walls, ceilings or any other portion of the building or structure are required to be altered or replaced in the process of installing or repairing any system, the building or structure shall be left in a safe structural condition in accordance with the *New York City Building Code*.

302.1.1  **Loading.** Alterations resulting in the addition of loads to any member, such as HVAC equipment and water heaters, shall not be permitted without verification that the members are capable of supporting such additional loading.

302.2  **Penetrations of floor/ceiling assemblies and fire-resistance-rated assemblies.** Penetrations of floor/ceiling assemblies and assemblies required to have a fire-resistance rating shall be protected in accordance with Chapter 7 of the *New York City Building Code* and Chapter 6 of this code.

302.3  **Cutting, notching and boring in wood framing.** The cutting, notching and boring of wood framing members shall comply with Sections 302.3.1 through 302.3.5.

302.3.1  **Joist notching.** Solid non-engineered joist notches and holes. Notches on the ends of the solid, non-engineered joists shall not exceed one-fourth the joist depth. Notches in the top or bottom of joists shall not exceed one-sixth the depth, shall not be longer than one-third the depth and shall not be located in the middle third of the span. Holes bored in joists shall not be within 2 inches (50.8 mm) of the top or bottom of the joist, and the diameter of any such hole shall not exceed one-third the depth of the joist. Holes bored in the middle third of the span shall be located at the center of the joist depth. Clear distance between holes and notches shall be a minimum of 2 inches (50.8 mm). See Figure 2308.5.8 of the *New York City Building Code*. 
302.3.2 Stud cutting and notching. In exterior walls and bearing partitions, any wood studs are permitted to be cut or notched to a depth not exceeding 25 percent of the width of the stud. Cutting or notching of studs to a depth not greater than 40 percent of their depth is permitted in nonbearing partitions supporting no loads other than the weight of the partition. See Figure 2308.5.8 of the New York City Building Code.

302.3.3 Bored holes in studs. Bored holes not greater than 40 percent of the stud depth are permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the stud width are permitted in nonbearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored. In no case shall the edge of the bored hole be nearer than 0.625 inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch. See Figure 2308.5.8 of the New York City Building Code.

302.3.4 Engineered wood products. Cuts, notches and holes bored in trusses, structural composite veneer lumber, structural glue-laminated members and I-joists are prohibited except where permitted by the manufacturer’s recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.

302.3.5 Drilling and notching of top plate. When piping or ductwork is placed in or partly in an exterior wall or interior load-bearing wall, necessitating cutting, drilling or notching of the top plate by more than 50 percent of its width, a galvanized metal tie not less than 0.054 inch thick (1.37 mm) (16 ga) and 1½ inches (38.1 mm) wide shall be fastened across and to the plate at each side of the opening with not less than eight 10d (0.148 inch diameter) nails having a minimum length of 1½ inches (38.1 mm) at each side or equivalent. The metal tie must extend a minimum of 6 inches past the opening. See Figure 2308.5.8 of the New York City Building Code.

Exception: When the entire side of the wall with the notch or cut is covered by wood structural panel sheathing additional fastening is not required.

302.4 [Alterations to trusses] Trusses. Truss members of any material and components shall not be cut, drilled, notched, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. [Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heaters) shall not be permitted without verification that the truss is capable of supporting such additional loading.]

302.5 Cutting, notching and boring in steel framing. The cutting, notching and boring of steel framing members shall comply with Sections 302.5.1 through 302.5.4.

302.5.1 [Cutting, notching and boring holes in structural] Structural steel framing. The cutting, notching and boring of holes in structural steel framing members shall be as prescribed by the registered design professional.

302.5.2 [Cutting, notching and boring holes in cold-formed] Cold-formed steel framing. Flanges and lips of load-bearing, cold-formed steel framing members shall not be cut or notched. Holes in webs of load-bearing, cold-formed steel framing members shall be permitted along the
centerline of the web of the framing member and shall not exceed the dimensional limitations, penetration spacing or minimum hole edge distance as prescribed by the registered design professional. [Cutting, notching and boring holes of steel floor/roof decking shall be as prescribed by the registered design professional.]

302.5.3 [Cutting, notching and boring holes in nonstructural] Nonstructural cold-formed steel wall framing. Flanges and lips of nonstructural cold-formed steel wall studs [shall not be cut or notched. Holes in webs of nonstructural cold-formed steel wall studs] shall be permitted along the centerline of the web of the framing member, shall not exceed 1½ inches (38.1 mm) in width or 4 inches (101.6 mm) in length, and the holes shall not be spaced less than 24 inches (609.6 mm) center to center from another hole or less than 10 inches (254 mm) from the bearing end.

302.5.4 Steel floor and roof decking. Cutting, notching and boring holes in steel floor and roof decking shall be as prescribed by the registered design professional.

302.6 Cutting, notching and coring into concrete. The cutting, notching or coring of concrete must comply with provisions of Chapter 19 of the New York City Building Code and is not permitted without prior approval of the registered design professional.

302.7 Protection of footings. Trenching installed parallel to footings and walls shall not extend into the bearing plane of a footing or wall. The upper boundary of the bearing plane is a line that extends downward, at an angle of 34 degrees (1:1.5 slope) from horizontal, from the outside bottom edge of the footing or wall.

302.8 Piping materials exposed within plenums. Piping materials exposed within plenums shall comply with this code.

SECTION MC 303
EQUIPMENT AND APPLIANCE LOCATION

303.1 General. Equipment and appliances shall be located as required by this section, specific requirements elsewhere in this code and the conditions of the equipment and appliance listing.

303.2 Hazardous locations. Appliances shall not be located in a hazardous location unless listed and approved for the specific installation.

303.3 Prohibited locations. Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following exceptions:

Exceptions: This section shall not apply to the following appliances:

1. In rooms other than those used for sleeping purposes, direct-vent appliances that obtain all combustion air directly from the outdoors and are installed in accordance with the conditions of the listing and manufacturer’s instructions.

2. In rooms other than those used for sleeping purposes, vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and
decorative appliances for installation in vented solid fuel-burning fireplaces that are installed in rooms that meet the required volume criteria of Section 702.

3. In rooms other than those used for sleeping purposes, appliances installed in a dedicated enclosure in which all combustion air is taken directly from the outdoors, in accordance with Section 703. Access to such enclosure shall be through a solid door, weather-stripped in accordance with the exterior door air leakage requirements of the New York City Energy Conservation Code and equipped with an approved self-closing device.

303.4 Protection from physical damage. Appliances shall not be installed in a location where subject to physical damage, including vehicular impact, unless protected by approved barriers meeting the requirements of the New York City Fire Code.

303.5 Indoor locations. Furnaces and boilers installed in closets and alcoves shall be listed for such installation. For purposes of this section, a closet or alcove shall be defined as a room or space having a volume less than 12 times the total volume of fuel-fired appliances other than boilers and less than 16 times the total volume of boilers. Room volume shall be computed using the gross floor area and the actual ceiling height up to a maximum computation height of 8 feet (2438 mm).

303.6 Outdoor locations. Appliances installed in other than indoor locations shall be listed and labeled for outdoor installation.

303.7 Pit locations. Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil. The sides of the pit or excavation shall be held back [a minimum of] not less than 12 inches ([305] 304.8 mm) from the appliance. Where the depth exceeds 12 inches ([305] 304.8 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry. Such concrete or masonry shall extend [a minimum of] not less than 4 inches ([102] 101.6 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. The appliance shall be protected from flooding.

303.8 Elevator shafts. Mechanical systems shall not be located in an elevator shaft.

SECTION MC 304
INSTALLATION

304.1 General. Equipment and appliances shall be installed as required by the terms of their approval, in accordance with the conditions of the listing, the manufacturer’s instructions and this code. Manufacturer’s instructions shall be available on the job site at the time of inspection.

304.2 Conflicts. Where conflicts between this code and the conditions of listing or the manufacturer’s instructions occur, the provisions of this code shall apply.

Exception: Where a code provision is less restrictive than the conditions of the listing of the equipment or appliance or the manufacturer’s instructions, the conditions of the listing and the manufacturer’s instructions shall apply.
304.3 Elevation of ignition source. Equipment and appliances having an ignition source and located in hazardous locations and public garages, private garages, repair garages, automotive motor fuel-dispensing facilities and parking garages shall be elevated such that the source of ignition is not less than 18 inches ([457] 457.2 mm) above the floor surface on which the equipment or appliance rests. For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

**Exception:** Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

304.3.1 Parking garages. Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Section 304.3.

**Exception:** This section shall not apply to appliance installations complying with Section 304.6.

304.4 Prohibited equipment and appliance location. Equipment and appliances having an ignition source shall not be installed in Group H occupancies or control areas where open use, handling or dispensing of combustible, flammable or explosive materials occurs.

304.5 Hydrogen generating and refueling operations. Hydrogen generating and refueling operations shall be prohibited except as permitted by the Commissioner of the Fire Department.

304.6 Public garages. Appliances located in public garages, motor fueling-dispensing facilities, repair garages or other areas frequented by motor vehicles, shall be installed [a minimum of] not less than 8 feet ([2438] 2438.4 mm) above the floor. Where motor vehicles are capable of passing under an appliance, the appliance shall be installed at the clearances required by the appliance manufacturer and not less than 1 foot ([305] 304.8 mm) higher than the tallest vehicle garage door opening.

**Exception:** The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with NFPA 30A and Section 304.3 of this code [and NFPA 30A].

304.7 Private garages. Appliances located in private garages and carports shall be installed with a minimum clearance of 6 feet ([1829] 1828.8 mm) above the floor.

**Exception:** The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 304.3.

304.8 Construction and protection. Boiler rooms and furnace rooms shall be protected as required by the New York City Building Code.

304.9 Clearances to combustible construction. Heat-producing equipment and appliances shall be installed to maintain the required clearances to combustible construction as specified in the listing and manufacturer’s instructions. Such clearances shall be reduced only in accordance with Section
308. Clearances to combustibles shall include such considerations as door swing, drawer pull, overhead projections or shelving and window swing, shutters, coverings and drapes. Devices such as doorstops or limits, closers, drapery ties or guards shall not be used to provide the required clearances.

304.10 Clearances from grade. Equipment and appliances installed at grade level shall be supported on a level concrete slab or other approved material extending not less than 3 inches ([76] 76.2 mm) above adjoining grade or shall be suspended not less than 6 inches ([152] 152.4 mm) above adjoining grade. Such support shall be in accordance with the manufacturer’s [installation] instructions.

304.11 Guards. Guards shall be provided where appliances, equipment, fans or other components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of such appliances, equipment, fans, components and roof hatch openings and the top of the guard shall be located not less than 42 inches ([1067] 1066.8 mm) above the elevated surface adjacent to the guard. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter ([533] 533.4 mm) sphere and shall comply with the loading requirements for guards specified in the New York City Building Code.

304.12 Area served. Appliances serving different areas of a building other than where they are installed shall be permanently marked in an approved manner that uniquely identifies the appliance and the area it serves.

304.13 Rooftop access and obstructions. Equipment and appliances installed on rooftops of buildings shall be installed in accordance with the requirements of the New York City Fire Code regarding rooftop access and obstructions, and shall not obstruct or interfere with firefighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

SECTION MC 305
PIPING SUPPORT

305.1 General. [All mechanical] Mechanical system piping shall be supported in accordance with this section.

305.2 Materials. Pipe hangers and supports shall have sufficient strength to withstand all anticipated static and specified dynamic loading conditions associated with the intended use.

Pipe hangers and supports that are in direct contact with piping shall be of materials that are compatible with the piping and that will not promote galvanic action.

305.3 Structural attachment. Hangers and anchors shall be attached to the building structure. Post-installed anchors shall be subject to special inspection in accordance with Section 1705.37 of the New York City Building Code.

305.4 Interval of support. Piping shall be supported at distances not exceeding the spacing specified in Table 305.4, or in accordance with [MSS SP-69] ANSI/MSS SP-58.
### TABLE 305.4
**PIPING SUPPORT SPACING**

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. See Section [301.15](#) [301.18](#).
- b. The maximum horizontal spacing of cast-iron pipe hangers shall be increased.
- c. Mid-story guide [?].

#### 305.5 Protection against physical damage

In concealed locations where piping, other than cast-iron or steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1½ inches (38.1 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. Protective steel shield plates having a minimum thickness of [0.0575 inch thick](0.1463 mm) (No. 16 gage) shall cover the area of the pipe where the member is notched or bored, and shall extend [a minimum of] not less than 2 inches (50.8 mm) above sole plates and below top plates.

#### SECTION MC 306
**ACCESS AND SERVICE SPACE**

#### 306.1 Access [for maintenance and replacement]

Appliances, control devices, heat exchangers and HVAC system components that require maintenance shall be accessible for inspection, service, repair and replacement without disabling the function of a fire-resistance-rated assembly or removing permanent construction, other appliances, venting systems or any other piping or ducts not connected to the appliance being inspected, serviced, repaired or replaced. A level working space [at least] not less than 30 inches deep and 30 inches wide (762 mm by 762 mm) shall be provided in front of the
control side to service an appliance. Clearance shall also be provided as required by the New York City Electrical Code. 

306.1.1 Central furnaces. Central furnaces within compartments or alcoves shall have a minimum working space clearance of 3 inches (76.2 mm) along the sides, back and top with a total width of the enclosing space being at least not less than 12 inches (304.8 mm) wider than the furnace. Furnaces having a firebox open to the atmosphere shall have at least not less than 6 inches (152.4 mm) working space along the front combustion chamber side. Combustion air openings at the rear or side of the compartment shall comply with the requirements of Chapter 7.

Exception: This section shall not apply to replacement appliances installed in existing compartments and alcoves where the working space clearances are in accordance with the equipment or appliance manufacturer’s [installation] instructions.

306.2 Appliances in rooms. Rooms containing appliances shall be provided with a door and an unobstructed passageway measuring not less than 36 inches (914.4 mm) wide and 80 inches (2032 mm) high.

Exception: Within a dwelling unit, appliances installed in a compartment, alcove, basement or similar space shall be accessed by an opening or door and an unobstructed passageway measuring not less than 24 inches (609.6 mm) wide and large enough to allow removal of the largest appliance in the space, provided that a level service space of not less than 30 inches (762 mm) deep and the height of the appliance, but not less than 30 inches (762 mm), is present at the front or service side of the appliance with the door open.

306.3 Appliances in attics. Attics containing appliances shall be provided with an opening and unobstructed passageway large enough to allow removal of the largest appliance. The passageway shall be not less than 30 inches (762 mm) high and 22 inches (558.8 mm) wide and not more than 20 feet (6096 mm) in length measured along the centerline of the passageway from the opening to the appliance. The passageway shall have continuous solid flooring not less than 24 inches (609.6 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. The clear access opening dimensions shall be a minimum of not less than 20 inches by 30 inches (508 mm by 762 mm), and large enough to allow removal of the largest appliance.

Exceptions:

1. The passageway and level service space are not required where the appliance is capable of being serviced and removed through the required opening.

2. [Where the passageway is not less than 6 feet (1829 mm) high for its entire length, the passageway shall be not greater than 50 feet (15 250 mm) in length.] Where the passageway is unobstructed and not less than 6 feet (1828.8 mm) high and 22 24 inches (559) 609.6 mm wide for its entire length, the passageway shall be not greater than 50 feet (15 250 mm) in length.
306.3.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the New York City Electrical Code.

306.4 Appliances under floors. Under-floor spaces containing appliances shall be provided with an access opening and unobstructed passageway large enough to remove the largest appliance. The passageway shall be not less than 30 inches (762 mm) high and 22 inches (559 mm) wide, nor more than 20 feet (6096 mm) in length measured along the centerline of the passageway from the opening to the appliance. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. If the depth of the passageway or the service space exceeds 12 inches (305 mm) below the adjoining grade, the walls of the passageway shall be lined with concrete or masonry. Such concrete or masonry shall extend a minimum of not less than 4 inches (101.6 mm) above the adjoining grade and shall have sufficient lateral-bearing capacity to resist collapse. The clear access opening dimensions shall be a minimum of not less than 22 inches by 30 inches (559 mm by 762 mm), and large enough to allow removal of the largest appliance.

Exceptions [Exceptions]:

1. The passageway is not required where the level service space is present when the access is open and the appliance is capable of being serviced and removed through the required opening.

2. Where the passageway is not less than 6 feet high (1829 mm) for its entire length, the passageway shall not be limited in length. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall not be limited in length.

306.4.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the New York City Electrical Code.

306.5 Equipment and appliances on roofs or elevated structures. Where equipment or appliances requiring access are located on roofs or an elevated structure, building such that personnel will have to climb higher than 16 feet (4876.8 mm) above grade, roof or floor level to access such equipment or appliances, an interior or exterior means of access shall be provided by a permanent approved means of access, the extent of which shall be from grade or floor level to the equipment and appliances’ level service space. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) high, in height or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access to the roof or elevated structure and access from the roof or elevated structure to equipment requiring maintenance shall not require the use of portable ladders. Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.
Permanent ladders installed to provide the required access shall comply with the following minimum design criteria:

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).

2. Ladders shall have rung spacing not to exceed 12 inches (305 mm) on center. The uppermost rung shall be not more than 24 inches (609.6 mm) below the upper edge of the roof hatch, roof or parapet, or equipment access platform, as applicable.

3. Ladders shall have a toe spacing not less than 7 inches (177.8 mm) deep.

4. There shall be a minimum of not less than 18 inches (457 mm) between rails.

5. Rungs shall have a diameter not less than 0.75-inch (19 mm) and be capable of withstanding a 300-pound (136.1 kg) load.

6. Where a cage, well or ladder safety device is prohibited, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 30 feet (9144 mm) of height. Where a cage, well or ladder safety device is not provided, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 20 feet (6096 mm) of height. Landings shall be capable of withstanding 100 pounds (488.2 kg/m²) per square foot. Landing dimensions shall be not less than 30 inches (762 mm) in length and not less than 24 inches (610 mm) in width. A guard rail and toeboard shall be provided on all open sides of the landing.

7. Where ladder extensions are installed, the side rails of through or side-step ladder extensions shall extend 3½ feet (1077 mm) above the parapets and landings. For through ladder extensions, the rungs shall be omitted from the extensions and shall have not less than 18 (457 mm) nor more than 24 inches (610 mm) of clearance between rails. For side-step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3½ feet (1077 mm) minimum.

Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be not less than 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15 inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs except where cages or wells are installed.

8. Landing required. The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches by 30 inches (762 mm by 762 mm) centered in front of the ladder.

9. Ladders shall be protected against corrosion by approved means.

[9-] 10. Service personnel shall have access to ladders at all times.

11. Where ladder extensions are installed, the side rails of through or side-step ladder extensions shall extend 3½ feet (1066.8 mm) above the parapets and landings. For through ladder
extensions, the rungs shall be omitted from the extensions and shall have not less than 18 inches (457.2 mm) nor more than 24 inches (609.6 mm) of clearance between rails. For side-step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3½ feet (1066.8 mm) minimum.

Catwalks installed to provide the required access shall be not less than 24 inches ([610] 609.6 mm) wide and shall have railings as required for service platforms.

**Exception:** This section shall not apply to Group R-3 occupancies.

### 306.5.1 Sloped roofs
Where appliances, equipment, fans or other components that require service are installed on a roof having a slope of [3] three units vertical in 12 units horizontal (25-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the appliance or equipment to which access is required for service, repair or maintenance. The platform shall be not less than 30 inches (762 mm) in any dimension and shall be provided with guards. The guards shall extend not less than 42 inches ([1067] 1066.8 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch ([533] 533.4 mm) diameter sphere and shall comply with the loading requirements for guards specified in the **New York City Building Code**. Access shall not require walking on roofs having a slope greater than four units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section 306.5 or [stairs] stairways installed in accordance with the requirements specified in the **New York City Building Code** in the path of travel to and from appliances, fans or equipment requiring service.

### 306.5.2 Electrical requirements
A receptacle outlet shall be provided at or near the equipment location in accordance with the **New York City Electrical Code**.

### SECTION MC 307
**CONDENSATE DISPOSAL**

### 307.1 Fuel-burning appliances
Liquid combustion by-products of condensing appliances shall be collected and discharged to [a] an approved plumbing fixture or disposal area in accordance with the manufacturer’s [installation] instructions. Condensate piping shall be of approved corrosion-resistant material in accordance with Section 803 of the **New York City Plumbing Code** and shall not be smaller than the drain connection on the appliance. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than [⅛] one-eighth unit vertical in 12 units horizontal (1-percent slope). Piping shall be configured to permit clearing of blockages and performance of maintenance without requiring the drain line to be cut.

**307.1.1 Condensate disposal.** Condensate from all fuel-burning appliances and associated flues shall be neutralized to a pH of at least 6 and no more than 8 prior to disposal to a sanitary system.

**307.2 Evaporators and cooling coils.** Condensate drain systems shall be provided for equipment and appliances containing evaporators or cooling coils. Condensate drain systems shall be designed, constructed and installed in accordance with Sections 307.2.1 through [307.2.4] 307.2.6.
**Exception:** Evaporators and cooling coils that are designed to operate in sensible cooling only and not support condensation shall not be required to meet the requirements of this section.

307.2.1 Condensate disposal. Condensate from all cooling coils and evaporators shall be conveyed from the drain pan outlet to an approved place of disposal. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than one-eighth unit vertical in 12 units horizontal (1-percent slope). Condensate shall not discharge into a street, alley or other areas so as to cause a nuisance.

307.2.2 Drain pipe materials and sizes. Components of the condensate disposal system shall be cast iron, galvanized steel, copper, cross-linked polyethylene, polyethylene, ABS, CPVC, or PVC pipe or tubing. Polypropylene tubing may be used in lengths that do not exceed 12 inches (304.8 mm) for an individual drain application. Components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the New York City Plumbing Code relative to the material type. Condensate waste and drain line size shall be not less than \( \frac{3}{4} \) inch (19 mm) internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized in accordance with Table 307.2.2.

<table>

</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 ton = 3.517 kW.

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, where damage to any building components could occur as a result of overflow from the equipment primary condensate removal system, one of the following auxiliary protection methods shall be provided for each cooling coil or fuel-fired appliance that produces condensate:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a [minimum] depth of not less than 1\( \frac{1}{2} \) inches ([38] mm), shall be not [be] less than 3 inches ([76] mm) larger than the unit, or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Metallic pans shall have a [minimum] thickness of not less than 0.0236 inches (0.6010 mm) (No. 24 gage) for galvanized sheet metal pans, 0.0179 inches (0.4546 mm) (No. 26 gage) for stainless steel pans, or 0.0320 inches (0.8128 mm) (No. 20 gage) for aluminum pans. Nonmetallic pans shall have a [minimum] thickness of not less than 0.0625 inch (1.6 mm). [.]
2. A separate overflow drain line shall be connected to the drain pan provided with the equipment. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.

3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a listed water-level detection device that will shut off the equipment served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.

4. A listed water-level detection device shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

[Exception: Fuel-fired] Exceptions:

1. An auxiliary drain protection method shall not be required for fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

2. An auxiliary drain protection method shall not be required where a suitably sized and located floor drain is provided.

307.2.3.1 Water-level monitoring devices. On down-flow units and all other coils that do not have a secondary drain or provisions to install a secondary or auxiliary drain pan, a water-level monitoring device shall be installed inside the primary drain pan. This device shall shut off the equipment served in the event that the primary drain becomes restricted. Devices installed in the drain line shall not be permitted.

307.2.3.2 Appliance, equipment or insulation in pans. Where an appliance, equipment or insulation is subject to water damage when auxiliary drain pans fill, that portion of the appliance, equipment or insulation shall be installed above the rim of the pans. Supports located inside of the pans to support the appliance or equipment or insulation shall be water resistant and approved.

307.2.4 Traps. Condensate drains shall be trapped as required by the equipment or appliance manufacturer.

307.2.5 Drain line maintenance. Condensate drain lines shall be configured to permit the clearing of blockages and performance of maintenance without requiring the drain line to be cut.

307.2.6 Condensate discharge. Where multiple evaporators and/or condensate pumps discharge into the same piping system, it shall be piped to prevent the discharge of condensate from one appliance to another.
307.3 Exceptions. This section applies to permanently installed equipment. Window units and through-the-wall air-conditioning units are exempt from the requirements of this section.

SECTION MC 308
CLEARANCE REDUCTION

308.1 Scope. This section shall govern the reduction in required clearances to gypsum board, combustible materials and combustible assemblies for chimneys, vents, kitchen exhaust equipment, mechanical appliances, and mechanical devices and equipment.

308.2 Listed appliances and equipment. The reduction of the required clearances to combustibles for listed and labeled appliances and equipment shall be in accordance with the requirements of this section except that such clearances shall not be reduced where reduction is specifically prohibited by the terms of the appliance or equipment listing.

308.3 Protective assembly construction and installation. Reduced clearance protective assemblies, including structural and support elements, shall be constructed of noncombustible materials. Spacers utilized to maintain an airspace between the protective assembly and the protected material or assembly shall be noncombustible. Where a space between the protective assembly and protected combustible material or assembly is specified, the same space shall be provided around the edges of the protective assembly and the spacers shall be placed so as to allow air circulation by convection in such space. Protective assemblies shall not be placed less than 1 inch (25 mm) from the mechanical appliances, devices or equipment, regardless of the allowable reduced clearance.

308.4 Allowable reduction. The reduction of required clearances to combustible assemblies or combustible materials shall be based on the utilization of a reduced clearance protective assembly in accordance with Section [308.5] 308.4.1 or [308.6] 308.4.2.

[308.5] 308.4.1 Labeled assemblies. The allowable clearance reduction shall be based on a reduced clearance protective assembly that has been tested and bears the label of an approved agency.

[308.6] 308.4.2 Reduction table. The allowable clearance reduction shall be based on one of the methods specified in Table [308.6] 308.4.2. Where required clearances are not listed in Table [308.6] 308.4.2, the reduced clearances shall be determined by linear interpolation between the distances listed in the table. Reduced clearances shall not be derived by extrapolation below the range of the table.

</tbody>
</table>

For SI: 1 inch = 25.4 mm, °C = \(\frac{(°F - 32)}{1.8}\), 1 pound per cubic foot = 16.02 kg/m\(^3\), 1.0 Btu • in/(ft\(^2\) • h • °F) = 0.144 W/m\(^2\) • K.

- \(^a\) Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1,500°F. Insulation material utilized as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu • in/(ft\(^2\) • h • °F) or less. Insulation board shall be formed of noncombustible material.
- \(^b\) For limitations on clearance reduction for solid fuel-burning appliances, masonry chimneys, connector pass-throughs, masonry fireplaces and kitchen ducts, see Sections [308.4.2.1] through [308.4.2.5].

#### [308.7] 308.4.2.1 Solid fuel-burning appliances.
The clearance reduction methods specified in Table [308.6] 308.4.2 shall not be utilized to reduce the clearance required for solid fuel-burning appliances that are labeled for installation with clearances of 12 inches ([305] 304.8 mm) or less. Where appliances are labeled for installation with clearances of greater than 12 inches ([305] 304.8 mm), the clearance reduction methods of Table [308.6] 308.4.2 shall not reduce the clearance to less than 12 inches ([305] 304.8 mm).

#### [308.8] 308.4.2.2 Masonry chimneys.
The clearance reduction methods specified in Table [308.6] 308.4.2 shall not be utilized to reduce the clearances required for masonry chimneys as specified in [Chapter 8 of this code and] the New York City Building Code and Chapter 8 of this code.
308.4.2.3 Chimney connector pass-throughs. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearances required for chimney connector pass-throughs as specified in Section 803.10.4.

308.4.2.4 Masonry fireplaces. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the clearances required for masonry fireplaces as specified in Chapter 8 of this code and the New York City Building Code and Chapter 8 of this code.

308.4.2.5 Kitchen exhaust ducts. The clearance reduction methods specified in Table 308.6 shall not be utilized to reduce the minimum clearances required by Section 506.3.10 for kitchen exhaust ducts enclosed in a shaft.

SECTION MC 309
TEMPERATURE CONTROL

309.1 Space-heating systems. Interior spaces intended for human occupancy shall be provided with active or passive space-heating systems capable of maintaining a minimum indoor temperature of not less than 68°F (20°C) at a point 3 feet (914 mm) above floor on the design heating day. The installation of portable space heaters shall not be used to achieve compliance with this section. Refer to Section 1204 of the New York City Building Code.

Exception: Interior spaces where the primary purpose is not associated with human comfort.

SECTION MC 310
EXPLOSION CONTROL

310.1 Required. Structures occupied for purposes involving explosion hazards shall be provided with explosion control in compliance with rules of the Commissioner of the Fire Department. Explosion control systems shall be designed and installed in accordance with the New York City Fire Code.

SECTION MC 311
SMOKE AND HEAT VENTS

311.1 Required. Approved smoke and heat vents shall be installed in the roofs of one-story buildings where required by the New York City Fire Code. Smoke and heat vents shall be designed and installed in accordance with the New York City Fire Code.

SECTION MC 312
HEATING AND COOLING LOAD CALCULATIONS

312.1 Load calculations. Heating and cooling system design loads for the purpose of sizing systems, appliances and equipment shall be determined in accordance with the procedures described in the ASHRAE Handbook of Fundamentals. Heating and cooling loads shall be adjusted to account for load reductions that are achieved when energy recovery systems are utilized in the HVAC system in accordance with the ASHRAE Handbook—HVAC Systems and Equipment.
Standard 183. Alternatively, design loads shall be determined by an approved equivalent computation procedure, using the design parameters specified in [Chapter 3 of] the New York City Energy Conservation Code. Heating and cooling system design loads for the purpose of sizing systems, appliances and equipment shall also comply with the requirements of Section 1204 of the New York City Building Code.

SECTION MC 313
NOISE CONTROL AND VIBRATION ISOLATION REQUIREMENTS

313.1 General. Interior and exterior mechanical equipment and systems shall comply with the provisions of this section.

313.2 Noise from exterior mechanical equipment. Mechanical equipment located outside of the building in a yard or court or on a roof, or located inside a building but open to the exterior of the building, shall comply with the requirements of Sections 313.2.1 and 313.2.2.

313.2.1 Design and installation. The applicant shall select and design any such exterior mechanical equipment in order to achieve compliance with the applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the Administrative Code, also known as the New York City Noise Control Code, in accordance with generally acceptable engineering practices.

313.2.2 Operation. The operation of such exterior mechanical equipment shall comply with any applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the New York City Noise Control Code, as enforced by the Department of Environmental Protection.

313.3 Minimum structure-borne noise and vibration isolation requirements. All isolators shall comply with the requirements of Sections 313.3.1 through 313.3.10. Where vibration isolation of equipment and appliances is employed, supplemental restraint shall be used to accomplish the support and restraint.

Exception: When specified by the registered design professional, the requirements of Sections 313.3.1 through 313.3.10 may be modified provided that the equipment, appliances, and supports shall be designed and installed so that continuous or intermittent vibration transmitted to structural slabs shall not exceed the following values between 8 Hz and 80 Hz on the structural slab in the affected occupancy space:

1. Group E, I or R occupancies: 5,600 microinches (142.4 um) per second.
2. All other occupancies: 16,000 microinches (406.4 um) per second.

For the purposes of this exception, transmitted vibration shall be in accordance with the following parameters:

1. The peak third-octave band RMS velocity measurements.
2. The method shall be in accordance with ANSI/ASA S2.71.
313.3.1 **Boiler rooms.** Boilers, boiler breeching, and boiler piping shall be isolated in accordance with the applicable requirements of Sections 313.3.1.1 and 313.3.1.2.

313.3.1.1 **Boilers.** All boilers supported on floors directly above a story having dwelling units shall be supported on resilient isolators having a minimum static deflection of 1 inch (25.4 mm). The isolators shall be installed directly under the structural frame of the boiler.

313.3.1.2 **Boiler breeching and piping.** When boilers are equipped with mechanical draft fans, the boiler breeching and piping that are supported from or on slabs, floors or walls that are contiguous to the dwelling unit shall be supported for a distance of 50 pipe diameters on or from resilient isolators. Each isolator shall have a minimum static deflection of 1 inch (25.4 mm).

313.3.2 **Refuse charging chutes.** Metal chutes, chute supports, and chute bracing shall be installed in accordance with Section 313.3.2.1. Masonry chutes must comply with Section 313.3.2.2.

313.3.2.1 **Metal chutes.** Metal chutes, metal chute supports, and/or metal chute bracing shall be free of direct contact with the shaft enclosure and the openings provided in the floor construction. Metal chutes shall be resiliently supported at each structural support location. Isolators shall provide a minimum static deflection of 0.30 inches (7.62 mm). All chutes shall be plumb.

313.3.2.2 **Masonry chutes.** The interior chute wall shall be plumb and without obstructions for the full height of the shaft and shall have a smooth interior finish.

313.3.3 **Piping.** Equipment piping shall be installed as follows:

1. Metal piping connected to power driven equipment shall be resiliently supported from or on the building structure for a distance of 50 pipe diameters from the power driven equipment. The resilient isolators shall have a minimum static deflection of 1 inch (25.4 mm) for all piping with a 4 inch (101.6 mm) or larger in actual outside diameter and ½ inch (12.7 mm) for piping with less than 4 inches (101.6 mm) in actual outside diameter. Piping connected to fluid pressure-reducing valves shall be resiliently isolated for a distance of 50 pipe diameters from pressure-reducing valves and isolators shall provide a minimum static deflection of ½ inch (12.7 mm).

2. Equipment such as heat exchangers, absorption refrigeration machines, or similar equipment, that is located on any floor or roof other than a floor on grade, and that is not power driven but is connected by metal piping to power driven equipment, shall be resiliently supported from or on the building structure, for a distance of 50 pipe diameters from the power driven equipment. The resilient supports shall be vibration isolators having a minimum static deflection of 1 inch (25.4 mm) and shall incorporate approved resilient pads having a minimum thickness of ¼ inch (6.4 mm).

313.3.4 **Fans.** All fan equipment with motors in excess of ½ horsepower (0.37 kW), located on any roof or floor other than a floor on grade shall be mounted on or from vibration isolators. Fan equipment with motor drives separated from the fan equipment shall be supported on an isolated
integral rigid structural base supporting both the fan and motor. Fan equipment with motor drives supported from the fan equipment shall be mounted directly on vibration isolators. Each isolator shall have provision for leveling. Isolators shall incorporate resilient pads having a minimum thickness of ¼ inch (6.4 mm). The vibration isolators shall provide a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum deflection of 2 inches (51.0 mm). Fans and compressors assembled in unitary containers may meet this requirement with isolators internal to the container providing the isolators meet the above minimum isolator efficiencies.

313.3.5 Pumps. All pumps of 3 horsepower (2.24 kW) or more located on any floor other than a floor on grade shall be supported on vibration isolators having a minimum isolation efficiency of 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm).

313.3.6 Compressors. Compressors and drives located on a floor other than a floor on grade shall be mounted on vibration isolators having a minimum isolation efficiency of 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm).

313.3.7 Cooling towers and fluid coolers. All moving parts of cooling towers located on a roof or floor other than a floor on grade shall be installed on vibration isolators providing a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (101.6 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm). Vibration cutoff switches shall be provided.

313.3.8 Evaporative condensers. Evaporative and air cooled condensers located on a roof or floor other than a floor on grade shall be mounted on vibration isolators providing a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (101.6 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of ¼ inch (6.4 mm). Vibration cutoff switches shall be provided on evaporative condensers.

313.3.9 Duct connections to fans. Flexible connections shall be installed between fan equipment and connecting ductwork.

313.3.10 Ceiling suspended packaged HVAC units with compressors. Equipment such as heat pumps, air-conditioning units, or similar equipment, that is suspended from a structure shall be resiliently supported from or on the building structure. Vibration isolators shall have a minimum isolation efficiency of 90 percent at the lowest disturbing frequency.

§ 5. Chapter 4 of the New York city mechanical code, as amended by local law number 141 for the year 2013, section 401.5 as amended by local law number 51 for the year 2014, and section 403.3 as amended by local law number 187 for the year 2017, is amended to read as follows:
401.1 Scope. This chapter shall govern the ventilation of spaces within a building intended to be occupied. Mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking appliances; hazardous exhaust systems; dust, stock and refuse conveyor systems; subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502 shall comply with Chapter 5.

401.2 Ventilation required. Habitable and occupiable spaces shall be provided with ventilation in accordance with this section.

1. Every occupiable space shall be:

   1.1. Naturally ventilated [by natural means] in accordance with Section 402 and mechanically exhausted in accordance with Table 403.3.1.1; or

   1.2. [by mechanical means] Mechanically ventilated in accordance with Section 403.

2. All habitable spaces and occupiable spaces provided with air conditioning shall be mechanically ventilated in accordance with Section 403.

3. Every habitable space shall be naturally ventilated [by natural means] in accordance with Section 402 [and].

4. Every habitable space shall be mechanically ventilated if required by [Table 403.3, by mechanical means in accordance with] Section 403.

   Ambulatory care facilities (Group B) and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

401.3 When required. Ventilation shall be provided during the periods that the room or space is occupied or during operation of gas appliances.

401.4 Intake [Opening] opening location. [Air] Ventilation air intake openings shall comply with all of the following:

1. Intake openings shall be located [a minimum of] not less than 10 feet (3048 mm) from lot lines or buildings on the same lot. For buildings on lots measuring less than 20 feet (6096 mm) in width, intake openings shall be located at the centerline between lot lines. Where openings front on a street or public way, the distance shall be measured to the centerline of the street or public way.

2. Outdoor air intakes for [high rise] office [buildings] occupancies having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access serving spaces above the second story and serving spaces greater than 10,000 square
feet (929 m²) of floor area shall be located at least 20 feet (6096 mm) above ground level, at least 30 feet (9144 mm) from exhaust outlets and other exhaust discharges, and at least 20 feet (6096 mm) from areas that may collect vehicular exhaust, such as off street loading bays.

3. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) horizontally from any hazardous or noxious contaminant source, such as vents, exhausts (including but not limited to exhaust from dry cleaning establishments, spray booths, and cooling towers), streets, alleys, parking lots and loading docks, except as specified in Item 3 of Section [501.2.1] 501.2.1. Outdoor air intake openings shall be permitted to be located less than 10 feet (3048 mm) horizontally from streets, alleys, parking lots and loading docks provided that the openings are located not less than 25 feet (7620 mm) vertically above such locations. Where openings front on a street or public way, the distance shall be measured from the closest edge of the street or public way.

4. Where the requirements of Item 3 above cannot be achieved, intake openings shall be located not less than 3 feet ([914] 914.4 mm) below contaminant sources where such sources are located within 10 feet (3048 mm) of the opening.

5. Intake openings in Group I occupancies shall comply with ANSI/ASHRAE/ASHE 170, as required.

6. Intake openings on structures in flood hazard areas shall comply with the additional requirements of Appendix G of the New York City Building Code.

**Exception:** Group R-3 occupancies are not required to comply with Section 401.4. [\*]

[401.4] **401.4.1 Required dampers in intake openings.** [An outdoor air intake opening with gross area of more than 144 square inches (0.0929 m²) shall be provided with fire dampers and smoke dampers, or combined fire and smoke dampers when such opening is located as follows:] Outdoor air intakes shall be provided with dampers in accordance with Chapter 6.

[1. Less than 30 feet (9144 mm) above grade.-]

[2. Less than 30 feet (9144 mm) in any direction from any opening in another building.-]

[3. Less than 15 feet (4572 mm) from a lot line.-]

[4. Less than 50 feet (15 240 mm) above and less than 50 feet (15 240 mm) in any direction from a roof constructed of combustible material or a building in which the exterior walls are constructed wholly or partly of wood.] 

[5. Where fire dampers are required by Section 607.5.6.]

[Exceptions:]

[1. Smoke dampers shall not be required for outdoor air intake openings installed in any construction required to have a fire-resistance rating that is less than 2 hours.-]
[2. Smoke dampers shall not be required for outdoor air intake openings of systems greater than 15,000 cfm (7.1 m³/s) which are provided with smoke dampers in accordance with Chapter 6 of this code and arranged so as to not introduce smoke into the building or space in which the equipment is located.]

401.5 Intake opening protection. Air intake openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in louvers, grilles and screens shall be sized in accordance with Table 401.6, and shall be protected against local weather conditions. Outdoor air intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with Section 705 of the New York City Building Code.

<table>

<tr>
<td>Intake openings in other than residential occupancies</td>
<td>[Not &lt; ¼] &gt; ¼ inch and not &gt; 1 inch</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm.

401.6 Contaminant sources. Stationary local sources producing air-borne particulates, heat, odors, fumes, spray, vapors, smoke or gases in such quantities as to be irritating or injurious to health shall be provided with an exhaust system in accordance with Chapter 5 or a means of collection and removal of the contaminants. Such exhaust shall discharge directly to an approved location at the exterior of the building.

401.6.1 Wind-driven rain [rating]. All exterior louvers for building ventilation systems shall [either] conform to the requirements of Chapter 16 of the New York City Building Code, where applicable, and the following:

1. [Receive an A rating according to] Comply with the requirements of AMCA 550 [for wind-driven rain penetration for a 50 mile per hour (80.4 km/h) wind velocity with a rainfall rate of 8 inches (203 mm) per hour]. Louvers shall comply with the intrusion requirements of wind-driven rain without the use of a damper. Outdoor air intake openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with Chapter 16 of the New York City Building Code; or

2. Be installed on a plenum configured to intercept any wind-driven rain penetrating the louver and to prevent the rain from entering the building ductwork system. Such plenum shall be waterproofed and equipped with a drainage system to convey water penetrating the louver [to storm or sanitary drains] directly to the outdoors or in accordance with the New York City Plumbing Code.
SECTION MC 402
NATURAL VENTILATION

402.1 General. Natural ventilation of occupied and habitable spaces shall comply with Chapter 12 of the New York City Building Code.

402.2 Reserved.

402.3 Reserved.

402.4 Reserved.

SECTION MC 403
MECHANICAL VENTILATION

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or exhaust air. The amount of supply air shall be approximately equal to the amount of return and exhaust air. The system shall not be prohibited from producing negative or positive pressure; such pressures shall not result in door opening forces in excess of those indicated in the New York City Building Code and shall not prevent doors from closing as required by the New York City Building Code. The system method to convey ventilation air shall be designed and installed in accordance with Chapter 6.

403.2 Outdoor air required. The minimum outdoor airflow rate shall be determined in accordance with Section 403.3.1.1. Ventilation supply systems shall be designed to deliver the required rate of outdoor airflow to the breathing zone within each occupiable space.

Exception: Where a registered design professional demonstrates that an engineered ventilation system design will prevent the maximum concentration of contaminants from exceeding that obtainable by the rate of outdoor air ventilation determined in accordance with Section 403.3, the minimum required rate of outdoor air shall be reduced in accordance with such engineered system design. The minimum required rate of outdoor air may be reduced where the registered design professional demonstrates that an engineered ventilation system is designed in accordance with ASHRAE 62.1 Indoor Air Quality Procedure.

403.2.1 Recirculation of air. The outdoor air required by Section 403.3.1.1 shall not be recirculated. Air in excess of that required by Section 403.3.1.1 shall not be prohibited from being recirculated as a component of supply air to building spaces, except that:

1. Ventilation air shall not be recirculated from one dwelling unit to another or to dissimilar occupancies.

2. Supply air to a swimming pool and associated deck areas shall not be recirculated unless such air is dehumidified to maintain the relative humidity of the area at 60 percent or less. Air from this area shall not be recirculated to other uses or occupancies.

3. Where mechanical exhaust is required by Note b of Table 403.3.1.1, recirculation of air from such spaces shall be prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited. Where recirculation of
air is prohibited, all air supplied to such spaces shall be exhausted, including any air in excess of that required by Table [403.3] 403.3.1.1.

4. Where mechanical exhaust is required by Note g [of] in Table [403.3] 403.3.1.1, mechanical exhaust is required and recirculation is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited.

403.2.2 Transfer air. Except where recirculation from such spaces is prohibited by Table [403.3] 403.3.1.1, air transferred from occupiable spaces is not prohibited from serving as makeup air for required exhaust systems in such spaces as kitchens, baths, toilet rooms, elevators and smoking lounges. The amount of transfer air and exhaust air shall be sufficient to provide the flow rates as specified in Section [403.3] 403.3.1.1. The required outdoor airflow rates specified in Table [403.3] 403.3.1.1 shall be introduced directly into such spaces or into the occupied spaces from which air is transferred or a combination of both.

403.3 Outdoor air and local exhaust airflow rates. Buildings that are not more than three stories in height above grade plane, and that (i) are within Occupancy Group R-2 or Occupancy Group R-3, (ii) are adult homes or enriched living housing as described in Section 308.3.1 of the New York City Building Code, within Occupancy Group I-1 and have 16 occupants or fewer, or (iii) are community residences or intermediate-care facilities as described in Section 308.3.2 of the New York City Building Code, shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.1.2. All other buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Sections 403.3.1.1 through 403.3.1.6.

403.3.1 Reserved.

403.3.1.1 Outdoor airflow rate. Ventilation systems shall be designed to have the capacity to supply the minimum outdoor airflow rate [;] determined in accordance with this section. In each occupiable space and, where required, each habitable space, the ventilation system shall be designed to deliver the required rate of outdoor airflow to the breathing zone. The occupant load utilized for design of the ventilation system shall be not [be] less than the number determined from the estimated maximum occupant load rate indicated in Table [403.3] 403.3.1.1. Ventilation rates for occupancies not represented in Table [403.3] 403.3.1.1 shall be those for a listed occupancy classification that is most similar in terms of occupant density, activities and building construction; or shall be determined by an approved engineering analysis. The ventilation system shall be designed to supply the required rate of ventilation air continuously during the period the building is occupied, except as otherwise stated in other provisions of the code.

With the exception of non-tobacco hookah establishments, the ventilation rates in Table [403.3] 403.3.1.1 are based on the absence of smoking in occupiable spaces. Where smoking is anticipated in a space other than a non-tobacco hookah establishment, the ventilation system serving the space shall be designed to provide ventilation over and above that required by Table [403.3] 403.3.1.1 in accordance with accepted engineering practice.

[Exception] Exceptions:
1. The occupant load is not required to be determined based on the estimated maximum occupant load rate indicated in Table 403.3.1.1, where approved statistical data documents the accuracy of an alternate anticipated occupant load.

2. The occupant load used in computing the required ventilation shall be the maximum number who will occupy the room or space simultaneously during any 2-hour period.

3. Dynamic reset (Demand Controlled Ventilation). The system may be designed to reset the design outdoor air intake airflow and/or space or zone airflow as operating conditions change. Dynamic reset shall be designed in accordance with ASHRAE 62.1 and comply with footnote k of Table 403.3.1.1. These conditions include, but are not limited to:

   3.1 Variations in occupancy or ventilation airflow in one or more individual zones for which ventilation airflow requirements will be reset. Note: Examples of measures for estimating such variations include: occupancy scheduled by time of day, a direct count of occupants, or an estimate of occupancy or ventilation rate per person using occupancy sensors such as those based on indoor CO2 concentrations.

   3.2 Variations in the efficiency with which outdoor air is distributed to the occupants under different ventilation system airflows and temperatures.

   3.3 A higher fraction of outdoor air in the air supply due to intake of additional outdoor air for free cooling or exhaust air makeup.

  - Darkrooms
- Copy, printing rooms
- Darkrooms: (Copy, printing rooms)
- Meat processing
- Pharmacy (prep. area)
- Photo studios
- Computer (without printing)
- Computer (without printing)

For SF: 1 cubic foot per minute = 0.0004719 m³/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 m³/(s • m²), °C = ((°F) − 32)/1.8, 1 square foot = 0.0929 m².

a. Based upon net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited (see Section 403.2.1, Item [4]).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet or urinal. The higher rate shall be provided where [period of heavy use are expected to occur, such as toilets in theaters, schools and sports facilities] and the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where [periods of heavy use are not expected] the exhaust system is designed to operate continuously while the space served by the toilet facilities is occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate continuously [during normal hours of use] while the sleeping unit or sleeping unit served by the toilet facility is occupied.

- Mechanical exhaust is required and recirculation from such spaces is prohibited (see Section 403 2.1, Item 4).

- For nail salons, the required exhaust shall include ventilation fans or other systems that capture the contaminants and odors at their source and are capable of exhausting a minimum of 40 cubic feet per station. Each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1 for the nail salon.

- For R-2 buildings less than 125 feet in height, outdoor ventilation air provided by mechanical means serving dwelling units designed to exceed 100 cfm per dwelling unit, whether intermittent or continuous, shall be required. For buildings 125 feet and greater, outdoor ventilation air shall be provided by mechanical means when the sum of the exhaust designed to exceed 75 cfm, whether continuous or intermittent, per dwelling unit. Manually operated operable exterior wall openings shall not be used to provide outside ventilation air except where calculations are submitted showing that such openings are located at or below the lowest calculated neutral pressure plane (calculated at the winter outdoor design temperature); and taking into account a composite mass flow air balance of the building including all mechanical systems.

- For each dwelling unit within R-2 occupancies, outdoor ventilation air shall be provided by mechanical means when the sum of all exhaust air flow rates, whether continuous or intermittent, is designed to exceed 75 cfm. When provided, mechanical ventilation air flow rate shall be approximately equal to the exhaust air flow rate in accordance with Section 403.1 and shall not be less than that required by the air flow rates prescribed in Table 403.3.1. For such dwelling units, manually operated, operable exterior wall openings shall not be used to provide required mechanical ventilation air.

- During unoccupied hours the ventilation rate and exhaust rates may be reduced to 0.5 cfm/ft².

- When an educational science laboratory is occupied and hoods are not in use and hazardous materials are not present, then ventilation rates shall be consistent with actual use of the space, but not less than 0.5 cfm/ft².

- See Section 502.6 for additional requirements.

**[403.3.1] 403.3.1.1 Zone outdoor airflow.** The minimum outdoor airflow required to be supplied to each zone shall be determined as a function of occupancy classification and space air distribution effectiveness in accordance with Sections [403.3.4] 403.3.1.1.1 through [403.3.3] 403.3.1.1.3.
403.3.1.1 Breathing zone outdoor airflow. The outdoor airflow rate required in the breathing zone \( V_{bz} \) of the occupiable space or spaces in a zone shall be determined in accordance with Equation 4-1.

\[
V_{bz} = R_p P_z + R_a A_z \quad \text{(Equation 4-1)}
\]

where:

\( A_z = \) Zone floor area: the net occupiable floor area of the space or spaces in the zone.

\( P_z = \) Zone population: the number of people in the space or spaces in the zone.

\( R_p = \) People outdoor air rate: the outdoor airflow rate required per person from Table 403.3.1.1.1.

\( R_a = \) Area outdoor air rate: the outdoor airflow rate required per unit area from Table 403.3.1.1.1.

403.3.1.2 Zone air distribution effectiveness. The zone air distribution effectiveness \( E_z \) shall be determined using Table [403.3.1.2] 403.3.1.1.2.

<table>
<thead>
<tr>
<th>AIR DISTRIBUTION CONFIGURATION</th>
<th>( E_z )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ceiling or floor supply of cool air</td>
<td>1.0 [^{[f]}]</td>
</tr>
<tr>
<td>Ceiling or floor supply of warm air and floor return</td>
<td>1.0</td>
</tr>
<tr>
<td>Ceiling supply of warm air and ceiling return</td>
<td>0.8 [^{[f]}]</td>
</tr>
<tr>
<td>Floor supply of warm air and ceiling return</td>
<td>0.7</td>
</tr>
<tr>
<td>Makeup air drawn in on the opposite side of the room from the exhaust and/or return</td>
<td>0.8</td>
</tr>
<tr>
<td>Makeup air drawn in near to the exhaust and/or return location</td>
<td>0.5</td>
</tr>
</tbody>
</table>

For SI: 1 foot = 304.8 mm, 1 foot per minute = 0.00506 m/s, °C = (°F − 32) / 1.8.

[^{f}]: "Cool air" is air cooler than space temperature.

[^{f}]: "Warm air" is air warmer than space temperature.

[^{f}]: "Ceiling" includes any point above the breathing zone.

[^{f}]: "Floor" includes any point below the breathing zone.

[^{f}]: "Makeup air" is air supplied or transferred to the room to replace air removed from the room by exhaust or return systems.

[^{f}]: Zone air distribution effectiveness of 1.2 shall be permitted for systems with a ceiling supply of warm air, provided that supply air temperature is less than 15°F above space temperature and provided that the 150 foot-per-minute supply air jet reaches to within 4½ feet of floor level.

403.3.1.3 Zone outdoor airflow. The zone outdoor airflow rate \( V_{oz} \), shall be determined in accordance with Equation 4-2.

\[
V_{oz} = \frac{V_{bz}}{E_z} \quad \text{(Equation 4-2)}
\]

403.3.2 System outdoor airflow. The outdoor air required to be supplied by each ventilation system shall be determined in accordance with Sections 403.3.2.1 through 403.3.2.3 as a function of system type and zone outdoor airflow rates.

403.3.2.1 Single zone systems. Where one air handler supplies a mixture of outdoor air and recirculated return air to only one zone, the system outdoor air intake flow rate \( V_{oi} \) shall be determined in accordance with Equation 4-3.
\[ V_{ot} = V_{oz} \]  \hspace{1cm} \text{(Equation 4-3)}

[403.3.2.2] 403.3.1.1.2.2 100-percent outdoor air systems. Where one air handler supplies only outdoor air to one or more zones, the system outdoor air intake flow rate \( V_{ot} \) shall be determined using Equation 4-4.

\[ V_{ot} = \sum_{\text{all zones}} V_{oz} \]  \hspace{1cm} \text{(Equation 4-4)}

[403.3.2.3] 403.3.1.1.2.3 Multiple zone recirculating systems. Where one air handler supplies a mixture of outdoor air and recirculated return air to more than one zone, the system outdoor air intake flow rate \( V_{ot} \) shall be determined in accordance with Sections [403.3.2.3.1] 403.3.1.2.3.1 through [403.3.2.3.4] 403.3.1.2.3.4.

[403.3.2.3.1] 403.3.1.1.2.3.1 Primary outdoor air fraction. The primary outdoor air fraction \( Z_p \) shall be determined for each zone in accordance with Equation 4-5.

\[ Z_p = \frac{V_{oz}}{V_{pz}} \]  \hspace{1cm} \text{(Equation 4-5)}

where:

\[ V_{pz} = \text{Primary airflow: The airflow rate supplied to the zone from the air-handling unit at which the outdoor air intake is located. It includes outdoor intake air and recirculated air from that air-handling unit but does not include air transferred or air recirculated to the zone by other means. For design purposes, } V_{pz} \text{ shall be the zone design primary airflow rate, except for zones with variable air volume supply and } V_{pz} \text{ shall be the lowest expected primary airflow rate to the zone when it is fully occupied.} \]

[403.3.2.3.2] 403.3.1.1.2.3.2 System ventilation efficiency. The system ventilation efficiency \( E_v \) shall be determined using Table [403.3.2.3.2] 403.3.1.2.3.2 or Appendix A of ASHRAE 62.1.

<table>
<thead>
<tr>
<th>Max ((Z_p))</th>
<th>( E_v )</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

a. Max \((Z_p)\) is the largest value of \(Z_p\) calculated using Equation 4-5 among all the zones served by the system.
b. Interpolating between table values shall be permitted.

[403.3.2.3.3] 403.3.1.1.2.3.3 Uncorrected outdoor air intake. The uncorrected outdoor air intake flow rate \( V_{ou} \) shall be determined in accordance with Equation 4-6.

\[ V_{ou} = D \sum_{\text{all zones}} R_{pPz} + \sum_{\text{all zones}} R_{aAz} \]  \hspace{1cm} \text{(Equation 4-6)}

where:
D = Occupant diversity: the ratio of the system population to the sum of the zone populations, determined in accordance with Equation 4-7.

\[ D = \frac{P_s}{\sum_{\text{all zones}} P_z} \]  
(Equation 4-7)

where:

\[ P_s = \] System population: The total number of occupants in the area served by the system. For design purposes, \( P_s \) shall be the maximum number of occupants expected to be concurrently in all zones served by the system.

[403.3.2.3.4] **403.3.1.2.3.4 Outdoor air intake flow rate.** The outdoor air intake flow rate \( (V_{ot}) \) shall be determined in accordance with Equation 4-8.

\[ V_{ot} = V_{ou} / E_v \]  
(Equation 4-8)

[403.4] **403.3.1.2 Short-term conditions.** If it is known that peak occupancy will be of short duration and/or ventilation will be varied or interrupted for a short period of time, the design may be based on the average conditions over a time period \( T \) determined by Equation 4-9.

\[ T = \frac{3V}{V_{bz}} \]  
(Equation 4-9) (US)

\[ T = \frac{50V}{V_{bz}} \]  
(Equation 4-9) (SI)

where:

\[ T = \] averaging time period, minutes

\[ V = \] the volume of the zone of which averaging is being applied, cubic feet

\[ V_{bz} = \] the breathing zone outdoor airflow calculated using Equation 4-1 and design valve of the zone population \( P_z \), cfm

Acceptable design adjustments based on this optional provision include the following:

1. Zone with fluctuating occupancy: the zone population \( (P_z) \) may be averaged over time \( T \).
2. Zone with intermittent interruption of supply air: the average outdoor airflow supplied to breathing zone over time \( T \) shall be no less than the breathing zone outdoor airflow \( (V_{bz}) \) calculated using \[ \text{equation} \] Equation 4-1.
3. A system with intermittent closure of outdoor air intake: the average outdoor air intake over time \( T \) shall be no less than the minimum outdoor air intake \( (V_{ot}) \) calculated using \[ \text{equation} \] Equation 4-3, 4-4 or 4-8, as appropriate.

[403.5] **403.3.1.3 Exhaust ventilation.** Exhaust airflow rate shall be provided in accordance with the requirements \[ \text{in} \] of Table [403.3] 403.3.1.1. Exhaust makeup air shall be permitted to be any combination of outdoor air, recirculated air and transfer air, except as limited in accordance with Section 403.2.

[403.6] **403.3.1.4 System operation.** The minimum flow rate of outdoor air that the ventilation system must be capable of supplying during its operation shall be permitted to be based on the rate per person indicated in Table 403.3 403.3.1.1 and the actual number of occupants present.
Variable air volume system control. Variable air volume air distribution systems, other than those designed to supply only 100-percent outdoor air, shall be provided with controls to regulate the flow of outdoor air. Such control system shall be designed to maintain the flow rate of outdoor air at a rate of not less than that required by Section [403.3] 403.3.1.1 over the entire range of supply air operating rates.

Balancing. The ventilation air distribution system shall be provided with means to adjust the system to achieve [at least] not less than the minimum ventilation airflow rate as required by Sections [403.3] 403.3.1.1 and [403.4] 403.3.1.2. Ventilation systems shall be balanced by an approved method. Such balancing shall verify that the ventilation system is capable of supplying and exhausting the airflow rates required by Sections [403.3] 403.3.1.1 and [403.4] 403.3.1.2.

SECTION MC 404
ENCLOSED PARKING GARAGES

Enclosed parking garages. Where mechanical ventilation systems for enclosed parking garages shall be permitted to operate intermittently where the system is arranged to operate automatically upon detection of a concentration, such operation shall be automatic by means of carbon monoxide of 25 parts per million (ppm) by approved automatic detection devices detectors applied in conjunction with nitrogen dioxide detectors. Such detectors shall be installed in accordance with their manufacturers’ instructions. Such systems shall operate automatically upon detection of a concentration of carbon monoxide of 25 parts per million (ppm) or nitrogen dioxide of 500 parts per billion (ppb).

Minimum ventilation. Automatic operation of the system shall not reduce the ventilation airflow rate below 0.05 cfm per square foot (0.00025 m³/s • m²) of the floor area and the system shall be capable of producing a ventilation airflow rate of 0.75 cfm per square foot (0.0038 m³/s • m²) of floor area.

Occupied spaces accessory to public garages. Connecting offices, waiting rooms, ticket booths and similar uses that are accessory to a public garage shall be maintained at a positive pressure and shall be provided with ventilation in accordance with Section 403.3.

SECTION MC 405
SYSTEMS CONTROL

General. Mechanical ventilation systems shall be provided with manual or automatic controls that will operate such systems whenever the spaces are occupied. Air-conditioning systems that supply required ventilation air shall be provided with controls designed to automatically maintain the required outdoor air supply rate during occupancy.

Manual control. Each air distribution system shall be provided with not less than one manual control to stop the operation of the supply, return, and exhaust fans(s) in an emergency. The manual control shall be provided at an approved location. A disconnect switch shall not be considered a manual control.
405.2.1 Office buildings. Any building where the main use or dominant occupancy is classified in Occupancy Group B having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, where a system serves a floor or floors other than the floor on which the equipment is located, shall be provided with the following controls, in addition to the controls required by this chapter:

1. Manual controls for operating individually each air supply and each exhaust or return fan in the system located as follows:
   1.1. At the Fire Command Center, and
   1.2. In the room containing the affected air-handling fans.

2. Manual controls for operating individually or in groups each remote control reversible fire shutter, when such shutters are provided in accordance with the provisions of the New York City Building Code, or each smoke damper provided in accordance with the provisions of the New York City Building Code. Such controls shall be located at the Fire Command Center.

SECTION MC 406
VEHILATION OF UNINHABITED SPACES

406.1 General. Uninhabited spaces, such as crawl spaces and attics, shall be provided with natural ventilation openings as required by the New York City Building Code or shall be provided with a mechanical exhaust and supply air system. The mechanical exhaust rate shall be not less than 0.02 cfm per square foot (0.00001 m³/s • m²) of horizontal area and shall be automatically controlled to operate when the relative humidity in the space served exceeds 60 percent.

406.1.1 Methane and radon venting. The design and materials used in the installation of the methane and radon vent systems shall be approved by the commissioner and shall comply with all applicable rules of the Fire Department.

SECTION MC 407
AMBULATORY CARE FACILITIES AND GROUP I-2 OCCUPANCIES

407.1 General. Mechanical ventilation for ambulatory care facilities (Group B) and Group I-2 occupancies shall be designed and installed in accordance with all applicable federal, state and local regulations.

SECTION MC 408
VENTILATION OF NONPRODUCTION CHEMICAL LABORATORIES

408.1 General. Nonproduction chemical laboratories complying with the hazardous materials quantity limitations of Section [424] 427 of the New York City Building Code shall provide a mechanical ventilation system in accordance with NFPA 45 and Table [403.3] 403.3.1.1 of this code [and NFPA 45], except that ducts constructed of combustible materials shall not be permitted.
§ 6. Chapter 5 of the New York city mechanical code, as amended by local law number 141 for the year 2013, section 507.16 as amended by local law number 148 for the year 2013, and section 513.4.6 as amended by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 5
EXHAUST SYSTEMS

SECTION MC 501
GENERAL

501.1 Scope. This chapter shall govern the design, construction and installation of mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking appliances; hazardous exhaust systems; dust, stock and refuse conveyor systems; subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502.

501.2 Independent system required. Single or combined mechanical exhaust systems for environmental air shall be independent of all other exhaust systems except as permitted in Section 514. Dryer exhaust shall be independent of all other systems. Type I exhaust systems shall be independent of all other exhaust systems except as provided in Section 506.3.5. Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems. Kitchen exhaust systems shall be constructed in accordance with Section 505 for domestic equipment and Sections 506 through 509 for commercial equipment.

501.3 Exhaust discharge. The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a public nuisance and the air shaft will be located not less than the distances specified in Section 501.2.1 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic or crawl space.

Exceptions:

1. Whole-house ventilation-type attic fans shall be permitted to discharge into the attic space of dwelling units having private attics.

2. Commercial cooking recirculating systems.

3. Where installed in accordance with the manufacturer’s instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled domestic ductless range hoods shall not be required to discharge to the outdoors.

[501.2.1] 501.3.1 Location of exhaust outlets. The termination point of exhaust outlets and ducts discharging to the outdoors shall be located within the following minimum distances of separation specified in Items 1 through 6 of this section. Separation shall not be required between an air intake and the discharge air from non-evaporative heat rejection or heat absorption
appliances such as air-cooled condensers, dry coolers, or heat pump evaporators; such air is not exhaust. The inlet and discharge of the appliance shall not reduce the effective separation of other exhausts from ventilation intakes to less than the required minimums.

1. For ducts conveying noxious, toxic, explosive or flammable vapors, fumes or dusts (including but not limited to exhaust from dry cleaning establishments and spray booths): 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1828.8 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade. Additional requirements may apply to Hazardous Exhaust Systems; see Section 510.

2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914.4 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade; 10 feet from any exterior fire escape, stair, or balcony.

3. For all environmental air exhaust outlets: 3 feet (914.4 mm) from property lines separating lots; 3 feet (914.4 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust outlets shall not be considered hazardous or noxious.

Exception: A 10 foot (3048 mm) separation is not required between a mechanical air intake and an exhaust outlet which serve either of the following:

1. a single room, dwelling or sleeping unit with less than 750 cfm (354 L/s) Class 1 exhaust air; or

2. a single dwelling or sleeping unit with less than 400 cfm (189 L/s) Class 2 exhaust air.

For this exception, the sum of any energy recovery device cross contamination and any re-entrainment of exhaust through the intake shall be less than 10% of the intake air flow as established by the manufacturer. The distance requirements from property lines and operable openings shall be maintained. Air Class shall be determined in accordance with ASHRAE Standard 62.1.

4. Exhaust outlets and openings serving structures in flood hazard areas shall [be installed in accordance] comply with the additional requirements of Appendix G of the New York City Building Code.

5. For specific systems see the following sections:

5.1. Clothes dryer exhaust, Section 504.4.

5.2. Kitchen hoods and other kitchen exhaust equipment, Sections [506.3.12] 506.3.13, 506.4 and 506.5.

5.3. Dust stock and refuse conveying systems, Section 511.
5.4. Subslab soil exhaust systems, Section 512.4.

5.5. Smoke control systems, Section [513.10.3] 909.10.3 of the New York City Building Code.

5.6. Refrigerant discharge, Section 1105.7.

5.7. Machinery room discharge, Section 1105.6.1.

6. In Occupancy Groups R-2 and R-3, each dwelling unit may be individually exhausted directly to the outdoors with a dedicated [1] exhaust fan and shall comply with the following:

6.1. The exhaust system for the kitchen and the toilet/baths may be combined to the inlet of a [continuously operated] single fan, provided such exhaust system serves only one dwelling unit.

6.2. The dedicated exhaust from each dwelling unit shall be directed away from any window serving the same dwelling unit from which the exhaust is taken, and in addition, such exhaust opening shall terminate at least:

6.2.1. Two feet ([610] 609.6 mm) from any operational window or door serving the same dwelling unit.

6.2.2. Three feet ([1219] 914.4 mm) from any operational window or door serving an adjoining dwelling unit.

6.2.3. Three feet ([1219] 914.4 mm) from any operational window or door serving another occupancy group in the same building.

6.2.4. Ten feet (3048 mm) from any outdoor air intake opening other than intakes serving the same dwelling unit.

6.2.5. Ten feet (3048 mm) above the public sidewalk adjoining the same building.

6.2.6. All other minimum distances prescribed in Items 1 through 5 of Section [501.2.1] 501.3.1 shall be satisfied.

[501.2.2] 501.3.2 Exhaust opening protection. Exhaust openings that terminate outdoors shall be protected with corrosion-resistant screens, louvers or grilles. Openings in screens, louvers and grilles shall be sized not less than ¼ inch ([6] 6.4 mm) and not larger than ½ inch ([13] 12.7 mm). Openings shall be protected against local weather conditions. Louvers that protect exhaust openings shall comply with AMCA Standard 550. Outdoor openings located in exterior walls shall meet the provisions for exterior wall opening protective in accordance with the New York City Building Code.
501.2.1 Wind-driven rain [rating]. All exterior louvers for building exhaust systems shall [either:] conform to the requirements of Chapter 16 of the New York City Building Code, where applicable, and the following:

1. [Receive an A rating according to AMCA Standard 550 for wind driven rain penetration for a 50 mile per hour (80.4 km/h) wind velocity with a rainfall rate of 8 inches (203 mm) per hour] Comply with the requirements of AMCA Standard 550. Louvers shall comply with the intrusion requirements of wind-driven rain without the use of a damper. Exhaust openings located in exterior walls shall meet the provisions for exterior wall opening protectives in accordance with Chapter 16 of the New York City Building Code; or

2. Be installed on a plenum configured to intercept any wind-driven rain penetrate the louver and to prevent the rain from entering the building ductwork system. Such plenum shall be waterproofed and equipped with a drainage system to convey water penetrating the louver [to storm or sanitary drains] directly to the outdoors or in accordance with the New York City Plumbing Code.

501.4 Pressure equalization. Mechanical exhaust systems shall be sized to remove the quantity of air required by this chapter to be exhausted. The system shall operate when air is required to be exhausted. Where mechanical exhaust is required in a room or space in other than occupancies in R-3, such space shall be maintained with a neutral or negative pressure. If a greater quantity of air is supplied by a mechanical ventilating supply system than is removed by a mechanical exhaust for a room, adequate means shall be provided for the natural or mechanical exhaust of the excess air supplied. If only a mechanical exhaust system is installed for a room or if a greater quantity of air is removed by a mechanical exhaust system than is supplied by a mechanical ventilating supply system for a room, adequate makeup air consisting of supply air, transfer air or outdoor air shall be provided to satisfy [the deficiency] the deficiency. The calculated building infiltration rate and openable area shall not be used to satisfy the requirements of this section.

501.5 Ducts. Where exhaust duct construction is not specified in this chapter, such construction shall comply with Chapter 6.

501.6 Independent system required. The following shall be independent of other exhaust systems:

1. Single or combined mechanical exhaust systems from bath, toilet, urinal, locker, service sink closets and similar rooms shall be independent of all other exhaust systems, except as permitted in Section 501.2.1.

2. A separate grease duct system shall be provided for each Type I hood except as provided in Section 506.3.5.

3. Hazardous exhaust systems shall be independent of other types of exhaust systems as provided in Section 510.
SECTION MC 502
REQUIRED SYSTEMS

502.1 General. An exhaust system shall be provided, maintained and operated as specifically required by this section and for all occupied areas where machines, vats, tanks, furnaces, forges, salamanders and other appliances, equipment and processes in such areas produce or throw off dust or particles sufficiently light to float in the air, or which emit heat, odors, fumes, spray, gas or smoke, in such quantities so as to be irritating or injurious to health or safety.

502.1.1 Exhaust location. The inlet to an exhaust system shall be located in the area of heaviest concentration of contaminants.

502.1.2 Fuel-dispensing areas. The bottom of an air inlet or exhaust opening in fuel-dispensing areas shall be located not more than 18 inches ([457] 457.2 mm) above the floor.

502.1.3 Equipment, appliance and service rooms. Equipment, appliance and system service rooms that house sources of odors, fumes, noxious gases, smoke, steam, dust, spray or other contaminants shall be designed and constructed so as to prevent spreading of such contaminants to other occupied parts of the building.

502.1.4 Hazardous exhaust. The mechanical exhaust of high concentrations of dust or hazardous vapors shall conform to the requirements of Section 510.

502.2 Aircraft fueling and defueling. Compartments housing piping, pumps, air eliminators, water separators, hose reels and similar equipment used in aircraft fueling and defueling operations shall be adequately ventilated [in an approved manner] at floor level or within the floor itself.

502.3 Battery-charging areas for powered vehicles and equipment. Ventilation shall be provided in an approved manner in battery-charging areas to prevent a dangerous accumulation of flammable gases.

Exception: Lithium-ion batteries shall not require ventilation.

502.4 Stationary storage battery systems. Stationary storage battery systems, as regulated by Section 608 of the New York City Fire Code, shall be provided with ventilation in accordance with this chapter [and] Section 502.4.3 and either Section 502.4.1 or 502.4.2.

Exception: Lithium-ion batteries shall not require ventilation.

502.4.1 Hydrogen limit [limit] in rooms. For flooded lead acid, flooded nickel cadmium and VRLA batteries, the ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the room.

502.4.2 Ventilation rate in rooms. Continuous ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (cfm/ft²) (0.00508 m³/(s • m²)) of floor area of the room.
502.4.3 **Supervision.** Mechanical ventilation systems required by Section 502.4 shall be supervised with proof of airflow by a central, proprietary system or remote station service or shall initiate an audible and visual signal at a constantly attended on-site location.

502.5 **Valve-regulated lead-acid batteries in cabinets.** Valve-regulated lead-acid (VRLA) [battery systems] batteries installed in cabinets, as regulated by Section 608.6.2 of the New York City Fire Code, shall be provided with ventilation in accordance with Section 502.5.3 and either Section 502.5.1 or 502.5.2.

502.5.1 **Hydrogen limit in cabinets.** The cabinet ventilation system shall be designed to limit the maximum concentration of hydrogen to 1.0 percent of the total volume of the cabinet during the worst-case event of simultaneous boost charging of all batteries in the cabinet.

502.5.2 **Ventilation rate in cabinets.** Continuous cabinet ventilation shall be provided at a rate of not less than 1 cubic foot per minute per square foot (1 cfm/ft\(^2\)) \((0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))\) of the floor area covered by the cabinet. The room in which the cabinet is installed shall [also] be ventilated as required by Section 502.4.1 or 502.4.2.

502.5.3 **Supervision.** Mechanical ventilation systems required by Section 502.5 shall be supervised with proof of airflow by a central, proprietary system or remote station service or shall initiate an audible and visual signal at a constantly attended on-site location.

502.6 **Dry cleaning plants.** Mechanical ventilation in dry cleaning plants shall be provided and shall be adequate to protect employees and the public in accordance with this section and DOL 29 CFR Part 1910.1000, where applicable. Dry cleaning separations must comply with the requirements of Section [415.6.4] 415.9.3 of the New York City Building Code and NFPA 32.

502.6.1 **Type II and III systems.** Type II and III dry cleaning systems shall be provided with a mechanical ventilation system that is designed to exhaust 1 cubic foot of air per minute for each square foot of floor area \((1 \text{ cfm/ft}^2) \ (0.00508 \text{ m}^3/(\text{s} \cdot \text{m}^2))\) in dry cleaning rooms and in drying rooms. The ventilation system shall operate automatically when the dry cleaning equipment is in operation and shall have manual controls at an approved location.

502.6.2 **Type IV and V systems.** Type IV and V dry cleaning systems shall be provided with an automatically activated exhaust ventilation system to maintain \([a minimum of] \) an air velocity of not less than 100 feet per minute \((0.51 \text{ m/s})\) \([air velocity]\) through the loading door when the door is opened.

**Exception:** Dry cleaning units are not required to be provided with exhaust ventilation where an exhaust hood is installed immediately outside of and above the loading door which operates at an airflow rate as follows:

\[
Q = 100 \times A_{LD}
\]

\((\text{Equation 5-1})\)

where:

\[
Q = \text{Flow rate exhausted through the hood, cubic feet per minute.}
\]

\[
A_{LD} = \text{Area of the loading door, square feet.}
\]
502.6.3 Spotting and pretreating. Scrubbing tubs, scouring, brushing or spotting operations shall be located such that solvent vapors are captured and exhausted by the ventilating system.

502.7 Application of flammable finishes. Mechanical exhaust as required by this section shall be provided for operations involving the application of flammable finishes and shall comply with the New York City Fire Code.

502.7.1 During construction. Ventilation shall be provided for operations involving the application of materials containing flammable solvents in the course of construction, alteration or demolition of a structure.

502.7.2 Limited spraying spaces. Positive mechanical ventilation [which] that provides [at a] not less than six complete air changes per hour shall be installed in limited spraying spaces. Such system shall meet the requirements of the New York City Fire Code for handling flammable vapors. Explosion venting is not required.

502.7.3 Flammable vapor areas. Mechanical ventilation of flammable vapor areas shall be provided in accordance with the New York City Fire Code and Sections 502.7.3.1 through 502.7.3.6 of this code.

502.7.3.1 Operation. Mechanical ventilation shall be kept in operation at all times while spraying operations are being conducted and for a sufficient time thereafter to allow vapors from drying coated articles and finishing material residue to be exhausted. Spraying equipment shall be interlocked with the ventilation of the flammable vapor area such that spraying operations cannot be conducted unless the ventilation system is in operation.

502.7.3.2 Recirculation. Air exhausted from spraying operations shall not be recirculated.

Exceptions:

1. Air exhausted from spraying operations shall be permitted to be recirculated as makeup air for unmanned spray operations provided that:

1.1. [Solid] The solid particulate has been removed.

1.2. The vapor concentration is less than 25 percent of the lower flammable limit (LFL).

1.3. Approved equipment is used to monitor the vapor concentration.

1.4. An alarm is sounded and spray operations are automatically shut down if the vapor concentration exceeds 25 percent of the LFL.

1.5. In the event of shutdown of the vapor concentration monitor, 100 percent of the air volume specified in Section 510 is automatically exhausted.

2. Air exhausted from spraying operations is allowed to be recirculated as makeup air to manned spraying operations where all of the conditions provided in Exception 1 are included in the installation and documents have been prepared to
show that the installation does not pose a life safety hazard to personnel inside the spray booth, spraying space or spray room.

**502.7.3.3 Air velocity.** Ventilation systems shall be designed, installed and maintained such that the average air velocity over the open face of the booth, or booth cross section in the direction of airflow during spraying operations, is not less than 100 feet per minute (0.51 m/s). The ventilation system shall be designed, installed and maintained so that the flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust air flow below 25 percent of the contaminant’s lower flammable limit (LFL). In addition, the spray booth shall be provided with mechanical ventilation so that the average air velocity through openings is in accordance with Sections 502.7.3.3.1 and 502.7.3.3.2.

**502.7.3.3.1 Open face or open front spray booth.** For spray application operations conducted in an open face or open front spray booth, the ventilation system shall be designed, installed and maintained so that the average air velocity into the spray booth through all openings is not less than 100 feet per minute (0.51 m/s).

*Exception:* For fixed or automated electrostatic spray application equipment, the average air velocity into the spray booth through all openings shall be not less than 50 feet per minute (0.25 m/s).

**502.7.3.3.2 Enclosed spray booth or spray room with openings for product conveyance.** For spray application operations conducted in an enclosed spray booth or spray room with openings for product conveyance, the ventilation system shall be designed, installed and maintained so that the average air velocity into the spray booth through openings is not less than 100 feet per minute (0.51 m/s). For occupied spray booths and occupied spray rooms, the air velocity at the point of application shall not be less than 100 feet per minute (0.51 m/s).

*Exceptions:*

1. For fixed or automated electrostatic spray application equipment, the average air velocity into the spray booth through all openings shall be not less than 50 feet per minute (0.25 m/s).

2. Where methods are used to reduce cross drafts that can draw vapors and overspray through openings from the spray booth or spray room, the average air velocity into the spray booth or spray room shall be that necessary to capture and confine vapors and overspray to the spray booth or spray room.

**502.7.3.4 Ventilation obstruction.** Articles being sprayed shall be positioned in a manner that does not obstruct collection of overspray.

**502.7.3.5 Independent ducts.** Each spray booth and spray room shall have an independent exhaust duct system discharging to the outdoors.

*Exceptions:*
1. Multiple spray booths having a combined frontal area of 18 square feet (1.67 m²) or less are allowed to have a common exhaust where identical spray-finishing material is used in each booth. If more than one fan serves one booth, such fans shall be interconnected so that all fans operate simultaneously.

2. Where treatment of exhaust is necessary for air pollution control or energy conservation, ducts shall be allowed to be manifolded if all of the following conditions are met:
   
   2.1. The sprayed materials used are compatible and will not react or cause ignition of the residue in the ducts.
   
   2.2. Nitrocellulose-based finishing material shall not be used.
   
   2.3. A filtering system shall be provided to reduce the amount of overspray carried into the duct manifold.
   
   2.4. Automatic sprinkler protection shall be provided at the junction of each booth exhaust with the manifold, in addition to the protection required by this chapter.

[502.7.3.7] **502.7.3.6 Fan motors and belts.** Electric motors driving exhaust fans shall not be placed inside booths or ducts. Fan rotating elements shall be nonferrous or nonsparking or the casing shall consist of, or be lined with, such material. Belts shall not enter the duct or booth unless the belt and pulley within the duct are tightly enclosed.

**502.7.4 Dipping operations.** Flammable vapor areas of dip tank operations shall be provided with mechanical ventilation adequate to prevent the dangerous accumulation of vapors. Required ventilation systems shall be so arranged that the failure of any ventilating fan will automatically stop the dipping conveyor system.

**502.7.5 Electrostatic apparatus.** The flammable vapor area in spray-finishing operations involving electrostatic apparatus and devices shall be ventilated in accordance with Section 502.7.3.

**502.7.6 Powder coating.** Exhaust ventilation for powder-coating operations shall be sufficient to maintain the atmosphere below one-half of the minimum explosive concentration for the material being applied. Nondeposited, air-suspended powders shall be removed through exhaust ducts to the powder recovery system.

**502.7.7 Floor resurfacing operations.** To prevent the accumulation of flammable vapors during floor resurfacing operations, mechanical ventilation at a minimum rate of 1 cfm/ft² (0.00508 m³/(s • m²)) of area being finished shall be provided. Such exhaust shall be by approved temporary or portable means. Vapors shall be exhausted to the exterior of the building. Such exhaust equipment shall be kept in operation while the floor finishing operations are conducted and until any flammable vapors have been exhausted to the exterior of the building.
502.7.8 Resin application areas. Exhaust ventilation for resin application areas shall comply with Section 502.7.3.

Exception: Mechanical ventilation is not required for buildings that are unenclosed for at least 75 percent of the perimeter.

502.8 Hazardous materials—general requirements. Exhaust ventilation systems for structures containing hazardous materials shall be provided as required in Sections 502.8.1 through 502.8.5 and shall comply with the New York City Fire Code.

502.8.1 Storage in excess of the maximum allowable quantities. Indoor storage areas and storage buildings for hazardous materials in amounts exceeding the maximum allowable quantity per control area, as defined by the New York City Fire Code, shall be provided with mechanical exhaust ventilation or natural ventilation where natural ventilation can be shown to be acceptable for the materials as stored.

[Exception: ] Exceptions:

1. Storage areas for flammable solids complying with the New York City Fire Code.

2. Storage areas and storage buildings for fireworks and explosives complying with the New York City Fire Code.

502.8.1.1 System requirements. Exhaust ventilation systems shall comply with all of the following:

1. The installation shall be in accordance with this code.

2. Mechanical ventilation shall be provided at a rate of not less than 1 cfm/ft\(^2\) (0.00508 m\(^3\)/s • m\(^2\)) of floor area over the storage area.

3. The systems shall operate continuously unless alternate designs are approved.

4. A manual shutoff control shall be provided outside of the room in a position adjacent to the access door to the room or in another approved location. The switch shall be a break-glass or other approved type and shall be labeled: VENTILATION SYSTEM EMERGENCY SHUTOFF.

5. The exhaust ventilation shall be designed to consider the density of the potential fumes or vapors released. For fumes or vapors that are heavier than air, exhaust shall be taken from a point within 12 inches (305 mm) of the floor. For fumes or vapors that are lighter than air, exhaust shall be taken from a point within 12 inches (305 mm) of the highest point of the room.

6. The location of both the exhaust and inlet air openings shall be designed to provide air movement across all portions of the floor or room to prevent the accumulation of vapors.
7. The exhaust air shall not be recirculated to occupied areas if the materials stored are capable of emitting hazardous vapors and contaminants have not been removed. Air contaminated with explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive materials shall not be recirculated.

502.8.2 Gas rooms, exhausted enclosures and gas cabinets. The ventilation system for gas rooms, exhausted enclosures and gas cabinets for any quantity of hazardous material shall be designed to operate at a negative pressure in relation to the surrounding area. Highly toxic and toxic gases shall [also] comply with Sections 502.9.7.1, 502.9.7.2 and 502.9.8.4.

502.8.3 Indoor dispensing and use. Indoor dispensing and use areas for hazardous materials in amounts exceeding the maximum allowable quantity per control area shall be provided with exhaust ventilation in accordance with Section 502.8.1.

**Exception:** Ventilation is not required for dispensing and use of flammable solids other than finely divided particles.

502.8.4 Indoor dispensing and [use-point] use—point sources. Where gases, liquids or solids in amounts exceeding the maximum allowable quantity per control area and having a hazard ranking of 3 or 4 in accordance with NFPA 704 are dispensed or used, mechanical exhaust ventilation shall be provided to capture gases, fumes, mists or vapors at the point of generation.

**Exception:** Where it can be demonstrated that the gases, liquids or solids do not create harmful gases, fumes, mists or vapors.

502.8.5 Closed systems. Where closed systems for the use of hazardous materials in amounts exceeding the maximum allowable quantity per control area are designed to be opened as part of normal operations, ventilation shall be provided in accordance with Section 502.8.4.

502.9 Hazardous materials—requirements for specific materials. Exhaust ventilation systems for specific hazardous materials shall be provided as required in Section 502.8 and Sections 502.9.1 through 502.9.11 and shall comply with the New York City Fire Code.

502.9.1 Compressed [gases medical] gases—medical gas systems. Rooms for the storage of compressed medical gases [in amounts exceeding the maximum allowable exempt quantity per control area] where the amounts being stored require a permit in accordance with the New York City Fire Code, and [which] that do not have an exterior wall, shall be exhausted through a duct to the exterior of the building. Each space shall be separately exhausted, and each exhaust air stream shall be enclosed in a 1-hour-rated shaft enclosure from the room to the exterior. Approved mechanical ventilation shall be provided at a minimum rate of 1 cfm/ft² (0.00508 m³/(s • m²)) of the area of the room.

Gas cabinets for the storage of compressed medical gases [in amounts exceeding the maximum allowable exempt quantity per control area] where the amounts being stored require a permit in accordance with the New York City Fire Code shall be connected to an exhaust system. The average velocity of ventilation at the face of access ports or windows shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point at the access port or window.
502.9.2 Corrosives. Where corrosive materials in amounts exceeding the maximum allowable quantity per control area are dispensed or used, mechanical exhaust ventilation in accordance with Section 502.8.4 shall be provided.

502.9.3 Cryogenics. Storage areas for stationary or portable containers of cryogenic fluids in any quantity shall be ventilated in accordance with Section 502.8. Indoor areas where cryogenic fluids in any quantity are dispensed shall be ventilated in accordance with the requirements of Section 502.8.4 in a manner that captures any vapor at the point of generation.

   Exception: Ventilation for indoor dispensing areas is not required where it can be demonstrated that the cryogenic fluids do not create harmful vapors.

502.9.4 Explosives. Squirrel cage blowers shall not be used for exhausting hazardous fumes, vapors or gases in operating buildings and rooms for the manufacture, assembly or testing of explosives. Only nonferrous fan blades shall be used for fans located within the ductwork and through which hazardous materials are exhausted. Motors shall be located outside the duct.

502.9.5 Flammable and combustible liquids. Exhaust ventilation systems shall be provided as required by Sections 502.9.5.1 through 502.9.5.5 for the storage, use, dispensing, mixing and handling of flammable and combustible liquids. Unless otherwise specified, this section shall apply to any quantity of flammable and combustible liquids.

   Exception: This section shall not apply to flammable and combustible liquids that are exempt from the New York City Fire Code.

502.9.5.1 Vaults. Vaults that contain tanks of Class I liquids shall be provided with continuous ventilation at a rate of not less than 1 cfm/ft² of floor area (0.00508 m³/(s • m²)), but not less than 150 cfm (4 m³/min). Failure of the exhaust airflow shall automatically shut down the dispensing system. The exhaust system shall be designed to provide air movement across all parts of the vault floor. Supply and exhaust ducts shall extend to a point not greater than 12 inches ([305] 304.8 mm) and not less than 3 inches ([76] 76.2 mm) above the floor. The exhaust system shall be installed in accordance with the provisions of NFPA 91. Means shall be provided to automatically detect any flammable vapors and to automatically shut down the dispensing system upon detection of such flammable vapors in the exhaust duct at a concentration of 25 percent of the LFL.

502.9.5.2 Storage rooms and warehouses. Liquid storage rooms and liquid storage warehouses for quantities of liquids exceeding those specified in the New York City Fire Code shall be ventilated in accordance with Section 502.8.1.

502.9.5.3 Cleaning machines. Areas containing machines used for parts cleaning in accordance with the New York City Fire Code shall be adequately ventilated to prevent accumulation of vapors.

502.9.5.4 Use, dispensing and mixing. Continuous mechanical ventilation shall be provided for the use, dispensing and mixing of flammable and combustible liquids in open or closed systems in amounts exceeding the maximum allowable quantity per control area and for bulk transfer and process transfer operations. The ventilation rate shall be not less than 1
cfm/ft²(0.00508 m³/(s • m²)) of floor area over the design area. Provisions shall be made for the introduction of makeup air in a manner that will include all floor areas or pits where vapors can collect. Local or spot ventilation shall be provided where needed to prevent the accumulation of hazardous vapors.

502.9.5.5 Bulk plants or terminals. Ventilation shall be provided for portions of properties where flammable and combustible liquids are received by tank vessels, pipelines, tank cars or tank vehicles and which are stored or blended in bulk for the purpose of distributing such liquids by tank vessels, pipelines, tank cars, tank vehicles or containers as required by Sections 502.9.5.5.1 through 502.9.5.5.3.

502.9.5.5.1 General. Ventilation shall be provided for rooms, buildings and enclosures in which Class I liquids are pumped, used or transferred. Design of ventilation systems shall consider the relatively high specific gravity of the vapors. Where natural ventilation is used, adequate openings in outside walls at floor level, unobstructed except by louvers or coarse screens, shall be provided. Where natural ventilation is inadequate, mechanical ventilation shall be provided. The natural ventilation design shall be approved for each specific application by the commissioner prior to installation and/or use.

502.9.5.5.2 Basements and pits. Class I liquids shall not be stored or used within a building having a basement or pit into which flammable vapors can travel, unless such area is provided with ventilation designed to prevent the accumulation of flammable vapors therein.

502.9.5.5.3 Dispensing of Class I liquids. Containers of Class I liquids shall not be drawn from or filled within buildings unless a provision is made to prevent the accumulation of flammable vapors in hazardous concentrations. Where mechanical ventilation is required, it shall be kept in operation while flammable vapors could be present.

502.9.6 Highly toxic and toxic liquids. Ventilation exhaust shall be provided for highly toxic and toxic liquids as required by Sections 502.9.6.1 and 502.9.6.2.

502.9.6.1 Treatment system. This provision shall apply to indoor and outdoor storage and use of highly toxic and toxic liquids in amounts exceeding the maximum allowable quantities per control area. Exhaust scrubbers or other systems for processing vapors of highly toxic liquids shall be provided where a spill or accidental release of such liquids can be expected to release highly toxic vapors at normal temperature and pressure.

502.9.6.2 Open and closed systems. Mechanical exhaust ventilation shall be provided for highly toxic and toxic liquids used in open systems in accordance with Section 502.8.4. Mechanical exhaust ventilation shall be provided for highly toxic and toxic liquids used in closed systems in accordance with Section 502.8.5.

Exception: Liquids or solids that do not generate highly toxic or toxic fumes, mists or vapors.
502.9.7 Highly toxic and toxic compressed gases—any quantity. Ventilation exhaust shall be provided for highly toxic and toxic compressed gases in any quantity as required by Sections 502.9.7.1 and 502.9.7.2.

502.9.7.1 Gas cabinets. Gas cabinets containing highly toxic or toxic compressed gases in any quantity shall comply with Section 502.8.2 and the following requirements:

1. The average ventilation velocity at the face of gas cabinet access ports or windows shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s) at any point at the access port or window.

2. Gas cabinets shall be connected to an exhaust system.

3. Gas cabinets shall not be used as the sole means of exhaust for any room or area.

502.9.7.2 Exhausted enclosures. Exhausted enclosures containing highly toxic or toxic compressed gases in any quantity shall comply with Section 502.8.2 and the following requirements:

1. The average ventilation velocity at the face of the enclosure shall be not less than 200 feet per minute (1.02 m/s) with a minimum velocity of 150 feet per minute (0.76 m/s).

2. Exhausted enclosures shall be connected to an exhaust system.

3. Exhausted enclosures shall not be used as the sole means of exhaust for any room or area.

502.9.8 Highly toxic and toxic compressed gases—quantities exceeding the maximum allowable quantity per control area. Ventilation exhaust shall be provided for highly toxic and toxic compressed gases in amounts exceeding the maximum allowable quantities per control area as required by Sections 502.9.8.1 through 502.9.8.6.

502.9.8.1 Ventilated areas. The room or area in which indoor gas cabinets or exhausted enclosures are located shall be provided with exhaust ventilation. Gas cabinets or exhausted enclosures shall not be used as the sole means of exhaust for any room or area.

502.9.8.2 Local exhaust for portable tanks. A means of local exhaust shall be provided to capture leakage from indoor and outdoor portable tanks. The local exhaust shall consist of portable ducts or collection systems designed to be applied to the site of a leak in a valve or fitting on the tank. The local exhaust system shall be located in a gas room. Exhaust shall be directed to a treatment system where required by the New York City Fire Code.

502.9.8.3 Piping and controls—stationary tanks. Filling or dispensing connections on indoor stationary tanks shall be provided with a means of local exhaust. Such exhaust shall be designed to capture fumes and vapors. The exhaust shall be directed to a treatment system where required by the New York City Fire Code.
502.9.8.4 Gas rooms. The ventilation system for gas rooms shall be designed to operate at a negative pressure in relation to the surrounding area. The exhaust ventilation from gas rooms shall be directed to an exhaust system.

502.9.8.5 Treatment system. The exhaust ventilation from gas cabinets, exhausted enclosures and gas rooms, and local exhaust systems required in Sections 502.9.8.2 and 502.9.8.3 shall be directed to a treatment system where required by the New York City Fire Code.

502.9.8.6 Process equipment. Effluent from indoor and outdoor process equipment containing highly toxic or toxic compressed gases which could be discharged to the atmosphere shall be processed through an exhaust scrubber or other processing system. Such systems shall be in accordance with the New York City Fire Code.

502.9.9 Ozone gas generators. Ozone cabinets and ozone gas-generator rooms for systems having a maximum ozone-generating capacity of one-half pound (0.23 kg) or more over a 24-hour period shall be mechanically ventilated at a rate of not less than six air changes per hour. For cabinets, the average velocity of ventilation at makeup air openings with cabinet doors closed shall be not less than 200 feet per minute (1.02 m/s).

502.10 Hazardous production materials (HPM). Exhaust ventilation systems and materials for ducts utilized for the exhaust of HPM shall comply with this section, other applicable provisions of this code, the New York City Building Code and the New York City Fire Code.

502.10.1 Where required. Exhaust ventilation systems shall be provided in the following locations in accordance with the requirements of this section and the New York City Building Code:

1. Fabrication areas: Exhaust ventilation for fabrication areas shall comply with the New York City Building Code. Additional manual control switches shall be provided where required by the commissioner.
2. Workstations: A ventilation system shall be provided to capture and exhaust gases, fumes and vapors at workstations.

3. Liquid storage rooms: Exhaust ventilation for liquid storage rooms shall comply with Section 502.8.1.1 and the New York City Building Code.

4. HPM rooms: Exhaust ventilation for HPM rooms shall comply with Section 502.8.1.1 and the New York City Building Code.

5. Gas cabinets: Exhaust ventilation for gas cabinets shall comply with Section 502.8.2. The gas cabinet ventilation system is allowed to connect to a workstation ventilation system. Exhaust ventilation for gas cabinets containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.

6. Exhausted enclosures: Exhaust ventilation for exhausted enclosures shall comply with Section 502.8.2. Exhaust ventilation for exhausted enclosures containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.

7. Gas rooms: Exhaust ventilation for gas rooms shall comply with Section 502.8.2. Exhaust ventilation for gas cabinets containing highly toxic or toxic gases shall also comply with Sections 502.9.7 and 502.9.8.

502.10.2 Penetrations. Exhaust ducts penetrating fire barrier assemblies constructed in accordance with Section 707 of the New York City Building Code or horizontal assemblies constructed in accordance with Section 711 of the New York City Building Code shall be contained in a shaft of equivalent fire-resistive fire-resistance-rated construction. Exhaust ducts shall not penetrate building separation fire walls. Fire dampers shall not be installed in exhaust ducts.

502.10.3 Treatment systems. Treatment systems for highly toxic and toxic gases shall comply with the New York City Fire Code.

502.11 Motion picture projectors. Motion picture projectors shall be exhausted in accordance with Section 502.11.1 or 502.11.2.

502.11.1 Projectors with an exhaust discharge. Projectors equipped with an exhaust discharge shall be directly connected to a mechanical exhaust system. The exhaust system shall operate at an exhaust rate as indicated by the manufacturer’s installation instructions.

502.11.2 Projectors without exhaust connection. Projectors without an exhaust connection shall have contaminants exhausted through a mechanical exhaust system. The exhaust rate for electric arc projectors shall be [a minimum of] not less than 200 cubic feet per minute (cfm) (0.09 m³/s) per lamp. The exhaust rate for xenon projectors shall be [a minimum of] not less than 300 cfm (0.14 m³/s) per lamp. Xenon projector exhaust shall be at a rate such that the exterior temperature of the lamp housing does not exceed 130°F (54°C). The lamp and projection room exhaust systems, whether combined or independent, shall not be interconnected with any other exhaust or return system within the building.
502.12 Organic coating processes. Enclosed structures involving organic coating processes in which Class I liquids are processed or handled shall be ventilated at a rate of not less than 1 cfm/ft$^2$ (0.00508 m$^3$/s • m$^2$) of solid floor area. Ventilation shall be accomplished by exhaust fans that intake at floor levels and discharge to a safe location outside the structure. Noncontaminated intake air shall be introduced in such a manner that all portions of solid floor areas are provided with continuous uniformly distributed air movement.

502.13 Public garages. Mechanical exhaust systems for public garages, as required in Chapter 4, shall operate continuously or in accordance with Section 404.

502.14 Motor vehicle operation. In areas where motor vehicles operate, mechanical ventilation shall be provided in accordance with Section 403. Additionally, areas in which stationary motor vehicles are operated shall be provided with a source capture system that connects directly to the motor vehicle exhaust systems. Such system shall be engineered by a registered design professional or shall be factory-built equipment designed and sized for the purpose.

Exceptions:

1. This section shall not apply where the motor vehicles being operated or repaired are electrically powered.

2. This section shall not apply to one- and two-family dwellings.

3. This section shall not apply to motor vehicle service areas where engines are operated inside the building only for the duration necessary to move the motor vehicles in and out of the building.

502.15 Repair garages. Where Class I liquids or LP-gas are stored or used within a building having a basement or pit wherein flammable vapors could accumulate, the basement or pit shall be provided with ventilation at a minimum rate of 1.5 cubic feet per minute per square foot (cfm/ft$^2$) (0.008 m$^3$/s • m$^2$) designed to prevent the accumulation of flammable vapors therein.

502.16 Repair garages for natural gas- and hydrogen-fueled vehicles. Repair garages used for the repair of natural gas- or hydrogen-fueled vehicles shall be provided with an approved mechanical ventilation system. The mechanical ventilation system shall be in accordance with Sections 502.16.1 and 502.16.2.

Exception: Where approved by the commissioner, natural ventilation shall be permitted in lieu of mechanical ventilation.

502.16.1 Design. Indoor locations shall be ventilated utilizing air supply inlets and exhaust outlets arranged to provide uniform air movement to the extent practical. Inlets shall be uniformly arranged on exterior walls near floor level. Outlets shall be located at the high point of the room in exterior walls or the roof.

1. Ventilation shall be by a continuous mechanical ventilation system or by a mechanical ventilation system activated by a continuously monitoring natural gas detection system, or for hydrogen, a continuously monitoring flammable gas detection system, each
activating at a gas concentration of 25 percent of the lower flammable limit (LFL). In all
cases, the system shall shut down the fueling system in the event of failure of the
ventilation system.

2. The ventilation rate shall be \textit{at least not less than} 1 cubic foot per minute per 12 cubic
feet \(0.00138 \text{ m}^3/(\text{s} \cdot \text{m}^3)\) of room volume.

\textbf{502.16.2 Operation.} The mechanical ventilation system shall operate continuously.

\textbf{Exceptions:}

1. Mechanical ventilation systems that are interlocked with a gas detection system
designed in accordance with the \textit{New York City Building Code}.

2. Mechanical ventilation systems in garages that are used only for the repair of vehicles
fueled by liquid fuels or odorized gases, such as CNG, where the ventilation system is
electrically interlocked with the lighting circuit.

\textbf{502.17 Tire rebuilding or recapping.} Each room where rubber cement is used or mixed, or where
flammable or combustible solvents are applied, shall be ventilated in accordance with the applicable
provisions of NFPA 91.

\textbf{502.17.1 Buffing machines.} Each buffing machine shall be connected to a dust-collecting system
that prevents the accumulation of the dust produced by the buffing process.

\textbf{502.18 Specific rooms.} Specific rooms, including bathrooms, locker rooms, smoking lounges and
toilet rooms, shall be exhausted in accordance with the ventilation requirements of Chapter 4.

\textbf{502.19 Domestic kitchen exhaust systems.} In all Group R occupancies a minimum of No. 18 Gage
galvanized sheet metal shall be used, except that ductwork that complies with Section 603.6.1.2 shall
be permitted for independent apartment exhaust systems providing general exhaust ventilation of
kitchen and toilet areas.

\textbf{502.20 Nonproduction chemical laboratories.} Nonproduction chemical laboratories shall comply
with Section 424 of the \textit{New York City Building Code} and NFPA 45.

\textbf{502.21 Indoor firing ranges.} Ventilation shall be provided in an approved manner in areas
utilized as indoor firing ranges. Firing ranges shall comply with all applicable laws and the
requirements of the \textit{New York City Department of Health and Mental Hygiene}.

\textbf{502.20 Manicure and pedicure stations.} Manicure and pedicure stations shall be provided with an
exhaust system in accordance with Table 403.3.1.1, Note h. Manicure tables and pedicure stations
not provided with factory-installed exhaust inlets shall be provided with exhaust inlets located not
more than 12 inches (304.8 mm) horizontally and vertically from the point of chemical application.

\textbf{502.21 Domestic kitchen exhaust systems.} In all Group R occupancies, a minimum of No. 18 Gage
galvanized sheet metal shall be used, except that ductwork that complies with Section 603.6.1.2 shall
be permitted for independent apartment exhaust systems providing general exhaust ventilation of
kitchen and toilet areas.
502.22 **Nonproduction chemical laboratories.** Nonproduction chemical laboratories shall comply with the *New York City Building Code* and NFPA 45.

**SECTION MC 503**

**MOTORS AND FANS**

503.1 **General.** Motors and fans shall be sized to provide the required air movement. Motors in areas that contain flammable vapors or dusts shall be of a type approved for such environments. A manually operated remote control installed at an approved location shall be provided to shut off fans or blowers in flammable vapor or dust systems. Electrical equipment and appliances used in operations that generate explosive or flammable vapors, fumes or dusts shall be interlocked with the ventilation system so that the equipment and appliances cannot be operated unless the ventilation fans are in operation. Motors for fans used to convey flammable vapors or dusts shall be located outside the duct or shall be protected with approved shields and dustproofing. Motors and fans shall be provided with a means of access for servicing and maintenance.

503.2 **Fans.** Parts of fans in contact with explosive or flammable vapors, fumes or dusts shall be of nonferrous or nonsparking materials, or their casing shall be lined or constructed of such material. Where the size and hardness of materials passing through a fan are capable of producing a spark, both the fan and the casing shall be of nonsparking materials. Where fans are required to be spark resistant, their bearings shall not be within the airstream, and all parts of the fan shall be grounded. Fans in systems-handling materials that are capable of clogging the blades, and fans in buffing or woodworking exhaust systems, shall be of the radial-blade or tube-axial type.

503.3 **Equipment and appliance identification plate.** Equipment and appliances used to exhaust explosive or flammable vapors, fumes or dusts shall bear an identification plate stating the ventilation rate for which the system was designed.

503.4 **Corrosion-resistant fans.** Fans located in systems conveying corrosives shall be of materials that are resistant to the corrosive or shall be coated with corrosion-resistant materials.

503.5 **Fan location.** Fans exhausting noxious, toxic, hot vapor or grease-laden air shall be located as close to the terminus as practicable, at the roof or within a mechanical equipment room, immediately below the roof.

[**Exception:** Where the fan is listed or approved for such an application.]

**SECTION MC 504**

**CLOTHES DRYER EXHAUST**

504.1 **Installation.** Clothes dryers shall be exhausted in accordance with the manufacturer’s instructions. Dryer exhaust systems shall be independent of all other systems and shall convey the moisture and any products of combustion to the outside of the building. For the installation of gas dryers, refer to [Section 614 of] the *New York City Fuel Gas Code*. 
Exception: This section shall not apply to listed and labeled condensing (ductless) electric clothes dryers.

504.2 Exhaust duct penetrations. Where a clothes dryer exhaust duct penetrates a wall or ceiling membrane, the annular space shall be sealed with noncombustible material, approved fire caulking or a noncombustible dryer exhaust duct wall receptacle. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstopping or any wall, floor/ceiling or other assembly required by the New York City Building Code to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating is maintained in accordance with the New York City Building Code. Fire dampers, combination fire/smoke dampers and any similar devices that will obstruct the exhaust flow shall be prohibited in clothes dryer exhaust ducts.

