1905.1.3 Basis of \( f'_{c} \). Unless otherwise specified, \( f'_{c} \) shall be based on 28-day tests. If other than 28 days, test age for \( f'_{c} \) shall be as indicated in construction documents. If at any time during the concrete operations, the concrete is not in conformance with ASTM C 94 or is otherwise compromised, it shall be rejected. If it is placed, the location of the load shall be recorded and a pair of cylinders shall be molded from the load per ASTM C 31 and included in the average \( f'_{c} \).

1905.1.4 Lightweight aggregate concrete. Where design criteria in ACI 318, [Sections 8.6.1, 9.5.2.3, 11.2, 12.2.4, and 22.2.4, provide] Section 19.2.4, provides for use of a splitting tensile strength value of concrete (\( f'_{ct} \)), laboratory tests shall be made in accordance with ASTM C 330 to establish the value of \( f'_{ct} \) corresponding to the specified value of \( f'_{c} \).

1905.1.5 Field acceptance. Splitting tensile strength tests shall not be used as a basis for field acceptance of concrete.

1905.2 Selection of concrete proportions. Concrete proportions shall be determined in accordance with ACI 318 and the provisions of Sections 1905.2.1 through 1905.2.4 of this code.
1905.2.1 General. Proportions of materials for concrete shall be established to provide:

1. Workability and consistency to permit concrete to be worked readily into forms and around reinforcement under the conditions of placement to be employed, without segregation or excessive bleeding.

2. Resistance to special exposures as required by Section 1904.

3. Conformance with the strength test requirements of Section 1905.6.

1905.2.2 Different materials. Where different materials are to be used for different portions of proposed work, each combination shall be evaluated.

1905.2.3 Basis of proportions. Concrete proportions shall be established in accordance with Section 1905.3 or Section 1905.4, and shall comply with the applicable requirements of Section 1904.

1905.2.4 Mass concrete. For areas of high-strength mass concrete, including but not limited to, 8,000 psi (55 158 kPa) or greater and the least dimension being equal to or greater than 36 inches (914 mm), as indicated on the construction documents, a thermal control plan complying with ACI 301, Section 8.1 and acceptable to the registered design professional of record shall be submitted by the contractor.

1905.3 Proportioning on the basis of field experience and/or trial mixtures. Concrete proportioning determined on the basis of field experience or trial mixtures shall be done in accordance with ACI 318, [Section 5.3] Sections 26.4.3 and 26.4.4, and Sections 1905.3.1 through 1905.3.5 of this chapter. If the required $f'_{ct}$ is obtained for trial batch mixes prior to the date specified, the trial mix design may be approved. All mixes shall be approved by the registered design professional of record prior to construction.

1905.3.1 Required Strength. If the required $f'_{ct}$ is obtained for trial batch mixes prior to the date specified, the trial mix design may be approved by the registered design professional of record for the structural design.

1905.3.2 Performance and approval. Concrete mix designs shall be performed by an approved agency or by a concrete producer who is approved by the department as an approved fabricator in accordance with Section 1704.2.2, and approved in accordance with the requirements of Sections 1905.3.2.1 through 1905.3.2.3.

1905.3.2.1 Certification. All mix designs submitted for review and approval in accordance with Section 1905.3.2.2 shall be certified by the director of the approved agency or the quality control manager of the approved concrete producer that performed the tests used to substantiate the mix design. In addition, all mix designs shall be signed by an owner or officer of the concrete production facility.

1905.3.2.2 Review and approval. All mixes shall be approved by the registered design professional of record and filed with the department prior to use in construction.
1905.3.2.3 Distribution. Copies of the approved mix design(s) shall be maintained at the construction site by the contractor and made available to the department upon request. A copy of the approved mix design(s) shall be provided by the contractor to the licensed concrete testing laboratory performing the acceptance testing of the concrete at the construction site.

1905.3.3 Test records and trial mixtures. Field strength test records or trial mixtures used to determine \( f'_{cr} \) shall not be more than 24 months old measured from the date of batching, provided the materials are the same as those proposed for use and the concrete producer provides a written statement confirming the materials are the same as those proposed for use.

Exceptions:

1. Coarse aggregates may be acquired from an alternative source provided the nominal maximum size and the volume of coarse aggregate used remain unchanged.

2. Fine aggregates may be acquired from an alternative source provided the volume of fine aggregate used remains unchanged.

1905.3.4 Materials. The type and source of the materials used in the concrete shall be identified in the proposed concrete mix design. In order for materials in field strength test records or trial mixtures to be considered the same as those proposed for use, the materials shall, at a minimum, comply with the following:

1. Cementitious materials. Cementitious materials shall be used in the same quantities for each individual component and shall be of the same type and shall be from the same source and mill. Upon request, the concrete producer shall provide mill certificates for the cementitious materials proposed for use and cementitious materials represented by the field strength test records or trial mixtures to the registered design professional of record and the department.

2. Aggregates. Coarse and fine aggregates shall be the same nominal maximum size and shall be used in the same volume for each individual component. The aggregate supplier shall attest that the aggregates proposed are not alkali-silica reactive. The aggregate supplier is permitted to rely on New York State Department of Transportation approval of the supplier’s aggregate source.

3. Admixtures. Admixtures shall meet the requirements of the same admixture type in accordance with ASTM C 494 or ASTM C 260 and there shall be no change in air content or water content from the previously specified mix.

   Exception: Addition or removal of retarding or accelerating admixtures as described in Section 1905.3.5 is acceptable.

4. Additional testing. Differences or changes in materials that are proposed for use, not meeting the requirements of Items 1 through 3 above, shall require new testing demonstrated by either field strength test records or trial mixtures.

   Exception: Field changes to concrete proportions specified in Section 1905.3.5.
1905.3.5 Field changes to concrete proportions. Based on test data and observations during the course of construction, the following changes described in Sections 1905.3.5.1 and 1905.3.5.2 are permitted without requiring additional trial mixtures or field strength test records, provided:

1. There are no changes to the type and source of materials described in Sections 1905.3.3 and 1905.3.4, except as permitted in Sections 1905.3.5.1 and 1905.3.5.2;

2. Documentation of these changes are maintained by the concrete producer and the concrete contractor;

3. The changes described in Section 1905.3.5 cannot be used for the submission of an initial mix design to demonstrate that a previously prepared mix design meets strength or air content requirements that differ from the required concrete properties without new field strength test records or new trial mix designs;

4. Where required in Section 1905.3.5, documentation of these changes shall be submitted for acceptance to the registered design professional of record for the structural design by the concrete producer prior to use;

5. Copies of the revised mixtures shall be maintained at the construction site and provided to the licensed concrete testing laboratory performing the acceptance testing of concrete in accordance with Item 4 of Table 1704.4 of this code; and

6. The documentation required by Items 2 and 5 above shall be made available to the commissioner upon request.

1905.3.5.1 Changes that do not require prior approval of the registered design professional of record for the structure. The following admixture modifications to concrete proportions can be made without requiring prior acceptance by the registered design professional of record:

1. Air-entraining admixtures. Air-entraining admixture dosages can be increased or decreased as needed to obtain the air content specified in the construction documents.

2. Water reducing admixtures. Water reducing admixture dosages can be increased or decreased to produce the specified workability, provided that the design water is not exceeded and the changes do not segregate the concrete mix.

1905.3.5.2 Changes that require prior approval of the registered design professional of record for the structure. The following modifications to concrete proportions can be made only with prior acceptance by the registered design professional of record. Any added materials and the final mix proportions shall be indicated in a revised mix design submitted to the registered design professional of record prior to use:

1. Retarding and accelerating admixtures. Retarding and accelerating admixtures may be added to concrete mixtures or the dosage may be modified as needed to maintain practical set times.
2. Pigment. Pigment dosage may be adjusted to maintain uniform concrete color.

3. Fibers. Synthetic, glass or natural fibers may be added to the mix within the manufacturer recommended range. Any loss in workability shall be compensated with a water reducer.

   **Exception:** Steel fibers may not be added to a concrete mixture without the performance of a new mix design.

4. Corrosion inhibitor. Corrosion inhibiting admixtures may be added, provided the corresponding adjustment of mix water remains within the limits of the required water/cementitious material ratio. The added materials and the revised design mix shall be submitted for review by the registered design professional of record for the structure prior to use.

5. Cementitious content and \[\text{water-cementitious}\] material ratio (w/cm). The cementitious content may be increased by a maximum of 12 percent, or the w/cm ratio may be decreased while maintaining the same cementitious content, but the w/cm and air content shall not be increased. Aggregate quantities shall be adjusted, as required, to maintain the mix proportion and yield.

6. Hydration control. Admixture may be added for the purpose of delaying hydration and maintaining a workable mix.

7. Source of aggregate. Change to the source of aggregate may be approved by the registered design professional of record without providing additional test data only when the original aggregate source is no longer producing the required aggregates or the quality of the aggregates produced no longer meets the requirements of ASTM C 33 or the New York State Department of Transportation, provided:

   7.1. The new aggregate source is approved by the New York State Department of Transportation;

   7.2. A modulus of elasticity is not specified;

   7.3. The volume of both the fine and coarse aggregates remains the same and the nominal maximum size of coarse aggregates is unchanged;

   7.4. Lightweight aggregate shall not be substituted for dense, nor dense aggregate for lightweight, where lightweight aggregates are defined as having a specific gravity less than 2.5; and

   7.5. The registered design professional of record is informed of the reason necessitating the change of aggregate.

8. Cementitious materials. Any change to cementitious materials shall require an additional laboratory testing trial batch. The new cementitious material shall maintain the same air and water cementitious ratio (w/cm) as the original mix and meet the strength requirements of ACI 301, Table 4.2.3.3 b. Approval of the registered design
professional of record and submittal of data from either a three- or seven-day compressive strength test shall be required prior to the placement of concrete.

1905.4 Proportioning without field experience or trial mixtures. Concrete proportioning determined without field experience or trial mixtures shall be done in accordance with ACI 318, Section [5.4] 26.4.4.1(b). This method of proportioning shall not be permitted for:

1. Load-carrying structural concrete where the total volume of concrete on a given project exceeds 50 cubic yards (38 m³); or

2. Structural or non-structural concrete mix proportions that will be exposed to exposure classes S1, P1, or C2.

1905.5 Average strength reduction. As data becomes available during construction, it is permissible to reduce the amount by which the average compressive strength (f’c) is required to exceed the specified value of f’c in accordance with ACI 318, Section [5.5] 26.4.4.1(c). A new mix design shall be submitted to the registered design professional of record for approval prior to use.

1905.6 Evaluation and acceptance of concrete. The criteria for evaluation and acceptance of concrete shall be as specified in ACI 318, Sections 26.12 and 26.13, and Sections [1905.6.2] 1905.6.1 through [1905.6.5.5] 1905.6.5 of this code.

1905.6.1 Acceptance testing. Concrete shall be tested in accordance with the requirements in Sections 1905.6.2 through 1905.6.5. Concrete sampling and testing for acceptance shall be deemed a special inspection performed by a licensed concrete testing laboratory as an approved agency. An approved agency shall perform tests on fresh concrete at the job site, prepare specimens required for curing under field conditions, prepare specimens required for testing in the laboratory and record the temperature of the fresh concrete when preparing specimens for strength tests. All field sampling and testing, including the testing of aggregates, concrete mixes, and strength testing of specimens, shall be subject to special inspection by an approved agency. All testing laboratories shall be approved agencies and shall employ qualified special inspectors to perform all required field and laboratory tests. Test results shall be promptly distributed by the testing laboratory to the registered design professional of record, concrete producer, owner and contractor to allow for corrective action where the concrete is found to be noncompliant with the mix design or noncompliant with the requirements otherwise specified in this code. Unless more prompt action is required, test results shall be reported no [less] more than 7 business days after the date the respective tests were performed.

1905.6.2 Frequency of testing. The frequency of conducting strength tests of concrete shall be as specified in Sections 1905.6.2.1 through 1905.6.2.4.

1905.6.2.1 Minimum frequency. For the first 250 cubic yards of each class of concrete placed each day, samples for strength tests of each such class shall be taken: (i) not less than once a day; (ii) not less than once for each 50 cubic yards (38 m³) of concrete; and (iii) not less than once for each 5,000 square feet (465 m²) of surface area for slabs or walls. After the first 250 cubic yards (191 m³), samples for strength tests of each class of concrete placed each day shall be taken once for each additional 150 cubic yards (115 m³). For structural concrete exposed to exposure class C2, additional field testing of the concrete for water
content per AASHTO T 318 shall be required. At the discretion of the registered design professional of record, the frequency of testing may be reduced, but not less than once for each 150 cubic yards (115 m³).

1905.6.2.2 Minimum number. On a given project, if the total volume of concrete is such that the frequency of testing required by Section 1905.6.2.1 would provide less than five strength tests for a given class of concrete, tests shall be made from at least five randomly selected batches or from each batch if fewer than five batches are used.

1905.6.2.3 Small volume. When the total volume of concrete is less than 50 cubic yards (38 m³) on a given project, testing may be waived by the registered design professional of record.

1905.6.2.4 Strength test. A strength test shall be the average of the strengths of two 6 inch by 12 inch (152 mm by 3048 mm) or two 4 inch by 8 inch (102 mm by 203 mm) cylinders made from the same sample of concrete and tested at 28 days or at the test age designated for the determination of \( f_{c} \). Consideration shall be given specifying an \( f_{c} \) at 56 days or later for concrete utilizing pozzolans in the mix proportions. At the discretion of the registered design professional of record or the approved agency performing the testing, additional pairs of test cylinders may be taken at the time of sampling for testing at a later date. The additional cylinders may be tested at a later date should the strength at the specified date not meet the required \( f_{c} \).

1905.6.3 Standard-cured specimens. Standard-cured specimens shall comply with the provisions of Sections 1905.6.3.1 through 1905.6.3.9.

1905.6.3.1 Mix Design. The special inspector shall verify that the proportions indicated on the batch ticket for the concrete delivered to the construction site are as per the approved concrete mix design prior to concrete placement (see Table 1704.4 and 1705.3 of this code). Concrete that does not meet the requirements of the approved concrete mix design shall be rejected.

1905.6.3.2 Sampling. Samples for strength tests shall be taken in accordance with ASTM C 172.

1905.6.3.3 Cylinders. Cylinders for strength tests shall be molded and standard-cured in accordance with ASTM C 31.

1905.6.3.3.1 On-site curing. The contractor shall be responsible for providing the specified field storage curing facility and for monitoring the temperature of the cylinders as defined in ASTM C 31.

1905.6.3.3.2 Final curing. Cylinders shall be placed in final curing conditions meeting the requirements of ASTM C 511. Cylinders shall be transported to final curing conditions by the licensed concrete testing laboratory within 48 hours of casting the cylinders.

1905.6.3.3.3 Compressive strength testing. The cylinders shall be tested in accordance with ASTM C 39.
1905.6.3.4 Evaluation of results. The strength level of an individual class of concrete shall be considered satisfactory if both of the following requirements are met:

1. Every arithmetic average of any three consecutive strength tests equals or exceeds \( f'_{c} \).

2. No individual strength test (average of two cylinders) falls below \( f'_{c} \) by more than 500 psi (3.45 MPa) when \( f'_{c} \) is 5,000 psi (34.50 MPa) or less, or by more than 0.10 \( f'_{c} \) when \( f'_{c} \) is more than 5,000 psi (34.50 MPa).

1905.6.3.5 Correction. If either of the requirements of Section [1905.6.3.4] 1905.6.3.4 is not met, steps shall be taken to increase the average of subsequent strength test results. The requirements of Section 1905.6.5 shall govern if the requirement of Section [1905.6.3.6] 1905.6.3.4, Item 2, is not met.

1905.6.3.6 Field testing. Each time concrete is sampled for strength testing, the tests set forth in Items 1 through 5 shall be performed by the approved agency:

1. Temperature in accordance with ASTM C 1064.

2. Slump in accordance with ASTM C 143.

3. Unit weight in accordance with ASTM C 138.

4. Air content in accordance with ASTM C 173 or C 231. Testing in accordance with ASTM C 173 must be used for concretes made with lightweight aggregates, and other instances where ASTM C 231 is not applicable.

5. Water content per AASHTO T 318 when required by Section 1905.6.2.1 of this code.

1905.6.3.7 Mass concrete. For mass concrete sections identified as requiring monitoring, install temperature devices that are capable of measuring the temperature of the concrete continuously and record temperature data in increments that do not exceed 30 minutes for a minimum period of seven days per ACI 301, Section 8.3 or as otherwise directed by the registered design professional of record. In lieu of monitoring a concrete placement for core and outside face temperatures, a computer simulated thermal study may be substituted, if approved by the registered design professional of record. The computer simulated thermal study shall be of the largest section placed for a specific concrete mix proportion and reflect the thermal properties for the specific cementitious materials and quantities in the mix. The thermal study shall include the maximum temperature at which concrete may be placed and the ambient temperature range for concrete placement.

1905.6.3.8 Results of field tests. The approved agency shall immediately report the results of field tests performed to the contractor and concrete truck driver, or other representative of the concrete producer. If at any time during the concrete operations, the concrete is not in conformance with ASTM C 94, this code, or is otherwise compromised, it shall be rejected. If it is placed, the location of the load shall be recorded and a pair of cylinders shall be molded from the load per ASTM C 31 and included in the average \( f'_{c} \). The approved agency shall keep
a written record of all field tests at the construction site and make the records available upon request. These results need not be used in calculating the arithmetic average of consecutive test results required by Section 1905.6.3.4.

1905.6.3.9 Reporting requirements. Field sampling and testing shall be deemed a special inspection, and the approved agency performing the field sampling and testing of concrete at the construction site shall be subject to the requirements of Section 1704.1.2 regarding reporting of deficiencies.

1905.6.4 Field-cured specimens. Field-cured specimens shall comply with the provisions of Sections 1905.6.4.1 through 1905.6.4.4.

1905.6.4.1 When required. Where required by the commissioner, the results of strength tests of cylinders cured under field conditions shall be provided to the department.

1905.6.4.2 Curing. Field-cured cylinders shall be cured under field conditions in accordance with ASTM C 31.

1905.6.4.3 Sampling. Field-cured test cylinders shall be molded at the same time and from the same samples as laboratory-cured test cylinders.

1905.6.4.4 Correction. Procedures for protecting and curing concrete shall be improved when the strength of field-cured cylinders at the test age designated for determination of $f'_c$ is less than 85 percent of that of companion laboratory-cured cylinders. The 85-percent limitation shall not apply if the field-cured strength exceeds $f'_c$ by more than 500 psi (3.45 MPa).

1905.6.5 Low-strength test results. The investigation of low-strength test results shall be in accordance with the provisions of Sections 1905.6.5.1 through 1905.6.5.5.

1905.6.5.1 Precaution. If any strength test of laboratory-cured cylinders performed in accordance with Section 1905.6.2.4 falls below the specified value of $f'_c$ by more than the values given in Section 1905.6.3.4, Item 2, or if tests of field-cured cylinders performed in accordance with Section 1905.6.4.4 indicate deficiencies in protection and curing, steps shall be taken to assure that the load-carrying capacity of the structure is not jeopardized.

1905.6.5.2 Core tests. Where calculations indicate that load-carrying capacity is significantly reduced, tests of cores drilled from the area in question in accordance with ASTM C 42 shall be permitted. In such cases, three cores shall be taken for each strength test that falls below the values given in Section 1905.6.3.4, Item 2.

1905.6.5.3 Condition of cores. Cores shall be prepared for transport and storage by wiping drilling water from their surfaces and placing the cores in water-tight bags or containers immediately after drilling. Cores shall be tested not earlier than 48 hours nor later than seven days after coring unless approved by the registered design professional of record.
1905.6.5.4 Test results. Concrete in an area represented by core tests shall be considered structurally adequate if the average of three cores is equal to at least 85 percent of $f'c$ and if no single core is less than 75 percent of $f'c$. Additional testing of cores extracted from locations represented by erratic core strength results is permitted.

1905.6.5.5 Strength evaluation. If the criteria of Section 1905.6.5.4 are not met and the structural adequacy remains in doubt, the commissioner may order a strength evaluation in accordance with ACI 318, Chapter [20] 27, for the questionable portion of the structure, or take other appropriate action. The registered design professional of record shall present to the commissioner a complete analysis showing the final safe load-carrying capacity of the questionable portion of the structure including any proposed remedial actions necessary for review and approval.

1905.6.6 Steel fiber-reinforced concrete. Steel fiber-reinforced concrete used in beams shall be subject to the requirements of ACI 318, Section [5.6.6] 26.12.5. The required testing and inspection of steel fiber-reinforced concrete shall be deemed a special inspection. Steel fibers shall not be used in place of required reinforcing bars.

1905.7 Preparation of equipment and place of deposit. Preparation before concrete placement shall include the following:

1. Equipment for mixing and transporting concrete shall be clean.
2. Debris and ice shall be removed from spaces to be occupied by concrete.
3. Forms shall be properly coated.
4. Masonry filler units that will be in contact with concrete shall be well drenched.
5. Reinforcement shall be thoroughly clean of ice or other deleterious coatings.
6. Water shall be removed from the place of deposit before concrete is placed unless a tremie is to be used or unless otherwise permitted by the commissioner.
7. Laitance and other unsound material shall be removed before additional concrete is placed against hardened concrete.

1905.8 Mixing. Mixing of concrete shall be performed in accordance with Sections 1905.8.1 through 1905.8.3.

1905.8.1 General. Concrete shall be mixed until there is a uniform distribution of materials and shall be discharged completely before the mixer is recharged. Concrete delivered shall be proportioned in accordance with Section 1905.2.3. Modification to the approved concrete proportions shall be based upon standards acceptable to the commissioner.

1905.8.2 Ready-mixed concrete. Ready-mixed concrete shall be mixed and delivered in accordance with the requirements of ASTM C 94 or ASTM C 685.
1905.8.2.1 **Concrete plants.** Concrete plants shall be certified by the National Ready Mixed Concrete Association (NRMCA), the Concrete Industry Board Concrete Producer Certification Program, or other program acceptable to the department, and shall comply with the rules of the department. Concrete producers shall have their plants inspected quarterly and have their scales and trucks certified. In fulfilling this certification requirement, the concrete producer may present certification by either a New York City government agency, or by the New York State Department of Transportation subject to the approval of the commissioner.

1905.8.2.2 **Delivery personnel.** Concrete ready-mix truck drivers shall be certified by the NRMCA and shall comply with the rules of the department.

1905.8.2.3 **Batch tickets.** Batch tickets shall accompany every load of concrete delivered to a site. The batch ticket shall contain the information specified in Items 1 through 7:

1. Plant name and location.
2. Contract number and project.
3. Mix designation as to type and strength.
4. Each material in the load along with quantities of each by weight, and admixture by ounces or gallons.
5. The total amount of mix proportion water approved, quantity of water added at the plant and in transit, and the remaining water that can be added on site.
6. Any deviations from the approved concrete mix design and variations permitted by Section 1905.3.5.
7. The time the water was added to the batch.

1905.8.2.3.1 **Copies of batch tickets.** A copy of each batch ticket shall be given to the licensed concrete testing laboratory special inspector performing the acceptance testing at the delivery of each load. The licensed laboratory shall maintain copies of the batch tickets along with other inspection reports required by Section 1704.1, and make them available to the department upon request.

1905.8.3 **Job-mixed concrete.** Job-mixed concrete shall comply with ACI 318, Section 10.2.6.5.

1905.9 **Conveying.** The method and equipment for conveying concrete to the place of deposit shall comply with Sections 1905.9.1 and 1905.9.2.

1905.9.1 **Method of conveyance.** Concrete shall be conveyed from the mixer to the place of final deposit by methods that will prevent separation or loss of materials that may alter the properties of the concrete delivered. Cylinders shall be made to determine the quality of concrete. Such cylinders shall be made at the truck or at the point of placement of the concrete as determined by the special inspection agency or the registered design professional of record.
1905.9.2 Conveying equipment. The conveying equipment shall be capable of providing a supply of concrete at the site of placement without separation of ingredients and without interruptions sufficient to permit the loss of plasticity between successive increments.

1905.10 Depositing. The depositing of concrete shall comply with the provisions of Sections 1905.10.1 through 1905.10.8.

1905.10.1 Segregation. Concrete shall be deposited as nearly as practicable to its final position to avoid segregation due to rehandling or flowing.

1905.10.2 Placement timing. Concreting operations shall be carried on at such a rate that the concrete is at all times plastic and flows readily into spaces between reinforcement.

1905.10.3 Unacceptable concrete. Concrete that has partially hardened or been contaminated by foreign materials shall not be deposited in the structure.

1905.10.4 Retempering. Retempered concrete or concrete that has been remixed after initial set shall not be used.

1905.10.5 Continuous operation. After concreting has started, it shall be carried on as a continuous operation until placing of a panel or section, as defined by its boundaries or predetermined joints, is completed, except as permitted or prohibited by Section 1906.4.

1905.10.6 Placement in vertical lifts. The top surfaces of vertically formed lifts shall be generally level.

1905.10.7 Construction joints. When construction joints are required, they shall be made in accordance with Section 1906.4.

1905.10.8 Consolidation. Concrete shall be thoroughly consolidated by suitable means during placement and shall be thoroughly worked around reinforcement and embedded fixtures and into corners of the forms.

1905.11 Curing. The curing of concrete shall be in accordance with Sections 1905.11.1 through 1905.11.3.

1905.11.1 Regular. Concrete (other than high early strength) shall be maintained above 50°F (10°C) and in a moist condition for at least the first seven days after placement, except when cured in accordance with Section 1905.11.3.

1905.11.2 High-early-strength. High-early-strength concrete shall be maintained above 50°F (10°C) and in a moist condition for at least the first three days, except when cured in accordance with Section 1905.11.3.

1905.11.3 Accelerated curing. Accelerated curing of concrete shall comply with ACI 318, Section [5.11.3] 26.5.3.2(c), but concrete temperature shall not exceed 160°F (71°C).

1905.12 Cold weather requirements. Concrete that is to be placed during freezing or near-freezing weather shall comply with the following:
1. Adequate equipment shall be provided for insulating or heating concrete materials and protecting concrete during freezing or near-freezing weather.

2. Concrete materials and reinforcement, forms, fillers and ground with which concrete is to be in contact shall be free from frost. The temperature of surfaces in contact with fresh concrete, including but not limited to forms and reinforcing steel, shall be raised above freezing.

3. Frozen materials or materials containing ice shall not be used.

1905.13 Hot weather requirements. During hot weather, proper attention shall be given to ingredients, production methods, handling, placing, protection and curing to prevent excessive concrete temperatures or water evaporation that could impair the required strength or serviceability of the member or structure.

SECTION BC 1906
FORMWORK, EMBEDDED PIPES AND CONSTRUCTION JOINTS

1906.1 Formwork. The design, fabrication and erection of forms shall comply with the requirements of ACI 318, Section 26.11 and Section 3305.3 of this code [and with ACI 318, Section 6.1].

1906.2 Removal of forms, shores and reshores. The removal of forms and shores, including slabs and beams (except where cast on the ground), and the installation of reshores shall comply with ACI 318, Section 26.11.2 and Section 3305.3 of this code [and ACI 318, Section 6.2].

1906.3 Conduits and pipes embedded in concrete. Conduits, pipes and sleeves of any material not harmful to concrete and within the limitations of ACI 318, Section [6.3] 20.7, are permitted to be embedded in concrete with approval of the registered design professional of record.

1906.4 Construction joints. Construction joints, including their location, shall comply with the provisions of ACI 318, Section [6.4] 26.5.6. Construction joints, including their location, shall be approved by the registered design professional of record prior to installation.

SECTION BC 1907
DETAILS OF REINFORCEMENT

1907.1 Hooks. Standard hooks on reinforcing bars used in concrete construction shall comply with ACI 318, Section [7.4] 25.3.

1907.2 Minimum bend diameters. Minimum reinforcement bend diameters utilized in concrete construction shall comply with ACI 318, Section [7.2] 25.3.2.

1907.3 Bending. The bending of reinforcement shall comply with Sections 1907.3.1 and 1907.3.2.

1907.3.1 Cold bending. Reinforcement shall be bent cold, unless otherwise permitted by the registered design professional of record.

1907.3.2 Embedded reinforcement. Reinforcement partially embedded in concrete shall not be field bent, except as shown on the construction documents or permitted by the registered design
professional of record.

1907.4 Surface conditions of reinforcement. The surface conditions of reinforcement shall comply with the provisions of Sections 1907.4.1 through 1907.4.3.

1907.4.1 Coatings. At the time concrete is placed, reinforcement shall be free from mud, oil or other nonmetallic coatings that decrease bond. Zinc and epoxy-coating of steel reinforcement in accordance with ACI 318, [Sections 3.5.3.8, 3.5.3.9, and 3.5.3.10] Section 20.6.2 shall be permitted.

1907.4.2 Rust or mill scale. Except for prestressing [steel] reinforcement, steel reinforcement with rust, mill scale or a combination of both, shall be permitted, provided the minimum dimensions, including height of deformations and weight of a hand-wire-brushed test specimen, comply with applicable ASTM specifications specified in Section [1903.5] 1903.6.

1907.4.3 Prestressing [steel] reinforcement. Prestressing [steel] reinforcement shall be clean and free of oil, dirt, scale, pitting and excessive rust. A light coating of rust is permitted.

1907.5 Placing reinforcement. The placement of concrete reinforcement shall comply with the provisions of Sections 1907.5.1 through 1907.5.4.

1907.5.1 Support. Reinforcement, including tendons, and posttensioning ducts shall be accurately placed and adequately supported before concrete is placed, and shall be secured against displacement within tolerances permitted in Section 1907.5.2. Where approved by the registered design professional of record, embedded items (such as dowels or inserts) that either protrude from precast concrete members or remain exposed for inspection are permitted to be embedded while the concrete is in a plastic state, provided the following conditions are met:

1. Embedded items are maintained in the correct position while the concrete remains plastic.
2. The concrete is properly consolidated around the embedded item. Embedded items are not required to be hooked or tied to reinforcement within the concrete.

1907.5.2 Tolerances. Unless otherwise specified by the registered design professional of record, reinforcement, including tendons, and posttensioning ducts shall be placed within the tolerances specified in Sections 1907.5.2.1 and 1907.5.2.2.

1907.5.2.1 d and cover. Tolerance for d and concrete cover [in flexural members, walls and compression members] shall be as shown required in [Table 1907.5.2.1, except that tolerance for the clear distance to formed soffits shall be minus 1/4 inch (6.4 mm) and tolerance for cover shall not exceed minus one-third the concrete cover specified in the design drawings or specifications] ACI 318, Section 26.6.2.1(a).

[For SI: 1 inch = 25.4 mm.]

1907.5.2.2 Bends and ends. Tolerance for longitudinal location of bends and ends of reinforcement shall be ±2 inches (±51 mm) except the tolerance shall be ±1/2 inch (±12.7 mm) at the discontinuous ends of brackets and corbels, and ±1 inch (25 mm) at the discontinuous ends of other members. The tolerance for concrete cover of Section 1907.5.2.1 shall also apply at discontinuous ends of members, as required by ACI 318, Section 26.6.2.1(b).

1907.5.3 Welded wire reinforcement. Welded wire reinforcement with wire size not greater than W5 or D5 used in slabs not exceeding 10 feet (3048 mm) in span is permitted to be curved from a point near the top of the slab over the support to a point near the bottom of the slab at midspan, provided such reinforcement is either continuous over, or securely anchored at support.

1907.5.4 Welding. Welding of crossing bars shall not be permitted for assembly of reinforcement unless authorized by the registered design professional of record.

1907.6 [Spacing limits for] Minimum spacing of reinforcement. The clear distance between reinforcing bars, bundled bars, tendons and ducts shall comply with ACI 318, Section 7.6 25.2.

1907.7 Concrete protection for reinforcement. The minimum concrete cover for reinforcement shall comply with Sections 1907.7.1 through 1907.7.8.

1907.7.1 Cast-in-place concrete (nonprestressed). Minimum specified concrete cover shall be provided for reinforcement in nonprestressed, cast-in-place concrete construction in accordance with [Table 1907.7.1] ACI 318, Section 20.6.1.3.1, but shall not be less than required by Sections 1907.7.6 and 1907.7.8 of this code.

For SI: 1 inch = 25.4 mm.

1907.7.2 **Cast-in-place concrete (prestressed).** The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in cast-in-place prestressed concrete shall comply with ACI 318, Section [7.7.2] 20.6.1.3.2.

1907.7.3 **Precast concrete (manufactured under plant control conditions).** The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in precast concrete manufactured under plant control conditions shall comply with ACI 318, Section [7.7.3] 20.6.1.3.3.

1907.7.4 **Bundled bars.** The minimum specified concrete cover for bundled bars shall comply with ACI 318, Section [7.7.4] 20.6.1.3.4.

1907.7.5 **Headed shear stud reinforcement.** For headed shear stud reinforcement, the minimum specified concrete cover shall comply with ACI 318, Section [7.7.5] 20.6.1.3.5.

1907.7.6 **Corrosive environments.** In corrosive environments or other severe exposure conditions, prestressed and nonprestressed reinforcement shall be provided with additional protection in accordance with ACI 318, Section [7.7.6] 20.6.1.4.

1907.7.7 **Future extensions.** Exposed reinforcement, inserts and plates intended for bonding with future extensions shall be protected from corrosion.
1907.7.8 Fire protection. When this code requires a thickness of cover for fire protection greater than the minimum concrete cover in Section 1907.7, such greater thickness shall be specified on the construction documents.

1907.8 Special reinforcement details for columns. Offset bent longitudinal bars in columns and load transfer in structural steel cores of composite compression members shall comply with the provisions of ACI 318, Section [7.8] 10.7.4.