504.3 Cleanout. Each vertical riser shall be provided with a means for cleanout.

504.4 Exhaust installation. Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building. Single dryer installations shall be equipped with a backdraft damper. Multiple dryer installations shall not have a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

504.5 Dryer exhaust duct power ventilators. Domestic dryer exhaust duct power ventilators shall be listed and labeled to UL 705 for use in dryer exhaust duct systems. The dryer exhaust duct power ventilator shall be installed in accordance with the manufacturer’s instructions.

504.6 Makeup air. Installations exhausting more than 200 cfm (0.09 m³/s) shall be provided with makeup air. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (0.0645 m²) shall be provided in the closet enclosure or makeup air shall be provided by other approved means.

504.7 Protection required. Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than 1¼ inches (31.8 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, have a thickness of 0.062 inch (1.6 mm) and extend not less than 2 inches ([54] 50.8 mm) above sole plates and below top plates.

504.8 Domestic clothes dryer ducts. Exhaust ducts for domestic clothes dryers shall conform to the requirements of Sections [504.6.1] 504.8.1 through [504.6.7] 504.8.6.

[504.6.4] 504.8.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal a minimum 0.016 inch (0.4 mm) thick. The exhaust duct size shall be 4 inches ([102] 101.6 mm) nominal in diameter, unless a larger duct size is specifically required by the dryer manufacturer. Exhaust ducts larger than 20 square inches (12 903.2 mm²) shall be individually exhausted.
**Exception:** Where the make and model of the clothes dryer to be installed is known and the manufacturer’s [installation] instructions for such dryer are provided, the maximum length of the exhaust duct, including any transition duct, shall be permitted to be in accordance with the dryer manufacturer’s [installation] instructions.

**[504.6.2] 504.8.2 Duct installation.** Exhaust ducts shall be supported at 4-foot ([1219] 1219.2 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts serving a single appliance shall not be joined with screws or similar fasteners that protrude more than ⅛ inch (3.2 mm) into the inside of the duct.

**[504.6.3] 504.8.3 Transition ducts.** Transition ducts used to connect the dryer to the exhaust duct system shall be a single length that is listed and labeled in accordance with UL 2158A. Transition ducts shall be [a maximum of] not greater than 8 feet ([2438] 2438.4 mm) in length and shall not be concealed within construction.

**[504.6.4] 504.8.4 Duct length.** The maximum allowable exhaust duct length shall be determined by one of the methods specified in [Section 504.6.4.1 or 504.6.4.2] Sections 504.8.4.1 through 504.8.4.3.

**[504.6.4.1] 504.8.4.1 Specified length.** The maximum length of the exhaust duct shall be 35 feet (10 668 mm) from the connection to the transition duct from the dryer to the outlet terminal or to a common or central exhaust system. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table [504.6.4.1] 504.8.4.1.

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 degree = 0.0175 rad.

\[a\] The equivalent length column of the table indicates how much length must be added to the exhaust duct total length for each fitting used.

**[504.6.2] 504.8.4.2 Manufacturer’s instructions.** The maximum length of the exhaust duct shall be determined by the dryer manufacturer’s [installation] instructions. The [code official] special inspector shall be provided with a copy of the [installation] instructions for the make and model of the dryer. Where the exhaust duct is to be concealed, the installation instructions shall be provided to the [code official] special inspector prior to the concealment inspection. In the absence of fitting equivalent length calculations from the clothes dryer manufacturer, Table [504.6.4.1] 504.8.4.1 shall be used.

**504.8.4.3 Dryer exhaust duct power ventilator length.** The maximum length of the exhaust duct shall be determined by the dryer exhaust duct power ventilator manufacturer’s instructions.
**504.6.5** **Length identification.** Where the exhaust duct is concealed within the building construction, the equivalent length of the exhaust duct exceeds 35 feet (10 668 mm) to the outlet terminal, common exhaust, or power ventilator, the equivalent length of the exhaust duct shall be identified on a permanent label or tag. The label or tag shall be located within 6 feet (1829 mm) of the exhaust duct connection.

**504.6.6** **Exhaust duct required.** Where space for a clothes dryer is provided, an exhaust duct system shall be installed. Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

**Exception:** Where a listed condensing clothes dryer is installed prior to occupancy of structure.

**504.6.7** **Protection required.** Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than 1¼ inches (32 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, have a thickness of 0.062 inch (1.6 mm) and extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

**504.9** **Commercial clothes dryers.** The installation of dryer exhaust ducts serving Type 2 commercial clothes dryers shall comply with the appliance manufacturer’s installation instructions and NFPA 54. Exhaust fan motors installed in exhaust systems shall be located outside of the airstream. In multiple installations, the fan shall operate continuously or be interlocked to operate when any individual unit is operating. Ducts shall have a minimum clearance of 6 inches (152 mm) to combustible materials. Clothes dryer transition ducts used to connect the appliance to the exhaust duct system shall be limited to single lengths not to exceed 8 feet (2438 mm) in length and shall be listed and labeled for the application. Transition ducts shall not be concealed within construction.

**504.10** **Common multistory exhaust systems for clothes dryers.** Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of the system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the *New York City Building Code*.

2. Dampers and subducts shall be prohibited in the exhaust duct.

3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.47 mm) (No. 26 gage) and in accordance with SMACNA SMACNA/ANSI Duct Construction Standards. The common ductwork ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.

4. Exhaust ducts 20 square inches (129 cm²) or less connected into a common multi-story exhaust system shall not require fire dampers when the exhaust fan runs...
continuously. Exhaust ducts greater than 20 square inches (129 cm$^2$) shall not be connected into a common multi-story exhaust system.

5. The exhaust fan motor design shall be in accordance with Section 503.2.

6. The exhaust fan motor shall be located outside of the airstream.

7. The exhaust fan shall run continuously, and shall be connected to a standby power source, where a building standby power source is required per the New York City Building Code.

8. Exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.

9. Makeup air shall be provided for the exhaust system.

10. A cleanout opening shall be located at the base of the shaft, at all offsets and at all changes of direction to provide access to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).

11. Screens shall not be installed at the termination.

12. The common multistory duct system shall serve only clothes dryers and shall be independent of other exhaust systems.

SECTION MC 505
DOMESTIC KITCHEN EXHAUST EQUIPMENT [EXHAUST]

505.1 Domestic systems. Where domestic range hoods or domestic appliances equipped with downdraft exhaust are located within dwelling units provided, such hoods and appliances shall discharge to the outdoors through ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper and shall be independent of all other exhaust systems. Such exhaust system shall be installed in strict compliance with the manufacturer’s instructions as well as the requirements of the listing.

Exceptions:

1. Where in other than Group I-1 and I-2, where installed in accordance with the manufacturer’s installation instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.

2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:

   2.1. The duct shall be installed under a concrete slab poured on grade.
2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.

2.3. The PVC duct shall extend not [greater] more than 1 inch ([25] 25.4 mm) above the indoor concrete floor surface.

2.4. The PVC duct shall extend not [greater] more than 1 inch ([25] 25.4 mm) above grade outside of the building.

2.5. The PVC ducts shall be solvent cemented.

505.2 Makeup air required. Exhaust hood systems capable of exhausting in excess of 400 cfm (0.19 m³/s) where required by Chapter 4 shall be provided with makeup air at a rate in accordance with Table [403.3] 403.3.1.1. Such makeup air systems shall be equipped with a means of closure and shall be automatically controlled to start and operate simultaneously with the exhaust system.

505.3 Reserved.

505.4 Other than Group R. All domestic cooking appliances installed in cafeterias and in Group A-1, A-2, A-4, A-5, and M occupancies shall be provided with hoods and exhaust systems as required for the type of appliances and processes in accordance with Sections 506 and 507. In other than Group R occupancies, domestic appliances may be provided with domestic kitchen exhaust systems ducted to outdoors in accordance with this section provided that the installation complies with all of the following:

1. No more than two domestic cooking appliances are installed in each fire separated room or tenancy in other than Group E occupancies;

2. Each appliance shall have electric or gas connections and nameplate ratings not to exceed 10kW for electric appliances or 75,000 Btu/h for gas appliances. Branch gas connections shall not be larger than ¾ inch (19.1 mm) pipe;

3. The appliances shall not include open top broilers or fryers; and

4. The appliances are used for periodic, non-commercial, non-revenue generating purposes, except for in Group A-3 occupancies, where such appliances may be used a maximum of 8 hours per week to generate revenue.

SECTION MC 506
COMMERCIAL KITCHEN HOOD VENTILATION SYSTEM DUCTS AND EXHAUST EQUIPMENT

506.1 General. Commercial kitchen hood ventilation ducts and exhaust equipment shall comply with the requirements of this section. Commercial kitchen grease ducts shall be designed for the type of cooking appliance and hood served. All ducts shall lead directly to the exterior of the building and terminate as required by Section [506.3.12] 506.3.13 for Type I hoods and Section 506.4.2 for Type II hoods [3].
**Exception:** Recirculating hoods that comply with Exception 2 of Section 507.1 do not require ducting in accordance with this section.

### 506.2 Corrosion protection
Ducts exposed to the outside atmosphere or subject to a corrosive environment shall be protected against corrosion.

1. At the base of each duct and at its termination point a clearly identifiable permanent sign shall be installed identifying the facility from which the duct originates. All exterior ducts shall be protected on the exterior by paint or other weatherproof protective coating. Stainless steel ducts shall not require paint or weatherproof protective coating.

2. No portion of an exterior metal duct shall be nearer than 24 inches (610 mm) to any door or window or to any exit, or located where it would be readily accessible to the public, unless it is insulated or shielded to avoid injury to any person coming in contact with the duct.

**Exception:** Listed and labeled factory-built commercial kitchen grease ducts may be used when installed in accordance with Section 304.1.

### 506.3 Ducts serving Type I hoods
Type I exhaust ducts shall be independent of all other exhaust systems except as provided in Section 506.3.5. Commercial kitchen duct systems serving Type I hoods shall be designed, constructed and installed in accordance with Sections 506.3.1 through 506.3.12.3.

#### 506.3.1 Duct materials
Ducts serving Type I hoods shall be constructed of materials in accordance with Sections 506.3.1.1 and 506.3.1.2.

##### 506.3.1.1 Grease duct materials
Grease ducts serving Type I hoods, and located within buildings, shall be constructed as follows:

1. Ducts with a cross-sectional area up to and including 155 square inches \( (100000 \text{ mm}^2) \) \( (1.0 \text{ square meters}) \) shall be constructed of 0.0598-inch (1.52 mm) No. 16 Gage steel;

2. Ducts with a cross-sectional area over 155 square inches (100 000 mm\(^2\)), but not more than 200 square inches (0.129 m\(^2\)) shall be constructed of 0.074-inch (1.9 mm) No. 14 Gage steel; and

3. Ducts with a cross-sectional area equal to or more than 200 square inches (0.129 m\(^2\)) shall be constructed of 0.1046-inch (2.66 mm) No. 12 Gage steel.

If stainless steel is used for ducts of any of the cross-sectional areas listed above, the Gage steel may be increased upwards (resulting in a smaller thickness) by 1 even Gage size.

**Exception:** Listed and labeled factory-built commercial kitchen grease ducts shall be listed and labeled in accordance with UL 1978 and installed in accordance with Section 304.1 and as approved by the commissioner.

##### 506.3.1.2 Makeup air ducts
Makeup air ducts connecting to or within 18 inches (457.2 mm) of a Type I hood shall be constructed and installed in accordance with
Sections 603.1, 603.3, 603.4, 603.9, 603.10 and 603.12. Duct insulation installed within 18 inches ([457] 457.2 mm) of a Type I hood shall be noncombustible or shall be listed for the application.

506.3.2 Joints, seams and penetrations of grease ducts. Joints, seams and penetrations of grease ducts shall be made with a continuous liquid-tight weld or braze made on the external surface of the duct system.

Exceptions:

1. Penetrations shall not be required to be welded or brazed where sealed by devices that are listed for the application.

2. Internal welding or brazing shall not be prohibited provided that the joint is formed or ground smooth and is provided with ready access for inspection.

3. Factory-built commercial kitchen grease ducts listed and labeled in accordance with UL 1978 and installed in accordance with Section 304.1 of this code.

506.3.2.1 Duct joint types. Duct joints shall be butt joints, welded flange joints with a maximum flange depth of ½ inch (12.7 mm) or overlapping duct joints of either the telescoping or bell type. Overlapping joints shall be installed to prevent ledges and obstructions from collecting grease or interfering with gravity drainage to the intended collection point. The difference between the inside cross-sectional dimensions of overlapping sections of duct shall not exceed ¼ inch (6.4 mm). The length of overlap for overlapping duct joints shall not exceed 2 inches ([51] 50.8 mm).

506.3.2.2 Duct-to-hood joints. Duct-to-hood joints shall be made with continuous internal or external liquid-tight welded or brazed joints. Such joints shall be smooth, accessible for inspection, and without grease traps.

Exceptions: This section shall not apply to:

1. A vertical duct-to-hood collar connection made in the top plane of the hood in accordance with all of the following:

   1.1. The hood duct opening shall have a 1-inch-deep ([25] 25.4 mm), full perimeter, welded flange turned down into the hood interior at an angle of 90 degrees (1.57 rad) from the plane of the opening.

   1.2. The duct shall have a 1-inch-deep ([25] 25.4 mm) flange made by a 1-inch by 1-inch ([25] 25.4 mm by [25] 25.4 mm) angle iron welded to the full perimeter of the duct not less than 1 inch ([25] 25.4 mm) above the bottom end of the duct.

   1.3. A gasket rated for use at not less than 1,500°F [(815°C)] (815.6°C) is installed between the duct flange and the top of the hood.
1.4. The duct-to-hood joint shall be secured by stud bolts not less than ¼ inch (6.4 mm) in diameter welded to the hood with a spacing not greater than 4 inches ([402] 101.6 mm) on center for the full perimeter of the opening. The bolts and nuts shall be secured with lockwashers.

2. Listed and labeled duct-to-hood collar connections installed in accordance with Section 304.1.

506.3.2.3 Duct-to-exhaust fan connections. Duct-to-exhaust fan connections shall be flanged and gasketed at the base of the fan for vertical discharge fans; shall be flanged, gasketed and bolted to the inlet of the fan for side-inlet utility fans; and shall be flanged, gasketed and bolted to the inlet and outlet of the fan for in-line fans. Approved flexible connectors may be provided. Gasket and sealing materials shall be rated for continuous duty at a temperature of not less than 1,500ºF (815.6ºC).

506.3.2.4 Vibration isolation. A vibration isolation connector for connecting a duct to a fan shall consist of noncombustible packing in a metal sleeve joint of approved design or shall be a coated-fabric flexible duct connector listed and labeled for the application. Vibration isolation connectors shall be installed only at the connection of a duct to a fan inlet or outlet.

506.3.2.5 Grease duct test. Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The duct installer shall be responsible for providing the necessary equipment and performing the grease duct leakage test. A duct leakage test, in accordance with this section, shall be performed for the entire duct system, including the hood-to-duct connection. The duct work shall be permitted to be tested in sections, provided that every joint is tested.

To determine the tightness of the grease duct construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The test shall be performed in the presence of the special inspector.

2. The grease duct shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs. A static pressure equal to or not less than 2 inches water gauge (500 Pa) shall be maintained throughout the test. The test shall be applied for a length of time sufficient to permit the inspection of the grease duct.

3. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirements of this chapter, and the test shall be repeated until there is no visible smoke observed.

506.3.3 Grease duct supports. Grease duct bracing and supports shall be of noncombustible material securely attached to the structure and designed to carry gravity and seismic loads within the stress limitations of the New York City Building Code. Bolts, screws, rivets and other mechanical fasteners shall not penetrate duct walls.
506.3.4 **Air velocity.** Grease duct systems serving a Type I hood shall be designed and installed to provide an air velocity within the duct system of not less than 500 feet per minute (2.5 m/s).

**Exception:** The velocity limitations shall not apply within duct transitions utilized to connect ducts to differently sized or shaped openings in hoods and fans, provided that such transitions do not exceed 3 feet (914 mm) in length and are designed to prevent the trapping of grease.

506.3.5 **Separation of grease duct system.** A separate grease duct system shall be provided for each Type I hood.

**Exceptions:**

1. A separate grease duct system is not required where all of the following conditions are met:
   1.1. All interconnected hoods are located within the same story, provided that they are part of the same facility and under the control of one owner or tenant.
   1.2. All interconnected hoods are located within the same room or in adjoining rooms, provided that they are part of the same facility and under the control of one owner or tenant.
   1.3. Interconnecting ducts do not penetrate assemblies required to be fire-resistance rated.
   1.4. The grease duct system does not serve solid fuel-fired appliances.

2. Branch ducts from other equipment in the same kitchen area, or from registers exhausting the kitchen space in general, may be connected to the main hood exhaust duct if the following requirements are complied with:
   2.1. A fusible link fire damper of the same gage as the hood exhaust duct shall be added at the point of connection of the branch duct to the exhaust duct.
   2.2. If the branch connection is made to the portion of the ductwork that will contain the fire-extinguishing medium, then the fire dampers required in Exception 2.1 shall be arranged to close automatically upon the operation of the fire-extinguishing system.
   2.3. The branch connection shall be made in either the top or sides of the main duct in a manner to prevent grease from flowing into the branch duct.
   2.4. The branch ducts shall be constructed of steel, aluminum, or copper of the gages and weights required in Chapter 6, and they shall be insulated with 2 inches (50.8 mm) of magnesia or other material having equivalent insulative and fire resistance qualities.
2.5. All registers in these branches shall have fusible link actuated dampers.

2.6. Where branch ductwork is to be used to exhaust vapors from dishwashers, pot sinks, or other similar equipment of a commercial type from which moisture is emitted, copper or aluminum of the minimum gage and weights required in Chapter 6 shall be used. Such ductwork shall be installed so that condensate cannot leak from it.

2.7. Type I and Type II exhaust systems can be interconnected downstream of filters with a fire damper at the connection to the exhaust system.

506.3.6 Grease duct clearances. Where enclosures are not required, grease duct systems and exhaust equipment serving a Type I hood shall have a clearance to combustible construction of not less than 18 inches ([457] 457.2 mm), and shall have a clearance to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 3 inches ([76] 76.2 mm).

Exceptions:

1. For factory-built commercial kitchen grease ducts [1] listed and labeled in accordance with UL 1978, the required clearance shall be in accordance with the listing of such material and as approved by the commissioner.

2. Listed and labeled exhaust equipment installed in accordance with Section 304.1.

3. Where commercial kitchen grease ducts are continuously covered on all sides with a listed and labeled field-applied grease duct enclosure material, system, product or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336, the required clearance shall be in accordance with the listing of such material, system, product or method.

4. Grease ducts protected with a minimum insulation covering of 2 inches ([54] 50.8 mm) of magnesium or calcium silicate block, with staggered joints, attached with galvanized steel wire or material assembly equivalent in insulating and fire-resistant qualities which cannot be penetrated by grease [1]. Such protection shall be applied to all ducts inside of the building as approved by the commissioner.

506.3.7 Prevention of grease accumulation in grease ducts. Duct systems serving a Type I hood shall be constructed and installed so that grease cannot collect in any portion thereof, and the system shall slope not less than one-fourth unit vertical in 12 units horizontal (2-percent slope) toward the hood or toward [an approved] a grease reservoir designed and installed in accordance with Section 506.3.7.1. Where horizontal ducts exceed 75 feet (22 860 mm) in length, the slope shall be not [be] less than one unit vertical in 12 units horizontal (8.3-percent slope). Dampers shall not be installed in the grease duct systems, except as required by Section 506.3.5, Exception 2.
506.3.7.1 **Residue trap.** A residue trap shall be provided at the base of each vertical riser with provision for cleanout in accordance with NFPA 96. **Grease duct reservoirs.** Grease duct reservoirs shall:

1. Be constructed as required for the grease duct they serve.
2. Be located on the bottom of the horizontal duct or the bottommost section of the duct riser.
3. Extend across the full width of the duct and have a length of not less than 12 inches (304.8 mm).
4. Have a depth of not less than 1 inch (25.4 mm).
5. Have a bottom that slopes to a capped drain connection.
6. Be provided with a cleanout opening constructed in accordance with Section 506.3.8 and installed to provide direct access to the reservoir. The cleanout opening shall be located on a side or on top of the duct so as to permit cleaning of the reservoir.
7. Be installed in accordance with the manufacturer’s instructions where manufactured devices are utilized.

506.3.8 Grease duct cleanouts and other openings. Grease duct systems shall not have openings therein other than those required for proper operation and maintenance of the system. Any portion of such system having sections not provided with access from the duct entry or discharge shall be provided with cleanout openings. Cleanout openings shall be provided at every change in direction, within 3 feet ([944] 914.4 mm) of the exhaust fan, and as required under Section 506.3.9. Cleanout openings shall be equipped with tight-fitting doors constructed of steel having a thickness not less than that required for the duct. Doors shall be equipped with a substantial method of latching, sufficient to hold the door tightly closed. Doors shall be designed so that they are operable without the use of a tool. Door assemblies shall have a gasket or sealant that is noncombustible and liquid tight, and shall not have fasteners that penetrate the duct. Listed and labeled access door assemblies shall be installed in accordance with the terms of the listing. Signage shall be provided at all required access doors and openings in accordance with Section [506.3.11] 506.3.12.

506.3.8.1 Personnel entry. Where ductwork is large enough to allow entry of personnel, not less than one approved or listed opening having dimensions not less than 22 inches by 20 inches ([559] 558.8 mm by 508 mm) shall be provided in the horizontal sections, and in the top of vertical risers. Where such entry is provided, the duct and its supports shall be capable of supporting the additional load, and the cleanouts specified in Section 506.3.8 are not required. Where personnel entry is not possible for cleaning the interior of vertical ducts, suitable provisions shall be made to clean the vertical duct in its entirety as well as for cleaning the base of the vertical riser.

506.3.8.2 Cleanouts serving in-line fans. A suitable cleanout shall be provided for both the inlet side and outlet side of an in-line fan except where a duct does not connect to the fan.
Such cleanouts shall be located within 3 feet (914.4 mm) of the fan duct connections to permit a thorough cleaning of the inlet and discharge ducts connected to the in-line fan as well as the interior of the fan itself.

**Exception:** Where suitable cleanouts for in-line fans cannot be provided, the in-line fan shall be of “clam shell” construction which shall permit the fan to be opened and thoroughly cleaned while remaining in place.

### 506.3.9 Grease duct horizontal cleanouts.

Cleanouts located on horizontal sections of ducts shall be spaced not more than 20 feet (6096 mm) apart, unless the opening prescribed by Section 506.3.8.1 is not possible, in which case openings large enough to permit thorough cleaning shall be provided at 12-foot (3657.6 mm) intervals. The cleanouts shall be located on the side of the duct with the opening not less than 1.5 inches (38.1 mm) above the bottom of the duct, and not less than 1 inch (25.4 mm) below the top of the duct. The opening minimum dimensions shall be 12 inches (304.8 mm) on each side. Where the dimensions of the side of the duct prohibit the cleanout installation prescribed herein, the openings shall be on the top of the duct or the bottom of the duct. Where located on the top of the duct, the opening edges shall be a minimum of 1 inch (25.4 mm) from the edges of the duct. Where located in the bottom of the duct, cleanout openings shall be designed to provide internal damming grease down the duct around the dam, and shall be approved for the application. Where the dimensions of the sides, top or bottom of the duct preclude the installation of the prescribed minimum-size cleanout opening, the cleanout shall be located on the duct face that affords the largest opening dimension and shall be installed with the opening edges at the prescribed distances from the duct edges as previously set forth in this section.

### 506.3.10 Underground and raised floor cavity grease duct installation.

Grease ducts shall not be installed underground or in raised floor cavities.

### 506.3.11 Grease duct enclosure.

[A grease duct serving a Type I hood that penetrates a ceiling, wall or floor shall be enclosed from the first point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the New York City Building Code. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be either field-applied or factory-built. Duct enclosures shall have a fire-resistance rating not less than that of the fire-resistance rated assembly penetrated, but need not exceed 2 hours. Duct enclosures shall be as prescribed by Section 506.3.10.1, 506.3.10.2 or 506.3.10.3.] A commercial kitchen grease duct serving a Type I hood that penetrates a ceiling, wall, floor or any concealed space shall be enclosed from the first point of penetration to the outlet terminal. In-line exhaust fans not located outdoors shall be enclosed as required for grease ducts. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the New York City Building Code. The duct enclosure shall serve a single grease duct and shall not contain other ducts, piping or wiring systems. Duct enclosures shall be a shaft enclosure in accordance with Section 506.3.11.1, a field-applied enclosure assembly in accordance with Section 506.3.11.2 or a factory-built enclosure assembly in accordance with Section 506.3.11.3. Duct enclosures shall have a fire-resistance rating of not less than that of the fire-resistance-rated assembly penetrated and not less than 1 hour. Fire dampers and smoke dampers shall not be installed in grease ducts.
Exception: A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

506.3.11.1 Shaft enclosure. [Commercial kitchen grease] Grease ducts constructed in accordance with Section 506.3.1 shall be permitted to be enclosed in accordance with the New York City Building Code requirements for shaft construction. Such grease duct systems and exhaust equipment shall have a clearance to combustible construction of not less than 18 inches (457.2 mm), and shall have a clearance to noncombustible construction and gypsum wallboard attached to noncombustible structures of not less than 6 inches (152.4 mm). Duct enclosures shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings.

Exceptions:

1. The shaft enclosure provisions of this section shall not be required where a duct penetration is protected with a through-penetration firestop system classified in accordance with ASTM E 814 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated and where the surface of the duct is continuously covered on all sides from the point at which the duct penetrates a ceiling, wall or floor to the outlet terminal with a classified and labeled material, system, method of construction or product specifically evaluated for such purpose, which material, system, method of construction or product is approved by the commissioner and installed according to the manufacturer’s instructions. Exposed duct wrap systems shall be protected where subject to physical damage.

2. As an alternative to Exception 1 of this section, a minimum insulation covering of 2 inches (50.8 mm) of magnesium or calcium silicate block, with staggered joints, attached with galvanized steel wire or material assembly equivalent in insulating and fire-resistant qualities which cannot be penetrated by grease, and as approved by the commissioner, shall be applied to all ducts inside of the building.

3. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

4. A listed and labeled factory-built commercial kitchen grease duct system, evaluated as an enclosure system for reduced clearances to combustibles, and approved by the commissioner and installed according to manufacturer’s instructions.

506.3.11.2 Field-applied grease duct enclosure. [Commercial kitchen grease] Grease ducts constructed in accordance with Section 506.3.1 shall be enclosed by a listed and labeled field-applied grease duct enclosure that is a listed and labeled material, system, product, or method of construction specifically evaluated for such purpose in accordance with ASTM E 2336. The surface of the duct shall be continuously covered on all sides from the point at which the duct originates to the outlet terminal. Duct penetrations shall
be protected with a through-penetration firestop system [classified] tested and listed in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. [Such systems] The grease duct enclosure and firestop system shall be installed in accordance with the listing and the manufacturer’s [installation] instructions. Exposed [duct-wrap] duct-wrap systems shall be protected where subject to physical damage.

506.3.10.3 Factory-built grease duct enclosure assemblies. Factory-built grease [duct assemblies] ducts incorporating integral enclosure materials shall be listed and labeled for use as [commercial kitchen] grease duct enclosure assemblies specifically evaluated for such purpose in accordance with UL 2221. Duct penetrations shall be protected with a through-penetration firestop system [classified] tested and listed in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated. [Such assemblies] The grease duct enclosure assembly and firestop system shall be installed in accordance with the listing and the manufacturer’s [installation] instructions.

506.3.10.4 Duct enclosure not required. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

506.3.11 Grease duct fire-resistant access opening. Where cleanout openings are located in ducts within a fire-resistance-rated enclosure, access openings shall be provided in the enclosure at each cleanout point. Access openings shall be equipped with tight-fitting sliding or hinged doors that are equal in fire-resistant protection to that of the shaft or enclosure. An approved sign shall be placed on access opening panels with wording as follows: “ACCESS PANEL. DO NOT OBSTRUCT.” Cleanout openings provided in ducts that are not located within a fire-resistance-rated enclosure shall be provided with sign-age at the required opening that contains the same wording.

506.3.12 Exhaust outlets serving Type I hoods. Exhaust outlets for grease ducts serving Type I hoods shall conform to the requirements of Sections [506.3.12.1] 506.3.13.1 through [506.3.12.3] 506.3.13.3.

506.3.12.1 Termination above the roof. Exhaust outlets that terminate above the roof shall have the discharge opening located not less than 40 inches (1016 mm) above the roof surface. The exhaust flow shall be directed away from the surface of the roof.

506.3.12.2 Termination through an exterior wall. Exhaust outlets shall be permitted to terminate through exterior walls where the smoke, grease, gases, vapors and odors in the discharge from such terminations do not create a public nuisance or a fire hazard. Such terminations shall not be located where protected openings are required by the New York City Building Code. Other exterior openings shall not be located within 3 feet ([914] 914.4 mm) of such terminations.

506.3.12.3 Termination location. Exhaust outlets shall be located not less than 10 feet (3048 mm) horizontally from parts of the same or contiguous buildings, adjacent buildings and adjacent property lines and shall be located not less than 10 feet (3048 mm) above the adjoining grade level. Exhaust outlets shall be located not less than 10 feet (3048 mm)
mm) horizontally from and not less than 3 feet ([914] 914.4 mm) above air intake openings into any building.

**Exception:** Exhaust outlets shall terminate not less than 5 feet (1524 mm) horizontally from parts of the same or contiguous building, an adjacent building, adjacent property line and air intake openings into a building where air from the exhaust outlet discharges away from such locations.

**506.4 Ducts serving Type II hoods.** [Single or combined Type II exhaust systems for food-processing operations shall be independent of all other exhaust systems.] Commercial kitchen exhaust systems serving Type II hoods shall comply with Sections 506.4.1 and 506.4.2.

**506.4.1 Ducts.** Ducts and plenums serving Type II hoods shall be constructed of rigid metallic materials. Duct construction, installation, bracing and supports shall comply with Chapter 6. Ducts subject to positive pressure and ducts conveying moisture-laden or waste-heat-laden air shall be constructed, joined and sealed in an approved manner.

**506.4.2 Type II terminations.** Exhaust outlets serving Type II hoods shall terminate in accordance with the hood manufacturer’s installation instructions and shall comply with all of the following:

1. [Exhaust outlets] **Outlets shall terminate not less than 3 feet ([914] 914.4 mm) in any direction from openings into the building.**
2. **Outlets shall terminate not less than 10 feet (3048 mm) from property lines or buildings on the same lot.**
3. **Outlets shall terminate not less than 10 feet (3048 mm) above grade.**
4. **Outlets that terminate above a roof shall terminate not less than 30 inches (762 mm) above the roof’s surface.**
5. **Outlets shall terminate not less than 30 inches (762 mm) from exterior vertical walls.**
6. **Outlets shall be protected against local weather conditions.**
7. **Outlets shall not be directed onto walkways.**
8. **Outlets shall meet the provisions for exterior wall opening protectives in accordance with the New York City Building Code.**

**506.4.2.1 Cooking spaces.** For all buildings other than those classified as residential occupancy, a minimum of No. 16 Gage for galvanized sheet duct shall be used for nongrease duct exhaust applications.

**506.5 Exhaust equipment.** Exhaust equipment, including fans and grease reservoirs, shall comply with Sections 506.5.1 through 506.5.5 and shall be of an approved design or shall be listed for the application.
506.5.1 Exhaust fans. Exhaust fan housings serving a Type I hood shall be constructed as required for grease ducts in accordance with Section 506.3.1.1.

Exception: Fans listed and labeled in accordance with UL 762.

506.5.1.1 Fan motor. Exhaust fan motors shall be located outside of the exhaust airstream.

506.5.1.2 In-line fan location. Where enclosed duct systems are connected to in-line fans not located outdoors, the fan shall be located in a room or enclosure having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of fan components. Such rooms or enclosures shall be ventilated in accordance with the fan manufacturer’s instructions.

506.5.2 Exhaust fan discharge. Exhaust fans shall be positioned so that the discharge will not impinge on the roof, other equipment or appliances or parts of the structure. A vertical discharge fan serving a Type I hood shall be manufactured with an approved drain outlet at the lowest point of the housing to permit drainage of grease to an approved grease reservoir.

506.5.3 Exhaust fan mounting. [An upblast fan shall be hinged and supplied with a flexible weatherproof electrical cable to permit inspection and cleaning. The ductwork shall extend a minimum of 18 inches (457 mm) above the roof surface.] Up-blast fans serving Type I hoods and installed in a vertical or horizontal position shall be hinged, supplied with a flexible weatherproof electrical cable to permit inspection and cleaning and shall be equipped with a means of restraint to limit the swing of the fan on its hinge. The ductwork shall extend not less than 18 inches (457.2 mm) above the roof surface.

506.5.4 Reserved.

506.5.5 Termination location. The outlet of exhaust equipment serving Type I hoods shall be in accordance with Section [506.3.12] 506.3.13.

Exception: The minimum horizontal distance between vertical discharge fans and parapet-type building structures shall be 2 feet (610 mm) provided that such structures are not higher than the top of the fan discharge opening.

506.5.6 Exhaust fan operation. The operation of the exhaust fan shall be in accordance with the following requirements:

1. The hood exhaust fan(s) shall continue to operate after the extinguishing system has been activated unless fan shutdown is required by a listed component of the ventilation system or by the design of the extinguishing system.

2. The hood exhaust fan shall not be required to start automatically upon activation of the extinguishing system if the exhaust fan and all cooking equipment served by the fan have previously been shut down.

3. The cooking appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating.
506.6 Exterior duct installations. The installation of exterior ducts shall comply with the following requirements:

1. The exterior portion of the ductwork shall be vertical wherever possible and shall be installed and supported on the exterior of a building.

2. Bolts, screws, rivets, and other mechanical fasteners shall not penetrate duct walls.

3. Clearance of any ducts shall comply with Section 506.3.6.

4. All ducts shall be protected on the exterior by paint or other suitable weather-protective coating.

5. Ducts constructed of stainless steel shall not be required to have additional paint or weather-protective coatings.

6. Ductwork subject to corrosion shall have minimal contact with the building surface.

7. No portion of an exterior metal duct shall be nearer than 24 inches (610 mm) to any door or window or to any exit, or located where it would be readily accessible to the public, unless it is insulated or shielded to avoid injury to any person coming in contact with the duct.

   Exception: Listed and labeled factory-built commercial kitchen grease ducts may be used when installed in accordance with Section 304.1.

506.7 Identification of ducts. All duct systems serving Type I and Type II exhaust equipment shall be permanently labeled: “CAUTION: KITCHEN EXHAUST SYSTEM.” At the base of each duct and at its termination point, a clearly identifiable permanent sign shall be installed identifying the facility from which the duct originates.

SECTION MC 507
COMMERCIAL KITCHEN HOODS

507.1 General. Commercial kitchen exhaust hoods shall comply with the requirements of this section. Hoods shall be Type I or Type II and shall be designed to capture and confine cooking vapors and residues. Commercial kitchen exhaust hood systems shall operate at all times while cooking equipment is in operation. For additional interlock requirements pertaining to gas appliances, refer to Section 505.1 of the New York City Fuel Gas Code. A Type I or Type II hood shall be installed at or above all commercial cooking appliances in accordance with Section 507.2 and 507.3. Where any cooking appliance under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed. Where a Type I hood is installed, the installation of the entire system, including the hood, ducts, exhaust equipment and makeup air system shall comply with the requirements of Sections 506, 507, 508 and 509. Where total kitchen hood exhaust airflow rate is greater than 5,000 cfm or as required by the New York City Energy Conservation Code, each hood shall be a factory-built commercial exhaust hood listed by a nationally recognized testing laboratory in compliance with UL 710.

Exceptions:
1. Factory-built commercial exhaust hoods which are tested in accordance with UL 710, listed, labeled and installed in accordance with Section 304.1 shall not be required to comply with Sections 507.4, 507.7, 507.11, 507.12, 507.13, 507.14 and 507.15. Factory-built commercial exhaust hoods that are listed and labeled in accordance with UL 710, and installed in accordance with Section 304.1, shall not be required to comply with Sections 507.1.5, 507.2.3, 507.2.5, 507.2.8, 507.3.1, 507.3.3, 507.4 and 507.5.

2. Hoods used with electric cooking equipment shall be in accordance with UL 710B and have a grease removal and fire suppression system.

3. Net exhaust volumes for hoods shall be permitted to be reduced during part-load cooking conditions, where engineered or listed multispeed or variable-speed controls automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall not be below that required to maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode. Where cooking appliances are equipped with integral down-draft exhaust systems and such appliances and exhaust systems are listed and labeled for the application in accordance with NFPA 96, a hood shall not be required at or above them.

[507.2 Where required. A Type I or Type II hood shall be installed at or above all commercial cooking appliances in accordance with Sections 507.2.1 and 507.2.2. Where any cooking appliance at or under a single hood requires a Type I hood, a Type I hood shall be installed. Where a Type II hood is required, a Type I or Type II hood shall be installed.]

[507.2.1 Type I hoods. Type I hoods shall be installed where cooking appliances produce grease or smoke. Type I hoods shall be installed over medium-duty, heavy-duty and extra-heavy-duty cooking appliances. Type I hoods shall be installed over light-duty cooking appliances that produce grease or smoke.]

[507.2.1.1 Operation. Type I hood systems shall be designed and installed to automatically activate the exhaust fan whenever cooking operations occur. The activation of the exhaust fan shall occur through an interlock with the cooking appliances, by means of heat sensors or by means of other approved methods. Commercial cooking appliances equipped with integral down-draft exhaust shall meet the requirements of Section 507.2.]

[507.2.2 Type II hoods. Type II hoods shall be installed above dishwashers and light-duty appliances that produce heat or moisture and do not produce grease or smoke except where the heat and moisture loads from such appliances are incorporated into a separate removal system. Type II hoods shall be installed above all light-duty appliances that produce products of combustion and do not produce grease or smoke. Spaces containing cooking appliances that do not require Type II hoods shall be ventilated in accordance with Section 403.3. For the purpose of determining the floor area required to be ventilated, each individual appliance that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m²). Type II hoods or heat and water exhaust systems installed in accordance with the manufacturer’s recommendations are required for commercial dishwashers and pot washer equipment.]
507.1.1 Operation. Commercial kitchen exhaust hood systems shall operate while cooking equipment is in operation. The hood exhaust rate shall comply with the listing of the hood or shall comply with Section 507.5. The exhaust fan serving a Type I hood shall have automatic controls that will activate the fan when any appliance that requires such Type I Hood is turned on, or a means of interlock shall be provided that will prevent operation of such appliances when the exhaust fan is not turned on. Where one or more temperature or radiant energy sensors are used to activate a Type I hood exhaust fan, the fan shall activate not more than 15 minutes after the first appliance served by that hood has been turned on. A method of interlock between an exhaust hood system and appliances equipped with standing pilot burners shall not cause the pilot burners to be extinguished. A method of interlock between an exhaust hood system and cooking appliances shall not involve or depend upon any component of a fire-extinguishing system.

Hood exhaust volumes may be reduced during part-load cooking conditions only for listed hoods that are provided with variable speed or multispeed controls from or as approved by the hood manufacturer. Such controls shall automatically operate the exhaust system to maintain capture and removal of cooking effluents as required by this section. Reduced volumes shall maintain capture and removal of effluents from the idle cooking appliances that are operating in a standby mode. Minimum duct velocities shall be maintained during part load operation. The replacement air system shall be operated in coordination with the variable flow operation of the exhausts.

507.1.1.1 Multiple hoods utilizing a single exhaust system. Where heat or radiant energy sensors are utilized in hood systems consisting of multiple hoods served by a single exhaust system, such sensors shall be provided in each hood. Sensors shall be capable of being accessed from the hood outlet or from a cleanout location.

[507.2.3] 507.1.2 Domestic cooking appliances used for commercial purposes. Domestic cooking appliances utilized for commercial purposes shall be provided with Type I or Type II hoods as required for the type of appliances and processes in accordance with Sections 507.2, 507.2.1 and 507.2.2. Domestic cooking appliances utilized for commercial purposes and all domestic cooking appliances installed in cafeterias and Group A-1, A-2, A-4, A-5, and M occupancies shall be provided with Type I, Type II, or UL 710B hoods as required for the type of appliances and processes in accordance with Sections 507.2 and 507.3. Refer to Section 505.4 for qualifying non-commercial uses.

[507.2.4] Extra-heavy-duty. Type I hoods for use over extra-heavy-duty cooking appliances shall not cover heavy-, medium- or light-duty appliances. Such hoods shall discharge to an exhaust system that is independent of other exhaust systems.

[507.3] 507.1.3 Fuel-burning appliances. Where vented fuel-burning appliances are located in the same room or space as the hood, provisions shall be made to prevent the hood system from interfering with normal operation of the appliance vents.

507.1.4 Cleaning. A hood shall be designed to facilitate thorough cleaning of the entire hood.

507.1.5 Exhaust outlets. Exhaust outlets located within the hood shall be located to optimize the capture of particulate matter. Each outlet shall serve not more than a 12-foot (3657.6 mm) section of hood.
**507.2 Type I hoods.** Type I hoods shall be installed where cooking appliances produce grease or smoke as a result of the cooking process. Type I hoods shall be installed over medium-duty, heavy-duty and extra-heavy-duty cooking appliances.

**Exception:** A Type I hood shall not be required for an electric cooking appliance where an approved testing agency provides documentation that the appliance effluent contains 5 mg/m$^3$ or less of grease when tested at an exhaust flow rate of 500 cfm (0.236 m$^3$/s) in accordance with UL 710B.

**507.2.1 Type I exhaust flow rate label.** Type I hoods shall bear a label indicating the minimum exhaust flow rate in cfm per linear foot (L/s per linear meter) of hood that provides for capture and containment of the exhaust effluent for the cooking appliances served by the hood, based on the cooking appliance duty classifications defined in this code.

**507.2.2 Type I extra-heavy-duty.** Type I hoods for use over extra-heavy-duty cooking appliances shall not cover heavy-, medium- or light-duty appliances. Such hoods shall discharge to an exhaust system that is independent of other exhaust systems.

**507.4 507.2.3 Type I materials.** Type I hoods shall be constructed of steel having a minimum thickness of 0.0466 inch (1.18 mm) (No. 18 gage) or stainless steel not less than 0.0335 inch (0.8525 mm) (No. 20 MSG) in thickness.

**507.5 Type II hood materials.** Type II hoods shall be constructed of steel having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage) stainless steel not less than 0.0220 inch (0.5550 mm) (No.24 gage) in thickness, copper sheets weighing not less than 24 ounces per square foot (7.3Kg/m$^2$) or of other approved material and gage.

**507.6 Supports.** 507.2.4 Type I supports. Type I hoods shall be secured in place by noncombustible supports. [All] Type I and Type II hood supports shall be adequate for the applied load of the hood, the unsupported ductwork, the effluent loading and the possible weight of personnel working in or on the hood.

**507.7 Hood joints, seams and penetrations.** Hood joints, seams and penetrations shall comply with Sections 507.7.1 and 507.7.2.

**507.7.1 Type I hoods.** 507.2.5 Type I hood joints, seams and penetrations. External hood joints, seams and penetrations for Type I hoods shall be made with a continuous external liquid-tight weld or braze to the lowest outermost perimeter of the hood. Internal hood joints, seams, penetrations, filter support frames and other appendages attached inside the hood shall not be required to be welded or brazed but shall be otherwise sealed to be grease tight.

**Exceptions:**

1. Penetrations shall not be required to be welded or brazed where sealed by devices that are listed for the application.
2. Internal welding or brazing of seams, joints and penetrations of the hood shall not be prohibited provided that the joint is formed smooth or ground so as to not trap grease, and is readily cleanable.

[507.7.2 Type II hoods. Joints, seams and penetrations for Type II hoods shall be constructed as set forth in Chapter 6, shall be sealed on the interior of the hood and shall provide a smooth surface that is readily cleanable and water tight.]

[507.8 Cleaning and grease gutters. A hood shall be designed to provide for thorough cleaning of the entire hood. Grease gutters shall drain to an approved collection receptacle that is fabricated, designed and installed to allow access for cleaning.]

[507.9] 507.2.6 Clearances for Type I hood. A Type I hood shall be installed with a clearance to combustibles of not less than 18 inches ([457] 457.2 mm).

Exception: Clearance shall not be required from gypsum wallboard or ½-inch (12.7 mm) or thicker cementitious wallboard attached to noncombustible structures provided that a smooth, cleanable, nonabsorbent and noncombustible material is installed between the hood and the gypsum or cementitious wallboard over an area extending not less than 18 inches ([457] 457.2 mm) in all directions from the hood.

[507.10 Hoods penetrating a ceiling.] 507.2.7 Type I hoods penetrating a ceiling. Type I hoods or portions thereof penetrating a ceiling, wall or furred space shall comply with [all the requirements of Section 506.3.10.] Section 506.3.11. Field-applied grease duct enclosure systems, as addressed in Section 506.3.11.2, shall not be utilized to satisfy the requirements of this section.

[507.11 Grease filters.] 507.2.8 Type I grease filters. Type I hoods shall be equipped with [UL 1046 listed] grease filters [designed for the specific purpose. Grease collecting equipment] listed and labeled in accordance with UL 1046. Grease filters shall be provided with access for cleaning or replacement. The lowest edge of a grease filter located above the cooking surface shall be not less than the height specified in Table [507.14] 507.2.8.

<table>
<thead>
<tr>
<th>TYPE OF COOKING APPLIANCE</th>
<th>HEIGHT ABOVE COOKING SURFACE (feet)</th>

<td>Without exposed flame</td>
<td>0.5</td>
</tr>
<tr>
<td>Exposed flame and burners</td>
<td>2</td>
</tr>
<tr>
<td>Exposed charcoal and charbroil type</td>
<td>4</td>
</tr>
</tbody>
</table>

For SI: 1 foot = 304.8 mm.

[507.11.1] 507.2.8.1 Criteria. Filters shall be of such size, type and arrangement as will permit the required quantity of air to pass through such units at rates not exceeding those for which the filter or unit was designed or approved. Filter units shall be installed in frames or holders so as to be readily removable without the use of separate tools, unless designed and installed to be cleaned in place and the system is equipped for such cleaning in place. [Removable] Where filters are designed and required to be cleaned, removable filter units shall be of a size that will allow them to be cleaned in a dishwashing machine or pot sink.
Filter units shall be arranged in place or provided with drip-intercepting devices to prevent grease or other condensate from dripping into food or on food preparation surfaces.

**507.11.2 Mounting position.**

**507.2.8.2 Mounting position of grease filters.** Filters shall be installed at an angle of not less than 45 degrees (0.79 rad) from the horizontal and shall be equipped with a drip tray beneath the lower edge of the filters.

**507.2.9 Grease gutters for Type I hood.** Grease gutters shall drain to an approved collection receptacle that is fabricated, designed and installed to allow access for cleaning.

**507.3 Type II hoods.** Type II hoods shall be installed above dishwashers and appliances that produce heat or moisture and do not produce grease or smoke as a result of the cooking process, except where the heat and moisture loads from such appliances are incorporated into the HVAC system design or into the design of a separate removal system. Type II hoods shall be installed above all appliances that produce products of combustion and do not produce grease or smoke as a result of the cooking process. Spaces containing cooking appliances that do not require Type II hoods shall be provided with exhaust at a rate of 0.70 cfm per square foot (0.00033 m³/s). For the purpose of determining the floor area required to be exhausted, each individual appliance that is not required to be installed under a Type II hood shall be considered as occupying not less than 100 square feet (9.3 m²). Such additional square footage shall be provided with exhaust at a rate of 0.70 cfm per square foot (0.00356 m³/(s × m²)).

**507.3.1 Type II hood materials.** Type II hoods shall be constructed of steel having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage) or stainless steel not less than 0.0220 inch (0.5550 mm) (No. 24 gage) in thickness, copper sheets weighing not less than 24 ounces per square foot (7.3 kg/m²) or of other approved material and gage.

**507.11.3 Filter servicing.** Filters shall be serviced and replaced regularly by qualified employees of the owner or by a cleaning agency. A record indicating the name of the person or firm doing the servicing and the dates when filters were cleaned or replaced shall be available for inspection by the commissioner. They shall be cleaned or replaced as frequently as necessary, but at least every 3 months, and no exhaust system shall be operated while cooking is being carried on without the filters installed in place.

**507.3.2 Type II supports.** Type II hood supports shall be adequate for the applied load of the hood, the unsupported ductwork, the effluent loading and the possible weight of personnel working in or on the hood.

**507.3.3 Type II hood joints, seams and penetrations.** Joints, seams and penetrations for Type II hoods shall be constructed as set forth in Chapter 6, shall be sealed on the interior of the hood and shall provide a smooth surface that is readily cleanable and water tight.

**507.4 Hood size and location.** Hoods shall comply with the overhang, setback and height requirements in accordance with Sections 507.4.1 and 507.4.2, based on the type of hood.

**507.12 507.4.1 Canopy size and location.** The inside lower edge of canopy-type Type I and II commercial hoods shall overhang or extend a horizontal distance of not less than 6 inches (152 mm) beyond the edge of the top horizontal surface of the appliance on all open sides. The
vertical distance between the front lower lip of the hood and such surface shall not exceed 4 feet ([1219] 1219.2 mm).

Exception: The hood shall be permitted to be flush with the outer edge of the cooking surface where the hood is closed to the appliance side by a noncombustible wall or panel.

507.4.2 Noncanopy size and location. Noncanopy-type hoods shall be located not greater than 3 feet (914.4 mm) above the cooking surface. The edge of the hood shall be set back not greater than 1 foot (304.8 mm) from the edge of the cooking surface.

507.5 Capacity of hoods. Commercial food service hoods shall exhaust a minimum net quantity of air determined in accordance with this section and Sections [507.13.1] 507.5.1 through [507.13.5] 507.5.5. The net quantity of exhaust air shall be calculated by subtracting any airflow supplied directly to a hood cavity from the total exhaust flow rate of a hood. Where any combination of heavy-duty, medium-duty and light-duty cooking appliances are utilized under a single hood, the exhaust rate required by this section for the heaviest duty appliance covered by the hood shall be used for the entire hood.

507.5.1 Extra-heavy-duty cooking appliances. The minimum net airflow for hoods, as determined by Section [507.2] 507.1, used for extra-heavy-duty cooking appliances shall be determined as follows:

<table>
<thead>
<tr>
<th>Type of Hood</th>
<th>CFM per linear foot of hood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backshelf/pass-over</td>
<td>Not allowed</td>
</tr>
<tr>
<td>Double island canopy (per side)</td>
<td>550</td>
</tr>
<tr>
<td>Eyebrow</td>
<td>Not allowed</td>
</tr>
<tr>
<td>Single island canopy</td>
<td>700</td>
</tr>
<tr>
<td>Wall-mounted canopy</td>
<td>550</td>
</tr>
</tbody>
</table>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

507.5.2 Heavy-duty cooking appliances. The minimum net airflow for hoods, as determined by Section [507.2] 507.1, used for heavy-duty cooking appliances shall be determined as follows:

<table>
<thead>
<tr>
<th>Type of Hood</th>
<th>CFM per linear foot of hood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backshelf/pass-over</td>
<td>400</td>
</tr>
<tr>
<td>Double island canopy (per side)</td>
<td>400</td>
</tr>
<tr>
<td>Eyebrow</td>
<td>Not allowed</td>
</tr>
<tr>
<td>Single island canopy</td>
<td>600</td>
</tr>
<tr>
<td>Wall-mounted canopy</td>
<td>400</td>
</tr>
</tbody>
</table>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.
**507.5.3 Medium-duty cooking appliances.** The minimum net airflow for hoods, as determined by Section 507.2, used for medium-duty cooking appliances shall be determined as follows:

<table>
<thead>
<tr>
<th>Type of Hood</th>
<th>CFM per linear foot of hood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backshelf/pass-over</td>
<td>300</td>
</tr>
<tr>
<td>Double island canopy (per side)</td>
<td>300</td>
</tr>
<tr>
<td>Eyebrow</td>
<td>250</td>
</tr>
<tr>
<td>Wall-mounted canopy</td>
<td>300</td>
</tr>
<tr>
<td>Single island canopy</td>
<td>500</td>
</tr>
<tr>
<td>Wall-mounted canopy</td>
<td>300</td>
</tr>
</tbody>
</table>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

**507.5.4 Light-duty cooking appliances.** The minimum net airflow for hoods, as determined by Section 507.2, used for light-duty cooking appliances and food service preparation shall be determined as follows:

<table>
<thead>
<tr>
<th>Type of Hood</th>
<th>CFM per linear foot of hood</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backshelf/pass-over</td>
<td>250</td>
</tr>
<tr>
<td>Double island canopy (per side)</td>
<td>250</td>
</tr>
<tr>
<td>Eyebrow</td>
<td>250</td>
</tr>
<tr>
<td>Single island canopy</td>
<td>400</td>
</tr>
<tr>
<td>Wall-mounted canopy</td>
<td>200</td>
</tr>
</tbody>
</table>

For SI: 1 cfm per linear foot = 1.55 L/s per linear meter.

**507.5.5 Dishwashing appliances.** The minimum net airflow for Type II hoods used for dishwashing appliances shall be 100 [CFM] cfm per linear foot (155 L/s per linear meter) of hood length.

**Exception:** Dishwashing appliances and equipment installed in accordance with Section 507.2.2, 507.3.

**507.14 Noncanopy size and location.** Noncanopy type hoods shall be located a maximum of 3 feet (914 mm) above the cooking surface. The edge of the hood shall be set back a maximum of 1 foot (305 mm) from the edge of the cooking surface.

**507.15 Exhaust outlets.** Exhaust outlets located within the hood shall be located so as to optimize the capture of particulate matter.

**507.16 Performance test.** A performance test shall be conducted upon completion and witnessed by a representative of the Fire Department before final approval of the installation of a ventilation system serving commercial cooking appliances. The test shall verify the rate of exhaust airflow required by Section 507.13, makeup airflow required by Section 508 and proper operation as specified in this chapter. The permit holder shall furnish the necessary test equipment and devices required to perform the tests.
SECTION MC 508
COMMERCIAL KITCHEN MAKEUP AIR

508.1 Makeup air. Makeup air shall be supplied during the operation of commercial kitchen exhaust systems that are provided for commercial cooking appliances. The amount of makeup air supplied to the building from all sources shall be approximately equal to the amount of exhaust air for all exhaust systems for the building. The makeup air shall not reduce the effectiveness of the exhaust system. Makeup air shall be provided by gravity or mechanical means or both. Mechanical makeup air systems shall be automatically controlled to start and operate simultaneously with the exhaust system. Makeup air intake opening locations shall comply with Section 401.4. Makeup air shall be provided in accordance with the New York City Energy Conservation Code.

508.1.1 Makeup air temperature. The temperature differential between makeup air delivered to the space and the air in the conditioned space shall not exceed 10ºF (6ºC) except where the [added heating and cooling loads of the makeup air do not exceed the capacity of the HVAC system.] makeup air contributes to satisfying the heating or cooling loads of the space and such temperature differential does not exceed 25ºF (-38.9ºC). The makeup air delivered to a compensating hood with front facing or side facing discharges shall be considered as being delivered to the space for the purposes of this section.

508.1.2 Air balance. Design plans for a commercial kitchen ventilation system shall include a schedule or diagram indicating the design air balance of the kitchen and all communicating spaces clearly indicating makeup, transfer, exhaust and infiltration air flow rates. Negative pressurization caused by the kitchen exhaust system shall not cause improper operation of systems in communicating spaces or cause door opening forces in the building to exceed the limits set forth in Chapter 10 of the New York City Building Code.

508.2 Compensating hoods. Manufacturers of compensating hoods shall provide a label indicating minimum exhaust flow and/or maximum makeup airflow that provides capture and containment of the exhaust effluent.

Exception: Compensating hoods with makeup air supplied only from the front face discharge and side face discharge openings shall not be required to be labeled with the maximum makeup airflow.

SECTION MC 509
FIRE SUPPRESSION SYSTEMS

509.1 Where required. Commercial cooking appliances required by Section [507.2.4] 507.2 to have a Type I hood shall be provided with an approved automatic fire suppression system complying with the New York City Building Code and the New York City Fire Code.

SECTION MC 510
HAZARDOUS EXHAUST SYSTEMS

510.1 General. This section shall govern the design and construction of duct systems for hazardous exhaust and shall determine where such systems are required. Hazardous exhaust systems are systems designed to capture and control hazardous emissions generated from product handling or processes,
and convey those emissions to the outdoors. Hazardous emissions include flammable vapors, gases, fumes, mists or dusts, and volatile or airborne materials posing a health hazard, such as toxic or corrosive materials. For the purposes of this section, the health-hazard rating of materials shall be as specified in NFPA 704.

For the purposes of the provisions of Section 510, a laboratory shall be defined as a building or portion thereof wherein chemicals or gases are used or synthesized on a nonproduction basis for testing, research, experimental, instructional or educational purposes.

**510.2 Where required.** A hazardous exhaust system shall be required wherever operations involving the handling or processing of hazardous materials, in the absence of such exhaust systems and under normal operating conditions, have the potential to create one of the following conditions:

1. A flammable vapor, gas, fume, mist or dust is present in concentrations exceeding 25 percent of the lower flammability limit of the substance for the expected room temperature.

2. A vapor, gas, fume, mist or dust with a health-hazard rating of 4 is present in any concentration.

3. A vapor, gas, fume, mist or dust with a health-hazard rating of 1, 2 or 3 is present in concentrations exceeding 1 percent of the median lethal concentration of the substance for acute inhalation toxicity.

**Exception:** Laboratories, as defined in Section 510.1, except where the concentrations listed in Item 1 are exceeded, or a vapor, gas, fume, mist or dust with a health-hazard rating of 1, 2, 3 or 4 is present in concentrations exceeding 1 percent of the median lethal concentration of the substance for acute inhalation toxicity.

**510.2.1 Lumber yards and woodworking facilities.** Equipment or machinery located inside buildings at lumber yards and woodworking facilities that generates or emits combustible dust shall be provided with an approved dust-collection and exhaust system installed in accordance with this section and the New York City Fire Code. Equipment and systems that are used to collect, process or convey combustible dusts shall be provided with an approved explosion-control system.

**510.2.2 Combustible fibers.** Equipment or machinery within a building that generates or emits combustible fibers shall be provided with an approved dust-collecting and exhaust system. Such systems shall comply with this code and the New York City Fire Code.

**510.3 Design and operation.** The design and operation of the exhaust system shall be such that flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust flow below 25 percent of the contaminant’s lower flammability limit.

**510.4 Independent system.** Hazardous exhaust systems shall be independent of other types of exhaust systems.

**510.5 Incompatible materials and common shafts.** Incompatible materials, as defined in the New York City Fire Code, shall not be exhausted through the same hazardous exhaust system. Hazardous
exhaust systems shall not share common shafts with other duct systems, except where such systems are hazardous exhaust systems originating in the same fire area.

**Exception:** The provisions of this section shall not apply to laboratory exhaust systems where all of the following conditions apply:

1. All of the hazardous exhaust ductwork and other laboratory exhaust within both the occupied space and the shafts are under negative pressure while in operation.
2. The hazardous exhaust ductwork manifolded together within the occupied space must originate within the same fire area.
3. Hazardous exhaust ductwork originating in different fire areas and manifolded together in a common shaft shall use steel sub-ducts in accordance with Chapter 6.

[3-] 4. Each control branch has a flow regulating device.

[4-] 5. Perchloric acid hoods and connected exhaust shall be prohibited from manifolding.

[5-] 6. Radioisotope hoods are equipped with filtration [and/or] carbon beds, or both where required by the registered design professional.

[6-] 7. Biological safety cabinets are filtered.

[7. Provision is made for continuous maintenance of negative static pressure in the ductwork.]

[Contaminated air shall not be recirculated to occupiable areas. Air containing explosive or flammable vapors, fumes or dusts; flammable, highly toxic or toxic gases; or radioactive material shall be considered to be contaminated.]

8. Each hazardous exhaust duct system shall be served by redundant exhaust fans that comply with either of the following:

8.1. The fans shall operate simultaneously in parallel and each fan shall be individually capable of providing the required exhaust rate.

8.2. Each of the redundant fans is controlled so as to operate when the other fan has failed or is shut down for servicing.

[510.5] **510.6 Design.** Systems for removal of vapors, gases and smoke shall be designed by the constant velocity or equal friction methods. Systems conveying particulate matter shall be designed employing the constant velocity method.

[510.5.1] **510.6.1 Balancing.** Systems conveying explosive or radioactive materials shall be prebalanced by duct sizing. Other systems shall be balanced by duct sizing with balancing devices, such as dampers. Dampers provided to balance air flow shall be provided with securely fixed minimum-position blocking devices to prevent restricting flow below the required volume or velocity.
**510.6.2 Emission control.** The design of the system shall be such that the emissions are confined to the area in which they are generated by air currents, hoods or enclosures and shall be exhausted by a duct system to a safe location or treated by removing contaminants.

**510.6.3 Hoods required.** Hoods or enclosures shall be used where contaminants originate in a limited area of a space. The design of the hood or enclosure shall be such that air currents created by the exhaust systems will capture the contaminants and transport them directly to the exhaust duct.

**510.6.4 Contaminant capture and dilution.** The velocity and circulation of air in work areas shall be such that contaminants are captured by an airstream at the area where the emissions are generated and conveyed into a product-conveying duct system. Contaminated air from work areas where hazardous contaminants are generated shall be diluted below the thresholds specified in Section 510.2 with air that does not contain other hazardous contaminants.

**510.6.5 Makeup air.** Makeup air shall be provided at a rate approximately equal to the rate that air is exhausted by the hazardous exhaust system. Makeup air intakes shall be located [so as to avoid recirculation of contaminated air] in accordance with Section 401.4.

**510.6.6 Clearances.** The minimum clearance between hoods and combustible construction shall be the clearance required by the duct system.

**510.6.6 Ducts.** Hazardous exhaust duct systems shall extend directly to the exterior of the building and shall not extend into or through ducts and plenums.

**510.7 Penetrations.** Penetrations of structural elements by a hazardous exhaust system shall conform to Sections [540.6.1] 510.7.1 through [540.6.4] 510.7.4.

**Exception:** Duct penetrations within Group H-5 occupancies as allowed by the New York City Building Code.

**510.7.1 Fire dampers and smoke dampers.** Fire dampers and smoke dampers are prohibited in hazardous exhaust ducts.

**510.7.1.1 Shaft penetrations.** Hazardous exhaust ducts that penetrate fire-resistance-rated shafts shall comply with Section 714.3.1 or 714.3.1.2 of the New York City Building Code.

**510.7.2 Floors.** Hazardous exhaust systems that penetrate a floor/ceiling assembly shall be enclosed in a fire-resistance-rated shaft constructed in accordance with the New York City Building Code.

**510.7.3 Wall assemblies.** Hazardous exhaust duct systems that penetrate fire-resistance-rated wall assemblies shall be enclosed in fire-resistance-rated construction from the point of penetration to the outlet terminal, except where the interior of the duct is equipped with an approved automatic fire suppression system. Ducts shall be enclosed in accordance with the New York City Building Code requirements for shaft construction and such enclosure shall have a minimum fire-resistance rating of not less than the highest fire-resistance-rated wall assembly penetrated.
**[510.6.4]** **510.7.4 Fire walls.** Ducts shall not penetrate a fire wall.

**[510.7]** **510.8 Suppression required.** Ducts shall be protected with an approved automatic fire suppression system installed in accordance with the *New York City Building Code*.

**Exceptions:**

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible under all conditions and at any concentrations.

2. Automatic fire suppression systems shall not be required in metallic and noncombustible, nonmetallic exhaust ducts in semiconductor fabrication facilities.

3. An approved automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).

4. For laboratories, as defined in Section 510.1, approved automatic fire suppression systems shall not be required in laboratory hoods or exhaust systems.

**[510.8]** **510.9 Duct construction.** [Ducts utilized to convey hazardous exhaust shall be constructed of approved G90 galvanized sheet steel, with a minimum nominal thickness as specified in Table 510.8. Nonmetallic ducts utilized in systems exhausting nonflammable corrosive fumes or vapors shall be listed and labeled. Nonmetallic ducts shall have a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723. Ducts shall be approved for installation in such an exhaust system.] Ducts used to convey hazardous exhaust shall be constructed of materials approved for installation in such an exhaust system and shall comply with one of the following:

1. Ducts shall be constructed of approved G90 galvanized sheet steel, with a minimum nominal thickness as specified in Table 510.9.

2. Ducts used in systems exhausting nonflammable corrosive fumes or vapors shall be constructed of nonmetallic materials that exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 and that are listed and labeled the application.

Where the products being exhausted are detrimental to the duct material, the ducts shall be constructed of alternative materials that are compatible with the exhaust.

### [510.8.3] 510.9.3 Explosion relief. Systems exhausting potentially explosive mixtures shall be protected with an approved explosion relief system or by an approved explosion prevention system designed and installed in accordance with NFPA 69. An explosion relief system shall be designed to minimize the structural and mechanical damage resulting from an explosion or deflagration within the exhaust system. An explosion prevention system shall be designed to prevent an explosion or deflagration from occurring.

### [510.9] 510.10 Supports. Ducts shall be supported at intervals not exceeding 10 feet (3048 mm). Supports shall be constructed of noncombustible material.

### SECTION MC 511
#### DUST, STOCK AND REFUSE CONVEYING SYSTEMS

#### 511.1 Dust, stock and refuse conveying systems. Dust, stock and refuse conveying systems shall comply with the provisions of Section 510 and Sections 511.1.1 through 511.2.
511.1.1 Collectors and separators. Collectors and separators involving such systems as centrifugal separators, bag filter systems and similar devices, and associated supports shall be constructed of noncombustible materials and shall be located on the exterior of the building or structure. A collector or separator shall not be located nearer than 10 feet (3048 mm) to combustible construction or to an unprotected wall or floor opening, unless the collector is provided with a metal vent pipe that extends above the highest part of any roof within a distance of 30 feet (9144 mm).

Exceptions:

1. [Collectors] Where dust producing equipment requires an aggregate dust collection flowrate less than 1,500 ft³ per min (708 liters per second), collectors such as “Point of Use” collectors, close extraction weld fume collectors, spray finishing booths, stationary grinding tables, sanding booths, and integrated or machine-mounted collectors shall be permitted to be installed indoors provided the installation is in accordance with the New York City Fire Code and [NFPA 70] the New York City Electrical Code.

2. Collectors in independent exhaust systems handling combustible dusts shall be permitted to be installed indoors provided that such collectors are installed in compliance with the New York City Fire Code and [NFPA 70] the New York City Electrical Code.

511.1.2 Discharge pipe. Discharge piping shall conform to the requirements for ducts, including clearances required for high-heat appliances, as contained in this code. A delivery pipe from a centrifugal separator collector shall not convey refuse directly into the firebox of a boiler, furnace, dutch oven, refuse burner, incinerator or other appliance.

511.1.3 Conveying systems exhaust discharge. An exhaust system shall discharge to the outside of the building either directly by flue or indirectly through the [-] bin or vault into which the system discharges except where the contaminants have been removed. Exhaust system discharge shall be permitted to be recirculated provided that the solid particulate has been removed at a minimum efficiency of 99.9 percent at 10 microns (10.01 mm), vapor concentrations are less than 25 percent of the LFL, and approved equipment is used to monitor the vapor concentration.

511.1.4 Spark protection. The outlet of an open-air exhaust terminal shall be protected with an approved metal or other noncombustible screen to prevent the entry of sparks.

511.1.5 Explosion relief vents. A safety or explosion relief vent shall be provided on all systems that convey combustible refuse or stock of an explosive nature, in accordance with the requirements of the New York City Building Code.

511.1.5.1 Screens. Where a screen is installed in a safety relief vent, the screen shall be attached so as to permit ready release under the explosion pressure.

511.1.5.2 Hoods. The relief vent shall be provided with an approved noncombustible cowl or hood, or with a counterbalanced relief valve or cover arranged to prevent the escape of hazardous materials, gases or liquids.
511.2 Exhaust outlets. Outlets for exhaust that exceed 600°F (315°C) shall be designed as a chimney in accordance with Table 511.2.

a. Lining shall extend from bottom to top of outlet.
b. Lining shall extend from 24 inches below connector to 24 feet above.
c. Clearance shall be as specified by the design engineer and shall have sufficient clearance from buildings and structures to avoid overheating combustible materials (maximum 160°F).

SECTION MC 512
SUBSLAB SOIL EXHAUST SYSTEMS

512.1 General. Where a subslab soil exhaust system is provided, the duct shall conform to the requirements of this section.

512.2 Materials. Subslab soil exhaust system duct material shall be air duct material listed and labeled to the requirements of UL 181 for Class 0 air ducts, or any of the following piping materials that comply with the New York City Plumbing Code as building sanitary drainage and vent pipe: cast iron; galvanized steel; brass or copper pipe; copper tube of a weight not less than that of copper drainage tube, Type DWV; and plastic piping.

512.3 Grade. Exhaust system ducts shall not be trapped and shall have a minimum slope of one-eighth unit vertical in 12 units horizontal (1-percent slope).

512.4 Termination. Subslab soil exhaust system ducts shall extend through the roof and terminate at least not less than 6 inches (152 mm) above the roof and at least not less than 10 feet (3048 mm) from any operable openings or air intake.

512.5 Identification. Subslab soil exhaust ducts shall be permanently identified within each floor level by means of a tag, stencil or other approved marking.
513.1 Scope and purpose. This section applies to mechanical and passive smoke control systems that are required by the New York City Building Code. A smoke control system, where required, facilitates the evacuation of the occupants. Smoke control systems not required by the New York City Building Code shall not be installed unless approved by the Department. The purpose of this section is to establish minimum requirements for the design, installation and acceptance testing of smoke control systems that are intended to provide a tenable environment for the evacuation or relocation of occupants. These provisions are not intended for the preservation of contents, the timely restoration of operations, or for assistance in fire suppression or [overhaul activities] post-fire smoke purge. Smoke control systems regulated by this section serve a different purpose than the smoke and heat-venting provisions found in Section 910 of the New York City Building Code. Mechanical smoke control systems shall not be considered exhaust systems under Chapter 5.

513.2 General design requirements. Buildings, structures, or parts thereof required by this code to have a smoke control system or systems shall have such systems designed in accordance with the applicable requirements of Section 909 of the New York City Building Code and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information and detail to describe adequately the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied with sufficient information and analysis to demonstrate compliance with these provisions. Smoke control systems shall be designed and installed in accordance with Section 909 of the New York City Building Code.

513.3 Special inspection and test requirements. In addition to the ordinary inspection and test requirements which buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Section 909 of the New York City Building Code shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the construction documents shall clearly detail procedures and methods to be used and the items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this section shall be conducted under the same terms as found in Section 1704 of the New York City Building Code.

513.4 Analysis. A rational analysis supporting the types of smoke control systems to be employed, their methods of operation, the systems supporting them, and the methods of construction to be utilized shall accompany the submitted construction documents and shall include, but not be limited to, the items indicated in Sections 513.4.1 through 513.4.6.

513.4.1 Stack effect. The system shall be designed such that the maximum probable normal or reverse stack effects will not adversely interfere with the system’s capabilities. In determining the maximum probable stack effects, altitude, elevation, weather history and interior temperatures shall be used.
513.4.2 Temperature effect of fire. Buoyancy and expansion caused by the design fire in accordance with Section 513.9 shall be analyzed. The system shall be designed such that these effects do not adversely interfere with its capabilities.]

513.4.3 Wind effect. The design shall consider adverse effects of wind. Such consideration shall be consistent with the wind-loading provisions of the New York City Building Code.

513.4.4 HVAC systems. The design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis shall include all permutations of systems' status. The design shall consider the effects of fire on the HVAC systems.

513.4.5 Climate. The design shall consider the effects of low temperatures on systems, property and occupants. Air inlets and exhausts shall be located so as to prevent snow or ice blockage.

513.4.6 Duration of operation. All portions of active or passive smoke control systems shall be capable of continued operation after detection of the fire event for a period of not less than 20 minutes or 1.5 times the calculated egress time, whichever is more.

513.5 Smoke barrier construction. Smoke barriers shall comply with the New York City Building Code. Smoke barriers shall be constructed and sealed to limit leakage areas exclusive of protected openings. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: \( A/A_w = 0.00100 \)
2. Exit enclosures: \( A/A_w = 0.00035 \)
3. All other shafts: \( A/A_w = 0.00150 \)
4. Floors and roofs: \( A/A_F = 0.00050 \text{ where:} \)
   - \( A = \text{Total leakage area, square feet (m}^2\text{).} \)
   - \( A_E = \text{Unit floor or roof area of barrier, square feet (m}^2\text{).} \)
   - \( A_w = \text{Unit wall area of barrier, square feet (m}^2\text{).} \)

The leakage area ratios shown do not include openings due to doors, operable windows or similar gaps. These shall be included in calculating the total leakage area.

513.5.1 Leakage area. Total leakage area of the barrier is the product of the smoke barrier gross area times the allowable leakage area ratio, plus the area of other openings such as gaps and operable windows. Compliance shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems. Passive smoke control systems tested using other approved means such as door fan testing shall be as approved by the commissioner.
[513.5.2 Opening protection. Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by door assemblies complying with the requirements of the New York City Building Code for doors in smoke barriers.]

[Exceptions:]

[1. Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with the New York City Building Code.]

[2. Fixed openings between smoke zones which are protected utilizing the airflow method.]

[3. In Group I-2 where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with approved fire rated glazing materials in approved fire rated frames, the area of which shall not exceed that tested. The doors shall be close-fitting within operational tolerances, and shall not have undercut, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges and automatic-closing devices. Positive-latching devices are not required.]

[4. Group I-3.]

[5. Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank down capacity of greater than 20 minutes as determined by the design fire size.]

[513.5.2.1 Ducts and air transfer openings. Ducts and air transfer openings are required to be protected with a minimum Class II, 250°F (121°C) smoke damper complying with the New York City Building Code.]

[513.6 Pressurization method. The primary mechanical means of controlling smoke shall be by pressure differences across smoke barriers. Maintenance of a tenable environment is not required in the smoke control zone of fire origin.]

[513.6.1 Minimum pressure difference. The minimum pressure difference across a smoke barrier shall be 0.05 inch water Gage (12.4 Pa) in fully sprinklered buildings. In buildings permitted to be other than fully sprinklered, the smoke control system shall be designed to achieve pressure differences at least two times the maximum calculated pressure difference produced by the design fire.]

[513.6.2 Maximum pressure difference. The maximum air pressure difference across a smoke barrier shall be determined by required door opening or closing forces. The actual force required to open exit doors when the system is in the smoke control mode shall be in accordance with the New York City Building Code. Opening and closing forces for other doors shall be determined by standard engineering methods for the resolution of forces and reactions. The calculated force to set a side-hinged, swinging door in motion shall be determined by:]

\[ F = F_{dc}K(W\Delta P)/(2(W-d)) \]  

(Equation 5-2)

Where:

- \( A \) = Door area, square feet (m\(^2\)).
- \( d \) = Distance from door handles to latch edge of door, feet (m).
- \( F \) = Total door opening force, pounds (N).
- \( F_{dc} \) = Force required to overcome closing device, pounds (N).
- \( K \) = Coefficient 5.2 (1.0).
- \( W \) = Door width, feet (m).
- \( \Delta P \) = Design pressure difference, inches (Pa) water gage.

513.7 Airflow design method. When approved by the commissioner, smoke migration through openings fixed in a permanently open position, which are located between smoke control zones by the use of the airflow method, shall be permitted. The design airflows shall be in accordance with this section. Airflow shall be directed to limit smoke migration from the fire zone. The geometry of openings shall be considered to prevent flow reversal from turbulent effects.

513.7.1 Velocity. The minimum average velocity through a fixed opening shall not be less than:

\[ v = 217.2\left[ h(T_f - T_o)/(T_f + 460) \right]^{1/2} \]  

(Equation 5-3)

For SI: \( v = 119.9\left[ h(T_f - T_o)/T_f \right]^{1/2} \)

Where:

- \( H \) = Height of opening, feet (m).
- \( T_f \) = Temperature of smoke, °F (K).
- \( T_o \) = Temperature of ambient air, °F (K).
- \( v \) = Air velocity, feet per minute (m/minute).

513.7.2 Prohibited conditions. This method shall not be employed where either the quantity of air or the velocity of the airflow will adversely affect other portions of the smoke control system, unduly intensify the fire, disrupt plume dynamics or interfere with exiting. In no case shall airflow toward the fire exceed 200 feet per minute (1.02 m/s). Where the formula in Section 513.7.1 requires airflow to exceed this limit, the airflow method shall not be used.

513.8 Exhaust method. When approved by the commissioner, mechanical smoke control for large enclosed volumes, such as in atriums or malls, shall be permitted to utilize the exhaust method. Smoke control systems using the exhaust method shall be designed in accordance with NFPA 92B.

513.8.1 Exhaust rate. The height of the lowest horizontal surface of the accumulating smoke layer shall be maintained at least 6 feet (1829 mm) above any walking surface which forms a portion of a required egress system within the smoke zone.
513.9 Design fire. The design fire shall be based on a rational analysis performed by the registered design professional and approved by the commissioner. The design fire shall be based on the analysis in accordance with Section 513.4 and this section.

513.9.1 Factors considered. The engineering analysis shall include: the characteristics of the fuel, fuel load, effects included by the fire, and whether the fire is likely to be steady or unsteady.

513.9.2 Design fire fuel. Determination of the design fire shall include consideration of type of fuel, fuel spacing and configuration.

513.9.3 Heat-release assumptions. The analysis shall make use of the best available data from approved sources and shall not be based on excessively stringent limitations of combustible material.

513.9.4 Sprinkler effectiveness assumptions. A documented engineering analysis shall be provided for conditions that assume fire growth is halted at the time of sprinkler activation.

513.10 Equipment. Equipment such as, but not limited to, fans, ducts, automatic dampers and balance dampers shall be suitable for their intended use, suitable for the probable exposure temperatures that the rational analysis indicates, and as approved by the commissioner.

513.10.1 Exhaust fans. Components of exhaust fans shall be rated and certified by the manufacturer for the probable temperature rise to which the components will be exposed. This temperature rise shall be computed by:

\[ T_s = (Q_c/mC) + (T_a) \]  \hspace{1cm} \text{[Equation 5-4]}  

where:
\[ C = \text{Specific heat of smoke at smoke-layer temperature, Btu/lb}°\text{F (kJ/kg} × \text{K)} \]  
\[ m = \text{Exhaust rate, pounds per second (kg/s)} \]  
\[ Q_c = \text{Convective heat output of fire, Btu/s (kW)} \]  
\[ T_a = \text{Ambient temperature, °F (K)} \]  
\[ T_s = \text{Smoke temperature, °F (K)} \]

Exception: Reduced \( T_s \) as calculated based on assurance on inadequate dilution air.

513.10.2 Ducts. Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 513.10.1. Ducts shall be constructed and supported in accordance with Chapter 6. Ducts shall be leak tested to 1.5 times the maximum design operating pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

Exception: Flexible connections, for the purpose of vibration isolation, that are constructed of approved fire-resistance-rated materials.
513.10.3 Equipment, inlets and outlets. Equipment shall be located so as to not expose uninvolved portions of the building to an additional fire hazard. Outdoor air inlets shall be located so as to minimize the potential for introducing smoke or flame into the building. Exhaust outlets shall be so located as to minimize reintroduction of smoke into the building and to limit exposure of the building or adjacent buildings to an additional fire hazard.

513.10.4 Automatic dampers. Automatic dampers, regardless of the purpose for which they are installed within the smoke control system, shall be listed and conform to the requirements of approved recognized standards.

513.10.5 Fans. In addition to other requirements, belt-driven fans shall have 1.5 times the number of belts required for the design duty with the minimum number of belts being two. Fans shall be selected for stable performance based on normal temperature and, where applicable, elevated temperature. Calculations and manufacturer’s fan curves shall be part of the documentation procedures. Fans shall be supported and restrained by noncombustible devices in accordance with the structural design requirements of the New York City Building Code. Motors driving fans shall not be operating beyond their nameplate horsepower (kilowatts) as determined from measurement of actual current draw. Motors driving fans shall have a minimum service factor of 1.15.

513.11 Power systems. The smoke control system shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby power source complying with the New York City Electrical Code. The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gear and ventilated directly to and from the exterior. The room shall be enclosed with not less than 2-hour fire-resistance rated fire barriers constructed in accordance with Section 707 of the New York City Building Code or horizontal assemblies constructed in accordance with Section 712 of New York City Building Code, or both. Power distribution from the two sources shall be by independent routes. Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power. The systems shall comply with the New York City Electrical Code.

513.11.1 Power sources and power surges. Elements of the smoke management system relying on volatile memories or the like shall be supplied with integral uninterruptible power sources of sufficient duration to span 15-minute primary power interruption. Elements of the smoke management system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

513.12 Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Chapter 9 of the New York City Building Code and NFPA 72. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, the presence of power downstream of all disconnects and, through a preprogrammed weekly test sequence report abnormal conditions audibly, visually and by printed report.
[513.12.1 Wiring. In addition to meeting the requirements of the New York City Electrical Code, all wiring, regardless of voltage, shall be fully enclosed within continuous raceways.]

[513.12.2 Activation. Smoke control systems shall be activated in accordance with the New York City Building Code.]

[513.12.3 Automatic control. Where completely automatic control is required or used, the automatic control sequences shall be initiated from an appropriately zoned automatic sprinkler system complying with Chapter 9 of the New York City Building Code or from manual controls that are readily accessible to the Fire Department, and any smoke detectors required by engineering analysis.]

[513.13 Control-air tubing. Control-air tubing shall be of sufficient size to meet the required response times. Tubing shall be flushed clean and dry prior to final connections. Tubing shall be adequately supported and protected from damage. Tubing passing through concrete or masonry shall be sleeved and protected from abrasion and electrolytic action.]

[513.13.1 Materials. Control-air tubing shall be hard-drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type, in accordance with ASME B 16.18 or ASME B 16.22. Changes in direction shall be made with appropriate tool bends. Brass compression type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP-5 brazing alloy with solids above 1,100°F (593°C) and liquids below 1,500°F (816°C). Brazing flux shall be used on copper-to-brass joints only.]

[Exception: Nonmetallic tubing used within control panels and at the final connection to devices provided all of the following conditions are met:]

1. Tubing shall be listed by an approved agency for flame and smoke characteristics.

2. Tubing and connected device shall be completely enclosed within a galvanized or paint grade steel enclosure having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage). Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or by suitable brass compression to male barbed adapter.

3. Tubing shall be identified by appropriately documented coding.

4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.

[513.13.2 Isolation from other functions. Control tubing serving other than smoke control functions shall be isolated by automatic isolation valves or shall be an independent system.]

[513.13.3 Testing. Test control-air tubing at three times the operating pressure for not less than 30 minutes without any noticeable loss in gauge pressure prior to final connection to devices.]
513.14 Marking and identification. The detection and control systems shall be clearly marked at all junctions, accesses and terminations.

513.15 Control diagrams. Identical control diagrams shall be provided and maintained as required by the New York City Fire Code.

513.16 Fire fighter's smoke control panel. A fire fighter's smoke control panel for Fire Department emergency response purposes only shall be provided in accordance with the New York City Fire Code.

513.17 System response time. Smoke control system activation shall comply with the New York City Fire Code.

513.18 Acceptance testing. Devices, equipment, components and sequences shall be tested in accordance with the New York City Fire Code.

513.19 System acceptance. Acceptance of the smoke control system shall be in accordance with the New York City Fire Code.

SECTION MC 514
ENERGY RECOVERY VENTILATION SYSTEMS

514.1 General. Energy recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy recovery ventilation systems shall comply with the New York City Energy Conservation Code. Ducted heat recovery ventilators shall be listed and labeled in accordance with UL 1812. Nonducted heat recovery ventilators shall be listed and labeled in accordance with UL 1815.

514.2 Prohibited applications. Unless specifically designed or listed for the specific applications and as part of an engineered system, energy recovery ventilation systems shall not be used in the following systems: Unless specifically designed and/or listed for the specific applications and as part of an engineered system:

1. Hazardous exhaust systems covered in Section 510.
2. Dust, stock and refuse systems that convey explosive or flammable vapors, fumes or dust.
3. Smoke control systems covered in Section 513.
4. Commercial kitchen exhaust systems serving Type I or Type II hoods.
5. Clothes dryer exhaust systems covered in Section 504.

**Exception:** The application of energy recovery ventilation equipment that recovers sensible heat only utilizing coil-type heat exchangers shall not be limited by this section.

514.3 Access. A means of access shall be provided to the heat exchanger and other components of the system as required for service, maintenance, repair or replacement.
514.4 Recirculated air. Class 1 or Class 2 air as described in ASHRAE 62.1 that is conveyed within energy recovery systems shall not be considered as recirculated air where the energy recovery ventilation system is constructed to limit cross-leakage between air streams to less than 10 percent of the total airflow design capacity.

514.5 Combined system allowed. Environmental exhaust air and toilet exhaust may be combined in any occupancy downstream of all air inlets of the system provided that such exhaust cannot be recirculated. In Group R occupancies, exhaust from domestic kitchens and toilets/baths from one or more dwelling or sleeping units may be combined at a point downstream of all air inlets of the system.

SECTION MC 515
POSTFIRE SMOKE PURGE SYSTEMS

515.1 General. Postfire smoke purge systems shall be provided as required by Chapter 9 of the New York City Building Code.

CHAPTER 6
DUCT SYSTEMS

SECTION MC 601
GENERAL

601.1 Scope. Duct systems used for the movement of air in air-conditioning, heating, ventilating and exhaust systems shall conform to the provisions of this chapter except as otherwise specified in Chapters 5 and 7.

Exception: Ducts discharging combustible material directly into any combustion chamber shall conform to the requirements of NFPA 82.

601.2 Air movement in corridors. Corridors shall not be used as a portion of direct supply, return, or exhaust air system serving adjoining areas. Air transfer opening(s) shall not be permitted in walls or in doors separating public corridors from adjoining areas.

Exceptions:

1. Where located within dwelling units, the use of corridors for conveying return air shall not be prohibited.
2. Where located within tenant spaces of 1,000 square feet (93 m²) or less in area, the use of corridors for conveying return air is permitted. [\*]

3. Corridors in Group B office buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *New York City Building Code*. [\*]

4. Incidental air movement from pressurized rooms within health care facilities, provided that the corridor is not the primary source of supply or return to the room.

5. Air transfer openings serving toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces opening onto the public corridor.

6. Group I-3 detention and correctional occupancies with corridor separations of open construction (e.g., grating doors or grating partitions).

7. Air transfer in openings because of pressure differential in Group I-2 health care occupancies from corridors is permitted.

8. Where door clearances do not exceed those specified for fire doors in the *New York City Building Code*, air transfer caused by pressure differentials shall be permitted.

9. Use of egress corridors as part of an engineered smoke-control system is permitted.

**601.2.1 Corridor ceiling.** Use of the space between the corridor ceiling and the floor or roof structure above as a return air plenum is permitted for one or more of the following conditions:

1. The corridor is not required to be of fire-resistance-rated construction [\*].

2. The corridor is separated from the plenum by fire-resistance-rated construction [\*].

3. The air-handling system serving the corridor is shut down upon activation of the air-handling unit smoke detectors required by this code [\*].

4. The air-handling system serving the corridor is shut down upon detection of sprinkler waterflow where the building is equipped throughout with an automatic sprinkler system [\* or \*].

5. The space between the corridor ceiling and the floor or roof structure above the corridor is used as a component of an approved engineered smoke control system.

**601.3 Exits.** Equipment and ductwork for exit enclosure ventilation shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit enclosure by ductwork enclosed in construction as required by the *New York City Building Code* for shafts.

2. Where such equipment and ductwork is located within the exit enclosure, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the
outdoors, or such air shall be conveyed through ducts enclosed in construction as required by the New York City Building Code for shafts.

3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required by the New York City Building Code for shafts.

In each case, openings into fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by self-closing fire-resistance-rated devices in accordance with the New York City Building Code for enclosure wall opening protectives. Exit enclosure ventilation systems shall be independent of other building ventilation systems.

601.4 Contamination prevention. Exhaust ducts under positive pressure, chimneys [1] and vents shall not extend into or pass through ducts or plenums.

Exceptions:

1. Exhaust systems conveying Class 1 or Class 2 air in accordance with ASHRAE 62.1, located in return air plenums and that have exhaust duct joints, seams and connections that comply with Section 603.9 without taking any exceptions. Such exhaust system and plenum shall be subject to special inspection in accordance with Section 1705.39 of the New York City Building Code and shall be subject to periodic inspection in accordance with Section 602.6 of this code.

2. This section shall not apply to chimneys and vents for appliances with a heat input not greater than 350,000 Btu/hr (103 kW) that pass through plenums provided that such venting systems are subject to special inspection in accordance with Section 1705.39 of the New York City Building Code and shall be subject to periodic inspection in accordance with Section 602.6 of this code and comply with one of the following requirements:

2.1. The venting system shall be listed for positive pressure applications and shall be sealed in accordance with the vent manufacturer’s instructions.

2.2. The venting system shall be installed such that fittings and joints between sections are not installed in the above ceiling space.

2.3. The venting system shall be installed in a conduit or enclosure with sealed joints separating the interior of the conduit or enclosure from the ceiling space.

SECTION MC 602
PLENUMS

602.1 General. Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a finished ceiling or below the finished floor, attic spaces and mechanical equipment rooms. Plenums shall be limited to one fire area. Air systems shall be fully ducted from the boundary of the fire area served to the air-handling equipment or associated mechanical room serving as a return air plenum. Fuel-fired appliances shall not be installed within a plenum.
**Exception:** In a fully sprinklered building, return air plenums may be separated by combination fire smoke dampers and a fully ducted return is not required. The requirements of Section 601.2.1 shall apply.

602.2 **Construction.** Plenum enclosures shall be constructed of material permitted for the type of construction classification of the building. Enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the New York City Building Code or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723. The temperature of air delivered to or through these plenums shall not exceed 250°F (121°C), except where used as part of an engineered smoke control system.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the [air] [airstream] dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

602.2.1 **Materials within plenums.** Except as required by Sections 602.2.1.1 through 602.2.1.6, materials within plenums shall be noncombustible or shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

**Exceptions:**

1. Rigid and flexible ducts and connectors shall conform to Section 603.
2. Duct coverings, linings, tape and connectors shall conform to Sections 603 and 604.
3. Materials This section shall not apply to materials exposed within plenums in one- and two-family dwellings.
4. Smoke This section shall not apply to smoke detectors.
5. Combustible materials fully enclosed within one of the following:
   5.1. Continuous noncombustible [raceways or enclosures [i]].
   5.2. Approved gypsum [board assemblies].
   5.3. Materials [or materials] listed and labeled for [such application] installation within a plenum.
6. Materials in Group H-5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area.
602.2.1.1 **Wiring.** Combustible electrical [or electronic] wiring methods and materials, wires and cables and optical fiber [cable, and optical fiber raceway] cables exposed within a plenum shall have a peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with NFPA 262 or shall be installed in metal raceways or metal sheathed cable. Combustible optical and communication raceways exposed within a plenum shall have a peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 5 feet (1524 mm) or less when tested in accordance with UL 2024. Only type OFNP (plenum rated) [nonconductive optical fiber cable] wires and cables shall be installed in plenum-rated raceways. Electrical wires and cables, optical fiber [raceways, Wiring, cable,] cables and raceways addressed in this section shall be listed and labeled [as plenum rated] and shall be installed in accordance with *New York City Electrical Code.*

602.2.1.2 **Fire sprinkler piping.** Plastic fire sprinkler piping exposed within a plenum shall be used only in wet pipe systems and shall have a peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a flame spread of 5 feet (1524 mm) or less when tested in accordance with UL 1887. Piping shall be listed and labeled.

602.2.1.3 **Pneumatic tubing.** Combustible pneumatic tubing exposed within a plenum shall have a peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a flame spread of 5 feet (1524 mm) or less when tested in accordance with UL 1820. Combustible pneumatic tubing shall be listed and labeled.

602.2.1.4 **Electrical equipment in plenums.** Electrical equipment exposed within a plenum shall comply with Sections 602.2.1.4.1 and 602.2.1.4.2.

602.2.1.4.1 **Equipment in metallic enclosures.** Electrical equipment with metallic enclosures exposed within a plenum shall be permitted.

602.2.1.4.2 **Equipment in combustible enclosures.** Electrical equipment with combustible enclosures exposed within a plenum shall be listed and labeled for such use in accordance with UL 2043.

602.2.1.5 **Discrete plumbing and mechanical products in plenums.** Where discrete plumbing and mechanical products and appurtenances are located in a plenum and have exposed combustible material, they shall be listed and labeled for such use in accordance with UL 2043.

602.2.1.6 **Foam plastic insulation.** Foam plastic insulation used in plenums as interior wall or ceiling finish [in plenums] or as interior trim shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall also comply with [Section] one or more of Sections [602.2.1.5.1] 602.2.1.6.1, [602.2.1.5.2] 602.2.1.6.2 [or] and [602.2.1.5.3] 602.2.1.6.3.
602.2.1.6.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 of the New York City Building Code and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.2.1.6.2 Approval. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 of the New York City Building Code when tested in accordance with NFPA 286.

The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9 of the New York City Building Code.

602.2.1.6.3 Covering. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

602.2.1.6 Semiconductor fabrication areas. Group H, Division 5 fabrication areas and the areas above and below the fabrication area that share a common air recirculation path with the fabrication area shall not be subject to the provisions of Section 602.2.1.

602.2.1.7 Plastic pipe and tube. Plastic piping and tubing shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

602.3 Stud cavity and joist space plenums. Stud wall cavities and the spaces between solid floor joists to be utilized as air plenums shall comply with the following conditions:

1. Such cavities or spaces shall not be utilized as a plenum for supply air.

2. Such cavities or spaces shall not be part of a required fire-resistance-rated assembly.

3. Stud wall cavities shall not convey air from more than one floor level.

4. Stud wall cavities and joist space plenums shall comply with the floor penetration protection requirements of the New York City Building Code.

5. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by approved fireblocking as required in the New York City Building Code.

6. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

602.4 Flood hazard. For structures located in areas of special flood hazard areas, plenum spaces shall comply with the additional requirements of Appendix G of the New York City Building Code.
602.5 Firestopping. Where required by the *New York City Building Code*, through penetrations shall be firestopped in accordance with Section [743] 714 of the *New York City Building Code*.

602.6 [Materials. Materials used in the construction of a plenum shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the plenum.] Periodic inspections to prevent contamination of mechanical systems. Covered buildings, as described in Section 28-325.1 of the *New York City Administrative Code*, shall be subject to periodic inspections to prevent contamination of mechanical systems in accordance with Section 28-325.2 of the *New York City Administrative Code*.

SECTION MC 603
DUCT CONSTRUCTION AND INSTALLATION

603.1 General. An air distribution system shall be designed and installed to supply the required distribution of air. The installation of an air distribution system shall not affect the fire protection requirements specified in the *New York City Building Code*. Ducts shall be constructed, braced, reinforced and installed to provide structural strength and durability.

603.2 Duct sizing. Ducts installed within a single dwelling unit shall be sized in accordance with ACCA Manual D, the appliance manufacturer’s instructions or other approved methods. Ducts installed within all other buildings shall be sized in accordance with the ASHRAE Handbook of Fundamentals or other equivalent computation procedure.

603.3 Duct classification. Ducts shall be classified based on the maximum operating pressure of the duct at pressures of positive or negative 0.5, 1.0, 2.0, 3.0, 4.0, 6.0 or 10.0 inches (1 inch w.c. = 248.7 Pa) of water column. The pressure classification of ducts shall equal or exceed the design pressure of the air distribution in which the ducts are utilized.

603.4 Metallic ducts. [All metallic] Metallic ducts shall be constructed as specified in the [SMACNA] SMACNA/ANSI HVAC Duct Construction Standards—Metal and Flexible.

**Exception:** Ducts installed within single dwelling units shall have a minimum thickness as specified in Table 603.4.

</table>

For SI: 1 inch = 25.4 mm, 1-inch water gage = 249 Pa.

a. Ductwork that exceeds 20 inches by dimension or exceeds a pressure of 1-inch water gage shall be constructed in accordance with SMACNA/ANSI HVAC Duct Construction Standards—Metal and Flexible.

**603.4.1 Minimum fasteners.** Round metallic ducts shall be mechanically fastened by means of [at least] not less than three sheet metal screws or rivets spaced equally around the joint.

**Exception:** Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion so as to prevent a hinge effect.

**603.4.2 Duct lap.** Crimp joints for round and oval metal ducts shall be lapped not less than 1 inch (25.4 mm) and the male end of the duct shall extend into the adjoining duct in the direction of airflow.
603.5 Nonmetallic ducts. Nonmetallic ducts shall be constructed with Class 0 or Class 1 duct material [in accordance] and shall comply with UL 181. Fibrous duct construction shall conform to the SMACNA /ANSI Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards. The maximum air temperature within nonmetallic ducts shall not exceed 250°F (121.1°C).

603.6 Air ducts and air connectors. Air ducts, both metallic and nonmetallic, shall comply with Section 603.6.1. Air connectors, both metallic and nonmetallic, shall comply with Sections 603.6.2 and 603.6.3.

603.6.1 Air ducts. Air ducts shall be permitted to be rigid or flexible and shall be constructed of materials that are reinforced and sealed to satisfy the requirements for the use of the air duct system, such as the supply air system, the return or exhaust air system, and the variable volume/pressure air system.

603.6.1.1 Materials. All air duct materials shall be suitable for continuous exposure to the temperature and humidity conditions of the environmental air in the air duct. Air ducts shall be constructed of any of the following materials:

1. Iron, steel, aluminum, copper, concrete, masonry or clay tile.
2. Class 0 or Class 1 rigid or flexible air ducts tested in accordance with UL 181 and installed in conformance with the conditions of the listing.

Exceptions:

1. Class 0 or Class 1 rigid or flexible air duct shall not be used as a vertical air duct that is more than two stories in height.
2. Class 0 or Class 1 rigid or flexible air ducts shall not be used for air ducts containing air at temperatures in excess of 250°F (121.1°C).
3. Where the temperature of the conveyed air does not exceed 125°F (51.7°C) in normal service, negative pressure exhaust or return air ducts shall be permitted to be constructed of gypsum board having a maximum flame spread index/rating of 25 without evidence of continued progressive combustion and a maximum smoke-developed index/rating of 50. Air ducts formed by gypsum boards shall have a surface temperature maintained above the [airstream] [dew-point] temperature, and shall not be used in air-handling systems utilizing evaporative coolers.

   Exception: The maximum conveyed air temperature of 125°F (51.7°C) shall not apply to gypsum board material used for post-fire smoke purge.
603.6.1.2 Installation. The materials, thickness, construction, and installation of ducts shall provide structural strength and durability in conformance with recognized good practice. Air ducts shall be considered to be in compliance with this requirement where constructed and installed in accordance with the New York City Building Code. Where no standard exists for the construction of air ducts, they shall be constructed to withstand both the positive and negative pressures of the system.

603.6.2 Air connectors. Air connectors are limited-use, flexible air ducts that are required to conform to other provisions applicable to air ducts and shall meet the following requirements:

1. Air connectors shall conform to the requirements for Class 0 or Class 1 connectors when tested and approved in accordance with UL 181.
2. Class 0 or Class 1 air connectors shall not be used for ducts containing air at temperatures in excess of 250°F (121.1 °C).
3. Air connector runs shall not exceed 14 feet (4267.2 mm) in length.
4. Air connectors shall not penetrate any rated wall, partition, or shaft that is required to have a fire-resistance rating of 1 hour or more.
5. Air connectors shall not pass through floors.

603.6.3 Flexible air duct and air connector clearance. Flexible air ducts and air connectors shall be installed with a minimum clearance to an appliance as specified in the appliance manufacturer’s installation instructions.

603.7 Rigid duct penetrations. Duct system penetrations of walls, floors, ceilings and roofs and air transfer openings in such building components shall be protected as required by Section 607. Ducts in a private garage and ducts penetrating the walls or ceilings separating a dwelling from a private garage shall be continuous and shall be constructed of galvanized sheet metal (No. 26 gage) and shall not have openings into the garage. Fire and smoke dampers are not required in such ducts passing through the wall or ceiling separating a dwelling from a private garage except where required by Chapter 7 of the New York City Building Code.

603.8 Underground ducts. Ducts shall be approved for underground installation. Metallic ducts not having an approved protective coating shall be completely encased in a minimum of not less than 2 inches (51.8 mm) of concrete.

603.8.1 Slope. Ducts shall have a minimum slope of ⅛ inch per foot (10.4 mm/m) to allow drainage to a point provided with access.

603.8.2 Sealing. Ducts shall be sealed and secured prior to pouring the concrete encasement.

603.8.3 Plastic ducts and fittings. Plastic ducts shall be constructed of PVC having a minimum pipe stiffness of 8 psi (55.1 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene. Plastic duct and fittings shall be utilized in underground installations only. The
maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F
([66]65.6°C).

603.9 Joints, seams and connections. All longitudinal and transverse joints, seams and connections
in metallic and nonmetallic ducts shall be constructed as specified in [SMACNA] SMACNA /ANSI
HVAC Duct Construction Standards—Metal and Flexible and NAIMA Fibrous Glass Duct
Construction Standards. All joints [; and ] longitudinal and transverse seams and connections in
ductwork shall be securely fastened and sealed with [the New York City Energy Conservation Code]
welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes.
[Closure systems] Tapes and mastics used to seal fibrous glass ductwork shall be listed and labeled
in accordance with UL 181A and shall be marked “181 A-P” for pressure-sensitive tape, “181 A-M”
for mastic or “181 A-H” for heat-sensitive tape. [Closure systems] Tapes and mastics used to seal
metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be
marked “181 B-FX” for pressure-sensitive tape or “181 B-M” for mastic. Duct connections to flanges
of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners
for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked “181 B-
C.” Closure systems used to seal [metal] all ductwork shall be installed in accordance with the
manufacturer’s [installation] instructions. [Unlisted duct tape is not permitted as a sealant on any
metal ducts.]

Exception: [Continuously welded and locking type longitudinal joints and seams in] For ducts
[operating at] having a static [pressures] pressure classification of less than 2 inch w.c. ([500]
497.7 Pa) [pressure classification shall not require] additional closure systems shall not be
required for continuously welded joints and seams and locking-type joints and seams of other than
the snap-lock and buttonlock types.

603.10 Supports. Ducts shall be supported [with approved hangers at intervals not exceeding 10 feet
(3048 mm) or by other approved duct support systems designed] in accordance with [the New York
Flexible and other factory-made ducts shall be supported in accordance with the manufacturer’s
[installation] instructions. Ducts shall not be hung from or supported by suspended ceilings.

603.11 Furnace connections. Ducts connecting to a furnace shall have a clearance to combustibles
in accordance with the furnace manufacturer’s [installation] instructions.

603.11.1 Air duct at heat sources. Where heat sources from electrical equipment, fossil fuel-
burning equipment, or solar energy collection equipment are installed in air ducts, the installation
shall avoid the creation of a fire hazard. Air ducts rated as Class 1 in accordance with UL 181,
air duct coverings, and linings shall be interrupted at the immediate area of operation of such
heat sources in order to meet the clearances specified in the equipment listing.

1. Appliances listed for zero clearance from combustibles where installed with the
conditions of their listings.

2. Insulation specifically suitable for the maximum temperature that reasonably can be
anticipated on the duct surface shall be permitted to be installed at the immediate area of
operation of such appliances.
603.12 Condensation. Provisions shall be made to prevent the formation of condensation on the exterior of any duct.

603.13 Flood hazard areas. For structures in areas of special flood hazard areas, ducts shall comply with the additional requirements of Appendix G of the New York City Building Code.

603.14 Location. Ducts shall not be installed in or within 4 inches (101.6 mm) of the earth, except where such ducts comply with Section 603.8.

603.15 Mechanical protection. Ducts installed in locations where they are exposed to mechanical damage by vehicles or from other causes shall be protected by approved vehicle barriers as required by the New York City Building Code.

603.16 Weather protection. [All ducts] Ducts including linings, coverings and vibration isolation connectors installed on the exterior of the building shall be adequately protected against the elements.

603.17 Air dispersion systems. Air dispersion systems shall:

1. Be installed entirely in exposed locations or in underfloor air supply plenums.

2. Be utilized in systems under positive pressure.

3. Not pass through or penetrate fire-resistant-rated construction.

4. Be listed and labeled in compliance with UL 2518.

603.18 Registers, grilles and diffusers. Duct registers, grilles and diffusers shall be installed in accordance with the manufacturer’s installation instructions and securely fastened to the ductwork. Volume dampers or other means of supply air adjustment shall be provided in the branch ducts or at each individual duct register, grille or diffuser. Each volume damper or other means of supply air adjustment used in balancing shall be accessible provided with access.

603.18.1 Floor registers. Floor registers shall resist, without structural failure, a 200-pound (90.8 kg) concentrated load on a 2-inch-diameter (50.8 mm) disc applied to the most critical area of the exposed face.

603.18.2 Prohibited locations. Ducts, registers [1] and grilles [and diffusers] shall be prohibited in the floor or its upward extension within toilet and bathing rooms and their upward extensions, to the extent those areas are rooms required by the New York City Building Code to have smooth, hard [and] nonabsorbent surfaces.

Exception: In R-3 occupancies.

603.19 Vibration isolation connectors. Vibration isolation connectors in duct systems shall be made of an approved flame-retardant fabric or shall consist of sleeve joints with packing of approved material, each having a maximum flame spread index/rating of 25 and a maximum smoke-developed rating of 50. The fabric shall have a maximum length of 10 inches (254 mm) in the direction of airflow.
604.1 General. Duct insulation shall conform to the requirements of Sections 604.2 through 604.13 and the New York City Energy Conservation Code.

604.2 Surface temperature. Ducts that operate at temperatures exceeding 120°F (49.4°C) shall have sufficient thermal insulation to limit the exposed surface temperature to 120°F (49.4°C).

604.3 Coverings and linings. Coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121.1°C). Coverings and linings shall be listed and labelled.

604.4 Foam plastic insulation. Foam plastic used as duct coverings and linings shall conform to the requirements of Section 604.

604.5 Appliance insulation. Listed and labeled appliances that are internally insulated shall be considered as conforming to the requirements of Section 604.

604.6 Penetration of assemblies. Duct coverings shall not penetrate a wall or floor required to have a fire-resistance rating or required to be fireblocked.

604.7 Identification. External duct insulation, except spray polyurethane foam, and factory-insulated flexible duct shall be legibly printed or identified at intervals not greater than 36 inches (914.4 mm) with the name of the manufacturer, the thermal resistance R-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. All duct insulation R-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested C-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its R-value shall be determined as follows:

1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
2. For duct wrap, the installed thickness shall be 75 percent (25 percent compression) of nominal thickness.
3. For factory-made flexible air ducts, the installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
4. For spray polyurethane foam, the aged R-value per inch, measured in accordance with recognized industry standards, shall be provided to the customer in writing at the time of foam application.
604.8 Lining installation. Linings shall be interrupted at the area of operation of a fire damper and at a minimum of not less than 6 inches (152.4 mm) upstream of and 6 inches (152.4 mm) downstream of electric-resistance and fuel-burning heaters in a duct system. Metal nosings or sleeves shall be installed over exposed duct liner edges that face opposite the direction of airflow, and all exposed edges, joints and seams shall be sealed.

604.9 Thermal continuity. Where a duct liner required for thermal insulation or condensation control has been interrupted, a duct covering of equal thermal performance shall be installed.

604.10 Service openings. Service openings shall not be concealed by duct coverings unless the exact location of the opening is properly identified.

604.11 Vapor retarders. Where ducts used for cooling are externally insulated, the insulation shall be covered with a vapor retarder having a maximum permeance of 0.05 perm (2.87 ng/(Pa • s • m²)) or aluminum foil having a minimum thickness of 2 mils (0.051 mm). Insulations having a permeance of 0.05 perm (2.87 ng/(Pa • s • m²)) or less shall not be required to be covered. All joints and seams shall be sealed to maintain the continuity of the vapor retarder.

604.12 Weatherproof barriers. Insulated exterior ducts shall be protected with an approved adequate weatherproof barrier.

604.13 Internal insulation. Materials used as internal insulation and exposed to the airstream in ducts shall be shown to be durable when tested in accordance with UL 181. Exposed internal insulation that is not impermeable to water shall not be used to line ducts or plenums from the exit of a cooling coil to the downstream end of the drain pan.

SECTION MC 605
AIR FILTERS

605.1 General. Heating and air-conditioning systems of the central type shall be provided with approved air filters. Filters shall be installed such that all return air, outdoor air and makeup air is filtered upstream from any heat exchanger or coil. Filters shall be installed in an approved convenient accessible location. Liquid adhesive coatings used on filters shall have a flash point not lower than 325°F (163 °C).

605.2 Standards. Media-type and electrostatic-type air filters shall be listed and labeled. Media-type air filters shall comply with UL 900. High efficiency particulate air filters shall comply with UL 586. Electrostatic-type air filters shall comply with UL 867. Air filters utilized within dwelling units shall be designed for the intended application and shall not be required to be listed and labeled.

605.2.1 Standards for air-handling units. Air-handling units of mechanical ventilation systems, any portion of which provide outdoor air ventilation, shall be equipped with a particulate matter filtration system in accordance with ASHRAE 62.1 or ASHRAE 62.2 and shall have a minimum efficiency reporting value (MERV) of 11 or greater in accordance with ASHRAE 52.2.

Exceptions:
1. This section shall not apply to the alteration or repair of a mechanical ventilation system that was installed prior to January 1, 2013 unless such alteration or repair includes the replacement or addition of an air-handling unit in such system.

2. [This section shall not apply to the replacement of an air-handling unit in a mechanical ventilation system installed prior to January 1, 2013 if the department determines that the design of such replacement air-handling unit cannot be made to comply with the allowable fan system power limitations of the New York City Energy Conservation Code.]

[3.] This section shall not apply to any air-handling unit with a design capacity of less than 5,000 cfm (2.4 m³/s).

[4.] This section shall not apply for combustion outside air, dilution air, ventilation air for mechanical room and [inhabitable] spaces not intended for occupancy.

605.3 Airflow over the filter. Ducts shall be constructed to allow an even distribution of air over the entire filter.

605.4 Liquid adhesive tanks. Tanks for liquid adhesives, into which removable filters are dipped, shall be [located either outside the building or, if such a location is not available, in a separate fire-resistive room and stored in accordance with NFPA 30. Such tanks shall be metal, equipped with tight-fitting covers and shall be kept tightly covered when not in actual use] prohibited.

605.5 Filter maintenance. All air filters shall be kept free of excess dust and combustible material. Unit filters shall be renewed or cleaned when the resistance to airflow has increased to two times the original resistance or when the resistance has reached a value of recommended replacement by the manufacturer. A permanently installed draft gauge or differential pressure transmitter shall be provided for all systems equal to or greater than 4000 cfm (1.89 m³/s). [Where the filters are of the automatic liquid adhesive type, sludge shall be removed from the liquid adhesive reservoir regularly.]

SECTION MC 606
SMOKE DETECTION SYSTEMS CONTROL

606.1 Controls required. Air distribution systems shall be equipped with smoke detectors listed and labeled for installation in air distribution systems, as required by this section. Duct smoke detectors shall comply with UL 268A. Other smoke detectors shall comply with UL 268.

606.2 Where required. Smoke detectors shall be installed where indicated in Sections 606.2.1 through 606.2.4.

[Exception: Smoke detectors shall not be required where air distribution systems are incapable of spreading smoke beyond the enclosing walls, floors and ceilings of the room or space in which the smoke is generated.]
606.2.1 Return air systems. Smoke detectors shall be installed in return air systems with a design capacity greater than 2,000 cfm (0.9 m³/s), in the return air duct or plenum upstream of any filters, exhaust air connections, outdoor air connections, or decontamination equipment and appliances.

**Exception:** Smoke detectors are not required in the return air system where all portions of the building served by the air distribution system are protected by area smoke detectors connected to a fire alarm system in accordance with the *New York City [Fire] Building Code*. The area smoke detection system shall comply with Section 606.4.

606.2.2 Common supply and return air systems. Where multiple air-handling systems share common supply or return air ducts or plenums with a combined design capacity greater than 2,000 cfm (0.9 m³/s), the return air system shall be provided with smoke detectors in accordance with Section 606.2.1.

**Exception:** Individual smoke detectors shall not be required for each fan-powered terminal unit, provided that such units do not have an individual design capacity greater than 2,000 cfm (0.9 m³/s) and will be shut down by activation of one of the following:

1. Smoke detectors required by Sections 606.2.1 and 606.2.3.
2. An approved area smoke detector system located in the return air plenum serving such units.
3. An area smoke detector system as prescribed in the exception to Section 606.2.1.

In all cases, the smoke detectors shall comply with Sections 606.4 and 606.4.1.

606.2.3 Return air risers. Where return air risers serve two or more stories and serve any portion of a return air system having a design capacity greater than 15,000 cfm (7.1 m³/s), smoke detectors shall be installed at each story. Such smoke detectors shall be located upstream of the connection between the return air riser and any air ducts or plenums.

606.2.4 Supply air systems. Smoke detectors listed for use in air distribution systems shall be installed downstream of the air filters and upstream of any branch connections in air supply systems having a capacity greater than 2,000 cfm (0.9 m³/s).

606.3 Installation. Smoke detectors required by this section shall be installed in accordance with the *New York City Electrical Code*. The required smoke detectors shall be installed to monitor the entire airflow conveyed by the system. Access shall be provided to smoke detectors for inspection and maintenance.

606.4 Controls operation. Upon activation, the smoke detectors shall shut down all operational capabilities of the air distribution systems serving the affected areas in accordance with the listing and labeling of appliances used in the system. Air distribution systems that are part of a smoke control system shall switch to the smoke control mode upon activation of a detector.

606.4.1 Supervision. The duct smoke detectors shall be connected to a fire alarm system where a fire alarm system is required by Section 907.2 of the *New York City Building Code*. The
actuation of a duct smoke detector shall activate a visible and audible alarm signal at a constantly attended location.

Exceptions:

1. The alarm signal at a constantly attended location is not required where the duct smoke detector activates the building’s alarm-indicating appliances.

2. In occupancies not required to be equipped with a fire alarm system, actuation of either area or duct smoke detector shall activate a visible and an audible alarm signal in an approved location. Additionally, duct smoke detector trouble conditions shall activate a visible or audible alarm signal in an approved location and shall be identified as air duct detector trouble.

606.4.2 Fan shutdown for recirculating air systems. When any building or floor is provided with an air system [utilizing] designed to use recirculated air and is protected by an automatic sprinkler system or an automatic fire alarm system, [provisions shall be made to automatically stop] the fans recirculating air serving the affected area shall automatically stop when [the] sprinkler water flow [system] or a fire [alarm system are installed] condition is detected in the area [it shall be required to have only one of these systems arranged to stop the fans]. For the purposes of this section, 100 percent outdoor air systems shall not be considered recirculating systems.

Exceptions:

1. Activation of a manual pull station shall not be required to automatically stop the fans.

2. Systems having a capacity of 2,000 cfm ([|0-2|] 0.9 m$^3$/s) or less or serving not more than one floor.

3. In Group R-2 and R-3 occupancies with energy recovery systems complying with Section 514.4 and not serving public corridors.

606.4.3 Manual restart of fans after automatic fire detecting device or fire alarm system shut down. Fans or fan systems which have been automatically shut down on activation of an automatic fire detecting device or fire alarm system shall be arranged and equipped so that they do not automatically restart when either the automatic fire detecting device or fire alarm system is reset. The manual means of restarting the fans or fan system shall function independently from the manual resetting of either the automatic fire detecting device or fire alarm system.

606.5 Manual control. Manual controls of fans shall be provided in accordance with Section 405.2.

SECTION MC 607
DUCTS AND AIR TRANSFER OPENINGS

607.1 General. The provisions of this section shall govern the protection of duct penetrations and air transfer openings in fire-resistance-rated assemblies required to be protected.
607.1.1 **Ducts and air transfer openings.** Ducts transitioning horizontally between shafts shall comply with one of the following:

1. The horizontal enclosure between shafts shall match the required rating of the shafts.
2. Fire-resistive duct assemblies shall be provided in accordance with Section 604. The duct assembly shall comply with all of the following:
   2.1. Ducts shall not be within the scope of Sections 502.10, 504, 506.3, 510, or 511; and
   2.2. Ducts shall not be lined with nor convey combustible materials; and
   2.3. Ducts shall not be constructed of materials that are sensitive to thermal shock.
3. The horizontal offset duct shall be provided with combination fire-smoke dampers at the penetration of each shaft. The duct system shall comply with all of the following:
   3.1. Ducts shall not be within the scope of Sections 502.10, 504, 506.3, 510, or 511; and
   3.2. The duct system shall be a type permitted to include dampers; and
   3.3. Protection of penetrations of the shaft enclosure shall not utilize exceptions requiring continuous air movement.

607.1.2 **Ducts that penetrate fire-resistance-rated assemblies without dampers.** Ducts that penetrate fire-resistance-rated assemblies and are not required by this section to have dampers [by this section] shall comply with the requirements of Sections [713.2] 714.2 through [713.3.3] 714.3.3 of the New York City Building Code. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and not required by this section to have dampers shall comply with the requirements of Sections [713.4 through 713.4.2.2] 714.4 of the New York City Building Code.

[Exception: Ducts 20 square inches (129 cm²) or less passing through fire resistance-rated assemblies shall not require fire dampers or fire smoke dampers.]

607.1.1.1 607.1.2.1 **Ducts that penetrate nonfire-resistance-rated assemblies.** The space around a duct penetrating a nonfire-resistance-rated floor assembly shall comply with Section [716.6.3] 717.6.3 of the New York City Building Code.

607.2 **Installation.** Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers located within air distribution and smoke control systems shall be installed in accordance with the requirements of this section, and the manufacturer’s [installation] instructions and [the damper’s] listing.

607.2.1 **Smoke control system.** Where the installation of a fire damper will interfere with the operation of a required smoke control system in accordance with Section 909 of the New York City Building Code, approved alternative protection shall be used. Where mechanical systems including ducts and dampers used for normal building ventilation serve as part of the smoke
control system, the expected performance of these systems in smoke control mode shall be addressed in the rational analysis required by Section 909.4 of the New York City Building Code.

607.2.1.1 Remote operation. Combination fire and smoke dampers shall be operable by remote controls where necessary for smoke removal. Such dampers shall have provisions that allow them to reclose automatically upon reaching the damper’s maximum degradation test temperature in accordance with UL 555S.

607.2.2 Hazardous exhaust ducts. Fire dampers for hazardous exhaust duct systems shall comply with Section 510.

607.2.3 Supply air systems. Smoke dampers listed for use in air distribution systems shall be installed both upstream and downstream of filters and ahead of any branch connections in supply air-handling apparatus and systems having a capacity equal to or greater than 15,000 cfm (7.1 m³/s).

Exceptions:

1. Where the air-handling unit is located on the floor that it serves and serves only that floor.

2. Where the air-handling unit is located on the roof and serves only the floor immediately below the roof.

607.3 Damper testing, ratings and actuation. Damper testing, ratings and actuation shall be in accordance with Sections 607.3.1 through 607.3.3.

607.3.1 Damper testing. Dampers shall be listed and bear the label of an approved testing agency indicating compliance with the standards in this section. Fire dampers shall comply with the requirements of UL 555. Only fire dampers and ceiling radiation dampers labeled for use in dynamic systems shall be installed in heating, ventilating and air-conditioning systems designed to operate with fans on during a fire. Smoke dampers shall comply with the requirements of UL 555S. Combination fire/smoke dampers shall comply with the requirements of both UL 555 and UL 555S. Ceiling radiation dampers shall comply with the requirements of UL 555C-Ceiling Dampers.

607.3.2 Damper [ratings] rating. Damper ratings shall be in accordance with Sections 607.3.2.1 through 607.3.2.3.

607.3.2.1 Fire damper ratings. Fire dampers shall have the minimum fire protection rating specified in Table 607.3.2.1 for the type of penetration.
TABLE 607.3.2.1
FIRE DAMPER RATING

<table>
<thead>
<tr>
<th>TYPE OF PENETRATION</th>
<th>MINIMUM DAMPER RATING (hour)</th>

</tbody>
</table>

607.3.2.2 Smoke damper ratings. Smoke damper leakage ratings shall not be less than Class I or II. Elevated temperature ratings shall not be less than 250°F (121°C).

607.3.2.3 Combination fire/smoke damper ratings. Combination fire/smoke dampers shall have the minimum fire protection rating specified for fire dampers in Table 607.3.2.1 for the type of penetration and shall also have a minimum Class II leakage smoke damper rating and a minimum elevated temperature rating of 250°F (121°C) as specified in Section 607.3.2.2.

607.3.3 Damper actuation. Damper actuation shall be in accordance with Sections 607.3.3.1 through 607.3.3.4 as applicable.

607.3.3.1 Fire damper actuation device. The fire damper actuation device shall meet one of the following requirements:

1. The operating temperature shall be approximately 50°F (28°C) above the normal temperature within the duct system, but not less than 160°F (71.1°C).

2. The operating temperature shall be not more than 350°F (176.7°C) where located in a smoke control system complying with Section 909 of the New York City Building Code.

607.3.3.2 Smoke damper actuation. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with Section 606 of this code and Section 907.3 of the New York City Building Code and one of the following methods, as applicable:

1. Where a smoke damper is installed within a duct, a smoke detector shall be installed inside the duct or outside the duct with sampling tubes protruding into the duct. The detector or tubes within the duct shall be within 5 feet (1524 mm) of the damper with no air. Air outlets and inlets shall not be located between the detector or tubes and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.
[Exceptions] Exception: Duct smoke detectors will not be required at each smoke or combination fire smoke damper provided:

1. Duct smoke detectors will not be required at each fire smoke damper provided the supply fan shall shut down and all the smoke and combination fire smoke dampers associated with the supply system automatically close upon actuation of any automatic alarm initiating device on the floor(s).

2. Duct smoke detectors will be required within 5 feet (1.5 m) downstream of any electric duct reheat coil.

3. Nonducted return air systems shall have a smoke detector located within 5 feet (1.5 m) upstream of each return air protected or transfer opening in a 2-hour fire-rated barrier fire barrier rated 2-hour or greater.

5. Ducted return air systems shall have a duct smoke detector located within 5 feet (1.5 m) of a smoke damper; additional smoke detectors are not required at smoke and combination fire smoke dampers located downstream where there are no additional return air inlets.

2. Where a smoke damper is installed above smoke barrier doors in a smoke barrier, a spot-type detector listed for releasing service shall be installed on either side of the smoke barrier door opening. The detector shall be listed for releasing service if used for direct interface with the damper.

3. Where a smoke damper is installed within an unducted opening in a wall, a spot-type detector listed for releasing service shall be installed within 5 feet (1524 mm) horizontally of the damper. The detector shall be listed for releasing service if used for direct interface with the damper.

4. Where a smoke damper is installed in a corridor wall or ceiling, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor.

5. Where a total-coverage smoke detector detection system is provided within installed in all areas served by an HVAC system, the duct in which the damper will be located, the smoke dampers shall be permitted to be controlled by the smoke detection system.

6. Smoke dampers that are part of an engineered smoke control system shall be capable of being positioned manually from a command station. Such positioning devices shall be provided for supply and return/exhaust dampers grouped by floor and by type. Damper switch positions shall indicate whether the related dampers are commanded to be either open or closed. Smoke damper positioning switches shall be located at the Fire Command Station, or in a Mechanical Control Center in buildings without a Fire Command Station.
607.3.3 Combination fire/smoke damper actuation. Combination fire/smoke damper actuation shall be in accordance with Sections 607.3.3.1 and 607.3.3.2. Combination fire/smoke dampers installed in smoke control system shaft penetrations shall not be activated by local area smoke detection unless it is secondary to the smoke management system controls.

607.3.4 Ceiling radiation damper actuation. The operating temperature of a ceiling radiation damper actuation device shall be 50°F ([28] 10°C) above the normal temperature within the duct system, but not less than 160°F ([71] 71.1°C).

607.4 Access and identification. Fire and smoke dampers shall be provided with an approved means of access, large enough to permit inspection and maintenance of the damper and its operating parts. The access shall not affect the integrity of fire-resistance-rated assemblies. The access openings shall not reduce the fire-resistance rating of the assembly. Access points shall be permanently identified on the exterior by a label having letters not less than 0.5 inch (12.7 mm) in height reading: FIRE/SMOKE DAMPER, SMOKE DAMPER or FIRE DAMPER, followed by an identification marking that is individual and unique to the damper accessed. Access doors in ducts shall be tight fitting and suitable for the required duct construction.

607.5 Where required. Fire dampers, smoke dampers, and combination fire/smoke dampers shall be provided at the locations prescribed in this section Sections 607.5.1 through 607.5.7. Where an assembly is required to have both fire dampers and smoke dampers, combination fire/smoke dampers or a fire damper and a smoke damper shall be provided.

Exceptions:

1. Ducts 20 square inches ([429 cm²] 12903 mm²) or less passing through fire-resistance-rated assemblies other than fire walls shall not require fire dampers or smoke dampers.

2. Smoke dampers shall not be required to be located within a prescribed distance of a fire-rated enclosure unless smoke dampers are used in air-handling equipment. (Θ)

607.5.1 Fire walls. Ducts and air transfer openings permitted in firewalls in accordance with Section 706.11 of the New York City Building Code shall be protected with listed fire dampers and smoke dampers installed in accordance with their listing.

Exception: Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions or loss of normal power by provision of standby power in accordance with Chapter 27 of the New York City Building Code.

607.5.1.1 Horizontal exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that a duct or air transfer opening penetrates a fire wall that serves as a horizontal exit.

Exception: Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions or loss of normal power by provision of standby power in accordance with Chapter 27 of the New York City Building Code.
return air under fire emergency conditions or loss of normal power by provision of standby power in accordance with Chapter 27 of the New York City Building Code.

607.5.2 Fire barriers. Ducts and air transfer openings that penetrate fire barriers shall be protected with listed fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate [exit] enclosures for interior exit stairways and ramps and exit passageways except as permitted by Sections 1022.4, 1023.5, and 1022.6, respectively, of the New York City Building Code. In addition, smoke dampers shall be installed in penetrations of public corridor and horizontal exit walls in accordance with Section 607.5.2.1.

Exceptions: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.

2. Ducts are used as part of an engineered smoke control system in accordance with Section 513 of this code and Section 909 of the New York City Building Code and where the fire damper would interfere with the operation of the smoke control system.

3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the New York City Building Code. For the purposes of this exception, a ducted HVAC system shall be a duct system for the structure’s HVAC system. Such a duct system shall be constructed of sheet metal not less than 26 gage (0.0217-inch) (0.55 mm) thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

607.5.2.1 Horizontal exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that a duct or air transfer opening penetrates a fire barrier that serves as a horizontal exit.

Exception: Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.2.2 Public corridors. A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a public corridor wall constructed as a fire barrier.

Exceptions:

1. Smoke dampers are not required where the building is equipped throughout with an approved smoke control system in accordance with Section 909 of the New York City Building Code, and smoke dampers are not necessary for the operation and control of the system.
2. Smoke dampers are not required in corridor penetrations where the duct is constructed of steel not less than 0.019-inch (0.48 mm) in thickness and there are no openings serving the corridor.

3. Smoke dampers are not required in corridor penetrations in Group R-2 buildings and public corridors serving R-2 spaces in mixed use buildings.

4. Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions or loss of normal power by provision of standby power in accordance with Chapter 27 of the New York City Building Code.

607.5.3 Fire partitions. Ducts and air transfer openings that penetrate fire partitions shall be protected with listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. The partitions are tenant separation and corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the New York City Building Code and the duct is protected as a through penetration in accordance with Section 714 of the New York City Building Code.

2. The partitions are tenant partitions in covered and open mall buildings where the walls are not required by provisions elsewhere in the New York City Building Code to extend to the underside of the floor or roof sheathing, slab or deck above.

3. The duct system is constructed of approved materials in accordance with [this] code and the duct penetrating the wall [meets] complies with all of the following [minimum] requirements.

   3.1. The duct shall not exceed 100 square inches (0.06 m²).

   3.2. The duct shall be constructed of steel [a minimum of 0.0217-inch] not less than 0.0217 inch (0.55 mm) in thickness.

   3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.

   3.4. The duct shall be installed above a ceiling.

   3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.

   3.6. A minimum 12-inch-long (304.8 305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum [1½-inch] 1½-inch by 1½-inch by 0.060-inch (38.1 mm by 38.1 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the
wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with rock (mineral) wool batting or approved equivalent on all sides.

4. Such partitions are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, and are in areas of other than Group H and are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 of the New York City Building Code. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure’s HVAC system. Such a duct system shall be constructed of sheet steel not less than 26 gage in thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

607.5.4 Smoke barriers. A listed smoke damper designed to resist the passage of smoke shall be provided at each point where a duct or an air transfer opening penetrates a smoke barrier wall enclosure required to have smoke and draft control doors in accordance with the New York City Building Code. Smoke dampers and smoke damper actuation methods shall comply with Section 607.5.4.1.

Exceptions:

1. Smoke dampers are not required in smoke barrier penetrations where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel.

2. Smoke dampers are not required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.5.4.1 Smoke damper. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with the New York City Building Code and Section 607.3.3.2.

607.5.5 Shaft enclosures. Ducts and air transfer openings shall not penetrate a shaft serving as an exit enclosure except as permitted by Section 1022.4 of the New York City Building Code. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where any of the following apply:

   1.1. In buildings equipped throughout with an automatic sprinkler system in accordance with Chapter 9 of the New York City Building Code, where [Steel] steel exhaust subducts have a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) and extend [at least] not less than 22 inches (559 mm) vertically in exhaust shafts, provided that there is a continuous airflow upward to the [outside, or] outdoors whenever the building is occupied.
1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance-rated assembly.

1.3. Ducts are used as part of an engineered smoke control system designed and installed in accordance with Section 909 of the New York City Building Code, and where the fire damper will interfere with the operation of the smoke control system.

1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

2. [In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the New York City Building Code, smoke dampers are not required at penetrations of shafts where kitchen, bathroom and toilet room exhaust openings with steel exhaust subducts, having a wall minimum thickness of at least 0.0187 inch (0.4712 mm) (No. 26 gage), extend at least 22 inches (559 mm) vertically and where the exhaust fan at the upper terminus is powered continuously and maintains airflow upward to the outdoors.] Smoke dampers are not required in exhaust ducts or shafts where the exhaust fan is maintained in operation whenever the building is occupied, in bathrooms and toilet room exhausts.

3. Smoke dampers are not required at penetrations of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

4. Smoke dampers are not required at penetrations where ducts are used as part of an engineered mechanical smoke control system designed in accordance with Section 909 of the New York City Building Code and where the smoke damper will interfere with the operation of the smoke control system.

5. Fire dampers and/or smoke dampers are not required at a shaft where the shaft is acting as an extension of the mechanical equipment room that it serves and the shaft and mechanical equipment room maintain fire and smoke separation required by the greater of the two spaces from the occupied portions of the building and meet the requirements of Sections 708.11, 713.11 and 713.12 of the New York City Building Code.

6. Smoke dampers are not required to be located within a prescribed distance of a fire-rated enclosure within which the air handling equipment is located and where isolation smoke dampers are used in air-handling equipment. See Section 607.2.3 for additional requirements.

7. Smoke dampers are not required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return
air during a fire emergency condition. Such fans shall be provided with standby power in accordance with Chapter 27 of the *New York City Building Code*.

[8. Smoke dampers are not required in exhaust ducts or shafts where the exhaust fan is maintained in operation during occupancy, such as in bathrooms and toilet room exhausts.]

607.5.5.1 **Enclosure at the bottom.** Shaft enclosures that do not extend to the bottom of the building or structure shall be protected in accordance with Section 708.11 of the *New York City Building Code*.

607.5.5.2 **Limitations.** Shafts that constitute air ducts or that enclose air ducts used for the movement of environmental air shall not enclose:

1. Exhaust ducts used for the removal of smoke and grease-laden vapors from cooking equipment;
2. Ducts used for removal of flammable vapors;
3. Ducts used for moving, conveying, or transporting stock, vapor or dust;
4. Ducts used for the removal of nonflammable corrosive fumes and vapors;
5. Refuse and linen chutes; or
6. Piping.

**Exception:** Shafts that constitute air ducts or that enclose air ducts used for the movement of environmental air may enclose noncombustible piping conveying water or other nonhazardous or nontoxic materials.

607.5.6 **Exterior walls.** Ducts and air transfer openings in fire-resistance-rated exterior walls required to have protected openings in accordance with Section 705.10 of the *New York City Building Code* shall be protected with listed fire dampers installed in accordance with their listing.

607.5.6.1 **Outdoor air intake openings.** An outdoor air intake opening with gross area of more than 144 square inches (92 903 mm²) shall be provided with fire dampers and smoke dampers, or combined fire and smoke dampers when such opening is located as follows (intake and exhaust separation requirements of Chapters 4 and 5 shall also be maintained):

1. Less than 30 feet (9144 mm) above grade.
2. Less than 30 feet (9144 mm) in any direction from any opening in another building.
3. Less than 15 feet (4572 mm) from a lot line.
4. Less than 50 feet (15 240 mm) above and less than 50 feet (15 240 mm) in any direction from a roof constructed of combustible material or a building in which the exterior walls are constructed wholly or partly of wood.
Exceptions:

1. Smoke dampers shall not be required for outdoor air intake openings of systems greater than 15,000 cfm (7.1 m³/s) which are provided with smoke dampers in accordance with Chapter 6 and arranged so as to not introduce smoke into the building or space in which the equipment is located.

2. A damper is not required where the combustion air intake duct, boiler room, and combustion air intake louver for such boiler room are enclosed with construction having a fire-resistance rating not less than the rating of the exterior wall, boiler room and any intervening space.

607.5.7 Smoke partitions. A listed smoke damper designed to resist the passage of smoke shall be provided at each point where an air transfer opening penetrates a smoke partition. Smoke dampers and smoke damper actuation methods shall comply with Section 607.3.3.2.

Exceptions:

1. Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Section 513, approved alternate protection shall be used.

2. Smoke dampers shall not be required in ducts where the air continues to move and the air-handling system installed is arranged to prevent recirculation of exhaust or return air under fire emergency conditions.

607.6 Horizontal assemblies. Penetrations by air ducts of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected by a shaft enclosure that complies with the New York City Building Code or shall comply with this section.

607.6.1 Through penetrations. In occupancies other than Groups I-2 and I-3, a duct and air transfer opening system constructed of approved materials in accordance with this code that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection [1] provided that a listed fire damper is installed at the floor line and the penetration is firestopped or the duct is protected in accordance with Section [713.4] 714.4 of the New York City Building Code. For air transfer openings, see [Exception-7] Item 6, Section [708.2] 712.1.9 of the New York City Building Code.

Exception: A duct serving a dwelling unit is permitted to penetrate three floors or less without a fire damper at each floor provided such duct meets all of the following requirements.

1. The duct is contained and located within the cavity of a wall and is constructed of steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) [1].

2. The duct opens into only one dwelling or sleeping unit and the duct system is continuous from the unit to the exterior of the building.
3. The duct does not exceed a 5-inch (127 mm) nominal diameter and the total area of such ducts does not exceed 100 square inches (64516 mm²) for any 100 square feet (9.3 m²) of the floor area.

4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly are protected with a listed ceiling radiation damper installed in accordance with Section 607.6.2.1.

607.6.2 Membrane penetrations. Ducts and air transfer openings constructed of approved materials, in accordance with Section 603, that penetrate the ceiling membrane of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with one of the following:

1. A shaft enclosure in accordance with Section [708] 713 of the New York City Building Code.

2. A listed ceiling radiation damper and firestopping installed at the ceiling line where a duct penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

3. A listed ceiling radiation damper and firestopping installed at the ceiling line where a diffuser with no duct attached penetrates the ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly.

607.6.2.1 Ceiling radiation dampers. Ceiling radiation dampers shall be tested as part of a fire-resistance-rated floor/ceiling or roof/ceiling assembly in accordance with ASTM E 119 or UL 263 Section 607.3.1. Ceiling radiation dampers shall be installed in accordance with the details listed in the fire-resistance-rated assembly and the manufacturer’s installation instructions and the listing. Ceiling radiation dampers are not required where any of the following apply:

1. Tests in accordance with ASTM E 119 or UL 263 have shown that ceiling radiation dampers are not necessary to maintain the fire-resistance rating of the assembly.

2. [Exhaust] Where exhaust duct penetrations are protected in accordance with Section [713.4.1.2] 714.4.2 of the New York City Building Code, are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.

3. Where duct and air transfer openings are protected with a duct outlet protection system tested as part of a fire-resistance-rated assembly in accordance with ASTM E 119 or UL 263 and the building is protected throughout with an automatic sprinkler system in accordance with Chapter 9 of the New York City Building Code.
607.6.3 Nonfire-resistance-rated floor assemblies. Duct systems constructed of approved materials in accordance with Section 603 that penetrate nonfire-resistance-rated floor assemblies shall be protected by any of the following methods:

1. A shaft enclosure in accordance with Section [708] 713 of the New York City Building Code.

2. The duct connects not more than two stories, and the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion.

3. In floor assemblies composed of noncombustible materials, a shaft shall not be required where the duct connects not more than three stories, and the annular space around the penetrating duct is protected with an approved noncombustible material that resists the free passage of flame and the products of combustion, and a listed fire damper is installed at each floor line.

Exception: Fire dampers are not required in ducts within individual residential dwelling units.

607.7 Flexible ducts and air connectors. Flexible ducts and air connectors shall not pass through any fire-resistance-rated assembly. Flexible air connectors shall not pass through any wall, floor or ceiling.

SECTION MC 608
AIR OUTLETS AND AIR INLETS

608.1 Air outlets. Air outlets shall comply with Sections 608.1.1 through 608.1.3.

608.1.1 General. Air supplied to any space shall not contain flammable vapors, flyings, or dust in quantities and concentrations that would introduce a hazardous condition.

608.1.2 Construction of air outlets. Air outlets shall be constructed of noncombustible material or a material that has a maximum smoke-developed index/rating of 50 and a maximum flame spread index/rating of 25.

608.1.3 Location of air outlets. The location of air outlets shall comply with the following requirements:

1. Air outlets shall be located at least 3 inches (76 mm) above the floor.

   Exception: Air outlets may be located less than 3 inches (76 mm) above the floor where provisions have been made to prevent dirt and dust accumulations from entering the system.

2. Where located less than 7 feet (2134 mm) above the floor, outlet openings shall be protected by a grille or screen having openings through which a ½-inch (12.7 mm) sphere cannot pass.
3. Grilles may be located in floors provided they are installed so that they may be removed for cleaning purposes and provided they are constructed as follows:

3.1. Grilles up to 3 square feet ($0.2787 \text{ m}^2$) in gross area shall be designed to support a concentrated live load of 250 pounds (113.4 kg) on any 4 square inches ($2580.6 \text{ mm}^2$) of surface.

3.2. Grilles over 3 square feet ($0.2787 \text{ m}^2$) in gross area shall be designed to support the same loads as the floor in the area where used.

3.3. If located where they may be walked upon, the opening in grilles shall reject a $\frac{1}{2}$-inch (12.7 mm) sphere.

608.2 Air inlets (return or exhaust or return and exhaust). Air inlets shall be constructed in accordance with Sections 608.2.1 through 608.2.3.

608.2.1 General. Air shall not be recirculated from any space in which flammable vapors, flyings, or dust is present in quantities and concentrations that would introduce a hazardous condition into the return air system.

608.2.2 Construction of air inlets. Air inlets shall be constructed of noncombustible material or a material that has a maximum flame spread index/rating of 25 and a maximum smoke-developed index/rating of 50.

608.2.3 Location of air inlets. The location of air inlets shall comply with the following requirements.

1. Air inlets shall be located at least 3 inches ($76.2 \text{ mm}$) above the floor.

   Exception: Air inlets may be located less than 3 inches ($76.2 \text{ mm}$) above the floor where provisions have been made to prevent dirt and dust accumulations from entering the system.

2. Where located less than 7 feet ($2133.6 \text{ mm}$) above the floor, inlet openings shall be protected by a grille or screens having openings through which a $\frac{1}{2}$-inch (12.7 mm) sphere cannot pass.

3. Grilles may be located in floors provided they are installed so that they may be removed for cleaning purposes and provided they are constructed as follows:

3.1. Grilles up to 3 square feet ($0.2787 \text{ m}^2$) in gross area shall be designed to support a concentrated live load of 250 pounds (113.4 kg) on any 4 square inches ($2580.6 \text{ mm}^2$) of surface.

3.2. Grilles over 3 square feet ($0.2787 \text{ m}^2$) in gross area shall be designed to support the same loads as the floor in the area where used.

3.3. If located where they may be walked upon, the opening in grilles shall reject a $\frac{1}{2}$-inch (12.7 mm) sphere.
SECTION MC 609
SERVICE OPENINGS

609.1 General. Horizontal air ducts and plenums shall be provided with service openings to facilitate the removal of accumulations of dust and combustible materials. Service openings shall be located at approximately [20 foot] 20-foot (6096 mm) intervals along the air duct and at the base of each vertical riser.

Exceptions:

1. Removable air outlet or air inlet devices of adequate size shall be permitted in lieu of service openings.

2. Service openings shall not be required in supply ducts where the supply air has previously passed through an air filter, air cleaner, or water spray. Such air filters and air cleaners shall be properly maintained and replaced when needed.

3. Service openings shall not be required where all of the following conditions exist:

   3.1. The occupancy has no process producing combustible material such as dust, lint, or greasy vapors. Such occupancies include banks, office buildings, houses of worship, hotels, and health care facilities (but not kitchens, laundries, and manufacturing portions of such facilities).

   3.2. The air inlets are at least 7 feet ([2134] 2133.6 mm) above the floor or are protected by corrosion-resistant metal screens of at least 14 mesh (0.07 inches) (1.8 mm) that are installed at the inlets so that they cannot draw papers, refuse, or other combustible solids into the return air duct.

   3.3. The minimum design velocity in the return duct for the particular occupancy is 1000 feet/minute (5.080 m/s).

§ 8. Chapter 7 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 7
COMBUSTION, VENTILATION, AND DILUTION AIR

SECTION MC 701
GENERAL

701.1 Scope. The provisions of this chapter shall govern the requirements for combustion, ventilation, and dilution air for fuel-burning appliances other than gas-fired appliances. The requirements for combustion, ventilation, and dilution air for gas-fired appliances shall be in accordance with the New York City Fuel Gas Code.

701.2 Combustion, ventilation, and dilution air required. Every room or space containing fuel-burning appliances shall be provided with combustion, ventilation, and dilution air as required by
this code. Combustion, ventilation, and dilution air shall be provided in accordance with Section 702, 703, 704, 705, 706 or 707 [of this code]. Direct-vent appliances or equipment that do not draw combustion air from inside of the building are not required to be considered in the determination of the combustion and dilution air requirements and shall be installed in accordance with the equipment manufacturer’s instructions and listing. Combustion air requirements shall be determined based on the simultaneous operation of all fuel-burning appliances drawing combustion, ventilation, and dilution air from the room or space. Combustion, ventilation, and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h ([1025] 102.6 kW). The room or space containing fuel-burning appliances shall comply with the requirements of Sections C402.5.3 and R402.4.4, as applicable, of the New York City Energy Conservation Code and Section 1012 of this code.

701.3 Circulation of air. The equipment and appliances within every room containing fuel-burning appliances shall be installed so as to allow free circulation of air. Provisions shall be made to allow for the simultaneous operation of mechanical exhaust systems, fireplaces or other equipment and appliances operating in the same room or space from which combustion, ventilation, and dilution air is being drawn. Such provisions shall prevent the operation of such appliances, equipment and systems from affecting the supply of combustion, ventilation, and dilution air.

701.3.1 Makeup air for fuel-burning devices. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air. Calculations shall be provided on the construction documents to validate the use of the exhaust fan(s) and compliance with this chapter.

701.3.2 Ventilation air for fuel-burning devices. Where ventilation air is brought in by mechanical means for heat generation mitigation, provisions must be made for proper air balance to prevent a negative or positive pressure in the boiler and to discharge the ventilation air directly to the outside.

For the purposes of this chapter, an opening to a naturally ventilated crawl space or attic space shall be considered equivalent to an opening to the outdoors.

701.4.1 Crawl space. Where lower combustion air openings connect with crawl spaces, such spaces shall have unobstructed openings to the outdoors at least twice that required for the combustion air openings. The height of the crawl space shall comply with the requirements of the New York City Building Code and shall be without obstruction to the free flow of air.

701.4.2 Attic space. Where combustion air is obtained from an attic area, the attic ventilating openings shall not be subject to ice or snow blockage, and the attic shall have not less than 30 inches (762 mm) vertical clear height at its maximum point. Attic ventilation openings shall be sufficient to provide the required volume of combustion air and the attic ventilation required by the New York City Building Code. The combustion air openings shall be provided with a sleeve of not less than 0.019 inch (0.48 mm) (No.26 Gage) galvanized steel or other approved material extending from the appliance enclosure to at least 6 inches ([152] 152.4 mm) above the top of the ceiling joists and insulation.
**701.5 Prohibited sources.** Openings and ducts shall not connect appliance enclosures with a space in which the operation of a fan will adversely affect the flow of the combustion, ventilation, and dilution air. Combustion, ventilation, and dilution air shall not be subject to ice or snow blockage. No combustion, ventilation, and dilution air inlet shall be less than 30 inches (762 mm) above grade. Combustion, ventilation, and dilution air shall not be obtained from a hazardous location, except where the fuel-fired appliances are located within the hazardous location and are installed in accordance with this code. Combustion, ventilation, and dilution air shall not be taken from a refrigeration machinery room, except where a refrigerant vapor detector system is installed to automatically shut off the combustion process in the event of refrigerant leakage. For structures in [areas of special] flood hazard areas, air shall be obtained from a location complying with the additional requirements of Appendix G of the *New York City Building Code*.

**SECTION MC 702**

**INSIDE AIR**

**702.1 All air from indoors.** Combustion, ventilation, and dilution air shall be permitted to be obtained entirely from the indoors in buildings that are not of unusually tight construction. In buildings of unusually tight construction, combustion air shall be obtained from the outdoors in accordance with Section 703, 705, 706, or 707.

**702.2 Air from the same room or space.** The room or space containing fuel-burning appliances shall be an unconfined space as defined in Section 202.

**702.3 Air from adjacent spaces.** Where the volume of the room in which the fuel-burning appliances are located does not comply with Section 702.2, additional inside combustion, ventilation, and dilution air shall be obtained by opening the room to adjacent spaces so that the combined volume of all communicating spaces meets the volumetric requirement of Section 702.2. Openings connecting the spaces shall comply with Sections 702.3.1, 702.3.2, and Figure A-1 of Appendix A [of this code].

**702.3.1 Number and location of openings.** Two openings shall be provided, one within 1 foot ([305] 304.8 mm) of the ceiling of the room and one within 1 foot ([305] 304.8 mm) of the floor.

**702.3.2 Size of openings.** The net free area of each opening, calculated in accordance with Section 708, shall be a minimum of 1 square inch per 1,000 Btu/h (2201 mm²/kW) of input rating of the fuel-burning appliances drawing combustion, ventilation, and dilution air from the communicating spaces and shall be not less than 100 square inches (64 516 mm²).

**SECTION MC 703**

**OUTDOOR AIR**

**703.1 All air from the outdoors.** Where all combustion, ventilation, and dilution air is to be provided by outdoor air, the required combustion, ventilation, and dilution air shall be obtained by direct opening by louver or a duct(s) from the boiler room to the outdoors. Openings connecting the room to the outdoor air shall comply with Sections 703.1.1 through [703.1.4] 703.1.2 of this code, and Figures [A-2] 304.6.1(1), [A-3 and A-4] 304.6.1(2), 304.6.1(3) and 304.6.2 of [Appendix A of this code]. *The New York City Fuel Gas Code.* The size of the openings connecting the room to the outdoor
air supply shall also comply with any applicable rules of the New York City Department of Environmental Protection.

**703.1.1 Two-permanent-openings method.** Two permanent openings, one commencing within 12 inches ([305] 304.8 mm) at the top and one commencing within 12 inches ([305] 304.8 mm) of the bottom of the room, shall be provided. The openings shall communicate directly, or by ducts, with the outdoors or spaces that freely communicate with the outdoors as follows:

1. Where directly communicating with the outdoors, or where communicating with the outdoors through vertical ducts, each opening shall have a minimum free area of 1 square inch per 4,000 Btu/h (550 mm²/kW) of total input rating of all equipment in the room.

2. Where communicating with the outdoors through horizontal ducts, each opening shall have a minimum free area of not less than 1 square inch per 2,000 Btu/H (1100 mm²/kW) of total input rating of all equipment in the room.

**703.1.2 One-permanent-opening method.** One permanent opening, commencing within 12 inches ([305] 304.8 mm) of the top of the enclosure, shall be provided. The equipment shall have clearances of at least 1 inch ([25] 25.4 mm) from the sides and back and 6 inches ([152] 152.4 mm) from the front of the appliance. The opening shall directly communicate with the outdoors or through a vertical or horizontal duct to the outdoors or spaces that freely communicate with the outdoors and shall have a minimum free area of 1 square inch per 3,000 Btu/h (734 mm²/kW) of the total input rating of all equipment located in the enclosure, and not less than the sum of the areas of all vent connectors in the space.

**SECTION MC 704**

**COMBINED USE OF INSIDE AND OUTDOOR AIR**

**(CONDITION 1)**

**704.1 Combination of air from inside and outdoors.** This section shall apply only to appliances located in confined spaces in buildings not of unusually tight construction. Where the volumes of rooms and spaces are combined for the purpose of providing indoor combustion air, such rooms and spaces shall communicate through permanent openings in compliance with Sections 702.3.1 and 702.3.2. The required combustion, ventilation, and dilution air shall be obtained by opening the room to the outdoors using a combination of inside and outdoor air, prorated in accordance with Section 704.1.6. The ratio of interior spaces shall comply with Section 704.1.5. The number, location and ratios of openings connecting the space with the outdoor air shall comply with Sections 704.1.1 through 704.1.4.

**704.1.1 Number and location of openings.** At least two openings shall be provided, one within 1 foot ([305] 304.8 mm) of the ceiling of the room and one within 1 foot ([305] 304.8 mm) of the floor.
704.1.2 Ratio of direct openings. Where direct openings to the outdoors are provided in accordance with Section 703.1, the ratio of direct openings shall be the sum of the net free areas of both direct openings to the outdoors, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.2.

704.1.3 Ratio of horizontal openings. Where openings connected to the outdoors through horizontal ducts are provided in accordance with Section 703.1, the ratio of horizontal openings shall be the sum of the net free areas of both such openings, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.3.

704.1.4 Ratio of vertical openings. Where openings connected to the outdoors through vertical ducts are provided in accordance with Section 703.1, the ratio of vertical openings shall be the sum of the net free areas of both such openings, divided by the sum of the required areas for both such openings as determined in accordance with Section 703.1.4.

704.1.5 Ratio of interior spaces. The ratio of interior spaces shall be the available volume of all communicating spaces, divided by the required volume as determined in accordance with Sections 702.2 and 702.3.

704.1.6 Prorating of inside and outdoor air. In spaces that utilize a combination of inside and outdoor air, the sum of the ratios of all direct openings, horizontal openings, vertical openings and interior spaces shall equal or exceed 1.

SECTION MC 705
COMBINED USE OF INSIDE AND OUTDOOR AIR
(CONDITION 2)

705.1 General. This section shall apply only to appliances located in unconfined spaces in buildings of unusually tight construction. Combustion air supplied by a combined use of indoor and outdoor air shall be supplied through openings and ducts extending to the appliance room or to the vicinity of the appliance.

705.1.1 Openings and supply ducts. Openings shall be provided, located and sized in accordance with Sections 702.3.1 and 702.3.2; additionally, there shall be one opening to the outdoors having a free area of at least 1 square inch per 5,000 Btu/h (440 mm²/kW) of total input of all appliances in the space.

SECTION MC 706
MECHANICAL COMBUSTION AIR SUPPLY

706.1 Rate of air supplied. Where all combustion air is provided by a mechanical air supply system, the combustion air shall be supplied from the outdoors at a rate of not less than 0.35 cubic feet per minute per 1,000 Btu/h (0.034 m³/min per kW) of total input rating for all the fuel-burning appliances located within the space. Combustion air rates shall also comply with any applicable rules of the New York City Department of Environmental Protection. The mechanical air supply shall be sufficient to accommodate combustion air, ventilation air, and dilution air requirements of the installation.
706.1.1 Appliance interlock. Each of the appliances served shall be interlocked with the mechanical air supply system to prevent main burner operation when the mechanical air supply system is not in operation. The air flow and the damper operation shall be proven prior to burner operation.

SECTION MC 707
DIRECT CONNECTION

707.1 General. Fuel-burning appliances that are listed and labeled for direct combustion air connection to the outdoors shall be installed in accordance with the manufacturer’s [installation] instructions.

SECTION MC 708
COMBUSTION AIR DUCTS

708.1 General. Combustion air ducts shall comply with all of the following:

1. Be of galvanized steel complying with Chapter 6 or of equivalent corrosion-resistant material approved for this application.

   Exception: Within dwelling units, unobstructed stud and joist spaces shall not be prohibited from conveying combustion air, provided that not more than one required fireblock is removed.

2. Have a minimum [cross-sectional] dimension of 3 inches ([76] 76.2 mm) in all directions.

3. Terminate in an unobstructed space allowing free movement of combustion air to the appliances.

4. Have the same cross-sectional areas as the free area of the openings to which they connect.

5. Serve a single appliance enclosure.

6. Not serve both upper and lower combustion air openings where both such openings are used. The separation between ducts serving upper and lower combustion air openings shall be maintained to the source of combustion air.

7. Not be screened where terminating in an attic space.

8. Not slope downward toward the source of combustion air, where serving the upper required combustion air opening.

9. Be constructed so that the remaining space surrounding a chimney or chimney liner, installed within a masonry, metal or factory-built chimney cannot be used to supply combustion, ventilation and dilution air, except for direct vent appliances designed and installed in accordance with the equipment manufacturer’s instructions and listing.

10. Be insulated in accordance with Section C402.5.3 of the New York City Energy Conservation Code.
SECTION MC 709
OPENING OBSTRUCTIONS

709.1 General. The required size of openings for combustion, ventilation, and dilution air shall be based on the net free area of each opening. The net free area of an opening shall be that specified by the manufacturer of the opening covering. In the absence of such information, openings covered with metal louvers shall be deemed to have a net free area of 60 percent of the area of the opening, and openings covered with wood louvers shall be deemed to have a net free area of 10 percent of the area of the opening. Louvers and grills shall be fixed in the open position.

Exception: Operable louvers shall be interlocked with the appliance so that they are proven to be in the full open position prior to main burner ignition and during main burner operation. Means shall be provided to prevent the main burner from igniting if the louvers fail to open during burner startup and to shut down the main burner if the louvers close during operation.

709.2 Dampered openings. Where the combustion air openings are provided with automatic, smoke or fire dampers, the dampers shall be electrically interlocked with the appliances served, so as to prevent operation of any appliance that draws combustion and dilution air from the room when any of the dampers are closed. Manually operated dampers shall not be installed in combustion air openings. The damper opening shall be proven prior to burner operation. Dampers shall be provided in accordance with Chapter 6.

709.3 Caution sign. A sign stating, “Louvers, dampers and/or ventilation openings must not be blocked or disabled.” shall be permanently affixed, in clear view, and adjacent to the opening(s) within the room containing the equipment. The letters used on the sign shall be at least 1 inch (25.4 mm) in height.

SECTION MC 710
OPENING LOCATION AND PROTECTION

710.1 General. Combustion air openings to the outdoors shall comply with the location and protection provisions applicable to outside air intake openings of Sections 401.5 and 401.6 of this code.

§ 9. Chapter 8 of the New York city mechanical code, as amended by local law number 141 for the year 2013, and sections 804.1 and 804.2 as amended by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 8
CHIMNEYS AND VENTS

SECTION MC 801
GENERAL

801.1 Scope. This chapter shall govern the installation, maintenance, design, minimum safety requirements, repair and approval of factory-built chimneys, chimney liners, vents and connectors, and field-built chimneys and connectors for all non-gas-fired nongas-fired appliances. This chapter shall also govern the utilization of masonry chimneys. Gas-fired appliances shall be vented in
accordance with the New York City Fuel Gas Code. The construction, repair, maintenance and approval of masonry chimneys shall be regulated by the New York City Building Code. Venting systems shall be designed in accordance with this chapter and comply with the requirements of the New York City Air Pollution Control Code.

801.1.1 [Adjoining] Existing chimneys and vents. [Adjoining] Existing chimneys and vents shall [be in accordance with] comply with the requirements of Section 28-104.13 of the New York City Administrative Code and Sections 801.1.1.1 through 801.1.1.8 of this code.

801.1.1.1 Responsibility of owner of taller building. Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any previously constructed existing chimneys or vents within 100 feet (30 480 mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed existing chimneys or vents to the height required in this chapter.

2. Offset such chimneys or vents to a distance beyond that required in this chapter from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.

Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

801.1.1.1.1 Chimney and vent plan. Applications for a new or altered building shall include a chimney and vent plan submitted pursuant to Section 107.18 of the New York City Building Code.

801.1.2 Protection of draft. After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

801.1.3 Written notification, plans and required documents. The owner of the new or altered building shall notify the owner of [the] any building that may require a chimney or vent to be altered. Notification, plans and required documents shall comply with the requirements of Sections 801.1.3.1 through 801.1.3.3, [affected in writing at least 45 days before starting the work required and request written consent to do such work. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.]
801.1.3.1 **First notice.** Written notice in a form acceptable to the department shall be provided to the building owner not less than 60 days prior to a request for permit for construction on the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. A copy of such return receipt shall be filed with the department.

801.1.3.2 **Second notice.** Written notice in a form acceptable to the department shall be provided to the building owner not more than 45 days following commencement of work after a permit has been issued for the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. The second notice shall also be posted by a licensed process server at the public entrance of the building requiring a chimney or vent to be altered. A copy of such return receipt and proof of service by the licensed process server shall be filed with the department.

**Exceptions:**

1. A second notice shall not be required where an application to alter the affected chimney or vent has been filed with the department.

2. A second notice shall not be required where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney and vent plan is submitted to the department.

801.1.3.3 **Plans and required documentation for alteration work.** Where access is granted and conditions are observed that result in a determination that chimney or vent alteration is required, plans for such alteration work shall be provided to the owner of the existing building and a request for written consent to submit construction documents and perform such work shall be made.

801.1.4 **Approval.** The construction documents for the proposed chimney extension, alteration or relocation shall be subject submitted to the approval of the department pursuant to Section 28-104 of the *New York City Administrative Code*. No certificate of occupancy shall be issued for the new building pursuant to Section 28-118.23 of the *New York City Administrative Code* until the work associated with such construction documents for the proposed chimney extension, alteration or relocation has been signed-off by the department.

**Exceptions:**

1. A certificate of occupancy may be issued where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney or vent plan is submitted pursuant to Section 107.18 of the *New York City Building Code* documenting such.
A certificate of occupancy may be issued in accordance with Section 28-118.23, Exception 2 of the New York City Administrative Code.

**801.1.1.5 Refusal of consent.** If consent is not granted by the owner of the affected building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having submitted plans that conform to the requirements of this section, provided the notices required by Section 801.1.1.3 shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building. Similarly, should such owner fail to grant consent within 45 days from the date of written request the second notice or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.

**801.1.1.6 Procedure.** It shall be the obligation of the owner of the new or altered building to:

1. Prepare and submit a chimney and vent plan to the department pursuant to Section 107.18 of the New York City Building Code.
2. Provide required notification pursuant to Section 801.1.1.3 of this code.
3. Provide plans pursuant to Section 801.1.1.3.3 of this code.
4. Prepare and submit construction documents to the department pursuant to Section 28-104 of the New York City Administrative Code for the alteration of existing chimneys or vents which conform to the requirements of this chapter;
5. Obtain permit(s) for the proposed work in accordance with Section 28-105 of the New York City Administrative Code;
6. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building;
7. Provide such essential services as are normally supplied by the equipment while it is out of service;
8. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building;
9. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; and
10. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where
there is practical difficulty in complying strictly with the provisions of this item, the
commissioner may permit an equally safe alternative.

11. Comply with the tenant protection plan requirements of Section 28-120 of the New
York City Administrative Code; and

12. Comply with inspection and sign-off requirements of Section 28-116 of the New York
City Administrative Code.

801.1.1.7 Existing violations. Any existing violations on the previously constructed
equipment shall be corrected by the owner of the equipment before any equipment is added
or alterations made at the expense of the owner of the new or altered building.

801.1.1.8 Variance. The commissioner may grant a variance in accordance with the
provisions of this code.

801.2 General. Every fuel-burning appliance shall discharge the products of combustion to a vent,
factory-built chimney or masonry chimney, except for appliances vented in accordance with Section
804. The chimney or vent shall be designed for the type of appliance being vented.

Exception: Commercial cooking appliances vented by a Type I hood installed in accordance
with Section 507.

801.2.1 Design. Chimneys and vents shall be designed and constructed so as to provide the
necessary draft and capacity for each appliance connected to completely exhaust the products of
combustion to the outside air. The temperature on adjacent combustible surfaces shall not be
raised above 160°F (71°C). Chimneys and vents shall be designed to resist the effects of
condensation that would cause deterioration of the chimney or vent.

801.2.2 Outlets. The outlet shall be arranged so that the flue gases are not directed so that they
jeopardize people, overheat combustible structures, or enter building openings in the vicinity of
the outlet.

801.2.3 Support. Chimneys and vents shall not be supported by the equipment they serve unless
such equipment has been specifically designed for such loads.

801.2.4 Oil-fired appliances. Oil-fired appliances shall be vented in accordance with this code
and NFPA 31.

801.2.5 Gas-fired appliances. Gas-fired appliances shall be vented in accordance with the New
York City Fuel Gas Code.

801.3 Masonry chimneys. Masonry chimneys shall be constructed in accordance with the New York
City Building Code.

801.4 Positive flow. Venting systems shall be designed and constructed so as to develop a positive
flow adequate to convey all combustion products to the outside atmosphere.
801.5 Design. Venting systems shall be designed in accordance with this chapter and comply with the requirements of the *New York City Air Pollution Control Code*.

801.6 Minimum size of chimney or vent. Except as otherwise provided for in this chapter, the size of the chimney or vent, serving a single appliance, except engineered systems, shall have a minimum area equal to the area of the appliance connection.

801.7 Solid [fuel] fuel-burning appliance flues. The cross-sectional area of a flue serving a [solid-fuel-burning] solid fuel-burning appliance shall be not greater than three times the cross-sectional area of the appliance flue collar or flue outlet.

801.8 Abandoned inlet openings. Abandoned inlet openings in chimneys and vents shall be closed by an approved method, sealed air-tight and permanently labeled as abandoned.

801.9 Positive pressure. Where an appliance equipped with a forced or induced draft system creates a positive pressure in the venting system, the venting system shall be designed and listed for positive pressure applications.

801.10 Connection to fireplace. Connection of appliances to chimney flues serving fireplaces shall be in accordance with Sections 801.10.1 through 801.10.3.

801.10.1 Closure and access. A noncombustible seal shall be provided below the point of connection to prevent entry of room air into the flue. Means shall be provided for access to the flue for inspection and cleaning.

801.10.2 Connection to factory-built fireplace flue. An appliance shall not be connected to a flue serving a factory-built fireplace unless the appliance is specifically listed for such installation. The connection shall be made in accordance with the appliance manufacturer’s [installation] instructions.

801.10.3 Connection to masonry fireplace flue. A connector shall extend from the appliance to the flue serving a masonry fireplace such that the flue gases are exhausted directly into the flue. The connector shall be provided with access or shall be removable for inspection and cleaning of both the connector and the flue. Listed direct connection devices shall be installed in accordance with their listing.

801.11 Multiple solid [fuel] fuel-burning appliances prohibited. A solid fuel-burning appliance or fireplace shall not connect to a chimney [passage-way] passageway venting another appliance.

801.12 Chimney entrance. Connectors shall connect to a chimney flue at a point not less than 12 inches ([305] 304.8 mm) above the lowest portion of the interior of the chimney flue.

801.13 Cleanouts. Factory-built chimneys and vents shall be provided with a cleanout opening or access door at the base of the chimney or vent installed in accordance with the manufacturer’s instructions. Masonry [chimney flues] and metal chimneys shall be provided with a cleanout opening having a minimum height of 6 inches ([152] 152.4 mm). The upper edge of the opening shall be located not less than 6 inches ([152] 152.4 mm) below the lowest chimney inlet opening. The cleanout shall be provided with a tight-fitting, noncombustible cover of a minimum size
of 8 inches by 8 inches (203.2 mm by 203.2 mm). Cleanouts shall comply with the requirements of the New York City Air Pollution Control Code.

**Exception:** Cleanouts shall not be required for chimney flues serving masonry fireplaces, if such flues are provided with access through the fireplace opening.

**801.14 Connections to exhauster.** Appliance connections to a chimney or vent equipped with a power exhauster shall be made on the inlet side of the exhauster. Joints and piping on the positive pressure side of the exhauster shall be listed for positive pressure applications as specified by the manufacturer’s installation instructions for the exhauster or in accordance with this code.

**801.15 Fuel-fired appliances.** Masonry chimneys utilized to vent fuel-fired appliances shall be located, constructed and sized as specified in the manufacturer’s installation instructions for the appliances being vented.

**801.16 Flue lining.** Masonry chimneys shall be lined. The lining material shall be compatible with the type of appliance connected, in accordance with the appliance listing and manufacturer’s installation instructions. Listed materials used as flue linings shall be installed in accordance with their listings and the manufacturer’s installation instructions.

**801.16.1 Residential and low-heat appliances (general).** Flue lining systems for use with residential-type and low-heat appliances shall be limited to the following:

1. Clay flue lining complying with the requirements of ASTM C 315 or equivalent. Clay flue lining shall be installed in accordance with the New York City Building Code.

2. Listed and labeled chimney lining systems complying with UL 1777 (new and existing chimneys) or ULC-S635 (existing chimneys) or ULC-S640 (new chimneys).

3. Other approved materials that will resist, without cracking, softening or corrosion, flue gases and condensate at temperatures up to 1,800°F (982°C).

4. Existing firebrick chimneys may be used to vent appliances if the firebrick is acid resistant and lab tested. The brick and mortar must be inspected in accordance with Section 1705.32 of the New York City Building Code.

**801.17 Space around lining.** The space surrounding a flue lining system or other vent installed within a masonry chimney shall not be used to vent any other appliance. This shall not prevent the installation of a separate flue lining in accordance with the manufacturer’s installation instructions and this code.

**801.18 Existing chimneys and vents.** Where an appliance is permanently disconnected from an existing chimney or vent, or where an appliance is connected to an existing chimney or vent during the process of a new installation, the chimney or vent shall comply with Sections 801.18.1 through 801.18.4.

**801.18.1 Size.** The chimney or vent shall be resized as necessary to control flue gas condensation in the interior of the chimney or vent and to provide the appliance or appliances served with the
required draft. For the venting of oil-fired appliances to masonry chimneys, the resizing shall be in accordance with NFPA 31.

**801.18.2 Flue passageways.** The flue gas passageway shall be free of obstructions and combustible deposits and shall be cleaned if previously used for venting a solid or liquid fuel-burning appliance or fireplace. The flue liner, chimney inner wall or vent [inner wall] inner wall shall be continuous and shall be free of cracks, gaps, perforations or other damage or deterioration which would allow the escape of combustion products, including gases, moisture and creosote. Where an oil-fired appliance is connected to an existing masonry chimney, such chimney flue shall be repaired or relined in accordance with NFPA 31.

**801.18.3 Cleanout.** Masonry chimneys shall be provided with a cleanout opening complying with Section 801.13.

**801.18.4 Clearances.** Chimneys and vents shall have [air-space] airspace clearance to combustibles in accordance with the New York City Building Code and the chimney or vent manufacturer’s [installation] instructions.

**Exception:** Masonry chimneys without the required airspace clearances shall be permitted to be used if lined or relined with a chimney lining system listed for use in chimneys with reduced clearances in accordance with UL 1777 or ULC-S635. The chimney clearance shall be not less than permitted by the terms of the chimney liner listing and the manufacturer’s instructions.

**801.18.4.1 Fireblocking.** Noncombustible fireblocking shall be provided in accordance with the New York City Building Code.

**801.19 Multistory prohibited.** Common venting systems for appliances located on more than one floor level shall be prohibited.

**801.20 Reserved.**

**801.21 Termination requirements.** Terminations shall comply with the appliance listing and manufacturer’s instructions, and the following:

1. Chimneys, vents and flues serving appliances or fireplaces with outlet temperatures less than 600°F ([346] 315.6°C) shall extend at least 3 feet ([914] 914.4 mm) above the highest construction, such as a roof ridge, parapet wall or penthouse [but] within 10 feet (3048 mm) of the chimney vent or flue outlet, whether the construction is on the same building as the chimney or on another building. Any [chimney] chimneys, vents or flues located in an area that is more than 10 feet (3048 mm) from such construction, but not more than the distance determined by Equation 8-1, shall be at least as high as the highest construction in such area. For purposes of determining the required height of a chimney, such construction shall not include other chimneys, vents or open structural framing.
2. Chimneys serving appliances or fireplaces with outlet temperatures between 600°F (315.6°C) and 1000°F (537.8°C) shall extend at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. Any chimneys located in an area more than 20 feet (6096 mm) from such construction, but not more than the distance determined from Equation 8-1, shall be at least as high as the highest construction in such area. For purposes of determining the required height of the chimney, such construction does not include other chimneys, vents or open structural framing.

3. Chamneys serving appliances or fireplaces with outlet temperatures greater than 1000°F (537.8°C) shall extend at least 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. Any chimneys located in an area that is more than 50 feet (15 240 mm) from such construction, but not more than the distance determined from Equation 8-1, shall be at least as high as the highest construction located in such area. For purposes of determining the required height of the chimney, such construction does not include other chimneys, vents, or open structural framing.

4. [Reserved.] Termination caps shall not be permitted. A drain shall be installed in accordance with Section 801.22. A positive means shall be provided to prevent water from entering the appliance.

**Exception:** Termination caps shall be permitted on listed factory-built chimneys unless otherwise prohibited by the New York City Air Pollution Control Code.

5. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers’ instructions.

6. The following formula shall be used in order to determine the distance referred to in Items 1, 2 and 3 of this section:

\[
D = F \times \sqrt{A} \quad \text{(Equation 8-1)}
\]

where:

- \(D\) = Distance, in feet, measured from the center of the chimney, vent or flue outlet to the nearest edge of the construction. If a single chimney is divided into multiple smaller flues or chimneys, measure from the center of the chimney outlet that is closest to the nearest edge of the construction.
- \(F\) = Value determined from Table 801.20 or 801.21.
- \(A\) = Free area, in square inches, of chimney flue space outlet. If a single chimney is divided into multiple smaller flues or chimneys, the total aggregate free area of such flue and chimney outlets shall be used to calculate “\(A\)".

### [801.21] 801.22 Drains.

A drain shall be provided for all chimneys and gas vents to remove rain water and condensation. The drain shall be a minimum of be not less than 1 inch (25.4 mm) in diameter and shall be equipped with an appropriately-sized p-trap with automatic trap seal primer in accordance with Section 1002 of the New York City Plumbing Code or a float drain trap installed in accordance with the manufacturer’s installation requirements. The drain shall be sized by the design engineer and shall be suitable for the chimney area. For listed chimneys and gas vents, the connection tap into the chimney shall be determined by the manufacturer and connected to the drain piping in accordance with the listing and installation instructions. On all outdoor chimneys and gas vents, the connection and drain shall be installed indoors as close as practicable to the chimney base to prevent freezing.

### 801.23 Draft controls.

The installation of draft controls shall comply with Sections 801.23.1 through 801.23.5.

**801.23.1 Draft control devices.** Where a draft control device is part of the appliance or is supplied by the appliance manufacturer, it shall be installed in accordance with the manufacturers’ instructions. In the absence of manufacturers’ instructions, the device shall be attached to the flue collar of the appliance or as near to the appliance as practical.

**801.23.2 Additional devices.** Appliances requiring a controlled chimney draft shall be permitted to be equipped with a listed barometric draft regulator or automatic damper installed and adjusted in accordance with the manufacturers’ instructions. Automatic dampers shall be installed in accordance with Section 803.6.

**801.23.3 Thermal safety (spill) switches.** Thermal safety (spill) switches shall be installed on barometric [dampers, draft hoods, draft diverters,] draft regulators and all other [appurtenances] appurtenances that allow dilution air into chimneys or [gas] vents. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or [gas] vent.

**801.23.4 Location.** Barometric draft regulators shall be installed in the same room or enclosure as the appliance in such a manner as to prevent any difference in pressure between the regulator and the combustion air supply.
**801.23.5 Positioning.** Barometric draft regulators shall be installed in the position for which they were designed with reference to the horizontal and vertical planes and shall be located so that the relief opening is not obstructed by any part of the appliance, adjacent construction or installation hardware.

**801.24 Obstructions.** Devices or items that protrude into, impede or restrict the flow of vent gases shall not be installed in a vent connector, chimney, or vent.

**801.25 Outdoor chimneys and vents.** Outdoor portions of chimneys or vents shall be provided with integral R-8 insulation or be provided with an R-8 insulation enclosure, where exposed to the outdoors for more than 5 feet (1524 mm).

**SECTION MC 802 VENTS**

**802.1 General.** Vent systems shall be listed and labeled or field fabricated in accordance with NFPA 211. Type L vents shall be tested in accordance with UL 641.

**802.2 Vent application.** The application of vents shall be in accordance with Table 802.2.

<table>
<thead>
<tr>
<th>VENT TYPES</th>
<th>APPLIANCE TYPES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type L oil vents</td>
<td>Oil-burning appliances listed and labeled for venting with Type L vents; gas appliances listed and labeled for venting with Type B vents.</td>
</tr>
</tbody>
</table>

**802.3 Installation.** Vent systems shall be sized, installed and terminated in accordance with the vent and appliance manufacturer’s [installation] instructions.

**802.4 Vent termination caps.** Vent termination caps shall not be permitted and a drain installed to receive condensed or rain water shall be required. A positive means, such as offsets, shall be provided to prevent water from entering the appliance.

**Exception:** Termination caps shall be permitted on listed factory-built chimneys unless otherwise prohibited by the *New York City Air Pollution Control Code*.

**802.5 Type L vent terminations.** Type L vents shall terminate in accordance with Section [801.20] 801.21.

**802.6 Minimum vent heights.** Vents shall terminate not less than 5 feet (1524 mm) in vertical height above the highest connected appliance flue collar.

**Exceptions:**
1. Venting systems of direct vent appliances shall be installed in accordance with the appliance and the vent manufacturer’s instructions.

2. Appliances listed for outdoor installations incorporating integral venting means shall be installed in accordance with their listings and the manufacturer’s installation instructions.

802.7 Support of vents. All portions of vents shall be installed in accordance with the manufacturer’s [listing and installation] instructions and shall be adequately supported for the design and weight of the materials employed.

802.8 Insulation shield. Where vents pass through insulated assemblies, an insulation shield constructed of not less than No. 26 [Gage] gage sheet metal shall be installed to provide clearance between the vent and the insulation material. The clearance shall be not less than the clearance to combustibles specified by the vent manufacturer’s [installation] instructions. Where vents pass through attic space, the shield shall terminate not less than 2 inches (50.8 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed vent system shall be installed in accordance with the manufacturer’s [installation] instructions.

802.9 Door swing. Appliance and equipment vent terminals shall be located such that doors cannot swing within 12 inches (304.8 mm) horizontally of the vent terminals. Doorstops or closers shall not be installed to obtain this clearance.

SECTION MC 803
CONNECTORS

803.1 Connectors required. Connectors shall be used to connect appliances to the vertical chimney or vent, except where the chimney or vent is attached directly to the appliance.

803.2 Location. Connectors shall be located entirely within the room in which the connecting appliance is located, except as provided for in Section 803.10.4. Where passing through an unheated space, a connector shall not be constructed of [single-wall] single-wall pipe.

803.3 Size. The connector shall not be smaller than the size of the flue collar supplied by the manufacturer of the appliance. Where the appliance has more than one flue outlet, and in the absence of the manufacturer’s specific instructions, the connector area shall be not less than the combined area of the flue outlets for which it acts as a common connector.

803.4 Branch connections. [All branch] Branch connections to the vent connector shall be made in accordance with the vent manufacturer’s instructions.

803.6 Automatic dampers. [Automatic] Automatically operated dampers shall be [listed and labeled in accordance with UL 17 for oil-fired heating appliances] equipped with safety controls and shall
be of a listed type. Such safety controls shall be capable of demonstrating operation of the damper and appropriate draft before appliance operation. The automatically operated dampers shall be installed in accordance with the manufacturer’s installation instructions. An automatic vent damper device shall not be installed on an existing appliance unless the appliance is listed and labeled and the device is installed in accordance with the terms of its listing. The name of the installer and date of installation shall be marked on a label affixed to the damper device.

803.7 Connectors serving two or more appliances. Where two or more connectors enter a common vent or chimney, the smaller connector shall enter at the highest level consistent with available headroom or clearance to combustible material.

803.8 Vent connector construction. A vent connector for a nonresidential, low-heat appliance shall be a factory-built chimney section or steel pipe having resistance to heat and corrosion equivalent to that for the appropriate galvanized pipe as specified in Table 803.8. Factory-built chimney sections shall be joined together in accordance with the chimney manufacturer’s instructions.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².

803.10 Installation. Connectors shall be installed in accordance with Sections 803.10.1 through 803.10.6.

803.10.1 Supports and joints. Connectors shall be supported in an approved manner, and overlapping joints shall be tight-fitting and fastened with sheet metal screws, rivets, welds or other approved means.

803.10.2 Length. The maximum horizontal length of a single-wall connector shall not affect the capability of the system to produce adequate draft.

803.10.3 Connection. The connector shall extend to the inner face of the chimney or vent liner, but not beyond. A connector entering a masonry chimney shall be cemented to masonry in an approved manner. Where thimbles are installed to facilitate removal of the connector from the masonry chimney, the thimble shall be permanently cemented in place with high-temperature cement.

803.10.4 Connector pass-through. Chimney connectors shall not pass through any floor or ceiling, nor through a fire-resistance-rated wall assembly. Chimney connectors for domestic-type appliances shall not pass through walls or partitions constructed of combustible material to reach a [masonry] chimney [unless] or vent, except where such chimney connector complies with Section 803.10.4.1 or 803.10.4.2.
803.10.4.1 Manufactured insulated chimney connectors. Manufactured insulated chimney connectors for domestic-type appliances that pass through walls or partitions of combustible construction must comply with the following:

1. The connector is labeled for wall pass-through and is installed in accordance with the manufacturer’s instructions; or

2. The connector is put through a device labeled for wall pass-through; or

3. The connector has a diameter not larger than 10 inches (254 mm) and is installed in accordance with one of the methods in Table 803.10.4. Concealed metal parts of the pass-through system in contact with flue gases shall be of stainless steel or equivalent material that resists corrosion, softening or cracking up to 1,800°F (980°C).

803.10.4.2 Field-applied insulation for chimney connectors. Chimney connectors of appliances with flue gas temperatures less than 500°F (260°C) that pass through walls or partitions of combustible construction shall be insulated with a field-applied flexible wrap assembly tested in accordance with either ASTM E2816 or ASTM E2336. The connector shall comply with all of the following:

1. The insulated vent connectors pass-through assemblies and through penetration assemblies shall be tested for F and T ratings in accordance with ASTM E 814. The F and T rating of the assembly shall be equal to or exceed the fire-resistance rating of the mechanical/boiler room.

2. Bracing and supports shall be of noncombustible material securely attached to the structure and designed to carry gravity and seismic loads within the stress limitations of Chapter 16 of the New York City Building Code. Bolts, screws, rivets and other mechanical fasteners shall not penetrate connector walls.

3. Insulated vent connector pass-through assemblies shall not pass through ceilings or floors.

4. Insulated vent connector pass-through assemblies shall not run through occupied spaces, corridors, sleeping rooms and spaces with hazardous materials.

5. Insulated vent connector pass-through assemblies material shall meet the requirements for minimum chimney connector thicknesses for medium and high-heat appliances in accordance with Table 803.9(2).

6. Insulated vent connector pass-through assemblies fittings shall be welded or shall be factory fabricated UL listed construction suitable for external flexible wrap insulation.

7. The draft calculations shall account for the insulating value of the field-applied flexible wrap insulation.
### TABLE 803.10.4

**CHIMNEY CONNECTOR SYSTEMS AND CLEARANCES TO COMBUSTIBLE WALL MATERIALS FOR DOMESTIC HEATING APPLIANCES**

<table>
<thead>
<tr>
<th>System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A</strong> (12-inch clearance)</td>
<td>A 3.5-inch-thick brick wall shall be framed into the combustible wall. A 0.625-inch-thick fire-clay liner (ASTM C 315 or equivalent) shall be firmly cemented in the center of the brick wall maintaining a 12-inch clearance to combustibles. The clay liner shall run from the outer surface of the bricks to the inner surface of the chimney liner.</td>
</tr>
<tr>
<td><strong>B</strong> (9-inch clearance)</td>
<td>A labeled solid-insulated factory-built chimney section (1-inch insulation) the same inside diameter as the connector shall be utilized. Sheet steel supports cut to maintain a 9-inch clearance to combustibles shall be fastened to the wall surface and to the chimney section. Fasteners shall not penetrate the chimney flue liner. The chimney length shall be flush with the masonry chimney liner and sealed to the masonry with water-insoluble refractory cement. Chimney manufacturers' parts shall be utilized to securely fasten the chimney connector to the chimney section.</td>
</tr>
<tr>
<td><strong>C</strong> (6-inch clearance)</td>
<td>A sheet metal (minimum number No. 24 gage) ventilated thimble having a minimum thickness of 0.0236 inch (No. 24 gage) having two 1-inch air channels shall be installed. Steel supports shall be cut to maintain a 6-inch clearance with a sheet steel chimney connector between the thimble and combustibles. The chimney connector and steel supports shall have a minimum thickness of 0.0236 inch (No. 24 gage). One side of the support shall be fastened to the wall on all sides. Glass-fiber insulation shall fill the 6-inch space between the thimble and the supports.</td>
</tr>
<tr>
<td><strong>D</strong> (2-inch clearance)</td>
<td>A labeled solid-insulated factory-built chimney section (1-inch insulation) with a diameter 2 inches larger than the chimney connector shall be installed with a steel chimney connector having a minimum thickness of 0.0236 inch (No. 24 gage). Sheet steel supports shall be positioned to maintain a 2-inch clearance to combustibles and to hold the chimney connector to ensure that a 1-inch airspace surrounds the chimney connector through the chimney section. The steel support shall be fastened to the wall on all sides and the chimney section shall be fastened to the supports. Fasteners shall not penetrate the liner of the chimney section.</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm. 1.0 Btu × in/ft²•h • °F = 0.144 W/m²•K.

| a. | Insulation material that is part of the wall pass-through system shall be noncombustible and shall have a thermal conductivity of 1.0 Btu × in/ft²•h • °F or less. |
| b. | All clearances and thicknesses are minimums. |
| c. | Materials utilized to seal penetrations for the connector shall be non-combustible. |
| d. | Connectors for all systems except System B shall extend through the wall pass-through system to the inner face of the flue liner. |
| e. | ASTM C 315. |

**803.10.5 Pitch.** Connectors shall rise vertically to the chimney or vent with a minimum pitch equal to one-fourth unit vertical in 12 units horizontal (2-percent slope).
**803.10.6 Clearances.** Connectors shall have a minimum clearance to combustibles in accordance with Table 803.10.6. The clearances specified in Table 803.10.6 apply, except where the listing and labeling of an appliance specifies a different clearance, in which case the labeled clearance shall apply. The clearance to combustibles for connectors shall be reduced only in accordance with Section 308 or via the use of a listed chimney or vent connector system.

SECTION MC 804
DIRECT-VENT, INTEGRAL VENT AND MECHANICAL DRAFT SYSTEMS

804.1 Direct-vent terminations. Vent terminals for direct-vent appliances shall be installed in accordance with the manufacturer’s installation instructions. In addition, direct vent terminations shall comply with the following requirements:

1. Where located adjacent to walkways, the termination shall be not less than 7 feet (2133.6 mm) above the level of the walkway.

2. Vents shall terminate at least 3 feet (914.4 mm) above any forced air inlet, other than the forced air inlet for the subject direct vent appliance, located within 10 feet (3048 mm).

3. The vent system shall terminate at least 4 feet (1219.2 mm) below, 4 feet (1219.2 mm) horizontally from or 1 foot (304.8 mm) above any door, window or gravity air inlet into the building.

4. The vent termination point shall not be located closer than 3 feet (914.4 mm) to an interior corner formed by two walls perpendicular to each other.

5. The vent termination shall not be mounted directly above or within 3 feet (914.4 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.

6. The bottom of the vent termination shall be located at least 36 inches (914.4 mm) above finished grade.

7. The maximum heat input of an appliance served by single horizontal vent termination shall be 350,000 Btu/h (1025.6 kW), unless otherwise approved by the commissioner.

8. The maximum heat input of all appliances served by horizontal vent terminations located within a 10 foot (3048 mm) radius shall be 350,000 Btu/h (1025.6 kW), unless otherwise approved by the commissioner.

9. The vent termination shall be located a minimum of 4 feet (1219.2 mm) from the lot line or from adjacent buildings. The termination shall be installed in accordance with the vent manufacturer’s listing and installation instructions.

804.2 Appliances with integral vents. Appliances incorporating integral venting means shall be installed in accordance with their listings and the manufacturer’s installation instructions. In addition, integral vent terminals shall comply with the following requirements:

1. Where located adjacent to walkways, the vent terminal shall be not less than 7 feet (2133.6 mm) above the level of the walkway.

2. The vent terminal shall be at least 3 feet (914.4 mm) above any forced air inlet, other than the forced air inlet for the subject integral vent appliance, located within 10 feet (3048 mm).
3. The vent terminal shall be at least 4 feet (1219.2 mm) below, 4 feet (1219.2 mm) horizontally from or 1 foot (304.8 mm) above any door, window or gravity air inlet into the building.

4. The vent terminal shall not be located closer than 3 feet (914.4 mm) to an interior corner formed by two walls perpendicular to each other.

5. The vent terminal shall not be mounted directly above or within 3 feet (914.4 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.

6. The bottom of the vent terminal shall be located at least 24 inches (610 mm) above finished grade.

7. The maximum heat input of an appliance served by single horizontal vent terminal shall be 350,000 Btu/h (1025.6 kW), unless otherwise approved by the commissioner.

8. The maximum heat input of all appliances served by horizontal vent terminals located within a 10 foot (3048 mm) radius shall be 350,000 Btu/h (1025.6 kW), unless otherwise approved by the commissioner.

9. The vent terminal shall be located a minimum of 4 feet (1219.2 mm) from the lot line or from adjacent buildings. The termination shall be installed in accordance with the vent manufacturer’s [listing and installation] instructions.

804.2.1 Reserved.

804.3 Mechanical draft systems. Mechanical draft systems of either forced or induced draft design shall be listed and labeled in accordance with UL 378 and shall comply with Sections 804.3.1 through 804.3.8.

804.3.1 Forced draft systems. Forced draft systems and all portions of induced draft systems under positive pressure during operation shall be designed and installed so as to be gas tight to prevent leakage of combustion products into a building.

804.3.2 Automatic shutoff. Power exhausters serving automatically fired appliances shall be electrically connected to each appliance to prevent operation of the appliance when the power exhauster is not in operation.

804.3.3 Termination. The termination of chimneys or vents equipped with power exhausters shall be located not less than 10 feet (3048 mm) from the lot line or from adjacent buildings, unless otherwise approved by the [Commissioner] commissioner. The exhaust shall be directed vertically away from the building.

804.3.4 Horizontal terminations. Horizontal terminations and discharges, including any horizontal direct vent terminations subject to Section 804.1 and horizontal integral vent terminals subject to Section 804.2, shall not be permitted, unless otherwise authorized by the [Commissioner] commissioner.
804.3.5 **Vertical terminations.** Vertical terminations and discharges shall comply with Section [801.20] 801.21.

804.3.6 **Exhauster connections.** An appliance vented by natural draft shall not be connected into a vent, chimney or vent connector on the discharge side of a mechanical flue or power exhauster.

804.3.7 **Exhauster sizing.** Mechanical flue or power exhausters and the chimney or vent system served shall be sized and installed in accordance with the manufacturer’s [installation] instructions.

804.3.8 **Mechanical draft systems for manually fired appliances and fireplaces.** A mechanical draft system shall be permitted to be used with manually fired appliances and fireplaces where such system complies with all of the following requirements:

1. The mechanical draft device shall be listed and labeled in accordance with UL 378, and shall be installed in accordance with the manufacturer’s [installation] instructions.

2. A device shall be installed in the room with the appliance or fireplace that produces visible and audible warning upon failure of the mechanical draft device or loss of electrical power, at any time that the mechanical draft device is turned on. This device shall be equipped with a battery backup if it receives power from the building wiring.

3. A smoke detector or alarm, and a carbon monoxide detector or alarm shall be installed in the room with the appliance or fireplace. This device shall be equipped with a battery backup if it receives power from the building wiring.

SECTION MC 805

FACTORY-BUILT CHIMNEYS

805.1 **Listing.** Factory-built chimneys shall be listed and labeled and shall be installed and terminated in accordance with this code and the manufacturer’s [installation] instructions.

805.2 **Solid [fuel] fuel-burning appliances.** Factory-built chimneys installed in dwelling units with solid fuel-burning appliances shall comply with the Type HT requirements of UL 103 and shall be marked “Type HT” and “Residential Type and Building Heating Appliance Chimney.”

**Exceptions:**

1. Chimneys for use with open combustion chamber fireplaces shall comply with the requirements of UL 103 and shall be marked “Residential Type and Building Heating Appliance Chimney.”

2. Chimneys for use with open combustion chamber appliances installed in buildings other than dwelling units shall comply with the requirements of UL 103 and shall be marked “Building Heating Appliance Chimney” or “Residential Type and Building Heating Appliance Chimney.”

805.3 **Factory-built fireplaces.** Chimneys for use with factory-built fireplaces shall comply with the requirements of UL 127. **Factory-built chimney offsets.** Where a factory-built chimney serving
a solid fuel-burning appliance or fireplace incorporates offsets, no part of the chimney shall be at an angle of more than 30 degrees (0.52 rad) from vertical at any point in the assembly and the chimney assembly shall not include more than four elbows.

**Exception:** Factory-built chimneys listed to UL103 Type HT serving a solid fuel-burning appliance or fireplace may offset at angles greater than 30 degrees from vertical if listed for such angles and installed in accordance with manufacturer’s instructions. Cleanouts shall be installed in accordance with Section 801.13.

**805.4 Support.** Where factory-built chimneys are supported by structural members, such as joists and rafters, such members shall be designed to support the additional load.

**805.5 Medium-heat appliances.** Factory-built chimneys for medium-heat appliances producing flue gases having a temperature above 1,000°F ([538] 537.8°C), measured at the entrance to the chimney, shall comply with UL 959.

**805.6 Decorative shrouds.** Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with Section 304.1.

**805.7 Factory-built fireplaces.** Chimneys for use with factory-built fireplaces shall comply with the requirements of UL 127.

**SECTION MC 806**
**METAL CHIMNEYS**

**806.1 General.** Metal chimneys shall be constructed and installed in accordance with NFPA 211.

**806.2 Exterior metal chimneys.** Exterior metal chimneys shall be stainless steel [or galvanized, painted on the exterior surface with a heat-resisting paint].

**SECTION MC 807**
**CHANGES IN APPLIANCE FUELS**

**807.1 Changes in appliance fuels.** Conversion of appliances from solid or liquid fuel to, or the addition of, natural gas shall be installed per the New York City Fuel Gas Code. Conversion from natural gas to, or the addition of, #2 fuel oil for a heating appliance shall be made only if:

1. The chimney design meets the requirements of this chapter for the conversion fuel, and the chimney is test run and smoke tested in accordance with Section 810.

2. The chimney is sized to provide adequate draft and vent the combustion products for the new fuel.

3. The chimney is thoroughly cleaned prior to the conversion to remove collected flue deposits.
SECTION MC 808
REDUCTION OF FLUE SIZE

808.1 Reduction of flue size. Conversion from one fuel to another or the use of an existing chimney to service a fireplace or wood-burning appliance may require a flue size change for proper operation. This may be done if the redesigned flue meets the criteria for the fuel and chimney type to be used as set forth in this chapter.

SECTION MC 809
CHIMNEY SUPPORTED FROM EQUIPMENT

809.1 Chimney support. Chimneys shall not be supported by the equipment they serve, unless such equipment has been specifically designed for such loads.

SECTION MC 810
TEST RUN AND SMOKE TEST

810.1 Test run. All new and altered chimneys, and chimneys to which a new appliance has been connected, shall be test run under operating conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The test run shall be conducted by a registered design professional or special inspector responsible for the test, and the results of such test run shall be certified as correct by such professional or special inspector and submitted in writing to the department. Refer to Section 1705.32 of the New York City Building Code for additional requirements.

810.2 Requirement of a smoke test. A smoke test shall be made as outlined in Section 810.3. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of a registered design professional or special inspector responsible for the test [which] shall be submitted in writing to the department.

810.3 Smoke test. To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.

2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirements of this chapter, and the test shall be repeated until the results are satisfactory.

3. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed and a pressure equivalent to 1/2-inch (13 mm) column of water measured at the base of the stack, shall be applied. The test shall be applied for a length of time sufficient to permit the inspection of the chimney.
4. Refer to Section 1704.32 of the New York City Building Code for requirements for existing and new negative pressure chimneys and vents.

SECTION MC 811
EXHAUST GASES FROM INTERNAL COMBUSTION ENGINES AND TURBINES

811.1 Exhaust [pipe] system construction. The exhaust [pipe] system from internal combustion engines shall be constructed in accordance with NFPA 211, NFPA 37, and based on the temperature of the [gases] flue gas entering the exhaust [pipe] system, and in accordance with the following:

1. The exhaust [pipe] system, if factory [fabricated] built, shall be installed in accordance with its listing and manufacturer’s instructions.
   1.1. Exhaust systems with flue gas temperatures greater than 300°F (148.9°C) shall be listed to UL 103 or UL 2561 and be rated for a minimum of 60 inch w.c. (14 934.3 Pa).
   1.2. Exhaust systems with flue gas temperatures not more than 300°F (148.9°C) and that are capable of causing excessive condensate production in the exhaust system shall be listed to UL 103 or UL 2561 and UL 1738 and be rated for a pressure suitable for the operating conditions.

2. The exhaust [pipe] system, if field fabricated, shall be constructed of at least ¾-inch (5 4.8 mm) steel, or of other equivalent metal of similar strength and resistance to the temperature and corrosive action of the exhaust gases. No lining shall be required.

3. Where the exhaust [pipe] system runs inside a building, it shall be insulated [with insulation adequate] adequately for the [temperature of the pipe] equipment operating temperature, so that the surface temperature shall be not more than 200°F (93.3°C).

4. Where the exhaust [pipe] system runs inside a building outside of the room containing the equipment, it shall be enclosed in fire-rated construction with a fire rating equal to the fire rating of the construction of the room.

5. All joints shall be constructed so as to be gas tight under all operating conditions and tested in accordance with Section 810.

811.2 Emergency and standby generator discharge opening termination requirements. The location of discharge [openings] outlets for emergency and standby internal combustion engines shall comply with the requirements of NFPA 37 so that the flue gases are not directed to jeopardize the health or safety of people, overheat combustible structures, nor enter building openings in the vicinity of the outlet, nor shall the location of such openings cause the condensate leaving the outlet to come into contact with people.

811.2.1 Interference. No discharge opening shall be located and constructed so as to interfere with the proper functioning of other openings in the same building or adjoining buildings, to interfere unreasonably with the occupants of the same building or adjoining buildings, or with the general public, or to create a fire or health hazard.
811.2.2 Chimneys. The exhaust pipe may be connected to a chimney used for other equipment, provided that the operation of the engine does not adversely affect the operation of the other equipment so that it is in violation of the New York City Air Pollution Control Code.

811.3 All other engine and turbine discharge opening termination requirements. The location of the discharge outlet from all other engines and turbines shall comply with the termination requirements of Section [801.20.2] 801.21, Item 2 or Section [801.20.3] 801.21, Item 3 based on the temperature of the [gases] flue gas entering the exhaust [pipe] system.

811.4 Chimneys. The exhaust system may be connected to a chimney used for other appliances, provided that the chimney complies with Section 811.1, Item 1 or Section 811.1, Item 2 and the operation of the engine does not adversely affect the operation of the other appliances and is in accordance with the New York City Air Pollution Control Code.

§ 10. Chapter 9 of the New York city mechanical code, as amended by local law 141 for the year 2013, section 901.3 of such chapter, as added by local law number 38 for the year 2015, and sections 901.4, 901.5, 901.6 and 901.7 of such chapter, as amended by local law number 141 for the year 2013 and renumbered by local law number 38 for the year 2015, is amended to read as follows:

CHAPTER 9
SPECIFIC APPLIANCES [AND FIREPLACES, SOLID FUEL-BURNING] AND EQUIPMENT [AND NOISE CONTROL REQUIREMENTS]

SECTION MC 901
GENERAL

901.1 Scope. This chapter shall govern the approval, design, installation, construction, maintenance, alteration and repair of the appliances and equipment specifically identified herein and factory-built fireplaces. The approval, design, installation, construction, maintenance, alteration and repair of gas-fired appliances shall be regulated by the New York City Fuel Gas Code.

901.2 General. The requirements of this chapter shall apply to the mechanical equipment and appliances regulated by this chapter, in addition to the other requirements of this code, and installed in accordance with the requirements of NFPA 31, NFPA 54 and NFPA 211.

901.3 Solid fuel-burning fireplaces and appliances. All solid fuel-burning fireplaces and appliances shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the New York City Air Pollution Control Code and no new solid fuel-burning fireplaces or appliances shall be permitted except those that burn the types of fuel allowed by such code.

901.4 Hazardous locations. Fireplaces and solid fuel-burning appliances shall not be installed in hazardous locations.
[901.5] **Fireplace accessories.** Listed fireplace accessories shall be installed in accordance with the conditions of the listing and the manufacturer’s installation instructions.

[901.6] **901.5 Inspection of solid fuel-burning heating appliances, chimneys and flues.** Inspections of solid fuel-burning heating appliances, chimneys and flues shall be in accordance with the *New York City Building Code*.

[901.7] **901.6 Fireplaces.** Fireplaces (solid-fuel-type or ANSI Z21.50) shall be installed with tight-fitting noncombustible fireplace doors to control infiltration losses in construction types listed here:

1. Masonry or factory-built fireplaces designed to allow an open burn.
2. Decorative appliances (ANSI Z21.60 gas-log style unit) installed in a vented solid fuel fireplace.

Fireplaces shall be provided with a source of combustion air as required by the fireplace construction provisions of the *New York City Building Code* and Chapter 7 of this code.

**SECTION MC 902
MASONRY FIREPLACES**

902.1 **General.** Masonry fireplaces shall be constructed in accordance with the *New York City Building Code*.

902.2 **Fireplace accessories.** Listed and labeled fireplace accessories shall be installed in accordance with the conditions of the listing and the manufacturer’s instructions. Fireplace accessories shall comply with UL 907.

**SECTION MC 903
FACTORY-BUILT FIREPLACES**

903.1 **General.** Factory-built fireplaces shall be listed and labeled and shall be installed in accordance with the conditions of the listing. Factory-built fireplaces shall be tested in accordance with UL 127.

903.2 **Hearth extensions.** Hearth extensions of approved factory-built fireplaces shall be listed in accordance with the listing of the fireplace. The hearth extension shall be readily distinguishable from the surrounding floor area. Listed and labeled hearth extensions shall comply with UL 1618.

903.3 **Unvented gas log heaters.** The installation of unvented gas-fired space heaters, gas stoves, gas logs, gas fireplaces and gas fireplace inserts is prohibited.

903.4 **Gasketed fireplace doors.** A gasketed fireplace door shall not be installed on a factory-built fireplace except where the fireplace system has been specifically tested, listed and labeled for such use in accordance with UL 127.

903.5 **Flues.** Separate flues shall be provided for every fireplace and fireplace stove.
Combustion air supply. All installations of factory-built fireplaces shall comply with the requirements of the New York City Energy Conservation Code concerning combustion air supply.

SECTION MC 904
PELLET FUEL-BURNING APPLIANCES

904.1 General. Pellet fuel-burning appliances shall be listed and labeled in accordance with ASTM E 1509 and shall be installed in accordance with the terms of the listing. If permitted, such appliances shall be operated in accordance with the New York City Air Pollution Control Code.

SECTION MC 905
FIREPLACE STOVES AND ROOM HEATERS

905.1 General. Fireplace stoves and solid-fuel-type room heaters shall be listed and labeled and shall be installed in accordance with the conditions of the listing. Fireplace stoves shall be tested in accordance with UL 737. Solid-fuel-type room heaters shall be tested in accordance with UL 1482. Fireplace inserts intended for installation in fireplaces shall be listed and labeled in accordance with the requirements of UL 1482 and shall be installed in accordance with the manufacturer’s installation instructions.

905.2 Connection to fireplace. The connection of solid fuel appliances to chimney flues serving fireplaces shall comply with Sections 801.7 and 801.10.

905.3 Hearth extensions. Hearth extensions for fireplace stoves shall be installed in accordance with the listing of the fireplace stove. The hearth extension shall be readily distinguishable from the surrounding floor area. Listed and labeled hearth extensions shall comply with UL 1618.

905.4 Air pollution. All fireplace stoves and room heaters shall comply with the requirements of the New York City Air Pollution Control Code.

905.5 Combustion air supply. All fireplace stoves and room heaters shall comply with the requirements of the New York City Energy Conservation Code concerning combustion air supply.

905.6 Flues. Separate flues and independent combustion air source shall be provided for every fireplace stove and room heater. Combustion air shall be provided in accordance with the manufacturer’s recommendations and Chapter 7.

SECTION MC 906
FACTORY-BUILT BARBECUE APPLIANCES

906.1 General. Factory-built barbecue appliances shall be of an approved type listed and labeled for the use intended and shall be installed in accordance with the manufacturer’s installation instructions, this chapter, Chapters 3, 5, 7, 8 of this code, and the New York City Fuel Gas Code, and Chapter 3, 5, 7, 8 of this code. All provisions for the construction and installation of fireplaces shall be complied within the construction and installation of barbecue grills. The construction and installation of chimneys serving barbeque appliances shall comply with all construction and installation requirements of fireplaces.
SECTION MC 907
INCINERATORS AND CREMATORIES

907.1 General. Incinerators and crematories shall be listed and labeled in accordance with UL 791 and NFPA 82 and shall be installed in accordance with the manufacturer’s [installation] instructions.

907.2 Compliance. All incinerators and crematories shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the Administrative Code and the New York City Air Pollution Control Code.

SECTION MC 908
COOLING TOWERS, EVAPORATIVE CONDENSERS AND FLUID COOLERS

908.1 General. A cooling tower used in conjunction with an air-conditioning appliance shall be installed in accordance with the manufacturer’s [installation] instructions.

908.2 Access. Cooling towers, evaporative condensers and fluid coolers shall be provided with ready access.

908.3 Location. Cooling towers, evaporative condensers and fluid coolers shall be located to prevent the discharge vapor plumes from entering occupied spaces. Plume discharges shall be not less than 5 feet (1524 mm) above or 20 feet (6096 mm) away from any ventilation inlet to a building. Location on the property shall be as required for buildings in accordance with the New York City Building Code.

908.3.1 Indoor. Cooling towers, evaporative condensers and fluid coolers located inside of buildings shall be constructed of noncombustible materials including fill and drift eliminators.

908.3.2 Outside. Cooling towers shall be constructed of noncombustible materials.

Exceptions:

1. Fill and drift eliminators of limited combustible materials may be considered [non-combustible] noncombustible if the cooling towers are provided with automatic sprinkler protection in compliance with Chapter 9 of the New York City Building Code.

2. Fill and drift eliminators for any individual cooling tower cell may be made of limited combustible materials provided all the following conditions are met:

   2.1. The cooling tower is located on a building of construction Types IA or IB of the New York City Building Code.

   2.2. The cooling tower [fill and drift eliminators are] cell is located at least 30 feet (9144 mm) away from windows or fresh air intakes which are at an elevation above the roof on which the cooling tower is located, whether in the same building or in an adjoining building.
2.3. The cooling tower cell is located not less than 15 feet (4572 mm) from the lot line.

2.4. The cooling tower cell is located not less than 10 feet (3048 mm) from any chimney, except that the distance shall not be less than 20 feet (6096 mm) from a chimney venting products of combustion other than from gas- or oil-fired appliances, whether on the same or an adjoining building.

908.4 Support and anchorage. Supports for cooling towers, evaporative condensers and fluid coolers shall be designed in accordance with the New York City Building Code. Seismic restraints shall be as required by the New York City Building Code. Adequate vibration isolation shall be provided in accordance with the manufacturer’s installation guidelines and as required for the supporting structure, and in accordance with Sections 313.3.7 and 313.3.8.

908.5 Water supply. Cooling towers, evaporative condensers and fluid coolers shall be provided with an approved water supply, sized for peak demand. The quality of water shall be provided in accordance with the equipment manufacturer’s recommendations. The piping system and protection of the potable water supply system shall be installed as required by the New York City Plumbing Code.

908.6 Drainage. Drains, overflows and blowdown provisions shall be indirectly connected to an approved disposal location. Discharge of chemical waste shall be approved by the appropriate regulatory authority.

908.7 Refrigerants and hazardous fluids. Heat exchange equipment that contains a refrigerant and that is part of a closed refrigeration system shall comply with Chapter 11. Heat exchange equipment containing heat transfer fluids which are combustible or hazardous shall comply with the New York City Fire Code. Flammable heat transfer fluids are prohibited.

908.8 Cooling towers. Cooling towers, both open circuit and closed circuit type, and evaporative condensers shall comply with Sections 908.8.1 and 908.8.2.

908.8.1 Conductivity or flow-based control of cycles of concentration. Cooling towers and evaporative condensers shall include controls that automate system bleed based on conductivity, fraction of metered makeup volume, metered bleed volume, recirculating pump run time or bleed time.

908.8.2 Drift eliminators. Cooling towers and evaporative condensers shall be equipped with drift eliminators that have a maximum drift rate of 0.005 percent of the circulated water flow rate as established in the equipment’s design specifications.

908.9 Additional requirements. The installation and maintenance of all cooling towers, evaporative condensers, and fluid coolers shall comply with the requirements of Article 317 of Chapter 3 of Title 1 of the Administrative Code.
SECTION MC 909
VENTED WALL FURNACES

909.1 General. Vented wall furnaces shall be installed in accordance with their listing and the manufacturer’s instructions. Oil-fired furnaces shall be tested in accordance with UL 730.

909.2 Location. Vented wall furnaces shall be located so as not to cause a fire hazard to walls, floors, combustible furnishings or doors. Vented wall furnaces installed between bathrooms and adjoining rooms shall not circulate air from bathrooms to other parts of the building.

909.3 Door swing. Vented wall furnaces shall be located so that a door cannot swing within 12 inches (305 mm) of an air inlet or air outlet of such furnace measured at right angles to the opening. Doorstops or door closers shall not be installed to obtain this clearance.

909.4 Ducts prohibited. Ducts shall not be attached to wall furnaces. Casing extension boots shall not be installed unless listed as part of the appliance.

909.5 Manual shutoff valve. A manual shutoff valve shall be installed ahead of all controls.

909.6 Access. Vented wall furnaces shall be provided with access for cleaning of heating surfaces, removal of burners, replacement of sections, motors, controls, filters and other working parts, and for adjustments and lubrication of parts requiring such attention. Panels, grilles and access doors that must be removed for normal servicing operations shall not be attached to the building construction.

SECTION MC 910
FLOOR FURNACES

910.1 General. Floor furnaces shall be installed in accordance with their listing and the manufacturer’s instructions. Oil-fired furnaces shall be tested in accordance with UL 729. Unvented floor furnaces are prohibited.

910.2 Placement. Floor furnaces shall not be installed in any corridor, in the floor of any aisle or passageway of any auditorium, public hall, place of assembly, or in any egress element from any such room or space.

With the exception of wall register models, a floor furnace shall not be placed closer than 6 inches (152.4 mm) to the nearest wall, and wall register models shall not be placed closer than 6 inches (152.4 mm) to a corner.

The furnace shall be placed such that a drapery or similar combustible object will not be nearer than 12 inches (305 mm) to any portion of the register of the furnace. Floor furnaces shall not be installed in concrete floor construction built on grade. The controlling thermostat for a floor furnace shall be located within the same room or space as the floor furnace or shall be located in an adjacent room or space that is permanently open to the room or space containing the floor furnace. Floor furnaces shall be located so as to be accessible. Floor furnaces shall be installed only in floors of noncombustible construction having at least a 2-hour fire rating, except as where required for one- and two-family dwellings.
910.3 **Bracing.** The floor around the furnace shall be braced and headed with a support framework design in accordance with the *New York City Building Code*.

910.4 **Clearance.** The lowest portion of the floor furnace shall have not less than a 6-inch ([152] 152.4 mm) clearance from the grade level; except where the lower 6-inch ([152] 152.4 mm) portion of the floor furnace is sealed by the manufacturer to prevent entrance of water, the minimum clearance shall be reduced to not less than 2 inches ([51] 50.8 mm). Where these clearances are not present, the ground below and to the sides shall be excavated to form a pit under the furnace so that the required clearance is provided beneath the lowest portion of the furnace. A 12-inch ([305] 304.8 mm) minimum clearance shall be provided on all sides except the control side, which shall have an 18-inch ([457] 457.2 mm) minimum clearance.