1907.9 Connections. Connections between concrete framing members shall comply with the provisions of ACI 318, [Section 7.9] Chapters 15 and 16.

1907.10 Transverse reinforcement for compression members. Transverse reinforcement for compression members shall comply with the provisions of ACI 318, Section [7.10] 25.7.2.

1907.11 Transverse reinforcement for flexural members. Transverse reinforcement for compression reinforcement in flexural members shall comply with the provisions of ACI 318, Section [7.11] 25.7.1.

1907.12 Shrinkage and temperature reinforcement. Reinforcement for shrinkage and temperature stresses in concrete members shall comply with the provisions of ACI 318, Section [7.12] 24.4.

1907.13 Requirements for structural integrity. The detailing of reinforcement and connections between concrete members shall comply with the provisions of ACI 318, Section [7.13] 4.10 and Section 1912 of this code.

SECTION BC 1908
MODIFICATIONS TO ACI 318

1908.1 General. The text of ACI 318 shall be modified as indicated in Sections 1908.1.1 through [1908.1.7] 1908.1.10.

1908.1.1 ACI 318, Section [2.2] 2.3. Modify existing definitions and add the following definitions to ACI 318, Section [2.2] 2.3.

DESIGN DISPLACEMENT. Total lateral displacement expected for the design-basis earthquake, as specified by Section 12.8.6 of ASCE 7.

DETAILED PLAIN CONCRETE STRUCTURAL WALL. A wall complying with the requirements of Chapter [22] including 22.6.7 including 14 including 14.6.2.

ORDINARY PRECAST STRUCTURAL WALL. A precast wall complying with the requirements of ACI 318 except for Chapters [1 through 18] 14, 17 and 18.

ORDINARY REINFORCED CONCRETE STRUCTURAL WALL. A cast-in-place wall complying with the requirements of ACI 318 except for Chapters [1 through 18] 14, 17 and 18.

ORDINARY STRUCTURAL PLAIN CONCRETE WALL. A wall complying with the requirements of Chapter [22] 14, excluding [22.6.7] 14.6.2.
SPECIAL STRUCTURAL WALL. A cast-in-place or precast wall complying with the requirements of [21.1.3] 18.2.4 through [21.1.7, 21.9] 18.2.8, 18.10 and [21.10] 18.11, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a “special reinforced concrete structural shear wall,” it shall be deemed to mean a “special structural wall.”

WALL PIER. A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not exceeding six, whose clear height is at least two times its horizontal length.

1908.1.2 ACI 318, Section 8.7.2. Modify ACI 318, Section 8.7.2.3 and 8.7.2.4, and add new sections 8.7.2.5 and 8.7.2.6 to read as follows:

8.7.2.3 – For prestressed slabs with Banded-Distributed tendon placement, the maximum spacing s of tendons or groups of tendons in the distributed direction shall be the lesser of 8h and 5ft.

8.7.2.4 – The placement of tendons banded in both directions over the supports in two-way slabs is allowed. For Banded-Banded tendon placement, all provisions of ACI-318 Chapter 8 shall apply, except section 8.7.2.3, referring to the maximum tendon spacing limitation.

8.7.2.5 – At locations where the average effective prestress is not distributed, the two-way slab shall be designed using non-prestressed reinforcement.

8.7.2.6 – Concentrated Loads and openings shall be considered in determining tendon spacing.

1908.1.3 ACI 318, Section 14.1.4. Delete ACI 318, Section 14.1.4 and replace with the following:

14.1.4 – Plain concrete in structures assigned to Seismic Design Category C or D.

14.1.4.1 – Structures assigned to Seismic Design Category C or D shall not have elements of structural plain concrete, except as follows:

(a) Structural plain concrete basement, foundation or other walls below the base, as defined in ASCE 7, are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall be not less than 7½ inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 14.6.1.

(b) Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.

Exception: In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.

(c) Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area
of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.

Exceptions:

1. In Seismic Design Categories A, B and C, detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls are permitted to have plain concrete footings without longitudinal reinforcement.

2. For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stem wall and at the bottom of the footing.

3. Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.

1908.1.4 ACI 318, Section 14.6. Modify ACI 318, Section 14.6 by adding new Section 14.6.2 to read as follows:

14.6.2 – Detailed plain concrete structural walls.

14.6.2.1 – Detailed plain concrete structural walls are walls conforming to the requirements of ordinary structural plain concrete walls and 14.6.2.2.

14.6.2.2 – Reinforcement shall be provided as follows:

(a) Vertical reinforcement of at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for one of the two No. 5 bars required by 14.6.1.

(b) Horizontal reinforcement at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided:

1. Continuously at structurally connected roof and floor levels and at the top of walls;

2. At the bottom of load-bearing walls or in the top of foundations where doweled to the wall; and

3. At a maximum spacing of 120 inches (3048 mm).

Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.

1908.1.5 ACI 318, Section 15.3. Modify ACI 318 by adding Section 15.3.2 to read as follows:
15.3.2 When the specified compressive strength of concrete in a column is greater than 1.4 times that specified for a floor system, the following additional requirements shall be adhered to:

1. All of the design provisions of Section 15.3 (unmodified) are adhered to.

2. The concrete construction is supervised and inspected continuously by a full-time professional engineer responsible for the concrete placement special inspection. Such professional engineer shall not delegate this responsibility to any subordinates.

1908.1.6 ACI 318, Section 17.2.3. Modify ACI 318 Sections 17.2.3.4.2, 17.2.3.4.3(d) and 17.2.3.5.2 to read as follows:

17.2.3.4.2 – Where the tensile component of the strength-level earthquake force applied to anchors exceeds 20 percent of the total factored anchor tensile force associated with the same load combination, anchors and their attachments shall be designed in accordance with 17.2.3.4.3. The anchor design tensile strength shall be determined in accordance with 17.2.3.4.4.

Exception: Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 shall be deemed to satisfy Section 17.2.3.4.3(d).

17.2.3.4.3(d) – The anchor or group of anchors shall be designed for the maximum tension obtained from design load combinations that include E, with E increased by $\Omega_0$. The anchor design tensile strength shall be calculated from 17.2.3.4.4.

17.2.3.5.2 – Where the shear component of the strength-level earthquake force applied to anchors exceeds 20 percent of the total factored anchor shear force associated with the same load combination, anchors and their attachments shall be designed in accordance with 17.2.3.5.3. The anchor design shear strength for resisting earthquake forces shall be determined in accordance with 17.5.

Exceptions:

1. For the calculation of the in-plane shear strength of anchor bolts attaching wood sill plates of bearing or nonbearing walls of light-frame wood structures to foundations or foundation stem walls, the in-plane shear strength in accordance with 17.5.2 and 17.5.3 need not be computed and 17.2.3.5.3 shall be deemed to be satisfied provided all of the following are met:

1.1. The allowable in-plane shear strength of the anchor is determined in accordance with AWC NDS Table 12E for lateral design values parallel to grain.

1.2. The maximum anchor nominal diameter is $\frac{3}{8}$ inch (16 mm).

1.3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).
1.4. Anchor bolts are located a minimum of 1¾ inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.

1.5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.

1.6. The sill plate is 2-inch (51 mm) or 3-inch (76 mm) nominal thickness.

2. For the calculation of the in-plane shear strength of anchor bolts attaching cold-formed steel track of bearing or non-bearing walls of light-frame construction to foundations or foundation stem walls, the in-plane shear strength in accordance with 17.5.2 and 17.5.3 need not be computed and 17.2.3.5.3 shall be deemed to be satisfied provided all of the following are met:

2.1. The maximum anchor nominal diameter is ⅝ inch (16 mm).

2.2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).

2.3. Anchors are located a minimum of 1¾ inches (45 mm) from the edge of the concrete parallel to the length of the track.

2.4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.

2.5. The track is 33 to 68 mil (0.84 mm to 1.73 mm) designation thickness.

Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete, shall be permitted to be determined in accordance with AISI S100, Section J3.3.1.

3. In light-frame construction bearing or non-bearing walls, shear strength of concrete anchors less than or equal to 1 inch (25 mm) in diameter attaching sill plate or track to foundation or foundation stem wall need not satisfy 17.2.3.5.3(a) through (c) when the design strength of the anchors is determined in accordance with 17.5.2.1(c).

1908.1.7 ACI 318, Section [21.1.1] 18.2.1. Modify ACI 318 Sections [21.1.1.3] 18.2.1.2 and [21.1.1.7] 18.2.1.6 to read as follows:

[21.1.1.3] 18.2.1.2 – Structures assigned to Seismic Design Category A shall satisfy requirements of Chapters 1 [to 19] through 17 and [22] 19 through 26; Chapter [24] 18 does not apply. Structures assigned to Seismic Design Category B, C, or D also shall satisfy [21.1.1.4] 18.2.1.3 through [21.1.1.8] 18.2.1.7, as applicable. Except for structural elements of plain concrete complying with Section [1908.1.8] 1908.1.2 of the New York City Building Code, structural elements of plain concrete are prohibited in structures assigned to Seismic Design Category C or D.

[21.1.1.7] 18.2.1.6 - Structural systems designated as part of the seismic force-resisting system shall be restricted to those permitted by ASCE 7 as modified
by Chapter 16 of the New York City Building Code. Except for Seismic Design Category A, for which Chapter [21] U8 does not apply, the following provisions shall be satisfied for each structural system designated as part of the seismic force-resisting system, regardless of the Seismic Design Category:

(a) Ordinary moment frames shall satisfy [21.2] 18.3.

(b) Ordinary reinforced concrete structural walls and ordinary precast structural walls need not satisfy any provisions in Chapter [21] 18.

(c) Intermediate moment frames shall satisfy [21.3] 18.4.

(d) Intermediate precast structural walls shall satisfy [21.4] 18.5.

(f) Special structural walls shall satisfy [21.9] 18.10.

(g) Special structural walls constructed using precast concrete shall satisfy [21.10] 18.11.

All special moment frames and special structural walls shall also satisfy [21.1.3] 18.2.4 through [21.1.7] 18.2.8.

[1908.1.3] 1908.1.8 ACI 318, [21.4] Section 18.5. Modify ACI 318, Section [21.4] 18.5, by adding new Section 18.5.2.2 and renumbering [Section 21.4.3] existing Sections 18.5.2.2 and 18.5.2.3 to become [21.4.4] and adding new Sections 21.4.3, 21.4.5, 21.4.6, and 21.4.7 to read as follows:

[21.4.3] 18.5.2.2 – Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement or shall use Type 2 mechanical splices.

[21.4.4] 18.5.2.3 – Elements of the connection that are not designed to yield shall develop at least 1.5 S_y.

18.5.2.4 – In structures assigned to Seismic Design Category D, wall piers shall be designed in accordance with Section 18.10.8 or 18.14 in ACI 318.

[21.4.6] Wall piers not designed as part of a moment frame in buildings assigned to Seismic Design Category C shall have transverse reinforcement designed to resist the shear forces determined from 21.3.3. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).]

[Exceptions:]

1469

[2.] Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.

[21.4.7] Wall segments with a horizontal length to thickness ratio less than 2.5 shall be designed as columns.

[1908.1.4 ACI 318, Section 21.9. Modify ACI 318, Section 21.9.8, by deleting Section 21.9.8 and replacing with the following:

[21.9.8.1] Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in Section 21.9.8.2.

[Exceptions:]

[1.] Wall piers that satisfy Section 21.13.

[2.] Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers, and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.

[21.9.8.2] Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from Sections 21.6.5.1. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

[21.9.8.3] Wall segments with a horizontal length to thickness ratio less than 2.5 shall be designed as columns.

[1908.1.5 ACI 318, Section 21.10.2. Modify ACI 318, Section 21.10.2, to read as follows:

1908.1.9 ACI 318, Section 18.11. Modify ACI 318, Section 18.11.2 to read as follows:

[21.10.2] 18.11.2.1 – Special structural walls constructed using precast concrete shall satisfy all the requirements of [21.9] Section 18.10 for cast-in-place special structural walls in addition to [Sections 21.4.2 through 21.4.4] Section 18.5.2.

[1908.1.6] 1908.1.10 ACI 318, Section 18.12.1.1. Modify ACI 318, Section 18.12.1.1, to read as follows:

[21.12.1.1] 18.13.1.1 Foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and the ground shall comply with the requirements of Section 21.10 18.13 and other applicable provisions of ACI 318 unless modified by Chapter 18 of the New York City Building Code.
[1908.1.7 ACI 318, Section 22.6. Modify ACI 318, Section 22.6 by adding new 22.6.7 to read as follows:]

[22.6.7—Detailed plain concrete structural walls.]

[22.6.7.1—Detailed plain concrete structural walls are walls conforming to the requirements of ordinary structural plain concrete walls and 22.6.7.2.]

[22.6.7.2—Reinforcement shall be provided as follows:]

(a) Vertical reinforcement of at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for one of the two No. 5 bars required by 22.6.6.5.]

(b) Horizontal reinforcement at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided:

1. Continuously at structurally connected roof and floor levels and at the top of walls;

2. At the bottom of load-bearing walls or in the top of foundations where doweled to the wall; and

3. At a maximum spacing of 120 inches (3048 mm).]

[Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.]

[1908.1.8 ACI 318, Section 22.10. Delete ACI 318, Section 22.10, and replace with the following:]

[22.10—Plain concrete in structures assigned to Seismic Design Category C or D.]

[22.10.1—Structures assigned to Seismic Design Category C or D shall not have elements of structural plain concrete, except as follows:]

(a) Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not less than 7½ inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.]

(b) Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.]
[Exception: In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.]

(e) Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.

[Exceptions:]

1. In Seismic Design Categories A, B and C, detached one- and two-family dwellings three stories or less in height and constructed with stud-bearing walls are permitted to have plain concrete footings without longitudinal reinforcement.

2. For foundation systems consisting of a plain concrete footing and a plain concrete stemwall, a minimum of one bar shall be provided at the top of the stem wall and at the bottom of the footing.

3. Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.

[1908.1.9—ACI 318, Section D.3.3—Modify ACI 318, Sections D.3.3.4.2, D.3.3.4.3(d), and D.3.3.5.2 to read as follows:]

[D.3.3.4.2—Where the tensile component of the strength level earthquake force applied to anchors exceeds 20 percent of the total factored anchor tensile force associated with the same load combination, anchors and their attachments shall be designed in accordance with D.3.3.4.3. The anchor design tensile strength shall be determined in accordance with D.3.3.4.4.]

[Exception: Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7–10 Equation 12.11-1 or 12.14-10 shall be deemed to satisfy Section D.3.3.4.3(d).]

[D.3.3.4.3(d)—The anchor or group of anchors shall be designed for the maximum tension obtained from design load combinations that include E, with E increased by \( \Omega_0 \). The anchor design tensile strength shall be calculated from Section D.3.3.4.4.]

[D.3.3.5.2—Where the shear component of the strength level earthquake force applied to anchors exceeds 20 percent of the total factored anchor shear force associated with the same load combination, anchors and their attachments shall be designed in accordance with D.3.3.5.3. The anchor design shear strength for resisting earthquake forces shall be determined in accordance with D.6.]
[Exceptions:]

1. For the calculation of the in-plane shear strength of anchor bolts attaching wood sill plates of bearing or nonbearing walls of light frame wood structures to foundations or foundation stem walls, the in-plane shear strength in accordance with D.6.2 and D.6.3 need not be computed and D.3.3.5.3 shall be deemed to be satisfied provided all of the following are met:

   1.1. The allowable in-plane shear strength of the anchor is determined in accordance with AF&PA NDS Table 11E for lateral design values parallel to grain.

   1.2. The maximum anchor nominal diameter is ⅝ inches (16 mm).

   1.3. Anchor bolts are embedded into concrete a minimum of 7 inches (178 mm).

   1.4. Anchor bolts are located a minimum of 1⅜ inches (45 mm) from the edge of the concrete parallel to the length of the wood sill plate.

   1.5. Anchor bolts are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the wood sill plate.

   1.6. The sill plate is of 2-inch or 3-inch nominal thickness.

2. For the calculation of the in-plane shear strength of anchor bolts attaching cold-formed steel track of bearing or nonbearing walls of light frame construction to foundations or foundation stem walls, the in-plane shear strength in accordance with D.6.2 and D.6.3 need not be computed and D.3.3.5.3 shall be deemed to be satisfied provided all of the following are met:

   2.1. The maximum anchor nominal diameter is ⅝ inches (16 mm).

   2.2. Anchors are embedded into concrete a minimum of 7 inches (178 mm).

   2.3. Anchors are located a minimum of 1⅜ inches (45 mm) from the edge of the concrete parallel to the length of the track.

   2.4. Anchors are located a minimum of 15 anchor diameters from the edge of the concrete perpendicular to the length of the track.

   2.5. The track is 33 to 68 mil designation thickness. Allowable in-plane shear strength of exempt anchors, parallel to the edge of concrete, shall be permitted to be determined in accordance with AISI S100 Section E3.3.1.

3. In light-frame construction, bearing or non-bearing walls, shear strength of concrete anchors less than or equal to 1 inch (25 mm) in diameter connecting sill plate or track to foundation or foundation stem wall need not satisfy D.3.3.5.3(a) through (c) when the design strength of the anchors is determined in accordance with D.6.2.1(c).
[1908.1.10] 1908.1.11 [Reserved.]

[1908.1.11] ACI 318, Section [9.5.2.3] 24.2.3.5. Add the following to Section [9.5.2.3] 24.2.3.5:

[2] When calculating $M_a$, consideration shall be given to loads imposed during construction.[2]

[1908.2 General. The text of ACI 318 shall be modified as indicated in Sections 1908.2.1 through 1908.2.4.]

[1908.2.1 ACI 318, Section 10.12. Modify ACI 318 by adding Section 10.12.4 to read as follows:]

10.12.4 When the specified compressive strength of concrete in a column is greater than 1.4 times that specified for a floor system, the following additional requirements shall be adhered to:

1. All of the design provisions of Section 10.12 (unmodified) are adhered to.

2. The concrete construction is supervised and inspected continuously by a full-time professional engineer responsible for the concrete placement special inspection. Such professional engineer shall not delegate this responsibility to any subordinates.

SECTION BC 1909
STRUCTURAL PLAIN CONCRETE

1909.1 Scope. The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of [Section 1909 and] ACI 318, [Chapter 22,] as modified by Section 1908 of this chapter.

1909.1.1 Special structures. For special structures, such as arches, underground utility structures, gravity walls and shielding walls, the provisions of Section 1909 shall govern where applicable.

1909.2 Limitations. The use of structural plain concrete columns and structural plain concrete footings on piles is not permitted. In addition to the limitations set forth in Section 1908.1.8 of this chapter, the use of structural plain concrete shall otherwise be limited to:

1. Members that are continuously supported by soil, such as walls and footings, or by other structural members capable of providing continuous vertical support.

2. Members for which arch action provides compression under all conditions of loading.

3. Walls and pedestals.

1909.3 Joints. Contraction or isolation joints shall be provided to divide structural plain concrete members into flexurally discontinuous elements in accordance with ACI 318, Section 22.3.
1909.4 Design. Structural plain concrete walls, footings and pedestals shall be designed for adequate strength in accordance with ACI 318, Sections 22.4 through 22.8.

Exception: For Group R-3 occupancies and buildings of other occupancies less than two stories above grade plane of light-frame construction, the required [edge] footing thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.

1909.5 Precast members. The design, fabrication, transportation and erection of precast, structural plain concrete elements shall be in accordance with ACI 318, Section 22.9.

1909.6 Walls. In addition to the requirements of this section, structural plain concrete walls shall comply with the applicable requirements of ACI 318, Chapter 22.

1909.6.1 Basement walls. The thickness of exterior basement walls and foundation walls shall be not less than 7 1/2 inches (191 mm).

1909.6.2 Other walls. Except as provided in Section 1909.6.1, the thickness of bearing walls shall be not less than 1/24 the unsupported height or length, whichever is shorter, but not less than 5 1/2 inches (140 mm).

1909.6.3 Openings in walls. Not less than two No. 5 bars shall be provided around window and door openings. The bars shall be anchored to develop f_y in tension at the corners of openings.

SECTION BC 1910
MINIMUM SLAB PROVISIONS

1910.1 General. The thickness of concrete floor slabs supported directly on the ground shall not be less than 3 1/2 inches (89 mm). A 6-mil (0.006 inch; 0.152 mm) polyethylene vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other approved equivalent methods or materials shall be used to retard vapor transmission through the floor slab.

Exception: A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m²) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For drive ways, walks, patios and other flat work that will not be enclosed at a later date.
5. Where approved based on local site conditions.
[SECTION BC-1911]
[ANCHORAGE TO CONCRETE—ALLOWABLE]
[STRESS DESIGN]

[1911.1] Scope. The provisions of this section shall govern the allowable stress design of headed bolts and headed stud anchors cast in normal-weight concrete for purposes of transmitting structural loads from one connected element to the other. These provisions do not apply to anchors installed in hardened concrete or where load combinations include earthquake loads or effects. The bearing area of headed anchors shall be not less than one and one-half times the shank area. Where strength design is used, or where load combinations include earthquake loads or effects, the design strength of anchors shall be determined in accordance with Section 1912. Bolts shall conform to ASTM A 307 or an acceptable equivalent.

[1911.2] Allowable service load. The allowable service load for headed anchors in shear or tension shall be as indicated in Table 1911.2. Where anchors are subject to combined shear and tension, the following relationship shall be satisfied:

\[
\left( \frac{P_2}{P_1} \right)^{5/2} + \left( \frac{V_2}{V_1} \right)^{5/2} \leq 1
\]

[Equation 19-1]

[where:]

- \( P_2 \) = Applied tension service load, pounds (N).
- \( P_1 \) = Allowable tension service load from Table 1911.2, pounds (N).
- \( V_2 \) = Applied shear service load, pounds (N).
- \( V_1 \) = Allowable shear service load from Table 1911.2, pounds (N).

[For SI: 1 inch = 25.4 mm, 1 pound per square inch = 0.00689MPa, 1 pound = 4.45 N.]

1911.3 Required edge distance and spacing. The allowable service loads in tension and shear specified in Table 1911.2 are for the edge distance and spacing specified. The edge distance and spacing are permitted to be reduced to 50 percent of the values specified with an equal reduction in allowable service load. Where edge distance and spacing are reduced less than 50 percent, the allowable service load shall be determined by linear interpolation.

1911.4 Reserved.

1911.5 Increase for special inspection. Where special inspection is provided for the installation of anchors, a 100 percent increase in the allowable tension values of Table 1911.2 is permitted. No increase in shear value is permitted.

[SECTION BC 1912]

ANCHORAGE TO CONCRETE — STRENGTH DESIGN

1912.1 Scope. The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J or L) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318 as modified by Sections 1.9 and 1908.1.10, provided they are within the scope of Appendix D.

1912.1.1 Anchors outside scope of Appendix D. The strength design of anchors that are not within the scope of Appendix D of ACI 318, as modified by this code, shall be in accordance with a procedure subject to the approval of the commissioner.

SECTION BC [1943] 1911

SHOTCRETE

1913.1 1911 General. Shotcrete is mortar or concrete that is pneumatically projected at high velocity onto a surface. Except as specified in this section, shotcrete shall conform to the requirements of this chapter for plain or reinforced concrete.

1913.1.1 1911.1 Qualifications. Nozzlemen shall be ACI certified.

1913.2 1911.2 Proportions and materials. Shotcrete proportions shall be selected that allow suitable placement procedures using the delivery equipment selected and shall result in finished in-place hardened shotcrete meeting the strength requirements of this code. Prior to using shotcrete, the mix design for shotcrete shall be performed by the contractor and shall be approved by the registered design professional of record. The approved mix design shall be filed with the department based upon preconstruction tests performed in accordance with Section 1913.5 1911.5.

1913.3 1911.3 Aggregate. Coarse aggregate, if used, shall not exceed 3/4 inch (19.1 mm).
[1913.4] 1911.4 Reinforcement. Reinforcement used in shotcrete construction shall comply with the provisions of Sections [1913.4.1] 1911.4.1 through [1913.4.4] 1911.4.4.

[1913.4.1] 1911.4.1 Size. The maximum size of reinforcement shall be No. 5 bars unless it is demonstrated by preconstruction tests that adequate encasement of larger bars will be achieved.

[1913.4.2] 1911.4.2 Clearance. When No. 5 or smaller bars are used, there shall be a minimum clearance between parallel reinforcement bars of 2½ inches (64 mm). When bars larger than No. 5 are permitted, there shall be a minimum clearance between parallel bars equal to six diameters of the bars used. When two curtains of steel are provided, the curtain nearer the nozzle shall have a minimum spacing equal to 12 bar diameters and the remaining curtain shall have a minimum spacing of six bar diameters.

Exception: Subject to the approval of the commissioner, required clearances shall be reduced where it is demonstrated by preconstruction tests that adequate encasement of the bars used in the design will be achieved.

[1913.4.3] 1911.4.3 Splices. Lap splices of reinforcing bars shall utilize the noncontact lap splice method with a minimum clearance of 2 inches (51 mm) between bars. The use of contact lap splices necessary for support of the reinforcing is permitted when approved by the commissioner, based on satisfactory preconstruction tests that show that adequate encasement of the bars will be achieved, and provided that the splice is oriented so that a plane through the center of the spliced bars is perpendicular to the surface of the shotcrete.

[1913.4.4] 1911.4.4 Spirally tied columns. Shotcrete shall not be applied to spirally tied columns.

[1913.5] 1911.5 Preconstruction tests. A test panel shall be shot by each nozzleman and then, cured, cored or sawn, examined and tested prior to commencement of the project. The sample panel shall be representative of the project and simulate job conditions as closely as possible. The panel thickness and reinforcing shall reproduce the thickest and most congested area specified in the structural design. It shall be shot for each proposed concrete mix, at the proposed angles. The equipment used in preconstruction testing shall be the same equipment used in the work requiring such testing, unless substitute equipment is approved by the commissioner. Cores taken from the test panel shall be used to demonstrate that the proposed mix design meets the requirements of the construction documents and this code. All sampling and testing of shotcrete shall be performed by a licensed concrete testing laboratory. Construction of the test panels shall be witnessed by the special inspection agency responsible for the shotcrete construction.

[1913.5.1] 1911.5.1 Sampling and testing. Six core samples shall be obtained from each preconstruction test panel:

1. Three specimens with no reinforcing shall be sampled and prepared in accordance with ASTM C 42; and

2. Three specimens with reinforcing steel.
[1913.5.2] 1911.5.2 Compressive strength testing. The licensed concrete testing laboratory that sampled the preconstruction test panels shall test the core specimens with no reinforcing in accordance with ASTM C 39.

[1913.5.3] 1911.5.3 Evaluation of strength tests. The shotcrete test panel strength shall be deemed acceptable if the mean compressive strength of the set of three cores shall equal or exceed $f'_c$ with no individual core less than 0.75 $f'_c$.

[1913.5.4] 1911.5.4 Visual grading of cores. Core samples and/or test panels shall be cut with reinforcing steel and shall be visually evaluated by the registered design professional of record for the structural design, or a registered design professional acceptable to the registered design professional of record for the structural design. The nozzleman shall not proceed with work if cores and/or sections cut show the rebar not to be encapsulated with concrete to the satisfaction of the registered design professional of record for the structural design.

[1913.6] 1911.6 Rebound. Any rebound or accumulated loose aggregate shall be removed from the surfaces to be covered prior to placing the initial or any succeeding layers of shotcrete. Rebound shall not be used as aggregate.

[1913.7] 1911.7 Joints. Except where permitted herein, unfinished work shall not be allowed to stand for more than 30 minutes unless edges are sloped to a thin edge. For structural elements that will be under compression and for construction joints shown on the approved construction documents, square joints are permitted. Before placing additional material adjacent to previously applied work, sloping and square edges shall be cleaned and wetted.

[1913.8] 1911.8 Damage. In-place shotcrete that exhibits sags, sloughs, segregation, honeycombing, sand pockets or other obvious defects shall be removed and replaced. Shotcrete above sags and sloughs shall be removed and replaced while still plastic.

[1913.9] 1911.9 Curing. During the curing periods specified herein, shotcrete shall be maintained above 40°F (4°C) and in moist condition.

[1913.9.1] 1911.9.1 Initial curing. Shotcrete shall be kept continuously moist for 24 hours after shotcreting is complete or shall be sealed with an approved curing compound.

[1913.9.2] 1911.9.2 Final curing. Final curing shall continue for seven days after shotcreting, or for three days if high-early-strength cement is used, or until the specified strength is obtained. Final curing shall consist of the initial curing process or the shotcrete shall be covered with an approved moisture-retaining cover.

[1913.9.3] 1911.9.3 Natural curing. Natural curing shall not be used in lieu of that specified in this section unless the relative humidity remains at or above 85 percent, and is authorized by the registered design professional of record and approved by the commissioner.

[1913.10] 1911.10 Strength tests. Strength tests for shotcrete shall be made by an approved agency on specimens that are representative of the work, and that are sampled and prepared in accordance with ASTM C 42.
1913.10.1 Sampling. Specimens shall be taken from the in-place work or from test panels, and shall be taken at least once each shift, but not less than three cores for each 50 cubic yards (38.2 m³) of shotcrete. With the approval of the registered design professional of record, when in-place cores are not feasible due to rebar spacing, test panels shall be shot in the same position as the work represented. One panel shall be cast for each 50 cubic yards (38.2 m³) of concrete and 3 cores shall be taken per ASTM C 42.

1913.10.2 Panel criteria. When the maximum-size aggregate is larger than ¾ inch (9.5 mm), the test panels shall have minimum dimensions of 18 inches by 18 inches (457 mm by 457 mm). When the maximum-size aggregate is ¾ inch (9.5 mm) or smaller, the test panels shall have minimum dimensions of 12 inches by 12 inches (305 mm by 305 mm). Panels shall be shot in the same position as the work, during the course of the work and by the nozzlemen doing the work. The conditions under which the panels are cured shall be the same as the work.

1913.10.3 Acceptance criteria. The average compressive strength of three cores from the in-place work tested in accordance with ASTM C 39 shall equal or exceed 0.85 \( f'_{c} \) with no single core less than 0.75 \( f'_{c} \). The average compressive strength of three cubes taken from the in-place work or a single test panel shall equal or exceed \( f'_{c} \) with no individual cube less than 0.88 \( f'_{c} \). To check accuracy, locations represented by erratic core or cube strengths shall be retested.

[SECTION BC 1914]
[REINFORCED GYPSUM CONCRETE]

1914.1 General. Reinforced gypsum concrete shall comply with the requirements of ASTM C 317 and ASTM C 956.

1914.2 Minimum thickness. The minimum thickness of reinforced gypsum concrete shall be 2 inches (51 mm) except the minimum required thickness shall be reduced to 1\(\frac{1}{2} \) inches (38 mm), provided the following conditions are satisfied:

1. The overall thickness, including the formboard, is not less than 2 inches (51 mm).
2. The clear span of the gypsum concrete between supports does not exceed 33 inches (838 mm).
3. Diaphragm action is not required.
4. The design live load does not exceed 40 pounds per square foot (psf) (1915 Pa).

1914.3 Limitations of use. Reinforced gypsum concrete shall not be used where exposed directly to the weather or where subject to frequent or continuous wetting. Precast units shall be protected by coverings or coatings from the weather and from contact with moisture during shipment and during storage at the work site.
[SECTION BC 1915]
[CONCRETE-FILLED STEEL COLUMNS]

[1915.1 General. Concrete-filled steel columns shall comply with Section 1915 and shall be filled with concrete so placed and manipulated as to secure maximum density and to ensure complete filling of the steel without voids.]

[1915.2 Design. The safe supporting capacity of concrete-filled steel columns shall be computed in accordance with ACI 318 and AISC 360 or as determined by a test approved by the commissioner.]

[1915.3 Connections. Caps, base plates and connections shall be in accordance with ACI 318 and AISC 360 and shall be positively attached to the shell and anchored to the concrete core. Welding of brackets without mechanical anchorage shall be prohibited. Where the pipe is slotted to accommodate webs of brackets or other connections, the integrity of the shell shall be restored by welding to ensure hooping action of the composite section.]

[1915.4 Reinforcement. Steel reinforcement shall be in the form of rods, structural shapes or pipe embedded in the concrete core in accordance with ACI 318 and AISC 360 with sufficient clearance to ensure the composite action of the section, but not nearer than 1 inch (25 mm) to the exterior steel shell. Structural shapes used as reinforcement shall be milled to ensure bearing on cap and base plates.]

[1915.5 Fire-resistance-rating protection. Steel columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire protective covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of steel columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three stories or 40 feet (12 192 mm) above grade plane, steel columns used in basements and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).]

[1915.5.1 Vent holes. Four minimum ½ in. (12.7 mm) diameter holes, top and bottom, shall be placed opposite each other, two at the top and two at the bottom of the column. The two bottom holes shall be rotated 90° relative to the two top holes.]

[1915.6 Approvals. Details of column connections and splices shall be shop fabricated in accordance with ACI 318 and AISC 360. Concrete-filled steel columns shall be inspected by an approved agency pursuant to Chapter 17 of this code.]

SECTION BC [1916] 1912
STRUCTURAL INTEGRITY REQUIREMENTS

[1916.1] 1912.1 General. Reinforced concrete structures shall meet all the requirements of Sections [1916.1] 1912.1 through [1916.3] 1912.3. Concrete slabs on metal deck shall be governed by the provisions of Chapter 22. Reinforcement provided for gravity, seismic and wind forces or for other purposes may be regarded as forming part of, or the whole of, these requirements. Reinforcing provided for one requirement may be counted towards the other requirements.
Continuity and ties. The structural integrity requirements of ACI 318, Sections 13.3.8.5 and 7.13, shall apply. In addition, the following requirements shall be met.

1912.1 Slab reinforcement. At all floor and roof levels, slabs shall have a mat of bottom reinforcement in two perpendicular (or roughly perpendicular) directions. Reinforcement in this bottom mat shall be made continuous with lap, mechanical or welded tension splices.

1912.1.1 Bottom mat reinforcement. In each direction, the bottom mat reinforcement shall be not less than the steel required for temperature reinforcement. The bottom mat reinforcement shall be anchored at discontinuous edges within the column strip, reentrant corners, elevation changes and anywhere else the continuity of the reinforcing is interrupted.

Exception: Flat plate middle strip bottom mat reinforcing perpendicular to discontinuous slab edges. In addition, the main bottom mat reinforcement in one-way slabs shall be anchored at discontinuous edges.

1912.2 Peripheral ties. At each floor and roof level, reinforcement forming a continuous peripheral tie shall be provided. Peripheral ties shall be located within perimeter beams or walls, where they occur, or within 4 feet (1219 mm) of the edge of slab, where perimeter beams or walls do not occur. Continuous tie reinforcement shall be equal to half of the bottom reinforcement within the edge or edge strip for two-way slabs but not less than two bars.

1912.3 Horizontal ties. At each column, beam reinforcement or slab bottom reinforcement shall be provided at each level that can develop a tension force equal to the maximum of Item 1 or 2:

1. Three times the load entering the column at that level, using a load combination of 1.0 x \( DL \) (self weight of structure only).

2. One and a half times the load entering the column at that level using the load combinations of \( (1.2 DL + 1.6 LL) \) or \( 1.4 DL \).

3. For transfer elements only, in lieu of Item 1 or 2, the horizontal reinforcement shall be anchored at all supports.

1912.3.1 Bottom reinforcing. This beam or slab bottom reinforcement shall be distributed around the column perimeter and shall be extended on all sides of the column into the adjacent slab for at least one-third of the span length. Where reinforcing bars cannot be extended beyond the column (e.g., at slab edges and openings), they shall be hooked or otherwise developed within the column.

1912.4 Vertical ties. Each column and each wall carrying vertical load shall be vertically tied continuously from its lowest to highest level. The vertical ties composed of vertical column reinforcement shall be capable of resisting a tensile force equal to the maximum design dead and live load received by the column or wall from any one story within four floors below. A concrete compression element subjected to load reversal may have a reinforcing bar splice.
length equal to the tension splice length required by ACI 318 reduced by the ratio of $A_s$ required/A$_s$ provided but not less than the splice required for compression.

[1916.3] 1912.3 Precast concrete general. Precast concrete structural elements shall be reinforced to meet all of the requirements of this section. However, reinforcement provided for gravity, seismic and wind forces and for other purposes may be regarded as forming part of, or the whole of, these requirements. Reinforcing provided for one requirement may be counted towards the other requirements.

[1916.3.1] 1912.3.1 Continuity and ties. The structural integrity requirements of ACI 318, Section [16.5] 4.10, shall apply. In precast and composite structures, ties within precast structural elements shall be continuous and shall be anchored to the supporting structure. In addition to Sections [1916.2.2] 1912.2.2 and [1916.2.4] 1912.2.4, the following requirements shall be met.

1916.3.1.1 End connections. End connections of all precast slabs, beams and girders shall have an axial tension capacity equal to the larger of the vertical shear capacity of the connection at either end, or at least 2 percent of the maximum factored vertical dead and live load in the precast compression element, whichever is larger, but not less than 20 kips or 2,500 pounds per linear foot of slab (36.48 kN/m). Where more than one element frames in one direction, none of the elements or connections shall have an axial tension capacity of less than 1 percent of the column load but not less than 20 kips.

1916.3.1.2 Side connections. Side connections of all precast elements shall have an axial tension capacity not less than the steel required for temperature reinforcement of the larger element at either side.

1916.3.1.3 Connection forces. For design of the connections, the transverse shear force and the axial tensile force need not be considered to act simultaneously.

1916.3.2 Joints. Joints in precast structures shall not rely on friction due to gravity to transfer load.

1916.3.3 Bearing. The net bearing area shall not be less than 2 inches (51 mm) wide and 3 inches (76 mm) long in the direction of the member.

SECTION BC [1917] 1913 ASPHALT PAVING

1917.1 Definitions. The following words and terms shall, for the purposes of this section, have the meanings shown herein:

ASPHALT. [A dark brown to black bitumen pitch that melts readily and which appears in nature in asphalt beds or is produced as a by-product of the petroleum industry.]

ASPHALTIC CONCRETE or ASPHALT PAVING. [A mixture of liquid asphalt and graded aggregate used as a paving material.]
I-4 MIX. [A type of heavy duty asphaltic concrete mix containing 0.75 inch (19 mm) nominal maximum size aggregate with 25 percent to 50 percent of the aggregate capable of passing through a No. 8 sieve and in which all sand contained in the mix is crushed.]

RECLAIMED ASPHALT PAVEMENT. [Asphalt pavement that has been processed for reuse in asphaltic concrete.]

[1917.2] 1913.2 Reclaimed asphalt pavement content in asphaltic concrete. [On and after January 1, 2015, asphaltic] Asphaltic concrete, other than I-4 mix or other approved heavy duty asphaltic concrete mix, shall contain not less than 30 percent reclaimed asphalt pavement, as measured by weight. I-4 mix or other approved heavy duty asphaltic concrete mix shall contain not less than 10 percent reclaimed asphalt pavement, as measured by weight. Reclaimed asphalt paving used in asphaltic concrete shall comply with ASTM D692 or ASTM D1073.

Exceptions:

1. Asphaltic concrete used in a project where the content of asphaltic concrete is governed by a federal or state law, rule, regulation, guideline, or specification that requires a different composition.

2. Asphaltic concrete used for runways, taxiways, or other surfaces utilized by aircraft.

3. The commissioner may waive compliance with this section if the commissioner, after consulting with the commissioner of transportation and the owners or persons in charge of all asphalt plants located within the city, finds that a sufficient supply of reclaimed asphalt pavement is not available.

§ 21. Chapter 21 of the New York city building code, as added by local law number 33 for the year 2007, sections 2101.2, 2101.2.1, 2101.2.2, 2101.2.3, 2101.2.4, 2101.2.5, 2101.2.6, 2101.3, 2101.3.1, 2102.1, 2103.1, 2103.2, 2103.4, 2103.5, 2103.6, 2103.7, 2103.8, 2103.9, 2103.10, 2103.10.1, 2103.10.2, 2103.10.3, 2103.10.4, 2103.10.5, 2103.10.6, 2103.10.7, 2103.13, 2104.1, 2104.1.1, 2104.1.2, 2104.1.3, 2104.1.5, 2104.2, 2104.3, 2104.3.1, 2104.4, 2105.2.1, 2105.2.2.1, 2105.2.2.1.2, 2106.1, 2106.1.1, 2107, 2107.1, 2108.1, 2109.1, 2109.1.1, 2109.2, 2109.2.1, 2109.2.2, 2109.5.3, 2109.7, 2109.7.1, 2109.7.2, 2110.1, 2110.1.1, 2111.2, 2111.2, 2111.3.1, 2111.4, 2111.8, 2112.1, 2112.2, 2112.4, 2113.1, 2113.1.6, 2113.3, 2113.4, 2113.9, 2113.11.1, 2113.11.1.2, 2113.12, 2113.15, and 2113.19, and tables 2103.10, 2105.2.2.1.1, 2109.2.1, 2109.5.3, 2113.16(2) as amended by, and sections 2103.3, 2103.11, 2103.12, 2104.6, 2104.7, 2104.8, 2104.8.1, 2104.8.2, 2104.9, 2104.9.1, 2104.9.1.1, 2104.9.1.2, 2104.9.1.3, 2104.10, 2104.10.1, 2104.10.2, 2104.11, 2104.12,
CHAPTER 21
MASONRY

SECTION BC 2101
GENERAL

2101.1 Scope. This chapter shall govern the materials, design, construction and quality of masonry.

2101.1.1 Referenced standards. Where this code makes reference to the nationally recognized standard TMS 402, such standard shall be as modified for New York City in accordance with this chapter.

2101.2 Design methods. Masonry shall comply with the provisions of [one of the following design methods in this chapter] TMS 402, TMS 403 or TMS 404, as well as the applicable requirements of [Sections 2101 through 2104. Masonry designed by the allowable stress design provisions of Section 2101.2.1, the strength design provisions of Section 2101.2.2 or the prestressed masonry provisions of Section 2101.2.3 shall comply with Section 2105 for quality assurance] this chapter.

2101.2.1 Allowable stress design. Masonry designed by the allowable stress design method shall comply with the provisions of Sections 2106 and 2107.

2101.2.2 Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that autoclaved aerated concrete (AAC) masonry shall comply with the provisions of Section 2106 of this code, and Chapter 1 and Appendix A of TMS 402/ACI 530/ASCE 5.

2101.2.3 Prestressed masonry. Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of TMS 402/ACI 530/ASCE 5 and Section 2106 of this code. Special inspection during construction shall be provided as set forth in Section 1704.5.

2101.2.4 Empirical design. Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 of this code or Chapter 5 of TMS 402/ACI 530/ASCE 5.

2101.2.5 Glass masonry. Glass masonry shall comply with the provisions of Section 2110 of this code or with the requirements of Chapter 7 of TMS 402/ACI 530/ASCE 5.

[2101.2.6] 2101.2.1 Masonry veneer. Masonry veneer shall comply with the provisions of Chapter 14 of this code or Chapter 6 or TMS 402/ACI 530/ASCE 5.
2101.3 Construction documents. The construction documents shall show all of the items required by this code including the following:

1. Specified size, grade, type and location of reinforcement, anchors and wall ties.
2. Reinforcing bars to be welded and welding procedure.
4. Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.
5. Specified compressive strength of masonry at stated ages or stages of construction for which masonry is designed, except where specifically exempted by this code.
6. Details of anchorage of masonry to structural members, including the type, size and location of connectors.
7. The minimum level of testing and inspection as defined in Chapter 17, or an itemized testing and inspection program that meets or exceeds the requirements of Chapter 17.

2101.3 Special inspection. The special inspection of masonry shall be as defined in Chapter 17, or an itemized testing and inspection program shall be provided that meets or exceeds the requirements of Chapter 17.

2101.3.1 Fireplace drawings. The construction documents shall describe in sufficient detail the location, size and construction of masonry fireplaces. The thickness and characteristics of materials and the clearances from walls, partitions and ceilings shall be clearly indicated. The masonry fireplace shall comply with the provisions of Section 2111.

SECTION BC 2102
DEFINITIONS AND NOTATIONS

2102.1 General. The following [words and terms] [shall, for the purposes of this chapter and as used elsewhere] are defined in [this code, have the meanings shown herein.] Chapter 2:

AAC MASONRY. [Masonry made of autoclaved aerated concrete (AAC) units, manufactured without internal reinforcement and bonded together using thin- or thick-bed mortar.]

ANCHOR. Metal rod, wire or strap that secures masonry to its structural support.

ARCHITECTURAL TERRA COTTA. [Plain- or ornamental-hard-burned-modified-clay units, larger in size than brick, with glazed or unglazed ceramic finish.]

AREA.

[Bedded. The area of the surface of a masonry unit that is in contact with mortar in the plane of the joint.]
Gross cross-sectional. [The area delineated by the out-to-out specified dimensions of masonry in the plane under consideration.]

Net cross-sectional. [The area of masonry units, grout and mortar crossed by the plane under consideration based on out-to-out specified dimensions.]

AUTOCLAVED AERATED CONCRETE (AAC). [Low-density cementitious product of calcium silicate hydrates, whose material specifications are defined in ASTM C-1386.]

BED JOINT. [The horizontal layer of mortar on which a masonry unit is laid.]

BOND BEAM. A horizontal grouted element within masonry in which reinforcement is embedded.

BOND REINFORCING. The adhesion between steel reinforcement and mortar or grout.

BRICK.

Calcium silicate (sand lime brick). [A masonry unit made of sand and lime.]

Clay or shale. [A masonry unit made of clay or shale, usually formed into a rectangular prism while in the plastic state and burned or fired in a kiln.]

Concrete. [A masonry unit having the approximate shape of a rectangular prism and composed of inert aggregate particles embedded in a hardened cementitious matrix.]

BUTTRESS. A projecting part of a masonry wall built integrally therewith to provide lateral stability.

CAST STONE. [A building stone manufactured from portland cement concrete precast and used as a trim, veneer or facing on or in buildings or structures.]

CELL. [A void space having a gross cross-sectional area greater than 1 1/2 square inches (967 mm²).]

CHIMNEY. [A primarily vertical enclosure containing one or more flues used to remove hot gases from burning fuel, refuse, or from industrial processes to the outside atmosphere.]

Factory-built chimney.

Masonry chimney.

Metal chimney.

CHIMNEY TYPES.

High-heat appliance type. [An approved chimney for removing the products of combustion from fuel burning, high-heat appliances producing combustion gases in excess of 2,000°F (1093°C) measured at the appliance flue outlet (see Section 2113.11.3).]
Low-heat appliance type. [An approved chimney for removing the products of combustion from fuel-burning, low-heat appliances producing combustion gases not in excess of 1,000°F (538°C) under normal operating conditions, but capable of producing combustion gases of 1,400°F (760°C) during intermittent forces firing for periods up to 1 hour. Temperatures shall be measured at the appliance flue outlet.]

[Masonry type. A field-constructed chimney of solid masonry units or stones.]

Medium-heat appliance type. [An approved chimney for removing the products of combustion from fuel-burning, medium-heat appliances producing combustion gases between 1000°F (538°C) and 2,000°F (1093°C) measured at the appliance flue outlet (see Section 2113.11.2).]

[CLEANOUT. An opening to the bottom of a grout space of sufficient size and spacing to allow the removal of debris.]

COLLAR JOINT. [Vertical longitudinal joint between wythes of masonry or between masonry and backup construction that is permitted to be filled with mortar or grout.]

[COMpressive STrength Of Masonry. Maximum compressive force resisted per unit of net cross-sectional area of masonry, determined by the testing of masonry prisms or a function of individual masonry units, mortar and grout.]

[CONNECTOR. A mechanical device for securing two or more pieces, parts or members together, including anchors, wall ties and fasteners.]

[COVER. Distance between surface of reinforcing bar and edge of member.]

DECORATIVE SHROUD. [A listed partial noncombustible enclosure for aesthetic purposes that is installed at the termination of a venting system that surrounds or conceals the chimney or vent cap.]

DIMENSIONS.

[Actual. The measured dimension of a masonry unit or element.]

Nominal. [The specified dimension plus an allowance for the joints with which the units are to be laid. Thickness is given first, followed by height and then length.]

Specified. [The dimensions specified for the manufacture or construction of masonry, masonry units, joints or any other component of a structure.]

FIREPLACE. [A hearth and fire chamber or similar prepared place in which a fire may be made and which is built in conjunction with a chimney.]

FIREPLACE THROAT. [The opening between the top of the firebox and the smoke chamber.]

FLUE. [A passageway within a chimney or vent through which gaseous combustion products pass.]

FLUE, APPLIANCE. [The passage(s) within an appliance through which combustion products pass from the combustion chamber of the appliance to the draft hood inlet opening on an appliance.
equipped with a draft hood or to the outlet of the appliance on an appliance not equipped with a draft hood.]

FLUE GASES. [Products of combustion plus excess air in appliance flues or heat exchangers.]

FLUE LINER (LINING). [A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and for conveying combustion products without leakage into the atmosphere.]

FOUNDATION PIER. [An isolated vertical foundation member whose horizontal dimension measured at right angles to its thickness does not exceed three times its thickness and whose height is equal to or less than four times its thickness.]

GROUT. [A plastic mixture of cementitious materials, aggregates, and water, with or without admixtures, initially produced to pouring consistency without segregation of the constituents during placement, or the equivalent of such mixtures, conforming to ASTM C 476.]

[GROUTED MASONRY.]

[Grouted hollow-unit masonry. That form of grouted masonry construction in which certain designated cells of hollow units are continuously filled with grout.]

[Grouted multi-wythe masonry. That form of grouted masonry construction in which the space between the wythes is solidly or periodically filled with grout.]

HEAD JOINT. [Vertical mortar joint placed between masonry units within the wythe at the time the masonry units are laid.]

[HEIGHT, WALLS. The vertical distance from the foundation wall or other immediate support of such wall to the top of the wall.]

MASONRY. [A built-up construction or combination of building units or materials of clay, shale, concrete, glass, gypsum, stone or other approved units bonded together with or without mortar or grout or other accepted method of joining.]

[Ashlar masonry. Masonry composed of various sized rectangular units having sawed, dressed or squared bed surfaces, properly bonded and laid in mortar.]

[Coursed ashlar. Ashlar masonry laid in courses of stone of equal height for each course, although different courses shall be permitted to be of varying height.]

Glass unit masonry. [Masonry composed of glass units bonded by mortar.]

Plain masonry. [Masonry in which the tensile resistance of the masonry is taken into consideration and the effects of stresses in reinforcement are neglected.]

[Random ashlar. Ashlar masonry laid in courses of stone set without continuous joints and laid up without drawn patterns. When composed of material cut into modular heights, discontinuous but aligned horizontal joints are discernible.]
Reinforced masonry. [Masonry construction in which reinforcement acting in conjunction with the masonry is used to resist forces.]

Solid masonry. [Masonry consisting of solid masonry units laid contiguously with the joints between the units filled with mortar.]

Unreinforced (plain) masonry. [Masonry in which the tensile resistance of masonry is taken into consideration and the resistance of the reinforcing steel, if present, is neglected.]

MASONRY UNIT. [Brick, tile, stone, glass block or concrete block conforming to the requirements specified in Section 2103.]

[Clay. A building unit larger in size than a brick, composed of burned clay, shale, fired clay or mixtures thereof.]

[Concrete. A building unit or block larger in size than 12 inches by 4 inches by 4 inches (305 mm by 102 mm by 102 mm) made of cement and suitable aggregates.]

Hollow. [A masonry unit whose net cross-sectional area in any plane parallel to the load-bearing surface is less than 75 percent of its gross cross-sectional area measured in the same plane.]

Solid. [A masonry unit whose net cross-sectional area in every plane parallel to the load-bearing surface is 75 percent or more of its gross cross-sectional area measured in the same plane.]

MORTAR. [A plastic mixture of approved cementitious materials, fine aggregates and water used to bond masonry or other structural units.]

MORTAR, SURFACE-BONDING. [A mixture to bond concrete masonry units that contains hydraulic cement, glass fiber reinforcement with or without inorganic fillers or organic modifiers and water.]

PRESTRESSED MASONRY. [Masonry in which internal stresses have been introduced to counteract potential tensile stresses in masonry resulting from applied loads.]

[PRISM. An assemblage of masonry units and mortar with or without grout used as a test specimen for determining properties of the masonry.]

[RUBBLE MASONRY. Masonry composed of roughly-shaped stones.]

[Coursed rubble. Masonry composed of roughly shaped stones fitting approximately on level beds and well-bonded.]

[Random rubble. Masonry composed of roughly shaped stones laid without regularity of coursing but well-bonded and fitted together to form well-divided joints.]

[Rough or ordinary rubble. Masonry composed of unsquared field stones laid without regularity of coursing but well-bonded.]
RUNNING BOND. [The placement of masonry units such that head joints in successive courses are horizontally offset at least one-quarter the unit length.]

[SHEAR-WALL.]

[Detailed plain masonry shear wall. A masonry shear wall designed to resist lateral forces neglecting stresses in reinforcement, and designed in accordance with Section 2106.1.]

[Intermediate reinforced masonry shear wall. A masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.]

[Ordinary plain masonry shear wall. A masonry shear wall designed to resist lateral forces neglecting stresses in reinforcement, and designed in accordance with Section 2106.1.]

[Prestressed masonry shear wall. A prestressed masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.1.]

[Ordinary reinforced masonry shear wall. A masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.]

[SHELL. The outer portion of a hollow masonry unit as placed in masonry.]

[SPECIFIED. Required by construction documents.]

SPECIFIED COMpressive STRENGTH OF MASONRY, $f'_{m}$. [Minimum compressive strength, expressed as force per unit of net cross sectional area, required of the masonry used in construction by the construction documents, and upon which the project design is based. Whenever the quantity $f'_{m}$ is under the radical sign, the square root of numerical value only is intended and the result has units of pounds per square inch (psi) (Mpa).]

[STACK BOND. The placement of masonry units in a bond pattern is such that head joints in successive courses are vertically aligned. For the purpose of this code, requirements for stack bond shall apply to masonry laid in other than running bond.]

STONE MASONRY. [Masonry composed of field, quarried or cast stone units bonded by mortar.]

[Ashlar stone masonry. Stone masonry composed of rectangular units having sawed, dressed or squared bed surfaces and bonded by mortar.]

[Rubble stone masonry. Stone masonry composed of irregular-shaped units bonded by mortar.]

STRENGTH.

Design strength. [Nominal strength multiplied by a strength reduction factor.]

Nominal strength. [Strength of a member or cross section calculated in accordance with these provisions before application of any strength reduction factors.]
Required strength. [Strength of a member or cross-section required to resist factored loads.]

[THIN-BED MORTAR. Mortar for use in construction of AAC unit masonry with joints 0.06 inch (1.5 mm) or less.]

[TIE, LATERAL. Loop of reinforcing bar or wire enclosing longitudinal reinforcement.]

TIE, WALL. [A connector that connects wythes of masonry walls together.]

[TILE. A ceramic surface unit, usually relatively thin in relation to facial area, made from clay or a mixture of clay or other ceramic materials, called the body of the tile, having either a “glazed” or “unglazed” face and fired above red heat in the course of manufacture to a temperature sufficiently high enough to produce specific physical properties and characteristics.]

TILE, STRUCTURAL CLAY. [A hollow masonry unit composed of burned-clay, shale, fire-clay or mixture thereof, and having parallel cells.]

WALL. [A vertical element with a horizontal length to thickness ratio greater than three, used to enclose space.]

Cavity wall. [A wall built of masonry units or of concrete, or a combination of these materials, arranged to provide an airspace within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.]

[Composite wall. A wall built of a combination of two or more masonry units bonded together, one forming the backup and the other forming the facing elements.]

Dry-stacked, surface-bonded walls. [A wall built of concrete masonry units where the units are stacked dry, without mortar on the bed or head joints, and where both sides of the wall are coated with a surface-bonding mortar.]

[Masonry-bonded hollow wall. A wall built of masonry units so arranged as to provide an airspace within the wall, and in which the facing and backing of the wall are bonded together with masonry units.]

Parapet wall. [The part of any wall entirely above the roof line.]

[WEB. An interior solid portion of a hollow masonry unit as placed in masonry.]

WYTHE. [Each continuous, vertical section of a wall, one masonry unit in thickness.]

NOTATIONS.

\[ d_b \quad = \quad \text{Diameter of reinforcement, inches (mm).} \]

\[ F_s \quad = \quad \text{Allowable tensile or compressive stress in reinforcement, psi (MPa).} \]

\[ f_r \quad = \quad \text{Modulus of rupture, psi (MPa).} \]

\[ f'_{AAC} \quad = \quad \text{Specified compressive strength of AAC masonry, the minimum compressive strength for a class of AAC masonry as specified in ASTM C 1386, psi (MPa).} \]
\[ f'_{m} = \text{Specified compressive strength of masonry at age of 28 days, psi (MPa).} \]
\[ f'_{mi} = \text{Specified compressive strength of masonry at the time of prestress transfer, psi} \]
\[ K = \text{The lesser of the masonry cover, clear spacing between adjacent reinforcement, or five times } d_{b}, \text{ inches (mm).} \]
\[ L_s = \text{Distance between supports, inches (mm).} \]
\[ l_d = \text{Required development length or lap length of reinforcement, inches (mm).} \]
\[ P = \text{The applied load at failure, pounds (N).} \]
\[ S_t = \text{Thickness of the test specimen measured parallel to the direction of load, inches} \]
\[ S_w = \text{Width of the test specimen measured parallel to the loading cylinder, inches (mm).} \]

SECTION BC 2103
MASONRY CONSTRUCTION MATERIALS

2103.1 [Concrete masonry] Masonry units. Concrete masonry units [shall conform to the following standards: ASTM C 55 for concrete brick; ASTM C 73 for calcium silicate face brick; ASTM C 90 for load bearing concrete masonry units; ASTM C 129 for nonload bearing concrete masonry units or ASTM C 744 for prefaced concrete and calcium silicate masonry units], clay or shale masonry units, stone masonry units, glass unit masonry and AAC masonry units shall comply with Article 2.3 of TMS 602. Architectural cast stone shall conform to ASTM C1364 and TMS 504. Adhered manufactured stone masonry veneer units shall conform to ASTM C1670.

[2103.2 Clay or shale masonry units. Clay or shale masonry units shall conform to the following standards: ASTM C 34 for structural clay load-bearing wall tile; ASTM C 56 for structural clay nonload bearing wall tile; ASTM C 62 for building brick (solid masonry units made from clay or shale); ASTM C 1088 for solid units of thin veneer brick; ASTM C 126 for ceramic-glazed structural clay facing tile, facing brick and solid masonry units; ASTM C 212 for structural clay facing tile; ASTM C 216 for facing brick (solid masonry units made from clay or shale); ASTM C 652 for hollow brick (hollow masonry units made from clay or shale) and ASTM C 73 for calcium silicate face brick or ASTM C 1405 for glazed brick (single-fired solid brick units).]

Exception: Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E 119 or UL 263 and shall comply with the requirements of Table 602 of this code.

[2103.3 AAC masonry. AAC masonry units shall conform to ASTM C 1386 for the strength class specified.]

[2103.4 Stone masonry units. Stone masonry units shall conform to the following standards: ASTM C 503 for marble building stone (exterior); ASTM C 568 for limestone building stone; ASTM C 615 for granite building stone; ASTM C 616 for sandstone building stone or ASTM C 629 for slate building stone.]

[2103.5 Ceramic tile. Ceramic tile shall be as defined in, and shall conform to the requirements of, ANSI A137.]
[2103.6] **Glass unit masonry.** Hollow glass units shall be partially evacuated and have a minimum average glass face thickness of \(3/16\) inch (4.8 mm). Solid glass block units shall be provided when required. The surfaces of units intended to be in contact with mortar shall be treated with a polyvinyl butyral coating or latex-based paint. Reclaimed units shall not be used.

[2103.7] **2103.1.1 Second-hand units.** Second-hand masonry units shall not be reused unless they conform to the requirements of new units. The units shall be of whole, sound materials and free from cracks and other defects that will interfere with proper laying or use. Old mortar shall be cleaned from the unit before reuse.

**Exception:** Second-hand masonry units need not conform to the requirements for new units when their reuse is to comply with historic restoration standards or requirements of the New York City Landmarks Preservation Commission or the New York State Historic Preservation Office.

[2103.8] **2103.2 Mortar.** Mortar for masonry construction shall comply with Section 2103.2.1, 2103.2.2, 2103.2.3 or 2103.2.4.

**2103.2.1 Masonry mortar.** Mortar for use in masonry construction shall conform to [ASTM C 270 and] Articles 2.1 and 2.6A of TMS 602/ACI 530/ASCE 6, except for mortars listed in Sections 2103.9, 2103.10, and 2103.11 of this code. Type S or N mortar conforming to ASTM C 270 shall be used for glass unit masonry.

[2103.9] **2103.2.2 Surface-bonding mortar.** Surface-bonding mortar shall comply with ASTM C 887. Surface bonding of concrete masonry units shall comply with ASTM C 946.

**2103.10** **2103.2.3 Mortars for ceramic wall and floor tile.** Portland cement mortars for installing ceramic wall and floor tile shall comply with ANSI A108.1A and ANSI A108.1B and be of the compositions indicated in Table [2103.10] 2103.2.3.
**TABLE [2103.10] 2103.2.3 CERAMIC TILE MORTAR COMPOSITIONS**

**[2103.10.1] 2103.2.3.1 Dry-set portland cement mortars.** Premixed prepared portland cement mortars, which require only the addition of water and are used in the installation of ceramic tile, shall comply with ANSI A118.1. The shear bond strength for tile set in such mortar shall be as required in accordance with ANSI A118.1. Tile set in dry-set portland cement mortar shall be installed in accordance with ANSI A108.5.

**[2103.10.2] 2103.2.3.2 Latex-modified portland cement mortar.** Latex-modified portland cement thin-set mortars in which latex is added to dry-set mortar as a replacement for all or part of the gauging water that are used for the installation of ceramic tile shall comply with ANSI A118.4. Tile set in latex-modified portland cement shall be installed in accordance with ANSI A108.5.

**[2103.10.3] 2103.2.3.3 Epoxy mortar.** Ceramic tile set and grouted with chemical-resistant epoxy shall comply with ANSI A118.3. Tile set and grouted with epoxy shall be installed in accordance with ANSI A108.6.

**[2103.10.4] 2103.2.3.4 Furan mortar and grout.** Chemical-resistant furan mortar and grout that are used to install ceramic tile shall comply with ANSI A118.5. Tile set and grouted with furan shall be installed in accordance with ANSI A108.8.

**[2103.10.5] 2103.2.3.5 Modified epoxy-emulsion mortar and grout.** Modified epoxy-emulsion mortar and grout that are used to install ceramic tile shall comply with ANSI A118.8. Tile set and grouted with modified epoxy-emulsion mortar and grout shall be installed in accordance with ANSI A108.9.

**[2103.10.6] 2103.2.3.6 Organic adhesives.** Water-resistant organic adhesives used for the installation of ceramic tile shall comply with ANSI A136.1. The shear bond strength after water immersion shall be not less than 40 psi (275 kPa) for Type I adhesive[1] and not less than 20 psi (138 kPa) for Type II adhesive when tested in accordance with ANSI A136.1. Tile set in organic adhesives shall be installed in accordance with ANSI A108.4.

**[2103.10.7] 2103.2.3.7 Portland cement grouts.** Portland cement grouts used for the installation of ceramic tile shall comply with ANSI A118.6. Portland cement grouts for tile work shall be installed in accordance with ANSI A108.10.
**2103.11 Mortar for AAC masonry.** Thin bed mortar for AAC masonry shall comply with Article 2.1C.1 of TMS 602/ACI 530.1/ASCE 6. Mortar used for the leveling courses of AAC masonry shall comply with Article 2.1C.2 of TMS 602/ACI 530.1/ASCE 6.

**2103.2.4 Mortar for adhered masonry veneer.** Mortar for use with adhered masonry veneer shall conform to ASTM C 270 for Type N or S, or shall comply with ANSI A118.4 for latex-modified portland cement mortar.

**2103.12 2103.3 Grout.** Grout shall comply with Article 2.2 of TMS 602/ACI 530.1/ASCE 6.

**2103.13 2103.4 Metal reinforcement and accessories.** Metal reinforcement and accessories shall conform to Article 2.4 of TMS 602/ACI 530.1/ASCE 6. Where unidentified reinforcement is approved for use, not less than three tension and three bending tests shall be made on representative specimens of the reinforcement from each shipment and grade of reinforcing steel proposed for use in the work.

**SECTION BC 2104 CONSTRUCTION**

**2104.1 Masonry construction.** Masonry construction shall comply with the requirements of Sections 2104.1.1 through 2104.5 and with 2104.10, TMS 402, and TMS 602/ACI 530.1/ASCE 6 or TMS 604.

**2104.1.1 Tolerances.** Masonry, except masonry veneer, shall be constructed within the tolerances specified in TMS 602/ACI 530.1/ASCE 6.

**2104.1.2 Placing mortar and units.** Placement of mortar, grout and of clay, concrete, glass, and AAC masonry units shall comply with TMS 602/ACI 530.1/ASCE 6.

**2104.1.3 Installation of wall ties.** Installation of wall ties shall comply with TMS 602/ACI 530.1/ASCE 6.

**2104.1.4 Chases and recesses.** Chases and recesses shall be constructed as masonry units are laid. Masonry directly above chases or recesses wider than 12 inches (305 mm) shall be supported on lintels.

**2104.1.5 2104.1.1 Lintels.** The design of lintels shall be in accordance with the masonry design provisions of either Section 2107 or 2108. Minimum length of end support shall be 4 inches (102 mm).

**2104.1.6 2104.1.2 Support on wood.** Masonry shall not be supported on wood girders or other forms of wood construction except as permitted in Section 2304.12.

**2104.2 Corbeled masonry.** Corbeled masonry shall comply with the requirements of Section 1.12 of TMS 402/ACI 530/ASCE 5.

**2104.2.1 2104.1.3 Molded cornices.** Projecting masonry and cornices. Unless structural support and anchorage are provided to resist the overturning moment, the center of gravity of projecting masonry or molded cornices shall lie within the middle one-third of the supporting
wall. Terra cotta and metal cornices shall be provided with a structural frame of approved noncombustible material anchored in a manner approved by the commissioner.

[2104.3] 2104.2 Cold weather construction. The cold weather construction provisions of [TMS 602/ACI-530.1/ASCE-6] Article 1.8 C of TMS 602 shall be implemented when either the ambient temperature falls below 40°F (4°C) or the temperature of masonry units is below 40°F (4°C).

[2104.3.1] 2104.2.1 Preparation. No salt or other chemicals for the purpose of lowering the freezing temperature of water shall be permitted in the mortar or grout mix.

[2104.4] 2104.3 Hot weather construction. The hot weather construction provisions of [TMS 602/ACI-530.1/ASCE-6] Article 1.8 D of TMS 602 shall be implemented when the temperature exceeds 100°F (37.8°C), or 90°F (32.2°C) with a wind-velocity greater than 8 mph (12.9 km/hr).