910.5 **Enclosures.** Enclosures of floor furnaces shall be constructed entirely of noncombustible materials with a fire-resistance rating of at least 1 hour and shall be provided with adequate outdoor air to ensure proper combustion. The enclosure shall be provided with adequate means of access for servicing the furnace.

910.6 **Duct temperature.** The outlet duct temperature of warm air heating furnaces shall not be greater than 250°F ([121] 121.1°C).

910.7 **One- and two-family dwellings.** Floor furnace enclosures shall be constructed of noncombustible materials with a fire-resistance rating of at least 1 hour. Means shall be provided for supporting the furnace when the grille is removed. Clearances shall be provided as per NFPA 54.

**SECTION MC 911**

**DUCT FURNACES AND HEATERS**

911.1 **General.** Duct furnaces and heaters shall be installed in accordance with the manufacturer’s installation instructions. Electric furnaces and duct heaters shall [be tested in accordance] comply with UL 1995 or UL 1996, as applicable. Unvented fuel-fired duct furnaces are prohibited.

911.2 **Access panels.** Ducts connected to duct furnaces shall have removable access panels on both the upstream and downstream sides of the furnace.

911.3 **Location of draft hood and controls.** The controls, combustion air inlets and draft hoods for duct furnaces shall be located outside of the ducts. The draft hood shall be located in the same enclosure from which combustion air is taken.

911.4 **Circulating air.** Where a duct furnace is installed so that supply ducts convey air to areas outside the space containing the furnace, the return air shall also be conveyed by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. The duct furnace shall be installed on the positive pressure side of the circulating air blower.

911.5 **Duct temperature.** The outlet duct temperature of duct furnaces shall not be greater than 250°F ([121] 121.1°C).
SECTION MC 912
INFRARED RADIANT HEATERS

912.1 General. Electric infrared radiant heaters shall comply with UL 499.

912.2 Support. Infrared radiant heaters shall be fixed in a position independent of fuel and electric supply lines. Hangers and brackets shall be noncombustible material.

[912.2] 912.3 Clearances. Heaters shall be installed with clearances from combustible material in accordance with the manufacturer’s [installation] instructions.

SECTION MC 913
CLOTHES DRYERS

913.1 General. Clothes dryers shall be installed in accordance with the manufacturer’s [installation] instructions and shall comply with the following as applicable:

1. Electric commercial clothes dryers shall be tested in accordance with UL 1240.
2. Electric residential [and] clothes dryers shall be tested in accordance with UL 2158.
3. Electric coin-, ticket-, or card-operated clothes dryers shall be tested in accordance with UL 2158.

913.2 Exhaust required. Clothes dryers shall be exhausted in accordance with Section 504.

   Exception: Electric clothes dryers provided with a condensate drain. Spaces containing such dryers shall be provided with transfer air openings or other approved means to provide adequate air exchanges with adjacent spaces.

913.3 Clearances. Clothes dryers shall be installed with clearance to combustibles in accordance with the manufacturer’s instructions.

SECTION MC 914
SAUNA HEATERS

914.1 Location and protection. Sauna heaters shall be located so as to minimize the possibility of accidental contact by a person in the room.

914.1.1 Guards. Sauna heaters shall be protected from accidental contact by an approved guard or barrier of material having a low coefficient of thermal conductivity. The guard shall not substantially affect the transfer of heat from the heater to the room.

914.2 Installation. Sauna heaters shall be listed and labeled in accordance with UL 875 and shall be installed in accordance with their listing and the manufacturer’s [installation] instructions.

914.3 Access. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building.
914.4 **Heat and time controls.** Sauna heaters shall be equipped with a thermostat that will limit room temperature to 194°F (90°C). If the thermostat is not an integral part of the sauna heater, the heat-sensing element shall be located within 6 inches ([152] 152.4 mm) of the ceiling. If the heat-sensing element is a capillary tube and bulb, the assembly shall be attached to the wall or other support, and shall be protected against physical damage.

914.4.1 **Timers.** A timer, if provided to control main burner operation, shall have a maximum operating time of 1 hour. The control for the timer shall be located outside the sauna room.

914.5 **Sauna room.** A ventilation opening into the sauna room shall be provided. The opening shall be not less than 4 inches by 8 inches ([102] 101.6 mm by [203] 203.2 mm) located near the top of the door into the sauna room.

914.5.1 **Warning notice.** The following permanent notice, constructed of approved material, shall be mechanically attached to the sauna room on the outside:

WARNING: DO NOT EXCEED 30 MINUTES IN SAUNA. EXCESSIVE EXPOSURE CAN BE HARMFUL TO HEALTH. ANY PERSON WITH POOR HEALTH SHOULD CONSULT A PHYSICIAN BEFORE USING SAUNA.

The words shall contrast with the background and the wording shall be in letters not less than [0.25-inch] ¼-inch (6.4 mm) high.

**Exception:** This section shall not apply to one- and two-family dwellings.

SECTION MC 915
ENGINE AND GAS TURBINE-POWERED EQUIPMENT AND APPLIANCES

915.1 **General.** The installation of liquid-fueled stationary internal combustion engines and gas turbines, including combustion air, exhaust, fuel storage and piping, shall meet the requirements of NFPA 37 and Chapters 7, 8, and 13 of this code. Stationary engine generator assemblies shall meet the requirements of UL 2200.

915.2 **Powered equipment and appliances.** Permanently installed equipment and appliances powered by internal combustion engines and turbines shall be installed in accordance with the manufacturer’s [installation] instructions and NFPA 37.

SECTION MC 916
POOL AND SPA HEATERS

916.1 **General.** Pool and spa heaters shall be installed in accordance with the manufacturer’s [installation] instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261.

SECTION MC 917
COOKING APPLIANCES

917.1 **Cooking appliances.** Cooking appliances that are designed for permanent installation, including ranges, ovens, stoves, broilers, grills, fryers [5] and griddles [6] and barbecues, shall be listed,
labeled and installed in accordance with the manufacturer’s [installation] instructions. Oil-fired cooking appliances are prohibited. Commercial electric cooking appliances shall be listed and labeled in accordance with UL 197. Household electric ranges shall be listed and labeled in accordance with UL 858. Microwave cooking appliances shall be listed and labeled in accordance with UL 923. Oil-burning stoves shall be listed and labeled in accordance with UL 896. Solid-fuel-fired ovens shall be listed and labeled in accordance with UL 2162.

917.2 Prohibited location. Cooking appliances designed, tested, listed and labeled for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

917.3 Domestic appliances. Cooking appliances installed within dwelling units and within areas where domestic cooking operations occur shall be listed and labeled as household-type appliances for domestic use.

917.4 Domestic range installation. Domestic ranges installed on combustible floors shall be set on their own bases or legs and shall be installed with clearances of not less than that shown on the label.

917.5 Open-top broiler unit hoods. A ventilating hood shall be provided above a domestic open-top broiler unit, unless otherwise listed for forced down draft ventilation.

917.5.1 Clearances. A minimum clearance of 24 inches (609.6 mm) shall be maintained between the cooking top and combustible material above the hood. The hood shall be at least as wide as the open-top broiler unit and be centered over the unit.

917.6 Commercial cooking appliance venting. Commercial cooking appliances, other than those exempted by Section 501.8 of the New York City Fuel Gas Code, shall be vented by connecting the appliance to a vent or chimney in accordance with this code and the appliance manufacturer’s instructions or the appliance shall be vented in accordance with Section 505.1.1 of the New York City Fuel Gas Code.

917.7 Domestic ventilation. When a hood is required for proper ventilation of a domestic cooking appliance, the exhaust and make-up air systems shall be properly engineered and designed in accordance with Chapter 5.

SECTION MC 918
FORCED-AIR WARM-AIR FURNACES

918.1 Forced-air furnaces. Oil-fired furnaces shall be tested in accordance with UL 727. Electric furnaces shall be tested in accordance with UL 1995. Solid fuel furnaces shall be tested in accordance with UL 391. Forced-air furnaces shall be installed in accordance with the listings and the manufacturer’s [installation] instructions. Forced-air warm-air furnaces shall be installed in accordance with the requirements of NFPA 31 and the New York City Fuel Gas Code. Unvented fuel-fired furnaces are prohibited.

918.2 Minimum duct sizes. The minimum unobstructed total area of the outside and return air ducts or openings to a forced-air warm-air furnace shall be not less than 2 square inches per 1,000 Btu/h (4402 mm²/kW) output rating capacity of the furnace and not less than that specified in the furnace.
manufacturer’s installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall not be less than 2 square inches for each 1,000 Btu/h (4402 mm²/kW) output rating capacity of the furnace and not less than that specified in the furnace manufacturer’s installation instructions.]

[Exception: The total area of the supply air ducts and outside and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer’s installation instructions and in accordance with NFPA54.]

[918.3] **918.2 Heat pumps.** [The minimum unobstructed total area of the outside and return air ducts or openings to a heat pump shall be not less than 6 square inches per 1,000 Btu/h (13 208 mm²/kW) output rating or as indicated by the conditions of listing of the heat pump. Electric heat pumps shall be tested in accordance with UL 1995.] Electric heat pumps shall be tested in accordance with UL 1995 or UL 60335-2-40.

[918.4] **918.3 Dampers.** Volume dampers shall not be placed in the air inlet to a furnace in a manner that will reduce the required air to the furnace.

[918.5] **918.4 Circulating air ducts for forced-air warm-air furnaces.** Circulating air for fuel-burning, forced-air-type, warm-air furnaces shall be conducted into the blower housing from outside the furnace enclosure by continuous air-tight ducts.

[918.6] **Prohibited sources.** Outdoor or return air for a forced-air heating system shall not be taken from the following locations:

1. Less than 10 feet (3048 mm) from an appliance vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.

2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.

3. A hazardous or unsanitary location or a refrigeration machinery room as defined in this code.

4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Sections 918.2 and 918.3, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

[Exception: The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.]

5. A closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room, furnace room or unconditioned attic.
Exception: Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances, and serve the kitchen area only, taking return air from a kitchen shall not be prohibited.

6. An unconditioned crawl space by means of direct connection to the return side of a forced air system. Transfer openings in the crawl space enclosure shall not be prohibited.

7. A room or space containing a fuel-burning appliance where such room or space serves as the sole source of return air.

Exceptions:

1. This shall not apply where the fuel-burning appliance is a direct-vent appliance.

2. This shall not apply where the room or space complies with the following requirements:

   2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.

   2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.

   2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of any appliance firebox or draft hood in the same room or space.

3. This shall not apply to rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

918.5 Outdoor and return air openings. Outdoor intake openings shall be located in accordance with Section 401.4. Return air openings shall be located in accordance with Section 618.4 of the New York City Fuel Gas Code.

918.7 Outside] 918.6 Outdoor opening protection. Outdoor air intake openings shall be protected in accordance with Section 401.5.

918.8 Return-air limitation. Return air from one dwelling unit shall not be discharged into another dwelling unit.

SECTION MC 919
CONVERSION BURNERS

919.1 Conversion burners. The installation of conversion burners shall conform to ANSI Z21.8 and the applicable requirements of Chapter 10 of this code.
SECTION MC 920
UNIT HEATERS

920.1 General. Unit heaters shall be installed in accordance with the listing and the manufacturer’s [installation] instructions. Oil-fired unit heaters shall be tested in accordance with UL 731.

920.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material. Suspended-type oil-fired unit heaters shall be installed in accordance with NFPA 31.

920.3 Ductwork. A unit heater shall not be attached to a warm-air duct system unless listed for such installation.

SECTION MC 921
VENTED ROOM HEATERS

921.1 General. Vented room heaters shall be listed and labeled and shall be installed in accordance with the conditions of the listing and the manufacturer’s instructions.

SECTION MC 922
KEROSENE AND OIL-FIRED STOVES

922.1 General. The installation of kerosene and oil-fired stoves is prohibited.

SECTION MC 923
[SMALL] CERAMIC KILNS

923.1 General. [The provisions of this section shall apply to kilns that are used for ceramics, have a maximum interior volume of 20 cubic feet (0.566 m³) and are used for hobby and noncommercial purposes.] Kilns shall be listed and labeled unless otherwise approved in accordance with Section 105.1 Electric kilns shall comply with UL 499. The approval of unlisted appliances in accordance with Section 105.1 shall be based on approved engineering evaluation.

923.1.1 Installation. Kilns shall be installed in accordance with the manufacturer’s [installation] instructions and the provisions of this code.

SECTION MC 924
STATIONARY FUEL CELL POWER PLANTS

924.1 General. Stationary fuel cell power plants having a power output not exceeding [1,000 kW] 10 MW, shall be tested in accordance with [ANSI Z21.83] ANSI/CSA America FC1 and shall be installed in accordance with the manufacturer’s [installation] instructions and NFPA 853. [Only fuel cell plants that derive hydrogen from natural gas shall be used. No on site storage of hydrogen, natural gas or any other flammable gas shall be allowed.] Such fuel cell plants shall be powered by hydrogen derived on-site from piped natural gas, except where the storage, handling and use of hydrogen or other flammable gas is authorized by the New York City Fire Code for such purposes and approved by the fire commissioner.
SECTION MC 925
MASONRY HEATERS

925.1 General. Masonry heaters shall be constructed in accordance with the New York City Building Code.

SECTION MC 926
GASEOUS HYDROGEN SYSTEMS

926.1 Installation. The installation of gaseous hydrogen systems shall be in accordance with the applicable requirements of this code, the New York City Fire Code, the New York City Fuel Gas Code and the New York City Building Code.

SECTION MC 927
[HEAT RECOVERY VENTILATORS] ELECTRIC RADIANT HEATING SYSTEMS

927.1 [Ducted heat recovery ventilators] General. Electric radiant heating systems shall be installed in accordance with the manufacturer’s instructions and shall be listed for the application.

927.2 [Nonducted heat recovery ventilators] Clearances. Clearances for radiant heating panels or elements to any wiring, outlet boxes and junction boxes used for installing electrical devices or mounting luminaires shall be in accordance with the New York City Building Code and the New York City Electrical Code.

927.3 Installation on wood or steel framing. Radiant panels installed on wood or steel framing shall conform to the following requirements:

1. Heating panels shall be installed parallel to framing members and secured to the surface of framing members or shall be mounted between framing members.

2. Mechanical fasteners shall penetrate only the unheated portions provided for this purpose. Panels shall not be fastened at any point closer than 1/4 inch (6.4 mm) to an element. Other methods of attachment of the panels shall be in accordance with the panel installation instructions.

3. Unless listed and labeled for field cutting, heating panels shall be installed as complete units.

927.4 Installation in concrete or masonry. Radiant heating systems installed in concrete or masonry shall conform to the following requirements:

1. Radiant heating systems shall be identified as being suitable for the installation, and shall be secured in place as specified in the manufacturer’s instructions.

2. Radiant heating panels and radiant heating panel sets shall not be installed where they bridge expansion joints unless they are protected from expansion and contraction.
927.5 Finish surfaces. Finish materials installed over radiant heating panels and systems shall be installed in accordance with the manufacturer’s instructions. Surfaces shall be secured so that fasteners do not pierce the radiant heating elements.

SECTION MC 928
[NOISE CONTROL REQUIREMENTS] EVAPORATIVE COOLERS

928.1 General. [Interior and exterior mechanical equipment and systems shall comply with the provisions of this section.] Evaporative cooling equipment shall:

1. Be installed in accordance with the manufacturer’s instructions.
2. Be installed on level platforms and in accordance with Section 304.10.
3. Have openings in exterior walls or roofs flashed in accordance with the New York City Building Code.
4. Be provided with an approved water supply, sized for peak demand. The quality of water shall be provided in accordance with the equipment manufacturer’s recommendations. The piping system and protection of the potable water supply system shall be installed as required by the New York City Plumbing Code.
5. Have ventilation air intake opening locations in accordance with Section 401.4.

[928.2 Noise from exterior mechanical equipment. Mechanical equipment located outside of the building in a yard or court or on a roof, or located inside a building but open to the exterior of the building, shall comply with the requirements of Sections 928.2.1 and 928.2.2.]

928.2.1 Design and Installation. The applicant shall select and design any such exterior mechanical equipment in order to achieve compliance with the applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the Administrative Code, also known as the New York City Noise Control Code, in accordance with generally acceptable engineering practices.

928.2.2 Operation. The operation of such exterior mechanical equipment shall comply with any applicable requirements of Sections 24-218, 24-227, 24-228 and 24-232 of the New York City Noise Control Code, as enforced by the Department of Environmental Protection.

928.3 Minimum structure-borne noise and vibration isolation requirements. All isolators shall comply with the requirements of Sections 928.3.1 through Section 928.3.10.

928.3.1 Boiler rooms.

928.3.1.1 Boilers. All boilers supported on floors directly above a story having dwelling units shall be supported on resilient isolators having a minimum static deflection of 1 inch (25 mm). The isolators shall be installed directly under the structural frame of the boiler.

928.3.1.2 Boiler breeching and piping. When boilers are equipped with mechanical draft fans, the boiler breeching and piping that are supported from or on slabs, floors or walls that are contiguous to the dwelling unit shall be supported for a distance of 50 pipe diameters on
or from resilient isolators. Each isolator shall have a minimum static deflection of 1 inch (25 mm).

[928.3.2 Refuse charging chutes.]

[928.3.2.1 Metal chutes. Metal chutes, metal chute supports, and/or metal chute bracing shall be free of direct contact with the shaft enclosure and the openings provided in the floor construction. Metal chutes shall be resiliently supported at each structural support location. Isolators shall provide a minimum static deflection of 0.30 inches (7.62 mm). All chutes shall be plumb.]

[928.3.2.2 Masonry chutes. The interior chute wall shall be plumb and without obstructions for the full height of the shaft and shall have a smooth interior finish.]

[928.3.3 Piping. Equipment piping shall be installed as follows:]

1. Metal piping connected to power driven equipment shall be resiliently supported from or on the building structure for a distance of 50 pipe diameters from the power driven equipment. The resilient isolators shall have a minimum static deflection of 1 inch (25 mm) for all piping with a 4 inch (102 mm) or larger in actual outside diameter and 1/2 inch (12.7 mm) for piping with less than 4 inches (102 mm) in actual outside diameter. Piping connected to fluid pressure reducing valves shall be resiliently isolated for a distance of 50 pipe diameters from pressure reducing valves and isolators shall provide a minimum static deflection of 1/2-inch (12.7 mm).]

2. Equipment such as heat exchangers, absorption refrigeration machines, or similar equipment, that is located on any floor or roof other than a floor on grade, and that is not power driven but is connected by metal piping to power driven equipment, shall be resiliently supported from or on the building structure, for a distance of 50 pipe diameters from the power driven equipment. The resilient supports shall be vibration isolators having a minimum static deflection of 1 inch (25 mm) and shall incorporate approved resilient pads having a minimum thickness of 1/4 inch (6.4 mm).]

[928.3.4 Fans. All fan equipment with motors in excess of ½ horsepower (0.37 kW), located on any roof or floor other than a floor on grade shall be mounted on or from vibration isolators. Fan equipment with motor drives separated from the fan equipment shall be supported on an isolated integral rigid structural base supporting both the fan and motor. Fan equipment with motor drives supported from the fan equipment shall be mounted directly on vibration isolators. Each isolator shall have provision for leveling. Isolators shall incorporate resilient pads having a minimum thickness of 1/4-inch (6.4 mm). The vibration isolators shall provide a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum deflection of 2 inches (51 mm). Fans and compressors assembled in unitary containers may meet this requirement with isolators internal to the container providing the isolators meet the above minimum isolator efficiencies.]

[928.3.5 Pumps. All pumps of 3 horsepower (2.25 kW) or more located on any floor other than a floor on grade shall be supported on vibration isolators having a minimum isolation efficiency of 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of 1/4-inch (6.4 mm).]
[928.3.6 Compressors. Compressors and drives located on a floor other than a floor on grade shall be mounted on vibration isolators having a minimum isolation efficiency of 90 percent at the lowest disturbing frequency. Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of $\frac{1}{4}$-inch (6.4 mm).]

[928.3.7 Cooling towers and fluid coolers. All moving parts of cooling towers located on a roof or floor other than a floor on grade shall be mounted on vibration isolators providing a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of $\frac{1}{4}$-inch (6.4 mm). Vibration cutoff switches shall be provided.]

[928.3.8 Evaporative condensers. Evaporative and air cooled condensers located on a roof or floor other than a floor on grade shall be mounted on vibration isolators providing a minimum isolation efficiency of 90 percent at fan rotor rpm with a maximum static deflection of 4 inches (102 mm). Each isolator shall incorporate a leveling device and a resilient pad having a minimum thickness of $\frac{1}{4}$-inch (6.4 mm). Vibration cutoff switches shall be provided on evaporative condensers.]

[928.3.9 Duct connections to fans. Flexible connections shall be installed between fan equipment and connecting ductwork.]

[928.3.10 Ceiling suspended packaged HVAC units with compressors. Equipment such as heat pumps, AC units, or similar equipment, that is suspended from a structure shall be resiliently supported from or on the building structure. Vibration isolators shall have a minimum isolation efficiency of 90 percent at the lowest disturbing frequency.]

§ 11. Chapter 10 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 10

BOILERS, WATER HEATERS
AND PRESSURE VESSELS

SECTION MC 1001
GENERAL

1001.1 Scope. This chapter shall establish the minimum safety requirements for and shall govern the installation, alteration and repair of boilers, water heaters and pressure vessels.

Exceptions:

1. Pressure vessels used for unheated water supply.
2. Portable unfired pressure vessels and Interstate Commerce Commission containers.
3. Containers for bulk oxygen and medical gas.
4. Unfired pressure vessels having a volume of 5 cubic feet (0.14 m$^3$) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1723.7 kPa) and located within occupancies of Groups B, F, H, M, R, S and U.

5. Pressure vessels used in refrigeration systems that are regulated by Chapter 11 of this code.

6. Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.

7. Any boiler or pressure vessel subject to inspection by federal inspectors.

1001.2 Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric dampers, draft hoods, draft diverters, and all other appurtenances that allow dilution air into a chimney or gas vent. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent in accordance with Section 801.23.3.

1001.3 Clearances. Minimum clearances at boilers, water heaters and pressure vessels shall be maintained in accordance with Chapter 3.

SECTION MC 1002
WATER HEATERS

1002.1 General. Potable water heaters and hot water storage tanks shall be listed and labeled and installed in accordance with the manufacturer’s installation instructions, the New York City Plumbing Code and this code. All water heaters shall be capable of being removed without first removing a permanent portion of the building structure. The potable water connections and relief valves for all water heaters shall conform to the requirements of the New York City Plumbing Code. Domestic electric water heaters shall comply with UL 174 or UL 1453. Commercial electric water heaters shall comply with UL 1453. Oil-fired water heaters shall comply with UL 732. Approval for oil-fired water heaters 350,000 Btu/h input (1025 kW) and above shall be obtained from the New York City Department of Environmental Protection. Thermal solar water heaters shall comply with UL 174 or UL 1453, and Chapter 14 of this code. Heat pump water heaters shall comply with UL 174 or UL 1995.

1002.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be listed and labeled for such applications by the manufacturer and shall be built in accordance with Section IV of the ASME Boiler and Pressure Vessel Code with an “H” code stamp. Water heaters shall be installed in accordance with the manufacturer’s installation instructions, the ASME Boiler and Pressure Vessel Code and the New York City Plumbing Code. Oil-fired heaters shall comply with UL 732 and shall have an "HW" stamp.

1002.2.1 Sizing. Water heaters utilized for both potable water heating and space-heating applications shall be sized to prevent the space-heating load from diminishing the required potable water-heating capacity.
1002.2.2 **Temperature limitation.** Where a combination potable water-heating and space-heating system requires water for space heating [at temperatures higher than 140°F (60°C)], a temperature actuated mixing valve [that conforms to ANSI/ASSE 1017] complying with ASSE 1017 shall be provided to temper the water supplied to the potable hot water distribution system [to a temperature of 140°F (60°C) or less] in accordance with Section 607 of the New York City Plumbing Code.

1002.2.3 **Cross-connection.** Water heaters utilized for both potable hot water and hot water for space-heating applications shall have separate heating sections and connections for distribution systems and shall not be cross-connected. The potability of the domestic water shall be maintained throughout the system in accordance with the New York City Plumbing Code.

1002.3 **Supplemental water-heating devices.** Potable water-heating devices that utilize refrigerant-to-water heat exchangers shall be approved and installed in accordance with the New York City Plumbing Code, the applicable provisions of the New York City Energy Conservation Code and the manufacturer’s [installation] instructions.

**SECTION MC 1003**

**PRESSURE VESSELS**

1003.1 **General.** All pressure vessels shall be constructed and certified in accordance with the ASME Boiler and Pressure Vessel Code, and shall bear the label of an approved agency. Pressure vessels shall be installed in accordance with the manufacturer’s [installation] instructions and nationally recognized standards. Directly fired pressure vessels shall meet the requirements of Section 1004.

1003.2 **Piping.** All piping materials, fittings, joints, connections and devices associated with systems utilized in conjunction with pressure vessels shall be designed for the specific application and shall comply with the ASME Boiler and Pressure Vessel Code and this code.

1003.3 **Welding.** Welding on pressure vessels shall be performed by welders certified in compliance with nationally recognized standards, including the National Board Inspection Code—and ASME Boiler and Pressure Vessel Code, Section IX [1]. Such welders shall also comply with 12 NYCRR 4-6.2 [3] and 12 NYCRR 14-3.3 through 14-3.18.

**SECTION MC 1004**

**BOILERS**

1004.1 **Standards.** [Oil-fired boilers and their control systems shall be listed and labeled in accordance with UL 726. Electric boilers and their control systems shall be listed and labeled in accordance with UL 834. Boilers shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable: the ASME Boiler and Pressure Vessel Code, 12 NYCRR Parts 4 and 14; and NFPA 85. Approval for oil-fired boilers 350,000 Btu/h input (1025 kW) and above shall be obtained from the New York City Department of Environmental Protection.] Boilers shall be designed, constructed and certified in accordance with the ASME Boiler and Pressure Vessel Code, Section I or IV, and 12 NYCRR Parts 4 and 14. Controls and safety devices for boilers with fuel input ratings of 12,500,000 Btu/h (3663 kW) or less shall meet the requirements of ASME CSD-1. Controls and safety devices for boilers with inputs greater than 12,500,000 Btu/h (3663 kW) shall meet the requirements of NFPA 85. Packaged oil-fired boilers shall be listed and labeled in
accordance with UL 726. Packaged electric boilers shall be listed and labeled in accordance with UL 834. Approval for oil-fired boilers 350,000 Btu/h input (102.6 kW) and above shall be obtained from the New York City Department of Environmental Protection.

1004.1.1 Field erected boilers requirements. Field erected boiler installations shall comply with the following:

1. The vessel erector shall hold the appropriate ASME stamp for vessel construction.

2. The licensed installer is responsible for the installation of all controls and burners which shall be designed and constructed in accordance with the requirements of ASME CSD-1 and, as applicable, the ASME Boiler and Pressure Vessel Code, 12 NYCRR Parts 4 and 14, and NFPA 85.

3. The New York City Department of Environmental Protection shall approve the installation of the boiler and burner for compatibility, controls and safety devices.

4. Boiler vessels shall comply with one of the following listings:

   4.1. UL 726 or UL 795 as applicable; or
   4.2. UL 2106

   Exception: Unlisted equipment shall obtain [Department] approval from the department.

5. Controls and safety devices shall be tested and inspected in accordance with ASME CSD-1 and, as applicable, the ASME Boiler and Pressure Vessel Code, 12 NYCRR Parts 4 and 14, and NFPA 85. Testing and inspection shall be performed by the burner manufacturer’s authorized representative in the presence of the licensed installer.

6. Inspection of the installed boiler assembly shall be performed by the department.

1004.2 Installation. In addition to the requirements of this code, the installation of boilers shall conform to the manufacturer’s instructions. Operating instructions of a permanent type shall be located in the boiler room and readily accessible. Boilers shall have all controls set, adjusted and tested by the installer. The manufacturer’s rating data and the nameplate shall be attached to the boiler.

1004.3 Working clearance. Clearances shall be maintained around boilers, generators, heaters, tanks and related equipment and appliances so as to permit inspection, servicing, repair, replacement and visibility of all gauges. When boilers are installed or replaced, clearance shall be provided to allow access for maintenance and repair per the boiler’s listing and manufacturer’s [installation] instructions. Passageways for inspection around all sides of boilers shall have an unobstructed width of not less than 18 inches (457 mm) unless the boiler’s listing or department approval or manufacturer’s [installation] instructions state otherwise.
1004.3.1 Top clearance. [High-pressure steam boilers having a steam generating capacity in excess of 5,000 pounds per hour (2268 kg/h) or having a heating surface in excess of 1,000 square feet (93 m²) or input in excess of 5,000,000 Btu/h (1465 kW) shall have a minimum clearance of 7 feet (2134 mm) from the top of the boiler to the ceiling. Steam heating boilers and hot water heating boilers that exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or 1,000 square foot (93 m²) heating surface; and high pressure steam boilers that do not exceed one of the following limits: 5,000,000 Btu/h input (1465 kW); 5,000 pounds of steam per hour (2268 kg/h) capacity or a 1,000 square foot (93 m²) heating surface; and all boilers with manholes on top of the boiler, shall have a minimum clearance of 3 feet (914 mm) from the top of the boiler to the ceiling. Package boilers, steam heating boilers and hot water heating boilers without manholes on top of the boiler and not exceeding one of the limits of this section shall have a minimum clearance of 2 feet (610 mm) from the ceiling.]

Clearances from the tops of boilers to the ceiling or other overhead obstruction shall be in accordance with Table 1004.3.1.

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m², 1 pound per hour = 0.4536 kg/h, 1 Btu/hr = 0.293 W.

**1004.4 Mounting.** Equipment and appliances shall be set or mounted on a level base capable of supporting and distributing the weight contained thereon. Boilers, tanks and equipment shall be securely anchored to the structure. Equipment and appliances requiring vibration isolation shall be installed as designed by a registered design professional in accordance with the manufacturer’s installation instructions.

**1004.5 Floors.** Boilers shall be mounted on floors of noncombustible construction, unless listed for mounting on combustible flooring. Vibration isolation shall be in accordance with Section 313. In buildings with residential occupancies, boilers shall be installed in accordance with the requirements of Section 313.

**1004.6 Boiler rooms and enclosures.** Boiler rooms and enclosures and access thereto shall comply with Chapters 5 and 10 of the New York City Building Code and Chapter 3 of this code. Boiler rooms shall be equipped with a floor drain or other approved means for disposing of liquid waste in accordance with the New York City Plumbing Code.

**1004.7 Operating adjustments and instructions.** Hot water and steam boilers shall have all operating and safety controls set and operationally tested by the installing contractor. A complete control diagram and boiler operating instructions shall be furnished by the installer for each installation. A complete control diagram of a permanent type shall be located in the boiler room and shall be readily accessible.

**1004.8 Burner controls.** Gas and oil modulating burners shall be provided with burner controls (oil and gas equivalent ratings) in accordance with Table 1004.8 ASME CSD-1 and NFPA 85.

1004.9 Conversion burners. Conversion burners shall be installed in accordance with ANSI Z21.8.

### SECTION MC 1005
BOILER CONNECTIONS

1005.1 Valves. Every boiler or modular boiler shall have a shutoff valve in the supply and return piping. For multiple boiler or multiple modular boiler installations, each boiler or modular boiler shall have individual shutoff valves in the supply and return piping.

**Exception:** Shutoff valves are not required in a system having a single low-pressure steam boiler of 350,000 Btu/h (103 kW) output or less.

1005.2 Potable water supply. The water supply to all boilers, including but not limited to backflow prevention, shall be connected in accordance with the New York City Plumbing Code.

### SECTION MC 1006
SAFETY AND PRESSURE RELIEF VALVES AND CONTROLS

1006.1 Safety valves for steam boilers. [All steam] Steam boilers shall be protected with a safety valve in accordance with the ASME Boiler and Pressure Vessel Code or ASME CSD-1.

1006.2 Safety relief valves for hot water boilers. Hot water boilers shall be protected with a safety relief valve in accordance with the ASME Boiler and Pressure Vessel Code or ASME CSD-1.

1006.3 Pressure relief for pressure vessels. [All pressure] Pressure vessels shall be protected with a pressure relief valve or pressure-limiting device as required by the manufacturer’s [installation] instructions for the pressure vessel and in accordance with the ASME Boiler and Pressure Vessel Code or ASME CSD-1.

1006.4 Standards of safety and safety relief valves. Safety and safety relief valves shall be listed and labeled, and shall have a minimum rated capacity for the equipment or appliances served. Safety
and safety relief valves shall be set at not greater than the nameplate pressure rating of the boiler or pressure vessel and shall be in accordance with the ASME Boiler and Pressure Vessel Code or the ASME CSD-1.

1006.5 Installation. Safety or relief valves shall be installed directly into the safety or relief valve opening on the boiler or pressure vessel. Valves shall not be located on either side of a safety or relief valve connection. The safety or relief valve drain shall discharge by gravity to a nonhazardous point of discharge without obstruction. The discharge piping shall drain by gravity without traps.

1006.6 Safety and relief valve discharge. Safety and relief valve discharge pipes shall be of rigid pipe that is approved for the temperature of the system. The discharge pipe shall, at a minimum, be the same diameter as the safety or relief valve outlet. Safety and relief valve discharge pipes shall be properly supported to prevent stress on the valve and vessel. Safety and relief valves shall not discharge so as to be a hazard, a potential cause of damage or otherwise a nuisance. Discharge of hazardous materials must be properly contained in a method approved by the department. High-pressure-steam safety valves shall be vented to the outside of the structure. Where a low-pressure safety valve or a relief valve discharges to the drainage system, the installation shall conform to the New York City Plumbing Code.

1006.7 Boiler safety devices. Boilers shall be equipped with controls and limit devices as required by the manufacturer’s installation instructions and the conditions of the listing.

1006.8 Electrical requirements. The power supply to the electrical control system shall be from a two-wire branch circuit that has a grounded conductor, or from an isolation transformer with a two-wire secondary. Where an isolation transformer is provided, one conductor of the secondary winding shall be grounded. Control voltage shall not exceed 150 volts nominal, line to line. Control and limit devices shall interrupt the ungrounded side of the circuit. A means of manually disconnecting the control circuit shall be provided and controls shall be arranged so that when deenergized, the burner shall be inoperative. Such disconnecting means shall be capable of being locked in the off position and shall be provided with ready access.

1006.8.1 Remote control (shutdown). A remote control shall be provided to stop the flow of oil and/or gas and combustion air to any burner or fuel-burning internal combustion equipment. Such a control shall be located outside all provided along every means of egress from the room in which the burner or equipment is located and as close to such entrances as practicable, except that when an outside location is impracticable, such control may be located immediately inside the room in which the burner or equipment is located, provided such location is accessible at all times. Each remote control shall be located outside of, but as close as practicable to the burner or equipment room itself and shall be labeled: “REMOTE CONTROL FOR BURNER.”

Exception: Where an outside location is impracticable, the remote control shutdown may be provided immediately inside the room in which the burner or equipment is located. Such location must be accessible at all times.

1006.9 Carbon monoxide detectors. Carbon monoxide detectors shall be provided in all fuel-fired appliance rooms to detect the level of carbon monoxide in the room and signal an alarm. Such
detectors shall be listed and installed in accordance with Chapter 9 of the *New York City Building Code*.

**SECTION MC 1007**

**BOILER LOW-WATER CUTOFF**

**1007.1 General.** Steam and hot water boilers shall be protected with dual low-water cutoff control, with each control independently piped to the pressure vessel in accordance with ASME CSD-1. For hydronic boilers, the low-water cut out may be located in the supply piping above the boiler before any intervening valve. A flow-sensing control installed in accordance with ASME CSD-1 shall be considered a low-water cutoff for the purposes of this section.

**Exception:** Hot water boilers located within a dwelling unit supplying only that unit and having a total heat input of less than 400,000 Btu/h ([4025] 117.2 kW) may be protected by only one low-water cutoff control.

**1007.2 Operation.** Low-water cutoff controls and flow-sensing controls required by Section 1007.1 shall automatically stop the combustion operation of the appliance when the water level drops below the lowest safe water level as established by the manufacturer and in accordance with ASME CSD-1, or when water circulation stops, respectively.

**1007.3 Low-water cut out maintenance and testing.** Low-water cut outs shall be maintained in accordance with ASME CSD-1 and the manufacturer’s specifications. An operator shall test low-water cut outs as follows: (1) high pressure steam boilers every shift, (2) low pressure steam boilers daily and (3) hot water boilers monthly. Slow drain tests shall be conducted for steam boilers every six months. Every year, low-water cut outs and associated piping for steam boilers shall be opened, cleaned and inspected. Records of all testing, cleaning, and inspection required by this section shall be maintained, and made available to the department upon request.

**SECTION MC 1008**

**BOILER BLOWOFF/BLOWDOWN VALVES**

**1008.1 General.** Every boiler shall be equipped with blowoff/blowdown valve(s). The valve(s) shall be installed in the openings provided on the boiler. The minimum quantity and size of each valve the valve(s) and associated piping shall be the quantity and size specified by the boiler manufacturer or the quantity and size of the boiler blowoff/blowdown valve opening. Where the maximum allowable working pressure of the boiler exceeds 15 psig (103.4 kPa), two bottom blowoff valves shall be provided consisting of either two slow-opening valves in series or one quick-opening valve and one slow-opening valve in series, with the quick-opening valve installed closest to the boiler.

**1008.2 Discharge.** Blowoff/blowdown valves shall discharge to a safe place of disposal. Where discharging to the drainage system, the installation shall conform to the *New York City Plumbing Code*.

**1008.3 Maintenance.** Blowdown lines shall be inspected annually to verify they are free of deposits and in good working condition.
SECTION MC 1009
HOT WATER BOILER EXPANSION TANK

1009.1 Where required. An expansion tank shall be installed in every hot water system. For multiple boiler installations, a minimum of not less than one expansion tank is required. Expansion tanks shall be of the closed or open type. Tanks shall be rated for the pressure of the hot water system. Lockable shutoff valves shall be installed at connections to all expansion tanks. Valves shall remain locked in the open position.

1009.2 Closed-type expansion tanks. Closed-type expansion tanks shall be installed in accordance with the manufacturer’s instructions. Expansion tanks for systems designed to have an operating pressure in excess of 30 psi (205.8 kPa) shall be constructed and certified in accordance with the *ASME Boiler and Pressure Vessel Code*. The size of the tank shall be based on the capacity of the hot-water-heating system. The minimum size of the tank shall be determined in accordance with the following equation where all necessary information is known:

\[
V_t = \frac{(0.0041T-0.0466)V_s}{\left(\frac{P_a}{P_f}\right) - \left(\frac{P_a}{P_o}\right)}
\]

(Equation 10-1)

For SI:
\[
V_t = \frac{(0.00738T-0.03348)V_s}{\left(\frac{P_a}{P_f}\right) - \left(\frac{P_a}{P_o}\right)}
\]

where:
- \(V_t\) = Minimum volume of tanks (gallons) (L).
- \(V_s\) = Volume of system, not including expansion tanks (gallons) (L).
- \(T\) = Average operating temperature (°F) (°C).
- \(P_a\) = Atmospheric pressure (psi) (kPa).
- \(P_f\) = Fill pressure (psi) (kPa).
- \(P_o\) = Maximum operating pressure (psi) (kPa).

Where all necessary information is not known, the minimum size of the tank shall be determined from Table 1009.2.

For SI: 1 gallon = 3.795 L.

1009.3 Open-type expansion tanks. Open-type expansion tanks shall be located [a minimum of] not less than 4 feet ([1219] 1219.2 mm) above the highest heating element. The tank shall be adequately sized for the hot water system. An overflow with a minimum diameter of 1 inch ([25] 25.4 mm) shall be installed at the top of the tank. The overflow shall discharge to the drainage system in accordance with the New York City Plumbing Code.

SECTION MC 1010
GAUGES

1010.1 Hot water boiler gauges. Every hot water boiler shall have a pressure gauge and a temperature gauge, or a combination pressure and temperature gauge. The gauges shall indicate the temperature and pressure within the normal range of the system’s operation.

1010.2 Steam boiler gauges. Every steam boiler shall have a water-gauge glass and a pressure gauge with a siphon. The pressure gauge [installed with a siphon] shall indicate the pressure within the normal range of the system’s operation.

1010.2.1 Water-gauge glass. The gauge glass shall be installed [so that the midpoint is at the normal boiler water level] in accordance with the ASME Boiler and Pressure Vessel Code or ASME CSD-1.

SECTION MC 1011
TESTS

1011.1 Tests. Upon completion of the assembly and installation of boilers and pressure vessels, acceptance tests shall be conducted in accordance with the requirements of the ASME Boiler and Pressure Vessel Code. Boilers shall not be placed in operation upon completion of construction until they have been inspected and tested and a certificate of compliance has been issued by the commissioner. All final inspections and tests for boilers shall be [made] witnessed by a qualified boiler inspector in the employ of the department or a duly authorized insurance company as provided in Section 204 of the Labor Law of the State of New York. Equipment having an input of not more than 350,000 Btu/h (103 kW) shall be exempt from this requirement. Where field assembly of pressure vessels or boilers is required, a copy of the completed H-2, P-2 or U-1 Manufacturer’s Data Report and the completed Appendix C of ASME CSD-1 required by the ASME Boiler and Pressure Vessel Code shall be submitted to the department.

1011.1.1 Fitness for service. When a boiler or pressure vessel has exceeded its useful life or has been subjected to an event that may have impacted the integrity of the pressure vessel, the department may require that a fitness for service study be completed. The study shall be completed in accordance with the National Board Inspection Code Part 2, Section 4, and documented in accordance with the National Board 403 form.
1011.2 Test gauges. An indicating test gauge shall be connected directly to the boiler or pressure vessel where it is visible to the operator throughout the duration of the test. The pressure gauge scale shall be graduated over a range of not less than one and one-half times and not greater than four times the maximum test pressure. [All gauges] Gauges utilized for testing shall be calibrated and certified annually in accordance with ASME B40.100 by the test operator.

1011.3 Periodic boiler inspections. Periodic boiler inspections shall be performed in accordance with [Section 28-303] Article 303 of Chapter 3 of the Administrative Code and Section 1007.3 of this code. In addition, boiler inspections shall:

1. Be completed in accordance with the National Board Inspection Code.
2. Include the review of testing documentation for all controls and safety devices.
3. Verify that the flue connection from the boiler to the chimney is properly sealed and in good working condition.
4. Verify that the combustion air system as originally designed is operational.
5. Verify that the High Pressure Operators’ licenses are current and that Low Pressure Operators are qualified per New York State requirements.
6. Include a permanent record of the visit.
7. Be subject to the quality control measures of the department.

1011.4 Pressurized systems containing hazardous materials. Any pressurized system that contains hazardous materials or presents a physical hazard by release shall be pre-approved for installation, subject to testing, and subject to inspection by the department.

1011.5 Nondestructive examination. When required by the department, the nondestructive examination (NDE) requirements, including technique, extent of coverage, procedures, personnel qualification, and acceptance criteria, shall be performed in accordance with the applicable provisions of the edition of the code of construction for the pressure-vessel in effect at the time of installation. Weld repairs and alterations shall be subject to the same nondestructive examination requirements. Where this is not possible or practicable, alternative NDE methods acceptable to the inspector and the department may be used.

SECTION MC 1012
MAXIMUM TEMPERATURE

1012.1 Maximum temperature. Maximum indoor temperature in spaces surrounding boilers, water heaters, and pressure vessels shall not exceed the operational temperature of the installed equipment or 104°F (40°C).

§ 12. Chapter 11 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:
CHAPTER 11
REFRIGERATION

SECTION MC 1101
GENERAL

1101.1 Scope. This chapter shall govern the design, installation, construction, alteration and repair of refrigeration systems that vaporize and liquefy a fluid during the refrigerating cycle. Refrigerant piping design and installation, including pressure vessels and pressure relief devices, shall conform to this code. Permanently installed refrigerant storage systems and other components shall be considered as part of the refrigeration system to which they are attached. This chapter shall also govern the change of refrigerants in existing refrigerating systems having a different safety group classification.

1101.2 Factory-built equipment and appliances. Listed and labeled self-contained, factory-built equipment and appliances shall be tested in accordance with UL 207, 412, 471 or 1995. Such equipment and appliances are deemed to meet the design, manufacture and factory test requirements of this code if installed in accordance with their listing and the manufacturer’s installation instructions.

1101.3 Protection. Any portion of a refrigeration system that is subject to physical damage shall be protected in an approved manner.

1101.4 Water connection. Water supply and discharge connections associated with refrigeration systems shall be made in accordance with this code and the New York City Plumbing Code.

1101.5 Fuel-oil and fuel-gas connection. Refrigeration system devices, equipment and appliances utilizing fuel oil or fuel gas for combustion shall be installed in accordance with the applicable provisions of the New York City Fuel Gas Code and this code.

1101.6 General. Refrigeration systems shall comply with the requirements of this code and, except as modified by this code, ASHRAE 15. Ammonia-refrigerating systems shall comply with this code and, except as modified by this code, ASHRAE 15 and IIAR 2. Such systems shall be maintained in accordance with the New York City Fire Code.

1101.7 Maintenance. Mechanical refrigeration systems shall be maintained in proper operating condition, free from accumulations of oil, dirt, waste, excessive corrosion, other debris and leaks.

1101.8 Change in refrigerant type. The type of refrigerant in refrigeration systems having a refrigerant circuit containing more than 220 pounds (99.8 kg) of Group A1 or 30 pounds (13.6 kg) of any other group refrigerant shall not be changed without prior notification to the commissioner and compliance with the applicable code provisions for the new refrigerant type. The refrigerant being considered shall be evaluated for suitability by an engineer. Whenever change in the type of refrigerant is to be done, consideration shall be given to the following:

1. The effects of the substitute refrigerant on materials in the system;
2. The possibility of overloading the liquid receiver, which shall not be more than 80 percent full of liquid;

3. The possibility of exceeding motor rating, design working pressure, or other requirements that would violate any of the provisions of this code;

4. The proper size of refrigerant controls;

5. The effect of the operation and setting of safety devices;

6. The possible hazards created by mixture of the original and the substituted refrigerant; and

7. The effect of the classification of the refrigerant as provided.

1101.9 Refrigerant discharge. Notification of refrigerant discharge shall be provided in accordance with the New York City Fire Code.

1101.10 Gas- and oil-fired absorption systems. Refrigeration systems utilizing fuel oil or fuel gas for combustion shall be installed in accordance with the applicable provisions of the New York City Fuel Gas Code and this code.

1101.11 Signs, nameplates, and operation and emergency shut-down instructions. Signs, nameplates, and operation and emergency shut-down instructions for refrigeration systems shall comply with the following:

2. Each refrigeration unit or system shall be provided with a nameplate indicating the horsepower of the prime mover or compressor and the equivalent of such horsepower in kilowatts.

3. Section 1105.11 of this code.

1101.12 Locking access port caps. Refrigerant circuit access ports located outdoors shall be fitted with locking-type tamper-resistant caps requiring a special tool or key to open.

SECTION MC 1102
SYSTEM REQUIREMENTS

1102.1 General. The system classification, allowable refrigerants, maximum quantity, enclosure requirements, location limitations, and field pressure test requirements shall be determined as follows:

1. Determine the refrigeration system’s classification, in accordance with Section 1103.3.

2. Determine the refrigerant classification in accordance with Section 1103.1.

3. Determine the maximum allowable quantity of refrigerant in accordance with Section 1104, based on type of refrigerant, system classification and occupancy.
4. Determine the system enclosure requirements in accordance with Section 1104.

5. Refrigeration equipment and appliance location and installation shall be subject to the limitations of Chapter 3.

6. Nonfactory-tested, field-erected equipment and appliances shall be pressure tested in accordance with Section 1108.

1102.2 Refrigerants. The refrigerant shall be that which the equipment or appliance was designed to utilize or converted to utilize. Refrigerants not identified in Table 1103.1 shall be approved by the department before use. Refrigerants not identified in Table 1103.1, other than those having a Safety Group Classification of A-1, shall also be approved by the Fire Department before use.

1102.2.1 Mixing. Refrigerants, including refrigerant blends, with different designations in ASHRAE 34 shall not be mixed in a system.

Exception: Addition of a second refrigerant is allowed where permitted by the equipment or appliance manufacturer to improve oil return at low temperatures. The refrigerant and amount added shall be in accordance with the manufacturer’s instructions.

1102.2.2 Purity. Refrigerants used in refrigeration systems shall be new, recovered or reclaimed refrigerants in accordance with Section 1102.2.2.1, 1102.2.2.2 or 1102.2.2.3. Where required by the equipment or appliance owner, the installer shall furnish a signed declaration that the refrigerant used meets the requirements of Section 1102.2.2.1, 1102.2.2.2 or 1102.2.2.3.

Exception: The refrigerant used shall meet the purity specifications set by the manufacturer of the equipment or appliance in which such refrigerant is used where such specifications are different from that specified in Sections 1102.2.2.1, 1102.2.2.2 and 1102.2.2.3.

1102.2.2.1 New refrigerants. Refrigerants shall be of a purity level specified by the equipment or appliance manufacturer.

1102.2.2.2 Recovered refrigerants. Refrigerants that are recovered from refrigeration and air-conditioning systems shall not be reused in other than the system from which they were recovered and in other systems of the same owner. Recovered refrigerants shall be filtered and dried before reuse. Recovered refrigerants that show clear signs of contamination shall not be reused unless reclaimed in accordance with Section 1102.2.2.3.

1102.2.2.3 Reclaimed refrigerants. Used refrigerants shall not be reused in a different owner’s equipment or appliances unless tested and found to meet the purity requirements of [ARI] AHRI 700. Contaminated refrigerants shall not be used unless reclaimed and found to meet the purity requirements of [ARI] AHRI 700.

1102.3 Access port protection. Refrigerant access ports shall be protected in accordance with Section 1101.12 whenever refrigerant is added to or recovered from refrigeration or air-conditioning systems.

**Propane**

**Refrigeration System Classification**

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1.
### TABLE 1103.1

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³.

a. Data based on ASHRAE 34 including Addenda a through o. For more complete data see ASHRAE 34 and Addenda. Use of Addenda issued after Addendum o is subject to approval as set forth in Section 1102.2.

d. OCCUPATIONAL EXPOSURE LIMIT (OEL). The time-weighted average (TWA) concentration for a normal eight-hour workday and a 40-hour workweek to which nearly all workers can be repeatedly exposed without adverse effect, based on the OSHA PEL, ACGIH TLV-TWA, AIHA WEEL, or consistent value.

1103.2 Occupancy classification. Locations of refrigerating systems are described by occupancy classifications that consider the ability of people to respond to potential exposure to refrigerants.
Where equipment or appliances, other than piping, are located outside a building and within 20 feet (6096 mm) of any building opening, such equipment or appliances shall be governed by the occupancy classification of the building. Occupancy classifications of buildings shall be [•] in accordance with the building classifications in the New York City Building Code.

1. Institutional occupancy shall include Occupancy Groups I-1, I-2, I-3 and I-4.

3. Residential occupancy shall include Occupancy Groups R-1, R-2 and R-3.

4. Commercial occupancy shall include Occupancy Groups M and B, except Occupancy Group M with retail stores having an occupant load of more than 100 persons on any floor other than street level.

5. Large mercantile occupancy shall include Occupancy Group M with retail stores having an occupant load of more than 100 persons on any floor other than street level.

7. Mixed occupancy occurs where two or more occupancies are located within the same building. Where each occupancy is isolated from the rest of the building by tight walls, floors and ceilings and by self-closing doors, the requirements for each occupancy shall apply to its portion of the building. Where the various occupancies are not so isolated, the occupancy having the most stringent requirements shall be the governing occupancy.

1103.3 System classification. Refrigeration systems shall be classified according to the degree of probability that refrigerant leaked from a failed connection, seal or component could enter an occupied area. The distinction is based on the basic design or location of the components.

1103.3.1 Low-probability systems. Double-indirect open-spray systems, indirect closed systems and indirect-vented closed systems shall be classified as low-probability systems, provided that all refrigerant-containing piping and fittings are isolated when the quantities in Table 1103.1 are exceeded.

1103.3.2 High-probability systems. Direct systems and indirect open-spray systems shall be classified as high-probability systems.

Exception: An indirect open-spray system shall not be required to be classified as a high-probability system if the pressure of the secondary coolant is at all times (operating and standby) greater than the pressure of the refrigerant.

SECTION MC 1104
SYSTEM APPLICATION REQUIREMENTS

1104.1 General. The refrigerant, occupancy and system classification cited in this section shall be determined in accordance with Sections 1103.1, 1103.2 and 1103.3, respectively. For refrigerant blends assigned dual classifications, as formulated and for the worst case of fractionation, the
classifications for the worst case of fractionation shall be used. For blends assigned only a single
safety group classification in Table 1103.1 or ASHRAE 34, that classification shall be used. Use of
a Group A3 or Group B3 refrigerant is prohibited. In an industrial occupancy, a Group A3 or Group
B3 refrigerant may be used in high- or low-probability systems only when approved by the
commissioner and the Commissioner of the Fire Department. Such use will be approved only if the
applicant can demonstrate to the satisfaction of the commissioner and the Commissioner of the Fire
Department that the use of the refrigerant is a necessity and does not represent a substantial risk to
life, limb, health or property.

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components
containing the refrigerant shall be located either outdoors or in a machinery room where the quantity
of refrigerant in an independent circuit of a system exceeds the amounts shown in Table 1103.1. For
refrigerant names not listed in Table 1103.1, the same requirement shall apply when the amount for
any named component exceeds that indicated in Table 1103.1 for that component. This requirement
shall also apply when the combined amount of the named components exceeds a limit of 69,100 parts
per million (ppm) by volume. Machinery rooms required by this section shall be constructed and
maintained in accordance with Section 1105 for Group A1 and B1 refrigerants and in accordance with
Sections 1105 and 1106 for Group A2, B2, A3 and B3 refrigerants. Nothing in this section shall be
construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

Exceptions:

1. Machinery rooms are not required for listed equipment and appliances containing not more
   than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant’s safety classification,
   where installed in accordance with the equipment’s or appliance’s listing and the
   equipment or appliance manufacturer’s installation instructions.

2. Piping in conformance with Section 1107 of this chapter and Section 8.10 of ASHRAE
   15 is allowed in other locations to connect components installed in a machinery room with
   those installed outdoors.

1104.2.1 Institutional occupancies. The amounts shown in Table 1103.1 shall be reduced by 50
percent for all areas of institutional occupancies except kitchens, laboratories and mortuaries. The
total of all Group A2, B2, A3 and B3 refrigerants shall not exceed 550 pounds ([250] 249.4 kg)
in occupied areas or machinery rooms. Nothing in this section shall be construed to allow the use
of Group A3 and B3 refrigerants if otherwise prohibited.

1104.2.2 Industrial occupancies and refrigerated rooms. This section applies only to industrial
occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat
cutting, other processes and storage. Machinery rooms are not required where all of the following
conditions are met:

1. The space containing the machinery is separated from other occupancies by tight
   construction with tight-fitting doors.

2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m$^2$). Where provided with egress directly to the outdoors or into building exits meeting the requirements of the *New York City Building Code*, the minimum floor area shall not apply.

4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.

5. Surfaces having temperatures exceeding 800°F (426.7°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.3). Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

6. All electrical equipment and appliances conform to Class 1, Division 2, hazardous location classification requirements of the *New York City Electrical Code* where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space based on the volume determined by Section 1104.4. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

7. All refrigerant-containing parts in systems exceeding 100 hp (74.6 kW) drive power, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; and connecting piping, shall be located either outdoors or in a machinery room.

### 1104.3 Refrigerant restrictions

Refrigerant applications, maximum quantities and use shall be restricted in accordance with Sections 1104.3.1 through 1104.3.3.

#### 1104.3.1 Air-conditioning for human comfort

Group A2, A3, B1, B2 and B3 refrigerants shall not be used in high-probability air-conditioning systems for human comfort.

**Exceptions:**

1. Sealed absorption and unit air-conditioning systems having refrigerant quantities not exceeding those set forth in Table 1104.3.1.

2. Industrial occupancies.

Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.
TABLE 1104.3.1
SPECIAL QUANTITY LIMITS FOR SEALED AMMONIA/WATER ABSORPTION
AND SELF-CONTAINED SYSTEMS

</tbody>
</table>

For SI: 1 pound = 0.454 kg.

1104.3.2 All occupancies. The total of all Group A2, B2, A3 and B3 refrigerants other than R-717, ammonia, shall not exceed 1,100 pounds (499 kg) except where approved. Nothing in this section shall be construed to allow the use of Group A3 and B3 refrigerants if otherwise prohibited.

1104.3.3 Protection from refrigerant decomposition. Where any device having an open flame or surface temperature greater than 800°F (427°C) is used in a room containing more than 6.6 pounds (3 kg) of refrigerant in a single independent circuit, a hood and exhaust system shall be provided in accordance with Section 510. Such exhaust system shall exhaust combustion products to the outdoors.

Exception: A hood and exhaust system shall not be required where any of the following apply:

1. Where the refrigerant is R-717, R-718 or R-744.
2. Where the combustion air is ducted from the outdoors in a manner that prevents leaked refrigerant from being combusted.
3. Where a refrigerant detector is used to stop the combustion in the event of a refrigerant leak (see Sections 1105.3 and 1105.5).

1104.4 Volume calculations. Volume calculations shall be in accordance with Sections 1104.4.1 through 1104.4.3.

1104.4.1 Noncommunicating spaces. Where the refrigerant-containing parts of a system are located in one or more spaces that do not communicate through permanent openings or HVAC ducts, the volume of the smallest, enclosed occupied space shall be used to determine the permissible quantity of refrigerant in the system.

1104.4.2 Communicating spaces. Where an evaporator or condenser is located in an air duct system, the volume of the smallest, enclosed occupied space served by the duct system shall be used to determine the maximum allowable quantity of refrigerant in the system.
Exception: If airflow to any enclosed space cannot be reduced below one-quarter of its maximum, the entire space served by the air duct system shall be used to determine the maximum allowable quantity of refrigerant in the system.

1104.4.3 Plenums. Where the space above a suspended ceiling is continuous and part of the supply or return air plenum system, this space shall be included in calculating the volume of the enclosed space.

SECTION MC 1105
MACHINERY ROOM, GENERAL REQUIREMENTS

1105.1 Design and construction. Machinery rooms shall be designed and constructed in accordance with the New York City Building Code and this section.

1105.2 Openings. Ducts and air handlers in the machinery room that operate at a lower pressure than the room shall be sealed to prevent any refrigerant leakage from entering the airstream.

1105.3 Refrigerant detector. Refrigerant detectors in machinery rooms shall be provided as required by ASHRAE 15.

1105.4 Tests. Periodic tests of the mechanical ventilating system shall be performed in accordance with manufacturer’s specifications and as required by the Commissioner of the Fire Department.

1105.5 Fuel-burning appliances. Open flames that use combustion air from the machinery room shall not be installed in a machinery room.

Exceptions:

1. Where the refrigerant is carbon dioxide or water.

2. Fuel-burning appliances shall not be prohibited in the same machinery room with refrigerant-containing equipment or appliances where combustion air is ducted from outside the machinery room and sealed in such a manner as to prevent any refrigerant leakage from entering the combustion chamber, or where a refrigerant vapor detector is employed to automatically shut off the combustion process in the event of refrigerant leakage.

1105.6 Ventilation. Machinery rooms shall be mechanically ventilated to the outdoors. [Mechanical ventilation shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions. Multiple fans or multispeed fans shall be allowed in order to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.] Location of the mechanical ventilation openings within the machinery room shall be based on the relative density of the refrigerant to air. When compressors or self-contained unit system are housed in a machinery space, other than in a machinery room or plenum, the space shall be ventilated in accordance with the requirements of Section 1105.6.3.

Exception: Where a refrigerating system is located outdoors more than 20 feet (6096 mm) from any building opening and is enclosed by a penthouse, lean-to or other open structure, natural or mechanical ventilation shall be provided. Location of the openings shall be based on the relative
density of the refrigerant to air. The free-aperture cross section for the ventilation of the machinery room shall be not less than:

\[ F = \sqrt{G} \]  

*(Equation 11-1)*

For SI: \( F = 0.138\sqrt{G} \)

where:

\( F \) = The free opening area in square feet (m²).

\( G \) = The mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the machinery room.

1105.6.1 Discharge location. The discharge of the air shall be to the outdoors in accordance with Chapter 5. Exhaust from mechanical ventilation systems shall be discharged not less than 20 feet (6096 mm) from outdoor air intake or openings into buildings and 10 feet (3048 mm) from a fire escape or exterior stair.

1105.6.2 Makeup air. Provisions shall be made for makeup air to replace that being exhausted. Openings for makeup air shall be located to avoid intake of exhaust air. Supply and exhaust ducts serving the machinery room shall not serve any other area, shall be constructed in accordance with Chapter 5 and shall be covered with corrosion-resistant screen of not less than \( \frac{1}{4} \)-inch (6.4 mm) mesh.

**Exception:** The requirement for supply and exhaust ducts to the machinery room to serve no other area shall not apply to a change in the type of refrigerant in a lawfully installed existing refrigerating system being maintained and operated in accordance with these approved installation requirements:

1. Where the replacement refrigerant has a safety classification of Group A1; or

2. Where the replacement refrigerant is R123 and the engineer or architect demonstrates to the satisfaction of the commissioner that providing such air supply and exhaust ducts represents a hardship and that the proposed alternative provides an equivalent level of safety.

1105.6.3 Ventilation rate. For other than ammonia systems, the mechanical ventilation systems shall be capable of exhausting the minimum quantity of air both at normal operating and emergency conditions, as required by Sections 1105.6.3.1 and 1105.6.3.2. The minimum required ventilation rate for ammonia shall be 30 air changes per hour in accordance with IIAR2. Multiple fans or multispeed fans shall be allowed to produce the emergency ventilation rate and to obtain a reduced airflow for normal ventilation.

1105.6.3.1 Quantity-normal ventilation. During occupied conditions, the mechanical ventilation system shall exhaust the larger of the following:

1. Not less than 0.5 cfm per square foot (0.0025m³/s m²) of machinery room area or 20 cfm (0.009 m³/s) per person \([\text{50}]\).
2. A volume required to limit the room temperature rise to 18°F (\(\text{10} - 7.8 \, ^\circ\text{C}\)) taking into account the ambient heating effect of all machinery in the room but not above a maximum temperature of 122°F (50°C).

[1105.6.4] **1105.6.3.2 Quantity-emergency conditions.** Upon actuation of the refrigerant detector required in Section 1105.3, the mechanical ventilation system shall exhaust air from the machinery room in the following quantity:

\[
Q = 100 \times \sqrt{G}
\]  
\(\text{(Equation 11-2)}\)

For SI: \(Q = 0.07 \times \sqrt{G}\)

where:

\(Q\) = The airflow in cubic feet per minute (m\(^3\)/s).

\(G\) = The design mass of refrigerant in pounds (kg) in the largest system, any part of which is located in the machinery room.

**1105.7 Termination of relief devices.** In addition to the requirements of Section 9.7.8 of ASHRAE 15, pressure relief devices, fusible plugs and purge systems located within the machinery room shall terminate outside of the structure at a location not less than 15 feet (4572 mm) above the adjoining grade level and not less than 20 feet (6096 mm) from any window, ventilation opening or exit.

**1105.7.1 Discharge of Group A2, B2, A3 and B3 refrigerants.** Discharge of systems containing Group A2 or B2 refrigerants shall be acceptable to the commissioner. Discharge of systems containing Group A3 or B3 refrigerants shall be subject to the approval of the commissioner and the Commissioner of the Fire Department. Nothing in this section shall be construed to approve the use of Group A3 and B3 refrigerants if otherwise prohibited.

**1105.7.2 Certificate of qualification.** Discharge of pressure relief devices, fusible plugs and purge systems for refrigerating systems containing flammable, toxic and highly toxic refrigerants and ammonia shall comply with Section 606 of the *New York City Fire Code*.

**1105.8 Ammonia discharge.** Pressure relief valves for ammonia systems shall discharge in accordance with ASHRAE 15.

**1105.9 Emergency pressure control system.** [Refrigeration] Permanently installed refrigeration systems containing more than 6.6 pounds (3 kg) of a refrigerant other than a Group A1 refrigerant shall be provided with an emergency pressure control system in accordance with Sections 1105.9.1 and 1105.9.2.

**1105.9.1 Automatic crossover valves.** Each high- and intermediate-pressure zone in a refrigerating system shall be provided with a single automatic valve providing a crossover connection to a lower pressure zone. Such automatic crossover valves shall comply with Sections 1105.9.1.1 through 1105.9.1.3.

**1105.9.1.1 Overpressure limit setpoint.** Automatic crossover valves shall be arranged to automatically relieve excess system pressure to a lower pressure zone if the pressure in a high-
or intermediate-pressure zone rises to within 15 psi (108.4 kPa) of the setpoint for pressure-relief devices.

1105.9.1.2 Manual operation. Automatic crossover valves shall be capable of manual operation for refrigeration systems containing more than 200 pounds (90.8 kg) of refrigerant.

1105.9.1.3 System design pressure. Refrigerating system zones that are connected to a higher pressure zone by an automatic crossover valve shall be designed to safely contain the maximum pressure that can be achieved by interconnection of the two zones.

1105.9.2 Automatic emergency stop. An automatic emergency stop feature shall be provided in accordance with Sections 1105.9.2.1 and 1105.9.2.2.

1105.9.2.1 Automatic crossover valves. A refrigerating system equipped with an automatic crossover valve shall be designed, when such valve is activated, to cause all compressors on the affected system to immediately cease operating. Dedicated pressure-sensing devices located immediately adjacent to crossover valves may be used as a means for activating such crossover valve. To ensure that the automatic crossover valve system provides a redundant means of ceasing operation of the compressors in an overpressure condition, high-pressure cutout sensors associated with compressors shall not be used for purposes of activating such crossover valve.

1105.9.2.2 Overpressure in low-pressure zone. The lowest pressure zone in a refrigerating system shall be provided with a dedicated means of determining a rise in system pressure to within 15 psi (103.4 kPa) of the zone pressure relief device setpoint. Activation of such overpressure sensing device shall cause all compressors on the effected system to immediately cease operation.

1105.10 Remote control. A clearly identified switch of the break-glass type shall provide off-only control of the compressors in the machinery room. A second clearly identified switch of the break-glass type shall provide on-only control of the machinery room ventilation fans. Such switches shall be located outside each entrance to the machinery room and as close to the entrance as practicable, except that when an outside location is impracticable, such switches may be located immediately inside the machinery room provided such location is accessible at all times.

1105.11 Emergency signs. Signs shall comply with the following:

1. Sections 8.11.8 and 11.2.4 of ASHRAE 15.

2. Refrigeration units or systems having a refrigerant circuit containing more than 220 pounds (\(1400\) 99.8 kg) of Group A1 or 30 pounds (\(14\) 13.6 kg) of any other group refrigerant shall be provided with approved emergency signs, charts, and labels in accordance with NFPA 704.

1105.12 Storing refrigerant. The total amount of refrigerant stored in a machinery room shall be the lesser of: (i) not more than twenty percent of the normal charge in the system; or (ii) not more than 330 pounds (\(150\) 149.7 kg) in addition to the charge in the system and the refrigerant contained
in a permanently attached receiver. Refrigerant shall be stored in containers meeting the requirements of the *New York City Fire Code*.

**Exception:** Recovery service containers used for storing refrigerant during periods of system maintenance or replacement may exceed 330 pounds (149.7 kg) provided such containers are securely fixed in position and have pressure relief valves piped to the outside in conformance with this code.

**SECTION MC 1106**
**MACHINERY ROOM, SPECIAL REQUIREMENTS**

**1106.1 General.** Where required by Section 1104.2, the machinery room shall meet the requirements of this section in addition to the requirements of Section 1105.

**1106.2 Elevated temperature.** There shall not be an open flame-producing device or continuously operating hot surface over 800°F (426.7°C) permanently installed in the room.

**1106.3 Ammonia room ventilation.** Ventilation systems in ammonia machinery rooms shall be operated continuously at the emergency ventilation rate determined in accordance with Section 1105.6.4, specified in Section 1105.6.3.

Exceptions:

1. Machinery rooms equipped with a vapor detector that will automatically start the ventilation system at the emergency ventilation rate determined in accordance with Section 1106.3.4 and that will actuate an alarm at a detection level not to exceed 1,000 ppm;

2. Machinery rooms conforming to the Class 1, Division 2, hazardous location classification requirements of the *New York City Electrical Code*.

**1106.4 Flammable refrigerants.** Where refrigerants of Groups A2, A3, B2 and B3 are used, the machinery room shall conform to the Class 1, Division 2, hazardous location classification requirements of the *New York City Electrical Code*.

**Exception:** Ammonia machinery rooms that are provided with ventilation in accordance with Section 1106.3. Nothing in this section shall be construed to approve the use of Group A3 and B3 refrigerants if otherwise prohibited.

**1106.5 Remote controls.** Remote control of the mechanical equipment and appliances located in the machinery room shall be provided at an accessible location immediately outside the machinery room and adjacent to its principal entrance and shall comply with Sections 1106.5.1 and 1106.5.2.

**1106.5.1 Refrigeration system emergency shutoff.** A clearly identified switch of the break-glass type or an approved tamper-resistant switch shall provide off-only control of all electrically energized equipment and appliances in the machinery room, other than refrigerant leak detectors and machinery room ventilation; refrigerant compressors, refrigerant pumps, and normally closed, automatic refrigerant valves located in the machinery room. Additionally, this equipment shall be automatically shut off whenever the refrigerant vapor concentration in the machinery...
1106.5.2 Ventilation system. A clearly identified switch of the break-glass type or an approved tamper-resistant switch shall provide on-only control of the machinery room ventilation fans.

1107.1 General. [All] The design of refrigerant piping shall be in accordance with ASME B31.5. Refrigerant piping shall be installed, tested and placed in operation in accordance with this chapter.

1107.1.1 Protection of refrigerant piping located inside buildings. All refrigerant piping and fittings installed at a height less than 7 feet 3 inches (2209.8 mm) above the floor shall be concealed or otherwise protected from mechanical damage except at the point of connection to terminal equipment.

1107.2 Piping location. Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2209.8 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any elevator, dumbwaiter or other shaft containing a moving object or in any shaft that has openings to living quarters or to means of egress. Refrigerant piping shall not be installed in an enclosed public stairway, stair landing or an exit.

1107.2.1 Piping in public corridors. Refrigerant piping shall not be installed in public corridors.

**Exception:** Refrigerant piping in public corridors that complies with [all] either of the following conditions:

1. [The refrigeration system to which the piping is associated utilizes a Group A1 refrigerant and contains not more than 10 pounds (4.54 kg) of refrigerant per system, and there is not more than one system’s refrigerant piping per tenant per public corridor; and] Piping containing Group A1 refrigerant may be located in public corridors provided that the complete discharge of any one refrigerant system into the public corridor will not result in a refrigerant density equal to or greater than 50 percent of the allowable density set forth in Table 1103.1; and

   1.1. There is not more than one refrigerant system’s piping per tenant; and

   1.2. Refrigerant piping and fittings are concealed or otherwise protected from mechanical damage; and either

   1.3. Refrigerant piping and fittings are installed with brazed joints; or

   1.4. The refrigerant equipment manufacturer provided pre-charged tubing systems installed in accordance with the refrigerant equipment manufacturer’s instructions;
2. [A complete discharge of any one refrigerant system’s charge into the volume of the public corridor would be insufficient to achieve 50 percent of the allowable refrigerant densities set forth in Table 1103.1; and] Piping containing Group A1 refrigerant may be located in public corridors provided that the complete discharge of any one refrigerant system into the public corridor will not result in a refrigerant density of 100 percent of the allowable refrigerant density set forth in Table 1103.1; and

2.1. Such system is provided with fast-acting shutoff valves on both high and low pressure refrigerant line sets, actuated by either local refrigerant monitors in the corridor, or on sensing a drop in pressure on either high or low pressure refrigerant line sets; and

2.2. Upon accidental discharge, actuation of installed refrigerant shutoff valves shall initiate locally installed alarm; and

2.3. Installation of fast-acting shutoff valves, refrigerant detectors, and alarms shall be in accordance with Appendix C; and

2.4. There is not more than one refrigerant system’s piping per tenant; and

2.5. Refrigerant piping and fittings are concealed or otherwise protected from mechanical damage; and either

2.6. Refrigerant piping and fittings are installed with brazed joints; or

2.7. The refrigerant equipment manufacturer provided pre-charged tubing systems installed in accordance with the refrigerant equipment manufacturer’s instructions.

[3. Refrigerant piping and fittings within a public corridor are installed with brazed joints or the refrigerant equipment manufacturer provided pre-charged tubing systems installed in accordance with the refrigerant equipment manufacturer’s instructions. Refrigerant piping and fittings shall be concealed or otherwise protected from mechanical damage.]

1107.2.2 Piping in concrete floors. Refrigerant piping installed in concrete floors shall be encased in pipe ducts. The piping shall be isolated and supported to prevent damaging vibration, stress and corrosion.

1107.2.3 Refrigerant piping penetrations. Refrigerant piping shall not penetrate floors, ceilings or roofs.

Exceptions:

1. Penetrations connecting the basement and the first floor.

2. Penetrations connecting the top floor and a machinery penthouse or roof installation.

3. Penetrations connecting adjacent floors served by the refrigeration system.
4. Penetrations by piping in a direct system where the refrigerant quantity does not exceed Table 1103.1 for the smallest occupied space through which the piping passes.

5. Penetrations by piping in a direct system complying with Section 1107.2.3.1.

[5-4] 6. In other than industrial occupancies and where the refrigerant quantity exceeds Table 1103.1 for the smallest space, penetrations for piping that connects separate pieces of equipment that are either:

[5-4] 6.1. Enclosed by an approved gas-tight, fire-resistive duct or shaft with openings to those floors served by the refrigeration system; or

[5-2] 6.2. Located on the exterior of the building where vented to the outdoors or to the space served by the system and not used as an air shaft, closed court or similar space.

1107.2.3.1 Direct systems. Piping containing a quantity of Group A1 refrigerants in excess of Table 1103.1 for the smallest occupied space through which the piping passes, shall comply with Section 1107.9.

1107.3 Pipe enclosures. Rigid or flexible metal enclosures or pipe ducts shall be provided for soft, annealed copper tubing used for refrigerant piping erected on the premises and containing other than Group A1 refrigerant. Enclosures shall not be required for connections between condensing units and the nearest riser box(es), provided such connections do not exceed 6 feet (1828.8 mm) in length.

1107.4 Condensation. [All refrigerating] Refrigerating piping and fittings, brine piping and fittings that, during normal operation, will reach a surface temperature below the dew point of the surrounding air, and are located in spaces or areas where condensation will cause a safety hazard to the building occupants, structure, electrical equipment or any other equipment or appliances, shall be protected in an approved manner to prevent such damage.

1107.5 Materials for refrigerant pipe and tubing. Piping materials shall be as set forth in Sections 1107.5.1 through 1107.5.7.

1107.5.1 Steel pipe. Carbon steel pipe with a wall thickness not less than Schedule 80 shall be used for Group A2, A3, B2 or B3 refrigerant liquid lines for sizes 1.5 inches (38.1 mm) and smaller. Carbon steel pipe with a wall thickness not less than Schedule 40 shall be used for Group A1 or B1 refrigerant liquid lines 6 inches (152.4 mm) and smaller, Group A2, A3, B2 or B3 refrigerant liquid lines sizes 2 inches (50.8 mm) through 6 inches (152.4 mm) and all refrigerant suction and discharge lines 6 inches (152.4 mm) and smaller. Type F steel pipe shall not be used for refrigerant lines having an operating temperature less than -20°F (-28.9°C).

1107.5.2 Copper and brass pipe. Standard iron-pipe size, copper and red brass (not less than 80-percent copper) pipe shall conform to ASTM B 42 and ASTM B 43.
1107.5.3 Copper tube. Copper tube used for refrigerant piping erected on the premises shall be seamless copper tube of Type ACR (hard or annealed) complying with ASTM B 280. Where approved, copper tube for refrigerant piping erected on the premises shall be seamless copper tube of Type K or L (drawn or annealed) in accordance with ASTM B 88. Annealed temper copper tube shall not be used in sizes larger than a 2-inch (51 mm) nominal size. Mechanical joints shall not be used on annealed temper copper tube in sizes larger than 7/8-inch (22.2 mm) OD size.

1107.5.4 Copper tubing joints. Copper tubing joints used in refrigerating systems containing Group A2, A3, B1, B2 or B3 refrigerants shall be brazed. Soldered joints shall not be used in such refrigerating systems. Brazed joints shall be made in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with American Welding Society AWS B2.2 Standard for Brazing Procedure and Performance Qualification.

1107.5.5 Soldered joints. Soldered joints shall be made as follows: soldered joint surfaces shall be cleaned, a flux conforming to ASTM B 813 shall be applied, and the joint shall be soldered with a solder conforming to ASTM B 32.

1107.5.6 Aluminum tube. Type 3 003-0 aluminum tubing with high-pressure fittings shall not be used with methyl chloride and other refrigerants known to deteriorate aluminum.

1107.5.7 Insulation. Pipe and other refrigerant-containing components’ insulation shall meet the requirements of Section 1204.1 of this code.

1107.6 Joints and refrigerant-containing parts in air ducts. Joints and all refrigerant-containing parts of a refrigerating system located in an air duct of an air-conditioning system carrying conditioned air to and from human-occupied space shall be constructed to withstand, without leakage, a pressure of 150 percent of the higher of the design pressure or pressure relief device setting.

1107.7 Exposure of refrigerant pipe joints. Refrigerant pipe joints erected on the premises shall be exposed for visual inspection prior to being covered or enclosed.

1107.8 Stop valves. [All systems] Systems containing more than 6.6 pounds (3 kg) of a refrigerant in systems using positive-displacement compressors shall have stop valves installed as follows:

1. At the inlet of each compressor, compressor unit or condensing unit.

2. At the discharge outlet of each compressor, compressor unit or condensing unit and of each liquid receiver.

Exceptions:

1. Systems that have a refrigerant pumpout function capable of storing the entire refrigerant charge in a receiver or heat exchanger.

2. Systems that are equipped with provisions for pumpout of the refrigerant using either portable or permanently installed recovery equipment.

3. Self-contained systems.
1107.8.1 Liquid receivers. [All systems] Systems containing 100 pounds ([45] 45.4 kg) or more of a refrigerant, other than systems utilizing nonpositive displacement compressors, shall have stop valves, in addition to those required by Section [1107.7] 1107.8, on each inlet of each liquid receiver. Stop valves shall not be required on the inlet of a receiver in a condensing unit, nor on the inlet of a receiver which is an integral part of the condenser.

1107.8.2 Copper tubing. Stop valves used with soft annealed copper tubing or hard-drawn copper tubing 7/8-inch (22.2 mm) OD standard size or smaller shall be securely mounted, independent of tubing fastenings or supports.

1107.8.3 Identification. Stop valves shall be identified where their intended purpose is not obvious. Numbers shall not be used to label the valves, unless a key to the numbers is located near the valves.

1107.9 Alternative refrigerant piping safety. Where refrigerant piping penetrates floors, ceilings, or roofs pursuant to Section 1107.2.3, it shall comply with the alternative safety requirements of Sections 1107.9.1 through 1107.9.5.

1107.9.1 Nongas tight enclosures. Where refrigerant piping and fittings pass through public corridors or occupied spaces in shafts or cavities that are not gas tight, such piping and fittings shall comply with the requirements of EN378 Part 1, Section 3.2.3.

1107.9.2 Occupied spaces. Refrigerant piping systems in occupied spaces shall comply with the requirements of EN378 Part 1, Section C.3.2.1.

1107.9.2.1 Space volume calculations. Space volume calculations shall comply with EN378 Part 1, Section 7.

1107.9.2.2 Dilution transfer openings. Where required, dilution transfer openings shall be provided in accordance with EN378 Part 3, Section 6.3.2.

1107.9.3 Refrigerant shutoff valves. Where required, refrigerant shutoff valves shall comply with the requirements of EN378 Part 3, Sections 6.4.1 through 6.4.3.

1107.9.4 Refrigerant safety alarms. Where required, refrigerant safety alarms shall comply with the requirements of EN378 Part 3, Sections 8.1 through 8.2.

1107.9.5 Refrigerant detectors. Where required, refrigerant detectors shall comply with the requirements of EN378 Part 3, Section 9.3.1.

SECTION MC 1108
FIELD TEST

1108.1 General. Every refrigerant-containing part of every system that is erected on the premises, except compressors, condensers, vessels, evaporators, safety devices, pressure gauges and control mechanisms that are listed and factory tested, shall be tested and proved tight after complete installation, and before operation. Tests shall include both the high- and low-pressure sides of each system at not less than the lower of the design pressures or the setting of the pressure relief device(s).
The design pressures for testing shall be those listed on the condensing unit, compressor or compressor unit name-plate, as required by ASHRAE 15.

**Exceptions:**

1. Gas bulk storage tanks that are not permanently connected to a refrigeration system.

2. Systems using an A1 refrigerant erected on the premises with copper tubing not exceeding $\frac{5}{8}$-inch (15.8 mm) OD, with wall thickness as required by ASHRAE 15, shall be tested in accordance with Section 1108.1, or by means of refrigerant charged into the system at the saturated vapor pressure of the refrigerant at 70°F (21°C) or higher.

3. Limited-charge systems equipped with a pressure relief device, erected on the premises, shall be tested at a pressure not less than one and one-half times the pressure setting of the relief device. If the equipment or appliance has been tested by the manufacturer at one and one-half times the design pressure, the test after erection on the premises shall be conducted at the design pressure.

1108.1.1 **Booster compressor.** Where a compressor is used as a booster to obtain an intermediate pressure and discharges into the suction side of another compressor, the booster compressor shall be considered a part of the low side, provided that it is protected by a pressure relief device.

1108.1.2 **Centrifugal/nonpositive displacement compressors.** In field-testing systems using centrifugal or other nonpositive displacement compressors, the entire system shall be considered as the low-side pressure for field test purposes.

1108.2 **Test gases.** Tests shall be performed with an inert dried gas including, but not limited to, nitrogen and carbon dioxide. Oxygen, air, flammable gases and mixtures containing such gases shall not be used.

**Exceptions:**

1. The use of air is allowed to test R-717, ammonia, systems provided that they are subsequently evacuated before charging with refrigerant.

2. Mixtures of dry nitrogen, inert gases, or a combination of them with nonflammable refrigerants in concentrations of a refrigerant weight fraction (mass fraction) not exceeding five are allowed for tests.

1108.3 **Test apparatus.** The means used to build up the test pressure shall have either a pressure-limiting device or a pressure-reducing device and a gauge on the outlet side.

1108.4 **Declaration.** A certificate of test shall be provided for all systems containing 55 pounds (24.9 kg) or more of refrigerant. The certificate shall give the name of the refrigerant and the field test pressure applied to the high side and the low side of the system. The certification of test shall be signed by the installer and shall be made part of the public record.
SECTION MC 1109
PERIODIC TESTING

1109.1 Testing required. The following emergency devices and systems shall be periodically tested and the results logged in accordance with the manufacturer’s instructions and as required by the Commissioner of the Fire Department:

1. Treatment and flaring systems.
2. Valves and appurtenances necessary to the operation of emergency refrigeration control boxes.
3. Fans and associated equipment intended to operate emergency purge ventilation systems.
4. Detection and alarm systems.

1109.2 Operation. Operating permits and qualification of operators for refrigeration systems shall comply with the requirements of the New York City Fire Code.

§ 13. Chapter 12 of the New York city mechanical code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 12
HYDRONIC PIPING

SECTION MC 1201
GENERAL

1201.1 Scope. The provisions of this chapter shall govern the construction, installation, alteration and repair of hydronic piping systems. This chapter shall apply to hydronic piping systems that are part of heating, ventilation and air-conditioning systems. Such piping systems shall include steam, hot water, chilled water, condenser water, cooling coil condensate drain, steam condensate and ground-source [ground-source] ground-source heat pump loop systems. Potable cold and hot water distribution systems shall be installed in accordance with the New York City Plumbing Code.

1201.2 Sizing. Piping and piping system components for hydronic systems shall be sized for the design requirements of the system.

1201.3 Standards. As an alternative to the provisions of Sections 1202 and 1203, piping shall be designed, installed, inspected and tested in accordance with ASME B31.1 and ASME B31.9, as applicable.

SECTION MC 1202
MATERIAL

1202.1 Piping. Piping material, other than those contained within this section and conforming with the ASTM standards listed within this chapter, shall be of an approved type.
**Exception:** Embedded piping regulated by Section 1209, and ground-source heat pump loop systems regulated by Section 1210.

1202.2 Used existing materials. Reused pipe, fittings, valves or other materials shall be clean and free of foreign materials.

1202.3 Material rating. Materials shall be rated for the operating temperature and pressure of the hydronic system. Materials shall be suitable for the type of fluid in the hydronic system.

1202.4 Piping materials standards. Hydronic pipe shall conform to the standards listed in Table 1202.4. The exterior of the pipe shall be protected from corrosion and degradation.

1202.6 Valves. Valves shall be constructed of materials that are compatible with the type of piping material and fluids in the system. Valves shall be rated for the temperatures and pressures of the systems in which the valves are installed.

1202.7 Flexible connectors, expansion and vibration compensators. Flexible connectors, expansion and vibration control devices and fittings, when used, shall protect the components of the hydronic system from damage caused by expansion, contraction, transverse movement, angular deflection and vibration, shall be rated for the temperatures and pressures of the systems in which the devices are installed, and shall be compatible with the fluid and all materials provided.

SECTION MC 1203
JOINTS AND CONNECTIONS

1203.1 Approval. Joints and connections, other than those contained in Section 1203 and conforming to the ASTM standards listed in Section 1203, shall be of an approved type. Joints and connections shall be tight for the pressure of the hydronic system.

1203.1.1 Joints between different piping materials. Joints between different piping materials shall be rated for the temperatures and pressures of the systems in which the devices are installed and shall be compatible with the fluid and all materials provided.

1203.1.2 Joints between dissimilar metallic piping materials. Joints between dissimilar metallic piping materials shall be provided to protect against galvanic corrosion. Such joints shall be made with dielectric fittings conforming to ANSI B16.39 or ASTM F 492, as applicable, shall be rated for the temperatures and pressures of the systems in which the devices are installed and shall be compatible with the fluid and all materials provided.
**Exception:** Dielectric fittings shall not be required for joints between dissimilar metal piping used within heat transfer appliances or equipment when such joints are provided by the appliance or equipment manufacturer, and such appliance or equipment is connected with isolation valves that are accessible.

1203.2 **Preparation of pipe ends.** Pipe shall be cut square, reamed and chamfered, and shall be free of burrs and obstructions. Pipe ends shall have full-bore openings and shall not be undercut.

1203.3 **Joint preparation and installation.** [When] Where required by Sections 1203.4 through 1203.14, the preparation and installation of brazed, mechanical, soldered, solvent-cemented, threaded and welded joints shall comply with Sections 1203.3.1 through [1203.3.7] 1203.3.8.

1203.3.1 **Brazed joints.** All joints shall be brazed with a brazing procedure developed and qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.2 Standard for Brazing Procedure and Performance Qualification.

1203.3.2 **Mechanical joints.** Mechanical joints shall be installed in accordance with the manufacturer’s instructions.

1203.3.3 **Soldered joints.** Joint surfaces shall be cleaned. A flux conforming to ASTM B 813 shall be applied. The joint shall be soldered with a solder conforming to ASTM B 32.

1203.3.4 **Solvent-cemented joints.** Joint surfaces shall be clean and free of moisture. A primer, compatible with both the piping material and the cement shall be applied to pipe-joint surfaces, in accordance with the manufacturer’s requirements. Joints shall be made while the cement is wet. Solvent cement conforming to the following standards shall be applied to all joint surfaces:

1. ASTM D 2235 for ABS joints.
2. ASTM F 493 for CPVC joints.
3. ASTM D 2564 for PVC joints.

1203.3.5 **Threaded joints.** Threads shall conform to ASME B1.20.1. Schedule 80 or heavier plastic pipe shall be threaded with dies specifically designed for plastic pipe. Thread lubricant, pipe-joint compound or tape shall be applied on the male threads only and shall be compatible for application on the piping material and fluid.

1203.3.6 **Welded joints.** All joints shall be welded with a welding procedure developed and qualified in accordance with the ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.1 Specifications for Welding Procedure and Performance Qualification.

1203.3.7 **Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall conform to the requirements of ASTM F 1476 and shall be installed in accordance with the manufacturer’s installation instructions.
1203.3.8 Mechanically formed tee fittings. Mechanically extracted outlets shall have a height not less than three times the thickness of the branch tube wall.

1203.3.8.1 Full flow assurance. Branch tubes shall not restrict the flow in the run tube. A dimple/depth stop shall be formed in the branch tube to ensure that penetration into the outlet is of the correct depth. For inspection purposes, a second dimple shall be placed [0.25] \( \frac{1}{4} \) inch (6.4 mm) above the first dimple. Dimples shall be aligned with the tube run.

1203.3.8.2 Brazed joints. Mechanically formed tee fittings shall be brazed in accordance with Section 1203.3.1.

1203.4 ABS plastic pipe. Joints between ABS plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.5 Brass pipe. Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints conforming to Section 1203.3.

1203.6 Brass tubing. Joints between brass tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3.

1203.7 Copper or copper-alloy pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, soldered, threaded or welded joints conforming to Section 1203.3.

1203.8 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed, mechanical or soldered joints conforming to Section 1203.3, flared joints conforming to Section 1203.8.1 or push-fit joints conforming to Section 1203.8.2.

1203.8.1 Flared joints. Flared joints shall be made by a tool designed for that operation.

1203.8.2 Push-fit joints. Push-fit joints shall be installed in accordance with the manufacturer’s instructions.

1203.9 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.10 Reserved.

1203.11 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall conform to Sections 1203.11.1 and 1203.11.2. Mechanical joints shall conform to Section 1203.3.

1203.11.1 Compression-type fittings. [When] Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1203.11.2 Plastic-to-metal connections. Soldering on the metal portion of the system shall be performed [at least] not less than 18 inches (457.2 mm) from a plastic-to-metal adapter in the same water line.
1203.12 **PVC plastic pipe.** Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints conforming to Section 1203.3.

1203.13 **Steel pipe.** Joints between steel pipe or fittings shall be mechanical, threaded or welded joints conforming to Section 1203.3.

1203.14 **Steel tubing.** Joints between steel tubing or fittings shall be mechanical or welded joints conforming to Section 1203.3.

1203.15 **Polyethylene plastic pipe and tubing for ground source heat pump loop systems.** Joints between polyethylene plastic pipe and tubing or fittings for ground source heat pump loop systems shall be heat-fusion joints conforming to Section 1203.15.1, electrofusion joints conforming to Section 1203.15.2, or stab type insertion joints conforming to Section 1203.15.3.

1203.15.1 **Heat-fusion joints.** Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free of moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1203.15.2 **Electrofusion joints.** Joints shall be of the electrofusion type. Joint surfaces shall be clean and free of moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1203.15.3 **Stab type insert fittings.** Joint surfaces shall be clean and free of moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1203.16 **Polypropylene (PP) plastic.** Joints between PP plastic pipe and fittings shall comply with Sections 1203.16.1 1203.15.1 and 1203.16.2 1203.15.2.

1203.16.1 **Heat-fusion joints.** Heat-fusion joints for polypropylene (PP) pipe and tubing shall be installed with socket-type heat-fused polypropylene fittings. [electrofusion] electro-fusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1203.16.2 **Mechanical and compression sleeve joints.** Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer’s instructions.

1203.17 **Raised temperature polyethylene (PE-RT) plastic tubing.** Joints between raised temperature polyethylene tubing and fittings shall conform to Sections 1203.17.1 1203.16.1 and 1203.17.2 1203.16.2. Mechanical joints shall conform to Section 1203.3.

1203.17.1 **Compression-type fittings.** Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.
**1203.17.2 PE-RT-to-metal connections.** Solder joints in a metal pipe shall not occur within 18 inches (457.2 mm) of a transition from such metal pipe to PE-RT pipe.

**1203.18 PE-AL-PE pressure pipe.** Joints between polyethylene/aluminum/polyethylene pressure pipe and fittings shall conform to Sections 1203.17.1 and 1203.17.2. Mechanical joints shall comply with Section 1203.3.

**1203.18.1 Compression-type fittings.** Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

**1203.18.2 PE-AL-PE-to-metal connections.** Solder joints in a metal pipe shall not occur within 18 inches (457.2 mm) of a transition from such metal pipe to PE-AL-PE pipe.

**1203.19 Cross-linked polyethylene/aluminum/cross-linked polyethylene (PEX-AL-PE) pressure pipe.** Joints between cross-linked polyethylene/aluminum/cross-linked polyethylene pressure pipe and fittings shall conform to Sections 1203.18.1 and 1203.18.2. Mechanical joints shall comply with Section 1203.3.

**1203.19.1 Compression-type fittings.** Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

**1203.19.2 PEX-AL-PEX-to-metal connections.** Solder joints in a metal pipe shall not occur within 18 inches (457.2 mm) of a transition from such metal pipe to PEX-AL-PEX pipe.

---

**SECTION MC 1204**

**PIPE INSULATION**

**1204.1 Insulation characteristics.** Pipe insulation installed in buildings shall conform to the requirements of the New York City Energy Conservation Code, shall be tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231; and shall have a maximum flame spread index of 25 and a smoke-developed index not exceeding 450. Insulation installed in an air plenum shall comply with Section 602.2.1.

**1204.2 Required thickness.** Hydronic piping shall be insulated to the thickness required by the New York City Energy Conservation Code.

---

**SECTION MC 1205**

**VALVES**

**1205.1 Where required.** Shutoff valves shall be installed in hydronic piping systems in the locations indicated in Sections 1205.1.1 through 1205.1.6.

**1205.1.1 Heat exchangers.** Shutoff valves shall be installed on the supply and return side of a heat exchanger.
Exception: Shutoff valves shall not be required when heat exchangers are integral with a boiler; or are a component of a manufacturer’s boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1205.1.2 Central systems. Shutoff valves shall be installed on the building supply and return of central utility systems, and district heating and cooling systems.

1205.1.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1205.1.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1205.1.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical equipment and appliances. This requirement does not apply to components of a hydronic system such as pumps, air separators, metering devices and similar equipment.

1205.1.6 Expansion tanks. Lockable shutoff valves shall be installed at connections to all expansion tanks. Valves shall be locked in the open position.

1205.2 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

SECTION MC 1206
PIPING INSTALLATION

1206.1 General. Piping, valves, fittings and connections shall be installed in accordance with the conditions of approval.

1206.2 System drain down. Hydronic piping systems shall be designed and installed to permit the system to be drained. Where the system drains to the plumbing drainage system, the installation shall conform to the requirements of the New York City Plumbing Code.

Exception: The buried portions of systems embedded underground.

1206.3 Protection of potable water. The potable water system shall be protected from backflow in accordance with the New York City Plumbing Code.

1206.4 Pipe penetrations. Openings for pipe penetrations in walls, floors or ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the New York City Building Code.

1206.5 Clearance to combustibles. A pipe in a hydronic piping system in which the exterior temperature exceeds 250°F (121°C) shall have a minimum clearance of 1 inch (25.4 mm) to combustible materials.
1206.6 Contact with building material. A hydronic piping system shall not be in direct contact with building materials that cause the piping material to degrade or corrode, or that interfere with the operation of the system.

1206.7 Water hammer. The flow velocity of the hydronic piping system shall be controlled to reduce the possibility of water hammer. Where a quick-closing valve creates water hammer, an engineered water-hammer arrestor shall be installed. The arrestor shall be located within a range as specified by the manufacturer of the quick-closing valve.

1206.8 Steam piping pitch. Steam piping shall be installed to drain to the boiler or the steam trap. Steam systems shall not have drip pockets that reduce the capacity of the steam piping.

1206.9 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1206.9.1 Flood hazard. Piping located in areas of special flood hazard areas shall comply with Appendix G of the New York City Building Code.

1206.10 Pipe support. Pipe shall be supported in accordance with Section 305. Seismic supports shall be provided where required by the New York City Building Code.

1206.11 Condensation. Provisions shall be made to prevent the formation of condensation on the exterior of piping.

SECTION MC 1207
TRANSFER FLUID

1207.1 Flash point. The flash point of transfer fluid in a hydronic piping system shall be not less than 50°F (28°C) above the maximum system operating temperature.

1207.2 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

SECTION MC 1208
TESTS

1208.1 General. Hydronic piping systems other than ground-source heat pump loop systems shall be tested hydrostatically at one and one half times the system design operating pressure, but not less than 100 psi (689 kPa). The duration of each test shall be not less than 2 hours. Ground-source heat pump loop systems shall be tested in accordance with Section [1208.1.1] 1210.10.

[1208.1.1 Ground-source heat pump loop systems. Before connection (header) trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689 kPa).]
for 30 minutes with no observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the problem shall be identified and corrected.

SECTION MC 1209
EMBEDDED PIPING

1209.1 Materials. [Piping for heating panels] Embedded piping shall be [standard weight steel pipe, Type L copper tubing, or] plastic pipe or tubing, in accordance with Section 1202, rated at 100 psi ([689] 689.5 kPa) at 180°F ([82] 82.2°C).

1209.2 Pressurizing during installation. Piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure.

1209.3 Embedded joints. Joints of pipe or tubing that are embedded in a portion of the building, such as concrete or plaster, shall be [in accordance with the requirements of Sections 1209.3.1 and 1209.2] thermally-fused.

[1209.3.1 Steel pipe joints. Steel pipe shall be welded by electrical arc or oxygen/acetylene method.]

[1209.3.2 Copper tubing joints. Copper tubing joints shall be brazed in accordance with Section 1203.3.]

1209.4 Not embedded related piping. Joints of other piping in cavities or running exposed shall be joined in accordance with manufacturer’s [installation] instructions and related sections of this code.

1209.5 Thermal barrier required. Radiant floor heating systems shall be provided with a thermal barrier in accordance with Sections 1209.5.1 through 1209.5.4.

Exception: Insulation shall not be required in engineered systems where it can be demonstrated that the insulation will decrease the efficiency or have a negative effect on the installation.

1209.5.1 Slab-on-grade installation. Radiant piping utilized in slab-on-grade applications shall be provided with insulating materials installed beneath the piping having a minimum R-value of 5.

1209.5.2 Suspended floor installation. In suspended floor applications, insulation shall be installed in the joist bay cavity serving the heating space above and shall consist of materials having a minimum R-value of 11.

1209.5.3 Thermal break required. A thermal break shall be provided consisting of asphalt expansion joint materials or similar insulating materials at a point where a heated slab meets a foundation wall or other conductive slab.

1209.5.4 Thermal barrier material marking. Insulating materials utilized in thermal barriers shall be installed such that the manufacturer’s R-value mark is readily observable upon inspection.
SECTION MC 1210
PLASTIC PIPE GROUND-SOURCE HEAT PUMP LOOP SYSTEMS

1210.1 Ground-source heat pump-loop water piping. Ground-source heat pump ground-loop piping and tubing material for water-based systems shall conform to the standards cited in this section.

1210.2 Used materials. Reused pipe, fittings, valves, and other materials shall not be permitted in ground-source heat pump loop systems.

1210.3 Material rating. Pipe and tubing shall be rated for the operating temperature and pressure of the ground-source heat pump loop system. Fittings shall be suitable for the pressure applications and recommended by the manufacturer for installation with the pipe and tubing material installed. Where used underground, materials shall be suitable for burial.

1210.4 Piping and tubing materials standards. Ground-source heat pump ground-loop pipe and tubing shall conform to the standards listed in Table 1210.4.

1210.6 Joints. Joints and connections, other than those covered by Section 1210 and conforming to the ASTM standards listed therein, shall be of an approved type. Joints and connections shall be tight for the pressure of the ground-source loop system. Joints used underground shall be in accordance with manufacturer’s instructions for buried applications.

1210.6.1 Joints between different piping materials. Joints between different piping materials shall be made with transition fittings compatible with both materials and the fluid contained within the system. Transition fittings must be used in accordance with manufacturer’s instructions.

1210.6.1.1 Plastic-to-metal connections. Soldering on the metal portion of the system shall be performed not less than 18 inches (457.2 mm) from a plastic-to-metal adapter in the same water line.

1210.6.2 Preparation of pipe ends. Pipe shall be cut square, be reamed, and be free of burrs and obstructions. CPVC, PE, and PVC pipe shall be chamfered. Pipe ends shall have full-bore openings and shall not be undercut.

1210.6.3 Joint preparation and installation. Where required by Sections 1210.6.4 through 1210.6.6, the preparation and installation of mechanical and thermoplastic-welded joints shall comply with Sections 1210.6.3.1 and 1210.6.3.2.

1210.6.3.1 Mechanical joints. Mechanical joints shall be installed in accordance with the manufacturer’s instructions.

1210.6.3.2 Thermoplastic-welded joints. Joint surfaces for thermoplastic-welded joints shall be cleaned by a procedure in accordance with the manufacturer’s instructions. Joints shall be welded in accordance with the manufacturer’s instructions.

1210.6.4 CPVC plastic pipe. Joints between CPVC plastic pipe or fittings shall be solvent-cemented or threaded joints complying with Section 1203.3.

1210.6.5 Cross-linked polyethylene (PEX) plastic tubing. Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections 1210.6.5.1 and 1210.6.5.2. Mechanical joints shall comply with Section 1210.6.3.

1210.6.5.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.6.6 Polyethylene plastic pipe and tubing for ground-source heat pump loop systems. Joints between polyethylene plastic pipe and tubing or fittings for ground-source heat pump loop systems shall be heat fusion joints complying with Section 1210.6.6.1, electrofusion joints.
complying with Section 1210.6.6.2, or stab-type insertion joints complying with Section 1210.6.6.3.

1210.6.6.1 Heat-fusion joints. Joints shall be of the socket-fusion, saddle-fusion or butt-fusion type, joined in accordance with ASTM D 2657. Joint surfaces shall be clean and free from moisture. Joint surfaces shall be heated to melt temperatures and joined. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM D 2683 or ASTM D 3261.

1210.6.6.2 Electrofusion joints. Joints shall be of the electrofusion type. Joint surfaces shall be clean and free from moisture, and scoured to expose virgin resin. Joint surfaces shall be heated to melt temperatures for the period of time specified by the manufacturer. The joint shall be undisturbed until cool. Fittings shall be manufactured in accordance with ASTM F 1055.

1210.6.6.3 Stab-type insert fittings. Joint surfaces shall be clean and free from moisture. Pipe ends shall be chamfered and inserted into the fittings to full depth. Fittings shall be manufactured in accordance with ASTM F 1924.

1210.6.7 Polypropylene (PP) plastic. Joints between PP plastic pipe and fittings shall comply with Sections 1210.6.7.1 and 1210.6.7.2.

1210.6.7.1 Heat-fusion joints. Heat-fusion joints for polypropylene (PP) pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings, electrofusion polypropylene fittings or by butt fusion. Joint surfaces shall be clean and free from moisture. The joint shall be undisturbed until cool. Joints shall be made in accordance with ASTM F 2389.

1210.6.7.2 Mechanical and compression sleeve joints. Mechanical and compression sleeve joints shall be installed in accordance with the manufacturer’s instructions.

1210.6.8 Raised temperature polyethylene (PE-RT) plastic tubing. Joints between raised temperature polyethylene tubing and fittings shall comply with Sections 1210.6.8.1 and 1210.6.8.2. Mechanical joints shall comply with Section 1210.6.3.

1210.6.8.1 Compression-type fittings. Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

1210.6.9 PVC plastic pipe. Joints between PVC plastic pipe and fittings shall be solvent-cemented or threaded joints comply with Section 1203.3.

1210.7 Shutoff valves. Shutoff valves shall be installed in ground-source loop piping systems in the locations indicated in Sections 1210.7.1 through 1210.7.7.

1210.7.1 Heat exchangers. Shutoff valves shall be installed on the supply and return side of a heat exchanger.
Exception: Shutoff valves shall not be required where heat exchangers are integral with a boiler; or are a component of a manufacturer’s boiler and heat exchanger packaged unit and are capable of being isolated from the hydronic system by the supply and return valves required by Section 1005.1.

1210.7.2 Central systems. Shutoff valves shall be installed on the building supply and return of a central utility system.

1210.7.3 Pressure vessels. Shutoff valves shall be installed on the connection to any pressure vessel.

1210.7.4 Pressure-reducing valves. Shutoff valves shall be installed on both sides of a pressure-reducing valve.

1210.7.5 Equipment and appliances. Shutoff valves shall be installed on connections to mechanical equipment and appliances. This requirement does not apply to components of a ground-source loop system such as pumps, air separators, metering devices, and similar equipment.