[2104.5] 2104.4 Wetting of brick. Brick (clay or shale) at the time of laying shall require wetting if the unit’s initial rate of water absorption exceeds 21.42 grams per 30 square inches (19 355 mm²) per minute or 0.025 ounce psi (1 g/645 mm²), as determined by ASTM C 67.

[2104.6] 2104.5 Masonry construction bracing. In accordance with [TMS 602/ACI-530.1/ASCE-6 Section] Article 3.3E of TMS 602, the contractor shall design, provide, and install bracing that will assure stability of all masonry during construction. The contractor shall keep a bracing plan on site during all masonry construction. Bracing plans shall consider wind loads, initial and intermediate masonry strengths, and the contractor’s ability to evacuate the site. Construction bracing for walls within a distance less than their height from adjoining properties or other unprotected and uncontrolled areas shall be designed for code prescribed wind loads and the bracing plan shall be signed and sealed by a licensed professional engineer. Construction bracing for walls may be designed using reduced loading in accordance with Section [1618] 1619. Such reduced loading shall only be permitted when an action plan meeting the requirements of Section [1618.3] 1619.3 is provided and maintained at the site.

[2104.7] Conduits, pipes, and sleeves in masonry. Conduits, pipes and sleeves of any material not harmful to masonry are permitted to be installed in the masonry with approval of the registered design professional of record.

[2104.8] 2104.6 Parapet walls. At a minimum, parapet walls shall meet the following requirements:

[2104.8.1] 2104.6.1 Parapet wall construction. All cells in the hollow masonry units and all joints in solid, cavity, or masonry-bonded hollow wall construction shall be filled solid. All corners of masonry parapet walls shall be reinforced with joint reinforcement or its equivalent at vertical intervals not greater than 16[42] inches (305 mm) (406 mm). Such reinforcement shall extend around the corner for at least 4 feet (1219 mm) in both directions, and splices shall be lapped at least 6 inches (152 mm).

[2104.8.2] 2104.6.2 Parapet anchorage. Parapets [of buildings taller than 35 feet (10 668 mm)] shall be reinforced vertically and shall be anchored to the roof and floors that provide lateral support for the wall in accordance with Section 1604.8.2.
Floor and roof anchorage. Floor and roof anchorage shall comply with Section 2104.7.1 through 2104.7.1.3.

Bearing details. Concentrated loads shall be supported upon construction of solid masonry, concrete, or masonry of hollow units with cells filled with mortar, grout, or concrete. In addition, construction supporting concentrated loads shall be of sufficient height to distribute safely the loads to the wall or column, or other adequate provisions shall be made to distribute the loads.

Joists. Solid construction for support under joists shall be at least 2¼ inches (57 mm) in height, and joists supported on such construction shall extend into the masonry at least 3 inches (76 mm).

Beams. Solid construction for support under beams, girders, or other concentrated loads shall be at least 4 inches (102 mm) in height, and the bearing of beams shall extend into the masonry at least 4 inches (102 mm).

Isolated piers. Isolated masonry piers shall be bonded as required for solid walls of the same thickness and shall be provided with adequate means for distributing the load at the top of the pier.

Walls adjoining structural framing. Walls adjoining structural framing shall comply with Sections 2104.8.1 and 2104.8.2.

Use of existing walls. An existing masonry wall may be used in the alteration or extension of a building provided that it meets the requirements of this code.

Walls of insufficient thickness. Existing walls of masonry units that are structurally sound, but that are of insufficient thickness when increased in height, may be strengthened by an addition of similar masonry units laid in Type M or S mortar. The foundations and lateral support shall be equivalent to those required for newly constructed walls under similar conditions. All such linings shall be thoroughly bonded into existing masonry by toothings to assure combined action of wall and lining. Toothings shall be distributed uniformly throughout the wall, and shall aggregate in vertical cross-sectional area at least 15 percent of the total surface area of the lining. Stresses in the masonry under the new conditions shall not exceed the allowable stresses.

Isolation joints. All non-participating masonry walls and veneers shall be constructed with adequate depth and width of isolation joints to prevent masonry distress induced by deflections, drifts, shortening, expansion, or other similar movements in the plane of the wall.

Substitution. Mortar shall not be substituted for grout where grout is specified on the construction documents.
SECTION BC 2105
QUALITY ASSURANCE

2105.1 General. A quality assurance program shall be used to ensure that the constructed masonry is in compliance with the approved construction documents. [The quality assurance program shall comply with the inspection and testing requirements of Chapter 17.]

The quality assurance program shall comply with the inspection and testing requirements of Chapter 17 and TMS 602.

[2105.2 Acceptance relative to strength requirements.]

[2105.2.1 Compliance with \( f'_{m} \) and \( f'_{AAC} \). Compressive strength of masonry shall be considered satisfactory if the compressive strength of each masonry wythe and grouted collar joint equals or exceeds the value of \( f'_{m} \) for clay and concrete masonry and \( f'_{AAC} \) for AAC masonry. For partially grouted clay and concrete masonry, the compressive strength of both the grouted and ungrouted masonry shall equal or exceed the applicable \( f'_{m} \). At the time of prestress, the compressive strength of the masonry shall equal or exceed \( f'_{m} \), which shall be less than or equal to \( f'_{m} \).

[2105.2.2 Determination of compressive strength. The compressive strength for each wythe shall be determined by the unit strength method or by the prism test method as specified herein.]

[2105.2.2.1 Unit strength method.]

[2105.2.2.1.1 Clay masonry. The compressive strength of masonry shall be determined based on the strength of the units and the type of mortar specified using Table 2105.2.2.1.1, provided:]  

[1. Units are sampled and tested in accordance with ASTM C 67 to verify compliance with ASTM C 62, ASTM C 216 or ASTM C 652.]

[2. Thickness of bed joints does not exceed \( 5/8 \) inch (15.9 mm).]

[3. For grouted masonry, the grout meets one of the following requirements:]  

[3.1. Grout conforms to Article 2.2 of TMS 602/ACI 530.1/ASCE 6.]  

[3.2. Minimum grout compressive strength equals or exceeds \( f'_{m} \) but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.]
### TABLE 2105.2.2.1.1

**2105.2.2.1.2 Concrete masonry.** The compressive strength of masonry shall be determined based on the strength of the unit and type of mortar specified using Table 2105.2.2.1.2, provided:

1. Units conform to ASTM C 55 or ASTM C 90 and are sampled and tested in accordance with ASTM C 140.
2. Thickness of bed joints does not exceed 7/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
   3.1. Grout conforms to Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
   3.2. Minimum grout compressive strength equals $f_m$ but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

</tbody>
</table>

[For SI: 1 inch = 25.4 mm, 1 pound per square inch = 0.00689 MPa]

[a. For units less than 4 inches in height, 85 percent of the values listed.]

**2105.2.2.1.3 AAC masonry.** The compressive strength of AAC masonry shall be based on the strength of the AAC masonry unit only and the following shall be met:

1. Units conform to ASTM C 1386.
2. Thickness of bed joints does not exceed 1/8 inch (3.2 mm).
For grouted masonry, the grout meets one of the following requirements:

3.1. Grout conforms to Article 2.2 of TMS 602/ACI 530.1/ASCE 6.

3.2. Minimum grout compressive strength equals or exceeds $f'_{m,AC}$ but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

[2105.2.2.2] Prism test method.

2105.2.2.2.1 General. The compressive strength of masonry shall be determined by the prism test method:

1. Where specified in the construction documents.

2. Where masonry does not meet the requirements for application of the unit strength method in Section 2105.2.2.1.

2105.2.2.2.2 Number of prisms per test. A prism test shall consist of three prisms constructed and tested in accordance with ASTM C 1314.

2105.3 Testing prisms from constructed masonry. When approved by the commissioner acceptance of masonry that does not meet the requirements of Section 2105.2.2.1 or 2105.2.2.2 shall be permitted to be based on tests of prisms cut from the masonry construction in accordance with Sections 2105.3.1, 2105.3.2 and 2105.3.3.

2105.3.1 Prism sampling and removal. A set of three masonry prisms that are at least 28 days old shall be saw cut from the masonry for each 5,000 square feet (465 m$^2$) of the wall area that is in question but not less than one set of three masonry prisms for the project. The length, width and height dimensions of the prisms shall comply with the requirements of ASTM C 1314. Transporting, preparation and testing of prisms shall be in accordance with ASTM C 1314.

2105.3.2 Compressive strength calculations. The compressive strength of prisms shall be the value calculated in accordance ASTM C 1314, except that the net cross-sectional area of the prism shall be based on the net mortar bedded area.

2105.3.3 Compliance. Compliance with the requirement for the specified compressive strength of masonry, $f'_{m}$, shall be considered satisfied provided the modified compressive strength equals or exceeds the specified $f'_{m}$. Additional testing of specimens cut from locations in question shall be permitted.

2105.4 2105.2 Submittals. Submittals required by [TMS 602/ACI 530.1/ASCE 6 Section] Article 1.5 of TMS 602 shall be sent to the applicant of record for review prior to use of the materials or methods of construction. In addition the contractor shall submit a Material Storage and Protection Plan.
SECTION BC 2106
SEISMIC DESIGN

2106.1 Seismic design requirements for masonry. Masonry structures and components shall comply with the requirements in [Section] Chapter 7 of TMS 402/[ACI 530/ASCE 5] depending on the structure’s seismic design category as determined in Section 1613 of this code. All masonry walls, unless isolated on three edges from in-plane motion of the basic structural systems, shall be considered to be part of the seismic-force-resisting system.

2106.1.1 Non-participating masonry walls. Masonry walls that are not part of the lateral-force-resisting system shall be isolated from the structure so that the vertical and lateral forces are not imparted to these elements. Isolation joints and connectors between these elements and the structure shall be designed to accommodate the design story drift.

SECTION BC 2107
ALLOWABLE STRESS DESIGN

2107.1 General. The design of masonry structures using allowable stress design shall comply with Section 2106 and the requirements of Chapters 1 through 8 of TMS 402/[ACI 530/ASCE 5]. The text of TMS 402/ACI 530/ASCE 5 shall be except as modified by Sections 2107.2 through 2107.5 of this code.

2107.2 TMS 402/[ACI 530/ASCE 5], Section 6.1.6.1.1, lap splices. As an alternative to Section 6.1.6.1.1, it shall be permitted to design lap splices in accordance with Section 2107.2.1 of the New York City Building Code.

2107.3 TMS 402/ACI 530/ASCE 5, Section 2.1.9.7.1.1, lap splices. Modify Section 2.1.9.7.1.1 as follows:

2107.2.1 Lap splices. The minimum length of lap splices for reinforcing bars in tension or compression, \( l_d \), shall be

\[
l_d = 0.002d_b f_s
\]  
(Equation 21-1)

For SI: \( l_d = 0.29d_b f_s \)

but not less than 12 inches (305 mm). In no case shall the length of the lapped splice be less than 40 bar diameters.

where:

\[d_b = \text{Diameter of reinforcement, inches (mm).}\]

\[f_s = \text{Computed stress in reinforcement due to design loads, psi (MPa).}\]

In regions of moment where the design tensile stresses in the reinforcement are greater than 80 percent of the allowable steel tension stress, \( F_s \), the lap length of splices shall be increased not less than 50 percent of the minimum required length, but need not be greater than \( 72d_b \). Other equivalent means of stress transfer to accomplish the same 50 percent increase shall be permitted. Where epoxy coated bars are used, lap length shall be increased by 50 percent.
Modify Section [2.1.9.7] 6.1.6.1 as follows:

[2.1.9.7] 6.1.6.1 – Splices of reinforcement. Lap splices, welded splices or mechanical splices are permitted in accordance with the provisions of this section. All welding shall conform to AWS D1.4. Welded splices shall be of ASTM A706 steel reinforcement. Reinforcement larger than No. 9 (M #29) shall be spliced using mechanical connections in accordance with Section [2.1.9.7.3] 6.1.6.1.3.

[2.3.6] 8.3.6 – Maximum bar size. Add the following to Chapter [2] 8:

The bar diameter shall not exceed one-eighth of the nominal wall thickness and shall not exceed one-quarter of the least dimension of the cell, course or collar joint in which it is placed.

SECTION BC 2108
STRENGTH DESIGN OF MASONRY

2108.1 General. The design of masonry structures using strength design shall comply with Section 2106 and the requirements of Chapters 1 through 7 and [3] Chapter 9 of TMS 402/[ACI 530/ASCE 5], except as modified by Sections 2108.2 through 2108.3 of this code.

Exception: AAC masonry shall comply with the requirements of [Chapter] Chapters 1 through 7 and [Appendix A] Chapter 11 of TMS 402/[ACI 530/ASCE 5].

2108.2 TMS 402/[ACI 530/ASCE 5], Section [3.3.3.3] 6.1.5.1.1, development. Modify the second paragraph of Section [3.3.3.3] 6.1.5.1.1 as follows:

The required development length of reinforcement shall be determined by Equation [(3-16)] (6-1), but shall not be less than 12 inches (305 mm) and need not be greater than 72 dₜ.

2108.3 TMS 402/[ACI 530/ASCE 5], Section [3.3.3.4] 6.1.6.1.1, splices. Modify [items (b) and (e) of Section 3.3.3.4] subsections 6.1.6.1.2 and 6.1.6.1.3 as follows:

[3.3.3.4 (b)] 6.1.6.1.2 – A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, fₜ, of the bar in tension or compression, as required. Welded splices shall be of ASTM [A 706] A706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls [or special moment frames of masonry].

[3.3.3.4 (e)] 6.1.6.1.3 – Mechanical splices shall be classified as Type 1 or 2 [according to] in accordance with Section [24.2.6.1] 18.2.7.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls [or special moment frames]. Type 2 mechanical splices are permitted in any location within a member.
SECTION BC 2109
EMPIRICAL DESIGN OF MASONRY

2109.1 General. Empirically designed masonry shall conform to this chapter or [Chapter 5] the requirements of Appendix A of TMS 402/ACI 530/ASCE 5, except where otherwise noted in this section.

2109.1.1 Limitations. The use of empirical design of masonry shall be limited as noted in Section [5.1.2] A.1.2 of TMS 402/ACI 530/ASCE 5. The use of dry-stacked, surface-bonded masonry shall be prohibited in [Occupancy] Risk Category IV structures. In buildings that exceed one or more of the limitations of Section [5.1.2] A.1.2 of TMS 402/ACI 530/ASCE 5, masonry shall be designed in accordance with the engineered design provisions of Section 2101.2.1, 2101.2.2, 2101.2 or 2101.2.3 the foundation wall provisions of [this code] Section 1807.

2109.1.1.1 TMS 402, Section A.1.2.3, Wind. Section A.1.2.3 of TMS 402 shall be modified as follows:

A.1.2.3 – Wind. Empirical requirements shall not apply to the design or construction of masonry for buildings, parts of buildings, or other structures to be located in areas where \( V_{asd} \) as determined in accordance with Section 1609.3.1 of the New York City Building Code exceeds 110 mph.

2109.2 Surface-bonded walls. Dry-stacked, surface-bonded concrete masonry walls shall comply with the requirements of [Chapter 5] Appendix A of TMS 402/ACI 530/ASCE 5, except where otherwise noted in this section.

2109.2.1 Strength. Dry-stacked, surface-bonded concrete masonry walls shall be of adequate strength and proportions to support all superimposed loads without exceeding the allowable stresses listed in Table 2109.2.1. Allowable stresses not specified in Table 2109.2.1 shall comply with the requirements of TMS 402/ACI 530/ASCE 5.

2109.2.2 Construction. Construction of dry-stacked, surface-bonded masonry walls, including stacking and leveling of units, mixing and application of mortar and curing and protection shall comply with ASTM C 946.

2109.3 Reserved.

2109.4 [Reserved.]
[2109.5] **Thickness of masonry.** Minimum thickness requirements shall be based on nominal dimensions of masonry.

[2109.5.1] **2109.4.1 Thickness of walls.** The thickness of masonry walls shall conform to the requirements of Section [2109.5] 2109.4.

[2109.5.2] **2109.4.2 Minimum thickness.** The minimum thickness of masonry bearing walls more than one story high shall be 8 inches (203 mm) where the height floor to floor does not exceed 12 feet (3658 mm), the floor live load does not exceed 60 pounds per square foot (psf) (0.156 kg/m²), and the roof is designed so that the dead load imparts no lateral thrust to the wall. Bearing walls of one-story buildings shall not be less than 6 inches (152 mm) thick. However, the overall thickness of cavity or masonry-bonded hollow walls shall not be less than 8 inches (203 mm), including cavity.

[2109.5.2.1] **2109.4.2.1 Walls above roof level.** Masonry walls above roof level, 12 feet (3658 mm) or less in height, enclosing stairways, machinery rooms, shafts, or penthouses, may be up to 8 inches (203 mm) thick and shall be considered as neither increasing the height, nor requiring any increase in the thickness of the wall below.

[2109.5.3] **2109.4.3 Partitions.** The minimum thickness for partitions shall be as follows:

<table>
<thead>
<tr>
<th>HEIGHT OF WALLS</th>
<th>THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>8 ft. and under</td>
<td>2 in.</td>
</tr>
<tr>
<td>Over 8 ft. to 12 ft</td>
<td>3 in.</td>
</tr>
<tr>
<td>Over 12 ft. to 16 ft</td>
<td>4 in.</td>
</tr>
<tr>
<td>Over 16 ft. to 20 ft</td>
<td>6 in.</td>
</tr>
<tr>
<td>Over 20 ft. to 24 ft</td>
<td>8 in.</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

[2109.6] **Reserved.**

[2109.7] **2109.5 Horizontal joints.** All concrete framed buildings to be constructed over 35 feet (10668 mm) in height (as measured from adjoining grade to the main roof level), whose exterior wythe are of cavity wall construction with steel lintels, shall have horizontal joints in the exterior wythe to prevent masonry distress induced by vertical shortening of the structural frame.

[2109.7.1] **2109.5.1 Joint minimum thickness.** Unless substantiated as indicated by Section [2109.7.2] 2109.5.1, horizontal joints shall be 1/4 inch (6.4 mm) minimum thickness, with neoprene, polyethylene, or urethane gasket or equivalent joint filler filling the entire joint, except for a recess from the toe of the lintel angle to the exterior of the facing brick, to provide space for caulking. These joints shall be placed at each floor.

[2109.7.2] **2109.5.2 Joint thickness by analysis.** The applicant of record shall submit an engineering analysis establishing that proposed building horizontal joints spaced further apart than in Section [2109.7.1] 2109.5.1 are sufficient to provide for the effects of vertical shortening.
of the structural frame.

SECTION BC 2110
GLASS UNIT MASONRY

2110.1 General. [This section covers the empirical requirements for non load-bearing glass unit masonry elements in exterior or interior walls.] Glass unit masonry construction shall comply with Chapter 13 of TMS 402/ACI 530/ASCE 5 and this section.

2110.1.1 Limitations. Solid or hollow approved glass block shall not be used in firewalls, party walls, fire barriers, fire partitions, smoke barriers, or for load-bearing construction. Such blocks shall be erected with mortar and reinforcement in metal channel-type frames, structural frames, masonry or concrete recesses, embedded panel anchors as provided for both exterior and interior walls or other approved joint materials. Wood strip framing shall not be used in walls required to have a fire-resistance rating by other provisions of this code.

Exceptions:

1. [Glass block] Glass-block assemblies having a fire protection rating of not less than ¾ hour shall be permitted as opening protectives in accordance with Section 715 in fire barriers, fire partitions and smoke barriers that have a required fire-resistance rating of 1 hour and do not enclose exit stairways or exit passageways.

2. [Glass block] Glass-block assemblies as permitted in Section 404.6, Exception 2.

SECTION BC 2111
MASONRY FIREPLACES

2111.1 General. [A] The construction of masonry fireplaces is a fireplace constructed of concrete or masonry. Masonry fireplaces shall be constructed in accordance with this section, Table 2111.1 and Figure 2111.1. All masonry fireplaces shall be installed, altered and maintained in buildings in conformity with the applicable provisions of the New York City Mechanical Code, the New York City Fuel Gas Code and the New York City Air Pollution Control Code. [and no] No new masonry fireplaces shall be permitted except those that burn the types of fuel allowed by Section 24-149.2 of the New York City Air Pollution Control Code.

</table>
a. This table provides a summary of major requirements for the construction of masonry chimneys and fireplaces. Letter references [see] refer to Figure 2111.1, which shows examples of typical construction. This table does not cover all requirements, nor does it cover all aspects of the indicated requirements. For the actual mandatory requirements of the code, see the indicated section of text.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929m², 1 degree = 0.017 rad.
2111.2 **Fireplace drawings.** The construction documents shall describe in sufficient detail the location, size and construction of masonry fireplaces. The thickness and characteristics of materials and the clearances from walls, partitions and ceilings shall be indicated.

[2111.2] **2111.3 Footings and foundations.** Footings for masonry fireplaces and their chimneys shall be constructed of reinforced concrete or solid masonry at least 12 inches (305 mm) thick and shall extend at least 6 inches (152 mm) beyond the face of the fireplace or foundation wall on all sides. Footings shall be founded on natural undisturbed earth or engineered fill below frost depth. In areas not subjected to freezing, footings shall be at least 12 inches (305 mm) below finished grade.

[2111.2.1] **2111.3.1 Ash dump [clean-out] cleanout.** Cleanout openings, located within foundation walls below fireboxes, when provided, shall be equipped with ferrous metal or masonry doors and frames constructed to remain tightly closed, except when in use. Cleanouts shall be accessible and located so that ash removal will not create a hazard to combustible materials.

[2111.2.2] **2111.3.2 Elevated** **Floor-supported** **fireplaces.** Fireplaces not supported on foundations shall be supported on noncombustible construction having a minimum fire-resistance rating of 3 hours for the members or assemblies in contact with the fireplace. Structural members or assemblies not directly in contact with the fireplace shall only be required to meet the fire-resistance rating specified elsewhere in this code.

[2111.3] **Seismic reinforcing.** Masonry or concrete fireplaces shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category C or D, masonry and concrete fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2, 2111.4 and 2111.4.1 for chimneys serving fireplaces. In Seismic Design Category B, reinforcement and seismic anchorage is not required.

**2111.4 Seismic reinforcement.** In structures assigned to Seismic Design Category A or B, seismic reinforcement is not required. In structures assigned to Seismic Design Category C or D, masonry fireplaces shall be reinforced and anchored in accordance with Sections 2111.4.1, 2111.4.2 and 2111.5, and Table 2111.1, and Figure 2111.1.

**2111.4.1 Vertical reinforcing.** For fireplaces with chimneys up to 40 inches (1016 mm) wide, four No. 4 continuous vertical bars, anchored in the foundation, shall be placed in the concrete between wythes of solid masonry or within the cells of hollow unit masonry and grouted in accordance with Section 2103.12. For fireplaces with chimneys greater than 40 inches (1016 mm) wide, two additional No. 4 vertical bars shall be provided for each additional 40 inches (1016 mm) in width or fraction thereof.

**2111.4.2 Horizontal reinforcing.** Vertical reinforcement shall be placed enclosed within ¼-inch (6.4 mm) ties or other reinforcing of equivalent net cross-sectional area, spaced not to exceed 18 inches (457 mm) on center in concrete; or placed in the bed joints of unit masonry at a minimum of every 18 inches (457 mm) of vertical height. Two such ties shall be provided at each bend in the vertical bars.
[2111.4] 2111.5 Seismic anchorage. Masonry [and concrete chimneys in Seismic Design Category C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements] fireplaces shall have their chimneys anchored in accordance with Section 2113.4.

[2111.4.1] Anchorage. Two 3/16-inch by 1-inch (4.8 mm by 25 mm) straps shall be embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two ½-inch (12.7 mm) bolts.

[2111.5] 2111.6 Firebox walls. Masonry fireboxes shall be constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete. When a lining of firebrick at least 2 inches (51 mm) in thickness or other approved lining is provided, the minimum thickness of back and side walls shall each be 8 inches (203 mm) of solid masonry, including the lining. The approved lining shall be able to withstand a temperature of 2000°F (1093°C) without cracking. The width of joints between firebricks shall be not greater than ¼ inch (6.4 mm). When no lining is provided, the total minimum thickness of back and side walls shall be 12 inches (305 mm) of solid masonry. Firebrick shall conform to ASTM C 27 or ASTM C 1261 and shall be laid with medium-duty refractory mortar conforming to ASTM C 199.

[2111.5.1] 2111.6.1 Steel fireplace units. Steel fireplace units are permitted to be installed with solid masonry to form a masonry fireplace provided they are installed according to either the requirements of their listing or the requirements of this section. Steel fireplace units incorporating a steel firebox lining shall be constructed with steel not less than ¼ inch (6.4 mm) in thickness, and an air-circulating chamber which is ducted to the interior of the building. The firebox lining shall be encased with solid masonry to provide a total thickness at the back and sides of not less than 8 inches (203 mm), of which not less than 4 inches (102 mm) shall be of solid masonry or concrete. Circulating air ducts employed with steel fireplace units shall be constructed of metal or masonry.

[2111.6] 2111.7 Firebox dimensions. The firebox of a masonry fireplace shall have a minimum depth of 20 inches (508 mm). The throat shall be not less than 8 inches (203 mm) above the fireplace opening. The throat opening shall not be less than 4 inches (102 mm) in depth. The cross-sectional area of the passageway above the firebox, including the throat, damper and smoke chamber, shall be not less than the cross-sectional area of the flue.

Exception: Rumford fireplaces shall be permitted provided that the depth of the fireplace is at least not less than 12 inches (305 mm) and at least one-third of the width of the fireplace opening, and the throat is at least not less than 12 inches (305 mm) above the lintel, and at least 1/20 the cross-sectional area of the fireplace opening.

[2111.7] 2111.8 Lintel and throat. Masonry over a fireplace opening shall be supported by a lintel of noncombustible material. The minimum required bearing length on each end of the fireplace opening shall be 4 inches (102 mm). The fireplace throat or damper shall be located not less than 8 inches (203 mm) above the top of the fireplace opening.
**2111.8.1 Damper.** Masonry fireplaces shall be equipped with a ferrous metal damper located [at least] not less than 8 inches (203 mm) above the top of the fireplace opening. Dampers shall be installed in the fireplace or at the top of the flue venting the fireplace, and shall be operable from the room containing the fireplace. Damper controls shall be permitted to be located in the fireplace. The damper shall be able to withstand distortion from binding, cracking or corrosion when exposed to the fireplace operating temperature.

**2111.9 Smoke chamber walls.** Smoke chamber walls shall be constructed of solid masonry units, hollow masonry units grouted solid, or stone [or concrete]. Corbeling of masonry units shall not leave unit cores exposed to the inside of the smoke chamber. The inside surface of corbeled masonry shall be parged smooth. Where no lining is provided, the total minimum thickness of front, back and [side walls] sidewalls shall be 8 inches (203 mm) of solid masonry. When a lining of firebrick [at least] not less than 2 inches (51 mm) thick, or a lining of vitrified clay [at least] not less than ⅝ inch (15.9 mm) thick, is provided, the total minimum thickness of front, back and [side walls] sidewalls shall be 6 inches (152 mm) of solid masonry, including the lining. Firebrick shall conform to ASTM C 27 or ASTM C 1261 and shall be laid with refractory mortar conforming to ASTM C 199. (Verified) Vitrified clay linings shall conform to ASTM C 315.

**2111.9.1 Smoke chamber dimensions.** The inside height of the smoke chamber from the fireplace throat to the beginning of the flue shall be not [be] greater than the inside width of the fireplace opening. The inside surface of the smoke chamber shall not be inclined more than 45 degrees (0.76 rad) from vertical when prefabricated smoke chamber linings are used or when the smoke chamber walls are rolled or sloped rather than corbeled. When the inside surface of the smoke chamber is formed by corbeled masonry, the walls shall not be corbeled more than 30 degrees (0.52 rad) from vertical.

**2111.10 Hearth and hearth extension.** Masonry fireplace hearths and hearth extensions shall be constructed of concrete, ceramic tile, masonry or equivalent, supported by noncombustible materials, and reinforced to carry their own weight and all imposed loads. No combustible material shall remain against the underside of hearths or hearth extensions after construction.

**2111.10.1 Hearth thickness.** The minimum thickness of fireplace hearths shall be 4 inches (102 mm).

**2111.10.2 Hearth extension thickness.** The minimum thickness of hearth extensions shall be 2 inches (51 mm).

**Exception:** When the bottom of the firebox opening is raised [at least] not less than 8 inches (203 mm) above the top of the hearth extension, a hearth extension of not less than ⅝-inch-thick (9.5 mm) brick, concrete, stone, tile or other approved noncombustible material is permitted.

**2111.11 Hearth extension dimensions.** Hearth extensions shall extend [at least] not less than 16 inches (406 mm) in front of, and [at least] not less than 8 inches (203 mm) beyond, each side of the fireplace opening. Where the fireplace opening is 6 square feet (0.56 m$^2$) or larger, the hearth extension shall extend [at least] not less than 20 inches (508 mm) in front of, and [at least] not less than 12 inches (305 mm) beyond, each side of the fireplace opening.
[2111.10.1] **2111.1 Elevated or overhanging fireplace.** Where a fireplace is elevated or overhangs a floor, the hearth extension shall also extend over the area under the fireplace beneath the entire area of the fireplace.

[2111.11] **2111.12 Fireplace clearance.** Any portion of a masonry fireplace located in the interior of a building or within the exterior wall of a building shall have a clearance to combustibles of not less than 2 inches (51 mm) from the front faces and sides of masonry fireplaces and not less than 4 inches (102 mm) from the back faces of masonry fireplaces. The airspace shall not be filled, except to provide fireblocking in accordance with Section 2111.13.

**Exceptions:**

1. Masonry fireplaces listed and labeled for use in contact with combustibles in accordance with UL 127 and installed in accordance with the manufacturer’s installation instructions are permitted to have combustible material in contact with their exterior surfaces.

2. When masonry fireplaces are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete walls less than 12 inches (306 mm) from the inside surface of the nearest firebox lining.

3. Exposed combustible trim and the edges of sheathing materials, such as wood siding, flooring, and drywall, are permitted to abut the masonry fireplace sidewalls and hearth extension, in accordance with Figure [2111.11] 2111.12, provided such combustible trim or sheathing is a minimum of not less than 12 inches (306 mm) from the inside surface of the nearest firebox lining.

4. Exposed combustible mantels or trim is permitted to be placed directly on the masonry fireplace front surrounding the fireplace opening, provided such combustible materials shall not be placed within 6 inches (152 mm) of a fireplace opening. Combustible material within 12 inches (306 mm) of the fireplace opening shall not project more than 1/8 inch (3.2 mm) for each 1-inch (25 mm) distance from such opening.

For SI: 1 inch = 25.4 mm
[**2111.12 Mantel and trim.** Woodwork or other combustible materials shall not be placed within 6 inches (152 mm) of a fireplace opening. Combustible material within 12 inches (305 mm) of the fireplace opening shall not project more than ¼ inch (3.2 mm) for each 1-inch (25 mm) distance from such opening.]

**2111.13 Fireplace fireblocking.** All spaces between fireplaces and floors and ceilings through which fireplaces pass shall be fireblocked with approved noncombustible material securely fastened in place. The fireblocking of spaces between wood joists, beams or headers shall be to a depth of 1 inch (25 mm) and shall only be placed on strips of metal or metal lath laid across the spaces between combustible material and the chimney.

**2111.14 Exterior air.** Factory-built or masonry fireplaces covered in this section shall be equipped with an exterior air supply to ensure proper fuel combustion unless the room is mechanically ventilated and controlled so that the indoor pressure is neutral or positive.

**2111.14.1 Factory-built fireplaces.** Exterior combustion air ducts for factory-built fireplaces shall be listed components of the fireplace, and installed according to the fireplace manufacturer’s instructions.

**2111.14.2 Masonry fireplaces.** Listed combustion air ducts for masonry fireplaces shall be installed according to the terms of their listing and manufacturer’s instructions.

**2111.14.3 Exterior air intake.** The exterior air intake shall be capable of providing all combustion air from the exterior of the dwelling. The exterior air intake shall not be located within the garage, attic, basement or crawl space of the dwelling nor shall the air intake be located at an elevation higher than the firebox. The exterior air intake shall be covered with a corrosion-resistant screen of ¼-inch (6.4 mm) mesh.

**2111.14.4 Clearance.** Unlisted combustion air ducts shall be installed with a minimum 1-inch (25 mm) clearance to combustibles for all parts of the duct within 5 feet (1524 mm) of the duct outlet.

**2111.14.5 Passageway.** The combustion air passageway shall be [a minimum of] not less than 6 square inches (3870 mm²) and not more than 55 square inches (0.035 m²), except that combustion air systems for listed fireplaces or for fireplaces tested for emissions shall be constructed according to the fireplace manufacturer’s instructions.

**2111.14.6 Outlet.** The exterior air outlet is permitted to be located in the back or sides of the firebox chamber or within 24 inches (610 mm) of the firebox opening on or near the floor. The outlet shall be closable and designed to prevent burning material from dropping into concealed combustible spaces.
SECTION BC 2112
MASONRY HEATERS

2112.1 Definition. A masonry heater is a heating appliance constructed of concrete or solid masonry, hereinafter referred to as “masonry,” which is designed to absorb and store heat from a solid fuel fire built in the firebox by routing the exhaust gases through internal heat exchange channels in which the flow path downstream of the firebox may include flow in a horizontal or downward direction before entering the chimney and which delivers heat by radiation from the masonry surface of the heater.

2112.2 Installation. Masonry heaters may be installed only when their use is permitted by the New York City Air Pollution Control Code. When such use is permitted, such appliances shall be operated in compliance with the New York City Air Pollution Control Code. Masonry heaters shall also be installed in accordance with this section and comply with one of the following:

1. Masonry heaters shall comply with the requirements of ASTM E 1602.

2. Masonry heaters shall be listed and labeled in accordance with UL 1482 or EN 15250 and installed in accordance with the manufacturer’s installation instructions.

2112.3 Footings and foundation. The firebox floor of a masonry heater shall be a minimum thickness of 4 inches (102 mm) of noncombustible material and be supported on a noncombustible footing and foundation in accordance with Section 2113.2.

2112.4 Seismic reinforcing. In structures assigned to Seismic Design Category D, masonry heaters shall be anchored to the masonry foundation in accordance with Section 2113.3. Seismic reinforcing shall not be required within the body of a masonry heater with a height that is equal to or less than 3.5 times its body width and where the masonry chimney serving the heater is not supported by the body of the heater. Where the masonry chimney shares a common wall with the facing of the masonry heater, the chimney portion of the structure shall be reinforced in accordance with Section 2113.

2112.5 Masonry heater clearance. Combustible materials shall not be placed within 36 inches (914 mm) or the distance of the allowed reduction method from the outside surface of a masonry heater in accordance with NFPA 211, Section 12.6, and the required space between the heater and combustible material shall be fully vented to permit the free flow of air around all heater surfaces.

Exceptions:

[4.] 1. Where the masonry heater wall thickness is at least 8 inches (203 mm) thick of solid masonry and the wall thickness of the heat exchange channels is at least not less than 5 inches (127 mm) thick of solid masonry, combustible materials shall not be placed within 4 inches (102 mm) of the outside surface of a masonry heater. A clearance of at least not less than 8 inches (203 mm) shall be provided between the gas-tight capping slab of the heater and a combustible ceiling.

[5.] 2. Masonry heaters listed and labeled in accordance with UL 1482 or EN 15250 and installed in accordance with the manufacturer’s instructions.
SECTION BC 2113
MASONRY CHIMNEYS

2113.1 General. [A] The construction of masonry (chimney is a chimney constructed of concrete or masonry, hereinafter referred to as “masonry.” Masonry chimneys consisting of solid masonry units, hollow masonry units grouted solid, or stone shall be [constructed, anchored, supported and reinforced as required in this chapter] in accordance with this section.

Chimneys shall be designed and constructed so as to provide the necessary draft and capacity for each appliance connected to them to completely exhaust the products of combustion to the outside air. The temperature on adjacent combustible surfaces shall not be raised above 160°F (71°C). Chimney and vents shall be designed to resist the effects of condensation that would cause deterioration of the chimney or vent.

In any case, the outlet shall be arranged so that the flue gases are not directed so that they jeopardize people, overheat combustible structures, or enter building openings in the vicinity of the outlet. Gas-fired appliances shall be vented in accordance with this code, the New York City Fuel Gas Code and NFPA 54.

Chimneys shall not be supported by the equipment they serve unless such equipment has been specifically designed for such loads.

2113.1.1 Chimney adequacy for temperature and gas action. Chimneys shall be of adequate structural strength and resistant to the temperatures to which they may be subjected and to the corrosive action of gases.

2113.1.2 Chimney caps. Termination caps shall not be permitted and a 3-inch (76 mm) minimum drain shall be installed to receive collected water. A positive means shall be provided to prevent water from entering the appliance. [Exception: Termination caps shall be permitted on listed factory-built chimneys.]

2113.1.2.1 Decorative shrouds. Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers’ installation instructions.

2113.1.3 Chimney linings. The lining in chimneys shall not be considered as taking either compression or tension stresses.

2113.1.4 Chimney expansion and contraction. Expansion and contraction in chimney walls due to temperature variations shall be accommodated solely by the use of steel reinforcing rings.

2113.1.5 Reinforcing rings. Reinforcing rings shall be provided at all changes in wall thickness, at the top of the chimney, and above and below all flue openings.

2113.1.6 [Adjoining] Existing chimneys and vents. [Adjoining] Existing chimneys and vents shall [be in accordance with] comply with the requirements of Section 28-104.13 of
the Administrative Code and Sections 107.18 and 2113.1.5.1 through 2113.1.6.8 of this code.

2113.1.6.1 Responsibility of owner of taller building. Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any existing chimneys or vents within 100 feet (30 480 mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required, shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed existing chimneys or vents to the height required in this chapter.

2. Offset such chimneys or vents to a distance beyond that required in this chapter from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.

Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

2113.1.5.1 Chimney and vent plan. Applications for a new or altered building shall include a chimney and vent plan submitted pursuant to Section 107.18.

2113.1.5.2 Protection of draft. After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

2113.1.5.3 Written notification, plans and required documents. The owner of the new or altered building shall notify the owner of any building that may require a chimney or vent to be altered. Notification, plans and required documents shall comply with the requirements of Sections 2113.1.5.3.1 through 2113.1.5.3.3. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.

2113.1.5.3.1 First notice. Written notice in a form acceptable to the department shall be provided to the building owner not less than 60 days prior to a request for permit for construction on the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. A copy of such return receipt shall be filed with the department.
2113.1.5.3.2 Second notice. Written notice in a form acceptable to the department shall be provided to the building owner not more than 45 days following commencement of work after a permit has been issued for the new or altered building. Such notice shall include a request for access to determine the need to alter the existing chimney or vent and a description of such work. Notice shall be sent by regular mail and certified mail, return receipt requested. The second notice shall also be posted by a licensed process server at the public entrance of the building requiring a chimney or vent to be altered. A copy of such return receipt and proof of service by the licensed process server shall be filed with the department.

Exceptions:

1. A second notice shall not be required where an application to alter the affected chimney or vent has been filed with the department.

2. A second notice shall not be required where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney and vent plan is submitted to the department.

2113.1.5.3.3 Plans and required documentation for alteration work. Where access is granted and conditions are observed that result in a determination that chimney or vent alteration is required, plans for such alteration work shall be provided to the owner of the existing building and a request for written consent to submit construction documents and perform such work shall be made.

[2113.1.6.4] 2113.1.5.4 Approval. The [plans and method of] construction documents for the proposed chimney extension, alteration or relocation shall be [subject] submitted to the [approval of the commissioner] department pursuant to Section 28-104 of the Administrative Code. No certificate of occupancy shall be issued for the new building pursuant to Section 28-118.23 of the Administrative Code until the work associated with such construction documents for the proposed chimney extension, alteration or relocation has been signed-off by the department.

Exceptions:

1. A certificate of occupancy may be issued where access is granted and conditions are observed that result in a determination that chimney or vent alteration is not required and a revised chimney or vent plan is submitted pursuant to Section 107.18 of the New York City Building Code documenting such.

2. A certificate of occupancy may be issued in accordance with Section 28-118.23, Exception 2 of the Administrative Code.

[2113.1.6.5] 2113.1.5.5 Refusal of consent. If consent is not granted by the owner of the [previously constructed] affected building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having
submitted plans that conform to the requirements of this section] provided the notices required by Section 2113.1.5.3 shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building. Similarly, should such owner fail to grant consent within 45 days from the date of [written request] the second notice or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.

[2113.1.6.6] 2113.1.5.6 Procedure. It shall be the obligation of the owner of the new or altered building to:

1. Prepare and submit a chimney and vent plan to the department pursuant to Section 107.18.

2. Provide required notification pursuant to Section 2113.1.5.3.

3. Provide plans pursuant to Section 2113.1.5.3.3.

4. Prepare and submit construction documents to the department pursuant to Section 28-104 of the Administrative Code for the alteration of existing chimneys or vents which conform to the requirements of this chapter;

5. Obtain permit(s) for the proposed work in accordance with Section 28-105 of the Administrative Code;

6. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building;

7. Provide such essential services as are normally supplied by the equipment while it is out of service;

8. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building;

9. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; [and]

10. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where there is practical difficulty in complying strictly with the provisions of this item, the commissioner may permit an equally safe alternative;[and]

11. Comply with the tenant protection plan requirements of Section 28-120 of the Administrative Code; and
12. Comply with inspection and sign-off requirements of Section 28-116 of the Administrative Code.

[2113.1.6.7] 2113.1.5.7 Existing violations. Any existing violations on the previously constructed equipment shall be corrected by the owner of the equipment before any equipment is added or alterations made at the expense of the owner of the new or altered building.

[2113.1.6.8] 2113.1.5.8 Variance. The commissioner may grant a variance in accordance with the provisions of this code.

2113.2 Footings and foundations. [Foundations] Footings for masonry chimneys shall be constructed of concrete or solid masonry [at least] not less than 12 inches (305 mm) thick and shall extend at least 6 inches (152 mm) beyond the face of the foundation or support wall on all sides. Footings shall be founded on natural undisturbed earth or engineered fill below frost depth. In areas not subjected to freezing, footings shall be [at least] not less than 12 inches (305 mm) below finished grade.

2113.3 Seismic reinforcing. [Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category C or D, masonry and concrete chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2, and 2113.4. In Seismic Design Category B, reinforcement and seismic anchorage is not required.] In structures assigned to Seismic Design Category A or B, or those exempt from seismic analysis, seismic reinforcement is not required. In structures assigned to Seismic Design Category C or D, masonry chimneys shall be analyzed and designed for seismic loading in accordance with TMS 402, and at a minimum shall be reinforced and anchored in accordance with Sections 2113.3.1, 2113.3.2, and 2113.4, Table 2111.1 and Figure 2111.1.

2113.3.1 Vertical [reinforcing] reinforcement. For chimneys up to 40 inches (1016 mm) wide, four No. 4 continuous vertical bars anchored in the foundation shall be placed in the concrete[.] between wythes of solid masonry or within the cells of hollow unit masonry and grouted in accordance with Section 2103.10|2103.3. Grout shall be prevented from bonding with the flue liner so that the flue liner is free to move with thermal expansion. For chimneys greater than 40 inches (1016 mm) wide, two additional No. 4 vertical bars shall be provided for each additional 40 inches (1016 mm) in width or fraction thereof.

2113.3.2 Horizontal [reinforcing] reinforcement. Vertical reinforcement shall be placed enclosed within ¼-inch (6.4 mm) ties, or other reinforcing of equivalent net cross-sectional area, spaced not to exceed 18 inches (457 mm) [on center] in concrete, or placed in the bed joints of unit masonry, at a minimum of not less than every 18 inches (457 mm) of vertical height. Two such ties shall be provided at each bend in the vertical bars.

2113.4 Seismic anchorage. Masonry [and concrete] chimneys and foundations [in Seismic Design Category C or D] shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade[. except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements.]
2113.4.1 Anchorage. Two \( \frac{3}{16} \)-inch by 1-inch (4.8 mm by 25 mm) straps shall be embedded not less than 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to not less than four floor joists with two \( \frac{1}{2} \)-inch (12.7 mm) bolts.

Exception: Seismic anchorage is not required for the following:

1. In structures assigned to Seismic Design Category A or B.
2. Where the masonry fireplace is constructed completely within the exterior walls.

2113.5 Corbeling. Masonry chimneys shall not be corbeled more than half of the chimney’s wall thickness from a wall or foundation, nor shall a chimney be corbeled from a wall or foundation that is less than 12 inches (305 mm) in thickness unless it projects equally on each side of the wall, except that on the second story of a two-story dwelling, corbeling of chimneys on the exterior of the enclosing walls is permitted to equal the wall thickness. The projection of a single course shall not exceed one-half the unit height or one-third of the unit bed depth, whichever is less. No masonry shall be corbeled from hollow or cavity wall masonry units.

2113.6 Changes in dimension. The chimney wall or chimney flue lining shall not change in size or shape within 6 inches (152 mm) above or below where the chimney passes through floor components, ceiling components or roof components.

2113.7 Offsets. Where a masonry chimney is constructed with a fireclay flue liner surrounded by one wythe of masonry, the maximum offset shall be such that the centerline of the flue above the offset does not extend beyond the center of the chimney wall below the offset. Where the chimney offset is supported by masonry below the offset in an approved manner, the maximum offset limitations shall not apply. Each individual corbeled masonry course of the offset shall not exceed the projection limitations specified in Section 2113.5.

2113.8 Additional load. Chimneys shall not support loads other than their own weight unless they are designed and constructed to support the additional load. Masonry chimneys are permitted to be constructed as part of the masonry walls or concrete walls of the building.

2113.9 Termination. Chimneys serving appliances that operate at less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents or open structural framing. Any chimney located beyond 10 feet (3048 mm) from such construction, but not more than the distance determined from Equation [24–5] 21-2 and Table 2113.9, shall be at least as high as the construction.

Chimneys serving appliances that operate at between 600°F (316°C) and 1000°F (538°C) shall extend at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such construction does not include other chimneys, vents or open structural framing. Any chimney located beyond 20 feet (6096
mm) from such construction, but not more than the distance determined from Equation [21-5] 21-2 and Table 2113.9, shall be at least as high as the construction.

\[
D = F \times \sqrt{A}
\]

(Equation [21-5] 21-2)

where:

\[
D = \text{Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.}
\]

\[
F = \text{Value determined from Table 2113.9.}
\]

\[
A = \text{Free area, in square inches, of chimney flue space.}
\]

2113.9.1 Chimney caps. Masonry chimneys shall have a concrete, metal or stone cap, sloped to shed water, a drip edge and a caulked bond break around any flue liners in accordance with ASTM C 1283.

[2143.9.1] 2113.9.2 Spark arrestors. Where a spark arrestor is installed on a masonry chimney, the spark arrestor shall meet all of the following requirements:

1. The net free area of the arrestor shall be not less than four times the net free area of the outlet of the chimney flue it serves.

2. The arrestor screen shall have heat and corrosion resistance equivalent to 19-gage galvanized steel or 24-gage stainless steel.

3. Openings shall not permit the passage of spheres having a diameter greater than ½ inch (12.7 mm) nor block the passage of spheres having a diameter less than ⅜ inch (9.5 mm).

4. The spark arrestor shall be accessible for cleaning and the screen or chimney cap shall be removable to allow for cleaning of the chimney flue.

2113.9.3 Rain caps. Termination caps shall not be permitted and a 3-inch (76 mm) minimum drain shall be installed to receive collected water. A positive means shall be provided to prevent water from entering the appliance.

Exception: Termination caps shall be permitted on listed factory-built chimneys.
2113.9.3.1 **Decorative shrouds.** Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers’ installation instructions.

2113.10 **Wall thickness.** Masonry chimney walls shall be constructed of concrete, solid masonry units or hollow masonry units grouted solid with not less than 4 inches (102 mm) nominal thickness, or 8 inches (203 mm) nominal thickness for chimney walls extending more than 3 feet (914 mm) above the highest lateral support point.

2113.11 **Flue lining (material).** Masonry chimneys shall be lined. The lining material shall be appropriate for the type of appliance connected, according to the terms of the appliance listing and the manufacturer’s instructions.

2113.11.1 **Residential-type appliances and low heat appliances (general).** Flue lining systems shall comply with one of the following:

1. Clay flue lining complying with the requirements of ASTM C 315.
2. Listed chimney lining systems complying with UL 1777.
3. Factory-built chimneys or chimney units listed for installation within masonry chimneys.
4. Other approved materials that will resist corrosion, erosion, softening or cracking from flue gases and condensate at temperatures up to 1,800°F (982°C).

2113.11.1.1 **Flue linings for specific appliances.** Flue linings other than those covered in Section 2113.11.1 intended for use with specific appliances shall comply with Sections 2113.11.1.2 through 2113.11.1.4 and Sections 2113.11.2 and 2113.11.3.

2113.11.1.2 **Gas appliances.** Flue lining systems for gas appliances shall be in accordance with the *New York City Fuel Gas Code* and ULC-S635.

2113.11.1.3 **Pellet fuel-burning appliances.** Pellet fuel-burning appliances may be installed only when their use is permitted by the *New York City Air Pollution Control Code*. Any such appliances shall be listed and labeled and shall be installed in accordance with the terms of the listing. If permitted, such appliances shall be operated in compliance with the *New York City Air Pollution Control Code*. Flue lining and vent systems for use in masonry chimneys with pellet fuel-burning appliances shall be limited to flue lining systems complying with Section 2113.11.1 and pellet vents listed for installation within masonry chimneys ([see Section 2113.11.1.5 for marking]). See Section 2113.11.1.5 for marking.

2113.11.1.4 **Oil-fired appliances approved for use with L-vent.** Flue lining and vent systems for use in masonry chimneys with oil-fired appliances approved for use with Type L vent shall be limited to flue lining systems complying with Section 2113.11.1 and listed chimney liners complying with UL 641 ([see Section 2113.11.1.5 for marking]). See Section 2113.11.1.5 for marking.
2113.11.1.5 Notice of usage. When a flue is relined with a material not complying with Section 2113.11.1, the chimney shall be plainly and permanently identified by a label attached to a wall, ceiling or other conspicuous location adjacent to where the connector enters the chimney. The label shall include the following message or equivalent language: “This chimney is for use only with (type or category of appliance) that burns (type of fuel). Do not connect other types of appliances.”

2113.11.2 [Concrete and masonry] Masonry chimneys for [medium-heat] medium-heat appliances. Masonry chimneys for medium-heat appliances shall comply with the provisions of Sections 2113.11.2.1 through 2113.11.2.5.

[2113.11.2.1 General. Concrete and masonry chimneys for medium-heat appliances shall comply with Sections 2113.1 through 2113.5.]

[2113.11.2.2] 2113.11.2.1 Construction. Chimneys for medium-heat appliances shall be constructed of solid masonry units [or of concrete] with walls [a minimum of] not less than 8 inches (203 mm) thick, or with stone masonry [a minimum of] not less than 12 inches (305 mm) thick. Chimneys for medium-heat appliances constructed with radial brick may be permitted to have different requirements. Design of all such chimneys shall be submitted to the commissioner for approval.

[2113.11.2.3] 2113.11.2.2 Lining. [Concrete and masonry] Masonry chimneys shall be lined with an approved medium-duty refractory brick [a minimum of] not less than 4½ inches (114 mm) thick laid on the 4½-inch bed (114 mm) in an approved medium-duty refractory mortar. The lining shall start 2 feet (610 mm) or more below the lowest chimney connector entrance. Chimneys terminating 25 feet (7620 mm) or less above a chimney connector entrance shall be lined to the top.

[2113.11.2.4] 2113.11.2.3 Multiple passageway. [Concrete and masonry] Masonry chimneys containing more than one passageway shall have the liners separated by a minimum 4-inch-thick (102 mm) concrete or solid masonry wall.

[2113.11.2.5] 2113.11.2.4 Termination height. Chimneys serving appliances that operate at greater than 1,000°F (538°C) shall extend at least 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. However, such construction does not include other chimneys, vents, or open structural framing. Any chimney located beyond 50 feet (15 240 mm) from such construction but not more than the distance determined from Equation [21-5] 21-2 and Table 2113.9, shall be at least as high as the construction.

[2113.11.2.6] 2113.11.2.5 Clearance. A minimum clearance of 4 inches (102 mm) shall be provided between the exterior surfaces of a [concrete or] masonry chimney for medium-heat appliances and combustible material.

2113.11.3 [Concrete and masonry] Masonry chimneys for high-heat appliances. Masonry chimneys for high-heat appliances shall comply with the provisions of Sections 2113.11.3.1 through 2113.11.3.4.
[2113.11.3.1 General.} Concrete and masonry chimneys for high heat appliances shall comply with Sections 2113.1 through 2113.5.]

[2113.11.3.2] **2113.11.3.1 Construction.** Chimneys for high-heat appliances shall be constructed with double walls of solid masonry units or of concrete, each wall to be [a minimum of] not less than 8 inches (203 mm) thick with a minimum airspace of 2 inches (51 mm) between the walls. Alternate chimney designs for high-heat appliances constructed with radial brick shall be permitted subject to the approval of the commissioner.

[2113.11.3.3] **2113.11.3.2 Lining.** The inside of the interior wall shall be lined with an approved high-duty refractory brick, [a minimum of] not less than 4½ inches (114 mm) thick laid on the 4½-inch bed (114 mm) in an approved high-duty refractory mortar. The lining shall start at the base of the chimney and extend continuously to the top.

[2113.11.3.4] **2113.11.3.3 Termination height.** [Concrete and masonry] Masonry chimneys for high-heat appliances shall extend [at least] not less than 20 feet (6069 mm) (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimney located beyond 50 feet (15 240 mm) from such construction but not more than the distance determined from Equation [24-5] 21-2 and Table 2113.9, shall be at least as high as the construction.

[2113.11.3.5] **2113.11.3.4 Clearance.** [Concrete and masonry] Masonry chimneys for high-heat appliances shall have approved clearance from buildings and structures to prevent overheating combustible materials, permit inspection and maintenance operations on the chimney and prevent danger of burns to persons.

2113.12 Clay flue lining (installation). Flue liners shall be installed in accordance with ASTM C 1283 and extend from a point not less than 8 inches (203 mm) below the lowest inlet or, in the case of fireplaces, from the top of the smoke chamber to a point above the enclosing walls. The lining shall be carried up vertically, with a maximum slope no greater than 30 degrees (0.52 rad) from the vertical. [Clay flue liners shall be laid in medium-duty nonwater-soluble refractory mortar conforming to ASTM C 199, with tight mortar joints left smooth on the inside and installed to maintain an airspace or insulation not to exceed the thickness of the flue liner separating the flue liners from the interior face of the chimney masonry walls. Flue lining shall be supported on all sides. Only enough mortar shall be placed to make the joint and hold the liners in position.]

Clay flue liners shall be laid in medium-duty nonwater-soluble refractory mortar conforming to ASTM C 199 with tight mortar joints left smooth on the inside and installed to maintain an airspace or insulation not to exceed the thickness of the flue liner separating the flue liners from the interior face of the chimney masonry walls. Flue lining shall be supported on all sides. Only enough mortar shall be placed to make the joint and hold the liners in position.

2113.13 Additional requirements. Masonry chimneys shall also comply with the additional requirements of Sections 2113.13.1 and 2113.13.2.
2113.13.1 Listed materials. Listed materials used as flue linings shall be installed in accordance with the terms of their listings and the manufacturer’s instructions.

2113.13.2 Space around lining. The space surrounding a chimney lining system or vent installed within a masonry chimney shall not be used to vent any other appliance.

   Exception: This shall not prevent the installation of a separate flue lining in accordance with the manufacturer’s instructions.

2113.14 Multiple flues. When two or more flues are located in the same chimney, masonry wythes shall be built between adjacent flue linings. The masonry wythes shall be at least 4 inches (102 mm) thick and bonded into the walls of the chimney.

   Exception: When venting only one appliance, two flues are permitted to adjoin each other in the same chimney with only the flue lining separation between them. The joints of the adjacent flue linings shall be staggered [at least] not less than 4 inches (102 mm).

2113.15 Flue area (appliance). Chimney flues shall not be smaller in area than the area of the connector from the appliance. Chimney flues connected to more than one appliance shall be not less than the area of the largest connector plus 50 percent of the areas of additional chimney connectors.

   Exceptions:

   1. Chimney flues serving oil-fired appliances sized in accordance with the New York City Mechanical Code and NFPA 31.

   2. Chimney flues serving gas-fired appliances sized in accordance with the New York City Fuel Gas Code.
2113.16 Flue area (masonry fireplace). Flue sizing for chimneys serving fireplaces shall be in accordance with Section 2113.16.1 or 2113.16.2.

For SI: 1 inch = 25.4 mm, 1 square inch = 645 mm$^2$.

FIGURE 2113.16
FLUE SIZES FOR MASONRY CHIMNEYS

2113.16.1 Minimum area. Round chimney flues shall have a minimum net cross-sectional area of [at least] not less than 1/12 of the fireplace opening. Square chimney flues shall have a minimum net cross-sectional area of [at least] not less than 1/10 of the fireplace opening. Rectangular chimney flues with an aspect ratio less than 2 to 1 shall have a minimum net cross-sectional area of [at least] not less than 1/10 of the fireplace opening. Rectangular chimney flues with an aspect ratio of 2 to 1 or more shall have a minimum net cross-sectional area of [at least] not less than ⅛ of the fireplace opening.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².

a. Flue sizes are based on ASTM C 315.

2113.16.2 Determination of minimum area. The minimum net cross-sectional area of the flue shall be determined in accordance with Figure 2113.16. A flue size providing at least not less than the equivalent net cross-sectional area shall be used. Cross-sectional areas of clay flue linings are as provided in Tables 2113.16(1) and 2113.16(2) or as provided by the manufacturer or as measured in the field. The height of the chimney shall be measured from the firebox floor to the top of the chimney flue.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².  

a. Flue sizes are based on ASTM C 315.

#### 2113.17 Inlet
Inlets to masonry chimneys shall enter from the side. Inlets shall have a thimble of fireclay, rigid refractory material or metal that will prevent the connector from pulling out of the inlet or from extending beyond the wall of the liner.

#### 2113.18 Masonry chimney cleanout openings
Cleanout openings shall be provided within 6 inches (152 mm) of the base of each flue within every masonry chimney. The upper edge of the cleanout shall be located [at least] not less than 6 inches (152 mm) below the lowest chimney inlet opening. The height of the opening shall be [at least] not less than 6 inches (152 mm). The cleanout shall be provided with a noncombustible cover.

**Exception**: Chimney flues serving masonry fireplaces, where cleaning is possible through the fireplace opening.

#### 2113.19 Chimney clearances
Any portion of a masonry chimney located in the interior of the building or within the exterior wall of the building shall have a minimum airspace clearance to combustibles of 2 inches (51 mm). Chimneys located entirely outside the exterior walls of the building, including chimneys that pass through the soffit or cornice, shall have a minimum airspace
clearance of 1 inch (25 mm). The airspace shall not be filled, except to provide fireblocking in accordance with Section 2113.20.

Exceptions:

1. Masonry chimneys equipped with a chimney lining system listed and labeled for use in chimneys in contact with combustibles in accordance with UL 1777 and [ULc-S635] ULC-S635, and installed in accordance with the manufacturer’s instructions, are permitted to have combustible material in contact with their exterior surfaces.

2. Where masonry chimneys are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete wall less than 12 inches (305 mm) from the inside surface of the nearest flue lining.

3. Exposed combustible trim and the edges of sheathing materials, such as wood siding, are permitted to abut the masonry chimney sidewalls, in accordance with Figure 2113.19, provided such combustible trim or sheathing is [a minimum of] not less than 12 inches (305 mm) from the inside surface of the nearest flue lining. Combustible material and trim shall not overlap the corners of the chimney by more than 1 inch (25 mm).
2113.19.1 Additional requirements for clearance.

1. Trimmers shall be not less than 5 inches (127 mm) from the inside face of the concrete or masonry chimney wall. Finished flooring shall have at least \( \frac{1}{2} \) inch (13 mm) clearance from chimney walls.

2. A clearance of at least 2 inches (51 mm) shall be provided between the exterior surfaces of interior masonry or concrete chimneys for all wood-burning appliances.

3. No combustible lathing, furring, or plaster grounds shall be placed against a chimney at any point more than 1\( \frac{1}{2} \) inches (38 mm) from the corner of the chimney; but this shall not prevent plastering directly on masonry or on metal lath and metal furring nor shall it prevent placing chimneys for low-temperature equipment entirely on the exterior of a building against the sheathing.

2113.20 Chimney fireblocking. All spaces between chimneys and floors and ceilings through which chimneys pass shall be fireblocked with noncombustible material securely fastened in place. The fireblocking of spaces between wood joists, beams or headers shall be to a depth of 1 inch (25 mm) and shall only be self-supporting or be placed on strips of metal or metal lath laid across the spaces between combustible material and the chimney.

2113.21 Test run. All new chimneys shall be test run by the registered design professional responsible for the testing under standard conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The results of such test run shall be certified as correct by the design professional engineer responsible for the test and shall be submitted in writing to the department.

2113.22 Requirement of a smoke test. A smoke test shall be made as outlined below. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of the design professional engineer responsible for the test, which shall be submitted in writing to the department.

2113.22.1 Smoke test. To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.

2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirement of this chapter and the test shall be repeated until the results are satisfactory.

3. Method of test. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed, and a pressure equivalent to \( \frac{1}{2} \) inch (12.7 mm) column of water measured at the base of the stack shall be applied. The test shall be conducted for a length of time sufficient to permit the inspection of the chimney.
SECTION BC 2114
STRUCTURAL INTEGRITY REQUIREMENTS

2114.1 General. Load-bearing masonry structures shall be reinforced to meet all of the requirements of this section. However, reinforcement provided for gravity, seismic or wind forces or for other purposes may be regarded as satisfying part of, or the whole of, these requirements. Reinforcement provided for one requirement may be counted towards the other requirements.

2114.2 Continuity and ties. Load-bearing masonry structures shall be reinforced to obtain a continuous system of vertical and horizontal ties. Continuity of all ties shall be ensured by providing lap, welded or mechanical tension splices. The following requirements shall be met for walls, columns and piers:

2114.2.1 Horizontal. At each floor and roof level, continuous horizontal ties shall be provided in all load-bearing masonry walls, and around the perimeter of the building. Minimum horizontal tie reinforcement shall be not less than the equivalent of two No. 4 bars.

2114.2.1.1 Location of horizontal ties. Ties shall be located within the thickness of walls or beams, where they occur, or within 1 foot (305 mm) of the edge of slab, where walls or beams do not occur.

2114.2.1.2 End connections of horizontal ties. All horizontal ties shall be terminated in a perpendicular horizontal tie. Where no perpendicular horizontal tie exists within 4 feet (1219 mm) of the end of a wall, the horizontal tie shall be anchored at the end of the wall. The vertical reinforcement at the end of such walls shall not be less than two No. 4 bars placed within 16 inches (406 mm) of the end of the wall. This vertical reinforcement shall be continuous from the lowest to highest level of the wall, and anchored at each end in a horizontal tie or the foundation element.

2114.2.2 End connections. Where slab or beam elements are supported on a masonry wall, column or pier, the connection shall be designed to sustain an axial tension capacity equal to the greater of the vertical shear capacity of the connected element at either end or 2 percent of the maximum factored vertical dead and live load in the compression masonry element. The design of the end connections shall ensure the transfer of such loads to horizontal or vertical ties.

Where more than one element frames in one direction, none of the elements or connections shall have an axial tension capacity of less than 1 percent of the vertical load.

For the design of the connections, the transverse shear force and the axial tensile force need not be considered to act simultaneously.

The reinforcement of the end connections shall be equivalent to at least one No. 4 bar, at a maximum spacing of 24 inches (610 mm) on center. Where end connections occur at a masonry pier or column, reinforcement equivalent to a minimum of four fully developed No. 4 bars shall be provided. The reinforcement shall be distributed around the perimeter of the column or pier. The minimum anchorage into both the slab and the masonry compression element shall be equivalent to the capacity of the fully developed No. 4 bar.
Where the floor extends on both sides of a bearing wall, the portion of the tie within the slab shall alternate between both sides.

2114.2.3 Vertical ties. Each column, pier and wall shall be vertically tied continuously from its lowest to highest level. The vertical reinforcement shall be terminated in a horizontal tie or foundation or their equivalent. Where openings in bearing walls greater than 24 inches (610 mm) in height occur, ties shall be provided at each side of the opening that extend and are anchored in the masonry above and below the opening. Vertical ties shall be placed on both sides of control joints in bearing walls.

2114.2.3.1 Vertical ties reinforcing. Vertical tie reinforcing shall not be less than the equivalent of one No. 4 bar, at a maximum spacing of 48 inches (1219 mm) on center. A minimum of four continuous No.4 bars shall be provided per masonry column or pier.

§ 22. Chapter 22 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 22
STEEL

SECTION BC 2201
GENERAL

2201.1 Scope. The provisions of this chapter govern the quality, design, fabrication and erection of steel [used structurally in buildings or structures] construction.

2201.2 Special inspection. Steel shall be subject to the requirements of special inspection in accordance with Chapter 17.

SECTION BC 2202
DEFINITIONS

2202.1 Definitions. The following [words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meaning shown herein] terms are defined in Chapter 2.

STEEL CONSTRUCTION, COLD-FORMED. [That type of construction made up entirely or in part of steel structural members cold formed to shape from sheet or strip steel such as roof deck, floor and wall panels, studs, floor joists, roof joists and other structural elements.]

STEEL ELEMENT, STRUCTURAL.

STEEL JOIST. [Any steel structural member of a building or structure made of hot-rolled or cold-formed solid or open web sections, or riveted or welded bars, strip or sheet steel members, or slotted and expanded, or otherwise deformed rolled sections.]

[STEEL MEMBER, STRUCTURAL. Any steel structural member of a building or structure consisting of a rolled steel structural shape other than cold-formed steel, or steel joist members.]
SECTION BC 2203
IDENTIFICATION AND PROTECTION OF STEEL FOR STRUCTURAL PURPOSES

2203.1 Identification. Identification of structural steel members shall be in accordance with the requirements contained in AISC 360. Identification of cold-formed steel members shall be in accordance with the requirements contained in AISI S100. Identification of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200 or AISI S220, as applicable. Other steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Where the steel grade is not readily identifiable from marking and test records, the steel shall be tested to determine conformity to such standards.

2203.2 Protection. Painting of structural steel elements shall be in accordance with the requirements contained in AISC 360. Painting of open-web steel joists and joist girders shall be in accordance with the requirements of SJI CJ-1.0, SJI JG-1.1, SJI K-1.1 and SJI LH/DLH-1.1 SJI 100 and SJI 200. Individual structural members and assembled panels of cold-formed steel construction shall also comply with the requirements contained in AISI S100. Protection of cold-formed steel light-frame construction shall also comply with the requirements contained in AISI S200 S240 or AISI S220, as applicable.

SECTION BC 2204
CONNECTIONS

2204.1 Welding. The details of design, workmanship and technique for welding and qualification of welding operators, procedures and personnel shall be in accordance with the specifications listed in Sections 2205, 2206, 2207, [2209, 2208, 2210 and [2211, [Special] For special inspection of welding shall be provided where required by], see Section [1704] 1705.2.