1210.7.6 Expansion tanks. Shutoff valves shall be installed at connections to nondiaphragm-type expansion tanks.

1210.7.7 Reduced pressure. A pressure relief valve shall be installed on the low-pressure side of a hydronic piping system that has been reduced in pressure. The relief valve shall be set at the maximum pressure of the system design. The valve shall be installed in accordance with Section 1006.

1210.8 Installation. Piping, valves, fittings, and connections shall be installed in accordance with the conditions of approval.

1210.8.1 Protection of potable water. Where ground-source heat pump ground-loop systems have a connection to a potable water supply, the potable water system shall be protected from backflow in accordance with the New York City Plumbing Code.

1210.8.2 Pipe penetrations. Openings for pipe penetrations in walls, floors and ceilings shall be larger than the penetrating pipe. Openings through concrete or masonry building elements shall be sleeved. The annular space surrounding pipe penetrations shall be protected in accordance with the New York City Building Code.

1210.8.3 Clearance from combustibles. A pipe in a ground-source heat pump piping system having an exterior surface temperature exceeding 250°F (121.1°C) shall have a minimum clearance of 1 inch (25.4 mm) from combustible materials.

1210.8.4 Contact with building material. A ground-source heat pump ground-loop piping system shall not be in direct contact with building materials that cause the piping or fitting material to degrade or corrode, or that interfere with the operation of the system.
1210.8.5 Strains and stresses. Piping shall be installed so as to prevent detrimental strains and stresses in the pipe. Provisions shall be made to protect piping from damage resulting from expansion, contraction and structural settlement. Piping shall be installed so as to avoid structural stresses or strains within building components.

1210.8.6 Flood hazard. Piping located in a flood hazard area shall be capable of resisting hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation.

1210.8.7 Pipe support. Pipe shall be supported in accordance with Section 305.

1210.8.8 Velocities. Ground-source heat pump ground-loop systems shall be designed so that the flow velocities do not exceed the maximum flow velocity recommended by the pipe and fittings manufacturer and shall be controlled to reduce the possibility of water hammer.

1210.8.9 Labeling and marking. Ground-source heat pump ground-loop system piping shall be marked with tape, metal tags or other method where it enters a building indicating “GROUND-SOURCE HEAT PUMP LOOP SYSTEM.” The marking shall indicate any antifreeze used in the system by name and concentration.

1210.8.10 Chemical compatibility. Antifreeze and other materials used in the system shall be chemically compatible with the pipe, tubing, fittings, and mechanical systems.

1210.9 Makeup water. The transfer fluid shall be compatible with the makeup water supplied to the system.

1210.10 Tests. Before connection header trenches are backfilled, the assembled loop system shall be pressure tested with water at 100 psi (689.5 kPa) for 15 minutes, in which time there shall not be observed leaks. Flow and pressure loss testing shall be performed and the actual flow rates and pressure drops shall be compared to the calculated design values. If actual flow rate or pressure drop values differ from calculated design values by more than 10 percent, the cause shall be identified and corrective action taken.

1210.11 Embedded piping. Ground-source heat pump ground-loop piping to be embedded in concrete shall be pressure tested prior to pouring concrete. During pouring, the pipe shall be maintained at the proposed operating pressure. Embedded piping shall comply with Section 1209.

SECTION MC [1240] 1211
HIGH-PRESSURE STEAM AND HIGH TEMPERATURE HOT WATER PIPING SYSTEMS

1211.1 Scope. The provisions of this section shall apply to high-pressure steam piping system, which is defined as a system operating at a steam pressure of more than 15 psi (103.4 kPa), and high temperature water intended for operation at pressures in excess of 160 psi (1103.2 kPa) and temperatures in excess of 250°F (121.1°C). For purposes of this section, loops, bends or offsets of the piping shall not be considered expansion joints.
[1210.2] 1211.2 New systems. For purposes of this section, the replacement of existing steam piping systems, the installation of a new system in existing buildings, as well as installations in buildings hereafter constructed, shall be considered to be new high-pressure steam piping systems. The following requirements are applicable:

[1210.2.1] 1211.2.1 Design. The design of new steam piping systems shall be conducted as follows:

1. The system shall be designed by an engineer. An application and plans shall be filed and the approval of the department obtained. The plans and application shall contain, but not be limited to, the following information:
   1.1. Size and location of all steam piping.
   1.2. The operating pressures and temperatures.
   1.3. The location, type, specifications and details of all expansion joints.
   1.4. The design, size, material and location of all anchors, guides and auxiliary steel, and the stresses thereon.

2. Systems using utility street steam shall be designed for a pressure of 200 psig (1379 kPa) and 413°F (212°C) up to and including the steam pressure reducing valve or valves which reduce the pressure of 90 psig (620.5 kPa) or below. For steam pressures between 90 psig (620.5 kPa) and 16 psig (110.3 kPa), the system shall be designed for 125 psig (861.8 kPa).

3. Steam distribution systems utilizing pressure reducing valves.
   3.1. Safety Shutoff Valves (["SSO"] to protect downstream piping from overpressure shall be allowed in lieu of a safety relief valve vented to the outdoors as required by Section 1006.6.
   3.2. SSO shall be designed to automatically close at or below the design pressure of the downstream piping system that is being protected, to provide positive shutoff against full upstream pressure. Manual reset shall be required to reopen the SSO.
   3.3. SSO shall be designed in accordance with the Steam Distribution Utility System requirements of the utility company having jurisdiction and ASME B31.1.

4. Bellows expansion joints shall not be utilized on high pressure steam piping.

Exception: Bellows expansion joints shall be permitted for final connection to equipment where readily accessible for inspection and service and within Mechanical Equipment Rooms.
**1210.2.2 Installation.** The installation of new steam piping systems shall be conducted as follows:

1. Installations, including any welding, shall be subject to special inspection.

2. Welders shall be qualified for all required pipe sizes, wall thicknesses and positions in accordance with the *ASME Boiler and Pressure Vessel Code*, Section IX. Requalification is required every five years or sooner if the commissioner has a specific reason to doubt a welder’s ability to make acceptable welds.

3. Welder qualification testing shall be performed by an approved agency listed with the department, and the inspector witnessing the test shall be an authorized AWS Certified Welding Inspector. If the testing is by radiography, the test specimen shall be evaluated by personnel having a minimum radiography qualification of Level II in accordance with the ASNT, Document No. SNT-TC-1A, Supplement A. A successful radiographic test of a production weld made within the 6 months prior to requalification may be considered as an acceptable requalification test.

4. Copies of the certified welder qualification reports shall be maintained by the responsible welding agency and the company performing the welding, and shall be made available upon request to the department.

5. No reports from any welding inspection agency shall be accepted unless such agency has first requested and obtained approval from the department in accordance with rules of the department.

6. Pipe welding shall conform to the following:

   6.1. All piping over 2 inches (50.8 mm) shall be butt-welded. Piping 2 inches (50.8 mm) and under may be socket-welded or threaded, providing Schedule 80 piping is utilized.

   6.2.Threaded piping may continue to be used for existing construction in size of 6 inches (152 mm) and under.

   6.3. Where welding is not feasible, the commissioner may allow an acceptable alternative.

7. Radiographic examination, when required, shall be performed on butt-welds in accordance with ASME B31.1 based on the piping system design pressure and shall be as follows:

<table>
<thead>
<tr>
<th>Piping System Design Pressure</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>90 psig ([624] 620.5 kPa) or below</td>
<td>Not Required</td>
</tr>
<tr>
<td>91 psig ([627] 627.4 kPa) to</td>
<td></td>
</tr>
<tr>
<td>150 psig ([1034] 1034.2 kPa)</td>
<td>10 at Random</td>
</tr>
</tbody>
</table>
Over 150 psig (1034.2 kPa) 100

However, if, in the opinion of the engineer responsible for special inspection, radiographic examination is not required for piping at pressure between 90 psig (620.5 kPa) and 150 psig (1034.2 kPa), the engineer shall so specify in writing, and the final report on the installation may omit the foregoing, and be predicated on all of the other requirements noted in this section, and a hydrostatic test.

[1210.2.3] 1211.2.3 Testing. Hydrostatic testing shall be conducted on the completed installation at 150 percent of the design pressure for all piping pressure. Where the changes in an existing steam system involve less than 30 percent of the piping in the system, the testing may be in accordance with ASME B31.1.

[1210.2.4] 1211.2.4 Relocation. The commissioner, where deemed necessary, shall require the replacement or relocation of any expansion joints, guides or anchors. The commissioner shall cause the expansion joints in potentially hazardous locations, such as those that are located adjacent to tenant occupied spaces, to be relocated, unless means exist or are provided for eliminating the hazard.

[1210.3] 1211.3 Existing systems. Existing steam piping systems shall be in accordance with Sections [1210.3.1] 1211.3.1 through [1210.3.3] 1211.3.2. Upon the completion of a new high-pressure steam piping system and department approval of same, the rules relating to maintenance requirements and the keeping of records for existing high-pressure steam piping systems shall apply.

[1210.3.1] 1211.3.1 Maintenance inspections. Expansion joints, anchorage and guides shall be inspected as follows:

1. Expansion joints shall be visually inspected monthly.

2. The anchorage and guides shall be visually inspected annually. Exposure of the structural attachments to the buildings of the anchorages or guides shall not be required.

3. A record of such inspections shall be kept by the person in charge of the mechanical equipment of the building or other qualified person designated by the owner and acceptable to the commissioner. The records shall be available at the premises and subject to inspection by the commissioner.

[1210.3.2] 1211.3.2 Work approval. No joint, anchorage or guides shall be repaired, replaced or relocated without a work permit issued by the department. The application for the permit shall contain all pertinent information and shall be filed by an engineer knowledgeable as to high-pressure steam piping systems. The engineer shall be responsible for the special inspection of the proposed work in accordance with the approved application. This provision shall not apply to the repacking of a slip or ball joint; however, records of such repacking shall be kept in the inspection records as provided in Section [1210.3.4] 1211.3.1. Item 3. When, in the opinion of the engineer, the requirement for prior department approval would create an imminent health or safety hazard, the engineer may permit the work to proceed
without prior approval. In such cases, the engineer shall, prior to the repair, replacement or relocation, notify by telephone the borough commissioner of the borough in which the building is located; and, if the emergency occurs at other than normal working hours, he or she shall notify the department in a manner prescribed by the commissioner. This shall be followed by the filing of the application for department approval as specified in Section 28-105.4.1 of the Administrative Code.

§14. Chapter 13 of the New York city mechanical code, as amended by local law number 141 for the year 2013, exception 3 of section 1305.11.1.2 as amended by local law number 195 for the year 2018, is amended to read as follows:

CHAPTER 13
FUEL-OIL PIPING AND STORAGE

SECTION MC 1301
GENERAL

1301.1 Scope. This chapter shall govern the design, installation, construction and repair of fuel-oil storage and piping systems. The storage of flammable and combustible liquids not addressed in this chapter shall be in accordance with the New York City Fire Code.

1301.2 Storage and piping systems. Fuel-oil storage and piping systems shall comply with the requirements of [Chapter 13] this chapter, Appendix C and, to the extent not otherwise provided for in this code, shall comply with the requirements of NFPA 31. All [above ground] above-ground and underground storage facilities [with a combined storage capacity of over 1,100 gallons (4160 L)] shall also comply with the requirements of the New York State Department of Environmental Conservation’s Petroleum Bulk Storage Code.

1301.3 Fuel type. An appliance shall be designed for use with the type of fuel to which it will be connected. Such appliance shall not be converted from the fuel specified on the rating plate for use with a different fuel without conforming with its listing and manufacturers specifications and securing reapproval from the commissioner.

1301.4 Fuel tanks, piping and valves. The tank, piping and valves for appliances burning oil shall be installed in accordance with the requirements of this chapter. [When oil burning equipment is] Where oil-burning appliances are served by a tank located such that any part of the tank is above the level of the burner inlet connection and where the fuel supply line is taken from the top of the tank, an approved anti-siphon valve or other siphon-breaking device shall be installed. The anti-siphon valve or siphon-breaking device shall be located at the highest point in the supply line.

Exceptions: An anti-siphon valve or other siphon-breaking device shall not be required where either:

1. An approved foot valve is used in the tank, or

2. No. 6 fuel oil is used.
1301.5 Tanks abandoned or removed. All exterior above-grade fill piping shall be removed when tanks are abandoned or removed. Tank abandonment and removal shall be in accordance with Section 3404 of the New York City Fire Code.

1301.6 Out of service system. Fuel-oil storage systems that are temporarily or permanently taken out of service shall comply with the requirements of the New York City Fire Code and of the New York State Department of Environmental Conservation’s Petroleum Bulk Storage Code.

1301.7 Fuel-oil spill and overfill prevention equipment. Fuel-oil spill and overfill prevention equipment shall comply with EPA 40 CFR Parts 280, and Section 1305.6.6.

1301.8 Portable fire extinguishers. Portable fire extinguishers shall be provided as required by the New York City Fire Code and NFPA 10.

1301.9 Absorbent materials. The building owner shall maintain a sufficient quantity of absorbent materials near fuel-oil storage tanks, pumps, and related equipment to control leaks and slipping hazards.

1301.10 Certificate of fitness. Where fuel-oil piping systems utilize pumps to transfer fuel oil to equipment at levels above the lowest floor or to storage tanks at levels above the lowest floor in buildings, a qualified employee or contracted general company holding a certificate of fitness from the Fire Department shall maintain the fuel-oil system.

SECTION MC 1302
MATERIAL

1302.1 General. Piping materials shall conform to the ASTM standards cited in this section.

1302.2 Rated for system. All materials shall be rated for the operating temperatures and pressures of the system, and shall be compatible with the type of liquid being handled by the system.

1302.3 Pipe standards. Fuel-oil pipe shall comply with [the standards listed in Table 1302.3] Sections 1302.3.1 and 1302.3.2.

1302.3.1 Fuel-oil pipe. Fuel-oil pipe shall comply with the standards listed in Table 1302.3.

[Exception:] 1302.3.2 Systems serving appliances above ground above the lowest floor. Piping for fuel-oil systems utilizing a transfer pump to [equipment] appliances at levels above ground above the lowest floor or to storage tanks at levels above the lowest floor in buildings shall comply with the requirements of Section 1305.9.5.

</tbody>
</table>

1302.6 Bending of pipe. Pipe shall be suitable for bending and shall conform with Table 1302.3. Pipe bends shall be made with approved equipment. The bend shall not exceed the structural limitations of the pipe.

1302.7 Pumps. Pumps that are not part of an appliance shall be of a positive-displacement type. The pump shall automatically shut off the supply when not in operation. [Pumps shall be listed and labeled in accordance with UL 343.]

1302.8 Flexible connectors and hoses. Flexible metal connectors and hoses used where rigid connections are impractical or to reduce the effect of jarring and vibration shall be listed and labeled in accordance with [UL 536] UL 2039 and shall be installed in compliance with its label.
and the manufacturer’s installation instructions and shall not exceed 18 inches (457.2 mm). Connectors made from combustible materials shall not be used inside buildings or above ground outside of buildings.

**1302.9 Flexible fuel-oil piping systems with continuous vacuum leak detection.** Flexible fuel-oil piping systems with continuous vacuum leak detection consisting of a single wall or double wall metallic primary carrier encased with outer polymer jacket shall comply with the requirements of Sections 1302.9.1 through 1302.9.2.

**1302.9.1 Listing:** Flexible fuel-oil piping systems with continuous leak detection shall be tested and evaluated in accordance with ULC-S667 and shall be listed and labeled by an approved agency.

**1302.9.2 Design and Installation.** Flexible fuel-oil piping systems with continuous leak detection shall comply with the requirements of Sections 1302.9.2.1 through 1302.9.2.6.

**1302.9.2.1 Installation.** Flexible fuel-oil piping systems shall be designed and installed in accordance with this code, manufacturer’s recommendation, and their listing.

**1302.9.2.2 Outdoor applications.** Flexible fuel-oil piping systems with continuous vacuum leak detection may be used for above ground outdoor applications, if such systems are double metallic piping with polymer protective cover for exterior exposure to the elements. A fire-resistance-rated enclosure shall not be required for such applications.

**1302.9.2.3 Continuous pipe run.** Flexible fuel-oil piping systems shall be installed with a single continuous pipe run from the transfer pump to the appliance or storage tank it serves. Intermediate couplings are not allowed within buildings.

**1302.9.2.4 Levels above the lowest floor.** Where installed above ground, flexible fuel-oil piping systems connecting a transfer pump to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

**1302.9.2.5. Horizontal offsets.** Horizontal offsets shall comply with Section 1305.9.3.

**1302.9.2.6 Leak detection and alarm.** Flexible fuel-oil piping systems shall be installed with continuous vacuum leak detection and alarm. The alarm shall sound and the transfer pump shall stop when a leak is detected. The alarm shall be connected to a local audible alarm and to a remote alarm located at a supervising station. The wiring shall comply with the *New York City Electrical Code*.

**SECTION MC 1303**
**JOINTS AND CONNECTIONS**

**1303.1 General.** Joints and connections shall conform to the ASTM Standards listed in [Section 1203] Table 1302.5, shall be of a type approved for fuel-oil piping systems, shall be rated for the temperatures and pressures of the systems in which the devices are installed, and shall be compatible with the fluid and all materials used. All threaded joints and connections shall be made...
tight with suitable lubricant or pipe compound. Unions and flanges, right or left couplings, and sweat fittings shall be brazed in accordance with ASME Boiler and Pressure Vessel Code, Section IX (Welding and Brazing Qualifications) or in accordance with AWS B2.2 Standard for Brazing Procedure and Performance Qualification. Cast-iron fittings shall not be used. Joints and connections shall be tight for the pressure required by test. Flanged joints requiring gaskets or packing shall be equipped with gaskets rated for a minimum of 750°F (398.9°C).

1303.1.1 Joints between different piping materials. Joints between different piping materials shall be made with adapter fittings. Joints between different metallic piping materials shall be made with approved dielectric fittings. All such fittings shall conform with the requirements of Section 1203.

1303.2 Reserved.

1303.3 Joint preparation and installation. Where required by Sections 1303.4 through 1303.10, the preparation and installation of brazed, mechanical, threaded and welded joints shall comply with Sections 1303.3.1 through 1303.3.4.

1303.3.1 Brazed joints. All joints shall be brazed in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with American Welding Society AWS B2.2 Standard for Brazing Procedure and Performance Qualification.

1303.3.2 Mechanical joints. Mechanical joints utilizing an elastomeric and/or compression seal are not permitted. [Reserved.]

1303.3.3 Threaded joints. Threads shall conform to ASME B1.20.1. Pipe-joint compound or tape shall be applied on the male threads only and shall be compatible for application on the piping material and fluid.

1303.3.4 Welded joints. All joints shall be welded in accordance with ASME Boiler and Pressure Vessel Code, Section IX Welding and Brazing Qualifications or in accordance with AWS B2.1 Specifications for Welding Procedure and Performance Qualification.

1303.4 Brass pipe. Joints between brass pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.

1303.5 Reserved.

1303.6 Copper or copper-alloy pipe. Joints between copper or copper-alloy pipe or fittings shall be brazed, mechanical, threaded or welded joints complying with Section 1303.3.

1303.7 Copper or copper-alloy tubing. Joints between copper or copper-alloy tubing or fittings shall be brazed mechanical joints complying with Section 1303.3 or flared joints. Flared joints shall be made by a tool designed for that operation.

1303.8 Nonmetallic pipe. Joints between nonmetallic pipe or fittings shall be installed in accordance with the manufacturer’s instructions for the labeled pipe and fittings.
1303.9 Steel pipe. Joints between steel pipe or fittings shall be threaded or welded joints complying with Section 1303.3.

1303.10 Reserved.

1303.11 Piping protection. Proper allowance shall be made for expansion, contraction, jarring and vibration. Piping other than tubing, connected to underground tanks, except straight fill lines and test wells, shall be arranged to permit the tanks to settle without impairing the tightness of the piping connections. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Sections 1305.9.6 and 1305.9.7. Piping that is routed outside of the building or on the roof shall be provided with a protective coating to prevent rust. Supports for such piping shall be made of stainless steel or other corrosion resistive material.

SECTION MC 1304
PIPING SUPPORT

1304.1 General. Pipe supports shall be in accordance with Section 305. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Sections 1305.9.6 and 1305.9.7.

SECTION MC 1305
FUEL-OIL SYSTEM INSTALLATION

1305.1 General. Fuel-oil piping systems shall be installed in accordance with this section.

1305.2 Protection of pipe, equipment and appliances. All fuel-oil pipe, equipment and appliances shall be protected from physical damage. Piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.2.1 Flood hazard. All fuel-oil pipe, tanks, equipment and appliances located in areas of special flood hazard areas shall comply with Appendix G of the New York City Building Code.

1305.2.2 Identification of concealed fuel-oil piping. Where horizontal fuel-oil piping is concealed within the building construction, such piping at intervals not more than 40 feet (12192 mm) in length and at all changes of direction shall be identified by a permanent label or tag. The label or tag shall be located outside of the enclosure.

1305.3 [Supply piping, Supply piping] Piping. Piping shall comply with the requirements of Sections 1305.3.1 through 1305.3.7 1305.3.9.

1305.3.1 Size. The fuel-oil system shall be sized for the maximum capacity of fuel oil required. The minimum size of a supply line shall be ⅜-inch (9.5 mm) inside diameter nominal pipe or ⅛-inch (9.5 mm) OD tubing.

1305.3.2 Connections to tank. Supply piping shall connect to the top of the fuel-oil tank.
Exception: Storage tanks in buildings that comply with all of the following conditions:

1. The tank is located above ground on the lowest floor;
2. The tank does not exceed 330 gallons (1250 L); and
3. The tank is provided with a ½-inch (12.7 mm) opening for gravity discharge and a 1-inch (25 mm) opening in the bottom of the tank for cleaning and protection against corrosion.

1305.3.3 Pumps. Fuel oil shall be supplied by a transfer pump or automatic pump [or by other approved means].

1305.3.4 Smoke Safeties and heat detectors. Appropriate safeties shall be provided so that detection of smoke or heat within the generator or equipment room shall prevent additional fuel oil from being pumped into the piping system within such room, including a fusible link operated valve in the supply pipe at the wall of the fuel oil transfer pump and in the supply pipe entering the generator or fuel oil burning equipment room or rooftop equipment enclosure.

1305.3.5 Horizontal runouts. Horizontal runouts from risers to the generator or equipment room shall follow as direct a route as practicable.

1305.3.6 Supply piping. Supply piping from a transfer pump to appliances at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.3.7 Return piping. In direct feed systems, the minimum size of a return line shall be no less than the size of the supply piping specified in Section 1305.3.1. Valves shall not be installed on return piping unless a means of relieving overpressure is provided. Return piping serving equipment at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

1305.3.8 Overflow piping. In systems with fuel oil storage tanks above the lowest level, overflow piping from tanks installed above the lowest floor shall be piped by gravity into the top of the tank at the lowest floor that supplies fuel to such tank. The overflow pipe shall be minimum two pipe sizes larger than fuel oil supply pipe. Valves shall not be installed on overflow piping.

1305.3.9 Direct feed. Systems where day tanks are absent (such as generator installations where fuel oil is taken directly from a fuel-oil pipe or header into the engine) shall comply with Section 1305.9.12.

[1305.3.7 Piping from transfer pump to equipment or storage tanks above the lowest floor. Supply piping from a transfer pump to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.]
1305.4 Return piping. Return piping shall connect to the top of the fuel-oil tank. The minimum size of a return line shall be no less than the size of the supply piping specified in Section 1305.3.1. Valves shall not be installed on return piping unless a means of relieving overpressure is provided. Return piping serving equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall also comply with the requirements of Section 1305.9.

Reserved.

1305.5 System pressure. The system shall be designed for the maximum pressure required by the fuel-oil-burning appliance. Air or other gases shall not be used to pressurize tanks. Pressure in a storage tank for the purpose of discharging oil shall be prohibited.

1305.6 Fill piping. Fill piping shall comply with the requirements of Sections 1305.6.1 through 1305.6.6.

1305.6.1 Size. Fill piping shall be a minimum of 2 inches (50.8 mm) in diameter or 3 inches (76.2 mm) for No. 6 fuel oil.

1305.6.2 Termination location. A fill pipe shall terminate outside of a building at or above grade at a point not less than 2 feet (609.6 mm) from any building opening and not less than 5 feet (1524 mm) away from any subway grating at the same or lower level. A fill pipe shall terminate in a manner designed to minimize spilling when the filling hose is disconnected. Where No. 6 fuel oil is used, the fill pipe terminal shall be within 3 feet (914.4 mm) of the curb unless otherwise required by the Department of Transportation or the Transit Authority. If facilities exist for an oil delivery truck to drive onto the premises, the fuel-oil terminal may be located elsewhere other than the curb.

1305.6.3 Separate fill piping. Each storage tank shall be provided with a separate fill pipe, except that where a battery of tanks containing the same grade of oil is installed, a common fill and header pipe may be installed.

1305.6.4 [Check valve] Storage tank above the fill terminal. Where the top of the storage tank is above the fill pipe terminal, the fill pipe shall be connected to the top of the tank and provided with [a] one of the following:

1. A shutoff valve and swing check valve [both of which shall be] located at the fill pipe terminal [The shutoff valve and swing check valve may be] or installed in an accessible location inside the building at or below the level of the fill pipe terminal.

2. A dry disconnect fitting with a ball and a check valve located at the fill pipe terminal.

1305.6.5 Terminal opening. The fill opening shall be equipped with a tight metal cover designed to discourage tampering. All fill pipe terminals shall be of an approved type and shall be provided with lugs for embedding in concrete. In lieu of lugs, a set screw or threads to fasten the terminal to the fill pipe may be used. The outer flange of the fill pipe terminal or the seal cap shall be permanently marked: FUEL OIL. The fill pipe terminal shall be right-handed thread or provided with other equivalent means to receive the seal cap. The seal cap shall be suitably slotted for receiving an opening wrench, and an oilproof gasket inserted in a groove in the fill pipe terminal shall be provided so as to make the seal cap leakproof. A
strainer shall not be required but if used, shall be of at least 1/8-inch (3.2 mm) mesh. Where a storage system for volatile flammable oil and a storage system for fuel oil are to be used in the same premises, the terminal of the volatile oil pipe shall be provided with a left-handed thread and the fill pipe fitting shall be of a different size than that required for the fill pipes to the tanks containing the volatile flammable oil.

1305.6.6 Spill containment. For fill terminal openings serving underground storage tanks greater than 110 gallons (416.4 L) and above-ground storage tanks greater than 660 gallons ([2500] 2498.4 L), an approved overflow/spill containment device shall be provided.

1305.7 Normal vent piping. Normal vent piping shall comply with the requirements of Sections 1305.7.1 through 1305.7.9.

1305.7.1 Size. Normal vent sizes shall comply with the sizes listed in Tables 1305.7(1) and 1305.7(2); provided, however, for tanks other than those complying with the alternate tank design and construction standards contained in Section 1305.14, the normal vent shall not be smaller in size than the supply fill pipe.

* For tanks constructed to UL 80 specifications, the minimum vent diameter shall be 2 inches ([51] 50.8 mm). For tanks constructed to UL 142 specifications, the minimum vent diameter shall not be less than as required by Section 1305.8.4.

### 1305.7.2 Termination location. The location of the normal vent pipe terminations shall comply with the following:

1. Liquid fuel normal vent pipes shall terminate outside of buildings in a nonhazardous location at a point not less than 2 feet ([610] 609.6 mm) measured vertically or horizontally from any building opening and not less than 2 feet ([610] 609.6 mm) nor more than 12 feet ([3658] 3657.6 mm) above the fill pipe terminal.

2. If the normal vent pipe terminal is not visible from the fill pipe terminal location, an electronic overfill alarm system or a 1-inch ([25] 25.4 mm) tell-tale line shall be connected to the tank and shall parallel the fill pipe and terminate at the fill pipe terminal with an unthreaded end. Such tell-tale lines shall be provided with a check valve set to prevent flow of surface water to the storage tank.

3. Normal vent pipes shall terminate sufficiently above the ground to avoid being obstructed with snow or ice.

4. Normal vent pipes from tanks containing heaters shall be extended to a location where oil vapors discharging from the normal vent will be readily diffused.

### 1305.7.3 Termination caps. Outer ends of normal vent pipes shall terminate in a weatherproof vent cap or fitting or be provided with a weatherproof hood. All normal vent caps shall have a minimum free open area equal to the cross-sectional area of the normal vent pipe and shall not employ screens finer than No. 4 mesh.

### 1305.7.4 Tank pressure. The tank shall be designed for the maximum static head that will be imposed with the normal vent piping filled with oil.

### 1305.7.5 Multiple tanks. A normal vent pipe shall be provided for each storage tank. Normal vent piping from multiple tanks of the same grade oil with not more than 660 gallons ([2500] 2498.3 L) aggregate capacity may be combined. Where a battery of storage tanks complying with the alternate tank design and construction standards contained in Section 1305.14...
designed to hold the same grade of oil with not more than 660 gallons (2500 L) aggregate capacity is installed, normal vent pipes may be run into a main header.

1305.7.6 Pitch. Normal vent pipes shall drain toward the tank. The normal vent pipes shall have no sags or traps where liquid can collect.

1305.7.7 Protection. Normal vent pipes shall be located so that they are not subjected to physical damage.

1305.7.8 Cross-connection. Liquid fuel normal vent pipes shall not be cross-connected with fill pipes, supply lines to, or return lines from burners or overflow lines from auxiliary tanks other fuel-burning equipment.

1305.7.9 Tanks [above the lowest floor] served by pumps. For tanks [installed above the lowest floor] on any floor served by pumps, the normal vent shall be connected to the overflow pipe, shall be piped in an approved manner, into the vent or top of tank of the lowest floor storage tank that supplies the fuel to such tank a minimum of 8 feet (2438.4 mm) above the overflow pipe and terminated directly to the outdoors. A liquid sensor shall be installed in the vent of the remotely served tank in order to shut down oil supply in the event of an overflow.

1305.8 Emergency relief vent piping. Each primary tank, the interstitial space of a secondary containment tank and each compartment of a compartment tank complying with UL 142 shall be provided with emergency relief venting. A tank’s emergency relief vent piping and normal vent piping [shall] may be combined. The design and installation of the combined normal and emergency relief vent shall be in accordance with Section 1305.7 and Sections 1305.8.1 through 1305.8.4. Tanks designed in accordance with Section 1305.14 shall not require emergency relief vent piping. The use of a self-closing manway cover, a manway cover provided with long bolts that permit the cover to lift under internal pressure, or other type of emergency relief vent device inside the building, shall be prohibited.

1305.8.1 Piping. The combination normal and emergency relief venting shall be provided through an open vent pipe [connected directly, as applicable, to the primary tank, interstitial space or compartment. The use of a self-closing manway cover, a manway cover provided with long bolts that permit the cover to lift under internal pressure, or other type emergency relief vent device, shall be prohibited] and shall be terminated outdoors.

1305.8.2 [Termination. Combination normal and emergency relief vent piping shall terminate outdoors.] Reserved.

1305.8.3 [Tanks above the lowest floor. For tanks installed inside of buildings above the lowest floor, the combination normal and emergency vent piping shall be piped, in an approved manner, into the vent or top of tank of the lowest floor storage tank that supplies the fuel to such tank. Normal and emergency vents are to be sized in accordance with NFPA 30.] Reserved.

1305.8.4 Capacity. The total relief venting capacity of the combination normal and emergency relief venting shall be in accordance with Section 4.2.5.2 22.7 of NFPA 30. Construction documents shall include calculations demonstrating that the extension of the
normal and emergency vent piping is adequately sized to provide the required emergency vent flow while limiting the backpressure to less than the maximum pressure permitted by the design of the tank. Additionally, consistent with Section 4.2.5.2.5 of NFPA 30, where the design provides for a reduction in the required emergency venting capacity based upon the properties of the fuel oil to be stored in the tank, the construction documents shall include supporting calculations.

1305.9 Supplemental requirements for piping from transfer pumps to [equipment] appliances or storage tanks above lowest floor. Fuel-oil piping systems utilizing pumps to transfer fuel oil to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings shall comply with the requirements of Sections 1305.9.1 through 1305.9.12.

1305.9.1 Shaft enclosure. The piping from a transfer pump to equipment at levels above the lowest floor or storage tanks at levels above the lowest floor in buildings, the return or overflow piping, and vent piping where required to be connected to the main storage tank shall be enclosed in a shaft constructed of 4-inch (102 mm) concrete or masonry having a 4-inch (102 mm) clearance from all pipe or pipe covering [except that no such enclosures shall be required within the room containing the pump, tank, or equipment where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance rating] in accordance with the New York City Building Code. Multiple fuel oil risers serving multiple systems are permitted within a common shaft enclosure. All shaft penetrations shall be fire stopped.

Exceptions:

1. An enclosure shall not be required for piping located within the same room as the pump, tank, or equipment where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance rating.

2. An enclosure shall not be required for outdoor piping in existing buildings in compliance with Section 1305.9.13.

3. A concrete or masonry shaft enclosure shall not be required for metallic double wall flexible fuel-oil piping installed in a shaft enclosure having a fire-resistance rating of at least 2-hours and that complies with Sections 703.2 and 708 of the New York City Building Code.

1305.9.2 Ducts or other piping in shafts. Pipe shafts containing fuel-oil piping shall not be penetrated by or contain other piping or ducts.

1305.9.3 Horizontal offsets. Where it is necessary to make horizontal offsets in the fuel-oil piping and pipe shafts, including the lowest level, such piping shall be enclosed in a fully welded outer containment of at least No. 10 standard Gage steel [two sizes larger than the supply piping] fully welded outer containment of at least No. 10 standard Gage steel [two sizes larger than the supply piping] and arranged to drain into the shaft. Horizontal piping offsets shall be further enclosed in construction having a 2-hour fire-resistance rating except that no such enclosure or pipe sleeve shall be required for the pipes serving the equipment within the room containing the pump, tank, or equipment.
where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance rating. Horizontal piping shall include all piping at or above the roof level. No 2-hour fire-resistance-rated enclosure is required for horizontal piping offsets located outside the building].

Exceptions:

1. The containment enclosure may be omitted on horizontal piping along the roof for a maximum length of 72 inches (1828.8 mm) from the enclosure, tank or the equipment served for hard piped connections and valves as required.

2. The containment enclosure may be omitted where a double metallic wall flexible fuel-oil piping system is installed as a horizontal offset, such pipe system does not need to be enclosed in an additional containment enclosure.

1305.9.3.1 Drainage and leak detection. Horizontal offsets shall be arranged to drain by gravity toward the tank room on the lowest level. Where the length of the horizontal offset exceeds 25 feet (7620 mm), the containment enclosure shall be constructed with an integral leakage collection reservoir of a cross-section area equal to the containment enclosure and at a minimum 6 inches (152.4 mm) deep. The reservoir shall be provided with a leak detection alarm. Where provided, all leak detection alarms shall be connected to a local audible alarm and to a remote alarm located at a supervising station. The wiring shall comply with the New York City Electrical Code.

Exception: A leak collection reservoir is not required where double metallic wall flexible fuel-oil piping is installed as a horizontal offset in accordance with Section 1302.9.

1305.9.3.2 Size. The containment enclosure shall be two sizes larger than the enclosed pipe for single pipe enclosures. Enclosures containing multiple pipes shall be sized to provide a minimum ½-inch (12.7 mm) clearance around the pipe bundle.

1305.9.3.3 Fire-resistance rating. In addition to the outer containment enclosure, horizontal piping offsets shall be further enclosed in construction having a 2-hour fire-resistance rating.

Exceptions:

1. A containment enclosure and 2-hour fire-resistance-rated enclosure are not required for the pipes serving the equipment or appliance within the room containing the pump, tank, or fuel-burning appliance where such room is itself enclosed with construction and materials having at least a 2-hour fire-resistance-rating.

2. A 2-hour fire-resistance-rated enclosure is not required for horizontal piping offsets located outside the building or on the roof.
**1305.9.3.4 Horizontal offsets on roofs.** Horizontal offsets on roofs shall be limited to a maximum vertical rise of one story.

**1305.9.4 Drain pan at base of shafts [§] with leak detection.** A metal drain pan shall be installed at the base of every vertical shaft enclosing the fuel-oil piping. The pipe shall lead to a dedicated sump or minimum 55-gallon (208 L) container with a leak detection alarm, arranged so as to sound an alarm and stop the transfer pump. The alarm shall be connected to a local audible alarm and to a remote alarm located at a supervising station. The wiring shall comply with the New York City Electrical Code. Where the bottom of the shaft is located outside the fuel oil storage tank room, the drain pan shall be connected to and drained into a containment enclosure at the horizontal offset of fuel-oil piping. On the lowest level in the building, the outer containment of horizontal offsets shall be terminated inside the main storage tank room or transfer pump room. A drain pipe shall be provided from the lowest point in the containment enclosure to a minimum 55-gallon (208.2 L) container with a leak detection alarm, arranged so as to sound an alarm and stop the transfer pump.

**1305.9.5 Piping materials.** Oil lines for appliances, equipment or tanks shall be steel pipe ASTM A 53/A 53M or ASTM A 106, grade B seamless Schedule 40 with welded connections up to the oil tank or equipment, except that fittings at the tank or equipment, shutoff valves and other fuel-oil flow and control devices may be screwed or flanged.

**Exception:** Flexible fuel-oil piping systems with continuous vacuum leak detection in accordance with Section 1302.9.

**1305.9.6 Expansion.** Provision shall be made for expansion in piping without the use of expansion joints.

**1305.9.7 Movement and vibration.** The piping shall be located and secured from movement so as to prevent undue stress on the piping and to isolate the piping from vibrations from any equipment.

**1305.9.8 Connections to header.** Pipe connections to the main header (supply or return) shall be made from the top of the header [except for].

**Exception:** Systems with appliances above the lowest floor where such appliances are designed to operate utilizing fuel pumped as needed from the lowest floor and without utilizing fuel oil stored via header above the lowest floor.

**1305.9.9 [Air vents and breakers] Vacuum breaking devices.** Vacuum breaking devices shall be designed for their required use. Vacuum breaking devices shall be hard-piped to a reservoir with a leak detection alarm, arranged so as to sound an alarm. The alarm shall be connected to a local audible alarm and to a remote alarm located at a supervising station. The wiring shall comply with the New York City Electrical Code.
1305.9.10 Curb or pan. All air vents and vacuum breakers shall be hard piped to a curb or pan. Reserved.

1305.9.11 Pipe size; fuel storage tank above the lowest floor. In systems with [equipment] appliances above the lowest floor where such [equipment is] appliances are designed to operate utilizing fuel stored above the lowest floor, piping diameters shall not exceed 4 inches ([102] 101.6 mm). However, where

Exception: Where an applicant demonstrates, by the inclusion of calculations in the construction documents, that a greater diameter is necessary to ensure the proper flow for the functioning of the system, such greater diameter may be permitted. Piping shall not be used for fuel storage purposes.

1305.9.12 Pipe size; direct feed without fuel storage above the lowest floor. In systems with [equipment] appliances above the lowest floor, where such [equipment is] appliances are designed to operate utilizing fuel pumped as needed from the lowest floor and without utilizing fuel oil stored above the lowest floor, piping diameters throughout such systems shall not exceed the design flow (three times the maximum firing rate as calculated by the engineer or architect). However, piping on demand sequenced with the equipment operation, piping diameters shall not exceed 4 inches (101.6 mm). Piping shall not be used for fuel storage purposes.

Exceptions:

1. Piping diameters may exceed 4 inches (101.6 mm) where an applicant demonstrates, by calculations in the construction documents, that a greater diameter is necessary to ensure the proper flow for the functioning of the system.

2. Piping diameters within rooms containing [such] fuel-burning equipment may exceed the calculated design flow pipe size to provide limited [reservoir] storage to prime equipment, provided such [reservoir] storage is counted toward the maximum permitted oil storage per story, as provided for in Section 1305.11.1.3.

1305.9.13 Outdoor fuel-oil piping in existing buildings. Outdoor fuel-oil piping in existing buildings, including vertical piping, utilizing pumps to transfer fuel oil to appliances at levels above the lowest floor or to storage tanks at levels above the lowest floor in buildings shall additionally comply with the following:

1. Piping shall be located a minimum of 10 feet (3048 mm) from lot lines or a 2-hour fire-rated-enclosure shall be provided.

2. Piping shall be located a minimum of 3 feet (914.4 mm) from building openings and combustible construction.

3. Vertical outdoor fuel-oil piping shall be enclosed in a fully welded outer containment of at least No. 10 standard Gage steel sized in accordance with Section 1305.9.3.2.
4. Horizontal outdoor fuel-oil piping shall comply with Section 1305.9.3.

5. In addition to the requirement of Section 1305.9.4, a drain pipe shall also be provided from the lowest point in the vertical outdoor containment enclosure to a minimum 55-gallon (208 L) container with a leak detection alarm, arranged so as to sound an alarm and stop the transfer pump. The container may be located immediately inside the building.

6. Materials and supports directly exposed to the weather shall be stainless steel or other corrosion resistive material.

7. Details shall be provided for piping supports and connections to building structure.

8. Penetrations of building walls shall be encased in a protective pipe sleeve. The annular space between the piping and the sleeve shall be sealed in accordance with the New York City Building Code.

9. Piping shall be grounded in accordance with the New York City Electrical Code Section 250.104 (B).

10. Piping shall be protected from vehicle impact and physical damage.

11. Flexible fuel-oil piping systems shall not be utilized.

12. Egress paths shall not be obstructed.

13. Roof access shall comply with Section 306.5.

14. Piping shall be identified by a permanent label or tag at intervals not more than 40 feet (12192 mm) in length and at all changes of direction. The label or tag shall be located outside of the enclosure.

1305.10 Devices to control flow to oil-burning [equipment] appliances including generators. The following requirements shall apply:

1. The pressure in oil lines to oil-burning [equipment] appliances located above the lowest floor of a building shall not be more than is required to circulate oil to and from the burners, and all parts of the oil system shall be capable of withstanding the maximum working pressure in that part of the system.

2. A remote control shall be provided to stop the flow of oil to any burner wherever located, and to any oil-burning [equipment] appliances located on levels above the lowest floor in buildings as well as the fuel oil transfer pumps. Such control shall be located outside the entrance to the room in which the burner is located and as close to such entrance as practicable, except that when an outside location is impracticable, such control may be located immediately inside the room in which the burner is located, provided such location is accessible at all times. All such controls shall be permanently labeled: “REMOTE CONTROL FOR BURNER,” or as appropriate to the oil-burning [equipment] appliance.
On storage tanks of 60 gallons ([227] 227.1 L) or less capacity used with manually operated [equipment] appliances, such remote control may be installed in the supply lines between tank and burner.

3. In systems where either steam or air is used for atomizing the oil, the oil and the atomizing supply shall be interlocked so that where the supply of either is interrupted, the supply of the other will be immediately cut off.

1305.11 Limitations on quantities of fuel-oil storage. Quantities of fuel-oil storage shall be limited in accordance with the provisions of this section. For the purposes of this section, fuel oil stored on roofs shall be deemed inside of buildings and located on the floor to which they are adjacent.

1305.11.1 Inside of buildings. A total of not more than 100,000 gallons ([378 000] 378 541.2 L) shall be stored inside of any building. Oil storage inside of buildings shall also comply with applicable requirements of Sections 1305.11.1.1 through 1305.11.1.3.

1305.11.1.1 Inside of buildings; below ground. The maximum size of each below-ground oil-storage tank inside of a building shall be 35,000 gallons ([132 475] 132 489.4 L).

1305.11.1.2 Inside of buildings; above ground on the lowest floor. Fuel-oil storage tanks installed above ground on the lowest floor of a building shall be mounted on and anchored by adequate noncombustible supports. The maximum size of each individual tank shall be 660 gallons ([2500] 2498.4 L), and a total of not more than 1375 gallons ([5200] 5204.9 L) shall be stored within the same 2-hour fire [area] and smoke barrier construction.

Exceptions. Fuel-oil storage tanks shall be permitted to exceed 660 gallons ([2500] 2498.4 L), and the total quantity within a fire area shall be permitted to exceed 1375 gallons ([5200] 5204.9 L) in accordance with any one of the following options:

1. Buildings of Type I, II, IIIA, IV or VA construction with a total limit of 15,000 gallons ([56 781.1] 56 781.1 L). The maximum size of each individual tank shall be 15,000 gallons ([56 775] 56 781.1 L) provided that all such tanks are located in a room or enclosure dedicated to oil storage that is separated from the rest of the building by [fire-resistance-rated] fire and smoke barrier construction of at least 3 hours. Notwithstanding Section 1305.11.1, in such cases, the maximum total quantity in the building shall be limited to 15,000 gallons ([56 775] 56 781.1 L).

2. Buildings of Type IIIIB or VB construction with a total limit of 10,000 gallons ([37 854.1] 37 854.1 L). The maximum size of each individual tank shall be 10,000 gallons ([37 850] 37 854.1 L) provided that all such tanks are located in a room or enclosure dedicated to oil storage that is separated from the rest of the building by [fire-resistance-rated] fire and smoke barrier construction of at least 3 hours. Notwithstanding Section 1305.11.1, in such cases, the maximum total quantity in the building shall be limited to 10,000 gallons ([36 775] 37 854.1 L).
3. **Buildings of any type construction with a total limit of 100,000 gallons (378 541.8 L).** The maximum size of each individual tank shall be 25,000 gallons (94 625 L) provided that all such tanks are enclosed in a vault (i) with walls, floor, and top having a [fire resistance rating] fire and smoke barrier construction of not less than 3 hours, (ii) with such walls bonded to the floor, and (iii) with such top and walls of the vault independent of the building structure. An exterior building wall having a [fire resistance rating] fire and smoke barrier construction of not less than 3 hours shall be permitted to serve as a wall of the vault. The vault shall be located in a dedicated room or area of the building that is cut off vertically and horizontally from other areas and floors of the building by assemblies having a [fire resistance rating] fire and smoke barrier construction of not less than 2 hours. Where the aggregate fuel-oil storage on the lowest level of the building exceeds 50,000 gallons (189 250 L), such storage shall be protected with an alternate extinguishing system complying with the New York City Fire Code and Section 904 of the New York City Building Code.

1305.11.1.3 **Inside of buildings; above the lowest floor.** Fuel oil above the lowest floor inside of a building shall be limited to 330 gallons (1249.1 L) per story. The maximum quantity shall include oversized piping as described in Section 1305.9.12. Piping installations shall comply with the requirements of Section 1305.9.

**Exception:** Fuel-oil storage capacity in areas of special flood hazard areas and shaded X-Zones, as defined in Section G201.2 of Appendix G Chapter 2 of the New York City Building Code, shall comply with Section G307.4 of Appendix G of the New York City Building Code.

1305.11.2 **Outside of buildings.** Oil storage outside of buildings shall comply with applicable requirements of Sections 1305.11.2.1 and 1305.11.2.2.

1305.11.2.1 **Outside of buildings; below ground.** The maximum size of each below-ground oil-storage tank outside of a building shall be 35,000 gallons (132 489.4 L).

1305.11.2.2 **Outside of buildings; above ground.** The maximum size of each above-ground oil-storage tank outside of a building shall be 100,000 gallons (378 541.2 L).

1305.12 **Standards for tank design.** Tanks shall be designed and constructed in compliance with Sections 1305.12.1 and 1305.12.2.

1305.12.1 **Below ground.** Tanks located below ground, inside or outside of buildings, shall comply with any one of the following design standards, as appropriate for the specific installation as determined by the engineer [s]. Cathodic protection shall be provided in accordance with subpart 613-2 of the New York State Department of Environmental Conservation’s Petroleum Bulk Storage Code.

1. UL 58; such tanks shall be listed and labeled;
2. UL 1316; such tanks shall be listed and labeled; or

3. Alternate tank design and construction standards contained in Section 1305.14.

**1305.12.2 Above ground.** Tanks located above ground, inside or outside of buildings, shall comply with any one of the following design standards, as appropriate for the specific installation as determined by the engineer:

1. UL 80; such tanks shall be listed and labeled;

2. UL 142; such tanks shall be listed and labeled;

3. UL 2258; such tanks shall be installed only in one or two-family dwellings in accordance with Section 1305.15 and shall be listed and labeled;

4. ASME Boiler and Pressure Vessel Code, Section VIII, Division 1 or 2; such tanks shall be labeled; or

5. Alternate tank design and construction standards contained in Section 1305.14.

**1305.13 Installation of tanks.** Tanks shall be installed in accordance with the provisions of Sections 1305.13.1 through 1305.13.4. For the purposes of this section, fuel oil stored on roofs shall be deemed inside of buildings. At least 15 inches (381 mm) clearance shall be provided over tanks and on all sides between the tanks and the enclosure, embankment or dike or greater clearance as required by the manufacturer’s instructions.

**1305.13.1 Below ground.** Tanks located below ground, inside or outside of buildings, shall comply with the following requirements:

1. **Containment.** Fuel-oil tanks having a capacity of more than 660 gallons (2599.4L) shall be provided with secondary containment intended to prevent any leakage of fuel oil from the tank from entering the environment. The capacity of the containment shall equal or exceed the capacity of the tank served.

2. **Burial.** Regardless of capacity, fuel-oil tanks shall be buried with the top of the tank at least 2 feet (609.6 mm) below ground. Tanks shall be placed in firm soil and shall be surrounded by clean sand or well-tamped earth, free from ashes or other corrosive substance, and free from stones that will not pass a 1-inch (25.4 mm) mesh.

3. **Anchorage.** When necessary to prevent floating, fuel-oil tanks, regardless of capacity, shall be securely anchored.

4. **Distance to foundations.** Regardless of capacity, no fuel-oil tank shall be buried within 3 feet (914.4 mm) of any foundation wall or footing.
5. **Special limitations near subways.** Regardless of capacity, no fuel-oil tank shall be placed within 20 feet (6096 mm) of the outside line of a subway wall. For the purpose of the foregoing requirement, a subway shall be deemed to include any subsurface railroad or rapid transit roadbed.

### 1305.13.2 Above ground; on the lowest floor inside a building

Tanks located above ground, on the lowest floor inside of buildings, shall comply with the following requirements:

1. **Enclosure of room.** Installation of tank(s) and enclosure of room shall comply with Section 1305.11.1.2.

2. **Fire-extinguishing system.** Fire extinguishing systems shall comply with Section 1305.11.1.2.

3. **Ventilation.** Rooms containing fuel-oil tanks [which exceed 1375 gallons (5200 L)] shall be ventilated to limit the concentration of vapors within the room at or below 25 percent of the Lower Flammable Limit (LFL) of the fuel oil being used.

4. **Containment.** Fuel-oil tanks having a capacity of more than 660 gallons [(2500 L)] (2498.4 L) storage shall be provided with secondary containment intended to capture any leakage of fuel oil from the tank. The capacity of the containment shall equal or exceed the capacity of the tank served. For fuel storage, the capacity shall include the portion of the tank up to the height of the containment.

5. **Special limitations near subways.** Regardless of capacity, fuel-oil tanks located within the outer lines of the subway, or within 20 feet (6096 mm) of the outside line of a subway shall be placed within a welded steel oil-tight pan of not less than No. 18 Gage metal suitably reinforced and of capacity to contain the contents of the tank. For the purpose of the foregoing requirement, a subway shall be deemed to include any subsurface railroad or rapid transit roadbed.

### 1305.13.3 Above ground; above the lowest floor inside a building

Regardless of capacity, fuel-oil tanks and fuel-oil-burning [equipment] appliances located above ground, above the lowest floor inside of buildings, shall comply with the following requirements:

1. **Enclosure of room.** Fuel-oil tanks and fuel-oil-burning [equipment] appliances shall be located in a dedicated room or enclosure, having a fire-resistance rating of at least 2 hours. Rooftop tanks need not be enclosed provided that all exterior walls and [roof surfaces] roofs within 10 feet (3048 mm) horizontally and 20 feet (6096 mm) vertically have a fire-resistance rating of at least 2 hours or are otherwise separated by a constructed assembly with a fire-resistance rating of at least 2 hours.

2. **Fire-extinguishing system.** Rooms containing fuel-oil tanks and fuel-oil-burning [equipment] appliances shall be equipped with an automatic sprinkler system in accordance with Section 903.3.1 of the New York City Building Code. To prevent overfilling of the containment barriers, sprinkler shut-offs shall be located on the outside of tank and generator rooms and prominently placarded for immediate control by the Fire Department.
3. **Smoke detection.** Rooms containing fuel-oil tanks and fuel-oil-burning [equipment] appliances shall be equipped with automatic smoke detection in accordance with Section 907 of the *New York City Building Code*, except that heat detectors may be utilized where, during normal operation, products of combustion are present in sufficient quantity to actuate a smoke detector.

4. **Ventilation.** Rooms containing fuel-oil tanks shall be ventilated to limit the concentration of vapors within the room at or below 25 percent of the Lower Flammable Limit (LFL) of the fuel oil being used.

5. **Containment.** Fuel-oil tanks, fuel-oil-burning [equipment] appliances, and related equipment shall be provided with secondary containment area intended to capture any leakage of fuel oil. Floor drains shall be prohibited in containment areas. For tanks, the capacity of the containment area shall equal or exceed 2 times the capacity of the tank served. For fuel storage, the capacity shall include the portion of the tank up to the height of the containment. For fuel-oil-burning [equipment] appliances and related equipment, the capacity of the containment area shall equal or exceed 1.5 times the fuel capacity of the equipment or appliance.

6. **Transfer pumps.** Fuel-oil tanks shall be filled by means of a transfer pump supplied from a primary storage tank located on the lowest floor. A separate transfer pump and piping circuit shall be provided for each storage tank installed above the lowest floor. No intermediate pumping stations shall be provided between the storage tank and the transfer pump. Appropriate devices shall be provided for the automatic and manual starting and stopping of the transfer pumps so as to prevent the overflow of oil from these storage tanks. The transfer pumps shall be located above the tank secondary containment level or outside the tank containment area.

7. **Indicators and alarms.** Indicators and alarms shall be provided for fuel-oil tanks and rooms containing fuel-oil-burning [equipment] appliances, including a level sensor for height and capacity of fuel oil, high and low levels, and leak detection. The float switch shall be provided within the containment areas and shall be arranged so as to sound an alarm and stop the transfer pump in case of failure of the tank or the control in the tank. These indicators shall be connected to a local audible alarm in the tank room and to a remote alarm located at a supervising station. The wiring shall comply with the *New York City Electrical Code*.

8. **Weekly testing.** The operation of the float switch shall be tested at least once each week by the holder of the certificate of fitness as provided for in Sections 1301.10 and 1308.3.

### 1305.13.4 Above ground; outside a building

Tanks located above ground, outside of buildings, shall comply with the following requirements:

1. **Containment.** Regardless of capacity, each fuel-oil storage tank shall be protected by an embankment or dike. Such protection shall have a capacity at least 1½ times the capacity of the tank so surrounded (including the portion of the tank up to the height...
of the containment) and shall be at least 4 feet (1219.2 mm) high, but in no case shall the protection be higher than one-quarter the height of the tank when the height of the tank exceeds 16 feet (4876.8 mm). Embankments or dikes shall be made of earthwork with clay core, of masonry, of reinforced concrete or of steel. Earthwork embankments shall be firmly and compactly built of good earth free from stones, vegetable matter, or other similar material, and shall have a flat section of at least 3 feet (914.4 mm) at the top and a slope of at least 1½ feet (457.2 mm) rise to 2 feet (609.6 mm) of run on all sides. Concrete, masonry or steel dikes shall be designed so as to contain safely all of the oil in the tank so surrounded. Embankments or dikes shall be continuous and unpierced, and the outside toe shall be located at least 5 feet (1524 mm) inside of the property line, and no less than 5 feet (1524 mm) from a driveway or parking area.

2. **Distances to buildings, lot lines and other tanks.** Fuel oil storage tanks shall be located in accordance with the following:

   2.1. Storage tanks of a capacity greater than 330 gallons (1249.2 L) shall be not less than 1¼ tank diameters and in no case less than 10 feet (3048 mm) from the tax lot line, the nearest building not served by such tanks or adjacent other fuel oil storage tank. However, in no case shall the clearance between individual tanks and the tax lot line be less than the distance fixed by the following formula:

   \[
   M.C. = 10 + 4 \left( \frac{(G - 275)}{5000} \right) \quad \text{(Equation 13-1)}
   \]

   where:
   
   \( M.C. \) = Minimum clearance from nearest surface of tank to tax lot line, in feet.
   
   \( G \) = Capacity of tank, in gallons.

   2.2. Storage tanks with a capacity of not more than 330 gallons (1249.2 L) shall be not less than 5 feet (1524 mm) from the tax lot line, the nearest neighboring building or other fuel oil storage tank.

3. **Means of egress.** Tanks shall be located so as not to obstruct or interfere with any means of egress.

1305.14 **Alternate tank design and construction standards.** Oil-storage tanks, other than those conforming to ASME Boiler and Pressure Vessel Code, Section VIII, Division 1 or 2, UL 58, UL 80, UL 142, or UL 1316 shall be designed, constructed and installed in accordance with the requirements of Sections 1305.14.1 through 1305.14.5.

1305.14.1 **General construction standards.** All tanks shall comply with the requirements of Sections 1305.14.1.1 through 1305.14.1.9.

1305.14.1.1 **Materials and workmanship.** All fuel-oil storage tanks shall be built of steel plates or sheets, made by the open hearth or basic oxygen process. Such steel shall be free from physical imperfections, and shall be new, in good condition and free from rust.
1305.14.1.2 Assembly. Tanks, flanges or other pipe connections shall be welded. Filler of any kind between plates shall be prohibited.

1305.14.1.3 Corrosion resistance. Tanks to be buried shall be cleaned and then coated on the outside with two coats of corrosion protective material. They shall be further protected by a coating of hot tar, asphalt, or equivalent rust-resistive material, applied at the work site. Tanks installed inside buildings above ground shall be coated with one coat of corrosion protective material.

1305.14.1.4 External loads on underground tanks. All buried storage tanks shall be constructed of at least ¼-inch-thick (6.4 mm) metal and shall be designed to withstand any external loads to which the tank may be subjected.

1305.14.1.5 Identification. At the time of installation, all storage tanks shall bear a permanently fixed plate, spot welded or equivalent, bearing the name of the tank manufacturer, the gage of the material, and capacity of the tank. Shop-fabricated storage tanks shall be installed without structural alteration.

1305.14.1.6 Openings. All openings shall be through the top of the storage tank, except that storage tanks of [275] 330 gallon ([4044] 1249.2 L) capacity or less, located above ground but below on the lowest story, may be provided with a [2½-inch] ½-inch ([19.1] 12.7 mm) opening for gravity discharge and a 1-inch (25 mm) opening in the bottom of the storage tank for cleaning and protection against corrosion.

1305.14.1.7 Manholes. Tanks for No. 1, No. 2, No. 3 and No. 4 commercial-grade oils need not have manholes. However, if manholes are used for tanks containing such oils, the manhole covers shall be bolted and made gastight. Tanks for No. 5 and No. 6 commercial-grade oils shall have manhole covers bolted or otherwise secured to the tanks and kept hydrostatically tight at all times. Tanks [275] 330 gallon ([4044] 1249.2 L) capacity or less, and all other tanks without manholes, shall be provided with a [2] two screwed connection on the top of the tank to permit measuring the level of the oil within.

1305.14.1.8 Electrical grounding. Tanks outside of buildings shall be electrically grounded in accordance with the requirements for equipment grounding of the New York City Electrical Code.

1305.14.1.9 Protection from heat and flame. Tanks shall be located at least 7 feet ([2134] 2133.6 mm), measured in the most direct manner, from any source of exposed flame unless protected as provided in Section 1305.11.1.2, Exception 3, and at least 2 feet ([649] 609.6 mm) from any surface where the temperature exceeds 165°F ([74] 73.9°C).

**Exception:** Such above-ground vertical tanks that are outside of buildings shall comply with Sections 1305.14.1 and 1305.14.5.

### 1305.14.2.1 Thickness

The minimum thickness shall be as follows:

1. Tanks 36 inches (914.4 mm) in diameter or less shall have at least a ¼-inch (6.4 mm) shell and ¼-inch (6.4 mm) heads.

2. Tanks 37 inches (940 mm) to 72 inches (1829 mm) in diameter shall have at least a ¼-inch (6.4 mm) shell and 5/16-inch (7.9 mm) heads.

3. Tanks 73 inches (1854 mm) to 120 inches (3048 mm) in diameter shall have at least a 5/16-inch (7.9 mm) shell and ⅜-inch (9.5 mm) heads.

4. Tanks over 120 inches (3048 mm) in diameter shall be of at least ⅜-inch (9.5 mm) steel and shall be stiffened by angle rings or equivalent members so as to retain their cylindrical form.

### 1305.14.2.2 Dished heads

Dished heads for such tanks shall have a curvature the radius of which is not greater than the diameter of the tank. Dished heads shall be formed with an adequate cylindrical extension rim to provide a welding surface.

### 1305.14.2.3 Flat heads

If flat heads are used, they shall be braced in the same manner as described for the bracing of flat sides of rectangular tanks as provided for in Section 1305.14.3.

### 1305.14.3 Additional construction standards for rectangular tanks exceeding 330 gallon

Rectangular tanks exceeding 330-gallon (1249.2 L) capacity shall comply with the requirements of Sections 1305.14.3.1 through 1305.14.3.6.

#### 1305.14.3.1 Thickness

Plates for rectangular tanks of more than 330 gallon (1249.2 L) capacity shall be at least 5/16 inch (7.9 mm) thick.

#### 1305.14.3.2 Corners

Corners may be made up by bending the plates or by using angles.

#### 1305.14.3.3 Seams

All tanks shall have full penetration 5/16 welds at all seams.

#### 1305.14.3.4 Bracing

All flat surfaces of rectangular tanks shall be braced by structural members or rods.

#### 1305.14.3.5 Structural work

All structural members shall be designed in accordance with the requirements of the *New York City Building Code*.

#### 1305.14.3.6 Connections

Connections between bracing members and the sides of the tank shall be designed so that the connection will not fail before the member will fail.
1305.14.4 Additional construction standards for tanks [275] 330 gallons ( [4044] 1249.2 L) or less. Storage tanks with a capacity of less than or equal to [275] 330 gallons ( [4044] 1249.2 L) shall have a minimum thickness of shell and head plates of No. 10 manufacturer’s standard Gage steel plate. Storage tanks of 60 gallon ([227] 227.1 L) capacity or less shall be similarly constructed but need not be thicker than No.14 manufacturer’s standard Gage.

Exceptions:

2. Such underground tanks need comply only with Section 1305.14.1.

3. Storage containers of 6 gallons ([23] 22.7 L) or less used with burners or oil-burning heaters need only be designed so as to withstand a hydrostatic pressure test of at least 5 psi ([34] 34.5 kPa) without permanent deformation, rupture, or leakage, and shall be approved. Such containers shall be installed with rigid metal fasteners for wall, floor, or stand-type installations, and shall be protected against mechanical damage. Portable storage containers of 6 gallons ([23] 22.7 L) or less may be filled by a pump mounted on a storage tank, provided that the pump is approved.

1305.14.5 Additional construction standards for vertical above-ground cylindrical tanks outside of buildings exceeding 6 gallons ([23] 22.7 L). Vertical above-ground cylindrical storage tanks exceeding 6 gallons ([23] 22.7 L) that are located outside of buildings shall comply with the requirements of Sections 1305.14.5.1 through 1305.14.5.3.

1305.14.5.1 Plates. Such tanks shall be built of steel plates of the quality required for cylindrical tanks in accordance with Section 1305.14.2.

1305.14.5.2 Thickness. The minimum thickness of shell or bottom plates shall be ¼ inch (6.4 mm), and the minimum thickness of roof plates ⅛ inch (3.2 mm). The thickness of shell plates shall be determined in accordance with the following formula:

\[
t = \frac{P \times R \times F}{T \times E}
\]

(Equation 13-2)

where:

\[
t\quad \text{Thickness of shell plate in inches.}
\]

\[
P\quad \text{Head pressure at bottom of ring under consideration in psi.}
\]

\[
R\quad \text{Radius of shell, in inches.}
\]

\[
F\quad \text{Factor of safety (taken as 5).}
\]

\[
T\quad \text{Tensile strength of plate, in psi, as verified by mill test certificate.}
\]

\[
E\quad \text{Efficiency of vertical joint in ring under consideration. E shall in no case be taken greater than 1.00.}
\]
1305.14.5.3 Seams. Roof plates shall have welded water-tight seams, and the roof shall be built to shed water. Bottom plates shall have welded seams. Shell plate seams shall be designed to develop the full strength of the plate.

1305.15 Above-ground nonmetallic fuel-oil storage tanks for one- and two-family dwellings. Above-ground nonmetallic fuel-oil storage tanks may be used for indoor and outdoor storage and supply of fuel-oil in accordance with this section.

1305.15.1 Use. Nonmetallic tanks shall be permitted for one- and two-family dwellings only. Use of nonmetallic tanks in multi-family dwellings is prohibited. Nonmetallic fuel-oil tanks shall not be used for storage of waste-oil and flammable liquids.

1305.15.2 Capacity. The capacity of nonmetallic fuel-oil storage tanks shall be not less than 60 gallons (227.1 L) and not more than 660 gallons (2498.4 L).

1305.15.3 Construction Standards. Nonmetallic tanks shall be constructed per Sections 7, 8, 9, 10, 11, and 12 of UL 2258 and Chapter 7 of NFPA 31 and shall consist of a non-metallic primary tank and a metallic secondary tank.

1305.15.4 Identification. Above-ground nonmetallic fuel-oil storage tanks shall be marked in accordance with Sections 40, 41, and 42 of UL 2258. The label shall also include the biodiesel percentage as identified in the scope of UL 2258.

1305.15.5 Location. Above-ground nonmetallic fuel-oil storage tanks installed indoors shall not be exposed to sunlight on any plastic parts. Above-ground nonmetallic fuel-oil storage tanks installed outdoors shall be assembled with a required cover per the manufacturer’s recommendations. Outdoor installations shall comply with Section 1305.13.4.

1305.15.6 Installation. Nonmetallic fuel-oil tanks shall be installed in accordance with the manufacturer’s instructions, this code, and NFPA 31. Installation of above-ground nonmetallic fuel-oil storage tanks shall be performed by an oil-burning equipment installer licensed by the department with training and experience certified by the manufacturer.

1305.15.7 Testing. Nonmetallic fuel-oil tanks shall be tested in accordance with UL 2258.

1305.16 Method of ventilation of fuel oil storage tank rooms. Where required by this code, fuel oil storage tank rooms shall be ventilated to limit the concentration of vapors within the room at or below 25 percent of the Lower Flammable Limit (LFL) of the fuel oil being used via an independent exhaust system to the outdoors complying with the following:

1. The exhaust system shall operate continuously at a rate of two air changes per hour.

   Exception: Continuous operation shall not be required where listed detection devices are interlocked to operate such exhaust system to maintain concentration of vapors below 25 percent of LFL.

2. Multiple tank rooms may be served by a shared exhaust system.
3. Make-up air shall be provided via a ducted building ventilation system.

4. All dampers, including smoke dampers, shall be interlocked with the exhaust air system.

1305.16.1 Replacement of tanks in prior code buildings. Replacement of tanks in prior code buildings may utilize an existing gravity ventilation system complying with the following:

1. The total net free area of supply and exhaust openings shall be equal to at least 1 percent of the floor area of the room, equally divided between the supply and exhaust; and

2. Independent supply and exhaust openings to the outside; or

3. Independent supply and exhaust ducts to the outside.

SECTION MC 1306
OIL GAUGING

1306.1 Level indication. All tanks located inside buildings shall be equipped with a method of determining the oil level.

1306.2 Test wells. Test wells shall not be installed inside buildings. Unused tank openings shall be permanently sealed. For outside service, test wells shall be equipped with a tight metal cover designed to discourage tampering.

1306.3 Inside tanks. The gauging of inside tanks by means of measuring sticks shall not be permitted. An inside tank provided with fill and vent pipes shall be provided with a device to indicate either visually or audibly at the fill point when the oil in the tank has reached a predetermined safe level.

1306.4 Gauging devices. Gauging devices such as liquid level indicators or signals shall be designed and installed so that oil vapor will not be discharged into a building from the liquid fuel supply system.

1306.5 Gauge glass. A tank used in connection with any oil burner shall not be equipped with a glass gauge or any gauge which, when broken, will permit the escape of oil from the tank.

1306.6 Storage above lowest floors. Fuel oil stored above the lowest floor shall also comply with the indicator requirements of Section 1305.13.3, Item 7.

SECTION MC 1307
FUEL-OIL VALVES

1307.1 Building shutoff. For outside or below ground tanks, a shutoff valve shall be installed on the fuel-oil supply line at the entrance to the building. Inside or above-ground tanks shall have valves installed at the tank. The valve shall be capable of stopping the flow of fuel oil to the building or to the appliance served where the valve is installed at a tank inside the building. Valves shall comply with UL 842.
1307.2 **Appliance shutoff.** A shutoff valve shall be installed at the supply connection to each appliance and a check valve installed at the return connection.

1307.3 **Pump relief valve.** A relief valve shall be installed on the pump discharge line where a valve is located downstream of the pump.

1307.4 **Fuel-oil heater relief valve.** A relief valve shall be installed on the discharge line of fuel-oil-heating appliances.

1307.5 **Relief valve operation.** Relief valves shall be set to discharge at not more than 1½ times the maximum working pressure of the system. The discharge from relief valves shall be returned to the storage tank or to the supply line. Shutoff valves are not permitted in the line of relief.

**SECTION MC 1308**

**TESTING**

1308.1 **Testing required.** Fuel-oil storage tanks, other than tanks complying with the alternate tank design and construction standards contained in Section 1305.14, shall be tested in accordance with NFPA 31.

1308.2 **Hydrostatic test.** All liquid-fuel piping, and all tanks complying with the alternate tank design and construction standards contained in Section 1305.14, shall be hydrostatically tested for tightness by the contractor who made the installation before the work is closed in and before the system is operated. The piping shall be tested at 1½ times the maximum working pressure applicable to that part of the piping system but at a pressure not less than the test pressure required for the storage tank. The minimum pressure for testing tanks shall be 1½ times the maximum working pressure applicable to the tank but in no case less than 25 psig (172.4 kPag), except as provided for containers 6 gallons (22.7 L) or less in capacity as provided for in Section 1305.14.4, Exception 3. The hydrostatic pressure shall be maintained until all joints and connections have been visually inspected for leaks, but in no case for less than ½ hour. The tank shall not show any permanent deformation as a result of the test. A record shall be kept of the pressure tests showing the name of the contractor and the pressures at which the piping and the tank were tested.

1308.3. **Weekly testing.** For fuel-oil tanks and fuel-oil-burning equipment located above ground, above the lowest floor inside of buildings, the operation of the float switch shall be tested at least once each week by the holder of the certificate of fitness as provided for in Sections 1301.9 and 1305.13.3, Item 8.

§ 15. Chapter 14 of the New York city mechanical code, as added by local law number 33 for the year 2007, section 1402.1 as amended by local law number 141 for the year 2013, is amended to read as follows:
CHAPTER 14
SOLAR SYSTEMS

SECTION MC 1401
GENERAL

1401.1 Scope. This chapter shall govern the design, construction, installation, alteration and repair of systems, equipment and appliances intended to utilize solar energy for space heating or cooling, domestic hot water heating, swimming pool heating or process heating.

1401.2 Potable water supply. Potable water supplies to solar systems shall be protected against contamination in accordance with the New York City Plumbing Code.

   Exception: Where all solar system piping is a part of the potable water distribution system, in accordance with the requirements of the New York City Plumbing Code, and all components of the piping system are listed for potable water use, [cross-connection] protection measures shall not be required.

1401.3 Heat exchangers. Heat exchangers used in domestic water-heating systems shall be approved for the intended use. The system shall have adequate protection to ensure that the potability of the water supply and distribution system is properly safeguarded.

1401.4 Solar energy equipment and appliances. Solar energy equipment and appliances shall conform to the requirements of this chapter and shall be installed in accordance with the manufacturer’s installation instructions.

1401.5 Ducts. Ducts utilized in solar heating and cooling systems shall be constructed and installed in accordance with Chapter 6 of this code.

SECTION MC 1402
INSTALLATION

1402.1 Access. Access shall be provided to solar energy equipment and appliances for maintenance. Solar systems and appurtenances shall be installed in accordance with the requirements of Chapter 5 of the New York City Fire Code regarding rooftop access and obstructions, and shall not obstruct or interfere with fire-fighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

1402.2 Protection of equipment. Solar equipment exposed to vehicular traffic shall be installed not less than 6 feet (1828.8 mm) above the finished floor.

   Exception: This section shall not apply where the equipment is protected from motor vehicle impact.

1402.3 Controlling condensation. Where attics or structural spaces are part of a passive solar system, ventilation of such spaces, as required by Section 406, is not required where other approved means of controlling condensation are provided.
1402.4 **Roof-mounted collectors.** Roof-mounted solar collectors that also serve as a roof covering shall conform to the requirements for roof coverings in accordance with the *New York City Building Code.*

*Exception:* The use of plastic solar collector covers shall be limited to those approved plastics meeting the requirements for plastic roof panels in the New York City Building Code.

1402.4.1 **Collectors mounted above the roof.** Where mounted on or above the roof covering, the collector array and supporting construction shall be constructed of noncombustible materials or fire-retardant-treated wood conforming to the *New York City Building Code* to the extent required for the type of roof construction of the building to which the collectors are accessory.

*Exception:* The use of plastic solar collector covers shall be limited to those approved plastics meeting the requirements for plastic roof panels in the *New York City Building Code.*

1402.5 **Equipment.** The solar energy system shall be equipped in accordance with the requirements of Sections 1402.5.1 through 1402.5.4.

1402.5.1 **Pressure and temperature.** Solar energy system components containing pressurized fluids shall be protected against pressures and temperatures exceeding design limitations with a pressure and temperature relief valve. Each section of the system in which excessive pressures are capable of developing shall have a relief device located so that a section cannot be valved off or otherwise isolated from a relief device. Relief valves shall comply with the requirements of Section 1006.4 and discharge in accordance with Section 1006.6.

1402.5.2 **Vacuum.** The solar energy system components that are subjected to a vacuum while in operation or during shutdown shall be designed to withstand such vacuum or shall be protected with vacuum relief valves.

1402.5.3 **Protection from freezing.** System components shall be protected from damage by freezing of heat transfer liquids at the lowest ambient temperatures that will be encountered during the operation of the system.

1402.5.4 **Expansion tanks.** Liquid single-phase solar energy systems shall be equipped with expansion tanks sized in accordance with Section 1009.

1402.6 **Penetrations.** Roof and wall penetrations shall be flashed and sealed to prevent entry of water, rodents and insects.

1402.7 **Filtering.** Air transported to occupied spaces through rock or dust-producing materials by means other than natural convection shall be filtered at the outlet from the heat storage system.
SECTION MC 1403
HEAT TRANSFER FLUIDS

1403.1 Flash point. The flash point of the actual heat transfer fluid utilized in a solar system shall be not less than 50°F ([28] 10°C) above the design maximum nonoperating (no-flow) temperature of the fluid attained in the collector.

1403.2 Flammable gases and liquids. A flammable liquid or gas shall not be utilized as a heat transfer fluid.

SECTION MC 1404
MATERIALS

1404.1 Collectors. Factory-built collectors shall be listed and labeled, and bear a label showing the manufacturer’s name and address, model number, collector dry weight, collector maximum allowable operating and nonoperating temperatures and pressures, minimum allowable temperatures and the types of heat transfer fluids that are compatible with the collector. The label shall clarify that these specifications apply only to the collector.

1404.1.1 Types of collectors. The following types of collectors may be installed:

1. Flat-plate collectors.
2. Evacuated-tube collectors.
3. Integral collector storage systems.
4. Alternative collectors as approved by the commissioner in accordance with Section 28-113.2 of the Administrative Code.

1404.2 Thermal storage units. Pressurized thermal storage units shall be listed and labeled, and bear a label showing the manufacturer’s name and address, model number, serial number, storage unit maximum and minimum allowable operating temperatures, storage unit maximum and minimum allowable operating pressures and the types of heat transfer fluids compatible with the storage unit. The label shall clarify that these specifications apply only to the thermal storage unit.

§16. Chapter 15 of the New York city mechanical code is REPEALED and a new Chapter 15 is added to read as follows:

CHAPTER 15
REFERENCED STANDARDS

SECTION MC 1501
GENERAL

1501.1 General. This chapter lists the standards that are referenced in various sections of this document. The standards are listed herein by the promulgating agency of the standard, the standard
identification, the effective date and title and the section or sections of this document that reference the standard.

**1501.2 Subsequent additions, modifications or deletions.** Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the *Administrative Code*.

**1501.3 Applicability.** The application of the referenced standards shall be as specified in Section 102.8.

§ 17. Appendix A of the New York city mechanical code is REPEALED and a new appendix A is added to read as follows:

**APPENDIX A**

**CHIMNEY CONNECTOR PASS-THROUGHS**
§18. The New York city mechanical code is amended by adding a new appendix C, to read as follows:
C101.1 Scope. The figures in this appendix shall supplement the provisions for venting of tanks in Section 1305 and are intended for illustrative purposes. Where there is a conflict between the figures in this appendix and the provisions in Section 1305, the provisions of Section 1305 shall govern.
FIGURE C101.1(1)
PRIMARY TANK: UL 80, ASME BPVC, OR NYC ALTERNATE TANK
DAY TANK: UL 80, ASME BPVC, OR NYC ALTERNATE TANK

NOTES:
1. OVERFLOWPIPE TWO PIPE SIZES LARGER THAN SUPPLY PIPE (MC 1305.3.8).
2. COMBINED VENT PIPES SIZED TO LIMIT THE PRESSURE IN THE STORAGE TANK PER MC 1306.8.4. CALCULATIONS TO BE PROVEN ON DRAWINGS.
3. SENSOR TO SHUT DOWN TRANSFER PUMPS (MC. 1306.7.8).
4. VENTS MAY BE COMBINED (MC 1306.7.5).
§ 2. Chapter 1 of the New York city fuel gas code, as amended by local law number 141 for the year 2013, is amended to read as follows:
CHAPTER 1
ADMINISTRATION

SECTION FGC 101
GENERAL

101.1 Title. This code shall be known and may be cited as the “New York City Fuel Gas Code,” “NYCFGC” or “FGC.” All section numbers in this code shall be deemed to be preceded by the designation “FGC.”

101.2 Scope. This code shall apply to the installation of fuel-gas piping systems, fuel-gas appliances and related accessories in accordance with Sections 101.2.2 through 101.2.5.

101.2.1 Reserved.

101.2.2 Piping systems. These regulations cover piping systems for natural gas. High pressure natural gas installations at pressures of 15 psig ([403] 103.4 kPa gauge) or above shall also comply with the requirements of Appendix G of this code. Coverage shall extend to the outlet of the appliance shutoff valves. Piping system requirements shall include design, materials, components, fabrication, assembly, installation, testing, inspection, operation and maintenance.

101.2.3 Gas utilization appliances. Requirements for gas appliances and related accessories shall include installation, combustion and ventilation air and venting and connections to piping systems.

101.2.4 Systems and equipment outside the scope. This code shall not apply to the following:

1. Portable LP-gas appliances and equipment of all types that are not connected to a fixed fuel piping system.

2. Oxygen-fuel gas cutting and welding systems.

3. Industrial gas applications using gases such as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, oxygen and nitrogen.

4. Petroleum refineries, pipeline compressor or pumping stations, loading terminals, compounding plants, refinery tank farms and natural gas processing plants.

5. Integrated chemical plants or portions of such plants where flammable or combustible liquids or gases are produced by, or used in, chemical reactions.

6. LP-gas installations at utility gas plants.

7. Liquefied natural gas (LNG) installations.

8. Fuel gas piping in public utility power plants and atomic energy plants.

9. Components within proprietary items of equipment, apparatus or instruments such as gas-generating sets, compressors and calorimeters.
10. LP-gas equipment for vaporization, gas mixing and gas manufacturing.

11. Temporary LP-gas piping for buildings under construction or renovation that is not to become part of the permanent piping system.

12. Installation of LP-gas systems for railroad switch heating.

14. Except as provided in Section 401.1.1 and Appendices E and G, gas piping, meters, gas pressure regulators and other appurtenances used by the serving gas supplier in the distribution of gas, other than undiluted LP-gas.

15. Building design and construction, except as specified herein.

16. Piping systems for mixtures of gas and air within the flammable range with an operating pressure greater than 10 psig (69 kPa gauge).

17. Portable fuel cell appliances that are neither connected to a fixed piping system nor interconnected to a power grid.

101.2.5 Other fuels. The requirements for the design, installation, maintenance, alteration and inspection of mechanical systems operating with fuels other than fuel gas shall be regulated by the New York City Mechanical Code.

101.3 Reserved.

101.4 Intent. The purpose of this code is to provide minimum standards to safeguard life or limb, health, property, public welfare and the environment by regulating and controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of fuel gas systems.

101.5 Severability. If a section, subsection, sentence, clause or phrase of this code is, for any reason, held to be unconstitutional, such decision shall not affect the validity of the remaining portions of this code.

SECTION FGC 102
APPLICABILITY

102.1 General. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall govern. Where, in a specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern.

102.2 Existing installations. Except as otherwise provided for in this chapter or elsewhere in this code, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, existing installations lawfully in existence on the effective date of this code.
102.2.1 **Existing buildings.** Additions, alterations, renovations or repairs related to building or structural issues shall be governed by Chapter 1 of Title 28 of the *Administrative Code*, the *New York City Building Code* and the *1968 Building Code*, as applicable.

102.3 **Maintenance.** Installations, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe condition. Devices or safeguards that are required by this code shall be maintained in compliance with the applicable provisions under which they were installed.

102.3.1 **Owner responsibility.** The owner or the owner’s designated agent shall be responsible for maintenance of installations. To determine compliance with this provision, the commissioner shall have the authority to require an existing installation to be inspected.

102.4 **Additions, alterations or repairs.** Additions, alterations, renovations or repairs to installations shall conform to that required for new installations without requiring the existing installation to comply with all of the requirements of this code. Additions, alterations or repairs shall not cause an existing installation to become unsafe, hazardous or overloaded.

102.4.1 **Minor additions, alterations, renovations and repairs.** Minor additions, alterations, renovations and repairs to existing installations shall meet the provisions for new construction, unless such work is done in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

102.4.2 **Special provisions for prior code buildings.** In addition to the requirements of Sections 102.4 and 102.4.1, the provisions of Sections 102.4.2.1 through 102.4.2.4 shall apply to prior code buildings.

102.4.2.1 **Fuel gas piping in fire-resistance-rated assemblies prohibited locations.** For prior code buildings, the replacement of existing fuel gas piping in the same locations shall not be subject to Section 404.1, Item 5 when approved by the commissioner.

102.4.2.2 **Guards and access to roofs and elevated structures.** The provisions of Section 306.6 relating to guards and Section 306.5 relating to permanent means of access shall not apply where the equipment or appliances replace existing equipment or appliances in the same location.

102.4.2.3 **Seismic supports.** For prior code buildings, the determination as to whether seismic requirements apply to an alteration shall be made in accordance with the *1968 Building Code* and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements shall be permitted to be determined in accordance with Chapter 16 of the *New York City Building Code* or the *1968 Building Code* and Reference Standard RS 9-6 of such code.

102.4.2.4 **Wind resistance.** For prior code buildings, equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with Chapter 16 of the *New York City Building Code*.

102.5 **Change in occupancy.** Refer to Chapter 1 of Title 28 of the *Administrative Code*.

102.6 **Reserved.**
102.7 Reserved.

102.8 Referenced standards. The standards referenced in this code shall be those that are listed in Chapter 8 and in the rules of the department and such standards shall be considered part of the requirements of this code to the prescribed extent of each such reference. Where differences occur between provisions of this code and the referenced standards, the provisions of this code shall apply. Refer to Article 103 of Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to referenced standards.

102.8.1 Editions of referenced standards. References to standards in this code shall be to the editions of those standards provided for in Chapter 8 of this code, or as otherwise provided by rule.

102.9 Requirements not covered by code. Requirements necessary for the strength, stability or proper operation of an existing or proposed installation, or for the public safety, health and general welfare, not specifically covered by this code, shall be determined by the commissioner.

102.10 Application of references. Reference to chapter section numbers, or to provisions not specifically identified by number, shall be construed to refer to such chapter, section or provision of this code.

SECTION FGC 103
DEPARTMENT OF BUILDINGS

103.1 Enforcement agency. Refer to the New York City Charter and Chapter 1 of Title 28 of the Administrative Code.

103.2 Reserved.

103.3 Reserved.

103.4 Reserved.

SECTION FGC 104
DUTIES AND POWERS OF THE COMMISSIONER OF BUILDINGS

104.1 General. The commissioner shall have the authority to render interpretations of this code, adopt rules, and establish policies and procedures in order to clarify and implement its provisions. Such interpretations, policies, procedures, and rules shall be in compliance with the intent and purpose of this code. See the New York City Charter and Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to the authority of the commissioner.

SECTION FGC 105
APPROVALS

105.1 Approvals. Refer to Chapter 1 of Title 28 of the Administrative Code.
SECTION FGC [105] 106
PERMITS

[105.1] 106.1 General. Permits shall comply with this section, with Article 105 of Chapter 1 of Title 28 of the Administrative Code, and with requirements found elsewhere in this code.

[105.2] 106.2 Required. Any owner or authorized agent who intends to construct, add to, alter, repair, move, demolish, or change the occupancy of a building or structure, or to erect, install, add to, alter, repair, remove, convert or replace any gas, mechanical or plumbing system, the installation of which is regulated by this code, or to cause any such work to be done, shall first make application for construction document approval in accordance with Chapter 1 of Title 28 of the Administrative Code and this chapter and obtain the required permit.

[105.3] 106.3 Work exempt from permit. Exemptions from permit requirements of this code as authorized in Chapter 1 of Title 28 of the Administrative Code and the rules of the department shall not be deemed to grant authorization for any work to be done in any manner in violation of the provisions of this code or any other laws or rules.

[105.4] 106.4 Validity of permit. The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of any other law. Permits presuming to give authority to violate or cancel the provisions of this code or other law shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the commissioner from requiring the correction of errors in the construction documents and other data. The commissioner is also authorized to prevent occupancy or use of a structure where in violation of this code or of any other law.

[105.5] 106.5 Other permits. In addition to any permits required by the provisions of this code, permits for sidewalk and street openings shall be obtained from the Department of Transportation.

106.6 Permits with respect to limited alteration applications. For permits with respect to limited alteration applications, refer to Sections 28-101.5 and 28-104.6, Exception 1, of the Administrative Code.

SECTION FGC [106] 107
CONSTRUCTION DOCUMENTS

[106.1] 107.1 General. Construction documents shall comply with Article 104 of Chapter 1 of Title 28 of the Administrative Code and other applicable provisions of this code and its referenced standards. Such construction documents shall be coordinated with architectural, structural and means of egress plans.

[106.2] 107.2 Required documents. The applicant shall submit all of the documents specified in Sections [106.3] 107.3 through [106.8] 107.8 as appropriate to the nature and extent of the work proposed. Construction documents shall indicate the heating, ventilation, refrigeration, and other mechanical work to be performed, so drawn as to conform to the architectural and structural aspects of the building and to show in detail compliance with this code.
106.2.1 Composite plans. Composite plans showing compliance of architectural, structural, and mechanical parts of a building may be submitted provided that a clear understanding of each part is not impaired.

107.2.1 Lot diagram. The lot diagram shall be provided where applicable to the work proposed, including but not limited to the installation of exterior or rooftop equipment.

107.3 Lot diagram. The lot diagram shall be provided where applicable to the work proposed, including but not limited to the installation of exterior or rooftop equipment.

107.4 Building classification statement. Where applicable to the proposed work, the statement shall identify:

1. The occupancy group or groups that apply to parts of the building code in accordance with Section 302 of the New York City Building Code;
2. The occupancy group of the main use or dominant occupancy of the building;
3. The construction [class] type of the building in accordance with Section 602 of the New York City Building Code;
4. The structural occupancy/risk category in accordance with Table 1604.5 of the New York City Building Code;
5. The height of the building as defined in Section [502.4] 202 of the New York City Building Code;
6. The applicable measurements to the highest and lowest level of [fire department] Fire Department access; [and]
7. Whether the building is inside or outside of the fire districts [ ]; and
8. Whether the building is inside or outside a flood hazard area as such term is defined in Chapter 2 of the New York City Building Code.

107.5 Fuel-gas-burning appliance and fuel-gas piping plans. Construction documents for fuel-gas-burning appliances and fuel-gas piping shall contain plans that include the following data and information:

1. Riser diagrams showing the story heights, the gas [risers], riser diameter, operating pressure, gas meter piping and related appliances.
2. Diagrammatic floor plans showing the size, location, and material for all gas distribution piping and related appliances.
3. Floor plans or partial floor plans showing the location, operating pressure, layout, size, and listing information for all gas meter piping, gas distribution piping, fuel-gas burning appliances, gas vents, and chimneys, with the riser numbers coordinated with other plans and diagrams. The floor plans shall indicate locations of meters [ ] and shutoff valves, including the outside gas cut-off required by Appendix E, Section E6. The plans shall also indicate the method or means of providing air to the appliance space, including duct and opening sizes, or means of direct venting.
4. Plans indicating the location and type of any relevant smoke and heat detectors, alarm and fire-extinguishing systems.

5. Seismic protection and restraint details for piping and appliances as required by Chapter 16 of the New York City Building Code.

6. Details indicating the location, size and materials for all breechings; the thickness and type of insulation materials; and the clearances from combustible walls, partitions and ceiling; and the fire-resistive ratings of rooms and spaces containing the appliances.

7. Details describing the type, material, listing information, height, and termination distances to adjacent properties and structures for chimneys and gas vents.

8. Details showing structural supports for fuel-gas-burning equipment where required.

9. In areas of special flood hazard areas, construction documents shall comply with Appendix G of the New York City Building Code.

[106.6] 107.6 Heating systems. Construction documents for heating systems shall include the temperature to be maintained in every room and the output capacity in BTU per hour (W) of the central heating source.

[106.7] 107.7 Boilers. Construction documents for boiler installations shall indicate the output capacity in BTU per hour (W), the operating weight of each boiler, the pressure setting of the relief valves, and such other data and information as required by this code.

[106.8] 107.8 Energy efficiency. Construction documents shall include compliance documentation as required by the New York City Energy Conservation Code.

107.9 Retention of construction and submittal documents. Refer to Section 28-104.12 of the Administrative Code.

SECTION FGC [107] 108
INSPECTIONS AND TESTING

[107.1] 108.1 General. Except as otherwise specified in Section 28-116.2.4.3 of the Administrative Code, inspections required by this code or by the department during the progress of work may be performed on behalf of the owner by approved agencies or, if applicable, by special inspectors. However, in the interest of public safety, the commissioner may direct that any of such inspections be performed by the department. All inspections shall be performed at the sole cost and expense of the owner. Refer to Article 116 of Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to inspections.

[107.2] 108.2 Required inspections and testing. In addition to any inspections otherwise required by this code or applicable rules, the following inspections shall be required:

1. Progress inspections.
1.1. Underground inspection and/or testing of installed piping, valves, fittings, support structures, anti-corrosion equipment and associated underground components shall be made after trenches or ditches are excavated and bedded, piping is installed and before backfill is put in place. When excavated soil contains rocks, broken concrete, frozen chunks and other rubble that would damage or break the piping or cause corrosive action, clean backfill shall be on the job site ready for use in backfilling.

1.2. Rough-in inspection shall be made to determine that the materials, design, fabrication and installation comply with all requirements of this code. The inspection shall be conducted after the roof, framing, fireblocking and bracing are in place and components to be concealed are complete, and prior to the installation of wall or ceiling membranes. The inspection shall be conducted prior to or in conjunction with the gas pressure test. This inspection may be completed in sections.

Exceptions:

1. A rough-in inspection shall not be required when an existing gas appliance is replaced, provided that (i) no gas piping is replaced upstream of the existing appliance shutoff valve, and (ii) not more than 6 feet (1828.8 mm) of pipe is installed or replaced downstream of the existing appliance shutoff valve.

2. A rough-in inspection shall not be required when gas is reestablished by a utility company as permitted under Section 28-105.4.1 of the Administrative Code.

1.3. Inspections required by the New York City Energy Conservation Code shall be made in accordance with rules of the department, as applicable.

1.4. Gas final inspections shall be conducted after all appliances are installed, vented, wired and ready to operate with the establishment of gas. Gas final inspections shall include, but not be limited to, an inspection of components downstream of the appliance shutoff valve including gas piping, appliances, vents, accessory piping and make up air. Gas final inspections may be completed in sections.

2. Special inspections. Special inspections shall be performed in accordance with this code and Chapter 17 of the New York City Building Code.

3. Periodic inspections. Periodic inspections of gas piping systems shall be conducted in accordance with Article 318 of Chapter 3 of Title 28 of the Administrative Code.

4. Issuance of certificate of compliance: Upon satisfactory inspection of service equipment and the satisfaction of all the requirements for sign-off, the department shall issue a certificate of compliance as applicable for the following service equipment:

- Fuel-gas-burning equipment,
- Heating systems, and
- Boilers.

The requirements of Section 108.2 shall not be considered to prohibit the operation of any heating equipment or appliances installed to replace existing heating equipment or appliances serving an occupied portion of a structure provided that a request for inspection of such heating equipment or appliances has been filed with the department not more than 48 hours after such replacement work is completed, and all required inspections are performed before any portion of such equipment or appliances is concealed by any permanent portion of the structure.

107.2.1 108.2.1 Approved inspection agencies. Refer to Articles 114 and 115 of Chapter 1 of Title 28 of the Administrative Code.

107.2.2 108.2.2 Inspection of prefabricated construction assemblies. Prior to the approval of a prefabricated construction assembly having concealed work and the issuance of a permit, the department shall require the submittal of an evaluation report by an approved agency on each prefabricated construction assembly, indicating the complete details of the installation, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information and other data as necessary for the commissioner to determine conformance to this code.

107.2.2.1 108.2.2.1 Test and inspection records. Required test and inspection records shall be available to the commissioner at all times during the fabrication of the installation and the erection of the building; or such records as the commissioner designates shall be filed.

107.2.3 108.2.3 Exposure of work. It shall be the duty of the permit holder to cause the work to remain accessible and exposed for inspection purposes. Neither the commissioner nor the city shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.

107.3 108.3 Testing. Installations shall be tested as required in this code and in accordance with Sections 107.3.1 through 107.3.3. Tests shall be made by the permit holder and witnessed by the department [or an approved agency].

107.3.1 108.3.1 New, altered, extended or repaired installations. New installations and parts of existing installations that have been altered, extended, renovated or repaired, shall be tested as prescribed herein to disclose leaks and defects.

Exceptions:
1. A gas test shall not be required when an existing gas appliance is replaced, provided that (i) no gas piping is replaced upstream of the existing appliance shutoff valve and (ii) not more than 6 feet (1828.8 mm) of pipe is installed or replaced downstream of the existing appliance shutoff valve.

2. A gas test shall not be required when gas is reestablished by a utility company as permitted under section 28-105.4.1 of the Administrative Code.

[107.3.2] 108.3.2 Apparatus, instruments, material and labor for tests. Apparatus, instruments, material and labor required for testing an installation or part thereof shall be furnished by the permit holder.

[107.3.3] 108.3.3 Reinspection and testing. Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made [so as to achieve compliance] to comply with this code. The work or installation shall then be resubmitted to the department for inspection and testing.

108.3.4 Test validity. A gas test that is accepted by the department shall be valid for a period of one year from the date of the test.

[107.4] 108.4 Sign-off of completed work. Refer to Article 116 of Chapter 1 of Title 28 of the Administrative Code.

[107.5] 108.5 Temporary connection. The commissioner shall have the authority to allow the temporary connection of an installation to the sources of energy for the purpose of testing the installation or for use under a temporary certificate of occupancy.

SECTION FGC [108] 109
VIOLATIONS

[108.1] 109.1 General. Refer to Chapters 2 and 3 of Title 28 of the Administrative Code.

[108.2] 109.2 Authority to disconnect service utilities. The commissioner shall have the authority to require disconnection of utility service to the building, structure or system regulated by the technical codes in case of emergency where necessary to eliminate an immediate hazard to life or property. The commissioner shall notify the serving utility, and wherever possible, the owner and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnection, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practicable thereafter.

[108.3] 109.3 Connection after order to disconnect. A person shall not make energy source connections to installations regulated by this code that have been disconnected or ordered to be disconnected by the commissioner, or the use of which has been ordered to be discontinued by the commissioner until the commissioner authorizes the reconnection and use of such installations. When an installation is maintained in violation of this code, and in violation of a notice issued pursuant to the provisions of this section, the commissioner shall institute appropriate action to prevent, restrain, correct or abate the violation.
§ 3. Chapter 2 of the New York city fuel gas code, as added by local law number 33 for the year 2007, the definitions of “BTU” and “demand” as amended by local law number 8 for the year 2008, and the definitions of “connector” and “chimney or vent” as added by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 2
DEFINITIONS

SECTION FGC 201
GENERAL

201.1 Scope. Unless otherwise expressly stated, the following words and terms shall, for the purposes of this code and standard, have the meanings indicated in this chapter.

201.2 Interchangeability. Words used in the present tense include the future; words in the masculine gender include the feminine and neuter; the singular number includes the plural and the plural, the singular.

201.3 Terms defined in other codes. Where terms are not defined in this code and are defined in the New York City Electrical Code, New York City Building Code, New York City Fire Code, New York City Mechanical Code [or], New York City Plumbing Code, or the New York City Energy Conservation Code, such terms shall have meanings ascribed to them as in those codes.

201.3.1 Terms defined in the general administrative provisions. The following terms are defined in Section 28-101.5 of the Administrative Code:

1968 BUILDING CODE.

1968 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS).

ACCEPTANCE OR ACCEPTED.

ADDITION.

ADMINISTRATIVE CODE.

ALTERATION.

APPROVAL OR APPROVED.

APPROVED AGENCY.

APPROVED FABRICATOR.

APPROVED INSPECTION AGENCY.
APPROVED TESTING AGENCY.

ARCHITECT.

BUILDING.

CHARTER.

CERTIFICATE OF COMPLIANCE.

CITY.

COMMISSIONER.

CONSTRUCTION DOCUMENTS.

DAY.

DEFERRED SUBMITTAL.

DEMOLITION.

DEMOLITION, FULL.

DEMOLITION, PARTIAL.

DEPARTMENT.

ENGINEER.

ENLARGEMENT.

ENVIRONMENTAL CONTROL BOARD or ECB.

EXISTING BUILDING OR STRUCTURE.

FABRICATED ITEM.

FIRE PROTECTION PLAN.

HEREAFTER.

HERETOFORE.

INSPECTION CERTIFICATE.

INTERIM CERTIFICATE OF OCCUPANCY.
LABEL.
LABELED.
LAND SURVEYOR.
LANDSCAPE ARCHITECT.
LETTER OF COMPLETION.
LIMITED ALTERATION APPLICATION.
LIMITED PLUMBING ALTERATIONS.
LIMITED SPRINKLER ALTERATIONS.
LIMITED STANDPIPE ALTERATIONS.
LISTED.
MAIN USE OR DOMINANT OCCUPANCY (OF A BUILDING).
MANUFACTURER’S DESIGNATION.
MARK.
MATERIALS.
OCCUPANCY.
OWNER.
PARTY WALL.
PERMIT.
PERSON.
PREMISES.
PRIOR CODE BUILDING.
PROFESSIONAL CERTIFICATION.
PROGRESS INSPECTION.
PROJECT.
REGISTERED DESIGN PROFESSIONAL.
REGISTERED DESIGN PROFESSIONAL OF RECORD. REQUIRED.
RETAINING WALL. SERVICE EQUIPMENT.
SIGN-OFF. SINGLE ROOM OCCUPANCY MULTIPLE DWELLING.
SPECIAL INSPECTION.
SPECIAL INSPECTION AGENCY. SPECIAL INSPECTOR.
STRUCTURE. SUBMITTAL DOCUMENTS.
SUPERINTENDENT OF CONSTRUCTION (CONSTRUCTION SUPERINTENDENT).
USE (USED). UTILITY COMPANY OR PUBLIC UTILITY COMPANY.
UTILITY CORPORATION OR PUBLIC UTILITY CORPORATION.
WORK NOT CONSTITUTING MINOR ALTERATIONS OR ORDINARY REPAIRS.
WRITING (WRITTEN).
WRITTEN NOTICE.
ZONING RESOLUTION.

201.4 Terms not defined. Where terms are not defined through the methods authorized by this section, such terms shall have ordinarily accepted meanings such as the context implies.

SECTION FGC 202
GENERAL DEFINITIONS

[1068 OR PRIOR CODE BUILDINGS OR STRUCTURES (PRIOR CODE BUILDINGS).—See Section 28-101.5 of the Administrative Code.]

ABNORMAL OPERATING CONDITION. A condition that may indicate a malfunction or a noncompliant component of a piping system or appliance.
ACCESS (TO). That which enables a device, fixture, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door or similar obstruction (see also “Ready access (to)”).

[ADMINISTRATIVE CODE. The Administrative Code of the City of New York.]

AIR CONDITIONER, GAS-FIRED. A gas-burning, automatically operated appliance for supplying cooled and/or dehumidified air or chilled liquid.

AIR CONDITIONING. The treatment of air so as to control simultaneously the temperature, humidity, cleanliness and distribution of the air to meet the requirements of a conditioned space.

AIR, EXHAUST. See “Exhaust”. [Air being removed from any space or piece of equipment or appliance and conveyed directly to the atmosphere by means of openings or ducts.]

AIR-HANDLING UNIT. A blower or fan used for the purpose of distributing supply air to a room, space or area.

AIR, MAKEUP. [Air that is provided] Any combination of outdoor and transfer air intended to replace exhaust air and exfiltration.

[ALTERATION. Any construction, addition, change of use or occupancy, or renovation to a building or structure in existence. See Section 28-101.5 of the Administrative Code.]

[ANODELESS RISER. A transition assembly in which plastic piping is installed and terminated above ground outside of a building.]

APPLIANCE. Any apparatus or device that utilizes gas as a fuel or raw material to produce light, heat, power, refrigeration or air conditioning.

APPLIANCE, AUTOMATICALLY CONTROLLED. Appliances equipped with an automatic burner ignition and safety shutoff device and other automatic devices which accomplish complete turn-on and shutoff of the gas to the main burner or burners, and graduate the gas supply to the burner or burners, but do not affect complete shutoff of the gas.

[APPLIANCE, FAN-ASSISTED COMBUSTION. An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber or heat exchanger.]

APPLIANCE TYPE.

Low-heat appliance (residential appliance). Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of 1,000°F (538°C) or less.

Medium-heat appliance. Any appliance in which the products of combustion at the point of entrance to the flue under normal operating conditions have a temperature of more than 1,000°F (538°C) or less but not greater than 2,000°F (1093.3°C).
**APPLIANCE, UNVENTED.** An appliance designed or installed in such a manner that the products of combustion are not conveyed by a vent or chimney directly to the outdoor atmosphere.

**APPLIANCE, VENTED.** An appliance designed and installed in such a manner that all of the products of combustion are conveyed directly from the appliance to the outdoor atmosphere through an approved chimney or vent system. See also “VENTED APPLIANCE CATEGORIES.”

**APPROVED.** In reference to construction documents, the determination by the department after full examination that submitted construction documents comply with this code and other applicable laws and rules. In reference to materials, the determination by the commissioner that material is acceptable for its intended use. See Section 28-101.5 of the Administrative Code.

**APPROVED AGENCY.** An established and recognized agency, or other qualified person, engaged in conducting tests or furnishing inspection services, when approved pursuant to department rules as qualified to perform or witness identified testing or inspection services. See Chapter 1 of Title 28 of the Administrative Code.

**APPROVED INSPECTION AGENCY.** An approved agency that is approved by the department as qualified to perform one or more of the inspections required by this code. See Chapter 1 of Title 28 of the Administrative Code.

**APPROVED TESTING AGENCY.** An approved agency that is approved by the department as qualified to test and evaluate the performance of one or more of the materials regulated in their use by this code. Such term shall include, when approved pursuant to department rules, a third-party testing or certification agency, evaluation agency, testing laboratory, testing service, licensed concrete testing laboratory or other entity concerned with product evaluation. See Chapter 1 of Title 28 of the Administrative Code.

**ARCHITECT.** A person licensed and registered to practice the profession of architecture under the Education Law of the State of New York.

**ATMOSPHERIC PRESSURE.** The pressure of the weight of air and water vapor on the surface of the earth, approximately 14.7 pounds per square inch (psi) (101 kPa absolute) at sea level.

**AUTOMATIC IGNITION.** Ignition of gas at the burner(s) when the gas controlling device is turned on, including reignition if the flames on the burner(s) have been extinguished by means other than by the closing of the gas controlling device.

**BAFFLE.** An object placed in an appliance to change the direction of or retard the flow of air, air-gas mixtures or flue gases.

**BAROMETRIC DRAFT REGULATOR.** A balanced damper device attached to a chimney, vent connector, breeching or flue gas manifold to protect combustion appliances by controlling chimney draft. A double-acting barometric draft regulator is one in which the balancing damper is free to move in either direction to protect combustion appliances from both excessive draft and backdraft.