2204.2 Bolting. The design, installation and inspection of bolts shall be in accordance with the requirements of [the specifications listed in] Sections 2205, 2206, [2209, 2207, 2210 and [2211, [Special] For special inspection of the installation of high-strength bolts shall be provided where required by], see Section [1704] 1705.2.

2204.3 Anchor rods. Anchor rods shall be set accurately to the pattern and dimensions called for on the plans in accordance with the approved construction documents. The protrusion of the threaded ends through the connected material shall be sufficient to fully engage the threads of the nuts but shall not be greater than the length of the threads on the bolts. The entire projection of the rod beyond the connected material shall be fully threaded.

SECTION BC 2205
STRUCTURAL STEEL

2205.1 General. The design, fabrication and erection of structural steel elements in buildings and structures, including materials used for such elements, shall be in accordance with AISC 360.
Where required, the seismic design of steel structures shall be in accordance with the additional provisions of Section 2205.2.

2205.1.1 Structural steel. Material for use as structural steel not listed in AISC 360 may be used in accordance with AISC 360 when approved by the commissioner for such use. Refer to Section 28-113.2.2 of the [Administrative Code] Administrative Code for provisions relating to approval of alternative materials.

2205.2 Seismic requirements for steel structures design and detailing. The design of structural steel structures to resist seismic forces shall be in accordance with [the provisions of] Section 2205.2.1 or 2205.2.2 for the appropriate seismic design category, as applicable.

2205.2.1 Structural steel seismic force-resisting systems. The design, detailing, fabrication and erection of structural steel seismic force-resisting systems, and the material used for such systems, shall be in accordance with the provisions of Section 2205.2.1.1 or 2205.2.1.2, as applicable.

[2205.2.1] 2205.2.1.1 Seismic Design Category [A₁] B or C. Structural steel structures assigned to Seismic Design Category [A₁] B or C shall be of any construction permitted in Section 2205. An R factor as set forth in Section 12.2.1 of ASCE 7 for the appropriate steel system is permitted where the structure is designed and detailed in accordance with the provisions of AISC 341, Part I. Systems not detailed in accordance with the above shall use the R factor in Section 12.2.1 of ASCE 7 designated for “structural steel systems not specifically detailed for seismic resistance.” Where a response modification coefficient, R, in accordance with Table 1613.5, is used for the design of structures assigned to Seismic Design Category B or C, the structures shall be designed and detailed in accordance with the requirements of AISC 341.

Exception: The response modification coefficient, R, designated for “Steel systems not specifically detailed for seismic resistance, excluding cantilever column systems” in Table 1613.5, shall be permitted for systems designed and detailed in accordance with AISC 360, and need not be designed and detailed in accordance with AISC 341.

[2205.2.2] 2205.2.1.2 Seismic Design Category D. Structural steel structures assigned to Seismic Design Category D shall be designed and detailed in accordance with AISC 341, [Part I] except as specified in Table 1613.5.

2205.2.2 Structural steel elements. The design, detailing, fabrication and erection of structural steel elements in seismic force-resisting systems other than those covered in Section 2205.2.1, including struts, collectors, chords and foundation elements, shall be in accordance with AISC 341 where either of the following applies:

1. The structure is assigned to Seismic Design Category D except as specified in Table 1613.5.

2. A response modification coefficient, R, greater than 3 in accordance with Table 1613.5, is used for the design of the structure assigned to Seismic Design Category B or C.
[2205.3 Seismic requirements for composite construction. The design, construction and quality of composite steel and concrete components that resist seismic forces shall conform to the requirements of the AISC 360 and ACI 318. An R factor as set forth in Section 12.2.1 of ASCE 7 for the appropriate composite composite steel and concrete system is permitted where the structure is designed and detailed in accordance with the provisions of AISC 341, Part II. In Seismic Design Category B or above, the design of such systems shall conform to the requirements of AISC 341, Part II.]

[2205.3.1 Seismic Design Category D. Composite structures are permitted in Seismic Design Categories D, subject to the limitations in Section 12.2.1 of ASCE 7, where substantiating evidence is provided to demonstrate that the proposed system will perform as intended by AISC 341, Part II. The substantiating evidence shall be subject to the commissioner’s approval. Where composite elements or connections are required to sustain inelastic deformations, the substantiating evidence shall be based on cyclic testing.]

[2205.6] 2205.3 Fabrication, erection and quality control. In addition to the provisions for fabrication, erection and quality control in AISC 360, the following provisions shall be used.

[2205.6.1] 2205.3.1 Shop drawings. Shop drawings shall include the location of oversized, short slotted and long slotted holes, and shall comply with AISC 303.

[2205.6.2] 2205.3.2 Field connections. Field connections shall meet the requirements for corresponding types of shop connections described in AISC 360. No holes, copes or cuts of any type, or alterations to anchor rods, shall be made to facilitate erection unless specifically shown on the shop or erection drawings or authorized in writing by the [engineer or architect of record] registered design professional of record for the structural design.

[2205.6.3] 2205.3.3 Structural steel erection. In addition, to the provisions of AISC 360, the requirements of Section 3305.2 shall apply.

SECTION BC 2206
COMPOSITE STRUCTURAL STEEL AND CONCRETE STRUCTURES

2206.1 General. Systems of structural steel elements acting compositely with reinforced concrete shall be designed in accordance with AISC 360 and ACI 318, excluding ACI 318 Chapter 14.

2206.2 Seismic design. Where required, the seismic design, materials, fabrication and erection of composite steel and concrete systems shall be in accordance with Section 2206.2.1.

2206.2.1 Seismic requirements for composite structural steel and concrete construction. Where a response modification coefficient, R, in accordance with Table 1613.5, is used for the design of systems of structural steel acting compositely with reinforced concrete, the structures shall be designed and detailed in accordance with the requirements of AISC 341.
2206.3 Fabrication, erection and quality control. The fabrication, erection and quality control of composite structural steel and concrete construction shall comply with the applicable requirements of Sections 2205 and 3305, and Chapter 19 of this code, AISC 360, AISC 341 and ACI 318.

2206.4 Concrete-filled steel columns. Concrete-filled steel columns shall comply with Section 2206.4.1 through 2206.4.5 and shall be filled with concrete so placed and manipulated as to secure maximum density and to ensure complete filling of the steel without voids.

2206.4.1 Design. The safe supporting capacity of concrete-filled steel columns shall be computed in accordance with AISC 360 or as determined by a test approved by the commissioner.

2206.4.2 Connections. Caps, base plates and connections shall be in accordance with AISC 360 and shall be positively attached to the shell and anchored to the concrete core. Welding of brackets without mechanical anchorage is prohibited. Where the pipe is slotted to accommodate webs of brackets or other connections, the integrity of the shell shall be restored by welding to ensure hooping action of the composite section.

2206.4.3 Reinforcement. Steel reinforcement shall be in the form of rods, structural shapes or pipe embedded in the concrete core in accordance with AISC 360 with sufficient clearance to ensure the composite action of the section, but not nearer than 1 inch (25 mm) to the exterior steel shell. Structural shapes used as reinforcement shall be milled to ensure bearing on cap and base plates.

2206.4.4 Fire-resistance-rating protection of concrete filled columns. Concrete-filled steel columns shall comply with the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire protective covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of steel columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three stories or 40 feet (12 192 mm) above grade plane, steel columns used in basements and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).

2206.4.4.1 Vent holes. Concrete-filled steel columns shall have a minimum of four ½ in. (12.7 mm) diameter holes that shall be placed opposite each other with two at the top and two at the bottom of the column. The two bottom holes shall be rotated 90° relative to the two top holes.

2206.4.5 Approvals. Details of column connections and splices shall be shop-fabricated in accordance with AISC 360. Concrete-filled steel columns shall be inspected by an approved agency pursuant to Chapter 17 of this code.

SECTION BC 2207
STEEL JOISTS

[2206.1] 2207.1 General. The design, manufacture and use of [open-web] open-web steel joists and joist girders shall be in accordance with [one of the following Steel Joist Institute (SJI) specifications:] SJI 100 or SJI 200, as applicable.
**Seismic design.** Where required, the seismic design of buildings shall be in accordance with the additional provisions of Section 2205.2 or [2210.5] 2211.1.1.

**Design.** The registered design professional of record shall indicate on the construction documents the steel joist and [or] steel joist girder designations from the specifications listed in Section [2206.1] 2207.1; and shall indicate the requirements for joist and joist girder design, layout, end supports, anchorage, [non SJI standard bridging] bridging design that differs from the SJI specifications listed in Section 2207.1, bridging termination connections and bearing connection design to resist uplift and lateral loads. These documents shall indicate special requirements as follows:

1. Special loads including:
   1.1. Concentrated loads
   1.2. Nonuniform loads
   1.3. Net uplift loads
   1.4. Axial loads
   1.5. End moments
   1.6. Transfer forces
   1.7. Connection forces
2. Special considerations including:
   2.1. Profiles for [nonstandard] joist and joist girder configurations [(standard joist and joist girder configurations are as indicated in the SJI catalog)] that differ from those defined by the SJI specifications listed in Section 2207.1.
   2.2. Oversized or other nonstandard web openings
   2.3. Extended ends
3. [Deflection criteria for live and total loads for non SJI standard joists.] Live and total load deflection criteria for joists and joist girder configurations that differ from those defined by the SJI specifications listed in Section 2207.1.
[2206.3] 2207.3 Calculations. The steel joist and joist girder manufacturer shall design the steel joists and/or steel joist girders in accordance with the [current] SJI specifications and load tables listed in Section 2207.1 to support the load requirements of Section [2206.2] 2207.2. The registered design professional of record may be permitted to require submission of the steel joist and joist girder calculations as prepared by a registered design professional responsible for the product design. Where requested by the registered design professional of record, the steel joist manufacturer shall submit design calculations with a cover letter bearing the seal and signature of the joist manufacturer’s registered design professional. In addition to the design calculations submitted under this seal and signature, the following shall be included:

1. [Non-SJI standard bridging details (e.g., for cantilevered conditions, net uplift, etc.)] Bridging design that differs from the SJI specifications listed in Section 2207.1, such as cantilevered conditions and net uplift.

2. Connection [details] design for:

   2.1. [Non-SJI standard connections (e.g., flush-framed or framed connections)] Connections that differ from the SJI specifications listed in Section 2207.1, such as flush-framed or framed connections.

   2.2. Field splices.

   2.3. Joist headers.

[2206.4] 2207.4 Steel joist drawings. Steel joist placement plans shall be provided to show the steel joist products as specified on the approved construction documents and are to be utilized for field installation in accordance with specific project requirements as stated in Section [2206.2] 2207.2. Steel joist placement plans shall include, at a minimum, the following:

1. Listing of all applicable loads as stated in Section [2206.2] 2207.2 and used in the design of the steel joists and joist girders as specified in the approved construction documents.

2. Profiles for nonstandard joist and joist girder configurations (standard joist and joist girder configurations are as indicated in the SJI catalog) that differ from those defined by the SJI specifications listed in Section 2207.1.

3. Connection requirements for:

   3.1. Joist supports.

   3.2. Joist girder supports.

   3.3. Field splices.

   3.4. Bridging attachments.

4. [Deflection criteria for live and total loads for non-SJI standard joists] Live and total load deflection criteria for joists and joist girder configurations that differ from those defined by the SJI specifications listed in Section 2207.1.
5. Size, location and connections for [all] bridging.

[Exception:] Steel joist placement plans do not require the seal and signature of the joist manufacturer’s registered design professional.

2206.5 2207.5 Certification. At completion of manufacture, the steel joist manufacturer shall submit a certificate of compliance in accordance with Section 1704.2.2 stating that work was performed in accordance with approved construction documents and with SJI [standard] specifications listed in Section 2207.1.

2203.6 2207.6 Limitations of use. Open web steel joists shall be prohibited in high-rise buildings until the commissioner promulgates rules establishing minimum acceptable fireproofing methods.

SECTION BC [2207] 2208 STEEL CABLE STRUCTURES

2207.1 2208.1 General. The design, fabrication and erection including related connections, and protective coatings of steel cables for buildings shall be in accordance with ASCE 19.

2207.2 Seismic requirements for steel cable. The design strength of steel cables shall be determined by the provisions of ASCE 19 except as modified by these provisions.

1. A load factor of 1.1 shall be applied to the prestress force included in T2 and T4 as defined in Section 3.12.

2. In Section 3.2.1, Item (c) shall be replaced with “1.5 T3” and Item (d) shall be replaced with “1.5 T4”.

SECTION BC [2208] 2209 STEEL STORAGE RACKS

2208.1 2209.1 Storage racks. The design, testing and utilization of [industrial steel] storage racks made of cold-formed or hot-rolled steel structural members shall be in accordance with RMI ANSI/MH 16.1 Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the provisions of Section 15.5.3 of ASCE 7 except that items (1), (2) and (3) of Section 15.5.3 of ASCE 7 do not apply when the rack design satisfies RMI ANSI/MH 16.1.

2209.2 Cantilevered steel storage racks. The design, testing, and utilization of cantilevered storage racks made of cold-formed or hot-rolled steel structural members shall be in accordance with RMI ANSI/MH 16.1 Where required by ASCE 7, the seismic design of cantilevered steel storage racks shall be in accordance with Section 15.5.3 of ASCE 7.

SECTION BC [2209] 2210 COLD-FORMED STEEL

2209.1 2210.1 General. The design of cold-formed carbon and low-alloy steel structural members shall be in accordance with AISI S100. The design of cold-formed stainless-steel structural members
shall be in accordance with ASCE 8. Cold-formed steel [light-framed] light-frame construction shall [also] comply with Section [2240] 2211. Where required, the seismic design of cold-formed steel structures shall be in accordance with the additional provisions of Section 2210.2.

[2209.2] 2210.1.1 Steel decks. The design and construction of cold-formed steel decks shall be in accordance with this section.

[2209.2.1] Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3.

[2209.2.2] 2210.1.1.1 Noncomposite steel floor decks. Noncomposite steel floor decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-NC[1.0, as modified in Section 2209.2.2.1].

[2209.2.2.1] ANSI/SDI-NC1.0 Section 2.4B1. Replace Section 2.4B1 of ANSI/SDI-NC1.0 with the following:

[General. The design of the concrete slabs shall be done in accordance with the ACI Building Code Requirements for Reinforced Concrete. The minimum concrete thickness above the top of the deck shall be 1½ inches (38 mm).]

[2209.2.3] 2210.1.1.2 Steel roof deck. Steel roof decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-RD[1.0].

2210.1.1.3 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be permitted to be designed and constructed in accordance with SDI-C.

2210.2 Seismic requirements for cold-formed steel structures. Where a response modification coefficient, R, in accordance with Table 1613.5, is used for the design of cold-formed steel structures, the structures shall be designed and detailed in accordance with the requirements of AISI S100, ASCE 8, or, for cold-formed steel special-bolted moment frames, AISI S400.

SECTION BC [2240] 2211 COLD-FORMED STEEL LIGHT-FRAME CONSTRUCTION

[2210.1] General. The design and installation of structural members and nonstructural members utilized in cold-formed steel light-frame construction where the specified minimum base steel thickness is between 0.0179 inches (0.455 mm) and 0.1180 inches (2.997 mm) shall be in accordance with AISI S200 and Sections 2210.2 through 2210.7, as applicable.

2211.1 Structural framing. For cold-formed steel light-frame construction, the design and installation of the following structural framing systems, including their members and connections, shall be in accordance with AISI S240, and Sections 2211.1.1 through 2211.1.3, as applicable:

1. Floor and roof systems.
2. Structural walls.
3. Shear walls, strap-braced walls and diaphragms that resist in-plane lateral loads.
4. Trusses.

2211.1.1 Seismic requirements for cold-formed steel structural systems. The design of cold-formed steel light-frame construction to resist seismic forces shall be in accordance with the provisions of Section 2211.1.1 or 2211.1.1.2, as applicable.

2211.1.1.1 Seismic Design Categories B and C. Where a response modification coefficient, $R$, in accordance with Table 1613.5 is used for the design of cold-formed steel light-frame construction assigned to Seismic Design Category B or C, the seismic force-resisting system shall be designed and detailed in accordance with the requirements of AISI S400.

Exception: The response modification coefficient, $R$, designated for "Steel systems not specifically detailed for seismic resistance, excluding cantilever column systems" in Table 1613.5 shall be permitted for systems designed and detailed in accordance with AISI S240 and need not be designed and detailed in accordance with AISI S400.

2211.1.1.2 Seismic Design Categories D. In cold-formed steel light-frame construction assigned to Seismic Design Category D, the seismic force-resisting system shall be designed and detailed in accordance with AISI S400.

2211.1.2 Prescriptive framing. Detached one- and two-family dwellings and townhouses, less than or equal to three stories above grade plane, shall be permitted to be constructed in accordance with AISI S230 subject to the limitations therein.

[2210.2 Header design. Headers, including box and back to back headers, and double and single L-headers shall be designed in accordance with AISI S212 or AISI S100.]

[2210.3 Trusses. Cold-formed steel trusses shall comply with the requirements of Sections 2210.3.1 through 2210.3.5.]

[2210.3.1 2211.1.3 [Design] Truss design. Cold-formed steel trusses shall [be designed in accordance with AISI S214, Sections 2210.3.2 through 2210.3.5 and accepted engineering practice] comply with the additional provisions of Sections 2211.1.3.1. through 2211.1.3.3.]

[2210.3.2 2211.1.3.1 Truss design drawings. The truss design drawings shall conform to the requirements of Section [B2.3] I1 of AISI [S214] S202 and shall be provided with the shipment of trusses delivered to the job site. The truss design drawings shall include the details of permanent individual truss member restraint/bracing in accordance with Section [B6(a) or B6 (e) of AISI S214] I1.6 of AISI S202 where these methods are utilized to provide restraint/bracing.

[2210.3.3 Deferred submittals. AISI Section B4.2 shall be deleted.]

[2210.3.4 2211.1.3.2 Trusses spanning 60 feet or greater. The owner or the owner’s authorized agent shall contract with a registered design professional for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for trusses with clear spans 60 feet (18 288 mm) or greater. Special inspection of trusses over 60 feet (18 288 mm) in length shall be in accordance with Section 1705.2.]}
[2210.3.5] 2211.3.3 Truss quality assurance. [Trusses manufactured in the fabricators plant shall be manufactured in compliance with Sections 1704.2 and 1704.3, as applicable.] Trusses not part of a manufacturing process that provides requirements for quality control done under the supervision of a third-party quality control agency in accordance with AISI S240 Chapter D shall be fabricated in compliance with Sections 1704.2.2 and 1705.2, as applicable.

2211.2 Nonstructural members. For cold-formed steel light-frame construction, the design and installation of non-structural members and connections shall be in accordance with AISI S220.

[2210.4 Wall stud design. Wall studs shall be designed in accordance with either AISI S211 or AISI S100.]

[2210.5 Floor and roof system design. Framing for floor and roof systems in buildings shall be designed in accordance with either AISI S210 or AISI S100.]

[2210.6 Lateral design. Light frame shear walls, diagonal strap bracing that is part of a structural wall and diaphragms used to resist wind, seismic and other in-plane lateral loads shall be designed in accordance with AISI S213.]

[2210.7 Prescriptive framing. Detached one- and two family dwellings and townhouses, less than or equal to three stories above grade plane, shall be permitted to be constructed in accordance with AISI S230 subject to the limitations therein.]

SECTION BC [2211] 2212
MINIMUM THICKNESS OF METAL

[2211.1] 2212.1 General. All steel of Chapter 22 shall conform to the minimum thickness of metal in accordance with Section [2211.2] 2212.2.

[2211.2] 2212.2 Exterior members. All exterior structural steel members exposed to weather shall have a minimum thickness of metal of 0.23 inches (5.8 mm).

Exceptions:

1. When an approved type of atmospheric corrosion-resistant steel is used.

2. Exposed surfaces are zinc coated with a minimum weight of coating of approximately 0.6 ounces per square foot (0.00 156 kg/m²) of exposed surface and covered with a protective coating as required by Section 2203.2.

3. Exposed surfaces are protected by other means approved by the commissioner.

4. Temporary construction installations that will be in place for a period of 1 year or less, provided that all surfaces which are exposed to the weather shall have a protective coating as required by Section 2203.2.

5. Joists or purlins that are exposed to the weather but which do not support more than 200 square feet (19 m²) of floor or roof area, and which have a protective coating as required.
by Section 2203.2.

SECTION BC [2212] 2213
STRUCTURAL INTEGRITY REQUIREMENTS

[2212.1] 2213.1 General. Steel structures shall be designed to meet all of the requirements of this section. However, details provided for gravity, seismic and wind forces and for other purposes may be regarded as forming part of, or the whole of, these requirements. Detailing provided for one requirement may be counted towards the other requirements.

Exceptions:

1. One-story structures less than 5,000 square feet (465 m²) not to exceed 15 feet (4572 mm) in height.

2. Structures containing only Group R-3 occupancy not more than three stories in height.

[2212.2] 2213.2 Continuity and ties. The following requirements shall be met:

1. All bolted connections shall have at least two bolts.

2. Bolted connections of all columns, beams, braces and other structural elements that are part of the lateral load resisting system shall be designed as bearing-type connections with pretensioned bolts or as slip critical connections.

3. End connections of all beams and girders shall have a minimum available tensile strength equal to the larger of the required vertical shear strength of the connections at either end, but not less than 10 kips (45 kN)(LRFD) and 6.7 kips (30kN)(ASD). For the design of the connections, the shear force and the axial tensile force need not be considered to act simultaneously. For the purpose of this provision, a connection shall be considered compliant if it meets the following requirements:

3.1. For single-plate shear connections, the available tensile strength shall be determined only for the limit state of bolt bearing on the plate and beam web.

3.2. For single angle and double angle shear connections, the available tensile strength shall be determined for the limit states of bolt bearing on the angles and beam web and for tension yielding on the gross area of the angles.

3.3. All other connections shall be designed for the required tension force noted above in accordance with the provisions of AISC 360[ or AISC HSS].

4. For the purpose of satisfying these integrity provisions only, bearing bolts in connections with short-slotted holes parallel to the direction of the tension force and inelastic deformation are permitted. Elements and their connections that brace compression members shall have a minimum available tensile strength equal to at least 2 percent of the required compressive strength of the member being braced, but not less than 10 kips (45 kN)(LRFD) and 6.7 kips (30kN)(ASD). For design of these bracing connections, the shear force and the tensile force
need not be considered to act simultaneously. Where more than one element braces a compression member at a point in one direction, all elements and connections shall have a minimum available tensile strength equal to at least 1 percent of the required compressive strength of the member being braced but not less than 10 kips (45 kN)(LRFD) and 6.7 kips (30kN)(ASD).

[2212.2.1] 2213.2.1 Vertical ties. Column slices shall have an available tensile strength at least equal to the largest design gravity load reaction applied to the column at any floor level located within four floors below the splice.

[2212.3] 2213.3 Composite construction. For steel framing members and/or decking acting compositely with concrete slabs of roofs or floors, the following requirements shall be met:

1. Shear studs shall not be less than \( \frac{1}{2} \) inch (12.7 mm) in diameter. The spacing of shear studs shall not be greater than one every 12 inches (305 mm) averaged over the length of the beam.

2. Connections at the discontinuous edges of permanent metal decking to supporting members shall have a minimum connection strength in the direction parallel to the rib of the deck equal to the shear strength of a \( \frac{3}{4} \)-inch (19.1 mm) puddle weld every 12 inches (305 mm) on center.

3. Side lap connections of permanent metal decking shall have a minimum strength equal to the strength of a button punch every 24 inches (610 mm) on center.

4. Welded wire fabric reinforcement in concrete slabs shall be continuous over all supports and in all spans. Minimum area of continuous reinforcement in each direction shall be 0.0015 times the gross area of concrete. The welded wire fabric reinforcement shall have tension splices and be anchored at discontinuous edges, and shall not be substituted with alternative materials including but not limited to fibers.

§ 23. Chapter 23 of the New York city building code, as added by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 23
WOOD

SECTION BC 2301
GENERAL

2301.1 Scope. The provisions of this chapter shall govern the materials, design, construction and quality of wood members and their fasteners.

2301.2 General design requirements. The design of structural elements or systems, constructed partially or wholly of wood or wood-based products, shall be in accordance with one of the following methods:

1. Allowable stress design in accordance with Sections 2304, 2305 and 2306.

1545
2. Load and resistance factor design in accordance with Sections 2304, 2305 and 2307.

3. Conventional light-frame construction in accordance with Sections 2304 and 2308.

   [Exception: Buildings designed]

4. AWC WFCM in accordance with [the provisions of the AF&PA WFCM shall be deemed to meet the requirements of the provisions of] Section [2308] 2309.

5. The design and construction of log structures [shall be] in accordance with the provisions of ICC 400.

2301.3 Nominal sizes. For the purposes of this chapter, where dimensions of lumber are specified, they shall be deemed to be nominal dimensions unless specifically designated as actual dimensions (see Section 2304.2).

SECTION BC 2302
DEFINITIONS

2302.1 Definitions. The following [words and terms shall, for the purposes of this chapter, have the meanings shown herein] terms are defined in Chapter 2:

ACREDITATION BODY. [An approved, third party organization that is independent of the grading and inspection agencies, and the lumber mills, and that initially accredits and subsequently monitors, on a continuing basis, the competency and performance of a grading or inspection agency related to carrying out specific tasks.]

BRACED WALL LINE. [A series of braced wall panels in a single story that meets the requirements of Section 2308.3 or 2308.12.4.]

BRACED WALL PANEL. [A section of wall braced in accordance with Section 2308.9.3 or 2308.12.4.]

COLLECTOR. [A horizontal diaphragm element parallel and in line with the applied force that collects and transfers diaphragm shear forces to the vertical elements of the lateral force-resisting system and/or distributes forces within the diaphragm.]

CONVENTIONAL LIGHT-FRAME CONSTRUCTION. [A type of construction whose primary structural elements are formed by a system of repetitive wood framing members. See Section 2308 for conventional light-frame construction provisions.]

CRIPPLE WALL. [A framed stud wall extending from the top of the foundation to the underside of floor framing for the lowest occupied floor level.]

CROSS-LAMINATED TIMBER (CLT).

[DIAPHRAGM, UNBLOCKED. A diaphragm that has edge nailing at supporting members only. Blocking between supporting structural members at panel edges is not included. Diaphragm panels are field nailed to supporting members.]
DIAPHRAGM.

Diaphragm, blocked.

Diaphragm boundary.

Diaphragm chord.

Diaphragm, unblocked.

DRAG STRUT. [See "Collector."

ENGINEERED WOOD RIM BOARD.

FIBERBOARD. [A fibrous, homogeneous panel made from lignocellulosic fibers (usually wood or cane) and having a density of less than 31 pounds per cubic foot (pcf) (497 kg/m$^3$) but more than 10 pcf (160 kg/m$^3$).]

FIRECUT. [A sloping cut on the ends of wood beams, joists and rafters resting on masonry or concrete walls.]

GABLE.

[GLUED BUILT-UP MEMBER. A structural element, the section of which is composed of built-up lumber, wood structural panels or wood structural panels in combination with lumber, all parts bonded together with structural adhesives.]

GRADE (LUMBER). [The classification of lumber in regard to strength and utility in accordance with American Softwood Lumber Standard DOC PS 20 and the grading rules of an approved lumber rules-writing agency.]

HARDBOARD. [A fibrous felted, homogeneous panel made from lignocellulosic fibers consolidated under heat and pressure in a hot press to a density not less than 31 pcf (497 kg/m$^3$).]

HOLD-DOWN.

NAILING, BOUNDARY. [A special nailing pattern required by design at the boundaries of diaphragms.]

NAILING, EDGE. [A special nailing pattern required by design at the edges of each panel within the assembly of a diaphragm or shear wall.]

NAILING, FIELD. [Nailing required between the sheathing panels and framing members at locations other than boundary nailing and edge nailing.]

NATURALLY DURABLE WOOD. [The heartwood of the following species, with the exception that an occasional piece with corner sapwood is permitted if 90 percent or more of the width of each side on which it occurs is heartwood.]
Decay resistant. [Redwood, cedar, black locust and black walnut.]

Termite resistant. [Redwood, Alaska yellow cedar, Eastern red cedar and both heartwood and all sapwood of Western red cedar.]

NOMINAL SIZE (LUMBER). [The commercial size designation of width and depth, in standard sawn lumber and glued laminated lumber grades, somewhat larger than the standard net size of dressed lumber, in accordance with DOC PS 20 for sawn lumber and with the AF&PA NDS for glued-laminated lumber.]

PARTICLEBOARD. [A generic term for a panel primarily composed of cellulosic materials (usually wood), generally in the form of discrete pieces or particles, as distinguished from fibers. The cellulosic material is combined with synthetic resin or other suitable bonding system by a process in which the interparticle bond is created by the bonding system under heat and pressure.]

PERFORMANCE CATEGORY.

PREFABRICATED WOOD I-JOIST. [Structural member manufactured using sawn or structural composite lumber flanges and wood structural panel webs bonded together with exterior exposure adhesives, which forms an “I” cross-sectional shape.]

RIM BOARD.

RISK CATEGORY.

SHEAR WALL. [A wall designed to resist lateral forces parallel to the plane of a wall.]

Shear wall, perforated. [A wood structural panel sheathed wall with openings, that has not been specifically designed and detailed for force transfer around openings.]

Shear wall segment, perforated. [A section of shear wall with full-height sheathing that meets the height-to-width ratio limits of Section 4.3.4 of AF&PA SDPWS.]

STRUCTURAL COMPOSITE LUMBER. [Structural member manufactured using wood elements bonded together with exterior adhesives. Examples of structural composite lumber are:]

Laminated strand lumber (LSL).

Laminated veneer lumber (LVL). [A composite of wood veneer sheet elements with wood fibers primarily oriented along the length of the member.]

Oriented strand lumber (OSL).

Parallel strand lumber (PSL). [A composite of wood strand elements with wood fibers primarily oriented along the length of the member.]

STRUCTURAL GLUED-LAMINATED TIMBER. [An engineered, stress-rated product of a timber laminating plant, comprised of assemblies of specially selected and prepared wood
laminations in which the grain of all laminations is approximately parallel longitudinally and the laminations are bonded with adhesives.]

[SUBDIAPHRAGM. A portion of a larger wood diaphragm designed to anchor and transfer local forces to primary diaphragm struts and the main diaphragm.]

TIE-DOWN (HOLD-DOWN). [A device used to resist uplift of the chords of shear walls.]

TREATED WOOD. [Wood and wood-based materials that use vacuum-pressure impregnation processes to enhance fire retardant or preservative properties.]

Fire-retardant-treated wood. [Pressure-treated lumber and plywood that exhibit reduced surface-burning characteristics and resist propagation of fire.]

Preservative-treated wood. [Pressure-treated wood products that exhibit reduced susceptibility to damage by fungi, insects or marine borers.]

WOOD SHEAR PANEL. [A wood floor, roof or wall component sheathed to act as a shear wall or diaphragm.]

WOOD STRUCTURAL PANEL. [A panel manufactured from veneers, wood strands or wafers or a combination of veneer and wood strands or wafers bonded together with waterproof synthetic resins or other suitable bonding systems. Examples of wood structural panels are:]

Composite panels. [A wood structural panel that is comprised of wood veneer and reconstituted wood-based material and bonded together with waterproof adhesive.]

Oriented strand board (OSB). [A mat-formed wood structural panel comprised of thin rectangular wood strands arranged in cross-aligned layers with surface layers normally arranged in the long panel direction and bonded with waterproof adhesive; or]

Plywood. [A wood structural panel comprised of plies of wood veneer arranged in cross-aligned layers. The plies are bonded with waterproof adhesive that cures on application of heat and pressure.]

SECTION BC 2303
MINIMUM STANDARDS AND QUALITY

2303.1 General. Structural sawn lumber; end-jointed lumber; prefabricated wood I-joists; structural glued-laminated timber; cross-laminated timber; wood structural panels; fiberboard sheathing (when used structurally); hardboard siding (when used structurally); particleboard; preservative-treated wood; structural log members; structural composite lumber; round timber poles and piles; engineered wood rim board; fire-retardant-treated wood; hardwood plywood; wood trusses; joist hangers; nails; and staples shall conform to the applicable provisions of this section.

2303.1.1 Sawn lumber. Sawn lumber used for load-supporting purposes, including end-jointed or edge-glued lumber, machine stress-rated or machine-evaluated lumber, shall be identified by the grade mark of a lumber grading or inspection agency that has been approved by the commissioner that complies with DOC PS 20 or equivalent. Grading practices and identification
shall comply with rules published by an agency approved in accordance with the procedures of
DOC PS 20 or equivalent procedures.

2303.1.1 Certificate of inspection. In lieu of a grade mark on the material, a certificate of
inspection as to species and grade issued by a lumber grading or inspection agency meeting
the requirements of this section is permitted to be accepted for precut, remanufactured or
rough-sawn lumber and for sizes larger than 3 inches (76 mm) nominal thickness.

2303.1.2 End-jointed lumber. Approved end-jointed lumber is permitted to be used
interchangeably with solid-sawn members of the same species and grade. End-jointed lumber
used in an assembly required to have a fire-resistance rating shall have the designation “Heat
Resistant Adhesive” or “HRA” included in its grade mark.

2303.1.2 Prefabricated wood I-joists. Structural capacities and design provisions for
prefabricated wood I-joists shall be established and monitored in accordance with ASTM D 5055.
The use of prefabricated wood I-joists structurally shall be subject to the special inspection
requirements of Chapter 17.

2303.1.3 Structural glued-laminated timber. Glued-laminated timbers shall be manufactured
and identified as required in [ANSI/AITC A 190.1] ANSI/APA A190.1 and ASTM D3737.

2303.1.4 Cross-laminated timber. Cross-laminated timber shall be manufactured and identified
in accordance with ANSI/APA PRG 320.

2303.1.5 Wood structural panels. Wood structural panels, when used structurally (including
those used for siding, roof and wall sheathing, subflooring, diaphragms and built-up members),
shall conform to the requirements for their type in DOC PS 1, DOC PS 2 or [PS2] ANSI/APA
PRP 210. Each panel or member shall be identified for grade, bond classification, and [glue type]
Performance Category by the trademarks of an approved testing and grading agency. The
Performance Category value shall be used as the “nominal panel thickness” or “panel thickness”
whenever referenced in this code. Wood structural panel components shall be designed and
fabricated in accordance with the applicable standards listed in Section 2306.1 and identified by
the trademarks of an approved testing and inspection agency indicating conformance [with to] the
applicable standard. In addition, wood structural panels when permanently exposed in outdoor
applications shall be of [exterior] Exterior type, except that wood structural panel roof sheathing
exposed to the outdoors on the underside is permitted to be [interior type bonded with exterior
glue] Exposure 1 type.

[2303.1.5] 2303.1.6 Fiberboard. Fiberboard for its various uses shall conform to ASTM C208.
Fiberboard sheathing, when used structurally, shall be identified by an approved agency as
conforming to ASTM C208.

[2303.1.5.1] 2303.1.6.1 Jointing. To ensure tight-fitting assemblies, edges shall be
manufactured with square, shiplapped, beveled, tongue-and-groove or U-shaped joints.

[2303.1.5.2] 2303.1.6.2 Roof insulation. Where used as roof insulation in all types of
construction, fiberboard shall be protected with an approved roof covering.
Wall insulation. Where installed and fireblocked to comply with Chapter 7, fiberboards are permitted as wall insulation in all types of construction. In fire walls and fire barriers, unless treated to comply with Section 803.1 for Class A materials, the boards shall be cemented directly to the concrete, masonry or other noncombustible base and shall be protected with an approved noncombustible veneer anchored to the base without intervening airspaces.

Protection. Fiberboard wall insulation applied on the exterior of foundation walls shall be protected below ground level with a bituminous coating.

Hardboard. Hardboard siding used structurally shall be identified by an approved agency conforming to CPA/ANSI A135.6. Hardboard underlayment shall meet the strength requirements of 7/32-inch (5.6 mm) or 1/4-inch (6.4 mm) service class hardboard planed or sanded on one side to a uniform thickness of not less than 0.200 inch (5.1 mm). Prefinished hardboard paneling shall meet the requirements of CPA/ANSI A135.5. Other basic hardboard products shall meet the requirements of CPA/ANSI A135.4. Hardboard products shall be installed in accordance with manufacturer’s recommendations.

Particleboard. Particleboard shall conform to ANSI A208.1. Particleboard shall be identified by the grade mark or certificate of inspection issued by an approved agency. Particleboard shall not be utilized for applications other than indicated in this section unless the particleboard complies with the provisions of Section [2306.5] 2306.3.

Floor underlayment. Particleboard floor underlayment shall conform to Type PBU of ANSI A208.1. Type PBU underlayment shall not be less than 1/4-inch (6.4 mm) thick and shall be installed in accordance with the instructions of the Composite Panel Association.

Preservative-treated wood. Lumber, timber, plywood, piles and poles supporting permanent structures required by Section [2304.11] 2304.12 to be preservative treated shall conform to [the requirements of the applicable] AWPA [Standard] U1 and M4 [for the species, product, preservative and end use. Preservatives shall be listed in Section 4 of AWPA U1]. Lumber and plywood used in permanent wood foundation systems shall conform to Chapter 18 of this code.

Identification. Wood required by Section [2304.11] 2304.12 to be preservative treated shall bear the quality mark of an inspection agency that maintains continuing supervision, testing and inspection over the quality of the preservative-treated wood. Inspection agencies for preservative-treated wood shall be listed by an accreditation body that complies with the requirements of the American Lumber Standards Treated Wood Program, or its equivalent. The quality mark shall be on a stamp or label affixed to the preservative-treated wood, and shall include the following information:

1. Identification of treating manufacturer.
2. Type of preservative used.
3. Minimum preservative retention (pcf).
4. End use for which the product is treated.

5. AWPA standard to which the product was treated.

6. Identity of the accredited inspection agency.

[2303.1.8.2] **2303.1.9.2 Moisture content.** Where preservative-treated wood is used in enclosed locations where drying in service cannot readily occur, such wood shall be at a moisture content of 19 percent or less before being covered with insulation, interior wall finish, floor covering or other materials.

[2303.1.9] **2303.1.10 Structural composite lumber.** Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D5456.

[2303.1.10] **2303.1.11 Structural log members.** Stress grading of structural log members of nonrectangular shape, as typically used in log buildings, shall be in accordance with ASTM D3957. Such structural log members shall be identified by the grade mark of an approved lumber grading or inspection agency. In lieu of a grade mark on the material, a certificate of inspection as to species and grade issued by an approved lumber grading or inspection agency meeting the requirements of this section shall be permitted.

[2303.1.11] **2303.1.12 Round timber poles and piles.** Round timber poles and piles shall comply with ASTM D3200 and ASTM D25, respectively.

**2303.1.12 Engineered wood rim board.** Engineered wood rim boards shall conform to ANSI/APA PRR 410 or shall be evaluated in accordance with ASTM D7672. Structural capacities shall be in accordance with ANSI/APA PRR 410 or established in accordance with ASTM D7672. Rim boards conforming to ANSI/APA PRR 410 shall be marked in accordance with that standard.

**2303.2 Fire-retardant-treated wood.** Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10½-feet (3200 mm) beyond the centerline of the burners at any time during the test.

**2303.2.1 Pressure process.** For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures not less than 50 pounds per square inch gauge (psig) (345 kPa).

**2303.2.2 Other means during manufacture.** For wood products produced by other means during manufacture, the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.

**2303.2.3 Testing.** For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to be tested on only the front and back faces.
2303.2.4 Labeling. In addition to the labels required in Section 2303.1.1 for sawn lumber and Section 2303.1.5 for wood structural panels, each piece of fire-retardant-treated lumber and wood structural panels shall be labeled. The label shall contain the following items:

1. The identification mark of an approved agency in accordance with Chapter 1 of Title 28 of the Administrative Code;
2. Identification of the treating manufacturer;
3. The name of the fire-retardant treatment;
4. The species of wood treated;
5. Flame spread and smoke-developed index;
6. Method of drying after treatment;
7. Conformance with appropriate standards in accordance with Sections 2303.2.2 through 2303.2.5; and
8. For fire-retardant-treated wood exposed to weather, damp or wet locations, include the words “No increase in the listed classification when subjected to the Standard Rain Test” (ASTM D2898).

2303.2.5 Strength adjustments. Design values for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for fire-retardant-treated wood. Adjustments to design values shall be based on an approved method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and redrying procedures.

2303.2.5.1 Wood structural panels. The effect of treatment and the method of redrying after treatment, and exposure to high temperatures and high humidities on the flexure properties of fire-retardant-treated softwood plywood shall be determined in accordance with ASTM D5516. The test data developed by ASTM D5516 shall be used to develop adjustment factors, maximum loads and spans, or both, for untreated plywood design values in accordance with ASTM D6305. Each manufacturer shall publish the allowable maximum loads and spans for service as floor and roof sheathing for its treatment.

2303.2.5.2 Lumber. For each species of wood that is treated, the effects of the treatment, the method of redrying after treatment and exposure to high temperatures and high humidities on the allowable design properties of fire-retardant-treated lumber shall be determined in accordance with ASTM D5664. The test data developed by ASTM D5664 shall be used to develop modification factors for use at or near room temperature and at elevated temperatures and humidity in accordance with ASTM D6841. Each manufacturer shall publish the modification factors for service at temperatures of not less than 80°F (27°C) and for roof framing. The roof framing modification factors shall take into consideration the climatological location.
2303.2.6 Exposure to weather, damp or wet locations. Where fire-retardant-treated wood is exposed to weather, or damp or wet locations, it shall be identified as “Exterior” to indicate there is no increase in the listed flame spread index as defined in Section 2303.2 when subjected to ASTM D2898.

2303.2.7 Interior applications. Interior fire-retardant-treated wood shall have moisture content of not over 28 percent when tested in accordance with ASTM D3201 procedures at 92-percent relative humidity. Interior fire-retardant-treated wood shall be tested in accordance with Section 2303.2.5.1 or 2303.2.5.2. Interior fire-retardant-treated wood designated as Type A shall be tested in accordance with the provisions of this section.

2303.2.8 Moisture content. Fire-retardant-treated wood shall be dried to a moisture content of 19 percent or less for lumber and 15 percent or less for wood structural panels before use. For wood kiln-dried after treatment (KDAT), the kiln temperatures shall not exceed those used in kiln drying the lumber and plywood submitted for the tests described in Section 2303.2.5.1 for plywood and 2303.2.5.2 for lumber.

2303.2.9 Type I and II construction applications. See Section 603.1 for limitations on the use of fire-retardant-treated wood in buildings of Type I or II construction.

2303.3 Hardwood and plywood. Hardwood and decorative plywood shall be manufactured and identified as required in HPVA HP.

2303.4 Trusses. Wood trusses shall comply with Sections 2303.4.1 through 2303.4.8.

2303.4.1 Design. Wood trusses shall be designed in accordance with the provisions of this code and accepted engineering practice. Members are permitted to be joined by nails, glue, bolts, timber connectors, metal connector plates or other approved framing devices. Metal-plate-connected wood trusses shall also be subject to the special inspection requirements of Chapter 17.

2303.4.1.1 Truss design drawings. Truss construction documents shall be prepared by a registered design professional and the written, graphic and pictorial depiction of each individual truss shall be provided to the commissioner and approved prior to installation. Truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints and support locations;
3. Number of plies, if greater than one;
4. Required bearing widths;
5. Design loads as applicable, including:
   5.1. Top chord live load;
   5.2. Top chord dead load;
5.3. Bottom chord live load;
5.4. Bottom chord dead load;
5.5. Additional loads and locations; and
5.6. Environmental design criteria and loads (wind, rain, snow, seismic, etc.).

6. Other lateral loads, including drag strut loads;
7. Adjustments to wood member and metal connector plate design value for conditions of use;
8. Maximum reaction force and direction, including maximum uplift reaction forces where applicable;
9. [Metal connector plate type,] Joint connection type and description, such as size and thickness or gage, and the dimensioned location of each [metal joint connector plate] except where symmetrically located relative to the joint interface;
10. Size, species and grade for each wood member;
11. Truss-to-truss connections and truss field assembly requirements;
12. Calculated span-to-deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
13. Maximum axial tension and compression forces in the truss members; [and]
14. Required permanent individual truss member restraint location and the method and details of restraint/bracing to be used in accordance with Section 2303.4.1.2;
15. Required temporary individual and system truss member restraint/bracing requirements for safe handling and field assembly.

2303.4.1.2 Permanent individual truss member restraint. Where permanent restraint of truss members is required on the truss design drawings, it shall be accomplished by one of the following methods:

1. Permanent individual truss member restraint/bracing shall be installed using standard industry lateral restraint/bracing details in accordance with generally accepted engineering practice. Locations for lateral restraint shall be identified on the truss design drawing.

2. The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T-reinforcement or L-reinforcement, proprietary reinforcement, etc.). The buckling reinforcement of individual members of the trusses shall be
installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.

3. A project-specific permanent individual truss member restraint/bracing design shall be permitted to be specified by any registered design professional.

2303.4.1.3 Trusses spanning 60 feet or greater. The owner or the owner’s authorized agent shall contract with any qualified registered design professional for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for all trusses with clear spans 60 feet (18 288 mm) or greater.

2303.4.1.4 Truss designer. The individual or organization responsible for the design of trusses.

2303.4.1.4.1 Truss design drawings. Each individual truss design drawing shall bear the seal and signature of the truss designer.

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.

2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2303.4.2 Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams that serve only as a guide for installation and do not deviate from the Truss Designer’s approved construction drawings shall not be required to bear the seal or signature of the truss designer.

2303.4.3 Truss submittal package. The truss submittal package provided by the truss manufacturer shall consist of: (i) each individual truss design drawing; (ii) the truss placement diagram; (iii) the permanent individual truss member restraint/bracing method and details and any other structural details germane to the trusses; and, as applicable, the cover/truss index sheet.

2303.4.4 Anchorage. The design for the transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

2303.4.5 Alterations to trusses. Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g.,
HVAC equipment, piping, additional roofing or insulation, etc.) shall not be permitted without verification that the truss is capable of supporting such additional loading.

2303.4.6 TPI 1 specifications. In addition to Sections 2303.4.1 through 2303.4.5, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. Job-site inspections shall be in compliance with Section 110.4, as applicable.

2303.4.7 Glued prefabricated parallel chord wood trusses. In addition to Sections 2303.4.1 through 2303.4.5, the design, manufacture and quality assurance of glued prefabricated parallel chord wood trusses shall be in accordance with the rules of the department. Job-site inspections shall be in compliance with Sections 1704.6.2 and 1704.6.3, as applicable.

2303.4.8 Truss quality assurance. Trusses not part of a manufacturing process in accordance with either Section 2303.4.6 or a referenced standard [listed in Chapter 35], which provides requirements for quality control done under the supervision of a third-party quality control agency, shall be manufactured in compliance with Sections 1704.2 and [1704.6 1705.5], as applicable.

2303.5 Test standard for joist hangers [and connectors].[For the required test standards for joist hangers and connectors, see Section 1716.1.] Joist hangers shall be in accordance with ASTM D7147.

2303.6 Nails and staples. Nails and staples shall conform to requirements of ASTM F1667, including Supplement 1. Nails used for framing and sheathing connections shall have minimum average bending yield strengths as follows: 80 kips per square inch (ksi) (551 MPa) for shank diameters larger than 0.177 inch (4.50 mm) but not larger than 0.254 inch (6.45 mm), 90 ksi (620 MPa) for shank diameters larger than 0.142 inch (3.61 mm) but not larger than 0.177 inch (4.50 mm) and 100 ksi (689 MPa) for shank diameters of [at least] not less than 0.099 inch (2.51 mm) but not larger than 0.142 inch (3.61 mm). Staples used for framing and sheathing connections shall have minimum average bending moments as follows: 3.6 in.-lbs (0.41 N-m) for No. 16 gage staples, 4.0 in.-lbs (0.45 N-m) for No. 15 gage staples, and 4.3 in.-lbs (0.49 N-m) for No. 14 gage staples.

2303.7 Shrinkage. Consideration shall be given in design to the possible effect of cross-grain dimensional changes considered vertically which may occur in lumber fabricated in a green condition.

SECTION BC 2304
GENERAL CONSTRUCTION REQUIREMENTS

2304.1 General. The provisions of this section apply to design methods specified in Section 2301.2.

2304.2 Size of structural members. Computations to determine the required sizes of members shall be based on the net dimensions (actual sizes) and not nominal sizes.

2304.3 Wall framing. The framing of exterior and interior walls shall be in accordance with the provisions specified in Section 2308 unless a specific design is furnished.

2304.3.1 Bottom plates. Studs shall have full bearing on a 2-inch-thick (actual 1½-inch, 38 mm) or larger plate or sill having a width at least equal to the width of the studs.
2304.3.2 Framing over openings. Headers, double joists, trusses or other approved assemblies that are of adequate size to transfer loads to the vertical members shall be provided over window and door openings in load-bearing walls and partitions.

2304.3.3 Shrinkage. Wood walls and bearing partitions shall not support more than two floors and a roof unless an analysis satisfactory to the commissioner shows that shrinkage of the wood framing will not have adverse effects on the structure or any plumbing, electrical or mechanical systems or other equipment installed therein due to excessive shrinkage or differential movements caused by shrinkage. The analysis shall also show that the roof drainage system and the foregoing systems or equipment will not be adversely affected or, as an alternate, such systems shall be designed to accommodate the differential shrinkage or movements.

2304.4 Floor and roof framing. The framing of wood-jointed floors and roofs shall be in accordance with the provisions specified in Section 2308 unless a specific design is furnished.

2304.4.1 Firecutting. The ends of wood beams, joists and rafters resting on unreinforced masonry or plain concrete walls shall be firecut to a bevel of 3 inches (76 mm) in depth.

2304.5 Framing around flues and chimneys. Combustible framing shall be a minimum of 2 inches (51 mm), but shall not be less than the distance specified in Sections 2111 and 2113 and the New York City Mechanical Code, from flues, chimneys and fireplaces, and 6 inches (152 mm) away from flue openings.

2304.6 [Wall] Exterior wall sheathing. [Except as provided for in Section 1405 for weatherboarding or where stucco construction that complies with Section 2510 is installed, enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2304.6 or any other approved material of equivalent strength or durability.] Wall sheathing on the outside of exterior walls, including gables, and the connection of the sheathing to framing shall be designed in accordance with the general provisions of this code and shall be capable of resisting wind pressures in accordance with Section 1609.

*For SI: 1 inch = 25.4 mm.*

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the outside of exterior walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used elsewhere, but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). Wood structural panel wall sheathing or siding used as structural sheathing shall be capable of resisting wind pressures in accordance with Section 1609. Maximum wind speeds for wood structural panel sheathing used to resist wind pressures, connections and framing spacing shall be in accordance with Table 2304.6.1 for the applicable wind speed and exposure category where used in enclosed buildings with a mean roof height not greater than 30 feet (9144 mm) and an importance factor (I) of 1.0 and a topographic factor (Kzt) of 1.0.

For SI: 1 inch = 25.4 mm, 1 mile per hour = 0.447 m/s.

a. Panel strength axis shall be parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.

b. The table is based on wind pressures acting toward and away from building surfaces in accordance with Section 6.4.2.2 of ASCE 7. Lateral requirements shall be in accordance with Section 2305 or 2308.

c. Wood structural panels with span ratings of wall-16 or wall-24 shall be permitted as an alternative to panels with a 24/0 span rating. Plywood siding rated 16 [\(o.c.\)] on center or 24 [\(o.c.\)] on center shall be permitted as an alternative to panels with a 24/16 span rating. Wall-16 and plywood siding 16 [\(o.c.\)] on center shall be used with studs spaced [maximum] not more than 16 inches [\(o.c.\)] on center.

d. $V_{\text{std}}$ shall be determined in accordance with Section 1609.3.1.

2304.6.2 2304.7 Interior paneling. Softwood wood structural panels used for interior paneling shall conform to the provisions of Chapter 8 and shall be installed in accordance with Table 2304.9.1. Panels shall comply with DOC PS 1, DOC PS 2 or [PS2] ANSI/APA PRP 210. Prefinished hardboard paneling shall meet the requirements of CPA/ANSI A135.5. Hardwood plywood shall conform to HPVA HP-1.

2304.7 2304.8 Floor and roof sheathing. Structural floor sheathing and structural roof sheathing shall comply with Sections 2304.8.1 and 2304.8.2, respectively.

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m².

a. Applies to panels 24 inches or wider.

b. [Foot and roof sheathing conforming with this table shall be deemed to meet the design criteria of Section 2304.7.]

c. Uniform load deflection limitations 1/360 of span under live load plus dead load, 1/140 under live load only.

d. Permissible load for tongue and groove joints shall be supported by blocking unless ⅜-inch minimum thickness underlayment or 1½ inches of approved cellular or lightweight concrete is placed over the joists, or finish floor is ⅜-inch wood strip. Allowable uniform load based on deflection of 1/140 of span is 100 pounds per square foot except the span rating of 48 inches on center is based on a total load of 65 pounds per square foot.

e. Tongue and groove edges, panel edge clips (one midway between each support, except two equally spaced between supports 48 inches on center), lumber blocking or other. Only lumber blocking shall satisfy blocked diaphragm requirements.

f. For ½-inch panel, maximum span shall be 24 inches.

For ⅜-inch panel, maximum span shall be 24 inches.

</table>

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m².

a. [Roof sheathing conforming with this table shall be deemed to meet the design criteria of Section 2304.2.]

b. [Applicable to underlayment grade, C-C (Plugged) plywood, and Single Floor grade wood structural panels.]

c. [Uniform load deflection limitations \(3\frac{3}{4}\)in of span under live load plus dead load, \(\frac{3}{4}\)in under live load only. Edges shall be blocked with lumber or other approved type of edge support.]

For composite and four-ply plywood structural panel, load shall be reduced by 15 pounds per square foot.

[2304.7.1] 2304.8.1 Structural floor sheathing. Structural floor sheathing shall be designed in accordance with the general provisions of this code and the special provisions in this section. Roof sheathing conforming to the provisions of Table 2304.7(1), 2304.7(2), 2304.7(3) or 2304.7(4) shall be deemed to meet the requirements of this section.

Floor sheathing conforming to the provisions of Table 2304.8(1), 2304.8(2), 2304.8(3) or 2304.8(4) shall be deemed to meet the requirements of this section.

[2304.7.2] 2304.8.2 Structural roof sheathing. Structural roof sheathing shall be designed in accordance with the general provisions of this code and the special provisions in this section. Roof sheathing conforming to the provisions of Table 2304.7(1), 2304.7(2), 2304.7(3) or 2304.7(5) shall be deemed to meet the requirements of this section. Wood structural panel roof sheathing shall be bonded by exterior glue.

Roof sheathing conforming to the provisions of Table 2304.8(1), 2304.8(2), 2304.8(3) or 2304.8(5) shall be deemed to meet the requirements of this section. Wood structural panel roof sheathing shall be of a type manufactured with exterior glue (Exposure 1 or Exterior).

[2304.8] 2304.9 Lumber decking. Lumber decking shall be designed and installed in accordance with the general provisions of this code and Sections 2304.9.1 through 2304.9.5.3.

[2304.8.1] 2304.9.1 General. [Lumber decking shall be designed and installed in accordance with the general provisions of this code and Section 2304.8.] Each piece of lumber decking shall be [square end] square-end trimmed. When random lengths are furnished, each piece shall be [square end] square-end trimmed across the face so that at least 90 percent of the pieces are within 0.5 degrees (0.00873 rad) of square. The ends of the pieces shall be permitted to be beveled up to 2 degrees (0.0349 rad) from the vertical with the exposed face of the piece slightly longer than the opposite face of the piece. Tongue-and-groove decking shall be installed with the tongues up on sloped or pitched roofs with pattern faces down.

1562
Lumber decking is permitted to be laid up following one of five standard patterns as defined in Sections 2304.9.2.1 through 2304.9.2.5. Other patterns are permitted to be used provided they are substantiated through engineering analysis.

2304.9.2.1 Simple span pattern. All pieces shall be supported on their ends (i.e., by two supports).

2304.9.2.2 Two-span continuous pattern. All pieces shall be supported by three supports, and all end joints shall occur in line on alternating supports. Supporting members shall be designed to accommodate the load redistribution caused by this pattern.

2304.9.2.3 Combination simple and two-span continuous pattern. Courses in end spans shall be alternating simple-span pattern and two-span continuous pattern. End joints shall be staggered in adjacent courses and shall bear on supports.

2304.9.2.4 Cantilevered pieces intermixed pattern. The decking shall extend across a minimum of three spans. Pieces in each starter course and every third course shall be simple span pattern. Pieces in other courses shall be cantilevered over the supports with end joints at alternating quarter or third points of the spans. Each piece shall bear on at least one support.

2304.9.2.5 Controlled random pattern. The decking shall extend across a minimum of three spans. End joints of pieces within 6 inches (152 mm) of the end joints of the adjacent pieces in either direction shall be separated by at least two intervening courses. In the end bays, each piece shall bear on at least one support. Where an end joint occurs in an end bay, the next piece in the same course shall continue over the first inner support for at least 24 inches (610 mm). The details of the controlled random pattern shall be as specified for each decking material in Section 2304.3.3, 2304.4.3 or 2304.5.3. [Decking that cantilevers beyond a support for a horizontal distance greater than 18 inches (457 mm), 24 inches (610 mm) or 36 inches (914 mm) for 2-inch (51 mm), 3-inch (76 mm) and 4-inch (102 mm) nominal thickness decking, respectively, shall comply with the following;]

Decking that cantilevers beyond a support for a horizontal distance greater than 18 inches (457 mm), 24 inches (610 mm) or 36 inches (914 mm) for 2-inch (51 mm), 3-inch (76 mm) and 4-inch (102 mm) nominal thickness decking, respectively, shall comply with the following:

1. The maximum cantilevered length shall be 30 percent of the length of the first adjacent interior span;

2. A structural fascia shall be fastened to each decking piece to maintain a continuous, straight line; and

3. There shall be no end joints in the decking between the cantilevered end of the decking and the centerline of the first adjacent interior span.
Mechanically laminated decking. Mechanically laminated decking shall comply with Sections 2304.9.3.1 through 2304.9.3.3.

General. Mechanically laminated decking consists of square-edged dimension lumber laminations set on edge and mechanically fastened to the adjacent pieces and to the supports.

Nailing and fastening to supports. Nailing of adjacent laminations and fastening to supports shall conform to the requirements of Section 2304.9.3.2.1 through 2304.9.3.2.2.

Two-inch mechanically laminated decking. For mechanically laminated decking constructed with laminations of 2-inch (51 mm) nominal thickness, nailing and fastening to supports in accordance with Table 2304.9.3.2.1 shall be permitted. Other connections are permitted to be used provided they are reviewed and approved by the registered design professional of record, but shall be spaced at no more than 16 inches (406 mm) on center.

TABLE 2304.9.3.2.1
FASTENING SCHEDULE FOR MECHANICALLY LAMINATED DECKING USING LAMINATIONS OF 2-INCH NOMINAL THICKNESS

For SI: 1 inch = 25.4 mm

- \[^a\] Nails shall be driven perpendicular to the lamination face, alternating between top and bottom edges.
- \[^b\] Where nails penetrate through two laminations and into the third, they shall be staggered one-third of the spacing in adjacent laminations.
- \[^c\] Otherwise, nails shall be staggered one-half of the spacing in adjacent laminations.
- \[^d\] Two side nails shall be installed at each end of butt-jointed pieces.

Three- and four-inch mechanically laminated decking. For mechanically laminated decking constructed with laminations of 3-inch (76 mm) and 4-inch (102 mm) thickness, the length of nails connecting laminations shall not be less than two and one-half times the net thickness of each lamination. Where decking supports are 48 inches (1219 mm) on center or less, side nails shall be installed not more than 30 inches (762 mm) on center alternating between top and bottom edges, and staggered one-third of the spacing in adjacent laminations. Where supports are spaced more than 48 inches (1219 mm) on center, side nails shall be installed...
not more than 18 inches (457 mm) [on center] alternating between top and bottom edges and staggered one-third of the spacing in adjacent laminations. Two side nails shall be installed at each end of butt-jointed pieces. [Laminations shall be toenailed to supports with 20d or larger common nails. Where the supports are 48 inches (1219 mm) (o.c.) or less, alternate laminations shall be toenailed to alternate supports; where supports are spaced more than 48 inches (1219 mm) (o.c.), alternate laminations shall be toenailed to every support.]

Laminations shall be toenailed to supports with 20d or larger common nails. Where the supports are 48 inches (1219 mm) on center or less, alternate laminations shall be toenailed to alternate supports; where supports are spaced more than 48 inches (1219 mm) on center, alternate laminations shall be toenailed to every support.

Other connections are permitted to be used provided they are reviewed and approved by the registered design professional of record, but shall be spaced at no more than 16 inches (406 mm) on center.

2304.9.3.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.9.4 Two-inch sawn tongue-and-groove decking. Two-inch (51 mm) sawn tongue-and-groove decking shall comply with Sections 2304.9.4.1 through 2304.9.4.3.

2304.9.4.1 General. Two-inch (51 mm) decking shall have a maximum moisture content of 15 percent when machined and installed. Decking shall be machined with a single tongue-and-groove pattern. Each decking piece shall be nailed to each support.

2304.9.4.2 Nailing. Each piece of decking shall be toenailed at each support with one 16d common nail through the tongue and face-nailed with one 16d common nail.

2304.9.4.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.9.5 Three- and four-inch sawn tongue-and-groove decking. Three- and four-inch (76 mm and 102 mm) sawn tongue-and-groove decking shall comply with Sections 2304.9.5.1 through 2304.9.5.3.

2304.9.5.1 General. Three-inch (76 mm) and four-inch (102 mm) decking shall have a maximum moisture content of 19 percent when machined and installed. Decking shall be machined with a double tongue-and-groove pattern. Decking pieces shall be interconnected and nailed to the supports.
[2304.8.5.2] **2304.9.5.2 Nailing.** Each piece shall be toenailed at each support with one 40d common nail and face-nailed with one 60d common nail. Courses shall be spiked to each other with 8-inch (203 mm) spikes at maximum intervals of 30 inches (762 mm) through predrilled edge holes penetrating to a depth of approximately 4 inches \([402 \text{mm}] (102 \text{mm})\). One spike shall be installed at a distance not exceeding 10 inches (254 mm) from the end of each piece.

[2304.8.5.3] **2304.9.5.3 Controlled random pattern.** There shall be a minimum distance of 48 inches (1219 mm) between end joints in adjacent courses. Pieces not bearing on a support are permitted to be located in interior bays provided the adjacent pieces in the same course continue over the support for at least 24 inches (610 mm). This condition shall not occur more than once in every six courses in each interior bay.

[2304.9 Connections] **2304.10 Connectors and fasteners.** Connectors and fasteners shall comply with the applicable provisions of Sections 2304.10.1 through 2304.10.8.

[2304.9.1] **2304.10.1 Fastener requirements.** Connections for wood members shall be designed in accordance with the appropriate methodology in Section 2301.2. The number and size of fasteners connecting wood members shall not be less than that set forth in Table [2304.9.1] 2304.10.1.

</tbody>
</table>

For SI: 1 inch = 25.4 mm.

a. Nails spaced at 6 inches at intermediate supports where spans are 38 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.
b. Spacing shall be 6 inches on center on the edges and 12 inches on center at intermediate supports for nonstructural applications. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).
c. Where a rafter is fastened to an adjacent parallel ceiling joist in accordance with this schedule and the ceiling joist is fastened to the top plate in accordance with this schedule, the number of toenails in the rafter shall be permitted to be reduced by one nail.
d. RSRS-01 is a Roof Sheathing Ring Shank nail meeting the specifications of ASTM F1667.

[2304.9.2] 2304.10.2 Sheathing fasteners. Sheathing nails or other approved sheathing connectors shall be driven so that their head or crown is flush with the surface of the sheathing.

[2304.9.3] 2304.10.3 Joist hangers and framing anchors. Connections depending on joist hangers or framing anchors, ties and other mechanical fastenings not otherwise covered are permitted where approved. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with [Section 1716.1] ASTM D7147.

[2304.9.4] 2304.10.4 Other fasteners. Clips, staples, glues and other approved methods of fastening are permitted where approved.

[2304.9.5] 2304.10.5 Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners, including nuts and washers, and connectors in contact with preservative-treated and fire-retardant-treated wood shall be in accordance with Sections [2304.9.5.1] through [2304.9.5.4] 2304.10.5.4. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A153. Stainless steel driven fasteners shall be in accordance with the material requirements of ASTM F1667.

[2304.9.5.1] 2304.10.5.1 Fasteners and connectors for preservative-treated wood. Fasteners, including nuts and washers, in contact with preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Staples shall be of stainless steel. Fasteners other than nails, staples, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B695, Class 55 minimum. Connectors that are used in exterior applications and in contact with preservative-treated wood shall have coating types and weights in accordance with the treated wood or connector manufacturer’s recommendations. In the absence of manufacturer’s recommendations, a minimum of ASTM A653, [Type] Type G185 zinc-coated galvanized steel, or equivalent, shall be used.

Exception: Plain carbon steel fasteners, including nuts and washers, in SBX/DOT and zinc borate preservative-treated wood in an interior, dry environment shall be permitted.

[2304.9.5.2] 2304.10.5.2 Fastenings for wood foundations. Fastenings, including nuts and washers, for wood foundations shall be as required in [AF&PA PWF] AWC PWF.
[2304.9.5.3] 2304.10.5.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners, including nuts and washers, for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Staples shall be of stainless steel. Fasteners other than nails, staples, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B695, Class 55 minimum.

[2304.9.5.4] 2304.10.5.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners, including nuts and washers, for fire-retardant-treated wood used in interior locations shall be in accordance with the manufacturer’s recommendations. In the absence of manufacturer’s recommendations, Section [2304.9.5.3] 2304.10.5.3 shall apply.

[2304.9.6] 2304.10.6 Load path. Where wall framing members are not continuous from the foundation sill to the roof, the members shall be secured to ensure a continuous load path. Where required, sheet metal clamps, ties or clips shall be formed of galvanized steel or other approved corrosion-resistant material not less than [0.040 inch (1.01 mm) nominal] 0.0329-inch (0.836 mm) base metal thickness.

[2304.9.7] 2304.10.7 Framing requirements. Wood columns and posts shall be framed to provide full end bearing. Alternatively, column-and-post end connections shall be designed to resist the full compressive loads, neglecting end-bearing capacity. Column-and-post end connections shall be fastened to resist lateral and net induced uplift forces.