**BOILER, HIGH-PRESSURE.** An appliance for supplying steam or hot water that, for a steam boiler, operates at a pressure of more than 15 psig ([403] 103.4 kPa gauge), and for a hot water boiler, operates
at a pressure exceeding 160 psig ([1034] 1103 kPa gauge) or at a temperature exceeding 250°F ([121]121.1°C).

**BOILER, LOW-PRESSURE.** A self-contained appliance for supplying steam or hot water as follows:

- **Hot water heating boiler.** A boiler in which no steam is generated, from which hot water is circulated for heating purposes and then returned to the boiler, and that operates at water pressures not exceeding 160 pounds per square inch gauge (psig) (1103 kPa gauge) and at water temperatures not exceeding 250°F ([121]121.1°C) at or near the boiler outlet.

- **Hot water supply boiler.** A boiler, completely filled with water, which furnishes hot water to be used externally to itself, and that operates at water pressures not exceeding 160 psig (1103 kPa gauge) and at water temperatures not exceeding 250°F ([121]121.1°C) at or near the boiler outlet.

- **Steam heating boiler.** A boiler in which steam is generated and that operates at a steam pressure not exceeding 15 psig ([103]103.4 kPa gauge).

**BRANCH.** A section of gas piping downstream from a riser, leading to appliances or equipment on no more than two consecutive floors.

**BRAZING.** A metal-joining process wherein coalescence is produced by the use of a nonferrous filler metal having a melting point above 1,000°F ([538]537.8°C), but lower than that of the base metal being joined. The filler material is distributed between the closely fitted surfaces of the joint by capillary action.

**BROILER.** A general term including salamanders, barbecues and other appliances cooking primarily by radiated heat, excepting toasters.

**BTU.** Abbreviation for British thermal unit, which is the quantity of heat required to raise the temperature of 1 pound (454 g) of water 1°F ([0.56]-17.2°C) (1 Btu = 1055 J).

**BURNER.** A device for the final conveyance of the gas, or a mixture of gas and air, to the combustion zone.

- **[Induced-draft] Induced draft.** A burner that depends on draft induced by a fan that is an integral part of the appliance and is located downstream from the burner.

- **Power.** A burner in which gas, air or both are supplied at pressures exceeding, for gas, the line pressure, and for air, atmospheric pressure, with this added pressure being applied at the burner.

**CHIMNEY.** A primarily vertical structure containing one or more flues for the purpose of carrying gaseous products of combustion and air used to remove hot gases from burning fuel, refuse, or industrial processes from a fuel-burning appliance to the outside atmosphere.

- **Factory-built chimney.** A listed and labeled chimney composed of factory-made components, assembled in the field in accordance with manufacturer’s instructions and the conditions of the listing.

- **Masonry chimney.** A field-constructed chimney composed of solid masonry units, bricks, stones or concrete.
Metal chimney. A field-constructed chimney composed of metal.

[CHIMNEY CONNECTOR. A pipe that connects a fuel burning appliance to a chimney.]

CLEARANCE. The minimum distance through air measured between the heat-producing surface of the mechanical appliance, device or equipment and the surface of the combustible material or assembly.

CLOTHES DRYER. An appliance used to dry wet laundry by means of heated air. Dryer classifications are as follows:

Type 1. Factory-built package, multiple production. Primarily used in family living environment. Usually the smallest unit physically and in function output.

Type 2. Factory-built package, multiple production. Used in business with direct intercourse of the function with the public. Not designed for use in individual family living environment.

COMBUSTIBLE ASSEMBLY. Wall, floor, ceiling or other assembly constructed of one or more component materials that are not defined as noncombustible.

COMBUSTIBLE MATERIAL. Any material not defined as noncombustible.

COMBUSTION. In the context of this code, refers to the rapid oxidation of fuel accompanied by the production of heat or heat and light.

COMBUSTION AIR. Air necessary for complete combustion of a fuel, including theoretical air and excess air.

COMBUSTION CHAMBER. The portion of an appliance within which combustion occurs.

COMBUSTION PRODUCTS. Constituents resulting from the combustion of a fuel with the oxygen of the air, including inert gases, but excluding excess air.

[COMMISSIONER. The Commissioner of buildings of the City of New York or his or her duly authorized representative. See Section 28-101.5 of the Administrative Code.]

CONCEALED LOCATION. A location that cannot be accessed without damaging permanent parts of the building structure or finished surface. Spaces above, below or behind readily removable panels or doors shall not be considered as concealed.

CONCEALED PIPING. Piping that is located in a concealed location (see “Concealed Location”).

CONDENSATE. The liquid that condenses from a gas (including flue gas) caused by a reduction in temperature or increase in pressure.

CONNECTOR, APPLIANCE (Fuel). Rigid metallic pipe and fittings or a listed and labeled device that connects an appliance to the gas piping system.

[†] CONNECTOR, CHIMNEY OR VENT. The pipe that connects an appliance to a chimney or vent. [†]
CONSTRUCTION DOCUMENTS. Plans and specifications and other written, graphic and pictorial documents prepared or assembled for describing the design, location, physical characteristics and other elements of the project necessary for obtaining a building permit. See Section 28-101.5 of the Administrative Code.

CONTROL. A manual or automatic device designed to regulate the gas, air, water or electrical supply to, or operation of, a mechanical system.

CONVERSION BURNER. A unit consisting of a burner and its controls for installation in an appliance originally utilizing another fuel.

COUNTER APPLIANCES. Appliances such as coffee brewers and coffee urns and any appurtenant water-heating appliance, food and dish warmers, hot plates, griddles, waffle bakers and other appliances designed for installation on or in a counter.

CUBIC FOOT. The amount of gas that occupies 1 cubic foot (0.02832 m³) when at a temperature of 60°F (16.156°C), saturated with water vapor and under a pressure equivalent to that of 30 inches of mercury (101 kPa).

DAMPER. A manually or automatically controlled device to regulate draft or the rate of flow of air or combustion gases.

DECORATIVE APPLIANCE, VENTED. A vented appliance wherein the primary function lies in the aesthetic effect of the flames.

DECORATIVE APPLIANCES FOR INSTALLATION IN VENTED FIREPLACES. A vented appliance designed for installation within the fire chamber of a vented fireplace, wherein the primary function lies in the aesthetic effect of the flames.

DECORATIVE SHROUD. A listed, partial, noncombustible enclosure for aesthetic purposes that is installed at the termination of a venting system that surrounds or conceals the chimney a factory-built chimney system or vent cap.

DEMAND. The maximum amount of gas input required per unit of time, usually expressed in cubic feet per hour (1 ft³ = 0.0283 m³), or Btu/h (1 Btu/h = 0.2931 W).

DILUTION AIR. Air that is introduced into a draft hood and is mixed with the flue gases.

DIRECT-VENT APPLIANCES. Appliances that are constructed and installed so that all air for combustion is derived directly from the outdoor atmosphere and all flue gases are discharged directly to the outdoor atmosphere.

DRAFT. The pressure difference existing between the appliance or any component part and the atmosphere, that causes a continuous flow of air and products of combustion through the gas passages of the appliance to the atmosphere.

[MECHANICAL OR INDUCED] INDUCED DRAFT. The pressure difference created by the action of a fan, blower or ejector, that is located between the appliance and the chimney or vent termination.
Natural draft. The pressure difference created by a vent or chimney because of its height, and the temperature difference between the flue gases and the atmosphere.

DRAFT HOOD. A nonadjustable device built into an appliance, or made as part of the vent connector from an appliance, that is designed to (1) provide for ready escape of the flue gases from the appliance in the event of no draft, backdraft or stoppage beyond the draft hood, (2) prevent a backdraft from entering the appliance, and (3) neutralize the effect of stack action of the chimney or gas vent upon operation of the appliance.

DRAFT REGULATOR. A device that functions to maintain a desired draft in the appliance by automatically reducing the draft to the desired value.

DRIP. A nipple and cap placed at a low point in a system of piping to collect condensate and from which the condensate is removable.

DRY GAS. A gas having a moisture and hydrocarbon dew point below any normal temperature to which the gas piping is exposed.

DUCT FURNACE. A warm-air furnace or heater normally installed in an air distribution duct to supply warm air for heating. This definition shall apply only to a warm-air heating appliance that, [depends] for air circulation, depends on a blower not furnished as part of the furnace.

DUCT SYSTEM. A continuous passageway for the transmission of air that, in addition to ducts, includes duct fittings, dampers, plenums, fans and accessory air-handling equipment and appliances.

DWELLING. A building or structure which is occupied in whole or in part as the home, residence or sleeping place of one or more families.

DWELLING UNIT. A single unit consisting of one or more habitable rooms and occupied or arranged to be occupied as a unit separate from all other units within a dwelling.

[ENGINEER. A person licensed and registered to practice the profession of engineering under the Education Law of the State of New York.]

EQUIPMENT. Any apparatus or device that delivers gas as a fuel or raw material to an appliance or vents combustion products from an appliance, including but not limited to control devices, pressure regulators, valves, appliance appurtenances, gas connectors, or power exhausters used in connections to appliances.

EXCESS FLOW VALVE (EFV). A safety shut-off valve designed to activate to interrupt the flow of gas when the fuel gas passing through it exceeds a prescribed flow rate. Installed where specifically required by code or utility company.

EXHAUST. Air being removed from any space, appliance or piece of equipment conveyed directly to the atmosphere by means of openings or ducts.

EXTERIOR MASONRY CHIMNEYS. Masonry chimneys exposed to the outdoors on one or more sides below the roof line.
FIREPLACE. [A fire chamber and hearth constructed of noncombustible material for use with solid fuels and provided with a chimney.] An assembly consisting of a hearth and fire chamber of noncombustible material and provided with a chimney, for use with solid fuels.

Factory-built fireplace. [A fireplace composed of listed factory-built components assembled in accordance with the terms of listing to form the completed fireplace.] A listed and labeled fireplace and chimney system composed of factory-made components, and assembled in the field in accordance with manufacturer’s instructions and the conditions of the listing.

Masonry fireplace. A hearth and fire chamber of solid masonry units such as bricks, stones, listed masonry units or reinforced concrete, provided with a suitable chimney.

[FIRING VALVE. A valve of the plug and barrel type designed for use with gas, and equipped with a lever handle for manual operation and a dial to indicate the percentage of opening.]

FLAME SAFEGUARD. A device that will automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative, and when flame failure occurs on the burner or group of burners.

FLASHBACK ARRESTOR CHECK VALVE. A device that will prevent the backflow of one gas into the supply system of another gas and prevent the passage of flame into the gas supply system.

FLOOR FURNACE. A completely self-contained furnace suspended from the floor of the space being heated, taking air for combustion from outside such space and with means for observing flames and lighting the appliance from such space.

Fan type. A floor furnace equipped with a fan [which] that provides the primary means for circulating air.

Gravity type. A floor furnace depending primarily on circulation of air by gravity. This classification shall also include floor furnaces equipped with booster-type fans [which] that do not materially restrict free circulation of air by gravity flow when such fans are not in operation.

FLUE. A passageway within a chimney or vent through which gaseous combustion products pass.

FLUE, APPLIANCE. The passage(s) within an appliance through which combustion products pass from the combustion chamber of the appliance to the draft hood inlet opening on an appliance equipped with a draft hood or to the outlet of the appliance on an appliance not equipped with a draft hood.

FLUE COLLAR. That portion of an appliance designed for the attachment of a draft hood, vent connector or venting system.

FLUE GASES. Products of combustion plus excess air in fireplace and appliance flues or heat exchangers.

FLUE LINER (LINING). A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and for conveying combustion products without leakage into the atmosphere.
FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or mixtures of these gases.

[FUEL GAS UTILIZATION EQUIPMENT. See “Appliance.”]

FURNACE. A completely self-contained heating unit that is designed to supply heated air to spaces remote from or adjacent to the appliance location.

FURNACE, CENTRAL. A self-contained appliance for heating air by transfer of heat of combustion through metal to the air, and designed to supply heated air through ducts to spaces remote from or adjacent to the appliance location.

[Downflow furnace. A furnace designed with airflow discharge vertically downward at or near the bottom of the furnace.]

[Forced-air furnace with cooling unit. A single-package unit, consisting of a gas-fired forced air furnace of one of the types listed below combined with an electrically or fuel gas-powered summer air conditioning system, contained in a common casing.]

Forced-air type. A central furnace equipped with a fan or blower [which] that provides the primary means for circulation of air.

[Gravity furnace with booster fan. A furnace equipped with a booster fan that does not materially restrict free circulation of air by gravity flow when the fan is not in operation.]

[Gravity type. A central furnace depending primarily on circulation of air by gravity.]

[Horizontal forced-air type. A furnace with airflow through the appliance essentially in a horizontal path.]

[Multiple-position furnace. A furnace designed so that it can be installed with the airflow discharge in the upflow, horizontal or downflow direction.]

[Upflow furnace. A furnace designed with airflow discharge vertically upward at or near the top of the furnace. This classification includes “highboy” furnaces with the blower mounted below the heating element and “lowboy” furnaces with the blower mounted beside the heating element.]

[FURNACE, ENCLOSED. A specific heating, or heating and ventilating, furnace incorporating an integral total enclosure and using only outside air for combustion.]

FURNACE PLENUM. An air compartment or chamber to which one or more ducts are connected and [which] that forms part of an air distribution system.

GAS CONVENIENCE OUTLET. A permanently mounted, manually operated device that provides the means for connecting an appliance to, and disconnecting an appliance from, the supply piping. The device includes an integral, manually operated valve with a nondisplaceable valve member and is designed so that disconnection of an appliance only occurs when the manually operated valve is in the closed position.
GAS PIPING. An installation of pipe, valves or fittings installed on a premises or in a building and utilized to convey fuel gas.

GAS UTILIZATION EQUIPMENT. An appliance that utilizes gas as a fuel or raw material or both.

HAZARDOUS LOCATION. Any location considered to be a fire hazard for flammable vapors, dust, combustible fibers or other highly combustible substances. The location is not necessarily categorized in the New York City Building Code as a high-hazard group classification.

HOUSE PIPING. See “Piping system.”

HYDROGEN FUEL GAS ROOM. A separately ventilated, fully enclosed room designed to exclusively house the generation of gaseous hydrogen for immediate on-premises use in indoor fuel cells or other energy production process, and incidental indoor storage of gaseous hydrogen. A hydrogen fuel gas room is not intended to house the production or dispensing of hydrogen motor fuel.

IGNITION PILOT. A pilot that operates during the lighting cycle and discontinues during main burner operation.

IGNITION SOURCE. A flame, spark or hot surface capable of igniting flammable vapors or fumes. Such sources include appliance burners, burner ignitors, and electrical switching devices.

INCINERATOR. An appliance used to reduce combustible refuse material to ashes and manufactured, sold and installed as a complete unit.

INDUSTRIAL AIR HEATERS, NONRECIRCULATING DIRECT-FIRED. A heater in which all the products of combustion generated by the burners are released into the air stream being heated. The purpose of the heater is to offset building heat loss by heating only outdoor air.

INDUSTRIAL AIR HEATERS, RECIRCULATING DIRECT-FIRED. A heater in which all the products of combustion generated by the burners are released into the air stream being heated. The purpose of the heater is to offset building heat loss by heating outdoor air, and, if applicable, indoor air.

INFRARED RADIANT HEATER. A heater that directs a substantial amount of its energy output in the form of infrared radiant energy into the area to be heated. Such heaters are of either the vented or unvented type.

INTEGRAL VENT APPLIANCES. Appliances designed for outdoor installation that have built-in natural or mechanical venting means and are constructed and installed so that all air for combustion is derived from the outdoor atmosphere and all flue gases are discharged to the outdoor atmosphere through an integral vent termination.

INTERLOCK. A device actuated by another device with which it is directly associated, to govern succeeding operations of the same or allied devices. A circuit in which a given action cannot occur until after one or more other actions have taken place.
JOINT, FLANGED. A joint made by bolting together a pair of flanged ends.

JOINT, FLARED. A metal-to-metal compression joint in which a conical spread is made on the end of a tube that is compressed by a flare nut against a mating flare.

JOINT, MECHANICAL. A general form of gas-tight joints obtained by the joining of metal parts through a positive-holding mechanical construction, such as press joint, flanged joint, threaded joint, flared joint or compression joint.

JOINT, PLASTIC ADHESIVE. A joint made in thermoset plastic piping by the use of an adhesive substance [which] that forms a continuous bond between the mating surfaces without dissolving either one of them.

JOINT, PLASTIC HEAT FUSION. A joint made in thermoplastic piping by heating the parts sufficiently to permit fusion of the materials when the parts are pressed together.

JOINT, WELDED. A gas-tight joint obtained by the joining of metal parts in molten state.

[LABEL. Identification applied to material by the manufacturer or an approved agency that contains the name of the manufacturer, the function and performance characteristics of the material, and the name and identification of the approved agency that conducted the evaluation of a representative sample of such material.]

[LABELLED. Equipment, appliances, material or products to which has been attached a label, symbol or other identifying mark of the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the equipment, appliances, material or products, and the name and identification of an approved agency and that indicates that a representative sample of the equipment, appliances, material, or products has been tested and evaluated by an approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner. See Section 28-101.5 of the Administrative Code.]

LEAK CHECK. An operation performed on a gas piping system to verify that the system does not leak. Leakage checks are intended to discover open outlets, defective appliance connection and defects that have developed since the initial installation, normally performed after pressure testing.

LIMIT CONTROL. A device responsive to changes in pressure, temperature or level for turning on, shutting off or throttling the gas supply to an appliance.

LIQUEFIED PETROLEUM GAS or LPG (LP-GAS). Liquefied petroleum gas composed predominately of propane, propylene, butanes or butylenes, or mixtures thereof that is gaseous under normal atmospheric conditions, but is capable of being liquefied under moderate pressure at normal temperatures.

[LISTED. Material identified in a list published by an approved agency that maintains periodic inspection of production of listed material or periodic evaluation of services and whose listing states either that the material meets identified nationally recognized standards or has been tested and found suitable for a specified purpose when installed in accordance with the manufacturer’s installation instructions. See Section 28-101.5 of the Administrative Code.]
LIVING SPACE. Space within a dwelling unit utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes.

LOG LIGHTER. A manually operated solid fuel ignition appliance for installation in a vented solid fuel-burning fireplace.

[LUBRICATED PLUG-TYPE VALVE. A valve of the plug and barrel type provided with means for maintaining a lubricant between the bearing surfaces.]

MAIN BURNER. A device or group of devices essentially forming an integral unit for the final conveyance of gas or a mixture of gas and air to the combustion zone, and in which combustion takes place to accomplish the function for which the appliance is designed.

METER. The instrument installed to measure the volume of gas delivered through it.

[MODULATING. Modulating or throttling is the action of a control from its maximum to minimum position in either predetermined steps or increments of movement as caused by its actuating medium.]

NPS. An abbreviation for “Nominal pipe size.”

NONCOMBUSTIBLE MATERIALS. Materials that, when tested in accordance with ASTM E 136, have at least three of four specimens tested meeting all of the following criteria:

1. The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than $54^\circ$F ($12.2^\circ$C) above the furnace temperature at the beginning of the test.

2. There shall not be flaming from the specimen after the first 30 seconds.

3. If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.

[OCCUPANCY. The purpose or activity for which a building or space is used or is designed, arranged or intended to be used.]

OFFSET (VENT). A combination of approved bends that makes two changes in direction bringing one section of the vent out of line but into a line parallel with the other section.

ORIFICE. The opening in a cap, spud or other device whereby the flow of gas is limited and through which the gas is discharged to the burner.

OUTLET. The point at which a gas-fired appliance connects to the gas piping system.

OXYGEN DEPLETION SAFETY SHUTOFF SYSTEM (ODS). A system designed to act to shut off the gas supply to the main and pilot burners if the oxygen in the surrounding atmosphere is reduced below a predetermined level.

PILOT. A small flame that is utilized to ignite the gas at the main burner or burners.
PIPING. Where used in this code, “piping” refers to either pipe or tubing, or both.

Pipe. A rigid conduit of iron, steel, copper, brass or plastic.

Tubing. Semirigid conduit of copper, aluminum, plastic or steel.

PIPING SYSTEM. All fuel piping, valves and fittings from the outlet of the point of delivery to the outlets of the appliance shutoff valves.

PLASTIC, THERMOPLASTIC. A plastic that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.

POINT OF DELIVERY. For natural gas systems, the point of delivery is the outlet of the service meter assembly or the outlet of the service regulator or service shutoff valve where a meter is not provided. Where a valve is provided at the outlet of the service meter assembly, such valve shall be considered to be downstream of the point of delivery.

PORTABLE FUEL CELL APPLIANCE. A fuel cell generator of electricity, which is not fixed in place. A portable fuel cell appliance utilizes a cord and plug connection to a grid-isolated load and has an integral fuel supply.

PRESSURE DROP. The loss in pressure due to friction or obstruction in pipes, valves, fittings, regulators and burners.

PRESSURE TEST. An operation performed to verify the gas-tight integrity of gas piping following its installation or modification.

PURGE. To free a gas conduit of air or gas, or a mixture of gas and air.

QUICK-DISCONNECT DEVICE. A hand-operated device that provides a means for connecting and disconnecting an appliance or an appliance connector to a gas supply and that is equipped with an automatic means to shut off the gas supply when the device is disconnected.

READY ACCESS (TO). That which enables a device, fixture, appliance or equipment to be directly reached, without requiring the removal or movement of any panel, door or similar obstruction. (see “Access (to).”)

[REGISTERED DESIGN PROFESSIONAL. An architect or engineer.]

[REGISTERED DESIGN PROFESSIONAL OF RECORD. The registered design professional who prepared or supervised the preparation of applicable construction documents filed with the department.]

REGULATOR. A device for controlling and maintaining a uniform supply pressure, either pounds-to-inches water column (MP regulator) or inches-to-inches water column (appliance regulator).

REGULATOR, GAS APPLIANCE. A pressure regulator for controlling pressure to the manifold of the appliance. Types of appliance regulators are as follows:

Adjustable.
1. **Spring type, limited adjustment.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable over a range of not more than 15 percent of the outlet pressure at the midpoint of the adjustment range.

2. **Spring type, standard adjustment.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is adjustable. The adjustment means shall be concealed.

**Multistage.** A regulator for use with a single gas whose adjustment means is capable of being positioned manually or automatically to two or more predetermined outlet pressure settings. Each of these settings shall be adjustable or nonadjustable. The regulator may modulate outlet pressures automatically between its maximum and minimum predetermined outlet pressure settings.

**Nonadjustable.**

1. **Spring type, nonadjustable.** A regulator in which the regulating force acting upon the diaphragm is derived principally from a spring, the loading of which is not field adjustable.

2. **Weight type.** A regulator in which the regulating force acting upon the diaphragm is derived from a weight or combination of weights.

**REGULATOR, LINE GAS PRESSURE.** A device placed in a gas line between the service pressure regulator and the appliance for controlling, maintaining or reducing the pressure in that portion of the piping system downstream of the device.

**REGULATOR, MEDIUM-PRESSURE (MP Regulator).** A line pressure regulator that reduces gas pressure from the range of greater than 0.5 psig (3.4 kPa) and less than or equal to 5 psig (34.5 kPa) to a lower pressure.

**REGULATOR, PRESSURE.** A device placed in a gas line for reducing, controlling and maintaining the pressure in that portion of the piping system downstream of the device.

**REGULATOR, SERVICE PRESSURE.** A device installed by the serving gas supplier to reduce and limit the service line pressure to delivery pressure.

**RELIEF OPENING.** The opening provided in a draft hood to permit the ready escape to the atmosphere of the flue products from the draft hood in the event of no draft, back draft [7] or stoppage beyond the draft hood, and to permit air into the draft hood in the event of a strong chimney updraft.

**RELIEF VALVE (DEVICE).** A safety valve designed to forestall the development of a dangerous condition by relieving either pressure, temperature or vacuum [in the hot water supply system].

**RELIEF VALVE, PRESSURE.** An automatic valve that opens and closes a relief vent, depending on whether the pressure is above or below a predetermined value.

**RELIEF VALVE, TEMPERATURE.**
Manual reset type. A valve that automatically opens a relief vent at a predetermined temperature and that must be manually returned to the closed position.

Reseating or self-closing type. An automatic valve that opens and closes a relief vent, depending on whether the temperature is above or below a predetermined value.

RELIEF VALVE, VACUUM. A valve that automatically opens and closes a vent for relieving a vacuum within the hot water supply system, depending on whether the vacuum is above or below a predetermined value.

RISER, GAS. A vertical pipe supplying fuel gas that extends one full story or more.

ROOM HEATER, UNVENTED. See “Unvented room heater.”

ROOM HEATER, VENTED. See “Vented room heater.”

[ROOM LARGE IN COMPARISON WITH SIZE OF EQUIPMENT THE APPLIANCE. Rooms having a volume equal to at least 12 times the total volume of a furnace, water heater or air conditioning appliance and at least 16 times the total volume of a boiler. Total volume of the appliance is determined from exterior dimensions and is to include fan compartments and burner vestibules, when used. When the actual ceiling height of a room is greater than 8 feet (2438 mm), the volume of the room is figured on the basis of a ceiling height of 8 feet (2438 mm).]

ROUGH-IN. Parts of the gas system that are installed prior to the installation of appliances or equipment. This includes gas piping, all the necessary supports and any appliances that are built into the structure.

SAFETY SHUTOFF DEVICE. See “Flame safeguard.”

SERVICE PIPING. All fuel-gas piping, valves and fittings upstream of the point of delivery.

SHAFT. An enclosed space extending through one or more stories of a building, connecting vertical openings in successive floors, or floors and the roof.

SLEEPING UNIT. A dwelling unit, which may contain either toilet or kitchen facilities but not both. Any sleeping unit housing more than one family shall also be classified as a congregate living unit. The creation of or conversion to sleeping units shall be limited by Section 27-2077 of the New York City Housing Maintenance Code.

SPECIFIC GRAVITY. As applied to gas, specific gravity is the ratio of the weight of a given volume to that of the same volume of air, both measured under the same condition.

STATIONARY FUEL CELL POWER PLANT. A self-contained package or factory-matched packages that constitute an automatically operated assembly of integrated systems for generating electrical energy and recoverable thermal energy that is permanently connected and fixed in place.

THERMOSTAT.
**Electric switch type.** A device that senses changes in temperature and controls electrically, by means of separate components, the flow of gas to the burner(s) to maintain selected temperatures.

**Integral gas valve type.** An automatic device, actuated by temperature changes, designed to control the gas supply to the burner(s) in order to maintain temperatures between predetermined limits, and in which the thermal actuating element is an integral part of the device.

1. **Graduating thermostat.** A thermostat in which the motion of the valve is approximately in direct proportion to the effective motion of the thermal element induced by temperature change.

2. **Snap-acting thermostat.** A thermostat in which the thermostatic valve travels instantly from the closed to the open position, and vice versa.

**THIRD-PARTY CERTIFICATION AGENCY.** An approved agency operating a product or material certification system that incorporates initial product testing, assessment and surveillance of a manufacturer’s quality control system.

**THIRD-PARTY CERTIFIED.** Certification obtained by the manufacturer indicating that the function and performance characteristics of a product or material have been determined by testing and ongoing surveillance by an approved third-party certification agency. Assertion of certification is in the form of identification in accordance with the requirements of the third-party certification agency.

**THIRD-PARTY TESTED.** Procedure by which an approved testing laboratory provides documentation that a product, material or system conforms to specified requirements.

**TRANSITION FITTINGS, PLASTIC TO STEEL.** An adapter for joining plastic pipe to steel pipe. The purpose of this fitting is to provide a permanent, pressure-tight connection between two materials [which] that cannot be joined directly one to another.

**UNIT HEATER.**

**High-static pressure type.** A self-contained, automatically controlled, vented appliance having integral means for circulation of air against 0.2 inch (15 mm H2O) or greater static pressure. Such appliance is equipped with provisions for attaching an outlet air duct and, where the appliance is for indoor installation remote from the space to be heated, is also equipped with provisions for attaching an inlet air duct.

**Low-static pressure type.** A self-contained, automatically controlled, vented appliance, intended for installation in the space to be heated without the use of ducts, having integral means for circulation of air. Such units are allowed to be equipped with louvers or face extensions made in accordance with the manufacturer’s specifications.

**UNLISTED BOILER.** A boiler not listed by a nationally recognized testing agency.

**UNVENTED ROOM HEATER.** An unvented heating appliance designed for stationary installation and utilized to provide comfort heating. Such appliance provides radiant heat or convection heat by gravity or fan circulation directly from the heater and does not utilize ducts.
**VALVE.** A device used in piping to control the gas supply to any section of a system of piping or to an appliance.

**Appliance shutoff.** A valve located in the piping system, used to isolate individual appliances for purposes such as service or replacement.

**Automatic.** An automatic or semiautomatic device consisting essentially of a valve and operator that control the gas supply to the burner(s) during operation of an appliance. The operator shall be actuated by application of gas pressure on a flexible diaphragm, by electrical means, by mechanical means, or by other approved means.

**Automatic gas shutoff.** A valve used in conjunction with an automatic gas shutoff device to shut off the gas supply to a water-heating system. It shall be constructed integrally with the gas shutoff device or shall be a separate assembly.

**Individual main burner.** A valve that controls the gas supply to an individual main burner.

**Main burner control.** A valve that controls the gas supply to the main burner manifold.

**Manual main gas-control.** A manually operated valve in the gas line for the purpose of completely turning on or shutting off the gas supply to the appliance, except to pilot or pilots that are provided with independent shutoff.

**Manual reset.** An automatic shutoff valve installed in the gas supply piping and set to shut off when unsafe conditions occur. The device remains closed until manually reopened.

**Service shutoff.** A valve, installed by the serving gas supplier between the service meter or source of supply and the customer piping system, to shut off the entire piping system.

**VENT.** A pipe or other conduit composed of factory-made components, containing a passageway for conveying combustion products and air to the atmosphere, listed and labeled for use with a specific type or class of appliance.

**Special gas vent.** A vent listed and labeled for use with listed Category II, III and IV appliances.

**Type B vent.** A vent listed and labeled for use with appliances with draft hoods and other Category I appliances that are listed for use with Type B vents.

**Type BW vent.** A vent listed and labeled for use with wall furnaces.

**Type L vent.** A vent listed and labeled for use with appliances that are listed for use with Type L or Type B vents.

**VENT GASES.** Products of combustion from appliances plus excess air plus dilution air in the vent connector, gas vent or chimney above the draft hood or draft regulator.

**VENT PIPING.**
Breather. Piping run from a pressure-regulating device to the outdoors, designed to provide a reference to atmospheric pressure. If the device incorporates an integral pressure relief mechanism, a breather vent can also serve as a relief vent.

Relief. Piping run from a pressure-regulating or pressure-limiting device to the outdoors, designed to provide for the safe venting of gas in the event of excessive pressure in the gas piping system.

VENTED APPLIANCE CATEGORIES. Appliances that are categorized for the purpose of vent selection are classified into the following four categories:

Category I. An appliance that operates with a nonpositive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.

Category II. An appliance that operates with a nonpositive vent static pressure and with a vent gas temperature that is capable of causing excessive condensate production in the vent.

Category III. An appliance that operates with a positive vent static pressure and with a vent gas temperature that avoids excessive condensate production in the vent.

Category IV. An appliance that operates with a positive vent static pressure and with a vent gas temperature that is capable of causing excessive condensate production in the vent.

VENTED ROOM HEATER. A vented self-contained, free-standing, nonrecessed appliance for furnishing warm air to the space in which it is installed, directly from the heater without duct connections.

VENTED WALL FURNACE. A self-contained vented appliance complete with grilles or equivalent, designed for incorporation in or permanent attachment to the structure of a building, mobile home or travel trailer, and furnishing heated air circulated by gravity or by a fan directly into the space to be heated through openings in the casing. This definition shall exclude floor furnaces, unit heaters and central furnaces as herein defined.

VENTING SYSTEM. A continuous open passageway from the flue collar or draft hood of an appliance to the [outside] outdoor atmosphere for the purpose of removing flue or vent gases. A venting system is usually composed of a vent or a chimney and vent connector, if used, assembled to form the open passageway.

Forced-draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under positive static vent pressure.

Induced draft venting system. A portion of a venting system using a fan or other mechanical means to cause the removal of flue or vent gases under nonpositive static vent pressure.

Mechanical draft venting system. A venting system designed to remove flue or vent gases by mechanical means, that consists of an induced draft portion under nonpositive static pressure or a forced draft portion under positive static pressure.

Natural draft venting system. A venting system designed to remove flue or vent gases under nonpositive static vent pressure entirely by natural draft.
WALL HEATER, UNVENTED-TYPE. A room heater of the type designed for insertion in or attachment to a wall or partition. Such heater does not incorporate concealed venting arrangements in its construction and discharges all products of combustion through the front into the room being heated.

WATER HEATER. Any heating appliance or equipment that heats potable water and supplies such water to the potable hot water distribution system.

§ 4. Chapter 3 of the New York city fuel gas code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 3
GENERAL REGULATIONS

SECTION FGC 301
GENERAL

301.1 Scope. This chapter shall govern the approval and installation of all equipment and appliances that comprise parts of the installations regulated by this code in accordance with Section 101.2.

301.1.1 Other fuels. The requirements for combustion and dilution air for gas-fired appliances shall be governed by Section 304. The requirements for combustion and dilution air for appliances operating with fuels other than fuel gas shall be regulated by the New York City Mechanical Code.

301.2 Energy utilization. Heating, ventilating, air-conditioning, and refrigeration systems of all structures shall be designed and installed for efficient utilization of energy in accordance with the New York City Energy Conservation Code.

301.3 Listed and labeled. Appliances regulated by this code shall be listed and labeled.

301.4 Labeling. Refer to Article 114 and Section 28-113.4 of the Administrative Code and Article 114 of Chapter 1 of Title 28 of the Administrative Code.

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to appliances on which shall appear [s] in legible lettering[s]: the manufacturer’s name or trademark, the model number, serial number and, for listed appliances, the seal or mark of the testing agency. A label shall [also] include the hourly rating in British thermal units per hour (Btu/h) (W), the type of fuel approved for use with the appliance; and the minimum clearance requirements.

301.6 Plumbing connections. Potable water supply and building drainage system connections to appliances regulated by this code shall be in accordance with the New York City Plumbing Code.

301.7 Fuel types. Appliances shall be designed for use with the type of fuel gas that will be supplied to them.

301.7.1 Appliance fuel conversion. Appliances shall not be converted to utilize a different fuel gas except where complete instructions for such conversion are provided [in installation instructions] by the serving gas supplier [or by] the appliance manufacturer, the burner manufacturer or the boiler
manufacturer. If a specific listing and labeling is available for the burner and boiler combination it shall be submitted to the department. If a specific listing for the combination is not available the listing for the burner and a letter confirming compatibility shall be submitted by the burner manufacturer. The completed installation shall be inspected and tested in the field by a representative of the appliance manufacturer, the burner manufacturer or the boiler manufacturer, and certified by a registered design professional. A certification of compliance by a registered design professional developed in accordance with the requirements of the New York City Department of Environmental Protection may be used to satisfy this certification requirement. The registered design professional need not be the engineer of record for the design.

301.7.2 Liquid petroleum gas. Storage or use of LPG for a stationary LPG installation shall comply with the New York City Fire Code.

301.8 Vibration isolation. Where means for isolation of vibration of an appliance is installed, means for support and restraint of that appliance shall be provided as designed by a registered design professional.

301.9 Repair. Defective material or parts shall be replaced or repaired in such a manner so as to preserve the original approval or listing.

301.10 Wind resistance. Appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with the New York City Building Code.

301.11 Flood hazard. For structures located in areas of special flood hazard areas, the appliance, equipment and system installations regulated by this code shall comply with the additional requirements of Appendix G of the New York City Building Code.

301.12 Seismic resistance. When earthquake loads are applicable in accordance with the New York City Building Code, the supports shall be designed and installed for the seismic forces in accordance with that code.

301.13 Ducts. Ducts required for the installation of systems regulated by this code shall be designed and installed in accordance with the New York City Mechanical Code.

301.14 Rodentproofing. Buildings or structures and the walls enclosing habitable or occupiable rooms and spaces in which persons live, sleep or work, or in which feed, food or foodstuffs are stored, prepared, processed, served or sold, shall be constructed to protect against rodents in accordance with the New York City Building Code.

301.15 Prohibited location. The appliances, equipment and systems regulated by this code shall not be located in an elevator shaft.

301.16 Mechanical systems. Hydronic piping, ventilation and other mechanical systems not covered by this code shall be in accordance with the New York City Mechanical Code.

301.17 Electrical systems. Electrical wiring, controls and connections to equipment and appliances regulated by this code shall be in accordance with the New York City Electrical Code.
301.18 Noise control requirements. Appliances and equipment regulated by this code must comply with Section 928 of the New York City Mechanical Code.

SECTION FGC 302
STRUCTURAL SAFETY

302.1 Structural safety. The building shall not be weakened by the installation of any gas piping. In the process of installing or repairing any gas piping, the finished floors, walls, ceilings, tile work or any other part of the building or premises which is required to be changed or replaced shall be left in a safe structural condition in accordance with the requirements of the New York City Building Code.

302.1.1 Loading. Alterations resulting in the addition of loads to any member, such as HVAC equipment and water heaters, shall not be permitted without verification that the members are capable of supporting such additional loading.

302.2 Penetrations of floor/ceiling assemblies and fire-resistance-rated assemblies. Penetrations of floor/ceiling assemblies and assemblies required to have a fire-resistance rating shall be protected in accordance with the New York City Building Code.

302.3 Cutting, notching and boring in wood members. The cutting, notching and boring of wood members shall comply with Sections 302.3.1 through 302.3.5.

302.3.1 [Engineered wood products. Cuts, notches and holes bored in trusses, structural composite lumber, structural glued-laminated members and I-joists are prohibited except where permitted by the manufacturer’s recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.]

[302.3.2 Joist notching and boring.] Solid non-engineered joist notches and holes. [Notching at] Notches on the ends of the solid non-engineered joists shall not exceed one-fourth the joist depth. Notches in the top or bottom of joists shall not exceed one-sixth the depth, shall not be longer than one-third the depth and shall not be located in the middle third of the span. Holes bored in joists shall not be within 2 inches (50.8 mm) of the top or bottom of the joist, and [their] the diameter of any such hole shall not exceed one-third the depth of the joist. Notches in the top or bottom of the joist shall not exceed one-sixth the depth and shall not be located in the middle one-third of the span. Holes bored in the middle third of the span shall be located at the center of the joist depth. Clear distance between holes and notches shall be a minimum of 2 inches (50.8 mm). See Figure 2308.5.8 of the New York City Building Code.

[302.3.3] 302.3.2 Stud cutting and notching. In exterior walls and bearing partitions, [any] wood studs are permitted to be cut or notched to a depth not exceeding 25 percent of [its] the width of the stud. Cutting or notching of studs to a depth not greater than 40 percent of the width of the stud is permitted in nonload-bearing partitions supporting no loads other than the weight of the partition. See Figure 2308.5.8 of the New York City Building Code.

[302.3.4] 302.3.3 Bored holes in studs. [A hole] Bored holes not greater [in diameter] than 40 percent of the stud width are permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the depth of the stud width are permitted in nonload-bearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled...
studs are so bored. In no case shall the edge of the bored hole be nearer than ⅜ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch. See Figure 2308.5.8 of the New York City Building Code.

302.3.4 Engineered wood products. Cuts, notches and holes bored in trusses, structural composite lumber, structural glued-laminated members and I-joists are prohibited except where permitted by the manufacturer’s recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.

302.3.5 Drilling and notching of top plate. When piping is placed in or partly in an exterior wall or interior load-bearing wall, necessitating cutting, drilling or notching of the top plate by more than 50 percent of its width, a galvanized metal tie not less than 0.054 inch thick (1.37 mm) (No. 16 gage) and 1½ inches (38.1 mm) wide shall be fastened across and to the plate at each side of the opening with not less than eight 10d (0.148 inch diameter) nails having a minimum length of 1½ inches (38.1 mm) at each side or equivalent. The metal tie must extend a minimum of 6 inches (152.4 mm) past the opening. See Figure 2308.5.8 of the New York City Building Code.

Exception: When the entire side of the wall with the notch or cut is covered by wood structural panel sheathing, additional fastening is not required.

302.4 [Alterations to trusses] Trusses. Truss members of any material and components shall not be cut, drilled, notched, spliced or otherwise altered in any way without the written concurrence and approval of a registered design professional. [Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heaters) shall not be permitted without verification that the truss is capable of supporting such additional loading.]

302.5 Cutting, notching and boring in steel framing. The cutting, notching and boring of steel framing members shall comply with Sections 302.5.1 through 302.5.4.

302.5.1 [Cutting, notching and boring holes in structural] Structural steel framing. The cutting, notching and boring of holes in structural steel framing members shall be as prescribed by the registered design professional.

302.5.2 Cold-formed steel framing. Flanges and lips of load-bearing, cold-formed steel framing members shall not be cut or notched. Holes in webs of load-bearing, cold-formed steel framing members shall be permitted along the centerline of the web of the framing member and shall not exceed the dimensional limitations, penetration spacing or minimum hole edge distance as prescribed by [a] the registered design professional. [Cutting, notching and boring holes of steel floor/roof decking shall be as prescribed by a registered design professional.]

302.5.3 Nonstructural cold-formed steel wall framing. Flanges and lips of nonstructural cold-formed steel wall studs shall be permitted along the centerline of the web of the framing member, shall not exceed 1½ inches ([38] 38.1 mm) in width or 4 inches ([102] 101.6 mm) in length, and the holes shall not be spaced less than 24 inches ([640] 609.6 mm) center to center from another hole or less than 10 inches (254 mm) from the bearing end.
302.5.4 Steel floor and roof decking. Cutting, notching and boring holes in steel floor and roof decking shall be as prescribed by the registered design professional.

302.6 Cutting, notching and coring into concrete. The cutting, notching or coring of concrete must comply with provisions of Chapter 19 of the New York City Building Code and is not permitted without prior approval of the registered design professional.

302.7 Protection of footings. Trenching installed parallel to footings and walls shall not extend into the bearing plane of a footing or wall. The upper boundary of the bearing plane is a line that extends downward, at an angle of 34 degrees (1:1.5 slope) from horizontal, from the outside bottom edge of the footing or wall.

302.8 Piping materials exposed within plenums. Piping materials exposed within plenums shall comply with the provisions of the New York City Mechanical Code.

SECTION FGC 303
APPLIANCE LOCATION

303.1 General. Appliances shall be located as required by this section, specific requirements elsewhere in this code and the conditions of the equipment and appliance listing.

303.2 Hazardous locations. Appliances shall not be located in a hazardous location unless listed and approved for the specific installation.

303.3 Prohibited locations. Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces.

Exceptions:

1. In rooms other than those used for sleeping purposes, direct-vent appliances that obtain all combustion air directly from the outdoors and installed in accordance with the conditions of the listing and the manufacturer’s instructions.

2. In rooms other than those used for sleeping purposes, vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces that are installed in rooms that meet the required volume criteria of Section 304.5.

3. In rooms other than those used for sleeping purposes, appliances installed in an enclosure in which all combustion air is taken from the outdoors, in accordance with Section 304.6. Access to such enclosure shall be through a solid weather-stripped door, equipped with an approved self-closing device.

303.3.1 Gas-fired direct vent appliances. Gas-fired direct vent space-heating appliances used for providing heat in rooms for sleeping purposes shall be deemed to be located outside of the sleeping room provided that the appliance and its installation comply with Sections 303.3.1.1 through 303.3.1.7.
303.3.1 General. [Such a] Such unit is factory assembled and manufactured with an integral, factory assembled and hard-wired carbon monoxide detector interlock [with] and automatic main gas shut-off valve. [Such unit shall be of direct vent type, such that all air for combustion is derived from the outdoors and that all flue gases are discharged directly to the outdoors.] The appliance shall be tested, designed and evaluated in accordance with Section 622 of this code. Acceptable gas-fired direct vent space-heating appliances shall be listed and labeled by an approved agency in accordance with Section 28-113.2.3 of the Administrative Code. Installation shall be in accordance with the manufacturer’s instructions and the applicable listing.

303.3.1.2 Carbon monoxide detector. The carbon monoxide detector shall be listed and labeled in accordance with UL 2034 and UL 2075 and installed in accordance with the carbon monoxide detector manufacturer’s instructions. The carbon monoxide detector may be installed integral to the appliance, on the surface of the appliance or remotely, but hard-wired, no more than 5 feet (1.5 m) from the appliance.

303.3.1.3 Internal safety controls. The appliance shall be hard-wired to the carbon monoxide detector in a supervisory signaling mode. If the carbon monoxide detector connection is not sensed, the appliance shall not initiate a startup sequence and shall alert the operator to the fault condition. The appliance shall be supplied with a carbon monoxide fault indicator easily visible and recognizable to the operator. The appliance shall be equipped with a manual restart control. Automatic reset is not permitted.

303.3.1.4 Gas piping. The appliance shall be installed with natural gas only. All gas piping shall be hard-piped with no flexible connectors. [Such unit shall be installed through a sleeve located in an exterior wall.] Pursuant to Section 27-203(f) of the New York City Housing Maintenance Code, each heater shall be equipped with an effective device [which will] to automatically shut off the gas supply to the heater if its pilot light or other constantly burning flame is extinguished, or in the event of an interruption of the gas supply to the heater, and will not permit the heater to be relighted unless such shut-off device is first reset manually. [Installation requirements shall be in accordance with the manufacturer’s instructions and the applicable listing.]

303.3.1.5 Venting. Such unit shall be of direct vent type, such that all air for combustion is derived from the outdoors and that all flue gases are discharged directly to the outdoors. Such unit shall be installed through a sleeve located in an exterior wall.

303.3.1.6 Installation. Gas-fired direct vented appliances shall be installed in accordance with the following:

1. Carbon monoxide detectors installed with gas-fired direct vent space-heating appliance shall be provided in addition to code required carbon monoxide detector devices in dwelling units.

2. Carbon monoxide detectors installed with gas-fired direct vent space-heating appliance shall not be interconnected to other carbon monoxide detecting devices in the dwelling unit.

3. The appliance shall only be installed by a master licensed plumber.
303.3.1.7 Clearances. Gas-fired direct vented appliances shall be installed with the following clearances:

1. Clearances from adjacent combustible surfaces shall meet the minimum clearances indicated by the manufacturer’s instructions and the listing agency.

2. Clearances from adjacent openings or packaged terminal air conditioners (PTAC) and packaged terminal heat pumps (PTHP), the bottom of the vent terminal and the air intake shall be located at least 12 inches (304.8 mm) above finished ground level and in accordance with Table 303.3.1.7.

3. For all other equipment, all vent termination clearances from adjacent openings shall be in accordance with Section 503.8.

For SI: 1 inch = 25.4 mm, 1 British thermal unit per hour = 0.2931 W.

303.4 Protection from physical damage. Appliances shall not be installed in a location where subject to physical damage, including vehicular impact, unless protected by approved barriers meeting the requirements of the New York City Fire Code.

303.5 Indoor locations. Furnaces and boilers installed in closets and alcoves shall be listed for such installation.

303.5.1 [Gas-Fired Appliances] Gas fired appliances. [Gas-fired appliances] Boilers, furnaces and other centrally installed space heating equipment, regardless of btu per hour input, shall be located in an enclosure in accordance with Section 509 of the New York City Building Code.

   Exception: Gas-fired direct vented appliances with a 350,000 btu per hour (102.6 kW) input or less may be installed in a non-fire rated enclosure.

303.5.2 Maximum temperature. Maximum indoor temperature in spaces surrounding appliances shall not exceed the greater of the operational temperature of the installed equipment [and/or] or 104°F (40°C).
303.6 **Outdoor locations.** Appliances installed in outdoor locations shall be either listed for outdoor installation or provided with protection from outdoor environmental factors that influence the operability, durability and safety of the appliances.

303.7 **Pit locations.** Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil. The sides of the pit or excavation shall be held back a minimum of 12 inches ([305] 304.8 mm) from the appliance. Where the depth exceeds 12 inches ([305] 304.8 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches ([402] 101.6 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. The appliance shall be protected from flooding in a manner approved by the commissioner.

**SECTION FGC 304**

**COMBUSTION, VENTILATION AND DILUTION AIR**

304.1 **General.** Air for combustion, ventilation and dilution of flue gases for appliances installed in buildings shall be provided by application of one of the methods prescribed in Sections 304.5 through 304.9. Where the requirements of Section 304.5 are not met, outdoor air shall be introduced in accordance with one of the methods prescribed in Sections 304.6 through 304.9. Direct-vent appliances, gas appliances of other than natural draft design [and], vented gas appliances [other than] not designated as Category I and appliances equipped with power burners shall be provided with combustion, [ventilation] and dilution air in accordance with the appliance manufacturer’s instructions. Combustion, [ventilation,] and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h (102.6 kW). Ventilation air shall be provided by any suitable means. The mechanical room shall comply with the requirements of Section 1012 of the New York City Mechanical Code and Sections C402.5.3 and R402.4.4, as applicable, of the New York City Energy Conservation Code.

**Exception:** Type 1 clothes dryers that are provided with makeup air in accordance with Section [614.5] 504 of the New York City Mechanical Code.

304.1.1 **Crawl space and attic space.** For the purposes of this chapter, an opening to a naturally ventilated crawl space or attic space shall be considered equivalent to an opening to the outdoors.

[304.1.2] **304.1.1.1 Crawl space.** Where lower combustion air openings connect with crawl spaces, such spaces shall have unobstructed openings to the outdoors at least twice that required for the combustion air openings. The height of the crawl space shall comply with the requirements of the New York City Building Code and shall be without obstruction to the free flow of air.

[304.1.3] **304.1.1.2 Attic space.** Where combustion air is obtained from an attic area, the attic ventilating openings shall not be subject to ice or snow blockage, and the attic shall have not less than 30 inches (762 mm) vertical clear height at its maximum point. Attic ventilation openings shall be sufficient to provide the required volume of combustion air and the attic ventilation required by the New York City Building Code. The combustion air openings shall be provided with a sleeve of not less than 0.019 inch (0.48 mm) (No. 26 Gage) galvanized
steel or other approved material extending from the appliance enclosure to at least 6 inches ([152] 152.4 mm) above the top of the ceiling joists and insulation.

304.2 Appliance location. Appliances shall be located so as not to interfere with proper circulation of combustion, ventilation and dilution air.

304.3 Draft hood/regulator location. Where used, a draft hood or a barometric draft regulator shall be installed in the same room or enclosure as the equipment served [so as] to prevent any difference in pressure between the hood or regulator and the combustion air supply. A barometric damper may be installed in an adjacent room provided that a louver is installed in the adjacent room to the outside air. The net free area of the louver shall be equal to or greater than the area of the barometric damper.

304.4 Circulation of air. The equipment and appliances within every room containing fuel-burning appliances shall be installed so as to allow free circulation of air. Provisions shall be made to allow for the simultaneous operation of mechanical exhaust systems, fireplaces or other equipment and appliances operating in the same room or space from which combustion, ventilation, and dilution air is being drawn. Such provisions shall prevent the operation of such appliances, equipment and systems from affecting the supply of combustion, ventilation, and dilution air.

304.4.1 Makeup air for fuel burning devices. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air. Calculations shall be provided on the construction documents to validate the use of the exhaust fan(s) and compliance with this Chapter.

304.4.2 Ventilation air for fuel burning devices. Where ventilation air is brought in by mechanical means for heat generation mitigation, provisions must be made for proper air balance to prevent a negative or positive pressure in the boiler room and to discharge the ventilation directly to the outside.

304.4.3 Prohibited sources. Openings and ducts shall not connect appliance enclosures with a space in which the operation of a fan will adversely affect the flow of the combustion, ventilation, and dilution air. Combustion, ventilation, and dilution air shall not be subject to ice or snow blockage. No combustion, ventilation, and dilution air inlet shall be less than 30 inches (762 mm) above grade. Combustion, ventilation, and dilution air shall not be obtained from a hazardous location, except where the fuel-fired appliances are located within the hazardous location and are not installed in accordance with this code. Combustion, ventilation, and dilution air shall not be taken from a refrigeration machinery room, except where a refrigerant vapor detector system is installed to automatically shut off the combustion process in the event of refrigerant leakage. For structures in [areas of special] flood hazard areas, air shall be obtained from a location complying with the additional requirements of Appendix G of the New York City Building Code.

304.5 Indoor combustion air. The required volume of indoor air shall be determined in accordance with Section 304.5.1 or 304.5.2, except that where the air infiltration rate is known to be less than 0.40 air changes per hour (ACH), Section 304.5.2 shall be used. The total required volume shall be the sum of the required volume calculated for all appliances located within the space. Rooms communicating directly with the space in which the appliances are installed through openings not furnished with doors, and through combustion air openings sized and located in accordance with Section 304.5.3, are considered to be part of the required volume.
**Exception:** Combustion, ventilation, and dilution air shall be obtained solely from the outdoors for fuel-burning appliances with an input greater than 350,000 Btu/h (102.6 kW).

**304.5.1 Standard method.** The minimum required volume shall be 50 cubic feet per 1,000 Btu/h (4.8 m³/kW) of the appliance input rating.

**304.5.2 Known air-infiltration-rate method.** Where the air infiltration rate of a structure is known, the minimum required volume shall be determined as follows:

For appliances other than fan-assisted, calculate volume using Equation 3-1.

\[
\text{Required Volume}_{\text{other}} \geq \frac{21 \text{ ft}^3}{\text{ACH}} \left( \frac{I_{\text{other}}}{1,000 \text{Btu/hr}} \right) \quad (\text{Equation 3-1})
\]

For fan-assisted appliances, calculate volume using Equation 3-2.

\[
\text{Required Volume}_{\text{fan}} \geq \frac{15 \text{ ft}^3}{\text{ACH}} \left( \frac{I_{\text{fan}}}{1,000 \text{Btu/hr}} \right) \quad (\text{Equation 3-2})
\]

where:

- \( I_{\text{other}} \) = All appliances other than fan assisted (input in Btu/h).
- \( I_{\text{fan}} \) = Fan-assisted appliance (input in Btu/h).
- \( \text{ACH} \) = Air change per hour (percent of volume of space exchanged per hour, expressed as a decimal).

For purposes of this calculation, an infiltration rate greater than 0.60 ACH shall not be used in Equations 3-1 and 3-2.

**304.5.3 Indoor opening size and location.** Openings used to connect indoor spaces shall be sized and located in accordance with Sections 304.5.3.1 and 304.5.3.2 (see Figure 304.5.3).
304.5.3.1 Combining spaces on the same story. Each opening shall have a minimum free area of 1 square inch per 1,000 Btu/h (2200 mm²/kW) of the total input rating of all appliances in the space, but not less than 100 square inches (0.06 m²). One opening shall commence within 12 inches (305 mm) of the top and one opening shall commence within 12 inches (305 mm) of the bottom of the enclosure. The minimum dimension of air openings shall be not less than 3 inches (76.2 mm).

304.5.3.2 Combining spaces in different stories. The volumes of spaces in different stories shall be considered as communicating spaces where such spaces are connected by one or more openings in doors or floors having a total minimum free area of 2 square inches per 1,000 Btu/h (4402 mm²/kW) of total input rating of all appliances.

304.6 Outdoor combustion air. Outdoor combustion air shall be provided through opening(s) to the outdoors in accordance with Section 304.6.1 or 304.6.2. The minimum dimension of air openings shall be not less than 3 inches (76.2 mm). The size of the openings connecting the room to the outdoor air supply shall also comply with any applicable rules of the New York City Department of Environmental Protection.

304.6.1 Two-permanent-openings method. Two permanent openings, one commencing within 12 inches (305 mm) of the top and one commencing within 12 inches (305 mm) of the bottom of the enclosure, shall be provided. The openings shall communicate
directly \[ \square \] or by ducts \[ \square \] with the outdoors or spaces that freely communicate with the outdoors.

Where directly communicating with the outdoors, or where communicating with the outdoors through vertical ducts, each opening shall have a minimum free area of 1 square inch per 4,000 Btu/h (550 \( \text{mm}^2/\text{kW} \)) of total input rating of all appliances in the enclosure [\( \square \)] (see Figures 304.6.1(1) and 304.6.1(2) [\( \square \)].

Where communicating with the outdoors through horizontal ducts, each opening shall have a minimum free area of not less than 1 square inch per 2,000 Btu/h (1100 \( \text{mm}^2/\text{kW} \)) of total input rating of all appliances in the enclosure [\( \square \)] (see Figure 304.6.1(3) [\( \square \)].
FIGURE 304.6.1(1)
ALL AIR FROM OUTDOORS—INLET AIR FROM VENTILATED CRAWL SPACE AND OUTLET AIR TO VENTILATED ATTIC
(see Section 304.6.1)

FIGURE 304.6.1(2)
ALL AIR FROM OUTDOORS THROUGH VENTILATED ATTIC
(see Section 304.6.1)
304.6.2 One-permanent-opening method. One permanent opening, commencing within 12 inches ([305] 304.8 mm) of the top of the enclosure, shall be provided. The appliance shall
have clearances of at least not less than 1 inch (25.4 mm) from the sides and back and 6 inches (152.4 mm) from the front of the appliance. The opening shall directly communicate with the outdoors or through a vertical or horizontal duct to the outdoors or spaces that freely communicate with the outdoors (see Figure 304.6.2) and shall have a minimum free area of 1 square inch per 3,000 Btu/h (734 mm²/kW) of the total input rating of all appliances located in the enclosure [1] and not less than the sum of the areas of all vent connectors in the space.

304.7 Combination indoor and outdoor combustion air. The use of a combination of indoor and outdoor combustion air shall be in accordance with Sections 304.7.1 through 304.7.3.

304.7.1 Indoor openings. Where used, openings connecting the interior spaces shall comply with Section 304.5.3.

304.7.2 Outdoor opening location. Outdoor opening(s) shall be located in accordance with Section 304.6.

304.7.3 Outdoor opening(s) size. The outdoor opening(s) size shall be calculated in accordance with the following:

1. The ratio of interior spaces shall be the available volume of all communicating spaces divided by the required volume.

2. The outdoor size reduction factor shall be one minus the ratio of interior spaces.

3. The minimum size of outdoor opening(s) shall be the full size of outdoor opening(s) calculated in accordance with Section 304.6, multiplied by the reduction factor. The minimum dimension of air openings shall be not less than 3 inches (76.2 mm).
304.8 Reserved.

304.9 Mechanical combustion air supply. Where all combustion air is provided by a mechanical air supply system, the combustion air shall be supplied from the outdoors at a rate not less than 0.35 cubic feet per minute per 1,000 Btu/h (0.034 m³/min per kW) of total input rating of all appliances located within the space. Combustion air rates shall also comply with any applicable rules of the New York City Department of Environmental Protection. The mechanical air supply shall be sufficient to accommodate combustion air, ventilation air, and dilution air requirements of the installation.

304.9.1 Makeup air. Where exhaust fans are installed, makeup air shall be provided to replace the exhausted air.

304.9.2 Appliance interlock. Each of the appliances served shall be interlocked with the mechanical air supply system to prevent main burner operation when the mechanical air supply system is not in operation. The air flow and the damper operation shall be proven prior to burner operation.

304.9.3 Reserved.

304.10 Opening obstructions, locations, and protection. The required size of openings for combustion, ventilation, and dilution air shall be based on the net free area of each opening. The net free area of an opening shall be that specified by the manufacturer of the opening covering. In the absence of such information, openings covered with metal louvers shall be deemed to have a net free area of 60 percent of the area of the opening, and openings covered with wood louvers shall be deemed to have a net free area of 10 percent of the area of the opening. Louvers and grilles shall be fixed in the open position.

Exception: Operable louvers shall be interlocked with the appliance so that they are proven to be in the full open position prior to main burner ignition and during main burner operation. Means shall be provided to prevent the main burner from igniting if the louvers fail to open during burner startup and to shut down the main burner if the louvers close during operation.

304.10.1 Dampered openings. Where the combustion air openings are provided with automatic, smoke or fire dampers, the dampers shall be electrically interlocked with the appliances served, so as to prevent operation of any appliance when any of the dampers are closed. Manually operated dampers shall not be installed in combustion air openings. The damper opening shall be proven prior to burner operation.

304.10.2 Caution sign. A sign stating, “Louvers, dampers and/or ventilation openings must not be blocked or disabled.” shall be permanently affixed, in clear view, adjacent to the opening(s) within the room containing the equipment. The letters used on the sign shall be at least 1[-]inch ([25] 25.4 mm) in height.
304.10.3 Opening location and protection. Combustion air openings to the outdoors shall comply with the location and protection provisions applicable to outside air intake openings of Sections 401.5 and 401.6 of the New York City Mechanical Code.

304.11 Combustion air ducts. Combustion air ducts shall comply with all of the following:

1. Be of galvanized steel complying with Chapter 6 of the New York City Mechanical Code or of equivalent corrosion-resistant material approved for this application.

   **Exception:** Within dwelling units, unobstructed stud and joist spaces shall not be prohibited from conveying combustion air, provided that not more than one required fireblock is removed.

2. Have a minimum [cross-sectional] dimension of 3 inches ([76]76.2 mm) in all directions.

3. Terminate in an unobstructed space allowing free movement of combustion air to the appliances.

4. Have the same cross-sectional areas as the free area of the openings to which they connect.

5. Serve a single appliance enclosure.

6. Not serve both upper and lower combustion air openings where both such openings are used. The separation between ducts serving upper and lower combustion air openings shall be maintained to the source of combustion air.

7. Not be screened where terminating in an attic space.

8. Not slope downward toward the source of combustion air, where serving the upper required combustion air opening.

9. Be constructed so that the remaining space surrounding a chimney or chimney liner, installed within a masonry, metal or factory-built chimney cannot be used to supply combustion, ventilation and dilution air, except for direct vent appliances designed and installed in accordance with the equipment manufacturer’s instructions and listing. [\[^2\]]

304.12 Protection from fumes and gases. Where corrosive or flammable process fumes or gases, other than products of combustion, are present, means for the disposal of such fumes or gases shall be provided. Such fumes or gases include carbon monoxide, hydrogen sulfide, ammonia, chlorine and halogenated hydrocarbons.

In barbershops, beauty shops and other facilities where chemicals that generate corrosive or flammable products, such as aerosol sprays, are routinely used, nondirect-vent-type appliances shall be located in a mechanical room separated or partitioned off from other areas with provisions for combustion air and dilution air from the outdoors. Direct-vent appliances shall be installed in accordance with the appliance manufacturer’s [installation] instructions.
SECTION FGC 305
INSTALLATION

305.1 General. Equipment and appliances shall be installed as required by the terms of their approval, in accordance with the conditions of listing, the manufacturer’s instructions and this code. Manufacturers’ [installation] instructions shall be available on the job site at the time of inspection. Where a code provision is less restrictive than the conditions of the listing of the equipment or appliance or the manufacturer’s [installation] instructions, the conditions of the listing and the manufacturer’s [installation] instructions shall apply.

305.2 Hazardous area. Equipment and appliances having an ignition source shall not be installed in Group H occupancies or control areas where open use, handling or dispensing of combustible, flammable or explosive materials occurs.

305.3 Elevation of ignition source. Equipment and appliances having an ignition source shall be elevated such that the source of ignition is not less than 18 inches (457 mm) above the floor in hazardous locations and public garages, private garages, repair garages, motor fuel-dispensing facilities and parking garages. For the purpose of this section, rooms or spaces that are not part of the living space of a dwelling unit and that communicate directly with a private garage through openings shall be considered to be part of the private garage.

Exception: Elevation of the ignition source is not required for appliances that are listed as flammable vapor ignition resistant.

305.3.1 Installation in residential garages. In residential garages where appliances are installed in a separate, enclosed space having access only from outside of the garage, such appliances shall be permitted to be installed at floor level, provided that the required combustion air is taken from the exterior of the garage.

305.3.2 Parking garages. Connection of a parking garage with any room in which there is a fuel-fired appliance shall be by means of a vestibule providing a two-doorway separation, except that a single door is permitted where the sources of ignition in the appliance are elevated in accordance with Section 305.3.

Exception: This section shall not apply to appliance installations complying with Section 305.4.

305.4 Public garages, motor fuel-dispensing facilities and repair garages. Appliances located in public garages, motor fuel-dispensing facilities, repair garages or other areas frequented by motor vehicles shall be installed [a minimum of] not less than 8 feet (2438 mm) above the floor. Where motor vehicles are capable of passing under an appliance, the appliance shall be installed at the clearances required by the appliance manufacturer and not less than 1 foot (304.8 mm) higher than the tallest vehicle garage door opening.

Exceptions:
1. The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 305.3 of this code and NFPA 30A.

2. Appliances installed in repair garages shall be separated from repair areas by walls or partitions, floors, or floor ceiling assemblies that are constructed so as to prohibit the transmission of vapors and having a fire-resistance rating of not less than 1 hour, and that have no openings in the wall separating the repair area within 8 feet ([2438] 2438.4 mm) of the floor. Wall penetration shall be firestopped. Air for combustion purposes shall be obtained from the outdoors. The heating room shall not be used for the storage of combustible materials.

3. Heating appliances for vehicle repair areas where there is no dispensing or transferring of Class I or Class II flammable or combustible liquids or liquefied petroleum gas shall be installed in accordance with NFPA 30A.

305.5 Private garages. Appliances located in private garages shall be installed with a minimum clearance of 6 feet ([1829] 1828.8 mm) above the floor.

Exception: The requirements of this section shall not apply where the appliances are protected from motor vehicle impact and installed in accordance with Section 305.3.

305.6 Construction and protection. Boiler rooms and furnace rooms shall be protected as required by the New York City Building Code.

305.7 Clearances from grade. [Appliances] Equipment and appliances installed at grade level shall be supported on a level concrete slab or other approved material extending not less than 3 inches ([76] 76.2 mm) above adjoining grade or shall be suspended not less than 6 inches ([152] 152.4 mm) above adjoining grade. Such supports shall be installed in accordance with the manufacturer’s [installation] instructions.

305.8 Clearances to combustible construction. Heat-producing equipment and appliances shall be installed to maintain the required clearances to combustible construction as specified in the listing and manufacturer’s instructions. Such clearances shall be reduced only in accordance with Section 308. Clearances to combustibles shall include such considerations as door swing, drawer pull, overhead projections or shelving and window swing. Devices, such as door stops or limits and closers, shall not be used to provide the required clearances.

305.9 Parking structures. Appliances installed in enclosed, basement and underground parking structures shall be installed in accordance with NFPA 88A.

305.10 Repair garages. Appliances installed in repair garages shall be installed in accordance with NFPA 30A. [a detached building or room, separated from repair areas by walls or partitions, floors or floor ceiling assemblies that are constructed so as to prohibit the transmission of vapors and having a fire-resistance rating of not less than 1 hour, and that have no openings in the wall separating the repair area within 8 feet ([2438] 2438.4 mm) of the floor. Wall penetrations shall be firestopped. Air for combustion purposes shall be obtained from the outdoors. The appliance room shall not be used for the storage of combustible materials.]
305.11 Installation in aircraft hangars. Heaters in aircraft hangars shall be installed in accordance with NFPA 409.

305.12 Avoid strain on gas piping. Appliances shall be supported and connected to the piping so as not to exert undue strain on the connections.

SECTION FGC 306
ACCESS AND SERVICE SPACE

306.1 Clearances for maintenance and replacement. Appliances, control devices, heat exchangers and HVAC components shall be accessible for inspection, service, repair and replacement without disabling the function of a fire-resistance-rated assembly or removing permanent construction, other appliances, or any other piping or ducts not connected to the appliance being inspected, serviced, repaired or replaced. A level working space [at least] not less than 30 inches (762 mm) deep and 30 inches wide (762 mm) wide shall be provided in front of the control side to service an appliance.

306.2 Appliances in rooms. Rooms containing appliances shall be provided with a door and an unobstructed passageway measuring not less than 36 inches (914 mm) wide and 80 inches (2032 mm) high.

Exception: Within a dwelling unit, appliances installed in a compartment, alcove, basement or similar space shall be provided with access by an opening or door and an unobstructed passageway measuring not less than 24 inches (609.6 mm) wide and large enough to allow removal of the largest appliance in the space, provided that a level service space of not less than 30 inches (762 mm) deep and the height of the appliance, but not less than 30 inches (762 mm), is present at the front or service side of the appliance with the door open.

306.3 Appliances in attics. Attics containing appliances shall be provided with an opening and unobstructed passageway large enough to allow removal of the largest appliance. The passageway shall be not [be] less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) in length when measured along the centerline of the passageway from the opening to the appliance. The passageway shall have continuous solid flooring not less than 24 inches (609.6 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. The clear access opening dimensions shall be [a minimum of] not less than 20 inches by 30 inches (508 mm by 762 mm) and large enough to allow removal of the largest component of the appliance.
Exceptions:

1. The passageway and level service space are not required where the appliance is capable of being serviced and removed through the required opening.

2. Where the passageway is not less than 6 feet ([1829] 1828.8 mm) high and 24 inches (609.6 mm) wide for its entire length, the passageway shall be not greater than 50 feet (15 250 mm) in length.

306.3.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the New York City Electrical Code.

306.4 Appliances under floors. Under-floor spaces containing appliances shall be provided with an access opening and unobstructed passageway large enough to remove the largest component of the appliance. The passageway shall be not less than 30 inches (762 mm) high and 22 inches ([559] 558.8 mm) wide, nor more than 20 feet (6096 mm) in length when measured along the centerline of the passageway from the opening to the appliance. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present at the front or service side of the appliance. If the depth of the passageway or the service space exceeds 12 inches ([305] 304.8 mm) below the adjoining grade, the walls of the passageway shall be lined with concrete or masonry extending 4 inches ([102] 101.6 mm) above the adjoining grade and having sufficient lateral-bearing capacity to resist collapse. If the depth of the passageway or the service space exceeds 12 inches (305 mm) below the adjoining grade, the walls of the passageway shall be lined with concrete or masonry extending 4 inches (102 mm) above the adjoining grade and having sufficient lateral-bearing capacity to resist collapse. The clear access opening dimensions shall be [a minimum of] not less than 22 inches by 30 inches ([559] 558.8 mm by 762 mm), and large enough to allow removal of the largest appliance.

Exceptions:

1. The passageway is not required where the level service space is present when the access is open and the appliance is capable of being serviced and removed through the required opening.

2. Where the passageway is [unobstructed and] not less than 6 feet high ([1829] 1828.8 mm) [high] and 22 inches ([559] 558.8 mm) wide for its entire length, the passageway shall not be limited in length.

306.4.1 Electrical requirements. A luminaire controlled by a switch located at the required passageway opening and a receptacle outlet shall be provided at or near the appliance location in accordance with the New York City Electrical Code.

306.5 Equipment and appliances on roofs or elevated structures. Where equipment [and] or appliances requiring access are [installed] located on [roofs or] an elevated [structures at] structure or the roof of a [height exceeding] building such that personnel will have to climb higher than 16 feet (4877 mm) [such] above grade, roof, or floor level to access such equipment or appliances, an interior or exterior means of access shall be provided [by a permanent approved means of]
access, the extent of which shall be from grade or floor level to the equipment and appliances' level service space. Such access shall not require climbing over obstructions greater than 30 inches (762 mm) [high] in height or walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Such access to the roof or elevated structure and access from the roof or elevated structure to equipment requiring maintenance shall not require the use of portable ladders. Where access involves climbing over parapet walls, the height shall be measured to the top of the parapet wall.

Permanent ladders installed to provide the required access shall comply with the following minimum design criteria [-] :

1. The side railing shall extend above the parapet or roof edge not less than 30 inches (762 mm).

2. Ladders shall have rung spacing not to exceed 12 inches ([305] 304.8 mm) on center. The uppermost rung shall be not more than 24 inches ([610] 609.6 mm) below the upper edge of the roof hatch, roof or parapet, as applicable.

3. Ladders shall have a toe spacing not less than 7 inches ([178] 177.8 mm) deep.

4. There shall be [a minimum of] not less than 18 inches ([457] 457.2 mm) between rails.

5. Rungs shall have a [minimum] diameter of not less than 0.75-inch (19 mm) and [shall] be capable of withstanding a 300-pound (136.1 kg) load.

6. Where a cage, well or ladder safety device is provided, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 30 feet (9144 mm) of height. Where a cage, well or ladder safety device is not provided, ladders over 20 feet (6096 mm) in height shall be provided with landing platforms for each 20 feet (6096 mm) in height. Landings shall be capable of withstanding a load of 100 pounds per square foot (488.2 kg/m²). [Landing dimensions shall be not less than 30 inches (762 mm) and not less than 24 inches (610 mm) in width.] A guardrail and toeboard shall be provided on all open sides of the landing.

7. [Where ladder extensions are installed, the side rails of through or side step ladder extensions shall extend 3½ feet above the parapets and landings. For through ladder extensions, the rungs shall be omitted from the extensions and shall have not less than 18 inches nor more than 24 inches of clearance between rails. For side step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3½ feet minimum.]

Climbing clearance. The distance from the centerline of the rungs to the nearest permanent object on the climbing side of the ladder shall be not less than 30 inches (762 mm) measured perpendicular to the rungs. This distance shall be maintained from the point of ladder access to the bottom of the roof hatch. A minimum clear width of 15 inches (381 mm) shall be provided on both sides of the ladder measured from the midpoint of and parallel with the rungs, except where cages or wells are installed.
8. **Landing required.** The ladder shall be provided with a clear and unobstructed bottom landing area having a minimum dimension of 30 inches by 30 inches (762 mm by 762 mm) centered in front of the ladder.

9. Ladders shall be protected against corrosion by approved means.

10. Service personnel shall have access to ladders at all times.

11. Where ladder extensions are installed, the side rails of through or side-step ladder extensions shall extend 3½ feet (1066.8 mm) above the parapets and landings. For through ladder extensions, the rungs shall be omitted from the extensions and shall have not less than 18 inches (457.2 mm) nor more than 24 inches (609.6 mm) of clearance between rails. For side-step or offset fixed ladder sections, at landings, the side rails and rungs shall be carried to the next regular rung beyond or above the 3½ feet (1066.8 mm) minimum.

[9.] Catwalks installed to provide the required access shall be not less than 24 inches ([640] 609.6 mm) wide and shall have railings as required for service platforms.

**Exception:** This section shall not apply to Group R-3 occupancies.

306.5.1 **Sloped roofs.** Where appliances, equipment, fans or other components that require service are installed on a roof having a slope of 3 units vertical in 12 units horizontal (25-percent slope) or greater and having an edge more than 30 inches (762 mm) above grade at such edge, a level platform shall be provided on each side of the appliance or equipment to which access is required for service, repair or maintenance. The platform shall be not less than 30 inches (762 mm) in any dimension and shall be provided with guards. The guards shall extend not less than 42 inches ([1067] 1066.8 mm) above the platform, shall be constructed so as to prevent the passage of a 21-inch-diameter ([533] 533.4 mm) sphere and shall comply with the loading requirements for guards specified in the New York City Building Code. Access shall not require walking on roofs having a slope greater than 4 units vertical in 12 units horizontal (33-percent slope). Where access involves obstructions greater than 30 inches (762 mm) in height, such obstructions shall be provided with ladders installed in accordance with Section 306.5 or [stairs] stairways installed in accordance with the requirements specified in the New York City Building Code in the path of travel to and from appliances, fans or equipment requiring service.

306.5.2 **Electrical requirements.** A receptacle outlet shall be provided at or near the appliance location in accordance with the New York City Electrical Code.

306.6 **Guards.** Guards shall be provided where [appliances, equipment or other] various components that require service and roof hatch openings are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof, or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of [such appliances, fans or other] components [and roof hatch openings and the] that require service. The top of the guard shall be located not less than 42 inches ([1067] 1066.8 mm) above the elevated surface adjacent to the guard. The guard shall be
constructed so as to prevent the passage of a 21-inch-diameter ([533] 533.4 mm) sphere and shall comply with the loading requirements for guards specified in the New York City Building Code.

306.7 Rooftop access and obstructions. Equipment and appliances installed on rooftops of buildings shall be installed in accordance with the requirements of the New York City Fire Code regarding rooftop access and obstructions, and shall not obstruct or interfere with firefighting operations or the operation of any doors, windows, fire escapes, or other means of egress or other building components requiring operation or access.

SECTION FGC 307
CONDENSATE DISPOSAL

307.1 Evaporators and cooling coils. Condensate drain systems shall be provided for equipment and appliances containing evaporators and cooling coils in accordance with the New York City Mechanical Code.

307.2 Fuel-burning appliances. Liquid combustion by-products of condensing appliances shall be collected and discharged to an approved plumbing fixture or disposal area in accordance with the manufacturer’s instructions. Condensate piping shall [be of approved corrosion-resistant material] conform to one of the standards listed in Section 803 of the New York City Plumbing Code and shall not be smaller than the drain connection on the appliance. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than [one eighth] ⅛ unit vertical in 12 units horizontal (1-percent slope).

307.2.1 Condensate disposal. Condensate from all fuel-burning appliances and associated flues shall be neutralized to a pH of at least 6 and no more than 8 prior to disposal to a sanitary system.

307.3 Drain pipe materials and sizes. Components of the condensate disposal system shall be cast iron, galvanized steel, copper, cross-linked polyethylene, polybutylene, polyethylene, ABS, CPVC or PVC pipe or tubing. Polypropylene tubing may be used in lengths that do not exceed 12 inches (304.8 mm) for an individual drain application. Components shall be selected for the pressure and temperature rating of the installation. Joints and connections shall be made in accordance with the applicable provisions of Chapter 7 of the New York City Plumbing Code relative to the material type. Condensate waste and drain line size shall be not less than ¾-inch ([19] 19.1 mm) internal diameter and shall not decrease in size from the drain pan connection to the place of condensate disposal. Where the drain pipes from more than one unit are manifolded together for condensate drainage, the pipe or tubing shall be sized by a registered design professional.

307.4 Traps. Condensate drains shall be trapped as required by the equipment or appliance manufacturer.

307.5 Auxiliary drain pan. Category II or Category IV condensing appliances shall be provided with an auxiliary drain pan where damage to any building component will occur as a result of stoppage in the condensate drainage system. Such pan shall be installed in accordance with the applicable provisions of Section 307 of the New York City Mechanical Code and provided with a local alarm to indicate the collection of water.
Exceptions:

1. An auxiliary drain pan shall not be required for appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

2. An auxiliary drain pan shall not be required where a suitably sized and located floor drain is provided.

307.6 Condensate pumps. Condensate pumps located in uninhabitable spaces, such as attics and crawl spaces, shall be connected to the appliance or equipment served such that when the pump fails, the appliance or equipment will be prevented from operating. Pumps shall be installed in accordance with the manufacturer’s instructions.

Exceptions:

1. Equipment shutdown shall not be required when the condensate pump resides within the auxiliary drain pan provided under Section 307.5 and an alternate means for unit shutdown due to condensate overflow or leakage, such as a leak detector, is provided.

2. Equipment shutdown shall not be required when the potential for freezing of interior piping systems exists and the auxiliary drain pan provided under Section 307.5 is equipped with a secondary overflow drain that shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain.

307.7 Drain line maintenance. Condensate drain lines shall be configured to permit the clearing of blockages and performance of maintenance without requiring the drain line to be cut.

SECTION FGC 308 CLEARANCE REDUCTION

308.1 Scope. This section shall govern the reduction in required clearances to gypsum board, combustible materials and combustible assemblies for chimneys, vents, appliances, devices and equipment. Clearance requirements for air-conditioning equipment and central heating boilers and furnaces shall comply with Sections 308.3 and 308.4.

308.2 Reduction table. The allowable clearance reduction shall be based on one of the methods specified in Table 308.2 or shall utilize [an] a reduced clearance protective assembly listed [for such application] and labeled in accordance with UL 1618. Where required clearances are not listed in Table 308.2, the reduced clearances shall be determined by linear interpolation between the distances listed in the table. Reduced clearances shall not be derived by extrapolation below the range of the table. The reduction of the required clearances to combustibles for listed and labeled appliances and equipment shall be in accordance with the requirements of this section except that such clearances shall not be reduced where reduction is specifically prohibited by the terms of the appliance or equipment listing [{4} see Figures 308.2(1) through 308.2(3) [{4}].

</table>

For SI: 1 inch = 25.4 mm, °C = [(°F - 32)/1.8], 1 pound per cubic foot = 16.02 kg/m³, 1 Btu per inch per square foot per hour per °F = 0.144 W/m²·K.

a. Reduction of clearances from combustible materials shall not interfere with combustion air, draft hood clearance and relief, and accessibility of servicing.
b. All clearances shall be measured from the outer surface of the combustible material to the nearest point on the surface of the appliance, disregarding any intervening protection applied to the combustible material.
c. Spacers and ties shall be of noncombustible material. No spacer or tie shall be used directly opposite an appliance or connector.
d. For all clearance reduction systems using a ventilated airspace, adequate provision for air circulation shall be provided as described [see Figures 308.2(2) and 308.2(3)].
e. There shall be [at least] not less than 1 inch between clearance reduction systems and combustible walls and ceilings for reduction systems using ventilated airspace.
f. Where a wall protector is mounted on a single flat wall away from corners, it shall have a minimum 1-inch air gap. To provide air circulation, the bottom and top edges, or only the side and top edges, or all edges shall be left open.
g. Mineral wool batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1500°F.
h. Insulation material used as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu per inch per square foot per hour per °F or less.
i. There shall be [at least] not less than 1 inch between the appliance and the protector. In no case shall the clearance between the appliance and the combustible surface be reduced below that allowed in this table.
j. All clearances and thicknesses are minimum; larger clearances and thicknesses are acceptable.
k. Listed single-wall connectors shall be installed in accordance with the [terms of their listing and the] manufacturer’s [installation] instructions.

**Notes:**

“A” equals the [reduced] clearance with no protection.

“B” equals the reduced clearance permitted in accordance with Table 308.2. The protection applied to the construction using combustible material shall extend far enough in each direction to make “C” equal to “A.”
FIGURE 308.2(1)
EXTENT OF PROTECTION NECESSARY TO REDUCE CLEARANCES FROM [GAS EQUIPMENT] APPLIANCE OR VENT CONNECTIONS

For SI: 1 inch = 25.4 mm.

[FIGURE 308.2(2)]
WALL PROTECTOR CLEARANCE REDUCTION SYSTEM

For SI: 1 inch = 25.4 mm.
308.3 Clearances for indoor air-conditioning appliances. Clearance requirements for indoor air-conditioning equipment shall comply with Sections 308.3.1 through [308.3.5] 308.3.4.

308.3.1 [Appliances installed in rooms that are large in comparison with the size of the appliance.] Appliance clearances. Air-conditioning appliances installed in rooms that are large in comparison with the size of the appliance shall be installed with clearances in accordance with the terms of their listing and the manufacturer’s instructions.

308.3.2 [Appliances installed in rooms that are not large in comparison with the size of the appliance.] Air-conditioning appliances installed in rooms that are not large in comparison with the size of the appliance, such as alcoves and closets, shall be listed for such installations and installed in accordance with the manufacturer’s instructions. Listed clearances shall not be reduced by the protection methods described in Table 308.2, regardless of whether the enclosure is of combustible or noncombustible material.

[308.3.3] Clearance reduction. Air-conditioning appliances [installed in rooms that are large in comparison with the size of the appliance] shall be permitted to be installed with reduced clearances to combustible material, provided that the combustible material or appliance is protected as described in Table 308.2 and such reduction is allowed by the manufacturer’s instructions.

[308.3.4] 308.3.3 Plenum clearances. Where the furnace plenum is adjacent to plaster on metal lath or noncombustible material attached to combustible material, the clearance shall be
measured to the surface of the plaster or other noncombustible finish where the clearance specified is 2 inches (51.8 mm) or less.

[308.3.4] Clearances from supply ducts. [Air conditioning appliance shall] Supply air ducts connecting to listed central heating furnaces shall have the same minimum clearance from supply ducts within 3 feet (914 mm) of to combustibles as required for the furnace supply plenum for a distance of not less than that specified 3 feet (914.4 mm) from the furnace supply plenum. Clearance is not necessary required beyond this 3-foot (914.4 mm) distance.

308.4 Central-heating boilers and furnaces. Clearance requirements for central-heating boilers and furnaces shall comply with Sections 308.4.1 through 308.4.6. The clearance to these appliances shall not interfere with combustion air, draft hood clearance and relief, and accessibility for servicing.

308.4.1 [Appliances installed in rooms that are large in comparison with the size of the appliance. ] Appliance clearances. Central-heating furnaces and low-pressure boilers [installed in rooms large in comparison with the size of the appliance] shall be installed with clearances in accordance with the [terms of their listing and the] manufacturer’s instructions.

308.4.2 [Appliances installed in rooms that are not large in comparison with the size of the appliance. ] Central heating furnaces and low pressure boilers installed in rooms that are not large in comparison with the size of the appliance, such as alcoves and closets, shall be listed for such installations. Listed clearances shall not be reduced by the protection methods described in Table 308.2 and illustrated in Figures 308.2(1) through 308.2(3), regardless of whether the enclosure is of combustible or noncombustible material.

[308.4.3] Clearance reduction. Central-heating furnaces and low-pressure boilers [installed in rooms that are large in comparison with the size of the appliance] shall be permitted to be installed with reduced clearances to combustible material provided that such reduction is allowed by the manufacturer’s instructions and the combustible material or appliance is protected as described in Table 308.2.

[308.4.4] Clearance for servicing appliances. Front clearance shall be sufficient for servicing the burner and the furnace or boiler.

[308.4.5] Plenum clearances. Where the furnace plenum is adjacent to plaster on metal lath or noncombustible material attached to combustible material, the clearance shall be measured to the surface of the plaster or other noncombustible finish where the clearance specified is 2 inches (51.8 mm) or less.

[308.4.6] Clearances from supply ducts. [Central heating furnaces shall have the clearance from supply ducts within 3 feet (914 mm) of the furnace plenum be not less than that specified from the furnace plenum. No clearance is necessary beyond this distance] Supply air ducts connecting to listed central heating furnaces shall have the same minimum clearance to combustibles as required for the furnace supply plenum for a distance of not less than 3 feet (914.4 mm) from the supply plenum. Clearance is not required beyond the 3-foot (914.4 mm) distance.
SECTION FGC 309
ELECTRICAL

309.1 Grounding. Gas piping shall not be used as a grounding electrode.

309.2 Connections. Electrical connections between appliances and the building wiring, including the grounding of the appliances, shall conform to the New York City Electrical Code.

SECTION FGC 310
ELECTRICAL BONDING

310.1 Pipe and tubing. Each above-ground portion of a gas piping system that is likely to become energized shall be continuously bonded electrically to an effective ground-fault current path. Gas piping shall be considered to be bonded where it is connected to appliances that are connected to the equipment grounding conductor of the circuit supplying that appliance.

§ 5. Chapter 4 of the New York city fuel gas code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 4
GAS PIPING INSTALLATIONS

SECTION FGC 401
GENERAL

401.1 Scope. This chapter shall govern the design, installation, modification and maintenance of fuel-gas piping systems. The scope covered by this chapter includes piping systems from the point of delivery to the connections with the appliances and includes the design, materials, components, fabrication, assembly, installation, testing, inspection, operation and maintenance of such piping systems.

401.1.1 Meters and service piping. Service piping includes the fuel-gas piping up to the point of delivery. Meters and service piping shall comply with the requirements of Appendix E of this code. In addition, service piping located within buildings shall be designed and installed in accordance with the structural integrity, firestopping, and fire protection provisions of the New York City Building Code.

401.1.2 [Reserved.] Meters for gas consumption monitoring. Approved gas meters shall be permitted to be installed for gas consumption monitoring, energy measurement, verification and analysis. Gas meters shall be listed in accordance with ANSI B109.1, ANSI B109.2, or ANSI B109.3 and installed in accordance with the manufacturer’s instructions. A full size valve bypass shall be provided around gas meters for maintenance and repair.

401.2 Reserved.
401.3 Modifications to existing systems. In modifying or adding to existing piping systems, sizes shall be maintained in accordance with this chapter.

401.4 Additional appliances. Where an additional appliance is to be served, the existing piping shall be checked to determine if it has adequate capacity for all appliances served. If inadequate, the existing system shall be enlarged as required or separate piping of adequate capacity shall be provided.

401.5 Identification. All piping installed in new construction and all new piping installed in existing buildings, whether or not the piping is intended to be enclosed when construction is completed, shall be identified by a yellow label marked “Gas” in black letters. Where the installation requires a gas test, such labeling shall be completed prior to such test. Labels shall be provided in accordance with ASME A13.1 and the marking shall be spaced at intervals not exceeding 5 feet (1524 mm). The marking shall not be required on pipe located in the same room as the appliance served.

401.6 Interconnections. Where two or more meters are installed on the same premises but supply separate consumers, the piping systems shall not be interconnected on the outlet side of the meters.

401.7 Piping meter identification. Piping from multiple meter installations shall be marked with an approved permanent identification by the installer so that the piping system supplied by each meter is readily identifiable. Such marking shall be in accordance with ASME A13.1.

401.8 Minimum sizes. All pipe utilized for the installation, extension and alteration of any piping system shall be sized to supply the full number of outlets for the intended purpose and shall be sized in accordance with Section 402.

401.9 Identification. Each length of pipe and each pipe fitting, utilized in a fuel gas system, shall bear the identification of the manufacturer.

401.10 Third-party testing and certification. Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. Piping, tubing and fittings shall either be tested by an approved third-party testing agency or certified by an approved third-party certification agency.

SECTION FGC 402
PIPE SIZING

402.1 General considerations. Piping systems shall be of such size and so installed as to provide a supply of gas sufficient to meet the maximum demand and supply gas to each appliance inlet at not less than the minimum supply pressure required by the appliance.

402.2 Maximum gas demand. The [volume] volumetric flow rate of gas to be provided [in cubic feet per hour] shall be determined directly from the [manufacturer’s input ratings] sum of the [appliance] maximum input of the appliances served. [Where an input rating is not indicated, the gas supplier, appliance manufacturer or a qualified agency shall be contacted, or the rating from Table 402.2 shall be used for estimating the volume of gas to be supplied.]
The total connected hourly load shall be used as the basis for pipe sizing, assuming that all appliances could be operating at full capacity simultaneously. Where a diversity of load can be established, pipe sizing shall be permitted to be based on such loads.

The volumetric flow rate of gas to be provided shall be adjusted for altitude where the installation is above 2,000 feet (610 m) in elevation.

</table>
**402.3 Sizing.** Gas piping shall be sized in accordance with one of the following:

1. Pipe sizing tables or sizing equations in accordance with Section 402.4.

2. The sizing tables included in a listed piping system’s manufacturer’s installation instructions.

3. Other approved engineering methods.

4. Individual outlets to gas ranges shall not be less than ¾ inches (19.1 mm) NPS.

**402.4 Sizing tables and equations.** Where Tables 402.4(1) through 402.4(5) 402.4(7) are used to size piping or tubing, the pipe length shall be determined in accordance with Section 402.4.1, 402.4.2 or 402.4.3.

Where Equations 4-1 and 4-2 are used to size piping or tubing, the pipe or tubing shall have smooth inside walls and the pipe length shall be determined in accordance with Section 402.4.1, 402.4.2 or 402.4.3.

1. Low-pressure gas equation (Less than 1½ pounds per square inch (psi) (10.3 kPa)):

   \[
   D = \frac{Q^{0.381}}{19.17(\frac{\Delta H}{C_r \times L})^{0.206}} 
   \]  
   \text{(Equation 4-1)}

2. High-pressure gas equation (1½ psi (10.3 kPa) and above):

   \[
   D = \frac{Q^{0.381}}{18.93\left(\frac{(P_1^2 - P_2^2) \times Y}{C_r \times L}\right)^{0.206}} 
   \]  
   \text{(Equation 4-2)}

where:

- \( D \) = Inside diameter of pipe, inches (mm).
- \( Q \) = Input rate appliance(s), cubic feet per hour at 60°F (16.6°C) and 30-inch mercury column.
- \( P_1 \) = Upstream pressure, psia \((P_1 + 14.7) \) psia.
- \( P_2 \) = Downstream pressure, psia \((P_2 + 14.7) \) psia.
- \( L \) = Equivalent length of pipe, feet.
- \( \Delta H \) = Pressure drop, inch water column (27.7 inch water column = 1 psi).

Note: All table entries have been rounded to three significant digits.

**402.4.1 Longest length method.** The pipe size of each section of gas piping shall be determined using the longest length of piping from the point of delivery to the most remote outlet and the load of the section.

**402.4.2 Branch length method.** Pipe shall be sized as follows:

1. Pipe size of each section of the longest pipe run from the point of delivery to the most remote outlet shall be determined using the longest run of piping and the load of the section.

2. The pipe size of each section of branch piping not previously sized shall be determined using the length of piping from the point of delivery to the most remote outlet in each branch and the load of the section.

**402.4.3 Hybrid pressure.** The pipe size for each section of higher pressure gas piping shall be determined using the longest length of piping from the point of delivery to the most remote line pressure regulator. The pipe size from the line pressure regulator to each outlet shall be determined using the length of piping from the regulator to the most remote outlet served by the regulator.

**402.5 Allowable pressure drop.** The design pressure loss in any piping system under maximum probable flow conditions, from the point of delivery to the inlet connection of the appliance, shall be such that the supply pressure at the appliance is greater than or equal to the minimum pressure required by the appliance.

**402.6 Gas distribution pressures.** [No gas distribution piping containing gas at a pressure in excess of ½ psig (3.5 kPa gauge) shall be run within a building.] The maximum design operating pressure for piping systems located inside buildings shall not exceed ½ pounds per square inch gauge (psig) (3.5 kPa gauge).
Exceptions:

1. Pressure not exceeding 5 psig (34.5 kPa gauge) is permitted for: (a) commercial and industrial occupancies where fuel requirements for appliances exceed 4,000 cubic feet per hour (113.2 m³/h) and such large volume use is supplied through separate gas distribution piping where a system supplies one or more appliances that require gas pressure in excess of ½ psig (3.5 kPa gauge).

2. Gas pressure not exceeding 15 psig (103.4 kPa gauge) is permitted for appliances in excess of 100,000 cubic feet per hour (2830 m³/h) provided the gas distribution piping is installed as provided for in Section 404.

3. The use of pressure in excess of 15 psig (103.4 kPa gauge) shall be permitted for distribution piping provided all of the requirements of Section 406 and Appendix G are met.

SECTION FGC 403
PIPING MATERIALS

403.1 General. Materials used for piping systems shall be new and comply with the requirements of this chapter or shall be approved.

403.1.1 Pipe size and pressure limitations.

1. All requirements for installation of gas distribution piping (with operating pressures at ½ psig (3.5 kPa gauge) or less and above ½ psig (3.5 kPa gauge)) shall be in accordance with Chapter 4 of this code. Gas distribution piping with operating pressures of 15 psig (103.4 kPa gauge) or more shall be in accordance with Appendix G.

2. Gas distribution piping operating at a pressure of over ½ psig (3.5 kPa gauge) to 5 psig (34.5 kPa gauge) and size 4 inches (102 mm) or larger shall be welded.

   Exception: Manufactured and listed gas trains provided with the appliance may be threaded.

3. All gas distribution piping operating at a pressure above 5 psig (34.5 kPa gauge) shall be welded.

   [4–] All welding of gas distribution piping shall be subject to radiography or special inspection as set forth in Section 406.

   [5–] All piping 4 inches (102 mm) and greater operating at pressure exceeding 5 psig (34.5 kPa gauge) must be butt welded, subject to special inspection and radiographed.

   [6–] Threaded piping may be used up to 4 inches (101.6 mm) in diameter at pressure no greater than ½ psig (3.5 kPa gauge). All piping greater than 4 inches in diameter shall be welded, regardless of operating pressure.
5. All welded piping 2½ inches (63.5 mm) or greater in diameter shall be butt-welded, and welded piping less than 2½ inches (63.5 mm) in diameter may be socket-welded or butt-welded.

403.2 Used materials. Used pipe, fittings, valves and other materials shall not be reused.

403.3 Other materials. Material not covered by the standards specifications listed herein shall be investigated and tested to determine that it is safe and suitable for the proposed service, and, in addition, shall be recommended for that service by the manufacturer subject to approval by the commissioner.

403.4 Metallic pipe. Metallic pipe shall comply with Sections 403.4.1 through 403.4.4.

403.4.1 Cast iron. Cast-iron pipe shall not be used.

403.4.2 Steel. Carbon steel and wrought-iron pipe shall be [at least of] not less than standard weight and shall comply with one of the following standards:

1. ASME [B36.10, 10M] B36.10M.
2. ASTM A 53/A 53M [−06].

403.4.3 Copper and brass. Copper and brass pipe shall not be used.

403.4.4 Aluminum. Aluminum-alloy pipe shall not be used.

403.5 Metallic tubing. Metallic tubing shall not be used except as provided in Section 405.5.

403.5.1 Standards. Stainless steel flexible multiple leg hose assemblies shall be listed and labeled in accordance with UL 536 and designed in accordance with the manufacturer’s recommendation.

403.5.2 Seismic requirements. Stainless steel flexible multiple leg hose assemblies shall be designed to withstand seismic force and displacement in accordance with Section 1613 of the New York City Building Code.

403.5.3 Special inspection required. The installation of stainless steel flexible multiple leg hose assemblies shall be subject to special inspection in accordance with Section 1707.7 of the New York City Building Code and Section 406 of this code.

403.6 Reserved.

403.7 Workmanship and defects. Pipe and fittings shall be clear and free from cutting burrs and defects in structure or threading, and shall be thoroughly brushed, and chip and scale blown.
Defects in pipe and fittings shall not be repaired. Defective pipe and fittings shall be replaced (see Section 406.1.2).

403.8 Protective coating. Where in contact with material or atmosphere exerting a corrosive action, metallic piping and fittings coated with a corrosion-resistant material shall be used. External coatings or linings used on piping or components shall not be considered as adding strength.

403.9 Metallic pipe threads. Metallic pipe and fitting threads shall be taper pipe threads and shall comply with ASME B1.20.1.

403.9.1 Damaged threads. Pipe with threads that are stripped, chipped, corroded or otherwise damaged shall not be used. Where a weld opens during the operation of cutting or threading, that portion of the pipe shall not be used.

403.9.2 Number of threads. Field threading of metallic pipe shall be in accordance with Table 403.9.2.

For SI: 1 inch = 25.4 mm.

403.9.3 Thread joint compounds. Thread joint compounds shall be in non-hardening paste or tape form and shall be resistant to the action of liquefied petroleum gas or to any other chemical constituents of the gases to be conducted through the piping. Use of cotton thread (lamp wick) is prohibited. Threaded joint compound in tape form is prohibited for use at pressure regulator connections.

403.10 Metallic piping joints and fittings. The type of piping joint used shall be suitable for the pressure-temperature conditions and shall be selected giving consideration to joint tightness and mechanical strength under the service conditions. The joint shall be able to sustain the maximum end force caused by the internal pressure and any additional forces caused by temperature expansion or contraction, vibration, fatigue or the weight of the pipe and its contents.
403.10.1 Pipe joints. Pipe joints shall be threaded, flanged, or welded.

403.10.1.1 Prohibited joints and fittings. Unions and threaded close nipples shall be prohibited.

   Exception: Unions shall be permitted to be installed downstream of the appliance valve in accordance with Section 411.1.6.

403.10.2 Tubing joints. Tubing joints shall not be used.

403.10.3 Flared joints. Flared joints shall not be used.

403.10.4 Metallic fittings. Metallic fittings shall comply with the following:

1. Threaded fittings in sizes larger than 4 inches ([102] 101.6 mm) shall not be used.
2. Fittings used with steel or wrought-iron pipe shall be steel or malleable iron.
3. Bushings shall not be used.

403.11 Reserved.

403.12 Flanges. All flanges Flanges and flange gaskets shall comply with [ASME B16.1, ASME B16.20, or MSS SP 6. The pressure temperature ratings shall equal or exceed that required by the application] Sections 403.12.1 through 403.12.7.

403.12.1 Flange facings. Standard facings shall be permitted for use under this code. Where 150 pound (1034 kPa) pressure rated steel flanges are bolted to Class 125 cast iron flanges, the raised face on the steel flange shall be removed. Cast-iron. Cast-iron flanges shall not be used.

403.12.2 Steel. Steel flanges shall be in accordance with ASME B16.5 or ASME B16.47.

403.12.3 Nonferrous. Nonferrous flanges shall not be used.

403.12.4 Ductile iron. Ductile-iron flanges shall be in accordance with ASME B16.42.

403.12.5 Raised face. Raised face flanges shall not be joined to flat faced cast-iron, ductile-iron or nonferrous material flanges.

403.12.6 Flange facings. Standard facings shall be permitted for use under this code. Where 150 pound (1034 kPa) pressure-rated steel flanges are bolted to Class 125 cast-iron flanges, the raised face on the steel flange shall be removed.

403.12.7 Lapped flanges. Lapped flanges shall be used only above ground or in exposed locations accessible for inspection.

403.13 Flange gaskets. Material for gaskets shall be capable of withstanding the design temperature and pressure of the piping system, and the chemical constituents of the gas being
conducted, without change to its chemical and physical properties. The effects of fire exposure to
the joint shall be considered in choosing material. Acceptable materials include metal [or] (plain
or corrugated), [nonasbestos] non-asbestos fiber, [and] aluminum “O” rings and spiral wound
metal gaskets [and] rubber faced phenolic and elastomeric. Where a flanged joint is
opened, the gasket shall be replaced. Full-face flange gaskets shall be used with all [cast iron] non-
steel flanges. Rubber-faced phenolic and elastomeric gaskets shall be prohibited.

403.13.1 Metallic gaskets. Metallic flange gaskets shall be in accordance with ASME B16.20.

403.13.2 Nonmetallic gaskets. Nonmetallic flange gaskets shall be in accordance with ASME
B16.21.

403.14 Flange bolts. Flange bolts and associated hardware shall be manufactured from
corrosion-resistant materials.

SECTION FGC 404
PIPING SYSTEM INSTALLATION

404.1 Installation of materials. Materials used shall be installed in strict accordance with the
standards under which the materials are accepted and approved. In the absence of such installation
procedures, the manufacturer’s instructions shall be followed. Where the requirements of
referenced standards or manufacturer’s instructions do not conform to minimum provisions of this
code, the provisions of this code shall apply.

404.2 Pipe movement. Flammable or combustible gas piping systems shall be designed to
account for pipe movement resulting from thermal changes or seismic forces.

404.2.1 Seismic requirements. Gas piping shall be designed and installed to withstand seismic
forces in accordance with Section 1613 of the New York City Building Code.

404.2.1.1 Stainless steel flexible multiple leg hose assemblies. Stainless steel flexible
multiple leg hose assemblies may be installed where pipe movement resulting from seismic
forces may occur. Such assemblies shall be listed and labeled in accordance with UL 536
and shall be installed in accordance with the manufacturer’s instructions.

404.2.1.2 Inspection. The installation of stainless steel flexible multiple leg hose
assemblies shall be subject to special inspections in accordance with Chapter 17 of the New
York City Building Code.

404.3 Prohibited locations. Piping shall not be installed in or through a ducted supply, return or
exhaust duct, or a trash or clothes chute, chimney or gas vent, ventilating duct, dumbwaiter or
elevator shaft. Piping installed downstream of the point of delivery shall not extend through any
townhouse unit other than the unit served by such piping. Piping, fixtures, or equipment shall be
located so as not to interfere with the normal operation of windows or doors and other exit
openings. The following installation limitations shall apply:

1. Stair enclosures. Gas piping shall not be installed within a stair enclosure or required exit
or exit way.
2. **Fire standpipe riser.** Gas piping shall not be installed in any shaft containing standpipe risers.

3. **Fire pump and fire pump rooms.** Gas piping, gas consumption devices, appliances or any other gas equipment shall not be installed within any space housing a fire pump. Access to gas meter rooms shall not be permitted through rooms housing a fire pump.

4. **Fire-rated construction.** Gas piping shall not be installed within fire-rated assemblies a wall or assembly required to have a fire-resistance rating. Through penetrations of fire-resistance-rated assemblies shall be in accordance with Chapter 7 of the *New York City Building Code*.

5. **Public corridor.** Gas piping shall not be installed in public corridors and exit enclosures.

   **Exceptions:**

   1. Gas piping may be installed in public corridors or exit enclosures where separated by a fire-resistance-rated assembly meeting the hour rating and, if applicable, the impact-resistance rating required for the corridor or exit enclosure. Such assembly shall be rated for exposure to fire from both sides.

   2. In residential buildings that do not have floors below grade, or in multi-use buildings that have a residential occupancy, gas piping may be installed in public corridors in accordance with the following:

      [1-] 2.1. Gas piping shall be permitted to be installed within a public corridor at the lowest level of the building or the lowest residential level of the building.

      [2-] 2.2. All gas valves located within the public corridor shall be accessible for maintenance and inspection.

      [3-] 2.3. Gas pressure within the public corridor piping shall not exceed ½ psi (14 inch w.c.). The completed piping within the public corridor is to be tested and proven tight at 10 psig (69 kPa gauge) for a minimum of 30 minutes.

      [4-] 2.4. The public corridor shall be ventilated in accordance with the *New York City Mechanical Code*. The pipe shall not be installed in a return air plenum.

      [5-] 2.5. Pipes must be welded.

6. **Piping in solid partitions and walls.** Concealed piping shall not be located in solid partitions and solid walls, unless installed in a ventilated chase or casing.
**[404.5] Piping** Fittings in concealed locations. Portions of a piping system Fittings installed in concealed locations shall not have unions, tubing fittings, bushings, compression couplings or swing joints made by combinations of fittings. be limited to the following types:

1. Threaded elbows, tees and couplings.
2. Welded fittings.

**[404.6] Piping through foundation wall.** Underground piping, where installed below grade through the outer foundation or basement wall of a building, shall be encased in a protective pipe sleeve. Such sleeve shall extend a minimum of 1 inch (25.4 mm) beyond the inside of the foundation wall and a minimum of 4 inches (101.6 mm) beyond the outside of the foundation wall, or as otherwise required by the gas provider. The annular space between the gas piping and the sleeve shall be waterproofed and sealed.

**[404.7] Branch take-off.** Branches shall be taken off the riser with not less than a two-elbow swing.

**[404.8] Piping in solid floors.** Piping in solid floors shall be laid in channels in the floor and covered in a manner that will allow access to the piping with a minimum amount of damage to the building. Where such piping is subject to exposure to excessive moisture or corrosive substances, the piping shall be protected in an approved manner. As an alternative to installation in channels, the piping shall be installed in a conduit of Schedule 40 steel or wrought iron pipe [with tightly sealed ends and joints. At least one end shall have a vented outlet piped to a safe location outdoors. The vent terminal shall be outdoors, minimum 18 inches (457 mm) above grade, not under an opening to building or overhang, and shall be installed so as to prevent the entrance of water and insects. Both ends of such conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor installed in accordance with Section 404.8.1 or 404.8.2.

**[404.8.1] Conduit with one end terminating outdoors.** The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas piping shall be sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor. If the end sealing is capable of withstanding the full pressure of the gas pipe, the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (101.6 mm) outside the building, shall be vented above grade to the outdoors and shall be installed so as to prevent the entrance of water and insects.

**[404.8.2] Conduit with both ends terminating indoors.** Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (51 mm) beyond the point where the pipe emerges from the floor.
Above-ground outdoor piping. Piping installed outdoors shall be elevated not less than 3½ inches (88.9 mm) above ground and where installed across roof surfaces, shall be elevated not less than 3½ inches (88.9 mm) above the roof surface, identified in accordance with Section 401.5, and shall not be concealed. Piping installed above ground, outdoors, and installed across the surface of roofs shall be securely supported to the structure and located where it will be protected from physical damage. Where passing through an outside wall, the piping shall be protected against corrosion by coating or wrapping with an inert material in accordance with Section 404.11. Where piping is encased in a protective pipe sleeve, the annular space between the piping and the sleeve shall be sealed. At least one end shall have a vented outlet piped to a safe location outdoors. The vent terminal shall be outdoors, minimum 18 inches (457.2 mm) above grade, not under an opening to building or overhang, and shall be installed so as to prevent the entrance of water and insects.

Protection against corrosion. Metallic pipe, fittings, and joints susceptible to corrosive action, such as soil condition or moisture, shall be protected in an approved manner as set forth in Sections 404.11.1 through 404.11.6. Zinc coatings (galvanizing) shall not be deemed adequate protection for gas piping underground. Ferrous metal exposed in exterior locations shall be protected from corrosion. Zinc coatings (galvanizing) shall be deemed adequate protection for gas piping exposed in exterior locations. Where dissimilar metals are joined underground, an insulating coupling or fitting shall be used. Piping shall not be laid in contact with cinders.

Prohibited use. Threaded or uncoated welded joints shall not be used in piping in contact with soil. Uncoated piping, fittings, and joints shall be prohibited where internal or external crevice corrosion is known to occur.

Protection of exposed pipe. Ferrous metal exposed in exterior locations shall be protected from corrosion by one of the following methods:

1. Zinc coatings (galvanizing).
2. Bonded coatings in accordance with Section 404.11.4.
3. Protective coatings in accordance with Section 404.11.5.
4. Protective wrappings in accordance with Section 404.11.6.

Protection of buried pipe. Ferrous metal installed in buried locations shall be protected from corrosion by one of the following methods:

1. Bonded coatings in accordance with Section 404.11.4.
2. Protective wrappings in accordance with Section 404.11.6.
Where dissimilar metals are joined underground, an insulating coupling or fitting shall be used. Piping shall not be laid in contact with cinders.

404.11.4 Protective bonded coatings [and wrapping]. Pipe protective bonded coatings [and wrappings] shall be approved for the application and shall be factory applied.

**Exception:** Where installed in accordance with the manufacturer’s [installation] instructions, field application of bonded coatings [and wrappings] shall be permitted for pipe [nipples], fittings and locations where the factory coating or wrapping has been damaged or necessarily removed at joints.

404.11.5 Protective coatings. Pipe protective coatings shall be approved for the application and shall be factory applied or field applied in accordance with the manufacturer’s instructions.

**Exception:** Where installed in accordance with the manufacturer’s instructions, field application of coatings shall be permitted for pipe, fittings and locations where the factory coating has been damaged or necessarily removed at joints.

404.11.6 Protective wrappings. Pipe protective wrappings shall be approved for the application and shall be field applied in accordance with the manufacturer’s instructions.

404.12 Minimum burial depth. Underground piping systems shall be installed a minimum depth of 24 inches ([610] 609.6 mm) below grade, measured to the top of the pipe.

**Exception:** Burial depth less than 24 inches (609.6 mm) is permissible when the underground piping system is protected by steel protective plates not less than ¼--inch thick (6.36 mm) and with joints tack welded and overlapped a minimum of 3 inches (76.2 mm). The pipe shall be not less than 4 inches (101.6 mm) below the protective steel plate.

404.13 Trenches. The trench shall be graded so that the pipe has a firm, substantially continuous bearing on the bottom of the trench.

404.13.1 Backfilling. Material used under and beside pipes shall be clean backfill, free of discarded construction material and debris. Loose earth free from rocks, broken concrete and frozen chunks shall be placed in the trench in 6-inch (152.4 mm) layers and tamped in place until the crown of the pipe is covered by 12 inches (304.8 mm) of tamped earth. The backfill under and beside the pipe shall be compacted for pipe support. Backfill shall be brought up evenly on both sides of the pipe so that the pipe remains aligned. In instances where the manufacturer’s installation instructions for materials are more restrictive than those prescribed by the code, the material shall be installed in accordance with the more restrictive requirement. Backfilling is subject to progress inspection in accordance with Section 108.

404.14 Piping underground beneath buildings. Piping installed underground beneath buildings is prohibited except where the piping is encased in a conduit of wrought iron or steel pipe designed to withstand the superimposed loads. The conduit shall be protected from corrosion in accordance with Section [404.9] 404.11 and shall be installed in accordance with Section [404.12.1] 404.14.1, 404.14.2 or [404.12.2] 404.14.3.
404.14.1 Conduit with one end terminating outdoors. The conduit shall extend into an occupiable portion of the building and, at the point where the conduit terminates in the building, the space between the conduit and the gas piping shall be permanently sealed to prevent the possible entrance of any gas leakage. The conduit shall extend not less than 2 inches (50.8 mm) beyond the point where the pipe emerges from the floor. The end sealing shall be capable of withstanding the full pressure of the gas pipe, and the conduit shall be designed for the same pressure as the pipe. Such conduit shall extend not less than 4 inches (101.6 mm) outside of the building, shall be vented above grade to the outdoors and shall be installed so as to prevent the entrance of water and insects.

404.14.2 Conduit with both ends terminating indoors. Where the conduit originates and terminates within the same building, the conduit shall originate and terminate in an accessible portion of the building and shall not be sealed. The conduit shall extend not less than 2 inches (50.8 mm) beyond the point where the pipe emerges from the floor.

404.14.3 Conduit with both ends terminating indoors within different buildings. Where the conduit originates indoors in a building and terminates indoors within a different building, the conduit shall comply with Section 404.14.2.

404.15 Outlet closures. Gas outlets shall be permitted only under the following conditions:

1. Valved and capped gas tight outlets for single appliance outlets as listed on approved applications.

2. Valved and capped outlets on each floor in nonproduction laboratory buildings for future laboratories.

3. Listed and labeled flush-mounted-type quick disconnect devices and listed and labeled gas convenience outlets installed in accordance with the manufacturer’s installation instructions.

Exceptions:

1. Test ports for gas riser valves installed downstream of a riser control valve.

2. Outlets for pressure sensors and gauges installed in conjunction with gas appliances or equipment installed as per manufacturer’s instructions.

404.16 Location of outlets. The unthreaded portion of piping outlets shall extend not less than 1 inch (25.4 mm) through finished ceilings and walls and where extending through floors or outdoor patios and slabs, shall be not less than 2 inches (50.8 mm) above them. The outlet fitting or piping shall be securely supported. Outlets shall not be placed behind doors. Outlets shall be located in the room or space where the appliance is installed.
Exception: Listed and labeled flush-mounted-type quick-disconnect devices and listed and labeled gas convenience outlets shall be installed in accordance with the manufacturer’s instructions.

[404.15] 404.17 Reserved.

404.18 Pipe cleaning. The use of a flammable or combustible gas to clean or remove debris from the interior of a piping system shall be prohibited.

[404.16] 404.19 Prohibited devices. A device shall not be placed inside the piping or fittings that will reduce the cross-sectional area or otherwise obstruct the free flow of gas.

Exceptions:

1. Approved gas filters.
2. An approved fitting or device where the gas piping system has been sized to accommodate the pressure drop of the fitting or device.
3. Approved gas meters for monitoring and analysis of gas usage.

[404.17] 404.20 Testing of piping. Before any system of piping is put in service or concealed, it shall be tested to ensure that it is gas tight. Testing, inspection and purging of piping systems shall comply with Section 406.

404.21 Qualifications for gas work. Gas work shall be performed by individuals possessing the qualifications set forth in Article 28-423 of the Administrative Code. Welders must be qualified in accordance with Section 404.21.1.

404.21.1 Welder’s qualifications. Welders installing gas piping within buildings at any pressure shall comply with the following:

1. Welders shall be qualified for all pipe sizes, wall thicknesses and all positions in accordance with the ASME Boiler and Pressure Vessel Code, Section IX. Requalification of welders is required on an annual basis and when requested by the commissioner.

2. Welder qualification testing shall be performed by an approved agency and the inspector witnessing the test shall be an authorized AWS Certified Welding Inspector. Radiographic test specimens shall be evaluated by a radiographic inspector having a minimum radiography qualification of Level II in accordance with the ASNT, Document No. SNT-TC-1A, Supplement A.

3. Copies of the certified welder qualification reports shall be maintained by both the approved agency and the licensed master plumber employing the welder(s) for at least six years and shall be made available to the department upon request.
4. The approved agency shall submit certified welder qualification reports to the department upon successful qualification of a welder and when requested by the commissioner.

5. The licensed master plumber employing the welder(s) shall submit a statement to the department including who welded the gas piping along with a copy(s) of the certified welder qualification report(s) witnessed by a representative of the licensed master plumber, at the time of the first roughing inspection.

6. Requalification of a welder is required should the welder fail to maintain welder’s continuity every six months. The licensed master plumber employing the welder shall maintain a welder continuity log and the log shall be made available to the department upon request.

404.21.2 Welding requirements. All gas distribution piping to customer appliances operating in excess of ½ psig (3.5 kPa gauge) shall be welded.

404.21.3 Welding records. The licensed master plumber employing the welder(s) shall assign to each welder an identification symbol or number to identify the welds performed by that particular welder. The welder shall identify all welds with his or her symbol or number. The licensed master plumber shall maintain records identifying the weld(s) made by each welder for at least six years and shall make such records available to the department upon request.

SECTION FGC 405
PIPING BENDS AND CHANGES IN DIRECTION

405.1 General. Changes in direction of pipe shall be permitted to be made by the use of fittings, factory bends, or field bends.

405.2 [Reserved.] Metallic pipe. Metallic pipe bends shall comply with the following:

1. Bends shall be made only with bending tools and procedures intended for that purpose.

2. All bends shall be smooth and free from buckling, cracks or other evidence of mechanical damage.

3. Bends shall be made only with seamless pipe.

4. Pipe shall not be bent through an arc of more than 90 degrees (1.6 rad).

5. The inside radius of a bend shall be not less than six times the outside diameter of the pipe.

405.3 Reserved.

405.4 Elbows. Factory-made welding elbows or transverse segments cut therefrom shall have an arc length measured along the crotch [at least] of not less than 1 inch ([25] 25.4 mm) in pipe sizes 2 inches ([51] 50.8 mm) and larger.
[405.5 Pipe movement. Stainless steel flexible multiple leg hose assemblies listed and labeled as an assembly per UL 536 shall be installed for low pressure flammable and combustible gas piping systems where pipe movement resulting from thermal changes and random seismic shifts can occur in the piping systems.]

[405.5.1 Seismic requirements. Stainless steel flexible multiple leg hose assemblies shall be designed to withstand seismic force and displacement in accordance with Section 1613 of the New York City Building Code.]

[405.5.2 Inspection. The installation of stainless steel flexible multiple leg hose assemblies shall be subject to special inspections in accordance with Chapter 17 of the New York City Building Code.]

SECTION FGC 406
INSPECTION, TESTING AND PURGING

406.1 General. Prior to acceptance and initial operation, all piping installations shall be inspected and pressure tested to determine that the materials, design, fabrication and installation practices comply with the requirements of this code.

406.1.1 Inspections. Inspection shall consist of visual examination during or after manufacture, fabrication, assembly or pressure tests as appropriate. Supplementary types of nondestructive inspection techniques, such as magnetic-particle, radiographic, ultrasonic, etc., shall not be required unless specifically listed herein or in the engineering design. All inspections shall be performed in accordance with Section 108.

406.1.1.1 Welding inspections and testing. Welded gas piping shall be subject to special inspection in accordance with Chapter 17 of the New York City Building Code. Radiographic testing shall be performed on all butt welds in gas meter and gas distribution piping operating at pressures exceeding 5 psig (34.5 kPa gauge) within buildings, in accordance with ASME Boiler and Pressure Vessel Code, Section IX.

[Welder’s qualifications. Welders installing gas piping within buildings at any pressure shall comply with the following:]

[1. Welders shall be qualified for all pipe sizes, wall thicknesses and all positions in accordance with the ASME Boiler and Pressure Vessel Code, Section IX. Requalification of welders is required on an annual basis and when requested by the commissioner.]

[2. Welder qualification testing shall be performed by an approved agency and the inspector witnessing the test shall be an authorized AWS Certified Welding Inspector. Radiographic test specimens shall be evaluated by a radiographic inspector having a minimum radiography qualification of Level II in accordance with the ASNT, Document No. SNT-TC-1A, Supplement A.]
[3. Copies of the certified welder qualification reports shall be maintained by both the approved agency and the licensed master plumber employing the welder(s) for at least six years and shall be made available to the department upon request.]

[4. The approved agency shall submit certified welder qualification reports to the department upon successful qualification of a welder and when requested by the commissioner.]

[5. The licensed master plumber employing the welder(s) shall submit a statement to the department including who welded the gas piping along with a copy(s) of the certified welder qualification report(s) witnessed by a representative of the licensed master plumber, at the time of the first roughing inspection.]

[406.1.1.2 Welding requirements. All welded gas distribution and meter piping main and branch supplies to customer equipment operating in excess of 5 psig (34.5 kPa gauge) inside buildings shall be welded; and shall be subject to special inspection in accordance with Chapter 17 of the New York City Building Code. All piping 2½ inches (63.5 mm) or greater in diameter shall be butt-welded, and piping less than 2½ inches (63.5 mm) in diameter may be socket-welded or butt-welded.]

[Radiographic testing shall be performed on all butt-welds in gas meter and gas distribution piping operating at pressures exceeding 5 psig (34.5 kPa gauge) within buildings, in accordance with ASME Boiler and Pressure Vessel Code, Section IX.]

[406.1.1.3 Welding records. The licensed master plumber employing the welder(s) shall assign to each welder an identification symbol or number to identify the welds performed by that particular welder. The welder shall identify all welds with his or her symbol or number. The licensed master plumber shall maintain records identifying the weld(s) made by each welder for at least six years and shall make such records available to the department upon request.]

406.1.2 Repairs and additions. In the event repairs or additions are made after the pressure test, the affected piping shall be tested. All sections of de-energized piping shall be pressure tested in accordance with Section 406.4.

406.1.3 New branches. [A piping system shall be tested as a complete unit.] Where new branches are installed, the new branches shall be pressure tested. Connections between the new piping and the existing piping shall be pressure tested.

406.1.4 [System] Section testing. A piping system shall be permitted to be tested as a complete unit or in sections. Under no circumstances shall a valve in a line be used as a bulkhead between gas in one section of the piping system and test medium in an adjacent section, except where a double block and bleed valve system or flange is installed. A valve shall not be subjected to the test pressure unless the piping system upstream of the valve has been deenergized. The section of piping not subjected to the pressure test shall be checked with a
noncorrosive leak-detecting fluid or other approved leak-detecting methods. Sections may be tested at different pressures in accordance with Section 406.4.

406.1.5 Regulators and valve assemblies. Regulator and valve assemblies fabricated independently of the piping system in which they are to be installed shall be permitted to be tested with inert gas or air at the time of fabrication. Such regulators and valve assemblies shall not be subjected to the testing requirements of Section 406.4. Spool pieces shall be installed in place for the test. The regulators and valve assemblies not subjected to the pressure test shall be checked with a noncorrosive leak-detecting fluid or other approved leak-detecting methods.

406.1.6 Pipe clearing. Prior to testing, the interior of the pipe shall be purged with air or an inert gas to clear foreign material, including weld splatter, dirt, rags, and other debris left inside the pipe during welding operations or piping installation.

406.2 Test medium. The test medium shall be air, nitrogen, carbon dioxide or an inert gas. Oxygen shall not be used. Fresh water may be used as the test medium only where the required test pressure exceeds 100 psig (689 kPa).

406.3 Test preparation. Pipe joints and piping including welds, shall be left exposed for examination during the test.

   Exception: Covered or concealed pipe end joints that have been previously tested inspected in accordance with this code.

406.3.1 Expansion joints. Expansion joints shall be provided with temporary restraints, if required, for the additional thrust load under test.

406.3.2 Appliance and equipment isolation. Appliances and equipment that are not to be included in the test shall be either disconnected from the piping or isolated by blanks, blind flanges or caps. Flanged joints at which blinds are inserted to blank off other equipment during the test shall not be required to be tested. The affected piping and joints shall be checked with a noncorrosive leak-detecting fluid or other approved leak-detecting methods when gas is energized.

406.3.3 Appliance and equipment disconnection. Where the piping system is connected to appliances or equipment designed for operating pressures of less than the test pressure, such appliances or equipment shall be isolated from the piping system by disconnecting them and capping the outlet(s). The affected piping and joints shall be checked with a noncorrosive leak-detecting fluid or other approved leak-detecting methods when gas is energized.

406.3.4 Valve isolation. Where the piping system is connected to appliances or equipment designed for operating pressures equal to or greater than the test pressure, such appliances or equipment shall be isolated from the piping system by closing the individual appliance or equipment shutoff valve(s). The affected piping and joints shall be checked with a noncorrosive leak-detecting fluid or other approved leak-detecting methods when gas is energized.
406.3.5 Testing precautions. Testing of piping systems shall be performed in a manner that protects the safety of employees and the public during the test. Bulkheads, anchorage, and bracing suitably designed to resist test pressures shall be installed if necessary. Prior to testing, the interior of the pipe shall be purged to flush out all foreign material, including weld splatter, dirt, rags, and other debris left inside the pipe during welding operations and piping installation.

406.4 Test pressure measurement. Upon completion of the installation of a section of a gas system or of the entire gas system, and before appliances are connected thereto, the completed section or system shall be verified as to materials, and tested and proven tight as follows. Test pressure shall be measured with a manometer or with a pressure-measuring device designed and calibrated to read, record or indicate a pressure loss caused by leakage during the pressure test period. The source of pressure shall be isolated before the pressure tests are made. Mechanical gauges used to measure test pressures shall have a range such that the highest end of the scale is not greater than two times the test pressure. Gauges shall comply with the requirements of Section 406.4.3 or 406.4.4.

406.4.1 Test pressure. The test pressure to be used shall be not less than 1½ times the proposed maximum working pressure, but not less than 3 psig (20.9 kPa gauge), irrespective of design pressure. Where the test pressure exceeds 125 psig (861.8 kPa gauge), the test pressure shall not exceed a value that produces a hoop stress in the piping greater than 50 percent of the specified minimum yield strength of the pipe.

Exceptions:

[4. Gas distribution piping shall comply with the following:]

[4.1. Distribution pressures up to 1/2 psig (3.5 kPa gauge). The completed piping is to be tested with a nonmercury gauge at a pressure of 3 psig (20 kPa gauge) for a minimum of 30 minutes.]

[4.2. Distribution pressures over 1/2 psig (3.5 kPa gauge) through 5 psig (34.5 kPa gauge). The completed piping is to be tested at 50 psig (340 kPa gauge) for a minimum of 30 minutes.]

[4.3. Distribution pressures over 5 psig (34.5 kPa gauge) through 15 psig (100 kPa gauge). The completed piping is to be tested at 100 psig (689 kPa gauge) for a minimum of 1 hour.]

[4.4. Distribution] 1. Gas piping with distribution pressures above 15 psig (100 kPa gauge) shall be tested to twice the maximum allowable operating pressure, but not less than 100 psig (689 kPa gauge), for a minimum of 1 hour.
1. Where the test pressure exceeds 125 psig (862 kPa gauge), the test pressure shall not exceed a value that produces a hoop stress in the piping greater than 50 percent of the specified minimum yield strength of the pipe.

2. Gas piping installed in public corridors in accordance with Section 404 shall be tested and proven tight at a pressure of 10 psig ([69] 68.9 kPa gauge) for a minimum of 30 minutes.

3. Meter piping shall be pressure tested in accordance with the requirements of the serving utility. These requirements shall be either the same as those for testing distribution piping in [numbered paragraph] or, if different, the piping shall be certified by the [local] utility company as being tested in compliance with their requirements.

4. Notwithstanding the above, all field applied or factory applied coated and wrapped pipe shall be pressure tested at a minimum of [90] 100 psig ([69] 689.5 kPa gauge) for a minimum of 60 minutes. For testing, the piping shall be filled with air or an inert gas, and the source of pressure shall be isolated before the pressure readings are made. All test duration time periods are to be measured after stabilization of testing medium. [Fresh water may be used as the test medium only where the required test pressure exceeds 100 psig (689 kPa gauge).]

406.4.1.1 Factory applied coatings. Gas piping with factory applied coatings intended to protect against corrosion during material shipping and storage shall be tested at not less than 1½ times the proposed maximum working pressure, but not less than 3 psig (20.9 kPa gauge), irrespective of design pressure. Where the test pressure exceeds 125 psig (861.8 kPa gauge), the test pressure shall not exceed a value that produces a hoop stress in the piping greater than 50 percent of the specified minimum yield strength of the pipe.

406.4.1.2 Field applied paint. Gas piping with field applied paint intended to protect against corrosion shall be tested at not less than 1½ times the proposed maximum working pressure, but not less than 3 psig (20.9 kPa gauge), irrespective of design pressure. Where the test pressure exceeds 125 psig (861.8 kPa gauge), the test pressure shall not exceed a value that produces a hoop stress in the piping greater than 50 percent of the specified minimum yield strength of the pipe.

406.4.2 Test duration. Test duration shall be not less than ½ hour, unless a greater duration is required by Section 406.4.1.

406.4.3 Minimum standards for [nonmercury] gauges.

[1:] This section establishes minimum standards for [nonmercury] gauges used to test gas piping [drainage and vent systems].

[2:] Each gauge shall meet the following requirements:
[2.1.] 1. The gauge shall be manufactured and used in accordance with ASME [B 40.100, which incorporates ASME B 40.1 and ASME B 40.7, and the manufacturer shall provide with the gauge a written statement that the gauge is manufactured in accordance with such ASME standard;

[2.2.] 2. The gauge shall be labeled with the name of the manufacturer;

[2.3.] 3. The gauge shall be kept in a padded separate rigid box and the manufacturer's instructions for use and protection of the gauge shall be complied with;

[2.4.] 4. The units of measurement “psig” shall appear on the face of the gauge; and

[2.5.] 5. The gauge shall be kept in good working order.

406.4.2 Analog gauges used to measure pressure in the magnitude of 3 psig (20 kPa gauge). Each analog gauge used to measure pressure in the magnitude of 3 psig (20 kPa gauge) shall meet the following requirements in addition to satisfying the minimum requirements set forth in Section 406.4.1:

[1.] The face of the gauge shall not be smaller than 2¼ inches (57 mm) in diameter;

[2.] The gauge shall have a minimum of 270 degree (5 rad) dial arc;

[3.] The gauge shall be calibrated in increments of not greater than one-tenth of a pound;

[4.] The range of the gauge shall not exceed 5 psig (34.5 kPa gauge) when a 2¼ inch (57 mm) diameter gauge is used;

[5.] The 1/10 psig (0.69 kPa gauge) interval on the gauge shall not be smaller than one-tenth of an inch (2.5 mm) of arc;

[6.] The gauge shall be provided with an effective stop for the indicating pointer at the zero point;

[7.] The gauge shall be protected from excessive pressure with a shutoff valve and prior to using the 5 psig (34.5 kPa gauge) the sniffer valve shall be tested with a tire gauge to determine the magnitude of pressure; and

[8.] The gauge shall have a calibration screw.

406.4.3 Analog gauges used to measure pressure in the magnitude of 5 psig (34.5 kPa gauge). Each analog gauge used to measure pressure in the magnitude of 5 psig (34.5 kPa gauge) shall meet the following requirements in addition to satisfying the minimum requirements set forth in Section 406.4.1:

[1.] The face of the gauge shall not be smaller than 2¼ inches (57 mm) in diameter;

[2.] The gauge shall have a minimum of 270 degree (5 rad) dial arc;
3. The gauge shall be calibrated in increments not greater than one-fifth of a pound;

4. The range of the gauge shall not exceed 10 psig (69 kPa gauge) when a 2¼ inch (57 mm) diameter gauge is used;

5. The one-fifth interval on the gauge shall not be smaller than one-tenth of an inch (2.5 mm) of arc;

6. The gauge shall be provided with an effective stop for the indicating pointer at the zero point;

7. The gauge shall be protected from excessive pressure with a shutoff valve and prior to using the 10 psig (69 kPa gauge) the snifter valve shall be tested with a tire gauge to determine the magnitude of pressure; and

8. The gauge shall have a calibration screw.

406.4.4 Digital gauges used to measure pressure in the magnitude of 3 psig ([20] 20.9 kPa gauge) and higher. Each digital gauge used to measure pressure in the magnitude of 3 psig ([20] 20.9 kPa gauge) and higher shall meet the following requirements in addition to satisfying the minimum requirements set forth in Section [406.4.4] 406.4.3:

1. The gauge shall have a minimum reading of 1/100 of a psig (69 Pa), and

2. An extra charged battery shall be readily available for immediate use with the gauge.

406.4.5 Witnessing tests of gas-piping systems. Tests of gas piping systems in accordance with this code shall be witnessed by department plumbing inspectors, [or approved agencies. The department shall prescribe qualifications for individuals who are authorized to witness such tests on behalf of approved agencies, including but not limited to the requirement that such individuals shall be licensed master plumbers or registered design professionals with not less than 5 years’ experience in the inspection and testing of gas piping systems. Such tests may be conducted without any verifying inspection of tests by the department, provided that verified statements and supporting inspectorial and test reports are filed with the department within one working day of such tests.]

406.4.6 Conducting tests of gas-piping systems. Tests of gas piping systems in accordance with this code shall be conducted by an individual with not less than five years’ experience in gas work.

406.4.6 406.4.7 Notification. The holder of the plumbing permit shall give at least two days prior [written] notice to the commissioner that the plumbing work covered by the permit is ready for inspections and test.

406.5 Detection of leaks and defects. The piping system shall withstand the test pressure specified without showing any evidence of leakage or other defects. Any reduction of test pressures as indicated by pressure gauges shall be deemed to indicate the presence of a leak unless such reduction can be readily attributed to some other cause.
406.5.1 Detection methods. The leakage shall be located by means of an approved gas detector, a noncorrosive leak detection fluid [1] or other approved leak detection methods. [Matches, candles, open flames, or other methods that could provide a source of ignition shall not be used.]

406.5.2 Corrections. Where leakage or other defects are located, the affected portion of the piping system shall be repaired or replaced and retested.

406.6 Piping system and equipment leakage check. Leakage checking of systems and equipment shall be in accordance with Sections 406.6.1 through 406.6.4.

406.6.1 Check gases. Leak checks using fuel gas shall be permitted in piping systems that have been pressure tested in accordance with Section 406.

406.6.2 Before turning gas on. During the process of turning gas on into a system of new gas piping, the entire system shall be inspected to determine that there are no open fittings or ends and that all valves at unused outlets are closed and plugged or capped.

406.6.2.1 Gas authorization required. A gas piping system shall not be energized prior to authorization. Such authorization is demonstrated by issuance of a certificate of approval of gas installation by the department. The certificate shall not be issued prior to the completion of the required inspections and tests. The certificate shall not expire.

Exception: Gas authorization shall not be required when gas is reestablished by a utility company as permitted under Section 28-105.4.3 of Chapter 1 of Title 28 of the Administrative Code.

406.6.2.1.1 Existing gas piping. Any gas piping system or part thereof that has been previously energized and has been shut down shall be required to obtain a certificate of approval of gas installation for all appliances served by the affected gas meter(s) prior to the reestablishment of gas into such system.

Exception: When an existing gas appliance is replaced and no gas piping is replaced upstream of the existing appliance shut off valve and not more than 6 feet (1828.8 mm) of pipe is installed or replaced downstream of the existing appliance shut off valve, a certificate of approval of gas installation shall not be required to energize such pipe or replacement appliance.

406.6.2.1.2 Partial gas authorization. A certificate of approval of gas installation may be issued for a portion of a gas piping system provided the remainder of the system is locked-off by the gas service provider.

[406.6.2.1] 406.6.2.2 Establishing gas supply. It shall be unlawful for any utility company to supply or restore gas to a building, place or premises in which new meters other than replacement gas meters are required until a certificate of approval of gas installation [from the department] is [filed with such utility company] issued in accordance with Section
When new gas service piping has been installed, it shall be locked-off by the utility either by locking the gas service line valve or by installing a locking device on the outside gas service line valve. The lock shall not be removed until the gas meter piping (other than utility-owned) and gas distribution piping has been inspected and certified as required by the department as being ready for service. When an existing gas service piping has been taken out of service, it shall be locked-off by the utility. The lock shall not be removed until the gas meter piping (other than utility-owned) and gas distribution piping has been inspected and certified as required by the department as being ready for service.

Alterations to gas piping systems. When alterations, extensions or repairs to existing gas meter piping or gas distribution piping requires the shutoff of gas flow to a building operation of a service head valve, regulator valve or meter valve that would interrupt the flow of gas to a building, the utility shall be notified by the owner or his or her authorized representative.

Emergency service head valve, regulator valve or gas meter valve operation. It is permissible for a licensed plumber or his or her employee to operate a valve in an emergency to alleviate a hazardous condition. The utility shall be notified by the licensee or his or her authorized representative. Such licensee or authorized representative shall wait on location for utility company operators to arrive and lock the affected valve.

Leak check. Immediately after the gas is turned on into a new system or into a system that has been initially restored after an interruption of service, the piping system shall be checked for abnormal operating conditions and leakage. The leakage check shall be performed by means of a combustible gas indicator complying with Section 406.7.1.4, or a noncorrosive leak detection fluid. Where leakage is indicated, or where an abnormal operating condition presents a hazard, the gas supply shall be shut off until the necessary repairs have been made.

Placing appliances and equipment in operation. Appliances and equipment shall not be permitted to be placed in operation until after the piping system has been checked for leakage in accordance with Section 406.6.3 and determined to be free of leakage and, the piping system has been purged in accordance with Section 406.7 and the connections to the appliances have been checked for leakage.

Requirements for placing appliances in operation. The following will be required prior to placing appliances in operation as applicable:

1. Required fire protection system (sprinkler or standpipe) are completed, inspected and ready for service.

2. Such appliance and related equipment and gas piping are inspected by the department or authorized inspector.

3. Associated fire suppression system is inspected and approved by the Fire Department.
Exception: Appliances may be used as temporary sources of heat during construction as needed and in accordance with requirements of the department.

406.7 Purging. The purging of piping shall be in accordance with Sections 406.7.1 through 406.7.3.

406.7.1 Piping systems required to be purged outdoors. The purging of piping systems shall be in accordance with the provisions of Sections 406.7.1.1 through 406.7.1.4 where the piping system meets either of the following:

1. The design operating gas pressure is greater than 2 psig ([43.79] 13.8 kPa).

2. The piping being purged contains one or more sections of pipe [or tubing that meet(s)] meeting the size and length criteria of Table 406.7.1.1.

406.7.1.1 Removal from service. Where existing gas piping is opened, the section that is opened shall be isolated from the gas supply and the line pressure vented in accordance with Section 406.7.1.3. Where gas piping meeting the criteria of Table 406.7.1.1 is removed from service, the residual fuel gas in the piping shall be displaced with an inert gas.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

406.7.1.2 Placing in operation. Where gas piping containing air and meeting the criteria of Table 406.7.1.1 is placed in operation, the air in the piping shall first be displaced with an inert gas. The inert gas shall then be displaced with fuel gas in accordance with Section 406.7.1.3.

406.7.1.3 Outdoor discharge of purged gases. The open end of a piping system being pressure vented or purged shall discharge directly to an outdoor location. Purging operations shall comply with all of the following requirements:

1. The point of discharge shall be controlled with a shutoff valve.

2. The point of discharge shall be located [at least] not less than 10 feet (3048 mm) from sources of ignition, [at least] not less than 10 feet (3048 mm) from building openings and [at least] not less than 25 feet (7620 mm) from mechanical air intake openings.
3. During discharge, the open point of discharge shall be continuously attended and monitored with a combustible gas indicator that complies with Section 406.7.1.4.

4. Purging operations introducing fuel gas shall be stopped when [90 percent] at least 95 percent fuel gas by volume is detected within the pipe.

5. Persons not involved in the purging operations shall be evacuated from all areas within 10 feet (3048 mm) of the point of discharge.

406.7.1.4 Combustible gas indicator. Combustible gas indicators shall be listed and shall be calibrated in accordance with the manufacturer’s instructions. Combustible gas indicators shall numerically display a volume scale from zero percent to 100 percent in 1 percent or smaller increments.

406.7.2 Piping systems allowed to be purged indoors or outdoors. The purging of piping systems shall be in accordance with the provisions of Section 406.7.2.1 where the piping system meets both of the following:

1. The design operating gas pressure is 2 psig (13.79 kPa) or less.

2. The piping being purged is constructed entirely from pipe or tubing not meeting the size and length criteria of Table 406.7.1.1.

406.7.2.1 Purging procedure. The piping system shall be purged in accordance with one or more of the following:

[1. The piping shall be purged with fuel gas and shall discharge to the outdoors.]

[2. The piping shall be purged with fuel gas and shall discharge to the indoors or outdoors through an appliance burner not located in a combustion chamber. Such burner shall be provided with a continuous source of ignition.]

[3. The piping shall be purged with fuel gas and shall discharge to the indoors or outdoors through a burner that has a continuous source of ignition and that is designed for such purpose.]

[4.] 1. The piping shall be purged with fuel gas that is discharged to the indoors or outdoors, and the point of discharge shall be monitored with a listed combustible gas detector in accordance with Section 406.7.2.2. Purging shall be stopped when fuel gas is detected.

[5.] 2. The piping shall be purged by the gas supplier in accordance with written procedures of the utility company.
406.7.2.2 **Combustible gas detector.** Combustible gas detectors shall be listed and shall be calibrated or tested in accordance with the manufacturer’s instructions. Combustible gas detectors shall be capable of indicating the presence of fuel gas.

406.7.3 **Purging appliances and equipment.** After the piping system has been placed in operation, appliances and equipment subsequently installed shall be purged before being placed into operation.

**SECTION FGC 407**
**PIPING SUPPORT**

407.1 **General.** Piping shall be provided with support in accordance with Section 407.2. In addition, when earthquake loads are applicable in accordance with the New York City Building Code, a detailed piping system stress analysis including seismic analysis shall be performed. The pipe supports and restraints shall be designed and installed to accommodate the resultant seismic forces, moments and displacements from this stress analysis in accordance with the New York City Building Code.

407.2 **Design and installation.** Piping shall be supported with metal pipe hooks, metal pipe straps, metal bands, metal brackets, metal hangers or building structural components, suitable for the size of piping, of adequate strength and quality, and located at intervals so as to prevent or damp out excessive vibration. Piping shall be anchored to prevent undue strains on connected appliances and shall not be supported by other piping. Pipe hangers and supports shall conform to the requirements of MSS SP-58 and shall be spaced in accordance with Section 415. Supports, hangers and anchors shall be installed so as not to interfere with the free expansion and contraction of the piping between anchors. All parts of the supporting equipment shall be designed and installed so that they will not be disengaged by movement of the supported piping.

**SECTION FGC 408**
**DRIPS AND SLOPED PIPING**

408.1 **Slopes.** Piping for other than dry gas conditions shall be sloped not less than ¼ inch in 15 feet (6.3 mm in 4572 mm) to prevent traps. The local gas supplier/utility company should be consulted to determine the type of fuel gas available for the intended service.

408.2 **Drips.** Where the local gas supplier/utility company requires, a manufactured test fitting or drip leg shall be installed downstream of a lockable supply/riser valve in accordance with the requirements for installation of the serving utility. No other locations will be allowed to prevent additional unapproved gas connections. Drips are not permitted.

408.3 [Reserved.]

408.4 **Test fittings.** A manufactured test fitting shall be installed where required by the gas supplier. Such fitting shall be downstream of a lockable supply or riser valve in accordance with the requirements of the gas supplier and the manufacturer’s instructions. The outlet of the test fitting shall be the smallest commercially available. The installation of manufactured test fittings in other locations shall be prohibited.

408.4 **Sediment trap.** Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of
the appliance as practical. The sediment trap shall be either a tee fitting having a capped nipple of any length installed vertically in the bottom most opening of the tee as illustrated in Figure 408.4 or other device approved as an effective sediment trap. Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces [5] and outdoor grills need not be so equipped.

SECTION FGC 409
SHUTOFF VALVES

409.1 General. Piping systems shall be provided with shutoff valves in accordance with this section.

409.1.1 Valve approval. Shutoff valves shall be of an approved type; shall be constructed of materials compatible with the piping; and shall comply with the standard that is applicable for the pressure and application, in accordance with Table 409.1.1.

For SI: 1 pound per square inch gauge = 6.895 kPa.

a. If labeled 2G.

b. If labeled 5G.

409.1.2 Prohibited locations. Shutoff valves shall be prohibited in concealed locations and furnace plenums.

409.1.3 Access to shutoff valves. Shutoff valves shall be located in places so as to provide access for operation and shall be installed so as to be protected from damage.

409.2 Meter valve. Every meter shall be equipped with a shutoff valve located on the supply side of the meter. Meter valves shall be of a type approved by the utility company.

409.3 Shutoff valves for multiple-house line systems. Where a single meter is used to supply gas to more than one building or tenant, a separate shutoff valve shall be provided for each building or tenant.

409.3.1 Multiple tenant buildings. In multiple tenant buildings, where a common piping system is installed to supply other than individual dwelling units, shutoff valves shall be provided for each tenant. Each tenant shall have access to the shutoff valve serving that tenant’s space.
409.3.2 Individual buildings. In a common system serving more than one building, shutoff valves shall be installed outdoors at each building.

409.3.3 Identification of shutoff valves. Each house line shutoff valve shall be plainly marked with an identification tag attached by the installer so that the piping systems supplied by such valves are readily identified. Identification shall be provided in compliance with ASME A13.1.

409.4 MP regulator valves. [A-listed] An approved shutoff valve shall be installed immediately ahead of each MP regulator.

409.5 Appliance shutoff valve. Each appliance shall be provided with a shutoff valve in accordance with Section 409.5.1 or 409.5.2 or 409.5.3.

409.5.1 Located within the same room. The shutoff valve shall be located in the same room as the appliance. The shutoff valve shall be within 6 feet (1829 mm) of the appliance, and shall be installed upstream of the union, connector or quick disconnect device it serves. Such shutoff valves shall be provided with access and located not more than 60 inches (1524 mm) above the finished floor. Appliance shutoff valves located in the firebox of a fireplace shall be installed in accordance with the appliance manufacturer’s instructions. Where the shutoff valve is located in the firebox, a remote shutoff valve shall also be provided.

Exception: Shutoff valves may be located more than 60 inches (1524 mm) above the finished floor where the gas connection to the appliance is more than 60 inches (1524 mm) above the finished floor.

409.5.2 Vented decorative appliances and room heaters. Shutoff valves for vented decorative appliances, room heaters and decorative appliances for installation in vented fireplaces shall be permitted to be installed in an area remote from the appliances where such valves are provided with ready access. Such valves shall be permanently identified and shall not serve another appliance. The piping from the shutoff valve to within 6 feet (1829 mm) of the appliance shall be designed, sized and installed in accordance with Sections 401 through 408.

409.6 Shutoff valve for laboratories. Where provided with two or more fuel gas outlets, including table-, bench- and hood-mounted outlets, each laboratory space in educational, research, commercial and industrial occupancies shall be provided with a single dedicated shutoff valve through which all such gas outlets shall be supplied. The dedicated shutoff valve shall be readily accessible, located within the laboratory space served, located adjacent to the egress door from the space and shall be identified by approved signage stating “Gas Shutoff.”

409.7 Outside gas cut-off. An outside gas service line valve or other outside shutoff device or method acceptable to the commissioner shall be provided in accordance with Section E.2 of Appendix E of this code.

409.8 Riser shutoff valves. Risers shall be equipped with an approved lockable shutoff valve. There shall be a test port installed downstream of the valve.
409.9 Branch shutoff valves. Branches serving more than one appliance shall be equipped with an approved lockable shutoff valve. There shall be a test port installed downstream of the valve.

SECTION FGC 410
FLOW CONTROLS

410.1 Pressure regulators. A line pressure regulator shall be installed where the appliance is designed to operate at a lower pressure than the supply pressure. Line gas pressure regulators shall be listed as complying with ANSI Z21.80/CSA 6.22. Access shall be provided to pressure regulators. Pressure regulators shall be protected from physical damage. Regulators installed on the exterior of the building shall be approved for outdoor installation.

410.2 MP regulators. Medium pressure (MP) regulators shall comply with the following:

1. The MP regulator shall be approved and shall be suitable for the inlet and outlet gas pressures for the application.

2. The MP regulator shall maintain a reduced outlet pressure under lockup (no-flow) conditions.

3. The capacity of the MP regulator, determined by published ratings of its manufacturer, shall be adequate to supply the appliances served.

4. The MP regulator shall be provided with access. Where located indoors, the regulator shall be vented to the outdoors or shall be equipped with a leak-limiting device, in either case complying with Section 410.3.

5. A tee fitting with one opening capped or plugged shall be installed between the MP regulator and its upstream shutoff valve. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument and to serve as a sediment trap.

6. A tee fitting with one opening capped or plugged shall be installed not less than 10 pipe diameters downstream of the MP regulator outlet. Such tee fitting shall be positioned to allow connection of a pressure-measuring instrument. A pressure gauge with an isolation valve may also be installed in addition to the fitting.

7. At least one union shall be installed within 1 foot (304.8 mm) of either side of the MP regulator.

410.3 Venting of regulators. Pressure regulators that require a vent shall be vented directly to the outdoors. The vent terminal shall be a minimum of 18 inches (457 mm) above grade, not under an opening to the building, or building-opening or overhang, and shall be installed so as to prevent the entrance of water and insects.

Exception: A vent to the outdoors is not required for regulators less than 1¼ inches (31.7 mm) NPS equipped with and labeled for utilization with an approved vent-limiting device installed in accordance with ANSI Z21.18 and the manufacturer’s instructions. The
vent-limiting device shall be installed in a location sufficiently ventilated to dissipate any gas discharged from the device.

410.3.1 Vent piping. Vent piping for relief vents and breather vents shall be constructed of materials allowed for gas piping in accordance with Section 403. Vent piping shall be not smaller than the vent connection on the pressure-regulating device. Vent piping serving relief vents and combination relief and breather vents shall be run independently to the outdoors and shall serve only a single device vent. Vent piping serving only breather vents is permitted to be connected in a manifold arrangement where sized in accordance with an approved design that minimizes back pressure in the event of diaphragm rupture. Regulator vent piping shall not exceed the length specified in the manufacturer’s instructions.

410.4 Excess flow valves. Where automatic excess flow valves are installed, they shall be listed for the application and shall be sized and installed in accordance with the manufacturer’s instructions.

410.5 Flashback arrestor check valve. Where fuel gas is used with oxygen in any hot work operation, a listed protective device that serves as a combination flashback arrestor and backflow check valve shall be installed at an approved location on both the fuel gas and oxygen supply lines. Where the pressure of the piped fuel gas supply is insufficient to ensure such safe operation, approved equipment shall be installed between the gas meter and the appliance that increases pressure to the level required for such safe operation.

SECTION FGC 411
APPLIANCE AND MANUFACTURED HOME CONNECTIONS

411.1 Connecting appliances. Except as required by Section 411.1.1, appliances shall be connected to the piping system by one of the following:

1. Rigid metallic pipe and fittings. Space heaters and water heaters within dwelling units shall be connected using rigid piping and fittings only. Use of semirigid (flexible) metallic tubing, fittings, appliance connectors or quick-disconnect devices is not permitted for this application.

2. Listed and labeled appliance connectors in compliance with ANSI Z21.24/CGA 6.10 and installed in accordance with the manufacturer’s instructions and located entirely in the same room as the appliance. Connectors shall have an overall length not to exceed 6 feet (1828.8 mm). Measurement shall be made along the centerline of the connector. Only one connector shall be used for each appliance.

3. Listed and labeled quick-disconnect devices used in conjunction with listed and labeled appliance connectors.

4. Listed and labeled convenience outlets used in conjunction with listed and labeled appliance connectors.
5. Listed and labeled outdoor appliance connectors [complying in compliance] with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer’s [installation] instructions.

6. Listed outdoor gas hose connectors in compliance with ANSI Z21.54 used to connect portable outdoor appliances. The gas hose connection shall be made only in the outdoor area where the appliance is used, and shall be to the gas piping supply at an appliance shutoff valve, a listed quick-disconnect device or listed gas convenience outlet.

411.1.1 Commercial cooking appliances. Commercial cooking appliances installed on casters and appliances that are moved for cleaning and sanitation purposes shall be connected to the piping system with an appliance connector listed as complying with ANSI Z21.69/CSA 6.16 and NSF/ANSI 169 or in accordance with Item 1 of Section 411.1. The commercial cooking appliance connector installation shall be configured in accordance with the manufacturer’s instructions. Movement of appliances with casters shall be limited by a restraining device installed in accordance with the connector and appliance manufacturer’s instructions.

411.1.2 Protection against damage. Connectors and tubing shall be installed so as to be protected against physical damage.

411.1.3 Connector installation. Fuel connectors shall be installed in accordance with the manufacturer’s instructions and Sections 411.1.3.1 through 411.1.3.4.

411.1.3.1 Maximum length. Connectors shall have an overall length not to exceed 6 feet ([1829] 1828.8 mm). Measurement shall be made along the centerline of the connector. Only one connector shall be used for each appliance.

411.1.3.2 Minimum size. Connectors shall have the capacity for the total demand of the connected appliance.

411.1.3.3 Prohibited locations and penetrations. Connectors shall not be concealed within, or extended through, walls, floors, partitions, ceilings or appliance housings.

Exceptions:

1. Connectors constructed of materials allowed for piping systems in accordance with Section 403 shall be permitted to pass through walls, floors, partitions and ceilings where installed in accordance with Section 409.5.2.

2. Rigid steel pipe connectors shall be permitted to extend through openings in appliance housings.

3. Fireplace inserts that are factory equipped with grommets, sleeves or other means of protection in accordance with the listing of the appliance.
4. Listed connectors shall be permitted to extend through an opening in an appliance housing, cabinet or casing where the tubing or connector is protected against damage.

411.1.3.4 Shutoff valve. A shutoff valve not less than the nominal size of the piping system shall be installed ahead of the connector in accordance with Section 409.5.

411.1.4 Movable appliances. Where appliances are equipped with casters or are otherwise subject to periodic movement or relocation for purposes such as routine cleaning and maintenance, such appliances shall be connected to the supply system piping by means of an approved flexible connector designed and labeled for the application appliance connector listed as complying with ANSI Z21.69/CSA 6.16 or by means of Item 1 of Section 411.1 of this code. Such flexible connectors shall be installed and protected against physical damage in accordance with the manufacturer’s installation instructions.

411.1.5 Connection of gas engine-powered air conditioners. Internal combustion engines shall not be rigidly connected to the gas supply piping.

411.1.6 Unions. A union fitting shall be provided for appliances connected by rigid metallic pipe. Such unions shall be accessible and located within 6 feet (1828 mm) of the appliance.

411.2 Manufactured home connections. Manufactured homes shall be connected to the distribution piping system by one of the following materials:

1. Metallic pipe in accordance with Section 403.4.

2. Listed and labeled connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer’s installation instructions.

411.3 Suspended low-intensity infrared tube heaters. Suspended low-intensity infrared tube heaters shall be connected to the building piping system with a connector listed for the application complying with ANSI Z21.24/CGA 6.10. The connector shall be installed as specified by the tube heater manufacturer’s instructions.

SECTION FGC 412
LIQUEFIED PETROLEUM GAS MOTOR VEHICLE FUEL-DISPENSING [STATIONS] FACILITIES

412.1 Applicability. Motor fuel-dispensing facilities for LP-gas fuel shall be designed and operated in accordance with the New York City Fire Code.

412.2 Reserved.

412.3 Reserved.

412.4 Reserved.
SECTION FGC 413
COMPRESSED NATURAL GAS MOTOR VEHICLE FUEL-DISPENSING [STATIONS] FACILITIES

413.1 Applicability. Motor fuel-dispensing facilities for CNG fuel shall be designed and operated in accordance with the New York City Fire Code.

413.2 Reserved.

413.3 Reserved.

413.4 Reserved.

413.5 Reserved.

SECTION FGC 416
OVERPRESSURE PROTECTION DEVICES

416.1 [General. Overpressure protection devices shall be provided in accordance with this section to prevent the pressure in the piping system from exceeding the pressure that would cause unsafe operation of any connected and properly adjusted appliances.] Where required. Where the serving gas supplier delivers gas at a pressure greater than 2 psi (13.79 kPa) for piping systems serving appliances designed to operate at a gas pressure of 14 inches w.c. (3.49 kPa) or less, overpressure protection devices shall be installed. Piping systems serving appliances designed to operate at inlet pressures greater than 14 inches w.c. (3.49 kPa) shall be equipped with overpressure protection devices as required by the appliance manufacturer’s instructions.

416.2 [Protection methods. The requirements of this section shall be considered to be met and a piping system deemed to have overpressure protection where a service or line pressure regulator plus one other device are installed such that the following occur:] [1. Each device limits the pressure to a value that does not exceed the maximum working pressure of the downstream system.] [2. The individual failure of either device does not result in the over pressurization of the downstream system.]

Pressure limitation requirements. The requirements for pressure limitation shall be in accordance with Sections 416.2.1 through 416.2.5.

416.2.1 Pressure under 14 inches w.c. Where piping systems serving appliances designed to operate with a gas supply pressure of 14 inches w.c. (3.49 kPa) or less are required to be equipped with overpressure protection by Section 416.1, each overpressure protection device shall be adjusted to limit the gas pressure to each connected appliance to 2 psi or less upon a failure of the line pressure regulator.

416.2.2 Pressure over 14 inches w.c. Where piping systems serving appliances designed to operate with a gas supply pressure greater than 14 inches w.c. (3.49 kPa) are required to be equipped with overpressure protection by Section 416.1, each overpressure protection device shall be adjusted to limit the gas pressure to each connected appliance as required by the appliance manufacturer’s instructions.
416.2.3 **Device capability.** Each overpressure protection device installed to meet the requirements of this section shall be capable of limiting the pressure to its connected appliance(s) as required by Section 416.2.1, independently of any other pressure control equipment in the piping system.

416.2.4 **Failure detection.** Each gas piping system for which an overpressure protection device is required by Section 416 shall be designed and installed so that a failure of the primary pressure control device(s) is detectable.

416.2.5 **Relief valve.** Where a pressure relief valve is used to meet the requirements of Section 416, it shall have a flow capacity such that the pressure in the protected system is maintained at or below the limits specified in Section 416.2.1 under all of the following conditions:

1. The line pressure regulator for which the relief valve is providing overpressure protection has failed wide open.
2. The gas pressure at the inlet of the line pressure regulator for which the relief valve is providing overpressure protection is not less than the regulator’s normal operating inlet pressure.

416.3 **Device maintenance.** The overpressure protection device shall be properly maintained and inspected every two years by a Licensed Master Plumber and inspection records shall be maintained by the Owner and made available for the Department; and inspection procedures shall be in accordance with the commissioner; and replacements or repairs shall be promptly made.

**[Exception:** Where the gas pressure is 15 psig (103 kPa gauge) or above, the overpressure protection device shall be inspected annually.]

416.4 **Where required.** A pressure relieving or pressure limiting device shall not be required where: (1) the gas does not contain materials that could seriously interfere with the operation of the service or line pressure regulator; (2) the operating pressure of the gas source is 5 psi (34.5 kPa) or less; and (3) service or line pressure regulator has all of the following design features or characteristics:

1. Pipe connections to the service or line regulator do not exceed 2 inches (51 mm) nominal diameter.
2. The regulator is self-contained with no external static or control piping.
3. The regulator has a single port valve with an orifice diameter not greater than that recommended by the manufacturer for the maximum gas pressure at the regulator inlet.
4. The valve seat is made of resilient material designed to withstand abrasion of the gas, impurities in the gas and cutting by the valve, and to resist permanent deformation where it is pressed against the valve port.
5. The regulator is capable, under normal operating conditions, of regulating the downstream pressure within the necessary limits of accuracy and of limiting the discharge pressure
under no flow conditions to not more than 150 percent of the discharge pressure maintained under flow conditions.]

[416.5] 416.3 Devices. Pressure-relieving or pressure-limiting devices shall be one of the following:

1. [Spring-loaded relief device.] Pressure relief valve.
2. [Pilot-loaded back pressure regulator used as a relief valve and designed so that failure of the pilot system or external control piping will cause the regulator relief valve to open.] Monitoring regulator.
3. [A monitoring] Series regulator installed [in series with the service or] upstream from the line [pressure] regulator and set to continuously limit the pressure on the inlet of the line regulator to the maximum values specified by Section 416.2.1.
4. [An automatic] Automatic shutoff device installed in series with the [service or] line pressure regulator and set to shut off when the pressure on the downstream piping system reaches the maximum [working pressure or some other predetermined pressure less than the maximum working pressure] values specified by Section 416.2.1. This device shall be designed so that it will remain closed until manually reset.
5. [A liquid seal relief device that can be set to open accurately and consistently at the desired pressure.]

The devices specified in this section shall be installed either as an integral part of the service or line pressure regulator or as separate units. Where separate pressure-relieving or pressure-limiting devices are installed, they shall comply with Sections [416.5.1] 416.3.1 through [416.5.6] 416.3.6.

[416.5.1] 416.3.1 Construction and installation. [Pressure-relieving] Pressure-relieving and pressure-limiting devices shall be constructed of materials so that the operation of the devices will not be impaired by corrosion of external parts by the atmosphere or of internal parts by the gas. Pressure-relieving and pressure-limiting devices shall be designed and installed so that they can be operated to determine whether the valve is free. The devices shall [also] be designed and installed so that they can be tested to determine the pressure at which they will operate and examined for leakage when in the closed position. The devices shall be maintained and inspected in accordance with Section 416.3.7.

[416.5.2] 416.3.2 External control piping. External control piping shall be [protected from falling objects, excavations and other causes of damage and shall be] designed and installed so that damage to [any] the control piping of one device will not render both the regulator and the overpressure [protective] protection device inoperative.

[416.5.3] 416.3.3 Setting. Each pressure-relieving or pressure-limiting device shall be set so that the gas pressure [does not exceed a safe level beyond the maximum allowable working pressure for] supplied to the connected [piping and] appliances does not exceed the limits specified in Section 416.2.1.
[416.5.4] 416.3.4 Unauthorized operation. Precautions shall be taken to prevent unauthorized operation of any shutoff valve that will make a pressure-relieving valve or pressure-limiting device inoperative. The valve shall be locked [for] or continuously monitored in the open position.

[416.5.5] 416.3.5 Vents. The discharge stacks, vents and outlet parts of all pressure-relieving and pressure-limiting devices shall be located so that gas is safely discharged to the outdoors. Discharge stacks and vents shall be designed to prevent the entry of water, insects and other foreign material that could cause blockage. The discharge stack or vent line shall be [at least] not less than the same size as the outlet of the pressure-relieving device.

[416.5.6] 416.3.6 Size of fittings, pipe and openings. The fittings, pipe and openings located between the system to be protected and the pressure-relieving device shall be sized to prevent hammering of the valve and to prevent impairment of relief capacity.

416.3.7 Device maintenance. The overpressure protection device: (i) shall be properly maintained and inspected every two years by a licensed master plumber; (ii) inspection records shall be maintained by the owner and made available to the department; (iii) inspection procedures shall be in accordance with the commissioner; and (iv) replacements or repairs shall be promptly made.

Exception: Where the gas pressure is 15 psig (103.4 kPa gauge) or above, the overpressure protection device shall be inspected annually.

§ 6. Chapter 5 of the New York city fuel gas code, as amended by, and sections 507 and 508 as added by, local law number 141 for the year 2013, and section 504.3.20 as added by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 5
CHIMNEYS AND VENTS

SECTION FGC 501
GENERAL

501.1 Scope. This chapter shall govern the installation, alteration, maintenance, design, minimum safety requirements, repair and approval of factory-built chimneys, chimney liners, vents and connectors, field-built chimneys and connectors and the utilization of masonry chimneys serving gas-fired appliances. The requirements for the installation, maintenance, repair and approval of factory-built chimneys, chimney liners, vents and connectors serving appliances burning fuels other than fuel gas shall be regulated by the New York City Mechanical Code. The construction, repair, maintenance and approval of masonry chimneys shall be regulated by the New York City Building Code. Venting systems shall be designed in accordance with this chapter and comply with the requirements of the New York City Air Pollution Control Code.

501.1.1 [Adjoining] Existing chimneys and vents. [Adjoining] Existing chimneys and vents shall [be in accordance with] comply with the requirements of Section 28-104.13 of the Administrative Code and Sections 501.1.1.1 through 501.1.1.8 of this code.
501.1.1.1 Responsibility of owner of taller building. Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any previously constructed existing chimneys or vents within 100 feet (30 480 mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed existing chimneys or vents to the height required in this chapter.

2. Offset such chimneys or vents to a distance beyond that required by this chapter from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.

Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

501.1.1.1.1 Chimney and vent plan. Applications for a new or altered building shall include a chimney and vent plan submitted pursuant to Section 107.18 of the New York City Building Code.

501.1.1.2 Protection of draft. After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

501.1.1.3 Written notification, plans and required documents. The owner of the new or altered building shall notify the owner of any building that may require a chimney or vent to be altered. Notification, plans and required documents shall comply with the requirements of Sections 501.1.1.3.1 through 501.1.1.3.3, affected in writing at least 45 days before starting the work required and request written consent to do such work. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.

501.1.1.3.1 First notice. Written notice in a form acceptable to the department shall be provided to the building owner not less than 60 days prior to a request for permit for construction on the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. A copy of such return receipt shall be filed with the department.

501.1.1.3.2 Second notice. Written notice in a form acceptable to the department shall be provided to the building owner not more than 45 days following commencement of
work after a permit has been issued for the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. The second notice shall also be posted by a licensed process server at the public entrance of the building requiring a chimney or vent to be altered. A copy of such return receipt and proof of service by the licensed process server shall be filed with the department.

Exceptions:

1. A second notice shall not be required where an application to alter the affected chimney or vent has been filed with the department.

2. A second notice shall not be required where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney and vent plan is submitted to the department.

501.1.3.3 Plans and required documentation for alteration work. Where access is granted and conditions are observed that result in a determination that chimney or vent alteration is required, plans for such alteration work shall be provided to the owner of the existing building and a request for written consent to submit construction documents and perform such work shall be made.

501.1.4 Approval. The [plans and method of] construction documents for the proposed chimney extension, alteration or relocation shall be [subject] submitted to the [approval of the commissioner] department pursuant to Section 28-104 of the Administrative Code. No certificate of occupancy shall be issued for the new building pursuant to Section 28-118.23 of the Administrative Code until the work associated with the construction documents for the proposed chimney extension, alteration or relocation has been signed-off by the department.

Exceptions:

1. A certificate of occupancy may be issued where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney or vent plan is submitted pursuant to Section 107.18 of the New York City Building Code documenting such.

2. A certificate of occupancy may be issued in accordance with Section 28-118.23, Exception 2 of the Administrative Code.

501.1.5 Refusal of consent. If consent is not granted by the owner of the [previously constructed] affected building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having [submitted plans that conform to the requirements of this section,] provided the notices required by
Section 501.1.1.3 shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building. Similarly, should such owner fail to grant consent within 45 days from the date of the second notice or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.

501.1.1.6 Procedure. It shall be the obligation of the owner of the new or altered building to:

1. Prepare and submit a chimney and vent plan to the department pursuant to Section 107.18 of the New York City Building Code.

2. Provide required notification pursuant to Section 501.1.1.3 of this code.

3. Provide plans pursuant to Section 501.1.3.3 of this code.

4. Prepare and submit construction documents to the department pursuant to Section 28-104 of the Administrative Code for the alteration of existing chimneys or vents which conform to the requirements of this chapter;

5. Obtain permit(s) for the proposed work in accordance with Section 28-105 of the Administrative Code;

6. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building;

[2] 7. Provide such essential services as are normally supplied by the equipment while it is out of service;

[3] 8. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building;

[4] 9. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; [and]

[5] 10. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where there is practical difficulty in complying strictly with the provisions of this item, the commissioner may permit an equally safe alternative[;]

11. Comply with the tenant protection plan requirements of Section 28-120 of the Administrative Code; and
12. Comply with inspection and sign-off requirements of Section 28-116 of the Administrative Code.

501.1.1.7 Existing violations. Any existing violations on the previously constructed equipment shall be corrected by the owner of the equipment before any equipment is added or alterations made at the expense of the owner of the new or altered building.

501.1.1.8 Variance. The commissioner may grant a variance in accordance with the provisions of this code.

501.2 General. Every appliance shall discharge the products of combustion to the outdoors, except for appliances exempted by Section 501.8.

Exception: Commercial cooking appliances vented by a Type I hood installed in accordance with [MC] Section 507 of the New York City Mechanical Code.

501.2.1 Design. Chimneys and vents shall be designed and constructed so as to provide the necessary draft and capacity for each appliance connected to completely exhaust the products of combustion to the outside air. The temperature on adjacent combustible surfaces shall not be raised above 160°F (71°C). Chimneys and vents shall be designed to resist the effects of condensation that would cause deterioration of the chimney or vent.

501.2.2 Outlets. The outlet shall be arranged so that the flue gases are not directed so that they jeopardize people, overheat combustible structures, or enter building openings in the vicinity of the outlet. Gas-fired appliances shall be vented in accordance with this code and NFPA 54.

501.2.3 Support. Chimneys and vents shall not be supported by the equipment they serve unless such equipment has been specifically designed for such loads.

501.2.4 Changes in appliance fuels. Masonry chimneys shall be constructed in accordance with Section 507.

501.2.5 Exhaust gases from internal combustion engines and turbines. Exhaust pipes shall be constructed in accordance with Section 508.

501.3 Masonry chimneys. Masonry chimneys shall be constructed in accordance with Section 503.5.3 and the New York City Building Code.

501.4 Minimum size of chimney or vent. Chimneys and vents shall be sized in accordance with Sections 503 and 504.

501.5 Abandoned inlet openings. Abandoned inlet openings in chimneys and vents shall be closed by an approved method.

501.6 Positive pressure. Where an appliance equipped with a mechanical forced draft system creates a positive pressure in the venting system, the venting system shall be designed for positive pressure applications.
501.7 **Connection to fireplace.** Connection of appliances to chimney flues serving fireplaces shall be in accordance with Sections 501.7.1 through 501.7.3.

501.7.1 **Closure and access.** A noncombustible seal shall be provided below the point of connection to prevent entry of room air into the flue. Means shall be provided for access to the flue for inspection and cleaning.

501.7.2 **Connection to factory-built fireplace flue.** An appliance shall not be connected to a flue serving a factory-built fireplace unless the appliance is specifically listed for such installation. The connection shall be made in accordance with the appliance manufacturer’s [installation] instructions.

501.7.3 **Connection to masonry fireplace flue.** A connector shall extend from the appliance to the flue serving a masonry fireplace such that the flue gases are exhausted directly into the flue. The connector shall be accessible or removable for inspection and cleaning of both the connector and the flue. Listed direct connection devices shall be installed in accordance with their listing.

501.8 **Appliances not required to be vented.** The following appliances shall not be required to be vented:

1. Ranges.
2. Built-in domestic cooking units listed and marked for optional venting.
3. Hot plates and laundry stoves.
4. Type 1 clothes dryers (Type 1 clothes dryers shall be exhausted in accordance with the requirements of Section 614.504 of the New York City Mechanical Code).
5. A single booster-type automatic instantaneous water heater, where designed and used solely for the sanitizing rinse requirements of a dishwashing machine, provided that the heater is installed in a commercial kitchen having a mechanical exhaust system. Where installed in this manner, the draft hood, if required, shall be in place and unaltered and the draft hood outlet shall be not less than 36 inches ([914] mm) vertically and 6 inches ([152] mm) horizontally from any surface other than the heater.
6. Refrigerators.
7. Counter appliances.
8. Specialized appliances of limited input such as laboratory burners and gas lights.
9. Recirculating direct-fired industrial air heaters as provided for in Section 612.

Where the appliances listed in Items 5 through 9 above are installed so that the aggregate input rating exceeds 20 British thermal units (Btu) per hour per cubic [feet] foot (207 watts per m³) of volume of the room or space in which such appliances are installed, one or more shall be provided
with venting systems or other approved means for conveying the vent gases to the outdoor atmosphere so that the aggregate input rating of the remaining unvented appliances does not exceed 20 Btu per hour per cubic foot (207 watts per m$^3$). Where the room or space in which the appliance is installed is directly connected to another room or space by a doorway, archway, or other opening of comparable size that cannot be closed, the volume of such adjacent room or space shall be permitted to be included in the calculations.

501.9 Chimney entrance. Connectors shall connect to a masonry chimney flue at a point not less than 12 inches (305 [304.8 mm]) or one chimney diameter above the lowest portion of the interior of the chimney flue.

501.10 Connections to exhauster. Appliance connections to a chimney or vent equipped with a power exhauster shall be made on the inlet side of the exhauster. Joints and vent systems on the positive pressure side of the exhauster shall be sealed to prevent flue-gas leakage as specified by the manufacturer’s [installation] instructions for the exhauster or in accordance with this code.

501.11 Masonry chimneys. Masonry chimneys utilized to vent appliances shall be located, constructed and sized as specified in the manufacturer’s [installation] instructions for the appliances being vented and Section 503.

501.12 Residential and low-heat appliances flue lining systems. Flue lining systems for use with residential-type and low-heat appliances shall be limited to the following:

1. Clay flue lining complying with the requirements of ASTM C 315 or equivalent. Clay flue lining shall be installed in accordance with the New York City Building Code.

2. Listed chimney lining systems complying with UL 1777 (new and existing chimneys) or ULC-S635 (existing chimneys) or ULC-S640 (new chimneys) [1].

3. Other approved materials that will resist, without cracking, softening or corrosion, flue gases and condensate at temperatures up to 1,800°F ([982]182.2°C).

501.13 Category I appliance flue lining systems. Flue lining systems for use with Category I appliances shall be limited to the following:

1. Flue lining systems complying with Section 501.12.

2. Chimney lining systems listed and labeled for use with gas appliances with draft hoods and other Category I gas appliances listed and labeled for use with Type B vents.

501.14 Category II, III and IV appliance venting systems. The design, sizing and installation of vents for Category II, III and IV appliances shall be in accordance with the appliance manufacturer’s [installation] instructions.

501.15 Existing chimneys and vents. Where an appliance is permanently disconnected from an existing chimney or vent, or where an appliance is connected to an existing chimney or vent during the process of a new installation, the chimney or vent shall comply with Sections 501.15.1 through 501.15.4.
501.15.1 Size. The chimney or vent shall be resized as necessary to control flue gas condensation in the interior of the chimney or vent and to provide the appliance or appliances served with the required draft. For Category I appliances, the resizing shall be in accordance with Section 502.

501.15.2 Flue passageways. The flue gas passageway shall be free of obstructions and combustible deposits and shall be cleaned if previously used for venting a solid or liquid fuel-burning appliance or fireplace. The flue liner, chimney inner wall or vent inner wall shall be continuous and shall be free of cracks, gaps, perforations or other damage or deterioration which would allow the escape of combustion products, including gases, moisture and creosote.

501.15.3 Cleanout. Masonry chimney flues shall be provided with a cleanout opening having a minimum height of 6 inches (152.4 mm). The upper edge of the opening shall be located not less than 6 inches (152.4 mm) below the lowest chimney inlet opening. The cleanout shall be provided with a tight-fitting, noncombustible cover of a minimum size of 8 inches by 8 inches (203.2 mm by 203.2 mm).

501.15.4 Clearances. Chimneys and vents shall have airspace clearance to combustibles in accordance with the New York City Building Code and the chimney or vent manufacturer’s installation instructions.

Exception: Masonry chimneys without the required air-space clearances shall be permitted to be used if lined or relined with a chimney lining system listed for use in chimneys with reduced clearances in accordance with UL 1777 or ULC-S635. The chimney clearance shall be not less than permitted by the terms of the chimney liner listing and the manufacturer’s instructions.

501.15.4.1 Fireblocking. Noncombustible fireblocking shall be provided in accordance with the New York City Building Code.

501.15.5 Testing. Testing of existing chimneys shall be in accordance with Section 1705.32 of the New York City Building Code.

501.16 Drains. A drain shall be provided for all chimneys and gas vents to remove rain water and condensation. The drain shall be [a minimum of] not less than 1 inch (25.4 mm) in [size] diameter and shall be equipped with an appropriately-sized p-trap with automatic trap seal primer in accordance with Section 1002 of the New York City Plumbing Code or a float drain trap installed in accordance with the manufacturer’s installation requirements. The drain shall be sized by the design engineer and shall be suitable for the chimney area. For listed chimneys and gas vents, the connection tap into the chimney shall be determined by the manufacturer and connected to the drain piping in accordance with the listing and [installation] instructions. On all outdoor chimneys and gas vents, the connection and drain shall be installed indoors as close as practicable to the chimney base to prevent freezing.
501.17 [Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric dampers, draft hoods, draft diverters, and all other appurtenances that allow dilution air into chimneys or gas vents. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent.] Outdoor chimneys and vents. Outdoor portions of chimneys or vents shall be provided with integral R-8 insulation or be provided with an R-8 insulation enclosure, where exposed to the outdoors for more than 5 feet (1524 mm).

501.17.1 Type B vents. Type B vents shall not be considered exposed to the outdoors in the following conditions:

1. A type B vent of a listed chimney system passing through an unused masonry chimney provided with a sealed cap that prevents airflow within the confines of the masonry chimney; or

2. A type B vent passing through an unventilated enclosure or chase insulated to R-8.

SECTION FGC 502
VENTS

502.1 General. [All vents] Vents, except as provided in Section 503.7, shall be listed and labeled. Type B and BW vents shall be tested in accordance with UL 441 and labeled or field fabricated in accordance with NFPA 211. Type L vents shall be tested in accordance with UL 641. Vents for Category II [and], III and IV appliances shall be tested in accordance with UL 1738. Plastic piping shall be listed and installed in accordance with the terms of its listing and the appliance manufacturer’s instructions.

502.2 Connectors required. Connectors shall be used to connect appliances to the vertical chimney or vent, except where the chimney or vent is attached directly to the appliance. Vent connector size, material, construction and installation shall be in accordance with Section 503.

502.3 Vent application. The application of vents shall be in accordance with Table 503.4.

502.4 Insulation shield. Where vents pass through insulated assemblies, an insulation shield constructed of steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage) shall be installed to provide clearance between the vent and the insulation material. The clearance shall be not [be] less than the clearance to combustibles specified by the vent manufacturer’s [installation] instructions. Where vents pass through attic space, the shield shall terminate not less than 2 inches ([51] 50.8 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed vent system shall be installed in accordance with the manufacturer’s [installation] instructions.

502.5 Installation. Vent systems shall be sized, installed and terminated in accordance with the vent and appliance manufacturer’s [installation] instructions and Section 503.

502.6 Support of vents. All portions of vents shall be adequately supported for the design and weight of the materials employed.
502.7 Protection against physical damage. In concealed locations, where a vent is installed through holes or notches in studs, joists, rafters or similar members less than 1½ inches (38.1 mm) from the nearest edge of the member, the vent shall be protected by shield plates. Protective steel shield plates having a minimum thickness of 0.0575 inch (1.461 mm) (No. 16 gage) shall cover the area of the vent where the member is notched or bored and shall extend [a minimum of] not less than 4 inches (101.6 mm) above sole plates, below top plates and to each side of a stud, joist or rafter.

502.7.1 Door swing. Appliance and equipment vent terminals shall be located such that doors cannot swing within 12 inches (304.8 mm) horizontally of the vent terminal. Door stops or closers shall not be installed to obtain this clearance. Means of protecting the clearance that are not easily overridden or removed may be used to obtain this clearance.

SECTION FGC 503
VENTING OF APPLIANCES

503.1 General. [This section recognizes that the choice of venting materials and the methods of installation of venting systems are dependent on the operating characteristics of the appliance being vented. The operating characteristics of vented appliances can be categorized with respect to (1) positive or negative pressure within the venting system; and (2) whether or not the appliance generates flue or vent gases that might condense in the venting system. See Section 202 for the definition of these vented appliance categories.] The venting of appliances shall be in accordance with Sections 503.2 through 503.16.

503.2 Venting systems required. Except as permitted in Sections 503.2.1 through 503.2.3 and 501.8, all appliances shall be connected to venting systems.

503.2.1 Ventilating hoods. Ventilating hoods and exhaust systems shall be permitted to be used to vent appliances installed in commercial applications [see in accordance with Section 503.3.4] and to vent industrial appliances, such as where the process itself requires fume disposal.

503.2.2 Reserved.

503.2.3 Direct-vent appliances. Listed direct-vent appliances shall be considered properly vented where installed in accordance with the terms of its listing, the manufacturer’s instructions and Section 503.8.

503.2.4 Appliances with integral vents. An appliance incorporating integral venting means shall be considered properly vented where installed in accordance with its listing, the manufacturer’s instructions and Section 503.8.

503.2.5 Incinerators. Commercial-industrial-type incinerators shall be vented in accordance with NFPA 82.

503.3 Design and construction. Venting systems shall be designed and constructed so as to develop a positive flow adequate to convey all flue [or] and vent gases to the outdoors.
503.3.1 Appliance draft requirements. A venting system shall satisfy the draft requirements of the appliance in accordance with the manufacturer’s instructions.

503.3.2 Design and construction. Appliances required to be vented shall be connected to a venting system designed and installed in accordance with the provisions of Sections 503.4 through 503.16.

503.3.3 Mechanical draft systems. Mechanical draft systems shall comply with the following:

1. Mechanical draft systems shall be listed and shall be installed in accordance with the terms of their listing and both the appliance and the mechanical draft system manufacturer’s instructions.

2. Appliances [except incinerators] requiring venting shall be permitted to be vented by means of mechanical draft systems of either forced or induced draft design.

3. Forced draft systems and all portions of induced draft systems under positive pressure during operation shall be designed and installed so as to prevent leakage of flue or vent gases into a building.

4. Vent connectors serving appliances vented by natural draft shall not be connected into any portion of mechanical draft systems operating under positive pressure.

5. Where a mechanical draft system is employed, provisions shall be made to prevent the flow of gas to the main burners when the draft system is not performing so as to satisfy the operating requirements of the appliance for safe performance.

6. The exit terminals of mechanical draft systems shall be not less than 7 feet ([2134] 2133.6 mm) above finished ground level where located adjacent to public walkways and shall be located as specified in Section 503.8, Items 1 and 2.

503.3.4 Ventilating hoods and exhaust systems. Ventilating hoods and exhaust systems shall be permitted to be used to vent appliances installed in commercial applications. Where automatically operated appliances, other than commercial cooking appliances, are [is] vented through a ventilating hood or exhaust system equipped with a damper or with a power means of exhaust, provisions shall be made to allow the flow of gas to the main burners only when the damper is open to a position to properly vent the appliance and when the power means of exhaust is in operation.

503.3.5 Air ducts and furnace plenums. Venting systems shall not extend into or pass through any fabricated air duct or furnace plenum.

503.3.6 Above-ceiling air-handling spaces. Where a venting system passes through an above-ceiling air-handling space or other nonducted portion of an air-handling system, such space shall be accessible for inspection. The venting system shall conform to one of the following requirements:
1. The venting system shall be a listed special gas vent; other venting system serving a Category III or Category IV appliance; or other positive pressure vent, with joints sealed in accordance with the appliance or vent manufacturer’s instructions.

2. The venting system shall be installed such that fittings and joints between sections are not installed in the above-ceiling space.

3. The venting system shall be installed in a sealed metal conduit or enclosure with sealed joints separating the interior of the conduit or enclosure from the ceiling space.

**503.4 Type of venting system to be used.** The type of venting system to be used shall be in accordance with Table 503.4.

503.4.1 Plastic piping. Plastic piping used for venting appliances listed for use with such venting materials shall be listed and installed in accordance with the terms of its listing and the manufacturers’ instructions. Installation shall be in accordance with the New York City Building Code. PVC shall not be permitted [·].

503.4.1.1 Plastic vent joints. Plastic pipe and fittings used to vent appliances shall be installed in accordance with the appliance manufacturer’s instructions. Where a primer is required, it shall be of a contrasting color.

503.4.2 Special gas vent. Special gas vent shall be listed and installed in accordance with the terms of the special gas vent listing and the manufacturers’ instructions.

503.4.2.1 Inspection of special gas vents. Before replacing an existing appliance or connecting a vent connector to a special gas vent, the special gas vent shall be examined to ascertain that it is clear and free of obstructions.

503.4.2.2 Unsafe special gas vents. Where inspection reveals that an existing special gas vent is not safe for the intended application, it shall be repaired or replaced.

503.4.2.3 Test run. All special gas vents shall be test run by the registered design professional or special inspector responsible for the testing under operating conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The results of such test run shall be certified as correct by the registered design professional or special inspector responsible for the test and shall be submitted in writing to the department.

503.4.2.4 Requirement of a smoke test. A smoke test shall be conducted in accordance with Section 503.4.2.5. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In the alternative, the commissioner may accept a test report instead of requiring that it be witnessed by a representative of the commissioner. Such test report of the registered design professional or special inspector responsible for the test which shall be submitted in writing to the department.

503.4.2.5 Smoke test. To determine the tightness of vent construction, a smoke test shall be conducted in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, either the owner or holder of the work permit [·].

2. If the test shows any evidence of leakage or other defects, such leakage or other defects shall be corrected in accordance with the requirements of this chapter, and the test shall be repeated until the results are satisfactory.

3. The vent shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed and a pressure equivalent to ½ inch (12.7 mm) column of water measured at the base
of the special gas vent shall be applied. The test shall be applied for a length of time sufficient to permit the inspection of the special gas vent.

4. Testing and inspection of existing and new negative pressure chimneys and vents shall be in accordance with Section 1705.32 of the New York City Building Code.

503.5 Masonry, metal, and factory-built chimneys. Masonry, metal and factory-built chimneys shall comply with Sections 503.5.1 through 503.5.10.

503.5.1 Factory-built chimneys. Factory-built chimneys shall be installed in accordance with their listing and the manufacturer’s instructions. Factory-built chimneys used to vent appliances that operate at positive vent pressure shall be listed for such application.

503.5.2 Metal chimneys. Metal chimneys shall be built and installed in accordance with NFPA 211.

503.5.3 Masonry chimneys. Masonry chimneys shall be built and installed in accordance with Chapter 21 of the New York City Building Code and NFPA 211 and shall be lined with approved clay flue lining, a listed chimney lining system or other approved material that will resist corrosion, erosion, softening or cracking from vent gases at temperatures up to 1,800°F (982°C).

Exception: Masonry chimney flues serving listed gas appliances with draft hoods, Category I appliances and other gas appliances listed for use with Type B vents shall be permitted to be lined with a chimney lining system specifically listed for use only with such appliances. The liner shall be installed in accordance with the liner manufacturer’s instructions and the terms of the listing. A permanent identifying label shall be attached at the point where the connection is to be made to the liner. The label shall read: “This chimney liner is for appliances that burn gas only. Do not connect to solid or liquid fuel-burning appliances or incinerators.”

For information on installation of gas vents in existing masonry chimneys, see Section 503.6.3.

503.5.4 Chimney termination. Chimneys serving gas-fired equipment shall comply with the appliance listing, the manufacturer’s instructions, Figure 503.5.4 and the following requirements:

1. Chimneys, vents and flues serving appliances or fireplaces with outlet temperatures less than 600°F (315.6 °C) shall extend at least not less than 3 feet (914.4 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney, vent or flue outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimneys, vents or flues located beyond 10 feet (3048 mm) from such construction, but not more than the distance determined by Equation 5-1, shall be at least as high as the construction.
2. Chimneys serving appliances or fireplaces with outlet temperatures between 600°F ([343.3]316°C) and 1000°F ([538]537.8°C) shall extend [at least] not less than 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, and vents or open structural framing. Any [chimney] chimneys located beyond 20 feet (6096 mm) from such construction, but not more than the distance determined by Equation 5-1, shall be at least as high as the construction.

3. Chimneys serving appliances or fireplaces with outlet temperatures greater than 1000°F ([538]537.8°C) shall extend [at least] not less than 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any [chimney] chimneys located beyond 50 feet (15 240 mm) from such construction, but not more than the distance determined by Equation 5-1, shall be at least as high as the construction.

4. Termination caps shall not be permitted. A drain shall be installed in accordance with Section 801.21 or 801.22 of the New York City Mechanical Code. A positive means shall be provided to prevent water from entering the appliance.

   **Exception:** Termination caps shall be permitted on listed factory-built chimneys unless otherwise prohibited by the New York City Air Pollution Control Code.

5. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers’ [installation] instructions.

6. The following equation shall be used for determining the distances referred to in Items 1, 2 and 3 of this section.

\[
D = F \times \sqrt{A} \quad \text{(Equation 5-1)}
\]

where:

- \(D\) = Distance, in feet, measured from the center of the chimney, vent or flue outlet to the nearest edge of the construction. If a single chimney is divided into multiple smaller flues or chimneys, measure from the center of the chimney outlet that is closest to the nearest edge of the construction.

- \(F\) = Value determined from table below.
A = Free area, in square inches, of chimney flue space outlet. If a single chimney is divided into multiple smaller flues or chimneys, the total aggregate free area of such flue and chimney outlets shall be used to calculate “A”.

503.5.5 **Size of chimneys.** The effective area of a chimney venting system serving listed appliances with draft hoods, Category I appliances, and other appliances listed for use with Type B vents shall be determined in accordance with one of the following methods:

1. The provisions of Section 504.

2. For sizing an individual chimney venting system for a single appliance with a draft hood, the effective areas of the vent connector and chimney flue shall be not less than the area of the appliance flue collar or draft hood outlet, nor greater than seven times the draft hood outlet area.

3. For sizing a chimney venting system connected to two appliances with draft hoods, the effective area of the chimney flue shall be not less than the area of the larger draft hood outlet plus 50 percent of the area of the smaller draft hood outlet, nor greater than seven times the smallest draft hood outlet area.

4. Chimney venting systems using mechanical draft shall be sized in accordance with approved engineering methods.

5. Other approved engineering methods.

503.5.6 **Inspection of chimneys.** Before replacing an existing appliance or connecting a vent connector to a chimney, the chimney passageway shall be examined to ascertain that it is clear
and free of obstructions and it shall be cleaned if previously used for venting solid or liquid fuel-burning appliances or fireplaces.

503.5.6.1 Chimney lining. Chimneys shall be lined in accordance with NFPA 211.

Exception: Where an existing chimney complies with Sections 503.5.6 through 503.5.6.5 and its sizing is in accordance with Section 503.5.5, its continued use shall be allowed where the appliance vented by such chimney is replaced by an appliance of similar type, input rating and efficiency.

503.5.6.2 Cleanouts. Cleanouts shall be examined to determine if they will remain tightly closed when not in use.

503.5.6.3 Unsafe chimneys. Where inspection reveals that an existing chimney is not safe for the intended application, it shall be repaired, rebuilt, lined, relined or replaced with a vent or chimney to conform to NFPA 211 and it shall be suitable for the appliances to be vented.

503.5.6.4 Test run. All new chimneys shall be test run by the registered design professional responsible for the testing under operating conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The results of such test run shall be certified as correct by the registered design professional responsible for the test and shall be submitted in writing to the department.

503.5.6.5 Requirement of a smoke test. A smoke test shall be made as outlined below. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of the registered design professional or special inspector responsible for the test that shall be submitted in writing to the department.

503.5.6.5.1 Smoke test. To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.

2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirement of this chapter and the test shall be repeated until the results are satisfactory.

3. Method of test. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed and a pressure equivalent to ½ inch (12.7 mm) column of water measured at the base of the stack, shall be applied. The test shall be applied for a length of time sufficient to permit the inspection of the chimney.
503.5.7 Chimneys serving appliances burning other fuels. Chimneys serving appliances burning other fuels shall comply with Sections 503.5.7.1 through 503.5.7.4.

503.5.7.1 Solid fuel-burning appliances. An appliance shall not be connected to a chimney flue serving a separate appliance designed to burn solid fuel.

503.5.7.2 Liquid fuel-burning appliances. Where one chimney flue serves gas appliances and liquid fuel-burning appliances, the appliances shall be connected through separate openings or shall be connected through a single opening where joined by a suitable fitting located as close as practical to the chimney. Where two or more openings are provided into one chimney flue, they shall be at different levels. Where the appliances are automatically controlled, they shall be equipped with safety shutoff devices.

503.5.7.3 Combination [gas] gas- and solid fuel-burning appliances. A combination gas- and solid fuel-burning appliance shall be permitted to be connected to a single chimney flue where equipped with a manual reset device to shut off gas to the main burner in the event of sustained back draft or flue gas spillage. The chimney flue shall be sized to properly vent the appliance.

503.5.7.4 Combination gas- and oil fuel-burning appliances. A listed combination gas- and oil fuel-burning appliance shall be permitted to be connected to a single chimney flue. The chimney flue shall be sized to properly vent the appliance.

503.5.8 Support of chimneys. All portions of chimneys shall be supported for the design and weight of the materials employed. Factory-built chimneys shall be supported and spaced in accordance with their listings and the manufacturer’s instructions.

503.5.9 Cleanouts. Where a chimney that formerly carried flue products from liquid or solid fuel-burning appliances is used with an appliance using fuel gas, an accessible cleanout shall be provided. The cleanout shall have a tight-fitting cover and shall be installed at the base of all chimneys in accordance with the rules of the New York City Department of Environmental Protection. The cleanout shall be gas tight if the chimney is to be of positive pressure.

503.5.10 Space surrounding lining or vent. The remaining space surrounding a chimney liner, gas vent, special gas vent [1] or plastic piping installed within a masonry chimney flue shall not be used to vent another appliance. The insertion of another liner or vent within the chimney as provided in this code and the liner or vent manufacturer’s instructions shall not be prohibited.

The remaining space surrounding a chimney liner, gas vent, special gas vent [1] or plastic piping installed within a masonry, metal or factory-built chimney, shall not be used to supply combustion air. Such space shall not be prohibited from supplying combustion air to direct-vent appliances designed for installation in a solid fuel-burning fireplace and installed in accordance with the listing and the manufacturer’s instructions.

503.6 Gas vents. Gas vents shall comply with Sections 503.6.1 through 503.6.13 (see Section 202, Definitions).
503.6.1 Installation, general. Gas vents shall be installed in accordance with the terms of their listings and manufacturer’s instructions.

503.6.2 Type B-W vent capacity. A Type B-W gas vent shall have a listed capacity not less than that of the listed vented wall furnace to which it is connected.

503.6.3 Gas vents installed within masonry chimneys. Gas vents installed within masonry chimneys shall be installed in accordance with the terms of their listing and the manufacturer’s [installation] instructions. Gas vents installed within masonry chimneys shall be identified with a permanent label installed at the point where the vent enters the chimney. The label shall contain the following language: “This gas vent is for appliances that burn gas. Do not connect to solid or liquid fuel-burning appliances or incinerators.”

503.6.4 Gas vent terminations. A gas vent shall terminate in accordance with one of the following:

1. Gas vents that are 12 inches ([305] 304.8 mm) or less in size and located not less than 8 feet ([2438] 2438.4 mm) from a vertical wall or similar obstruction shall terminate above the roof in accordance with Figure [503.6.6] 503.6.4.

2. Gas vents that are over 12 inches ([305] 304.8 mm) in size or are located less than 8 feet ([2438] 2438.4 mm) from a vertical wall or similar obstruction shall terminate not less than 2 feet ([610] 609.6 mm) above the highest point where they pass through the roof and not less than 2 feet ([610] 609.6 mm) above any portion of a building within 10 feet (3048 mm) horizontally.

3. As provided for direct-vent systems in Section [503.2.2] 503.2.3.

4. As provided for appliances with integral vents in Section [503.2.3] 503.2.4.

5. As provided for mechanical draft systems in Section 503.3.3.

6. As provided for ventilating hoods and exhaust systems in Section 503.3.4.

However, such constructions do not include chimneys or other vents, or open structural framing. The vent shall be as high as such construction which is located beyond 10 feet (3048 mm) from the vent and up to and including the distance determined by the following formula:

\[ D = 2\sqrt{A} \]  

(Equation 5-2)

where:

- \( D \) = Distance, in feet, measured from the center of the vent outlet to the nearest edge of the construction.

- \( A \) = Free area, in square inches, of vent flue space.
TABLE 503.6.4.1
ROOF PITCH | H (min) ft
---|---
Flat to 6/12 | 1.0
Over 6/12 to 7/12 | 1.25
Over 7/12 to 8/12 | 1.5
Over 8/12 to 9/12 | 2.0
Over 9/12 to 10/12 | 2.5
Over 10/12 to 11/12 | 3.25
Over 11/12 to 12/12 | 4.0
Over 12/12 to 14/12 | 5.0
Over 14/12 to 16/12 | 6.0
Over 16/12 to 18/12 | 7.0
Over 18/12 to 20/12 | 7.5
Over 20/12 to 21/12 | 8.0

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

FIGURE 503.6.4
TERMINATION LOCATIONS FOR GAS VENTS WITH LISTED CAPS 12 INCHES OR LESS IN SIZE AT LEAST 8 FEET FROM A VERTICAL WALL

503.6.4.1 Decorative shrouds. Decorative shrouds shall not be installed at the termination of gas vents except where such shrouds are listed for use with the specific gas venting system and are installed in accordance with the manufacturer’s installation instructions.

All gas vents shall terminate in an approved vent or cowl, which shall prevent downdrafts and prevent rain and debris from entering the vent.

503.6.5 Minimum height. A Type B or L gas vent shall terminate at least not less than 5 feet (1524 mm) in vertical height above the highest connected appliance draft hood or flue collar. A Type B-W gas vent shall terminate at least not less than 12 feet (3658 mm) in vertical height above the bottom of the wall furnace.
503.6.6 **Roof terminations.** Gas vents shall extend through the roof flashing, roof jack or roof thimble and terminate with a listed cap or listed roof assembly.

503.6.7 **Forced air inlets.** Gas vents shall terminate not less than 3 feet (914.4 mm) above any forced air inlet located within 10 feet (3048 mm).

503.6.8 **Exterior wall penetrations.** A gas vent extending through an exterior wall shall not terminate adjacent to the wall or below eaves or parapets, except as provided in Sections 503.2.3, 503.2.4 and 503.3.3.

503.6.9 **Size of gas vents.** Venting systems shall be sized and constructed in accordance with Section 504 or other approved engineering methods acceptable to the commissioner. Gas vents shall also comply with the manufacturers’ instructions.

503.6.9.1 **Category I appliances.** The sizing of natural draft venting systems serving one or more listed appliances equipped with a draft hood or appliances listed for use with Type B gas vent, installed in a single story of a building, shall be in accordance with one of the following methods:

1. The provisions of Section 504.
2. For sizing an individual gas vent for a single, draft-hood-equipped appliance, the effective area of the vent connector and the gas vent shall be not less than the area of the appliance draft hood outlet, nor greater than seven times the draft hood outlet area.
3. For sizing a gas vent connected to two appliances with draft hoods, the effective area of the vent shall be not less than the area of the larger draft hood outlet plus 50 percent of the area of the smaller draft hood outlet, nor greater than seven times the smaller draft hood outlet area.
4. Engineering practices acceptable to the commissioner.

503.6.9.2 **Vent offsets.** Type B and L vents sized in accordance with Item 2 or 3 of Section 503.6.9.1 shall extend in a generally vertical direction with offsets not exceeding 45 degrees (0.79 rad), except that a vent system having not more than one 60-degree (1.04 rad) offset shall be permitted. Any angle greater than 45 degrees (0.79 rad) from the vertical is considered horizontal. The total horizontal distance of a vent plus the horizontal vent connector serving [draft-hood-equipped] draft-hood-equipped appliances shall be not greater than 75 percent of the vertical height of the vent.

503.6.9.3 **Category II, III, and IV appliances.** The sizing of gas vents or plastic pipe specified by the appliance manufacturer for Category II, III, and IV appliances shall be in accordance with the appliance manufacturer’s instructions.
503.6.9.4 Mechanical draft. Chimney venting systems using mechanical draft shall be designed and sized to develop a positive flow adequate to carry all products of combustion to the outside atmosphere.

503.6.10 Multistory prohibited. Common venting systems for appliances located on more than one floor level shall be prohibited.

503.6.11 Support of gas vents. Gas vents shall be supported and spaced in accordance with their listings and the manufacturer’s instructions.

503.6.12 Marking. Gas vents shall be permanently identified by a label attached to the wall or ceiling at a point where the vent connector enters the gas vent. The label shall read:

“This gas vent is for appliances that burn gas. Do not connect to solid or liquid fuel-burning appliances or incinerators.”

503.6.13 Fastener penetrations. Screws, rivets and other fasteners shall not penetrate the inner wall of double-wall gas vents, except at the transition from an appliance draft hood outlet, a flue collar or a single-wall metal connector to a double-wall vent.

503.7 Single-wall metal pipe. Single-wall metal pipe vents shall comply with Sections 503.7.1 through 503.7.13.

503.7.1 Construction. Single-wall metal pipe shall be constructed of galvanized sheet steel not less than 0.0304 inch ([0.7] 0.77 mm) thick, or other approved, noncombustible, corrosion-resistant material.

503.7.2 Climate protection. Uninsulated single-wall metal pipe shall not be used outdoors for venting appliances.

503.7.3 Termination. Single-wall metal pipe shall terminate at least 5 feet (1524 mm) in vertical height above the highest connected appliance draft hood outlet or flue collar. Single-wall metal pipe shall extend [at least] not less than 2 feet ([640] 609.6 mm) above the highest point where it passes through a roof of a building and [at least] not less than 2 feet ([640] 609.6 mm) higher than any portion of a building within a horizontal distance of 10 feet (3048 mm) (see Figure 503.5.4). An approved cap or roof assembly shall be attached to the terminus of a single-wall metal pipe (see also Section 503.7.9, Item 3). However, such constructions do not include chimneys or other vents, or open structural framing. The single-wall metal pipe shall be as high as such construction which is located beyond 10 feet (3048 mm) from the vent and up to and including the distance determined by Equation 5-2.

503.7.4 Limitations of use. Single-wall metal pipe shall be used only for runs directly from the space in which the appliance is located through the roof or exterior wall to the outdoor atmosphere.

503.7.5 Roof penetrations. A pipe passing through a roof shall extend without interruption through the roof flashing, roof jack, or roof thimble. Where a single-wall metal pipe passes through a roof constructed of combustible material, a noncombustible, non-ventilating thimble
shall be used at the point of passage. The thimble shall extend at least not less than 18 inches (\(457.2\) mm) above and 6 inches (\(152.4\) mm) below the roof with the annular space open at the bottom and closed only at the top. The thimble shall be sized in accordance with Section 503.7.7.

503.7.6 Installation. Single-wall metal pipe shall not originate in any unoccupied attic or concealed space and shall not pass through any attic, inside wall, concealed space, or floor. The installation of a single-wall metal pipe through an exterior combustible wall shall comply with Section 503.7.7. [Single-wall metal pipe used for venting an incinerator shall be exposed and readily examinable for its full length and shall have suitable clearances maintained.]

503.7.7 Single-wall penetrations of combustible walls. A single-wall metal pipe shall not pass through a combustible exterior wall unless guarded at the point of passage by a ventilated metal thimble not smaller than the following:

1. For listed appliances equipped with draft hoods and appliances listed for use with Type B gas vents, the thimble shall be not less than 4 inches (\(101.6\) mm) larger in diameter than the metal pipe. Where there is a run of not less than 6 feet (\(1828.8\) mm) of metal pipe in the open between the draft hood outlet and the thimble, the thimble shall be permitted to be not less than 2 inches (\(50.8\) mm) larger in diameter than the metal pipe.

2. For unlisted appliances having draft hoods, the thimble shall be not less than 6 inches (\(152.4\) mm) larger in diameter than the metal pipe.

3. For residential and low-heat appliances, the thimble shall be not less than 12 inches (\(304.8\) mm) larger in diameter than the metal pipe.

Exception: In lieu of thimble protection, all combustible material in the wall shall be removed a sufficient distance from the metal pipe to provide the specified clearance from such metal pipe to combustible material. Any material used to close up such opening shall be noncombustible.

503.7.8 Clearances. Minimum clearances from single-wall metal pipe to combustible material shall be in accordance with Table 503.10.5. The clearance from single-wall metal pipe to combustible material shall be permitted to be reduced where the combustible material is protected as specified for vent connectors in Table 308.2.

503.7.9 Size of single-wall metal pipe. A venting system constructed of single-wall metal pipe shall be sized in accordance with one of the following methods and the appliance manufacturer’s instructions:

1. For a draft-hood-equipped appliance, in accordance with Section 504.

2. For a venting system for a single appliance with a draft hood, the areas of the connector and the pipe each shall be not less than the area of the appliance flue collar or draft hood outlet, whichever is smaller. The vent area shall be not greater than seven times the draft hood outlet area.
3. Other approved engineering methods.

**503.7.10 Pipe geometry.** Any shaped single-wall metal pipe shall be permitted to be used, provided that its equivalent effective area is equal to the effective area of the round pipe for which it is substituted, and provided that the minimum internal dimension of the pipe is not less than 2 inches ([44] 50.8 mm).

**503.7.11 Termination capacity.** The vent cap or a roof assembly shall have a venting capacity of not less than that of the pipe to which it is attached.

**503.7.12 Support of single-wall metal pipe.** All portions of single-wall metal pipe shall be supported for the design and weight of the material employed.

**503.7.13 Marking.** Single-wall metal pipe shall comply with the marking provisions of Section 503.6.12.

**503.8 Venting system termination location.** The location of venting system terminations shall comply with the following:

1. Gas venting systems shall be extended at least 3 feet ([914] 914.4 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the vent outlet whether the construction is on the same building as the chimney or on another building. However, such constructions do not include chimneys or other vents, or open structural framing. The vent shall be as high as such construction which is located beyond 10 feet (3048 mm) from the vent and up to and including the distance determined by Equation 5-2.

   **Exception:** [Direct-vent] Horizontally terminated direct-vent appliances and integral vent appliances approved by the commissioner and installed in accordance with the manufacturer’s instructions and Section 503.8, Item 3.

2. Where permitted, through-the-wall vents for Category I, II, III and IV appliances and noncategorized condensing appliances shall not terminate over public walkways or over an area where condensate or vapor could create a nuisance or hazard or could be detrimental to the operation of regulators, relief valves or other equipment.

3. Horizontal terminations shall only be allowed if they are in a nonhazardous location and if the appliance has a sealed combustion chamber (direct vent) or integral vent in accordance with the appliance listing and manufacturer’s instructions. In addition, horizontal terminations shall comply with the following requirements:

   3.1. Where located adjacent to walkways, the termination shall be not less than 7 feet ([2134] 2133.6 mm) above the level of the walkway.
3.2. Vents shall terminate at least 3 feet (914.4 mm) above any forced air inlet, other than the forced air inlet for the subject direct vent or integral vent appliance, located within 10 feet (3048 mm).

3.3. The vent system shall terminate at least 4 feet (1219.2 mm) below, 4 feet (1219.2 mm) horizontally from or 1 foot (305.4 mm) above any door, window or gravity air inlet into the building.

3.4. The vent termination point shall not be located closer than 3 feet (914.4 mm) to an interior corner formed by two walls perpendicular to each other.

3.5. The vent termination shall not be mounted directly above or within 3 feet (914.4 mm) horizontally from any gas or electric metering, regulating, venting relief equipment or other building opening.

3.6. The bottom of the vent termination shall be located at least 24 inches (609.6 mm) above finished grade.

3.7. The maximum heat input of an appliance served by single horizontal vent termination shall be 350,000 Btu/h (102.6 kW), unless otherwise approved by the commissioner.

3.8. The maximum heat input of all appliances served by horizontal vent terminations located within a 10 feet (3048 mm) radius shall be 350,000 Btu/h (102.6 kW), unless otherwise approved by the commissioner.

3.9. The vent termination shall be located a minimum of 4 feet (1219.2 mm) from the lot line or from adjacent buildings. The termination shall be installed in accordance with the gas vent manufacturer’s listing and installation instructions.

503.9 Condensation drainage. Provisions shall be made to collect and dispose of condensate from venting systems serving Category II and IV appliances and noncategorized condensing appliances in accordance with Section 307.

503.10 Vent connectors for Category I appliances. Vent connectors for Category I appliances shall comply with Sections 503.10.1 through 503.10.14.

503.10.1 Where required. A vent connector shall be used to connect an appliance to a gas vent, chimney, or single-wall metal pipe, except where the gas vent, chimney, or single-wall metal pipe is directly connected to the appliance.

503.10.2 Materials. Vent connectors shall be constructed in accordance with Sections 503.10.2.1 through 503.10.2.5.

503.10.2.1 General. A vent connector shall be made of noncombustible corrosion-resistant material capable of withstanding the vent gas temperature produced by the appliance and of sufficient thickness to withstand physical damage.
503.10.2.2 Vent connectors located in unconditioned areas. Where the vent connector used for an appliance having a draft hood or a Category I appliance is located in or passes through attics, crawl spaces or other unconditioned spaces, that portion of the vent connector shall be listed Type B [or], Type L or listed vent material having equivalent insulation properties.

503.10.2.3 Residential-type appliance connectors. Where vent connectors for residential-type appliances are not installed in attics or other unconditioned spaces, connectors for listed appliances having draft hoods, appliances having draft hoods and equipped with listed conversion burners and Category I appliances shall be one of the following:

1. Type B or Type L vent material [i].
2. Galvanized sheet steel not less than 0.018 inch (0.46 mm) thick [i].
3. Aluminum (1100 or 3003 alloy or equivalent) sheet not less than 0.027 inch (0.69 mm) thick [i].
4. Stainless steel sheet not less than 0.012 inch (0.31 mm) thick [i].
5. Smooth interior wall metal pipe having resistance to heat and corrosion equal to or greater than that of Item 2, 3 or 4 [above; or].
6. A listed vent connector.

Vent connectors shall not be covered with insulation.

**Exception:** Listed insulated vent connectors shall be installed according to the terms of their listing [and], the manufacturer’s [installation] instructions and Section 803.10.4 of the New York City Mechanical Code.

503.10.2.4 Low-heat equipment. A vent connector for a nonresidential, low-heat [equipment] appliance shall be a factory-built chimney section or steel pipe having resistance to heat and corrosion equivalent to that for the appropriate galvanized pipe as specified in Table 503.10.2.4. Factory-built chimney sections shall be joined together in accordance with the chimney manufacturer’s instructions.

For SI: 1 inch = 25.4 mm.

**503.10.2.5 Medium-heat appliances.** Vent connectors for medium-heat appliances [and commercial and industrial incinerators] shall be constructed of factory-built medium-heat chimney sections or steel of a thickness not less than that specified in Table 503.10.2.5 and shall comply with the following:

1. A steel vent connector for an appliance with a vent gas temperature in excess of 1000°F ([538] 537.8°C) measured at the entrance to the connector shall be lined with medium-duty fire brick (ASTM C 64, Type F), or the equivalent.

2. The lining shall be [at least] not less than 2½ inches ([64] 63.5 mm) thick for a vent connector having a diameter or greatest cross-sectional dimension of 18 inches ([457] 457.2 mm) or less.

3. The lining shall be [at least] not less than 4½ inches ([114] 114.3 mm) thick laid on the 4½-inch ([114] 114.3 mm) bed for a vent connector having a diameter or greatest cross-sectional dimension greater than 18 inches ([457] 457.2 mm).

4. Factory-built chimney sections, if employed, shall be joined together in accordance with the chimney manufacturer’s instructions.

</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².

**503.10.3 Size of vent connector.** Vent connectors shall be sized in accordance with Sections 503.10.3.1 through 503.10.3.5.

**503.10.3.1 Single draft hood and fan-assisted.** A vent connector for an appliance with a single draft hood or for a Category I fan-assisted combustion system appliance shall be sized and installed in accordance with Section 504 or other approved engineering methods.
503.10.3.2 Multiple draft hoods. For a single appliance having more than one draft hood outlet or flue collar, the manifold shall be constructed according to the instructions of the appliance manufacturer. Where there are no instructions, the manifold shall be designed and constructed in accordance with approved engineering practices. As an alternate method, the effective area of the manifold shall equal the combined area of the flue collars or draft hood outlets and the vent connectors shall have a minimum 1-foot ([305] 304.8 mm) rise.

503.10.3.3 Multiple appliances. Where two or more appliances are connected to a common vent or chimney, each vent connector shall be sized in accordance with Section 504 or other approved engineering methods.

As an alternative method applicable only when all of the appliances are draft hood equipped, each vent connector shall have an effective area not less than the area of the draft hood outlet of the appliance to which it is connected.

503.10.3.4 Common connector/manifold. Where two or more appliances are vented through a common vent connector or vent manifold, the common vent connector or vent manifold shall be located at the highest level consistent with available headroom and the required clearance to combustible materials and shall be sized in accordance with Section 504 or other approved engineering methods.

As an alternate method applicable only where there are two draft hood-equipped appliances, the effective area of the common vent connector or vent manifold and all junction fittings shall be not less than the area of the larger vent connector plus 50 percent of the area of the smaller flue collar outlet.

503.10.3.5 Size increase. Where the size of a vent connector is increased to overcome installation limitations and obtain connector capacity equal to the appliance input, the size increase shall be made at the appliance draft hood outlet.

503.10.4 Two or more appliances connected to a single vent or chimney. Where two or more vent connectors enter a common gas vent, chimney flue or single-wall metal pipe, the smaller connector shall enter at the highest level consistent with the available headroom or clearance to combustible material. Vent connectors serving Category I appliances shall not be connected to any portion of a mechanical draft system operating under positive static pressure, such as those serving Category III or IV appliances.

503.10.4.1 Two or more openings. Where two or more openings are provided into one chimney flue or vent, the openings shall be at different levels, or the connectors shall be attached to the vertical portion of the chimney or vent at an angle of 45 degrees (0.79 rad) or less relative to the vertical in accordance with Figure 503.10.4.1.
503.10.5 Clearance. Minimum clearances from vent connectors to combustible material shall be in accordance with Table 503.10.5.

Exception: The clearance between a vent connector and combustible material shall be permitted to be reduced where the combustible material is protected as specified for vent connectors in Table 308.2.

For SI: 1 inch = 25.4 mm.

a. These clearances shall apply unless the manufacturer’s installation instructions for a listed appliance or connector specify different clearances, in which case the listed clearances shall apply.

503.10.6 [Flow resistance. A vent connector shall be installed so as to avoid turns or other construction features that create excessive resistance to flow of vent gases.]
[503.10.7] Joints. Joints between sections of connector [piping] and connections to flue collars and draft hood outlets shall be tight-fitting and fastened by one of the following methods:

1. **[Sheet metal screws.]** Galvanized steel – Overlapping joint with sheet metal screws or rivets at a minimum of 4 locations for diameters not greater than 12 inches (304.8 mm) and 8 locations for diameters greater than 12 inches (304.8 mm).

2. Carbon steel – Overlapping joint with ½ inch (12.7 mm) tack welds at a minimum of 4 locations for diameters up to 12 inches (304.8 mm) and 8 locations for diameters larger than 12 inches (304.8 mm).

2. Vent connectors of listed vent material assembled and connected to flue collars or draft hood outlets in accordance with the manufacturer’s instructions.

3. **Welding.**

[503.10.8] 503.10.7 Slope. A vent connector shall be installed without dips or sags and shall slope upward toward the vent or chimney at least not less than ¼ inch per foot (21 mm/m).

   **Exception:** Vent connectors attached to a mechanical draft system installed in accordance with the manufacturers’ instructions.

[503.10.9] 503.10.8 Length of vent connector. [A vent connector shall be as short as practical and the appliance located as close as practical to the chimney or vent.] The maximum horizontal length of a single-wall connector shall be 75 percent of the height of the chimney or vent except for engineered systems. The maximum horizontal length of a Type B double-wall connector shall be 100 percent of the height of the chimney or vent except for engineered systems.

[503.10.10] 503.10.9 Support. A vent connector shall be supported in accordance with the manufacturer’s recommendations for the design and weight of the material employed to maintain clearances and prevent physical damage and separation of joints.

[503.10.11] 503.10.10 Chimney connection. Where entering a flue in a masonry or metal chimney, the vent connector shall be installed above the extreme bottom to avoid stoppage. Where a thimble or slip joint is used to facilitate removal of the connector, the connector shall be firmly attached to or inserted into the thimble or slip joint to prevent the connector from falling out. Means shall be employed to prevent the connector from entering so far as to restrict the space between its end and the opposite wall of the chimney flue (see Section 501.9).

[503.10.12] 503.10.11 Inspection. The entire length of a vent connector shall be provided with ready access for inspection, cleaning [r] and replacement.

[503.10.13] 503.10.12 Fireplaces. A vent connector shall not be connected to a chimney flue serving a fireplace.
503.14 Passage through ceilings, floors or walls. Single-wall metal pipe connectors shall not pass through any wall, floor or fire-resistance-rated ceiling except as permitted by Section 503.7.4.

503.14 Medium-heat connectors. Vent connectors for medium-heat appliances shall not pass through walls or partitions constructed of combustible material.

503.11 Vent connectors for Category II, III, and IV appliances. Vent connectors for Category II, III, and IV appliances shall be as specified for the venting systems in accordance with Section 503.4.

503.12 Draft hoods and draft controls. The installation of draft hoods and draft controls shall comply with Sections 503.12.1 through 503.12.7.

503.12.1 Appliances requiring draft hoods. Vented appliances shall be installed with draft hoods.

Exception: [Incinerators, direct-vent] Direct-vent appliances, fan-assisted combustion system appliances, appliances requiring chimney draft for operation, appliances equipped with blast, power, or pressure burners that are not listed for use with draft hoods, and appliances designed for forced venting.

503.12.2 Installation. A draft hood supplied with or forming a part of a listed vented appliance shall be installed without alteration, exactly as furnished and specified by the appliance manufacturer. [Draft hoods shall be equipped with a thermal safety (spill) switch installed in accordance with its listing and the manufacturer’s instructions.]

503.12.2.1 Draft hood required. If a draft hood is not supplied by the appliance manufacturer where one is required, a draft hood shall be installed, shall be of a listed or approved type and, in the absence of other instructions, shall be of the same size as the appliance flue collar. Where a draft hood is required with a conversion burner, it shall be of a listed or approved type.

503.12.2.2 Special design draft hood. Where it is determined that a draft hood of special design is needed or preferable for a particular installation, the installation shall be in accordance with the recommendations of the appliance manufacturer and shall be approved by the department.

503.12.3 Draft control devices. Where a draft control device is part of the appliance or is supplied by the appliance manufacturer, it shall be installed in accordance with the manufacturer’s instructions. In the absence of manufacturer’s instructions, the device shall be attached to the flue collar of the appliance or as near to the appliance as practical.

503.12.4 Additional devices. Appliances requiring a controlled chimney draft shall be permitted to be equipped with a listed double-acting barometric-draft regulator installed and adjusted in accordance with the manufacturers’ instructions. [Barometric-draft regulators shall be equipped with a thermal safety (spill) switch installed in accordance with its listing and the manufacturer’s instructions.]
503.12.5 Location. Draft hoods and barometric draft regulators shall be installed in the same room or enclosure as the appliance in such a manner as to prevent any difference in pressure between the hood or regulator and the combustion air supply.

503.12.6 Positioning. Draft hoods and draft regulators shall be installed in the position for which they were designed with reference to the horizontal and vertical planes and shall be located so that the relief opening is not obstructed by any part of the appliance or adjacent construction. The appliance and its draft hood shall be located so that the relief opening is accessible for checking vent operation.

503.12.7 Clearance. A draft hood shall be located so its relief opening is not less than 6 inches (152.4 mm) from any surface except that of the appliance it serves and the venting system to which the draft hood is connected. Where a greater or lesser clearance is indicated on the appliance label, the clearance shall be not less than that specified on the label. Such clearances shall not be reduced.

503.12.8 Thermal safety (spill) switches. Thermal safety (spill) switches shall be installed on barometric-draft regulators and all other appurtenances that allow dilution air into chimneys or vents. Thermal safety (spill) switches shall be interlocked with all of the appliances connected to the same chimney or gas vent.

503.13 Manually operated dampers. A manually operated damper shall not be placed in the vent connector for any appliance. Fixed baffles shall not be classified as manually operated dampers.

503.14 Automatically operated vent dampers. An automatically operated vent damper shall be of a listed type complete with safety controls to prove open position of the damper [before equipment operation] and/or appropriate draft before appliance operation. The automatically operated dampers shall be installed in accordance with the manufacturer’s instructions. An automatic vent damper device shall not be installed on an existing appliance unless the appliance is listed and labeled and the device is installed in accordance with the terms of its listing. The name of the installer and date of installation shall be marked on a label affixed to the damper device.

503.15 Obstructions. Devices that retard the flow of vent gases shall not be installed in a vent connector, chimney [s] or vent. The following shall not be considered as obstructions:

1. Draft regulators and safety controls specifically listed for installation in venting systems and installed in accordance with the terms of their listing and manufacturer’s [installation] instructions.

2. Approved draft regulators and safety controls that are designed and installed in accordance with approved engineering methods.

3. Listed heat reclaimers and automatically operated vent dampers installed in accordance with the terms of their listing and manufacturer’s [installation] instructions.
4. Approved economizers, heat reclaimers [47] and recuperators installed in venting systems of appliances not required to be equipped with draft hoods, provided that the appliance manufacturer’s instructions cover the installation of such a device in the venting system and performance in accordance with Sections 503.3 and 503.3.1 is obtained.

5. Vent dampers serving listed appliances installed in accordance with Sections 504.2.1 and 504.3.1 or other approved engineering methods.

503.16 Outside wall penetrations. Where vents, including those for direct-vent appliances, penetrate outside walls of buildings, the annular spaces around such penetrations shall be permanently sealed using approved materials to prevent entry of combustion products into the building.

SECTION FGC 504
SIZING OF CATEGORY I
APPLIANCE VENTING SYSTEMS

504.1 Definitions. The following definitions apply to the tables in this section.

APPLIANCE CATEGORIZED VENT DIAMETER/AREA. The minimum vent area/diameter permissible for Category I appliances to maintain a non-positive vent static pressure when tested in accordance with nationally recognized standards.

FAN-ASSISTED COMBUSTION SYSTEM. An appliance equipped with an integral mechanical means to either draw or force products of combustion through the combustion chamber or heat exchanger.

FAN Min. The minimum input rating of a Category I fan-assisted appliance attached to a vent or connector.

FAN Max. The maximum input rating of a Category I fan-assisted appliance attached to a vent or connector.

NAT Max. The maximum input rating of a Category I draft-hood-equipped appliance attached to a vent or connector.

FAN + FAN. The maximum combined appliance input rating of two or more Category I fan-assisted appliances attached to the common vent.

FAN + NAT. The maximum combined appliance input rating of one or more Category I fan-assisted appliances and one or more Category I draft-hood-equipped appliances attached to the common vent.

NA. Vent configuration is not allowed due to potential for condensate formation or pressurization of the venting system, or not applicable due to physical or geometric restraints.

NAT + NAT. The maximum combined appliance input rating of two or more Category I draft-hood-equipped appliances attached to the common vent.
504.2 Application of single-appliance vent Tables 504.2(1) through 504.2(6). The application of Tables 504.2(1) through 504.2(6) shall be subject to the requirements of Sections 504.2.1 through 504.2.17.

For SI: °C = (°F – 32)/1.8, 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 British thermal unit per hour = 0.2931 W.

[Note: See Figure B-19 in Appendix B for a map showing local 99 percent winter design temperatures in the United States.]
504.2.1 Vent obstructions. These venting tables shall not be used where obstructions, as described in Section 503.15, are installed in the venting system. The installation of vents serving listed appliances with vent dampers shall be in accordance with the appliance manufacturer’s instructions or in accordance with the following:

1. The maximum capacity of the vent system shall be determined using the “NAT Max” column.

2. The minimum capacity shall be determined as if the appliance were a fan-assisted appliance, using the “FAN Min” column to determine the minimum capacity of the vent system. Where the corresponding “FAN Min” is “NA,” the vent configuration shall not be permitted and an alternative venting configuration shall be utilized.

504.2.2 Minimum size. Where the vent size determined from the tables is smaller than the appliance draft hood outlet or flue collar, the smaller size shall be permitted to be used provided that all of the following requirements are met:

1. The total vent height (H) is at least not less than 10 feet (3048 mm).

2. Vents for appliance draft hood outlets or flue collars 12 inches ([305] 304.8 mm) in diameter or smaller are not reduced more than one table size.

3. Vents for appliance draft hood outlets or flue collars larger than 12 inches ([305] 304.8 mm) in diameter are not reduced more than two table sizes.

4. The maximum capacity listed in the tables for a fan-assisted appliance is reduced by 10 percent (0.90 × maximum table capacity).

5. The draft hood outlet is greater than 4 inches ([102] 101.6 mm) in diameter. Do not connect a 3-inch-diameter ([76] 76.2 mm) vent to a 4-inch-diameter ([102] 101.6 mm) draft hood outlet. This provision shall not apply to fan-assisted appliances.

504.2.3 Vent offsets. Single-appliance venting configurations with zero (0) lateral lengths in Tables 504.2(1), 504.2(2) and 504.2(5) shall not have elbows in the venting system. Single-appliance venting configurations with lateral lengths include two 90-degree (1.57 rad) elbows. For each additional elbow up to and including 45 degrees (0.79 rad), the maximum capacity listed in the venting tables shall be reduced by 5 percent. For each additional elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum capacity listed in the venting tables shall be reduced by 10 percent. Where multiple offsets occur in a vent, the total lateral length of all offsets combined shall not exceed that specified in Tables 504.2(1) through 504.2(5).

504.2.4 Zero lateral. Zero (0) lateral (L) shall apply only to a straight vertical vent attached to a top outlet draft hood or flue collar.

504.2.5 Reserved.

504.2.6 Multiple input rate appliances. For appliances with more than one input rate, the minimum vent capacity (FAN Min) determined from the tables shall be less than the lowest appliance input rating, and the maximum vent capacity (FAN Max/NAT Max) determined from the tables shall be greater than the highest appliance rating input.
504.2.7 Liner system sizing and connections. Listed corrugated metallic chimney liner systems in masonry chimneys shall be sized by using Table 504.2(1) or 504.2(2) for Type B vents with the maximum capacity reduced by 20 percent (0.80 × maximum capacity) and the minimum capacity as shown in Table 504.2(1) or 504.2(2). Corrugated metallic liner systems installed with bends or offsets shall have their maximum capacity further reduced in accordance with Section 504.2.3. The 20-percent reduction for corrugated metallic chimney liner systems includes an allowance for one long-radius 90-degree ([1.57] $\pi$ rad) turn at the bottom of the liner.

Connections between chimney liners and listed double-wall connectors shall be made with listed adapters designed for such purpose.

504.2.8 Vent area and diameter. Where the vertical vent has a larger diameter than the vent connector, the vertical vent diameter shall be used to determine the minimum vent capacity, and the connector diameter shall be used to determine the maximum vent capacity. The flow area of the vertical vent shall not exceed seven times the flow area of the listed appliance categorized vent area, flue collar area [$\pi$] or draft hood outlet area unless designed in accordance with approved engineering methods.

504.2.9 Chimney and vent locations. Tables 504.2(1), 504.2(2), 504.2(3), 504.2(4) and 504.2(5) shall be used only for chimneys and vents not exposed to the outdoors below the roof line. A Type B vent or listed chimney lining system passing through an unused masonry chimney flue shall not be considered to be exposed to the outdoors. A Type B vent shall not be considered to be exposed to the outdoors where it passes through an unvented enclosure or chase insulated to a value of not less than R8. Table 504.2(3) in combination with Table 504.2(6) shall be used for clay-tile-lined exterior masonry chimneys, provided that all of the following are met:

1. Vent connector is a Type B double-wall.
2. Vent connector length is limited to 1½ feet for each inch (18 mm per mm) of vent connector diameter.
3. The appliance is draft hood equipped.
4. The input rating is less than the maximum capacity given by Table 504.2(3).
5. For a water heater, the outdoor design temperature is not less than 5°F (-15°C).
6. For a space-heating appliance, the input rating is greater than the minimum capacity given by Table 504.2(6).

Where these conditions cannot be met, an alternative venting design shall be used, such as a listed chimney lining system.

**Exception:** The installation of vents serving listed appliances shall be permitted to be in accordance with the appliance manufacturer’s instructions and the terms of the listing.

504.2.10 Corrugated vent connector size. Corrugated vent connectors shall be not smaller than the listed appliance categorized vent diameter, flue collar diameter [$\pi$] or draft hood outlet diameter.
504.2.11 **Vent connector size limitation.** Vent connectors shall not be increased in size more than two sizes greater than the listed appliance categorized vent diameter, flue collar diameter, or draft hood outlet diameter.

504.2.12 **Component commingling.** In a single run of vent or vent connector, different diameters and types of vent and connector components shall be permitted to be used, provided that all such sizes and types are permitted by the tables.

504.2.13 **Draft hood conversion accessories.** Draft hood conversion accessories for use with masonry chimneys venting listed Category I fan-assisted appliances shall be listed and installed in accordance with the manufacturer’s [installation] instructions for such listed accessories.

504.2.14 **Table interpolation.** Interpolation shall be permitted in calculating capacities for vent dimensions that fall between the table entries.

504.2.15 **Extrapolation prohibited.** Extrapolation beyond the table entries shall not be permitted.

504.2.16 **Engineering calculations.** For vent heights less than 6 feet ([1829] 1828.8 mm) and greater than shown in the tables, engineering methods shall be used to calculate vent capacities. Signed and sealed calculations shall be submitted with filing application.

504.2.17 **Height entries.** Where the actual height of a vent falls between entries in the height column of the applicable table in Tables 504.2(1) through 504.2(6), either interpolation shall be used or the lower appliance input rating shown in the table entries shall be used for FAN MAX and NAT MAX column values and the higher appliance input rating shall be used for the FAN MIN column values.

504.3 **Application of multiple appliance vent Tables 504.3(1) through 504.3(87)**. The application of Tables 504.3(1) through 504.3(7) shall be subject to the requirements of Sections 504.3.1 through [504.3.27] 504.3.28.

**VENT CONNECTOR CAPACITY**

- **Max** column represents the maximum number of appliances that can be connected through the vent connector capacity.
- **Max** is determined by the vent height and the connector rise, as indicated in the table.

Minimum Allowable Input Rating of Space-heating Appliance in Thousands of Btu per Hour
504.3.1 Vent obstructions. These venting tables shall not be used where obstructions, as described in Section 503.15, are installed in the venting system. The installation of vents serving listed appliances with vent dampers shall be in accordance with the appliance manufacturer’s instructions or in accordance with the following:

1. The maximum capacity of the vent connector shall be determined using the NAT Max column.

2. The maximum capacity of the vertical vent or chimney shall be determined using the FAN+NAT column when the second appliance is a fan-assisted appliance, or the NAT+NAT column when the second appliance is equipped with a draft hood.

3. The minimum capacity shall be determined as if the appliance were a fan-assisted appliance.

3.1. The minimum capacity of the vent connector shall be determined using the FAN Min column.

3.2. The FAN+FAN column shall be used where the second appliance is a fan-assisted appliance, and the FAN+NAT column shall be used where the second appliance is equipped with a draft hood, to determine whether the vertical vent or chimney configuration is not permitted (NA). Where the vent configuration is NA, the vent configuration shall not be permitted and an alternative venting configuration shall be utilized.

504.3.2 Connector length limit. The vent connector shall be routed to the vent utilizing the shortest possible route. Except as provided in Section 504.3.3, the maximum vent connector horizontal length shall be 1½ feet for each inch ([18 mm per mm] 18 mm for each mm) of connector diameter as shown in Table 504.3.2.
### TABLE 504.3.2

<td>20</td>
<td>30</td>
</tr>
<tr>
<td>22</td>
<td>33</td>
</tr>
<tr>
<td>24</td>
<td>36</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

504.3.3 Connectors with longer lengths. Connectors with longer horizontal lengths than those listed in Section 504.3.2 are permitted under the following conditions:

1. The maximum capacity (FAN Max or NAT Max) of the vent connector shall be reduced 10 percent for each additional multiple of the length allowed by Section 504.3.2. For example, the maximum length listed in Table 504.3.2 for a 4-inch ([402] 101.6 mm) connector is 6 feet (1829 mm). With a connector length greater than 6 feet ([1829] 1828.8 mm) but not exceeding 12 feet ([3658] 3657.6 mm), the maximum capacity must be reduced by 10 percent (0.90 × maximum vent connector capacity). With a connector length greater than 12 feet ([3658] 3657.6 mm) but not exceeding 18 feet (5486 mm), the maximum capacity must be reduced by 20 percent (0.80 × maximum vent capacity).

2. For a connector serving a fan-assisted appliance, the minimum capacity (FAN Min) of the connector shall be determined by referring to the corresponding single appliance table. For Type B double-wall connectors, Table 504.2(1) shall be used. For single-wall connectors, Table 504.2(2) shall be used. The height (H) and lateral (L) shall be measured according to the procedures for a single-appliance vent, as if the other appliances were not present.

504.3.4 Vent connector manifold. Where the vent connectors are combined prior to entering the vertical portion of the common vent to form a common vent manifold, the size of the common vent manifold and the common vent shall be determined by applying a 10[-]percent
reduction \((0.90 \times \text{maximum common vent capacity})\) to the common vent capacity part of the common vent tables. The length of the common vent connector manifold \((L_m)\) shall not exceed 1½ feet for each inch \((457 \text{ mm for each 25.4 mm})\) \(18 \text{ mm for each mm}\) of common vent connector manifold diameter \((D)\) (see Figure 504.3.4).

Example: Manifolded Common Vent Connector \(L_m\) shall be no greater than 18 times the common vent connector manifold inside diameter, i.e., a 4-inch (102 mm) inside diameter common vent connector manifold shall not exceed 72 inches (1829 mm) in length (see Section 504.3.4).

**Note:** This is an illustration of a typical manifolded vent connector. Different appliance, vent connector, or common vent types are possible. Consult Section 502.3.

**FIGURE 504.3.4**  
USE OF A MANIFOLD COMMON VENT CONNECTOR

504.3.5 **Common vertical vent offset.** Where the common vertical vent is offset, the maximum capacity of the common vent shall be reduced in accordance with Section 504.3.6. The horizontal length of the common vent offset \((L_o)\) shall not exceed 1½ feet for each inch \((18 \text{ mm per mm})\) \(18 \text{ mm for each mm}\) of common vent diameter \((D)\). Where multiple offsets
occur in a common vent, the total horizontal length of all offsets combined shall not exceed 1½ feet for each inch ([18 mm per mm] 18 mm for each mm) of common vent diameter (D).

504.3.6 Elbows in vents. For each elbow up to and including 45 degrees (0.79 rad) in the common vent, the maximum common vent capacity listed in the venting tables shall be reduced by 5 percent. For each elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum common vent capacity listed in the venting tables shall be reduced by 10 percent.

504.3.7 Elbows in connectors. The vent connector capacities listed in the common vent sizing tables include allowance for two 90-degree (1.57 rad) elbows. For each additional elbow up to and including 45 degrees (0.79 rad), the maximum vent connector capacity listed in the venting tables shall be reduced by 5 percent. For each elbow greater than 45 degrees (0.79 rad) up to and including 90 degrees (1.57 rad), the maximum vent connector capacity listed in the venting tables shall be reduced by 10 percent.

504.3.8 Common vent minimum size. The cross-sectional area of the common vent shall be equal to or greater than the cross-sectional area of the largest connector.

504.3.9 Common vent fittings. At the point where tee or wye fittings connect to a common vent, the opening size of the fitting shall be equal to the size of the common vent. Such fittings shall not be prohibited from having reduced size openings at the point of connection of appliance vent connectors.

504.3.9.1 Tee and wye fittings. Tee and wye fittings connected to a common gas vent shall be considered as part of the common gas vent and shall be constructed of materials consistent with that of the common gas vent.

504.3.10 Reserved.

504.3.11 Connector rise measurement. Connector rise (R) for each appliance connector shall be measured from the draft hood outlet or flue collar to the centerline where the vent gas streams come together.

504.3.12 Vent height measurement. For multiple units of appliances all located on one floor, available total height (H) shall be measured from the highest draft hood outlet or flue collar up to the level of the outlet of the common vent.

504.3.13 [Multistory height measurement. For multistory installations, available total height (H) for each segment of the system shall be the vertical distance between the highest draft hood outlet or flue collar entering that segment and the centerline of the next higher interconnection tee.] Reserved.

504.3.14 [Multistory lowest portion sizing. The size of the lowest connector and of the vertical vent leading to the lowest interconnection of a multistory system shall be in accordance with Table 504.2(1) or 504.2(2) for available total height (H) up to the lowest interconnection.] Reserved.
504.3.15 **Multistory common vents.** Where used in multistory systems, vertical common vents shall be Type B double wall and shall be installed with a listed vent cap. [Reserved.]

504.3.16 **Multistory common vents offsets.** Offsets in multistory common vent systems shall be limited to a single offset in each system, and systems with an offset shall comply with all of the following:

1. The offset angle shall not exceed 45 degrees (0.79 rad) from vertical.
2. The horizontal length of the offset shall not exceed 1½ feet for each inch (18 mm for each 25.4 mm) of common vent diameter of the segment in which the offset is located.
3. For the segment of the common vertical vent containing the offset, the common vent capacity listed in the common venting tables shall be reduced by 20 percent (0.80 × maximum common vent capacity).
4. A multistory common vent shall not be reduced in size above the offset. [Reserved.]

504.3.17 **Vertical vent maximum size.** Where two or more appliances are connected to a vertical vent or chimney, the flow area of the largest section of vertical vent or chimney shall not exceed seven times the smallest listed appliance categorized vent areas, flue collar area, or draft hood outlet area unless designed in accordance with approved engineering methods.

504.3.18 **Multiple input rate appliances.** For appliances with more than one input rate, the minimum vent connector capacity (FAN Min) determined from the tables shall be less than the lowest appliance input rating, and the maximum vent connector capacity (FAN Max or NAT Max) determined from the tables shall be greater than the highest appliance input rating.

504.3.19 **Liner system sizing and connections.** Listed, corrugated metallic chimney liner systems in masonry chimneys shall be sized by using Table 504.3(1) or 504.3(2) for Type B vents, with the maximum capacity reduced by 20 percent (0.80 × maximum capacity) and the minimum capacity as shown in Table 504.3(1) or 504.3(2). Corrugated metallic liner systems installed with bends or offsets shall have their maximum capacity further reduced in accordance with Sections 504.3.5 and 504.3.6. The 20-percent reduction for corrugated metallic chimney liner systems includes an allowance for one long-radius 90-degree (1.57 rad) turn at the bottom of the liner. Where double-wall connectors are required, tee and wye fittings used to connect to the common vent chimney liner shall be listed double-wall fittings. Connections between chimney liners and listed double-wall fittings shall be made with listed adapter fittings designed for such purpose.

504.3.20 **Chimney and vent location.** Tables 504.3(1), 504.3(2), 504.3(3), 504.3(4), and 504.3(5) shall be used only for chimneys and vents not exposed to the outdoors below the roof line. [A Type B vent or listed chimney lining system passing through an unused masonry chimney flue shall not be considered to be exposed to the outdoors. A Type B vent shall not be considered to be exposed to the outdoors where it passes through an unventilated enclosure or chase insulated to a value of not less than R8. Tables 504.3(6) and 504.3(7) shall be used]
for clay-tile-lined exterior masonry chimneys, provided that all of the following conditions are met:

Tables 504.3(6a), 504.3(6b), 504.3(7a) and 504.3(7b) shall be used for clay-tile-lined exterior masonry chimneys, provided that all of the following conditions are met:

1. Vent [connector is] connectors are Type B [double-wall] double wall.

2. [At least] Not less than one appliance is draft hood equipped.

3. The combined appliance input rating is less than the maximum capacity given by Table 504.3(6a) for NAT+NAT or Table 504.3(7a) for FAN+NAT.

4. The input rating of each space-heating appliance is greater than the minimum input rating given by Table 504.3(6b) for NAT+NAT or Table 504.3(7b) for FAN+NAT.

5. The vent connector sizing is in accordance with Table 504.3(3).

504.3.21 Connector maximum and minimum size. Vent connectors shall not be increased in size more than two sizes greater than the listed appliance categorized vent diameter, flue collar diameter [\(r\)] or draft hood outlet diameter. Vent connectors for draft hood-equipped appliances shall not be smaller than the draft hood outlet diameter. Where a vent connector size(s) determined from the tables for a fan-assisted appliance(s) is smaller than the flue collar diameter, the use of the smaller size(s) shall be permitted provided that the installation complies with all of the following conditions:

1. Vent connectors for fan-assisted appliance flue collars 12 inches ([305] 304.8 mm) in diameter or smaller are not reduced by more than one table size (e.g., 12 inches to 10 inches ([305] 304.8 mm to 254 mm) is a one-size reduction) and those larger than 12 inches ([305] 304.8 mm) in diameter are not reduced more than two table sizes (e.g., 24 inches to 20 inches ([640] 609.6 mm to 508 mm) is a two-size reduction).

2. The fan-assisted appliance(s) is common vented with a draft-hood-equipped appliance(s).

3. The vent connector has a smooth interior wall.

504.3.22 Component commingling. All combinations of pipe sizes, single-wall [\(r\)] and double-wall metal pipe shall be allowed within any connector run(s) or within the common vent, provided that all of the appropriate tables permit all of the desired sizes and types of pipe, as if they were used for the entire length of the subject connector or vent. Where single-wall and Type B double-wall metal pipes are used for vent connectors within the same venting system, the common vent must be sized using Table 504.3(2) or 504.3(4), as appropriate.

504.3.23 Draft hood conversion accessories. Draft hood conversion accessories for use with masonry chimneys venting listed Category I fan-assisted appliances shall be listed and installed in accordance with the manufacturer’s [installation] instructions for such listed accessories.
504.3.24 **Multiple sizes permitted.** Where a table permits more than one diameter of pipe to be used for a connector or vent, all the permitted sizes shall be permitted to be used.

504.3.25 **Table interpolation.** Interpolation shall be permitted in calculating capacities for vent dimensions that fall between table entries.

504.3.26 **Extrapolation prohibited.** Extrapolation beyond the table entries shall not be permitted.

504.3.27 **Engineering calculations.** For vent heights less than 6 feet ([18.29] 1828.8 mm) and greater than shown in the tables, engineering methods shall be used to calculate vent capacities.

504.3.28 **Height entries.** Where the actual height of a vent falls between entries in the height column of the applicable table in Tables 504.3(1) through 504.3(7b), either interpolation shall be used or the lower appliance input rating shown in the table shall be used for FAN MAX and NAT MAX column values and the higher appliance input rating shall be used for the FAN MIN column values.

**SECTION FGC 505**

**DIRECT-VENT, INTEGRAL VENT, MECHANICAL VENT AND VENTILATION/EXHAUST HOOD VENTING**

505.1 **General.** The installation of direct-vent and integral vent appliances shall be in accordance with Section 503. Mechanical venting systems and exhaust hood venting systems shall be designed and installed in accordance with Section 503.

505.1.1 **Commercial cooking appliances vented by exhaust hoods.** Refer to Chapter 5 of the *New York City Mechanical Code*.

505.1.2 **Interlock requirements.** Where commercial cooking appliances are vented by means of the Type I or Type II kitchen exhaust hood system that serves such appliances, the exhaust system shall be fan powered and the appliances shall be interlocked with the exhaust hood system to prevent appliance operation when the exhaust hood system is not operating. The method of interlock between the exhaust hood system and the appliances equipped with standing pilot burner ignition systems shall not cause such pilots to be extinguished. Where a solenoid valve is installed in the gas piping as part of an interlock system, gas piping shall not be installed to bypass such valve. Dampers shall not be installed in the exhaust system.

**Exception:** An interlock between the cooking appliance(s) and the exhaust hood system shall not be required where heat sensors or other approved methods automatically activate the exhaust hood system when cooking operations occur.
SECTION FGC 506
FACTORY-BUILT CHIMNEYS

506.1 Building heating appliances. Factory-built chimneys for building heating appliances producing flue gases having a temperature not greater than 1,000°F (538°C), measured at the entrance to the chimney, shall be listed and labeled in accordance with UL 103 and shall be installed and terminated in accordance with the manufacturer’s installation instructions and this code.

506.2 Support. Where factory-built chimneys are supported by structural members, such as joists and rafters, such members shall be designed to support the additional load.

506.3 Medium-heat appliances. Factory-built chimneys for medium-heat appliances producing flue gases having a temperature above 1,000°F (538°C), measured at the entrance to the chimney, shall be listed and labeled in accordance with UL 959 and shall be installed and terminated in accordance with the manufacturer’s installation instructions and this code.

SECTION FGC 507
CHANGES IN APPLIANCE FUELS

507.1 Changes in appliance fuels. Conversion of appliances from solid or liquid fuel to natural gas or the addition of natural gas, shall be made in accordance with this code. Conversion from natural gas to, or the addition of, #2 fuel oil for a heating appliance shall be made only if:

1. The chimney design meets the requirements of this chapter for the conversion fuel and the chimney is test run and smoke tested in accordance with Sections 503.5.6.4 and 503.5.6.5.

2. The chimney is sized to provide adequate draft and to vent the combustion products for the new fuel.

3. The chimney is thoroughly cleaned prior to the conversion to remove collected flue deposits.

SECTION FGC 508
EXHAUST GASES FROM INTERNAL COMBUSTION ENGINES AND TURBINES

508.1 Exhaust [pipe] system construction. The exhaust [pipe] system from internal combustion engines and turbines shall be constructed in accordance with [NFPA 211, NFPA 37, and based on the temperature of the gases entering the exhaust pipe, and in accordance with the following:]

[1. The exhaust pipe, if factory fabricated, shall be installed in accordance with its listing and the manufacturer’s instructions.]

[2. The exhaust pipe, if field fabricated, shall be constructed of at least 3/16-inch (5 mm) steel, or of other equivalent metal of similar strength and resistance to the temperature and corrosive action of the exhaust gases. No lining shall be required.]
[3. Where the exhaust pipe runs inside a building, it shall be insulated with insulation adequate for the temperature of the pipe, so that the surface temperature shall be not more than 200°F (93°C).]

[4. Where the exhaust pipe runs inside a building outside of the generator room, it shall be enclosed in a fire rated construction equal to the construction of the generator room.]

[5. All joints shall be constructed so as to be gas tight under all operating conditions and tested in accordance with Sections 503.5.6.4 and 503.5.6.5.] Section 811 of the New York City Mechanical Code.

§ 7. Chapter 6 of the New York city fuel gas code, as added by local law number 33 for the year 2007, section 605.3 as amended by local law number 85 for the year 2009, sections FGC 607, FGC 608, FGC 609, FGC 610, FGC 614, FGC 615, FGC 618, FGC 620, FGC 622, FGC 623, FGC 624, FGC 627, FGC 630, FGC 631 and FGC 633 as amended by and section FGC 635 as added by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 6
SPECIFIC APPLIANCES

SECTION FGC 601
GENERAL

601.1 Scope. This chapter shall govern the approval, design, installation, construction, maintenance, alteration and repair of the appliances and equipment specifically identified herein. The approval, design, installation, construction, maintenance, alteration and repair of nongas-fired appliances shall be regulated by the New York City Mechanical Code.

601.2 Fireplaces. Fireplaces (solid fuel type or ANSI Z21.50/CSA 2.22) shall be installed with tight-fitting noncombustible fireplace doors to control infiltration losses in construction type listed here:

1. Masonry or factory-built fireplaces designed to allow an open burn.

2. Whenever a decorative appliance (ANSI Standard Z21.60/CSA 2.26 gas-log style unit) is installed in a vented solid fuel fireplace.

Fireplaces shall be provided with a source of combustion air as required by the fireplace construction provisions of the New York City Building Code.

601.3 Flame safeguard device. All fuel gas space-heating appliances installed or used in a building occupied as a residence shall be equipped with an automatic flame safeguard device that
shall shut off the fuel supply to the main burner or group of burners when the flame or pilot light thereof is extinguished.

SECTION FGC 602
DECORATIVE GAS-FIRED APPLIANCES FOR INSTALLATION IN FIREPLACES

602.1 General. Decorative appliances for installation in approved solid fuel-burning fireplaces shall be tested in accordance with ANSI Z21.60/CISA 2.26 and shall be installed in accordance with the manufacturer’s [installation] instructions. Manually lighted natural gas decorative appliances shall be tested in accordance with ANSI Z21.84.

602.2 Flame safeguard device. Decorative appliances for installation in approved solid fuel-burning fireplaces, with the exception of those tested in accordance with ANSI Z21.84, shall utilize a direct ignition device, an ignitor or a pilot flame to ignite the fuel at the main burner, and shall be equipped with a flame safeguard device. The flame safeguard device shall automatically shut off the fuel supply to a main burner or group of burners when the means of ignition of such burners becomes inoperative.

602.3 Prohibited installations. Decorative appliances for installation in fireplaces shall not be installed where prohibited by Section 303.3.

SECTION FGC 603
LOG LIGHTERS

603.1 General. Log lighters shall be [tested in accordance with CSA 8 and] installed in accordance with the manufacturer’s [installation] instructions.

603.2 Automatic valves. Automatic valves or semiautomatic valves shall be provided and shall comply with the applicable provisions of ANSI Z21.21/CASA 6.5.

SECTION FGC 604
VENTED GAS FIREPLACES (DECORATIVE APPLIANCES)

604.1 General. Vented gas fireplaces shall be tested in accordance with ANSI Z21.50/CISA 2.22, shall be installed in accordance with the manufacturer’s [installation] instructions and shall be designed and equipped as specified in Section 602.2.

604.2 Access. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building.

SECTION FGC 605
VENTED GAS FIREPLACE HEATERS

605.1 General. Vented gas fireplace heaters shall be installed in accordance with the manufacturer’s [installation] instructions, shall be tested in accordance with ANSI Z21.88/CASA
2.33 and shall be designed and equipped as specified in Section 602.2. The installation of unvented gas fired space heaters, gas stoves, gas logs, gas fireplaces and gas fireplace inserts is prohibited.

605.2 Separate flues. Separate flues shall be provided for every fireplace and fireplace stove.

605.3 Combustion air supply. The requirements of the New York City Energy Conservation Code concerning combustion air supply shall be followed.

SECTION FGC 606
RESERVED

SECTION FGC 607
COMMERCIAL-INDUSTRIAL INCINERATORS AND CREMATORIES

607.1 Incinerators and crematories, commercial-industrial. Commercial-industrial-type incinerators and crematories shall be constructed and installed in accordance with NFPA 82.

607.2 Compliance. All new and existing refuse disposal systems shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the Administrative Code and the New York City Air Pollution Control Code.

SECTION FGC 608
VENTED WALL FURNACES

608.1 General. Vented wall furnaces shall be tested in accordance with ANSI Z21.86/CSA 2.32 and shall be installed in accordance with the manufacturer’s installation instructions.

608.2 Venting. Vented wall furnaces shall be vented in accordance with Section 503.

608.3 Location. Vented wall furnaces shall be located so as not to cause a fire hazard to walls, floors, combustible furnishings or doors. Vented wall furnaces installed between bathrooms and adjoining rooms shall not circulate air from bathrooms to other parts of the building.

608.4 Door swing. Vented wall furnaces shall be located so that a door cannot swing within 12 inches ([304.8 mm] of an air inlet or air outlet of such furnace measured at right angles to the opening. Doorstops or door closers shall not be installed to obtain this clearance.

608.5 Ducts prohibited. Ducts shall not be attached to wall furnaces. Casing extension boots shall not be installed unless listed as part of the appliance.

608.6 Access. Vented wall furnaces shall be provided with access for cleaning of heating surfaces, removal of burners, replacement of sections, motors, controls, filters and other working parts, and for adjustments and lubrication of parts requiring such attention. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building construction.
SECTION FGC 609
FLOOR FURNACES

609.1 General. Floor furnaces shall be tested in accordance with ANSI Z21.86/CSA 2.32 and shall be installed in accordance with the manufacturer’s installation instructions.

609.2 Placement. The following provisions apply to floor furnaces:

1. **Floors.** Floor furnaces shall not be installed in the floor of any doorway, stairway landing, aisle or passageway of any enclosure, public or private, or in an exit way a means of egress from any such room or space.

2. **Walls and corners.** The register of a floor furnace with a horizontal warm-air outlet shall not be placed closer than 6 inches (152.4 mm) to the nearest wall. A distance of at least not less than 18 inches (457.2 mm) from two adjoining sides of the floor furnace register to walls shall be provided to eliminate the necessity of occupants walking over the warm-air discharge. The remaining sides shall be permitted to be placed not closer than 6 inches (152.4 mm) to a wall. Wall-register models shall not be placed closer than 6 inches (152.4 mm) to a corner.

3. **Draperies.** The furnace shall be placed so that a door, drapery or similar object cannot be nearer than 12 inches (304.8 mm) to any portion of the register of the furnace.

4. **Floor construction.** Floor furnaces shall be located so as to be readily accessible. Means shall be provided for supporting the furnace when the grille is removed. Floor furnaces shall be installed only on floors of noncombustible construction having at least a 2-hour fire rating, except that floor furnace enclosures in one- and two-family dwellings shall be constructed of noncombustible materials with a fire-resistance rating of at least not less than 1 hour.

5. **Thermostat.** The controlling thermostat for a floor furnace shall be located within the same room or space as the floor furnace or shall be located in an adjacent room or space that is permanently open to the room or space containing the floor furnace.

609.3 Bracing. The floor around the furnace shall be braced and headed with a support framework designed in accordance with the New York City Building Code.

609.4 Clearance. The lowest portion of the floor furnace shall have not less than a 6-inch (152.4 mm) clearance from the grade level; except where the lower 6 inches (152.4 mm) portion of the floor furnace is sealed by the manufacturer to prevent entrance of water, the minimum clearance shall be not less than 2 inches (50.8 mm). Where such clearances cannot be provided, the ground below and to the sides shall be excavated to form a pit under the furnace so that the required clearance is provided beneath the lowest portion of the furnace. A 12-inch (305 mm) minimum clearance shall be provided on all sides except the control side, which shall have an 18-inch (457 mm) minimum clearance.
609.5 Reserved.

609.6 Reserved.

609.7 Enclosures. Enclosures of floor furnaces shall be constructed entirely of noncombustible materials with a fire-resistance rating of at least 1-hour and the enclosure shall be provided with adequate outdoor air to ensure proper combustion. The enclosure shall be provided with adequate means of access for servicing the furnace.

609.8 Duct temperature. The outlet duct temperature of warm-air heating furnaces shall not be greater than 250°F ([424]121.1°C).

609.9 One- and two-family dwellings. Floor furnace enclosures shall be constructed of noncombustible materials with a fire-resistance rating of at least 1-hour. Means shall be provided for supporting the furnace when the grille is removed. Clearances shall be provided as per NFPA 54.

SECTION FGC 610
DUCT FURNACES

610.1 General. Duct furnaces shall be tested in accordance with ANSI Z83.8/CSA 2.6 or UL 795 and shall be installed in accordance with the manufacturer’s installation instructions.

610.2 Access panels. Ducts connected to duct furnaces shall have removable access panels on both the upstream and downstream sides of the furnace.

610.3 Location of draft hood and controls. The controls, combustion air inlets and draft hoods for duct furnaces shall be located outside of the ducts. The draft hood shall be located in the same enclosure from which combustion air is taken.

610.4 Circulating air. Where a duct furnace is installed so that supply ducts convey air to areas outside the space containing the furnace, the return air shall [also] be conveyed by a duct(s) sealed to the furnace casing and terminating outside the space containing the furnace. The duct furnace shall be installed on the positive pressure side of the circulating air blower.

610.5 Unvented duct furnaces. Unvented duct furnaces are prohibited.

SECTION FGC 611
NONRECIRCULATING DIRECT-FIRED INDUSTRIAL AIR HEATERS

611.1 General. Nonrecirculating direct-fired industrial air heaters shall be listed to ANSI Z83.4/CSA 3.7 and shall be installed in accordance with the manufacturer’s instructions.

611.2 Installation. Nonrecirculating direct-fired industrial air heaters shall not be used to supply any area containing sleeping quarters. Nonrecirculating direct-fired industrial air heaters shall be installed only in industrial or commercial occupancies. Nonrecirculating direct-fired industrial air heaters shall be permitted to provide ventilation air.
611.3 Clearance from combustible materials. Nonrecirculating direct-fired industrial air heaters shall be installed with a clearance from combustible materials of not less than that shown on the rating plate and in the manufacturer’s instructions.

611.4 Supply air. All air handled by a nonrecirculating direct-fired industrial air heater, including combustion air, shall be ducted directly from the outdoors.

611.5 Outdoor air louvers. If outdoor air louvers of either the manual or automatic type are used, such devices shall be proven to be in the open position prior to allowing the main burners to operate.

611.6 Atmospheric vents and gas reliefs or bleeds. Nonrecirculating direct-fired industrial air heaters with valve train components equipped with atmospheric vents or gas reliefs or bleeds shall have their atmospheric vent lines or gas reliefs or bleeds lead to the outdoors. Means shall be employed on these lines to prevent water from entering and to prevent blockage by insects and foreign matter. An atmospheric vent line shall not be required to be provided on a valve train component equipped with a listed vent limiter.

611.7 Relief opening. The design of the installation shall include provisions to permit nonrecirculating direct-fired industrial air heaters to operate at rated capacity without overpressurizing the space served by the heaters by taking into account the structure’s designed infiltration rate, providing properly designed relief openings or an interlocked power exhaust system, or a combination of these methods. The structure’s designed infiltration rate and the size of relief openings shall be determined by approved engineering methods. Relief openings shall be permitted to be louvers or counterbalanced gravity dampers. Motorized dampers or closable louvers shall be permitted to be used, provided they are verified to be in their full open position prior to main burner operation.

611.8 Access. Nonrecirculating direct-fired industrial air heaters shall be provided with access for removal of burners; replacement of motors, controls, filters and other working parts; and for adjustment and lubrication of parts requiring maintenance.

611.9 Purging. Inlet ducting, where used, shall be purged by not less than four air changes prior to an ignition attempt.

611.10 Controls. Direct-fired make-up air heaters shall be equipped with airflow-sensing devices, safety shutoff devices, operating temperature controls and thermally actuated temperature limit controls in accordance with the terms of their listing.

SECTION FGC 612
RECIRCULATING DIRECT-FIRED INDUSTRIAL AIR HEATERS

612.1 General. Recirculating direct-fired industrial air heaters shall be listed to ANSI Z83.18 and shall be installed in accordance with the manufacturer’s [installation] instructions.

612.2 Location. Recirculating direct-fired industrial air heaters shall be installed only in industrial and commercial occupancies. Recirculating direct-fired air heaters shall not serve any area
containing sleeping quarters. Recirculating direct-fired industrial air heaters shall not be installed in hazardous locations or in buildings that contain flammable solids, liquids or gases, explosive materials or substances that can become toxic when exposed to flame or heat.

612.3 Installation. Direct-fired industrial air heaters shall be permitted to be installed in accordance with their listing and the manufacturer’s instructions. Direct-fired industrial air heaters shall be installed only in industrial or commercial occupancies. Direct-fired industrial air heaters shall be permitted to provide fresh air ventilation.

612.4 Clearance from combustible materials. Direct-fired industrial air heaters shall be installed with a clearance from combustible material of not less than that shown on the label and in the manufacturer’s instructions.

612.5 Air supply. Air to direct-fired industrial air heaters shall be taken from the building, ducted directly from outdoors, or a combination of both. Direct-fired industrial air heaters shall incorporate a means to supply outside ventilation air to the space at a rate of not less than 4 cubic feet per minute per 1,000 Btu per hour (0.38 m$^3$ per min per kW) of rated input of the heater. If a separate means is used to supply ventilation air, an interlock shall be provided so as to lock out the main burner operation until the mechanical means is verified. Where outside air dampers or closing louvers are used, they shall be verified to be in the open position prior to main burner operation.

612.6 Atmospheric vents, gas reliefs or bleeds. Direct-fired industrial air heaters with valve train components equipped with atmospheric vents, gas reliefs or bleeds shall have their atmospheric vent lines and gas reliefs or bleeds lead to the outdoors.

Means shall be employed on these lines to prevent water from entering and to prevent blockage by insects and foreign matter. An atmospheric vent line shall not be required to be provided on a valve train component equipped with a listed vent limiter.

612.7 Relief opening. The design of the installation shall include adequate provision to permit direct-fired industrial air heaters to operate at rated capacity by taking into account the structure’s designed infiltration rate, providing properly designed relief openings or an interlocked power exhaust system, or a combination of these methods. The structure’s designed infiltration rate and the size of relief openings shall be determined by a registered design professional. Relief openings shall be permitted to be louvers or counterbalanced gravity dampers. Motorized dampers or closable louvers shall be permitted to be used, provided they are verified to be in their full open position prior to main burner operation.

612.8 Controls. Recirculating direct-fired air heaters shall be equipped with airflow-sensing devices, safety shutoff devices, operating temperature controls and thermally actuated temperature limit controls in accordance with the terms of their listing.
SECTION FGC 613
CLOTHES DRYERS

613.1 General. Clothes dryers shall be tested in accordance with ANSI Z21.5.1/CSA 7.1 or ANSI Z21.5.2/CSA 7.2, and shall be installed in accordance with the manufacturer’s [installation] instructions.

SECTION FGC 614
CLOTHES DRYER EXHAUST

614.1 [Installation] Clothes dryer exhaust. [Clothes dryers shall be exhausted in accordance with the manufacturer’s instructions. Dryer exhaust systems shall be independent of all other systems and shall convey the moisture and any products of combustion to the outside of the building.] [Exception: This section shall not apply to listed and labeled condensing (ductless) clothes dryers.]

Clothes dryer exhaust shall be in accordance with Section 504 of the New York City Mechanical Code.

614.2 Duct penetrations. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstopping or any wall, floor/ceiling or other assembly required by the New York City Building Code to be fire resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Table 603.4 of the New York City Mechanical Code and the fire resistance rating is maintained in accordance with the New York City Building Code. Fire dampers shall not be installed in clothes dryer exhaust duct systems.

614.3 Cleaning access. Each vertical duct riser for dryers listed to ANSI Z21.5.2 shall be provided with a cleanout or other means for cleaning the interior of the duct.

614.4 Exhaust installation. Exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

614.5 Makeup air. Installations exhausting more than 200 cfm (0.09 m³/s) shall be provided with makeup air. Where a closet is designed for the installation of a clothes dryer, an opening having an area of not less than 100 square inches (645 mm²) for makeup air shall be provided in the closet enclosure, or makeup air shall be provided by other approved means.

614.6 Domestic clothes dryer exhaust ducts. Exhaust ducts for domestic clothes dryers shall conform to the requirements of Sections 614.6.1 through 614.6.7.

614.6.1 Material and size. Exhaust ducts shall have a smooth interior finish and shall be constructed of metal that is a minimum of 0.016 inches (0.4 mm) thick. The exhaust duct size
shall be 4 inches minimum (102 mm) nominal diameter, unless a larger duct size is—specifically required by the dryer manufacturer.]  

[614.6.2 Duct installation. Exhaust ducts shall be supported at 4 foot (1219 mm) intervals and secured in place. The inserted end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude into the inside of the duct.]  

[614.6.3 Protection required. Protective shield plates shall be placed where nails or screws from finish or other work are likely to penetrate the clothes dryer exhaust duct. Shield plates shall be placed on the finished face of all framing members where there is less than 1¼ inches (32 mm) between the duct and the finished face of the framing member. Protective shield plates shall be constructed of steel, shall have a minimum thickness of 0.062 inch (1.6 mm) and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.]  

[614.6.4 Transition ducts. Transition ducts used to connect the dryer to the exhaust duct system shall be a single length that is listed and labeled in accordance with UL 2158A. Transition ducts shall be a maximum of 8 feet (2438 mm) in length, and shall not be concealed within construction.]  

[614.6.5 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Section 614.6.5.1 or 614.6.5.2.]  

[614.6.5.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (10668 mm) from the connection to the transition duct from the dryer to the outlet terminal. Where fittings are utilized, the maximum length of the exhaust duct shall be reduced in accordance with Table 614.6.5.1.]

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 degree = 0.01745 rad.
The equivalent length column of the table indicates how much length must be added to the exhaust duct total length for each fitting used.

**[614.6.5.2 Manufacturer’s instructions.]** The maximum length of the exhaust duct shall be determined by the dryer manufacturer’s installation instructions. The special inspector shall be provided with a copy of the installation instructions for the make and model of the dryer. Where the exhaust duct is to be concealed, the installation instructions shall be provided to the special inspector prior to the concealment inspection. In the absence of fitting equivalent length calculations from the clothes dryer manufacturer, Table 614.6.5.1 shall be utilized.

**[614.6.6 Length identification.]** Where the exhaust duct is concealed within the building construction, the equivalent length of the exhaust duct shall be identified on a permanent label or tag. The label or tag shall be located within 6 feet (1829 mm) of the exhaust duct connection.

**[614.6.7 Exhaust duct required.]** Where space for a clothes dryer is provided, an exhaust duct system shall be installed.

Where the clothes dryer is not installed at the time of occupancy, the exhaust duct shall be capped at the location of the future dryer.

**[Exception:** Where a listed condensing clothes dryer is installed prior to occupancy of the structure.]

**[614.7 Commercial clothes dryers.]** The installation of dryer exhaust ducts serving Type 2 clothes dryers shall comply with the appliance manufacturer’s installation instructions. Exhaust fan motors installed in exhaust systems shall be located outside of the airstream. In multiple installations, the fan shall operate continuously or be interlocked to operate when any individual unit is operating. Ducts shall have a minimum clearance of 6 inches (152 mm) to combustible materials.

**[614.8 Common exhaust systems for clothes dryers located in multistory structures.]** Where a common multistory duct system is designed and installed to convey exhaust from multiple clothes dryers, the construction of such system shall be in accordance with all of the following:

1. The shaft in which the duct is installed shall be constructed and fire-resistance rated as required by the New York City Building Code.

2. Dampers shall be prohibited in the exhaust duct.

3. Rigid metal ductwork shall be installed within the shaft to convey the exhaust. The ductwork shall be constructed of sheet steel having a minimum thickness of 0.0187 inch (0.471 mm) (No. 26 gage) and in accordance with SMACNA Duct Construction Standards.

4. Exhaust ducts 20 square inches (12 903 mm²) or less connected into dryer exhaust shaft shall not require fire dampers when the exhaust fan runs continuously.

5. The exhaust fan motor design shall be in accordance with Section 503.2 of the New York City Mechanical Code.
6. The exhaust fan motor shall be located outside of the airstream.

7. The exhaust fan shall run continuously, and shall be connected to a standby power source, where a building emergency or standby power source is required by the New York City Building Code.

8. The exhaust fan operation shall be monitored in an approved location and shall initiate an audible or visual signal when the fan is not in operation.

9. Makeup air shall be provided for the exhaust system.

10. Cleanout openings shall be located at the base of the shaft and the bases of all offsets to provide access to the duct to allow for cleaning and inspection. The finished opening shall be not less than 12 inches by 12 inches (305 mm by 305 mm).

11. Screens shall not be installed at the termination.

---

SECTION FGC 615
SAUNA HEATERS

615.1 General. Sauna heaters shall be installed in accordance with the manufacturer’s [installation] instructions.

615.2 Location and protection. Sauna heaters shall be located so as to minimize the possibility of accidental contact by a person in the room.

615.2.1 Guards. Sauna heaters shall be protected from accidental contact by an approved guard or barrier of material having a low coefficient of thermal conductivity. The guard shall not substantially affect the transfer of heat from the heater to the room.

615.3 Access. Panels, grilles and access doors that are required to be removed for normal servicing operations shall not be attached to the building.

615.4 Combustion and dilution air intakes. Sauna heaters of other than the direct-vent type shall be installed with the draft hood and combustion air intake located outside the sauna room. Where the combustion air inlet and the draft hood are in a dressing room adjacent to the sauna room, there shall be provisions to prevent physically blocking the combustion air inlet and the draft hood inlet, and to prevent physical contact with the draft hood and vent assembly, or warning notices shall be posted to avoid such contact. Any warning notice shall be easily readable, shall contrast with its background and the wording shall be in letters not less than ¼ inch (6.4 mm) high.

615.5 Combustion and ventilation air. Combustion air shall not be taken from inside the sauna room. Combustion and ventilation air for a sauna heater not of the direct-vent type shall be provided to the area in which the combustion air inlet and draft hood are located in accordance with Section 304.

615.6 Heat and time controls. Sauna heaters shall be equipped with a thermostat which will limit room temperature to 194°F (90°C). If the thermostat is not an integral part of the sauna heater, the
heat-sensing element shall be located within 6 inches ([152] 152.4 mm) of the ceiling. If the heat-sensing element is a capillary tube and bulb, the assembly shall be attached to the wall or other support, and shall be protected against physical damage.

**615.6.1 Timers.** A timer, if provided to control main burner operation, shall have a maximum operating time of 1 hour. The control for the timer shall be located outside the sauna room.

**615.7 Sauna room.** A ventilation opening into the sauna room shall be provided. The opening shall be not less than 4 inches by 8 inches ([102] 101.6 mm by [203] 203.2 mm) located near the top of the door into the sauna room.

**615.7.1 Warning notice.** The following permanent notice, constructed of approved material, shall be mechanically attached to the sauna room on the outside:

**WARNING: DO NOT EXCEED 30 MINUTES IN SAUNA. EXCESSIVE EXPOSURE CAN BE HARMFUL TO HEALTH. ANY PERSON WITH POOR HEALTH SHOULD CONSULT A PHYSICIAN BEFORE USING SAUNA.**

The words shall contrast with the background and the wording shall be in letters not less than 1/4 inch (6.4 mm) high.

**Exception:** This section shall not apply to one- and two-family dwellings.

**SECTION FGC 616**
**ENGINE AND GAS TURBINE-POWERED**
**EQUIPMENT AND APPLIANCES**

**616.1 Powered equipment.** Permanently installed equipment powered by internal combustion engines and turbines shall be installed in accordance with the manufacturer’s [installation] instructions and NFPA 37. Stationary engine generator assemblies shall meet the requirements of UL 2200.

**616.2 Gas supply connection.** Equipment powered by internal combustion engines and turbines shall not be rigidly connected to the gas supply piping.

**SECTION FGC 617**
**POOL AND SPA HEATERS**

**617.1 General.** Pool and spa heaters shall be tested in accordance with ANSI Z21.56/CSA 4.7 and shall be installed in accordance with the manufacturer’s [installation] instructions.

**SECTION FGC 618**
**FORCED-AIR WARM-AIR FURNACES**

**618.1 General.** Forced-air warm-air furnaces shall be tested in accordance with ANSI Z21.47/CSA 2.3 or UL 795 and shall be installed in accordance with the manufacturer’s [installation] instructions.
618.2 Forced-air furnaces. The minimum unobstructed total area of outdoor and return air ducts or openings to a forced-air warm-air furnace shall be not less than 2 square inches for each 1,000 Btu/h (4402 mm²/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer’s installation instructions. The minimum unobstructed total area of supply ducts from a forced-air warm-air furnace shall be not less than 2 square inches (1290.32 mm²) for each 1,000 Btu/h (4402 mm²/W) output rating capacity of the furnace and not less than that specified in the furnace manufacturer’s installation instructions. 

**Exception:** The total area of supply air ducts and outdoor and return air ducts shall not be required to be larger than the minimum size required by the furnace manufacturer’s installation instructions.

618.3 Dampers. Volume dampers shall not be placed in the air inlet to a furnace in a manner that will reduce the required air to the furnace.

618.4 Circulating air ducts for forced-air warm-air furnaces. Circulating air for fuel-burning, forced air-type, warm air furnaces shall be conducted into the blower housing from outside the furnace enclosure by continuous air-tight ducts.

618.5 618.4 Prohibited sources. Outdoor or return air for a forced-air heating system or forced-air heating and cooling systems shall not be taken from the following locations:

1. *Closer* than 10 feet (3048 mm) from an appliance vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outdoor air inlet.

2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.

3. A hazardous or insanitary location or a refrigeration machinery room as defined in the New York City Mechanical Code.

4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an appliance where such a room or space serves as the sole source of return air.

**Exception:** This shall not apply where:
1. The appliance is a direct-vent appliance or an appliance not requiring a vent in accordance with Section 501.8.

2. The room or space complies with the following requirements:

   2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6 L/W) of combined input rating of all fuel-burning appliances therein.

   2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.

   2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of [any appliance firebox or] a draft hood in the same room or space or the combustion chamber of any atmospheric burner appliance in the same room or space.

3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.

6. A closet, bathroom, toilet room, kitchen, garage, [mechanical room,] boiler room, furnace room or unconditioned attic.

[Exception] Exceptions:

1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.

2. Dedicated forced-air systems serving only a garage shall not be prohibited from obtaining return air from the garage.

7. A crawl space by means of direct connection to the return side of a [forced-air] forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.

[618.6] 618.5 Screen. Required outdoor air inlets for residential portions of a building shall be covered with a screen having ¼-inch (6.4 mm) openings. Required outdoor air inlets serving a nonresidential portion of a building shall be covered with screen having openings larger than ¼ inch (6.4 mm) and not larger than 1 inch (25.4 mm).

[618.7] 618.6 Return-air limitation. Return air from one dwelling unit shall not be discharged into another dwelling unit.

[618.8] 618.7 Furnace plenums and air ducts. Where a furnace is installed so that supply ducts carry air circulated by the furnace to areas outside of the space containing the furnace, the return air shall [also] be handled by a duct(s) sealed to the furnace casing and terminating outside of the space containing the furnace.
SECTION FGC 619
CONVERSION BURNERS

619.1 Conversion burners. The installation of conversion burners shall conform to ANSI Z21.8 and ASME CSD-1, including Appendix C.

SECTION FGC 620
UNIT HEATERS

620.1 General. Unit heaters shall be tested in accordance with ANSI Z83.8/CSA 2.6 and shall be installed in accordance with the manufacturer’s [installation] instructions.

620.2 Support. Suspended-type unit heaters shall be supported by elements that are designed and constructed to accommodate the weight and dynamic loads. Hangers and brackets shall be of noncombustible material.

620.3 Ductwork. Ducts shall not be connected to a unit heater unless the heater is listed for such installation.

620.4 Clearance. Suspended-type unit heaters shall be installed with clearances to combustible materials of not less than 18 inches ([457] 457.2 mm) at the sides, 12 inches ([305] 304.8 mm) at the bottom and 6 inches ([152] 152.4 mm) above the top where the unit heater has an internal draft hood or 1 inch ([25] 25.4 mm) above the top of the sloping side of the vertical draft hood.

Floor-mounted-type unit heaters shall be installed with clearances to combustible materials at the back and one side only of not less than 6 inches ([152] 152.4 mm). Where the flue gases are vented horizontally, the 6-inch ([152] 152.4 mm) clearance shall be measured from the draft hood or vent instead of the rear wall of the unit heater. Floor-mounted-type unit heaters shall not be installed on combustible floors unless listed for such installation.

Clearances for servicing all unit heaters shall be in accordance with the manufacturer’s [installation] instructions.

Exception: Unit heaters listed for reduced clearance shall be permitted to be installed with such clearances in accordance with their listing and the manufacturer’s instructions and as approved by the department.

620.5 Installation in commercial garages and aircraft hangars. Unit heaters installed in garages for more than three motor vehicles or in aircraft hangars shall be installed in accordance with Sections 305.9, 305.10 and 305.11.

SECTION FGC 621
UNVENTED ROOM HEATERS

621.1 General. The installation of unvented room heaters is prohibited.
SECTION FGC 622
VENTED ROOM HEATERS

622.1 General. Vented room heaters shall be tested in accordance with ANSI Z21.86/CSA 2.32, [shall be designed and equipped as specified in Section 602.2 and shall be] installed in accordance with the manufacturer’s [installation] instructions, and shall be designed and equipped as specified in Section 602.2 of this code.

SECTION FGC 623
COOKING APPLIANCES

623.1 Cooking appliances. Cooking appliances that are designed for permanent installation, including ranges, ovens, stoves, broilers, grills, fryers, griddles, hot plates and barbecues, shall be tested in accordance with ANSI Z21.1/CSA 6.5, ANSI Z21.58/CSA 1.6 or ANSI Z83.11/CSA 1.8 and shall be installed in accordance with the manufacturer’s [installation] instructions.

623.1.1 LPG. Except as may be permitted by the New York City Fire Code, cooking appliances using LPG are prohibited.

623.2 Prohibited location. Cooking appliances designed, tested, listed and labeled for use in commercial occupancies shall not be installed within dwelling units or within any area where domestic cooking operations occur.

Exception: Appliances that are also listed as domestic cooking appliances.

623.2.1 Barbeque grills. Barbeque grills piped to natural gas shall not be installed or operated within 10 feet (3048 mm) of any combustible waste or combustible material including combustible building surfaces, balconies and decks.

623.3 Domestic appliances. Cooking appliances installed within dwelling units and within areas where domestic cooking operations occur shall be listed and labeled as household-type appliances for domestic use.

623.4 Domestic range installation. Domestic ranges installed on combustible floors shall be set on their own bases or legs and shall be installed with clearances of not less than that shown on the label.
623.5 Open-top broiler unit hoods. A ventilating hood shall be provided above a domestic open-top broiler unit, unless otherwise listed for forced down draft ventilation.

623.5.1 Clearances. A minimum clearance of 24 inches (609.6 mm) shall be maintained between the cooking top and combustible material above the hood. The hood shall be at least as wide as the open-top broiler unit and be centered over the unit.

623.6 Commercial cooking appliance venting. Commercial cooking appliances, other than those exempted by Section 501.8, shall be vented by connecting the appliance to a vent or chimney in accordance with this code and the appliance manufacturer’s instructions or the appliance shall be vented in accordance with Section 505.1.1.

623.7 Domestic ventilation. When a hood is provided for a domestic cooking appliance, the exhaust and make-up air systems shall be properly engineered and designed in accordance with Chapter 5 of this code and the New York City Mechanical Code. Household cooking appliances shall have a vertical clearance above the cooking top of not less than 30 inches (760 mm) to combustible material and metal cabinets. A minimum clearance of 24 inches (609.6 mm), measured to the underside of the above cabinet or combustible material, is permitted where one of the following is installed:

1. The undersides of the combustible material or metal cabinet above the cooking top is protected with not less than ¼-inch (6.4 mm) insulating millboard covered with sheet metal not less than 0.0122 inch (0.3 mm) thick.

2. A metal ventilating hood constructed of sheet metal not less than 0.0122 inch (0.3 mm) thick is installed above the cooking top with a clearance of not less than ¼ inch (6.4 mm) between the hood and the underside of the combustible material or metal cabinet. The hood shall have a width not less than the width of the appliance and shall be centered over the appliance.

3. A listed cooking appliance or microwave oven is installed over a listed cooking appliance and in compliance with the terms of the manufacturer’s installation instructions for the upper appliance.

SECTION FGC 624
WATER HEATERS

624.1 General. Water heaters shall be tested in accordance with ANSI Z21.10.1/CSA 4.1 and ANSI Z21.10.3/CSA 4.3 and shall be installed in accordance with the manufacturer’s installation instructions. Water heaters utilizing fuels other than fuel gas shall be regulated by the New York City Mechanical Code. Approval for water heaters 350,000 Btu/h input (102,6 kW) and above shall be obtained from the New York City Department of Environmental Protection.
624.1.1 Installation requirements. The requirements for water heaters relative to sizing, relief valves, drain pans and scald protection shall be in accordance with the New York City Plumbing Code and the following:

1. No person shall install or maintain in any dwelling unit a gas fuel-fired water heater unless the heater obtains combustion air directly from the outside of the building.

2. No person shall install or maintain a gas-fueled water heater in a room occupied for sleeping purposes, or cause or permit to be occupied for sleeping purposes any room in which a gas-fueled heater is installed.

3. Each heater shall be connected to a flue or outlet pipe.

624.2 Water heaters utilized for space heating. Water heaters utilized both to supply potable hot water and provide hot water for space-heating applications shall be listed and labeled for such applications by the manufacturer, and shall be built in accordance with Section IV of the ASME Boiler and Pressure Vessel Code with an “H” code stamp. They shall be installed in accordance with the manufacturer’s [installation] instructions, the ASME Boiler and Pressure Vessel Code and the New York City Plumbing Code.

SECTION FGC 625
REFRIGERATORS

625.1 General. Refrigerators shall be tested in accordance with ANSI Z21.19/CSA 1.4 and shall be installed in accordance with the manufacturer’s [installation] instructions.

Refrigerators shall be provided with adequate clearances for ventilation at the top and back, and shall be installed in accordance with the manufacturer’s instructions. If such instructions are not available, [at least] not less than 2 inches (51.0 mm) shall be provided between the back of the refrigerator and the wall and [at least] not less than 12 inches (305.0 mm) above the top.

SECTION FGC 626
GAS-FIRED TOILETS

626.1 General. Gas-fired toilets are not approved for use in New York City.

626.2 Reserved.

SECTION FGC 627
AIR CONDITIONING APPLIANCES

627.1 General. Gas-fired air-conditioning appliances shall be tested in accordance with ANSI Z21.40.1/CGA 2.91 or ANSI Z21.40.2/CGA 2.92 and shall be installed in accordance with the manufacturer’s [installation] instructions.
627.2 Independent piping. Gas piping serving heating appliances shall be permitted to also serve cooling appliances where such heating and cooling appliances cannot be operated simultaneously (see Section 402).

627.3 Connection of gas engine-powered air conditioners. To protect against the effects of normal vibration in service, gas engines shall not be rigidly connected to the gas supply piping. Where units are powered by internal combustion engines and turbines, installation shall comply with Section 616.1.

627.4 Clearances for indoor installation. Air-conditioning appliances installed in rooms other than alcoves and closets shall be installed with clearances not less than those specified in Section 308.3 [except that air-conditioning].

Exceptions:

1. Air-conditioning appliances listed for installation at lesser clearances than those specified in Section 308.3 shall be permitted to be installed in accordance with such listing and the manufacturer’s instructions [and air-conditioning]. Air-conditioning appliances installed in rooms other than alcoves and closets shall be permitted to be installed with reduced clearances to combustible material, provided that the combustible material is protected in accordance with Table 308.2.

2. Air-conditioning appliances listed for installation at greater clearances than those specified in Section 308.3 shall be installed in accordance with such listing and the manufacturer’s instructions.

[Air-conditioning appliances installed in rooms other than alcoves and closets shall be permitted to be installed with reduced clearances to combustible material, provided that the combustible material is protected in accordance with Table 308.2.]

627.5 Alcove and closet installation. Air-conditioning appliances installed in spaces such as alcoves and closets shall be specifically listed for such installation and installed in accordance with the terms of such listing. The installation clearances for air-conditioning appliances in alcoves and closets shall not be reduced by the protection methods described in Table 308.2.

627.6 Installation. Air-conditioning appliances shall be installed in accordance with the manufacturer’s instructions. Unless the appliance is listed for installation on a combustible surface such as a floor or roof, or unless the surface is protected in an approved manner, [appliances] the appliance shall be installed on a surface of noncombustible construction with noncombustible material and surface finish and with no combustible material against the underside thereof.

627.7 Plenums and air ducts. A plenum supplied as a part of the air-conditioning appliance shall be installed in accordance with the appliance manufacturer’s instructions. Where a plenum is not supplied with the appliance, such plenum shall be installed in accordance with the fabrication and installation instructions provided by the plenum and appliance manufacturer. The method of connecting supply and return ducts shall facilitate proper circulation of air.
Where the air-conditioning appliance is installed within a space separated from the spaces served by the appliance, the air circulated by the appliance shall be conveyed by ducts that are sealed to the casing of the appliance and that separate the circulating air from the combustion and ventilation air.

627.8 Refrigeration coils. A refrigeration coil shall not be installed in conjunction with a forced-air furnace where circulation of cooled air is provided by the furnace blower, unless the blower has sufficient capacity to overcome the external static resistance imposed by the duct system and cooling coil at the air throughput necessary for heating or cooling, whichever is greater. Furnaces shall not be located upstream from cooling units, unless the cooling unit is designed or equipped so as not to develop excessive temperature or pressure. Refrigeration coils shall be installed in parallel with or on the downstream side of central furnaces to avoid condensation in the heating element, unless the furnace has been specifically listed for downstream installation. With a parallel flow arrangement, the dampers or other means used to control flow of air shall be sufficiently tight to prevent any circulation of cooled air through the furnace.

Means shall be provided for disposal of condensate and to prevent dripping of condensate onto the heating element.

627.9 Cooling units used with heating boilers. Boilers, where used in conjunction with refrigeration systems, shall be installed so that the chilled medium is piped in parallel with the heating boiler with appropriate valves to prevent the chilled medium from entering the heating boiler. Where hot water heating boilers are connected to heating coils located in air-handling units where they might be exposed to refrigerated air circulation, such boiler piping systems shall be equipped with flow control valves or other automatic means to prevent gravity circulation of the boiler water during the cooling cycle.

627.10 Switches in electrical supply line. Means for interrupting the electrical supply to the air-conditioning appliance and to its associated cooling tower (if supplied and installed in a location remote from the air conditioner) shall be provided within sight of and not over 50 feet (15 240 mm) from the air conditioner and cooling tower.

SECTION FGC 628
ILLUMINATING APPLIANCES

628.1 General. Illuminating appliances shall be tested in accordance with ANSI Z21.42 and shall be installed in accordance with the manufacturer’s installation instructions.

628.2 Mounting on buildings. Illuminating appliances designed for wall or ceiling mounting shall be securely attached to substantial structures in such a manner that they are not dependent on the gas piping for support.

628.3 Mounting on posts. Illuminating appliances designed for post mounting shall be securely and rigidly attached to a post. Posts shall be rigidly mounted in accordance with the requirements of the New York City Building Code. Drain openings shall be provided near the base of posts where there is a possibility of water collecting inside them.
**628.4 Appliance pressure regulators.** Where an appliance pressure regulator is not supplied with an illuminating appliance and the service line is not equipped with a service pressure regulator, an appliance pressure regulator shall be installed in the line to the illuminating appliance. For multiple installations, one regulator of adequate capacity shall be permitted to serve more than one illuminating appliance.

**SECTION FGC 629**

**[SMALL] CERAMIC KILNS**

**629.1 General.** Ceramic kilns with a maximum interior volume of 20 cubic feet (0.566 m³) and used for hobby and noncommercial purposes shall be installed in accordance with the manufacturer’s installation instructions and the provisions of this code. Kilns shall be listed and labeled unless otherwise approved in accordance with Section 105.1. Electric kilns shall comply with UL 499. The approval of unlisted appliances in accordance with Section 105.1 shall be based on an approved engineering evaluation.

**SECTION FGC 630**

**INFRARED RADIANT HEATERS**

**630.1 General.** Infrared radiant heaters shall be tested in accordance with ANSI Z83.6/ANSI Z83.19/CSA 2.35 or ANSI Z83.20/CSA 2.34 and shall be installed in accordance with the manufacturer’s installation instructions.

**630.2 Support.** Infrared radiant heaters shall be safely and adequately fixed in an approved position independent of gas and electric supply lines. Hangers and brackets shall be of noncombustible material.

**630.3 Combustion and ventilation air.** Where unvented infrared heaters are installed, natural or mechanical means shall provide outdoor ventilation air at a rate of not less than 4 cfm per 1,000 Btu/h (0.38 m³/min/kW) of the aggregate input rating of all such heaters installed in the space. Exhaust openings for removing flue products shall be above the level of the heaters.

**630.4 Installation in commercial garages and air-craft hangars.** Overhead infrared heaters installed in garages for more than three motor vehicles or in aircraft hangars shall be installed in accordance with Sections 305.9, 305.10 and 305.11.

**SECTION FGC 631**

**BOILERS**

**631.1 Standards.** Boilers shall be listed in accordance with the requirements of ANSI Z21.13/CSA 4.9 or UL 795. If applicable, the boiler shall be designed and constructed in accordance with the requirements of ASME CSD-1 and as applicable, the ASME Boiler and Pressure Vessel Code, Sections I, II, IV, V, VI and IX [1] and NFPA [8501, NFPA 8502 and NFPA 8504] [85]. Low-pressure boilers shall conform to the requirements of 12 NYCRR Part 4 and high-pressure boilers shall conform to the requirements of 12 NYCRR Part 14.
631.2 Installation. In addition to the requirements of this code, the installation of boilers shall be in accordance with the manufacturer’s instructions and the New York City Mechanical Code. Operating instructions of a permanent type shall be attached to the boiler. Spill switches must be installed on all flue gas draft openings and interlocked with all vented appliances. Boilers shall have all controls set, adjusted and tested by the installer. A complete control diagram together with complete boiler operating instructions shall be furnished by the installer. The manufacturer’s rating data and the nameplate shall be attached to the boiler.

631.3 Clearance to combustible materials. Clearances to combustible materials shall be in accordance with Section 308.4.

SECTION FGC 632
EQUIPMENT INSTALLED IN EXISTING UNLISTED BOILERS

632.1 General. Gas equipment installed in existing unlisted boilers shall comply with Section 631.1 and shall be installed in accordance with the manufacturer’s instructions and the New York City Mechanical Code.

SECTION FGC 633
[FUEL CELL POWER PLANTS]
STATIONARY FUEL CELL POWER SYSTEMS

633.1 General. Stationary fuel[-] cell power systems having a power output not exceeding [4] 10 MW shall be tested in accordance with ANSI/CSA America FC 1 and shall be installed in accordance with the manufacturer’s [installation] instructions, NFPA 853, the New York City Building Code, the New York City Fire Code, [and] the National Electric Code Article 692 Fuel Cell Systems, and the New York City Electrical Code. Indoor stationary fuel cell power systems used in hydrogen generating systems shall be located in accordance with the requirements of Section 706 of this code.

SECTION FGC 634
CHIMNEY DAMPER OPENING AREA

634.1 Free opening area of chimney dampers. Where an unlisted decorative appliance for installation in a vented fireplace is installed, the fireplace damper shall have a permanent free opening equal to or greater than specified in Table 634.1.

<table>
<thead>
<tr>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square inch = 645.16m², 1 British thermal unit per hour = 0.2931 W.

c. The first six minimum permanent free openings (8 to 51 square inches) correspond approximately to the cross-sectional areas of chimneys having diameters of 3 through 8 inches, respectively. The 64-square-inch opening corresponds to the cross-sectional area of standard 8-inch by 8-inch chimney tile.

### SECTION FGC 635

**GASEOUS HYDROGEN SYSTEMS**

**635.1 Installation.** The installation of gaseous hydrogen systems shall be in accordance with the applicable requirements of the *New York City Fire Code*, the *New York City Building Code*, and Chapter 7 of this code [*].

### SECTION FGC 636

**OUTDOOR DECORATIVE APPLIANCES**

**636.1 General.** Permanently fixed-in-place outdoor decorative appliances shall be tested in accordance with ANSI Z21.97/CSA 2.41 and shall be installed in accordance with the manufacturer’s instructions.

§ 8. Chapter 7 of the New York city fuel gas code, as amended by local law number 141 for the year 2013, is amended to read as follows:

### CHAPTER 7

**GASEOUS HYDROGEN SYSTEMS**

**SECTION FGC 701

**GENERAL**

**701.1 Scope.** The installation of gaseous hydrogen systems shall comply with this chapter and Chapters [30 and 35] 53 and 58 of the *New York City Fire Code*. Compressed gases shall also comply with Chapter [27] 50 of the *New York City Fire Code* for general requirements.

**701.2 Permits.** Permits shall be required as set forth in Section 106 and as required by the *New York City Fire Code*. 

703.1 Hydrogen generation. The generation of gaseous hydrogen for immediate on-premises use in indoor fuel cells or other energy production process and incidental indoor storage of gaseous hydrogen shall be located in accordance with Section 706. Exhaust ventilation shall be required in rooms or spaces that house such generation of gaseous hydrogen in accordance with the applicable provisions of NFPA 2.

706.1 General. The location and installation of gaseous hydrogen systems and appliances shall be in accordance with Sections 706.2 and 706.3.

Exception: Outdoor stationary fuel cell power plants in accordance with Section 633.

Indoor stationary fuel cell power systems used in hydrogen generating systems shall be located in accordance with the requirements of Section 706.

706.2 Indoor gaseous hydrogen systems. Gaseous hydrogen systems shall be located in hydrogen fuel gas rooms constructed in accordance with the New York City Building Code, the New York City Mechanical Code, the New York City Fire Code and NFPA 2.

706.3 Outdoor gaseous hydrogen systems. Gaseous hydrogen systems located outdoors shall be in accordance with the New York City Fire Code.

§ 9. Chapter 8 of the New York city fuel gas code is REPEALED, and a new Chapter 8 is added to read as follows:

CHAPTER 8
REFERENCED STANDARDS

801.1 General. This chapter lists the standards that are referenced in various sections of this document. The standards are listed herein by the promulgating agency of the standard, the standard
identification, the effective date and title and the section or sections of this document that reference the standard.

**801.2 Subsequent additions, modifications or deletions.** Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the *Administrative Code*.

**801.3 Applicability.** The application of the referenced standards shall be as specified in Section 102.8

### SECTION FGC 802

APPENDIX E

METERS AND GAS SERVICE PIPING

E.1 General. This appendix addresses the requirements for meters and service piping, underground or aboveground, as the piping enters the building. Service piping includes fuel-gas piping, valves, and fittings upstream of the point of delivery. Service piping may include piping supplied by the gas service utility.

E.2 Gas regulator and gas regulator vent outlets. Gas meter piping supplying gas to a building at a pressure in excess of ½ psig (3.4 kPa gauge) shall be provided with a regulator that will reduce the pressure of the gas to ½ psig (3.4 kPa gauge) or less prior to entering the gas distribution piping in the building, except where the use of higher pressure is permitted. Where gas distribution pressure in excess of ½ psig (3.4 kPa gauge) is permitted, it shall be regulated [not to exceed the maximum pressure level as permitted by the code or the commissioner.

E.2.1 Inside gas meter piping operating at a pressure in excess of 15 psig ([103] 103.4 kPa gauge) shall comply with the following:

1. Where such piping is greater than 4 inches ([102] 102 mm) in diameter, the meter piping shall be installed in a properly ventilated meter room of 3-hour fire-rated construction.

2. The maximum [distance] total developed length from the outlet of the service [line] head valve to the inlet of the farthest regulator shall be limited as follows:
### SERVICE LINE VALVE SIZE

<table>
<thead>
<tr>
<th>SERVICE LINE VALVE SIZE</th>
<th>MAXIMUM DISTANCE (LINEAR FEET OF PIPE)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up [through] to 2-inch (51 mm) pipe size</td>
<td>4 feet (1219 mm)</td>
</tr>
<tr>
<td>Over 2-inch (51 mm) through 4-inch (102 mm) pipe size</td>
<td>8 feet (2438 mm)</td>
</tr>
<tr>
<td>Over 4-inch (102 mm) through 8-inch (203 mm) pipe size</td>
<td>15 feet (4572 mm)</td>
</tr>
<tr>
<td>10-inch (254 mm) pipe size and larger</td>
<td>20 feet (6096 mm)</td>
</tr>
</tbody>
</table>

3. Where these maximum distances cannot be met, the following shall be required:

<table>
<thead>
<tr>
<th>FOOTAGE (LINEAR FEET OF PIPE) IN EXCESS OF ABOVE REQUIREMENTS</th>
<th>ADDITIONAL REQUIREMENTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 5 feet (1534 mm)</td>
<td>The meter room shall have [3-hour fire rating] 3-hour fire-rated construction and adequate ventilation</td>
</tr>
<tr>
<td>Over 5 feet (1524 mm) through 10 feet (3048 mm)</td>
<td>Above requirements plus a combustible gas-detection alarm system</td>

<td>Over 20 feet (6096 mm)</td>
<td>Above requirements plus suitable fire protection approved by the commissioner</td>
</tr>
</tbody>
</table>

For new gas installations made in existing structures, the above requirements shall be used to the extent feasible. Alternate designs may be considered by the commissioner.

**E.2.2** When located inside the building, each regulator shall be provided with a vent pipe that leads directly to the outdoor air. The vent pipe shall be sized according to local utility requirements. The vent outlet shall not be located under a window or any opening leading back into the premises or located below any overhang or projection. No gas regulator vent outlet shall be covered over, plugged up, or otherwise obstructed, and all gas vents shall be identified by suitable marking on the outlet on the outside of the building. For buildings located in flood hazard areas, gas regulator vent outlets shall be installed in accordance with the additional requirements of Appendix G of the New York City Building Code.

**E.2.3** Gas appliance pressure regulators requiring access to the atmosphere for successful operation shall be equipped with vent leading to the outdoors, unless constructed or equipped
E.3 Gas meter location. Gas meter location shall comply with the following:

1. When located inside the building, meters shall be located as near as practicable to the point of entrance of the service and, where possible, the meters shall be located in the cellar or basement unless otherwise permitted by the commissioner. The meter location shall be clean, dry, and free of refuse, steam or chemical fumes and located not less than 3 feet (914.4 mm) from any source of ignition or any source of heat which might cause damage to the meter. Meters shall be adequately protected against extreme cold or heat and shall be readily accessible for reading and inspection. The area in which the meter is located shall be properly ventilated as per Section E.4. Notwithstanding the foregoing, outside meter installation shall be permitted in areas where the utility company certifies that dry gas is being distributed.

   **Exception.** Gas meter locations in one- and two-family dwellings shall not require ventilation.

2. No gas meter, other than the replacement of an existing meter shall be located in any boiler room or other room or space containing a heating boiler, in any stair hall, nor in any public hall above the cellar or above the lowest story if there is no cellar. However, where there is an existing gas meter located in any boiler room or other room or space containing a heating boiler, one additional gas meter may be installed in such room or space, provided such additional gas meter is installed adjacent to the existing gas meter and is used in conjunction with the supply of gas for a gas-fired heating boiler or a gas-fired water heater used as a central source of supply of heat or hot water for the tenants. Such additional gas meter may be installed only upon the condition that space heaters or hot water appliances in the tenant spaces are eliminated.

3. Gas meter rooms, when provided, shall at all times be kept clear of all rubbish; and shall not be used in any way for storage purposes, including material or equipment of any kind. A legible sign reading “Gas meter room—No storage permitted” shall be permanently and conspicuously posted on the exterior of the meter room door, except that the sign may be posted on the interior of the meter room door in Occupancy Group R-3. The lettering of such signs shall be of bold type at least 1 inch (25.4 mm) in height and shall be properly spaced to provide good legibility. The lettering and background shall be of contrasting colors. Where gas meters and related equipment are not located in a separate room but are located in an open floor area, no combustible material shall be stored or kept within 5 feet (1524 mm) of such equipment; nor shall the gas meter be within 3 feet (914.4 mm) of any heating boiler or sources of ignition and, except Occupancy Group R-3, there shall be a physical barrier required if the room is also used for storage purposes or the like.

4. The installation of gas meter piping shall be made in accordance with the requirements of this code and the local utility company.
5. Piping containing gas with a pressure exceeding $\frac{1}{2}$ psig (3.4 kPa gauge) and the gas service pressure regulator which may be subjected to accidental vehicular impact shall be suitably protected.

**E.4 Gas meter room ventilation.** Any one of the following methods shall be considered sufficient to provide proper ventilation to a room or space in which a gas meter(s) is installed:

1. An opening to the outside air in the wall of such room or space, provided the free area of the opening is not less than 30 square inches (19321 mm$^2$).

2. A duct or pipe having a cross-section area of at least 50 square inches (32522 mm$^2$) of free area and a maximum length of 15 feet (4572 mm) leading to the outside air. [If a longer duct is required due to the building construction, the area of the duct should be increased accordingly, subject to the approval of the commissioner.] However, under no circumstances shall the means of ventilation for the gas meter room or space be from an adjoining room or space within the building.

   [The above requirement is not applicable to one- and two-family dwellings, since the gas meter is available for continuous supervision.]

**E.5 Gas service piping connections.** Gas service piping connections shall comply with the following:

1. Gas service piping shall be fitted with a gas service line valve, the valve located on the supply side of the meter and service regulator, if a service regulator is required. [Where a plug-type valve is used, it shall be constructed so as to prevent the core from being blown out by the pressure of the gas. In addition, it shall be of a type capable of being locked in the off position by the local gas utility. When the gas service line valve is inside the building, it shall be in an accessible location within 2 feet (609.6 mm) of the point where the gas service connection enters the building or at such other location as may be permitted by the commissioner. Where the gas service connection is installed through a building wall below ground, it shall be protected with a wall sleeve extending at least 4 inches (101.6 mm) beyond the outer side of the wall and at least 1 inch (25.4 mm) beyond the inner side of the wall. The sleeve shall be sealed at both ends to prevent the entry of water and gas. Gas service connections, installed through ground slab construction, shall be protected with a floor sleeve sealed at both ends to prevent the entry of water and gas. The sleeve shall extend at least 4 inches (101.6 mm) above the floor, and shall be installed as specified by the utility company providing the service. It shall terminate at least 4 inches (101.6 mm) outside the building.]

2. In all high-pressure areas, the utility company providing the service may inspect the gas service line valve and regulator in accordance with the provisions of 16 NYCRR Part 255 in addition to the department in accordance with Section 406 of this code.

3. No gas service shall enter a structure at a horizontal distance of less than 10 feet (3048 mm) from the cellar termination of a stairway, nor shall any gas meters or gas regulators be located less than 10 feet (3048 mm) from such stairway termination. Where such services, meters
and regulators are separated from the stairway termination by a permanent partition or wall having a fire-resistance rating of at least 1 hour, the foregoing shall not apply. Unless forbidden by other provisions of this code, locations under a stairway are exempt from this requirement.

4. When the structure is erected on fill or on piles, provision shall be made to preclude possible damage to the gas service piping caused by settlement.

5. The installation of gas service piping shall be made in accordance with the requirements of the utility corporation providing the service as regulated by the provisions of 16 NYCRR Part 255. Further, such installation shall meet the requirements of the department.

6. Gas service piping outside a structure shall be installed not less than 24 inches ([640] 609.6 mm) below grade, except that a lesser distance of not less than 18 inches ([457] 457.2 mm) may be permitted, provided the piping is adequately protected in accordance with the requirements of this code and the utility corporation supplying service, and the piping is not located below a driveway. Any piping that is exposed to outdoor temperatures or installed underground with a cover of less than 2 feet ([640] 609.6 mm) shall be protected against frost, except that frost protection may be omitted in areas where the utility company certifies that dry gas is being distributed.

E.6 Outside gas cut-off. Outside gas cut-off shall comply with the following:

1. An outside gas service line valve or other outside emergency shutoff device, or other means acceptable to the commissioner and the Fire Commissioner, shall be installed in every gas service pipe outside the building. If buried, such valve, device or method shall be readily accessible from grade. Every existing service which is being replaced or refurbished shall be provided with such valve, device or means, but in any event, all existing gas services shall be provided with such valve, device or method by January 1, 2010. However, in Group R-3 occupancy the completion date shall be January 1, 2020. The utility company shall provide the Fire Department with suitable tools for operation of such emergency shutoff valves, devices or means. The number of such tools required for supplying Fire Department units shall be determined by the Fire Department. On or before January 31, of each year, the utility company shall report to the department and the Fire Department the actual number of emergency shutoff valves installed for the preceding year.

2. If the outside gas service line valve, emergency shutoff device or means is located below ground, it shall be installed in a protective housing, and a cover shall be provided for the housing. The cover shall be flush with the surface of the ground and kept clear at all times so as to be accessible for immediate use.

3. The valve or emergency shutoff device shall be capable of being readily operated by removing the cover of the housing and inserting a portable key or other device over the operating end of the valve or emergency shutoff device.
4. If the outside gas service line valve is located above ground, it shall be suitably protected to prevent accidental vehicular impact and must be installed in accordance with provisions of 16 NYCRR Part 255.

5. Where a gas-fired generator provides required emergency power in accordance with the *New York City Building Code*, such generator shall have an outside gas cut-off valve that is separate from other gas services to the buildings. Such valves shall be identified by signage.

Subpart 10 (Appendix F of the New York City Fuel Gas Code)

§ 11. The New York city fuel gas code is amended by adding a new appendix

F to read as follows:

**APPENDIX F**

**RESERVED**

§ 12. Appendix G of the New York city fuel gas code, as added by local law number 141 for the year 2013, is amended to read as follows:

**APPENDIX G**

**HIGH PRESSURE NATURAL GAS INSTALLATIONS**

**G.1 General.** This appendix addresses natural gas distribution piping requirements for systems where the gas pressure is at or above 15 psig ([403] 103.4 kPa gauge). Installations of gas piping at pressures at or above 15 psig ([403] 103.4 kPa gauge) and equipment and appliances using gas with an inlet pressure at or above 15 psig ([403] 103.4 kPa gauge) shall be considered as high pressure natural gas installations.

**G.1.1 Fire Department approval.** High pressure natural gas installations shall be approved by the Fire Department. All design documents associated with the installation shall be submitted to the Fire Department for approval. The Fire Department shall witness and approve final testing of the installation.

**G.1.2 Certificate of fitness.** High pressure natural gas installations shall be operated under the supervision of a person holding a Certificate of Fitness issued by the Fire Department when required by the *New York City Fire Code*.

**G.2 Construction requirements.** Buildings with high pressure natural gas installations shall meet the requirements of this section.

**G.2.1 Structural requirements.** The structural integrity of the building shall meet the requirements of Section 1615.6 of the *New York City Building Code* for gas explosions. An explosion analysis shall be conducted where the gas pressure exceeds 125 psig ([862] 861.8 kPa gauge). Where an explosion analysis shows explosion pressure exceeding 430 psf (20.5 kPa gauge), the building’s structural integrity shall be maintained at pressure levels determined by the
explosion analysis. The explosion scenario and explosion analysis shall be approved by the Fire Department.

**G.2.2 [Fire-resistance-rated] Fire-resistance-rated rooms and spaces.** Rooms and spaces containing high pressure natural gas piping shall be separated from all other areas of the building by fire barriers or horizontal assemblies, or both, having a fire-resistance rating of not less than 3 hours.

**G.2.2.1 Shaft requirements.** Vertical runs of high pressure gas piping within a building shall be enclosed in masonry shafts constructed of walls not less than 4 inches (100 mm) in thickness and sealed to prevent any gas leakage from the shaft. Such shaft shall be vented to the outdoors at the top. Such shaft shall not be located adjacent to an exit stairway or exit passageway unless the shaft wall separating the exit stairway or exit passageway from the shaft is designed to resist a potential gas explosion in accordance with Section 1615.6 of the *New York City Building Code*.

**G.2.3 Automatic sprinkler system.** Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 of the *New York City Building Code*, except where an alternative fire-extinguishing system is approved in accordance with [Section 904.1 of] the *New York City Fire Code* and the *New York City Building Code*.

**G.2.4 Gas detection.** Rooms and spaces containing the high pressure gas piping must be equipped with an approved and listed gas detection alarm system.

**G.2.4.1 Gas detection system.** A gas detection system including placement of gas detectors shall be installed in accordance with the manufacturer’s recommendations, its listing and Section 908 of the *New York City Building Code*.

**G.2.4.2 Supervision.** Gas detectors shall be supervised by a building fire alarm system in buildings where fire alarm systems are required or installed.

**G.2.4.3 Power supply.** Power supply to the system, wiring of the system, its associated components and outputs shall be in accordance with NFPA 72 as modified by Appendix Q of the *New York City Building Code* and Section 907 of the *New York City Building Code*.

**G.2.4.4 Alarm.** An audible and visual alarm shall be provided at the gas detection panel with an audible silence switch only.

**G.2.4.5 Alarm transmission.** The gas detection system shall transmit a trouble signal and an alarm to the supervising station and to a 24-hour supervised location within the building.

**G.2.4.6 Shutoff valves closure.** The gas detection system alarm activation shall trigger emergency gas shutoff valves serving the affected area to close and stop the gas flow.

**G.2.5 Ventilation.** Rooms containing appliances or equipment operating with gas pressure at or above 15 psig (103.4 kPa gauge) shall be provided with ventilation in accordance with the requirements of Chapter 4 of the *New York City Mechanical Code*. 
G.2.5.1 **Explosion prevention.** For rooms or spaces containing appliances operating with gas pressure at or above 15 psig (103.4 kPa gauge) and less than 125 psig (861.8 kPa gauge), explosion prevention systems shall be provided in accordance with NFPA 69.

G.3 **High hazard.** Rooms and areas containing appliances and equipment operating with gas pressure at or above 125 psig (861.8 kPa gauge) shall be classified as a Group H-2 occupancy and shall comply with the requirements of this section.

G.3.1 **Explosion venting.** Appliances and equipment using gas at or above 125 psig (861.8 kPa gauge) shall be located in rooms provided with explosion venting in accordance with NFPA 68.

G.3.1.1 **Gas turbines.** Gas turbine installations shall comply with the requirements of NFPA 37 and the requirements of Title 28 of the Administrative Code.

G.3.1.2 **Gas turbine rooms.** For rooms containing gas turbines and fuel gas compressors, the design of the explosion venting system shall be based on the explosion resulting from the lower explosion limit being achieved within the room housing the turbine or fuel gas compressor, including its enclosure. All control valve stations, filters, and related accessories shall be placed in the gas turbine room or a separately protected room.

G.3.2 **Emergency ventilation.** An emergency ventilation system shall be provided in accordance with NFPA 69 and shall be approved by the Fire Department. Ventilation calculations as listed in Annex D Ventilation Calculations of NFPA 69 shall be provided, and the gas release rate shall be approved.

G.3.3 **Electrical equipment.** Electrical equipment within rooms and enclosures requiring emergency ventilation shall conform to the New York City Electrical Code for Class 1 Division 2 requirements.

G.4 **Gas meter room.** A gas meter room served by gas at a pressure at or above 15 psig (103.4 kPa gauge) shall meet the requirements of Appendix E of this code and the New York City Electrical Code for Class 1 Division 2 requirements, and shall comply with Appendix E of this code.

G.5 **Piping requirements.** High pressure gas piping shall comply with the requirements of this section.

G.5.1 **Piping material.** Installations of natural gas piping operating at pressures of 125 psig (861.8 kPa gauge) and above shall comply with the requirements of ASME B 31.1.

G.5.2 **Double wall piping.** Horizontal piping that traverses within a building from a protected room or shaft to a protected room or shaft shall be run in an outer pipe of the same pressure rating as the inner pipe. The outer pipe shall be welded and the annular space between the inner and outer pipe shall be equal to or greater than the inside diameter of the inner pipe. The annular space shall be monitored for natural gas with an approved gas detection alarm system and shall be vented.
to the exterior of the building. The outer pipe must open to the shaft and/or protected room or to the outside air.

**G.5.3 Piping identification.** Piping shall be identified with markings in accordance with ASME A13.1.

**G.5.4 Emergency gas shutoff.** An emergency gas shutoff valve shall be provided on the gas supply outside of any room containing an appliance utilizing gas at a pressure at or above 15 psig (103.4 kPa gauge). The emergency shutoff valve shall be controlled from a break glass station located outside the room served and from the gas detection system monitoring the room. The emergency shutoff valve shall automatically stop the gas flow to the room(s) containing the appliance(s) in the event of an unsafe condition. The emergency shutoff valve shall be manually operable. Emergency gas shutoff valve bypasses shall be prohibited.

**G.6 Special inspection required.** The entire high pressure natural gas installation, including piping, equipment, appliances, gas detection and control systems, shall be subject to special inspection as set forth in Section 1704.19 1705.24 of the New York City Building Code.

**G.7 Cleaning and purging procedures.** Cleaning and purging procedures for high pressure natural gas piping, equipment and appliances shall be in accordance with NFPA 56.

Section 2. The New York city amendments to section 760.41(B) of the 2008 National Electrical Code as set forth in section 27-3025 of the administrative code of the city of New York, as added by local law number 39 for the year 2011, are amended to read as follows:

**(B) Secondary Power Source.** Where an emergency power system is provided or required to be provided for emergency system loads, the fire alarm circuits shall be provided with a secondary power source. Batteries shall not be a substitute for connection to a may serve as the secondary power source where allowed by the New York City Building Code. The secondary power source shall comply with the requirements for emergency power systems and/or emergency generator that are used for emergency systems loads as articulated below:

**(1) Generally.** Emergency power systems complying with Chapter 27 of the 2008 New York City Building Code shall be permitted to serve as a secondary power source or

**(2) Existing Buildings.** Emergency power systems and/or emergency generators in existing buildings in compliance with Title 27, chapter 1, subchapter 6, section 27-396.4 of the Administrative Code (also referred to as the 1968 Building Code) shall be permitted to serve as the secondary power source.

The secondary power supply shall be connected such that all other disconnecting means serving other building emergency loads can be opened without de-energizing the facility fire alarm secondary power supply.
FPN: The use of a main disconnecting means on the output of the generator(s) is permitted where the disconnection of all other loads does not interrupt the facility fire alarm system secondary power supply.

Section 3. Section 4 of local law number 14 for the year 2020 is amended to read as follows:

§4. This local law shall take effect on the same date as the effective date of a local law amending the administrative code of the city of New York [in relation to bringing the New York city building code up to date with the 2014 edition of the International Building Code published by the International Code Council] the New York city plumbing code, the New York city building code, the New York city mechanical code and the New York city fuel gas code in relation to bringing such codes and related provisions of law up to date with the 2015 editions of the international building, mechanical, fuel gas and plumbing codes, except that this local law shall not apply to plumbing work related to applications for construction document approval filed prior to such effective date.

Section 4. Notwithstanding any other law or rule, tables, figures or equations in PDF or other electronic format to be added to the New York city construction codes or amended pursuant to this local law need not be underlined to denote new matter being added. The absence of underlining to denote new matter being added shall not affect the validity of new tables, figures or equations in PDF or other electronic format to be added to the New York city construction codes or amended pursuant to this local law.

Section 5. This local law takes effect 12 months after it is enacted into law and shall apply to work related to applications for construction document approval filed on and after such effective date, except that:

(i) section 28-401.11 and articles 421, 422 and 425 of chapter 4 of title 28 of the administrative code of the city of New York as amended by section 4 of part A of this local law and
articles 303, 304 and 323 of chapter 3 of title 28 of the administrative code of the city of New York as amended by section 3 of part A of this local law shall take effect on January 1, 2022;

(ii) the amendments to section 28-110.1 of the administrative code of the city of New York made by section 1 of part A of this local law and the amendments to chapter 33 of the New York city building code made by sections 32 through 50 of part C of this local law shall apply to:

1. all work on major buildings as defined in section BC 202 of chapter 2 of the New York city building code, as added by section 3 of part C of this local law, for which a site safety plan is approved by the department of buildings on or after such effective date;

2. all temporary construction equipment permits and all crane and derrick permits, as required by article 105 of chapter 1 of Title 28 of the Administrative Code, as amended by section 1 of part A of this local law, where the application for approval for such permit is filed with the department of buildings on or after such effective date; and

(iii) the commissioner of buildings may promulgate rules or take other actions for the implementation of this local law prior to such effective date.

THE CITY OF NEW YORK, OFFICE OF THE CITY CLERK, s.s.:

I hereby certify that the foregoing is a true copy of a local law of The City of New York, passed by the Council on October 7, 2021 and returned unsigned by the Mayor on November 8, 2021.

MICHAEL M. McSWEENEY, City Clerk, Clerk of the Council.

CERTIFICATION OF CORPORATION COUNSEL

I hereby certify that the form of the enclosed local law (Local Law No. 126 of 2021, Council Int. No. 2261-A of 2021) to be filed with the Secretary of State contains the correct text of the local law passed by the New York City Council, presented to the Mayor and neither approved nor disapproved within thirty days thereafter.

STEPHEN LOUIS, Acting Corporation Counsel.