2304.10.8 Connection fire resistance rating. Wood structural connections, including connectors, fasteners, and portions of wood members included in the connection design, shall be protected from fire exposure for the required fire resistance time. For connections in Type IV construction, the required fire resistance time shall be at minimum one hour or as required for the building element by Table 601 and Section 602.4. Fire resistance ratings for connections shall be determined by one of the following:

1. Testing in accordance with Section 703.2 where the connection is part of the fire resistance test.

2. Engineering analysis that demonstrates that the temperature rise at any portion of the connection is limited to an average temperature rise of 250°F (139°C), and a maximum temperature rise of 325°F (181°C), for a time corresponding to the required fire resistance rating of the structural element being connected. For the purposes of this analysis, the connection includes connectors, fasteners, and portions of wood members included in the structural design of the connection.

[2304.10] 2304.11 Heavy timber construction. Where a structure, portion thereof or individual structural elements are required by other provisions of this code to be of heavy timber, the building elements therein shall comply with the applicable provisions of Sections 2304.11.1 through 2304.11.4. Minimum dimensions of heavy timber shall comply with the applicable requirements in Table 2304.11 based on roofs or floors supported and the configuration of each structural element, or the applicable requirements in Sections 2304.11.2 through 2304.11.4. Lumber decking shall be in accordance with Section 2304.9.

</table>

For SI: 1 inch = 25.4 mm.

a. Spaced members shall be permitted to be composed of two or more pieces not less than 3 inches nominal in thickness where blocked solidly throughout their intervening spaces or where spaces are tightly closed by a continuous wood cover plate of not less than 2 inches nominal in thickness secured to the underside of the members. Splice plates shall be not less than 3 inches nominal in thickness.

b. Where protected by approved automatic sprinklers under the roof deck, framing members shall be not less than 3 inches nominal in width.

[2304.10.1 Minimum member sizes.]

[2304.10.1.1 Columns. Columns shall be at least 8 inches (203 mm) in all dimensions when supporting floor loads and at least 6 inches (152 mm) wide and 8 inches (203 mm) deep when supporting roof and ceiling loads only.]

[2304.10.1.2 Beams and girders. Beams and girders shall be at least 6 inches (152 mm) wide and 10 inches (254 mm) deep.]

[2304.10.1.3 Frames and arches. Frames and arches that spring from grade or the floor line and support floor loads shall be at least 8 inches (203 mm) in all dimensions. Frames or arches for roof construction that spring from grade or the floor line and do not support floor loads shall have members at least 6 inches (152 mm) wide and 8 inches (203 mm) deep for the lower half of the height, and at least 6 inches (152 mm) deep for the upper half. Frames or arches for roof construction that spring from the top of walls or wall abutments, framed
timber trusses, and other roof framing, which do not support floor loads, shall have members at least 4 inches (102 mm) wide and 6 inches (152 mm) deep. Spaced members may be composed of two or more pieces at least 3 inches (76 mm) thick when blocked solidly through their intervening spaces or when such spaces are tightly closed by a continuous wood cover plate at least 2 inches (51 mm) thick secured to the underside of the members. Splice plates shall be at least 3 inches (76 mm) thick. When protected by approved automatic sprinklers under the roof deck, framing members shall be at least 3 inches (76 mm) wide.

[2304.10.1.4 Trusses. Timber trusses supporting floor loads shall have members at least 8 inches (203 mm) in all dimensions.]

[2304.10.2 Columns. Columns shall be continuous or superimposed throughout all stories by means of reinforced concrete or metal caps with brackets, or shall be connected by properly designed steel or iron caps, with pints and base plates, or by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other approved methods.]

[2304.10.2.1 Column connections. Girders and beams shall be closely fitted around columns and adjoining ends shall be cross tied to each other, or intertied by caps or ties, to transfer horizontal loads across joints. Wood bolsters shall not be placed on tops of columns unless the columns support roof loads only.]

[2304.10.3 Floor framing. Approved wall plate boxes or hangers shall be provided where wood beams, girders or trusses rest on masonry or concrete walls. Where intermediate beams are used to support a floor, they shall rest on top of girders, or shall be supported by ledgers or blocks securely fastened to the sides of the girders, or they shall be supported by an approved metal hanger into which the ends of the beams shall be closely fitted.]

[2304.10.4 Roof framing. Every roof girder and at least every alternate roof beam shall be anchored to its supporting member; and every monitor and every sawtooth construction shall be anchored to the main roof construction. Such anchors shall consist of steel bolts of sufficient strength to resist vertical uplift of the roof.]

[2304.10.5 Floor decks. Floor decks and covering shall not extend closer than $\frac{1}{2}$ inch (12.7 mm) to walls. Such $\frac{1}{2}$-inch (12.7 mm) spaces shall be covered by a molding fastened to the wall either above or below the floor and arranged such that the molding will not obstruct the expansion or contraction movements of the floor. Corbeling of masonry walls under floors is permitted in place of such molding.]

[2304.10.6 Roof decks. Where supported by a wall, roof decks shall be anchored to walls to resist uplift forces determined in accordance with Chapter 16. Such anchors shall consist of steel bolts of sufficient strength to resist vertical uplift of the roof.]

[2304.10.7 Fabrication. All timber shall be accurately cut and framed to a close fit in such a manner that the joints will have even bearing over the contact surfaces. Mortises shall be true to size for their full depth and tenons shall fit snugly. No shimming in joints, or open joints, shall be permitted.]
[2304.10.8 Erection. Joints shall have a tight fit. Fasteners shall be installed in a manner that will not damage the wood. End compression joints shall be brought to full bearing. All framework shall be carried up true and plumb. As erection progresses, the work shall be bolted, or nailed as necessary, to resist all dead load, wind, and erection stresses. The structure shall be properly aligned before final tightening of the connections.]

2304.11.1 Details of heavy timber structural members. Heavy timber structural members shall be detailed and constructed in accordance with Sections 2304.11.1 through 2304.11.1.4.

2304.11.1.1 Columns. Minimum dimensions of columns shall be in accordance with Table 2304.11. Columns shall be continuous or superimposed throughout all stories and connected in an approved manner. Girders and beams at column connections shall be closely fitted around columns and adjoining ends shall be cross tied to each other, or intertied by caps or ties, to transfer horizontal loads across joints. Wood bolsters shall not be placed on tops of columns unless the columns support roof loads only. Where traditional heavy timber detailing is used, connections shall be by means of reinforced concrete or metal caps with brackets, by properly designed steel or iron caps, with pintles and base plates, by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other approved methods.

2304.11.1.2 Floor framing. Minimum dimensions of floor framing shall be in accordance with Table 2304.11. Approved wall plate boxes or hangers shall be provided where wood beams, girders or trusses rest on masonry or concrete walls. Where intermediate beams are used to support a floor, they shall rest on top of girders, or shall be supported by an approved metal hanger into which the ends of the beams shall be closely fitted. Where traditional heavy timber detailing is used, these connections shall be permitted to be supported by ledgers or blocks securely fastened to the sides of the girders.

2304.11.1.3 Roof framing. Minimum dimensions of roof framing shall be in accordance with Table 2304.11. Every roof girder and not less than every alternate roof beam shall be anchored to its supporting member to resist forces as required in Chapter 16.

2304.11.1.4 Cross-laminated timber. Cross-laminated timber shall be used only when engineered by a registered design professional. The design shall take into account the effects of openings cut into the panels. Cross-laminated timber shall not be used as individual columns or beams.

2304.11.2 Partitions and walls. Partitions and walls shall comply with Section 2304.11.2.1 or 2304.11.2.2.

2304.11.2.1 Exterior walls. Exterior walls shall be of noncombustible materials or other materials as permitted by Section 602.4.

2304.11.2.2 Interior walls and partitions. Interior walls and partitions shall be of solid wood construction formed by not less than two layers of 1-inch (25 mm) matched boards or laminated construction 4 inches (102 mm) thick, or of 1-hour fire-resistance-rated construction.
2304.11.3 Floors. Floors shall be without concealed spaces. Wood floors shall be constructed in accordance with Section 2304.11.3.1 or 2304.11.3.2.

2304.11.3.1 Cross-laminated timber floors. Cross-laminated timber shall be not less than 4 inches (102 mm) in actual thickness. Cross-laminated timber shall be continuous from support to support and mechanically fastened to one another. Cross-laminated timber shall be permitted to be connected to walls without a shrinkage gap providing swelling or shrinking is considered in the design. Corbelling of masonry walls under the floor shall be permitted to be used.

2304.11.3.2 Sawn or glued-laminated plank floors. Sawn or glued-laminated plank floors shall be one of the following:

1. Sawn or glued-laminated planks, splined or tongue-and-groove, of not less than 3 inches (76 mm) nominal in thickness covered with 1-inch (25 mm) nominal dimension tongue-and-groove flooring, laid crosswise or diagonally, 15/32-inch (12 mm) wood structural panel or ½-inch (12.7 mm) particleboard.

2. Planks not less than 4 inches (102 mm) nominal in width set on edge close together and well spiked and covered with 1-inch (25 mm) nominal dimension flooring or 15/32-inch (12 mm) wood structural panel or ½-inch (12.7 mm) particleboard.

The lumber shall be laid so that continuous lines of joints will occur only at points of support. Floors shall not extend closer than ½ inch (12.7 mm) to walls. Such ½-inch (12.7 mm) space shall be covered by a molding fastened to the wall and so arranged that it will not obstruct the swelling or shrinkage movements of the floor. Corbelling of masonry walls under the floor shall be permitted to be used in place of molding.

2304.11.4 Roof decks. Roofs shall be without concealed spaces and roof decks shall be constructed in accordance with Section 2304.11.4.1 or 2304.11.4.2. Other types of decking shall be an alternative that provides equivalent fire resistance and structural properties. Where supported by a wall, roof decks shall be anchored to walls to resist forces determined in accordance with Chapter 16. Such anchors shall consist of steel bolts, lags, screws or approved hardware of sufficient strength to resist prescribed forces.

2304.11.4.1 Cross-laminated timber roofs. Cross-laminated timber roofs shall be not less than 3 inches (76 mm) nominal in thickness and shall be continuous from support to support and mechanically fastened to one another.

2304.11.4.2 Sawn, wood structural panel, or glued-laminated plank roofs. Sawn, wood structural panel, or glued-laminated plank roofs shall be one of the following:

1. Sawn or glued laminated, splined or tongue-and-groove plank, not less than 2 inches (51 mm) nominal in thickness.

2. 1⅛-inch-thick (32 mm) wood structural panel (exterior glue).
3. Planks not less than 3 inches (76 mm) nominal in width, set on edge close together and laid as required for floors.

2304.12 Protection against decay and termites. Wood shall be protected from decay and termites in accordance with the applicable provisions of Sections 2304.12.1 through 2304.12.8.

2304.11.1 General. Where required by this section, protection from decay and termites shall be provided by the use of naturally durable or preservative-treated wood.

2304.12 Wood used above ground. Wood used above ground in the locations specified in Sections 2304.12.1 through 2304.12.8 shall be naturally durable wood or preservative-treated wood using water-borne preservatives, in accordance with AWPA U1 (Commodity Specifications A or F) for above-ground use.

2304.12.1 Joists, girders and subfloor. Wood joists or the bottom of a wood structural floor that are closer than 18 inches (457 mm) or wood girders that are closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated areas located within the perimeter of the building foundation, the floor construction (including posts, girders, joists and subfloor) shall be of naturally durable or preservative-treated wood.

2304.12.2 Wood supported by exterior foundation walls. Wood framing members, including wood sheathing, that rest on exterior foundation walls and are less than 8 inches (203 mm) from exposed earth shall be of naturally durable or preservative-treated wood.

2304.12.3 Exterior walls below grade. Wood framing members and furring strips in direct contact with the interior of exterior masonry or concrete walls below grade shall be of approved naturally durable or preservative-treated wood.

2304.12.4 Sleepers and sills. Sleepers and sills on a concrete or masonry slab that is in direct contact with earth shall be of naturally durable or preservative-treated wood.

2304.12.5 Girder ends. The ends of wood girders entering exterior masonry or concrete walls shall be provided with a \( \frac{1}{2} \) inch (12.7 mm) air space on top, sides and end, unless naturally durable or preservative-treated wood is used.

2304.12.6 Wood siding. Clearance between wood siding and earth on the exterior of a building shall not be less than 8 inches (203 mm) or less than 2 inches (51 mm) vertical from covered concrete steps, porch slabs, patio slabs and similar horizontal surfaces exposed to the weather except where siding, sheathing and wall framing are of naturally durable or preservative-treated wood.

2304.12.2 Other locations. Wood used in the locations specified in Sections 2304.12.2.1 through 2304.12.2.5 shall be naturally durable wood or preservative-treated wood in accordance with AWPA U1. Preservative-treated wood used in interior locations shall be protected with two coats
of urethane, shellac, latex epoxy or varnish unless water-borne preservatives are used. Prior to application of the protective finish, the wood shall be dried in accordance with the manufacturer’s recommendations.

2304.12.2.1 Girder ends. The ends of wood girders entering exterior masonry or concrete walls shall be provided with a ½-inch (12.7 mm) airspace on top, sides and end, unless naturally durable or preservative-treated wood is used.

2304.11.2.7 2304.12.2.2 Posts or columns. Posts or columns supporting permanent structures and supported by a concrete or masonry slab or footing that is in direct contact with the earth shall be of naturally durable or preservative-treated wood.

[Exceptions]

1. Posts or columns that are either exposed to the weather or located in basements or cellars, supported by concrete piers or metal pedestals projected at least 1 inch (25 mm) above the slab or deck and 6 inches (152 mm) above exposed earth, and are separated therefrom by an impervious moisture barrier.

2. Posts or columns in enclosed crawl spaces or unexcavated areas located within the periphery of the building, supported by a concrete pier or metal pedestal at a height greater than 8 inches (203 mm) from exposed ground, and are separated therefrom by an impervious moisture barrier.

Exception: Posts or columns that meet all of the following:

1. Are not exposed to the weather, or are protected by a roof, eave, overhang, or other covering if exposed to the weather.

2. Are supported by concrete piers or metal pedestals projected not less than 1 inch (25 mm) above the slab or deck and are separated from the concrete pier by an impervious moisture barrier.

3. Are located not less than 8 inches (203 mm) above exposed earth.

2304.11.3 Laminated timbers. The portions of glued laminated timbers that form the structural supports of a building or other structure and are exposed to weather and not fully protected from moisture by a roof, eave or similar covering shall be pressure treated with preservative or be manufactured from naturally durable or preservative treated wood.

2304.11.4 Wood in contact with the ground or fresh water. Wood used in contact with the ground (exposed earth) in the locations specified in Sections 2304.11.4.1 and 2304.11.4.2 shall be naturally durable (species for both decay and termite resistance) or preservative-treated using water-borne preservatives in accordance with AWPA U1 (Commodity Specifications A or F) for soil or fresh water use.

Exception: Untreated wood is permitted where such wood is continuously and entirely below the groundwater level or submerged in fresh water.
2304.11.4.1 Posts or columns. Posts and columns supporting permanent structures that are embedded in concrete that is in direct contact with the earth, embedded in concrete that is exposed to the weather or in direct contact with the earth shall be of preservative-treated wood.

2304.11.4.2 Wood structural members. Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or preservative-treated wood unless separated from such floors or roofs by an impervious moisture barrier.

2304.11.5 2304.12.2.3 Supporting member for permanent appurtenances. Naturally durable or preservative-treated wood shall be utilized for those portions of wood members that form the structural supports of buildings, balconies, porches or similar permanent building appurtenances where such members are exposed to the weather without adequate protection from a roof, eave, overhang or other covering to prevent moisture or water accumulation on the surface or at joints between members.

2304.12.2.4 Laminated timbers. The portions of glued-laminated timbers that form the structural supports of a building or other structure and are exposed to weather and not fully protected from moisture by a roof, eave or similar covering shall be pressure treated with preservative or be manufactured from naturally durable or preservative-treated wood.

2304.12.2.5 Supporting members for permeable floors and roofs. Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or preservative-treated wood unless separated from such floors or roofs by an impervious moisture barrier. The impervious moisture barrier system protecting the structure supporting floors shall provide positive drainage of water that infiltrates the moisture-permeable floor topping.

2304.12.2.6 Ventilation beneath balcony or elevated walking surfaces. Enclosed framing in exterior balconies and elevated walking surfaces that are exposed to rain, snow or drainage from irrigation shall be provided with openings that provide a net free cross-ventilation area not less than 1/150 of the area of each separate space.

2304.12.3 Wood in contact with the ground or fresh water. Wood used in contact with exposed earth shall be naturally durable for both decay and termite resistance or preservative treated in accordance with AWPA U1 for soil or fresh water use.

Exception: Untreated wood is permitted where such wood is continuously and entirely below the ground-water level or submerged in fresh water.

2304.12.3.1 Posts or columns. Posts and columns that are supporting permanent structures and embedded in concrete that is exposed to the weather or in direct contact with the earth shall be of preservative-treated wood.

2304.12.4 Termite protection. In geographical areas where hazard of termite damage is known to be very heavy, wood floor framing in the locations specified in Section 2304.12.1 & 2304.12.2 and exposed framing of exterior decks or balconies shall be of naturally
[2304.11.7] **2304.12.5 Wood used in retaining walls and cribs.** Wood installed in retaining or crib walls shall be preservative treated in accordance with AWPA U1 [[Commodity Specifications A or F]] for soil and fresh water use.

[2304.11.8] **2304.12.6 Attic ventilation.** For attic ventilation, see Section 1203.2.

[2304.11.9] **2304.12.7 Under-floor ventilation (crawl space).** For under-floor ventilation (crawl space), see Section [1203.3] 1203.4.

[2304.11.10] **Firecutting.** The ends of wood beams, joists and rafters resting on masonry or concrete walls shall be firecut to a bevel of 3 inches (76 mm) in depth.

[2304.11.11] **2304.12.8 Debris.** All loose wood and debris and all wood forms shall be removed from spaces under the building. All stump and roots shall be grubbed to a minimum depth of 12 inches (305 mm).

[2304.12] **2304.13 Long-term loading.** Wood members supporting concrete, masonry or similar materials shall be checked for the effects of long-term loading using the provisions of the [AF&PA NDS] ANSI/AWC NDS. The total deflection, including the effects of long-term loading, shall be limited in accordance with Section 1604.3.1 for these supported materials.

**Exception:** Horizontal wood members supporting masonry or concrete nonstructural floor or roof surfacing not more than 4 inches (102 mm) thick need not be checked for long-term loading.

**SECTION BC 2305**

**GENERAL DESIGN REQUIREMENTS FOR LATERAL FORCE-RESISTING SYSTEMS**

2305.1 **General.** Structures using [wood] wood-frame shear walls [and] or wood-frame diaphragms to resist wind, seismic [and] or other lateral loads shall be designed and constructed in accordance with [AF&PA] AWC SDPWS and the applicable provisions of Sections 2305, 2306 and 2307.

2305.1.1 **Openings in shear panels.** Openings in shear panels that materially affect their strength shall be detailed on the plans[.] and shall have their edges adequately reinforced to transfer all shearing stresses.

2305.2 **Diaphragm deflection.** The deflection [(\(\Delta\))] of wood-frame diaphragms shall be determined in accordance with AWC SDPWS. The deflection \((\Delta_{\text{diw}})\) of a blocked wood structural panel diaphragm uniformly fastened throughout with staples is permitted to be calculated [by using the following equation] in accordance with Equation 23-1. If not uniformly fastened, the constant 0.188 (For SI: \(1/1627\)) in the third term shall be modified [accordingly] by an approved method.

\[
\Delta = \frac{5vl^2}{8EAd} + \frac{vL}{4G} + 0.188Le_n + \frac{\sum (\Delta_cX)}{2b}
\]  
(Equation 23-1)
For SI:

$$\Delta = \frac{0.052vL^2}{EA} + \frac{vL}{4G} + \frac{Le_n}{1627} + \frac{\Sigma (x \Delta_c X)}{2b}$$

$$\Delta_{dia} = \frac{5vL^3}{8EAW} + \frac{vL}{4G} + 0.188Le_n + \frac{\Sigma (x \Delta_c)}{2W}$$

For SI:

$$\Delta_{dia} = \frac{0.052vL^3}{EAW} + \frac{vL}{4G} + \frac{Le_n}{1627} + \frac{\Sigma (x \Delta_c)}{2W}$$

where:

- \(A\) = Area of chord cross section, in square inches (mm²).
- \([B= Diaphragm width, in feet (mm).]\)
- \(E\) = Elastic modulus of diaphragm chords, in pounds per square inch (N/mm²).
- \(e_n\) = Staple deformation slip, in inches (mm). [See Table 2305.2(1)] (See Table 2305.2(1)).
- \(Gt\) = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width of or depth. [See Table 2305.2(2)] (See Table 2305.2(2)).
- \(L\) = Diaphragm length (dimension perpendicular to the direction of the applied load), in feet (mm).
- \(v\) = Maximum shear due to design loads in the direction under consideration, in pounds per linear foot (plf) (N/mm). Induced unit shear in pounds per linear foot (plf) (N/mm).
- \([\Delta= The calculated deflection, in inches (mm).]\)
- \([\Sigma(\Delta_c X)\) = Sum of individual chord splice slip values on both sides of the diaphragm, each multiplied by its distance to the nearest support.]
- \(W\) = Diaphragm width (in the direction of applied force, in feet (mm)).
- \(x\) = Distance from chord splice to nearest support, in feet (mm).
- \(\Delta_c\) = Diaphragm chord splice slip at the induced unit shear, in inches (mm).
- \(\Delta_{dia}\) = Maximum mid-span diaphragm deflection determined by elastic analysis, in inches (mm).

a. Apply [Applies] applies to plywood with five or more layers; for five-ply | Applies | plywood with three layers, use values for four ply.
2305.3 Shear wall deflection. The deflection \((\Delta)\) of wood-frame shear walls shall be determined in accordance with AWC SDPWS. The deflection \((\Delta_{sw})\) of a blocked wood structural panel shear wall uniformly fastened throughout with staples is permitted to be calculated by the use of the following equation in accordance with Equation 23-2.

\[
[\Delta = \frac{8v\phi^2}{EAb} + \frac{vh}{Gt} + 0.75he_n + \frac{d_a r}{b}]
\]

[For SI: \(\Delta = \frac{v\phi^2}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{407.6} + \frac{d_a r}{b}\)]

\[
\Delta_{sw} = \frac{8v\phi^3}{EAb} + \frac{vh}{4Gt} + 0.75he_n + \frac{d_a h}{b}
\]

For SI: \(\frac{v\phi^3}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{407.6} + \frac{d_a h}{b}\)

where:

- \(A\) = Area of [boundary element] end-post cross section in square inches (mm²) [vertical member at shear wall boundary].
- \(b\) = [Wall width] Shear wall length, in feet (mm).
- \(d_a\) = [Vertical] Total vertical elongation of [overturning] wall anchorage system (including fastener slip, device elongation, etc.) rod elongation at the [design shear load] induced unit shear in the shear wall.\(v\).
- \(E\) = [Elastic modulus of boundary element (vertical member at shear wall boundary)] Modulus of elasticity of end posts, in pounds per square inch (N/mm²).
- \(e_n\) = Staple [deformation] slip, in inches (mm)[\%] [See Table 2305.2(1)] (See Table 2305.2(1)).
- \(Gt\) = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width [of] or depth[\%] [See Table 2305.2(2)] (See Table 2305.2(2)).
- \(h\) = [Wall] Shear wall height, in feet (mm).
- \(v\) = [Maximum shear due to design loads at the top of the wall] Induced unit shear, in pounds per linear foot (plf) (N/mm).

\([\Delta = \] \(\Delta_{sw} = \) [The calculated deflection] Maximum shear wall deflection determined by elastic analysis, in inches (mm).
SECTION BC 2306
ALLOWABLE STRESS DESIGN

2306.1 Allowable stress design. The [structural analysis] design and construction of wood elements in structures using allowable stress design shall be in accordance with the following applicable standards:

**American [Forest & Paper Association] Wood Council.**

ANSI/AWC NDS National Design Specification for Wood Construction
ANSI/AWC SDPWS Special Design Provisions for Wind and Seismic

[American Institute of Timber Construction.]

AITC 104________Typical Construction Details
AITC 110________Standard Appearance Grades for Structural Glued Laminated Timber
AITC 113________Standard for Dimensions of Structural Glued Laminated Timber
AITC 117________Standard Specifications for Structural Glued Laminated Timber of Softwood Species
AITC 119________Standard Specifications for Structural Glued Laminated Timber of Hardwood Species

[ANSI/AITC A190.1 Structural Glued Laminated Timber]

[AITC 200________Inspection Manual]

**American Society of Agricultural and Biological Engineers.**

ASABE EP [486.4] 486.2 Shallow Post Foundation Design
ASABE EP 559.1 Design Requirements and Bending Properties for Mechanically Laminated [Columns] Wood Assemblies

**APA—The Engineered Wood Association.**

ANSI 117________Standard Specifications for Structural Glued Laminated Timber of Softwood Species
ANSI A190.1________Structural Glued Laminated Timber

Panel Design Specification

- Plywood Design Specification Supplement 1 - Design & Fabrication of Plywood Curved Panel
- Plywood Design Specification Supplement 2 - Design & Fabrication of Glued Plywood-lumber Beams
- Plywood Design Specification Supplement 3 - Design & Fabrication of Plywood Stressed-skin Panels
2306.1.1 Joists and rafters. The design of rafter spans is permitted to be in accordance with the [AF&PA Span Tables for Joists and Rafters] AWC STJR.

2306.1.2 Plank and beam flooring. The design of plank and beam flooring is permitted to be in accordance with the [AF&PA] AWC Wood Construction Data No. 4.

2306.1.3 Treated wood stress adjustments. The allowable unit stresses for preservative-treated wood [need no adjustment] shall be adjusted for treatment[, but are subject to other adjustments. The allowable unit stresses for fire retardant treated wood, including fastener values, shall be developed from an approved method of investigation that considers the effects of anticipated temperature and humidity to which the fire retardant treated wood will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.] in accordance with the ANSI/AWC NDS.

The allowable unit stresses for fire-retardant-treated wood, including fastener values, shall be developed from an approved method of investigation that considers the effects of anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.
2306.1.4 Lumber decking. The capacity of lumber decking arranged according to the patterns described in Section [2304.8.2] 2304.9.2 shall be the lesser of the capacities determined for flexure and deflection according to the formulas in Table 2306.1.4.

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.

a. For framing of other species: (1) Find specific gravity for species of framing lumber in [AF&PA NDS ANSI/AWC NDS]. (2) For staples, find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. (3) For nails, find shear value from table above for nail size of actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor = (1 – (0.5 – SG)), where SG = Specific gravity of the framing lumber. This adjustment factor shall not be greater than 1.

b. Fastening along intermediate framing members: Space fasteners at a maximum of not greater than 12 inches on center, except 6 inches on center for spans greater than 32 inches.

c. Panels conforming to PS 1 or PS 2.

d. This table gives shear values for Cases 1 and 2 as shown in Table [2306.2.1(1)] [2306.2(1)]. The values shown are applicable to Cases 3, 4, 5 and 6 as shown in Table [2306.2.1(1)] [2306.2(1)], providing fasteners at all continuous panel edges are spaced in accordance with the boundary fastener spacing.

e. The minimum nominal depth of framing members shall be 3 inches nominal. The minimum nominal width of framing members not located at boundaries or adjoining panel edges shall be 2 inches.

f. Staples shall have a minimum crown width of 7/16 inch, and shall be installed with their crowns parallel to the long dimension of the framing members.

g. [High load] Diaphragms shall be subject to special inspection in accordance with Section [1704.6.1] [1705.5.1].

h. For shear loads of normal or permanent load duration as defined by the [AF&PA NDS ANSI/AWC NDS], the values in the table above shall be multiplied by 0.63 or 0.56, respectively.
2306.2.2 Single diagonally sheathed lumber diaphragms. Single diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS.

2306.2.3 Double diagonally sheathed lumber diaphragms. Double diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS.

2306.2.4 2306.2.1 Gypsum board diaphragm ceilings. Gypsum board diaphragm ceilings shall be in accordance with Section 2508.5.

2306.3 [Wood structural panel] Wood-frame shear walls. Wood-frame shear walls shall be designed and constructed in accordance with AF&PA SDPWS and AWC SDPWS. Where panels are fastened to framing members with staples, requirements and limitations of AWC SDPWS[...Wood structural panel shear walls are permitted to resist horizontal forces using the allowable capacities] shall be met and the allowable shear values set forth in Table [2306.3-Allowable capacities in Table 2306.3] 2306.3(1), 2306.3(2) or 2306.3(3) shall be permitted. The allowable shear values in Tables 2306.3(1) and 2306.3(2) are permitted to be increased 40 percent for wind design. Panels complying with ANSI/APA PRP-210 shall be permitted to use design values for Plywood Siding in the AWC SDPWS.

For SI, 1 inch = 25.4 mm, 1 pound per linear foot = 14.5939 N/m.

a. For framing of other species: (1) Find specific gravity for species of lumber in [AFPA/ANSI/AWC NDS]. (2) For staples, find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. (3) For nails, find shear values from table above for nail size for actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor: \( \frac{1}{1 + SG} \), where SG = Specific Gravity of the framing lumber. This adjustment factor shall not be greater than 1.

b. Panel edges backed with 2-inch nominal or wider framing. Install panels either horizontally or vertically. Space fasteners maximum 6 inches on center along intermediate framing members for 1/8-inch and 1/16-inch panels installed on studs spaced 24 inches on center. For other conditions and panel thickness, space fasteners maximum 12 inches on center on intermediate supports.

c. 1/8-inch panel thickness or siding with a span rating of 16 inches on center is the minimum recommended where applied directly to framing as exterior siding. For grooved panel siding, the nominal panel thickness is the thickness of the panel measured at the point of nailing. Where grooved panel siding is used, the grooved faces shall be nailable for maximum spacing of 24 inches on center along intermediate framing members.

d. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where panel edge nailing is specified at 2 inches on center or less.

[Additional notes and conditions for specific cases, such as values applying to all veneer plywood, thickness at point of fastening on panel edges, and where panels are applied on both faces of a wall and nailing spacing is less than 6 inches (in) on center on either side, panel joints shall be offset to fall on different framing members (1/8-inch or framing shall be 3 (in) nominal or thicker at adjoining panel edges and nails at all panel edges shall be staggered).]

Notes:
- Values apply to all veneer plywood. Thickness at point of fastening on panel edges governs shear values.
- Where panels are applied on both faces of a wall and nailing spacing is less than 6 inches (in) on center on either side, panel joints shall be offset to fall on different framing members (1/8-inch or framing shall be 3 (in) nominal or thicker at adjoining panel edges and nails at all panel edges shall be staggered).
For shear loads of normal or permanent load duration as defined by the [AF&PA NDS] ANSI/AWC NDS, the values in the table above shall be multiplied by 0.63 or 0.56, respectively.

[2306.4 Lumber sheathed shear walls.] Single and double diagonally sheathed lumber shear walls shall be designed and constructed in accordance with AF&PA SDPWS.

[2306.5 Particleboard shear walls.] Particleboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Particleboard shear walls shall be permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.5. Allowable capacities in Table 2306.5 are permitted to be increased 40 percent for wind design. Particleboard shall not be used to resist seismic forces in structures assigned to Seismic Design Category D.

[2306.6 Fiberboard shear walls.] Fiberboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Fiberboard shear walls are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.6. Allowable capacities in Table 2306.6 are permitted to be increased 40 percent for wind design. Fiberboard shall not be used to resist seismic forces in structures assigned to Seismic Design Category D.

For SI: 1 inch = 25.4 mm, 1 pound per linear foot = 14.5939 N/m.

* a. Fiberboard sheathing shall not be used to brace concrete or masonry walls.

b. Panel edges shall be backed with 2-inch or wider framing of Douglas fir-larch or Southern pine. For framing of other species: (1) Find specific gravity for species of framing lumber in [AF&PA NDS] ANSI/AWC NDS. (2) For staples, multiply the shear value from the table above by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. (3) For nails, multiply the shear value from the table above by the following adjustment factor: specific gravity adjustment factor = 11 – (0.5 – SG), where SG = Specific gravity of the framing lumber.

c. Values shown are for fiberboard sheathing on one side only with long panel dimension either parallel or perpendicular to studs.

d. Fastener shall be spaced 6 inches on center along intermediate framing members.

e. Values are not permitted in Seismic Design Category D [AF&PA NDS].

f. Staple length shall not be less than 1-1/2 inches for 1/2-inch sheathing or 1-3/4 inches for 3/4-inch sheathing.

[2306.7 Shear walls sheathed with other materials.] Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing or gypsum board shall be designed and constructed in accordance with AF&PA SDPWS. Shear walls sheathed with these materials are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.7.]

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per foot = 14.5939 N/m.

- These shear walls shall not be used to resist loads imposed by masonry or concrete walls (see Section 4.1.5 of ASCE 7.1). Values shown are for short-term loading due to wind or seismic loading. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7. Values shown shall be reduced 25 percent for normal loading.

- Applies to fastening at studs, top and bottom plates and blocking.

- Alternate fasteners are permitted to be used if their dimensions are not less than the specified dimensions. Drywall screws are permitted to substitute for the \(5d\) cooler \(1/2\) \(\times\) \(\times\) head, \(1/2\) \(\times\) galv. staple, \(1/2\) \(\times\) galv. staple, \(1/2\) \(\times\) head, \(1/2\) \(\times\) long. No. 16 gage galv. staple, \(1/2\) \(\times\) long. No. 16 gage galv. staple, \(1/2\) \(\times\) long. No. 16 gage galv. staple, \(1/2\) \(\times\) long. No. 16 gage galv. staple, \(1/2\) \(\times\) long.

- For property of cooler nails, see ASTM C 514.

- Except as noted, shear values are based on a maximum framing spacing of 16 inches on center.

- Maximum framing spacing of 24 inches on center.

- All edges are blocked, and edge fastening is provided at all supports and all panel edges.

- Fastener spacing at the edges; second number denotes fastener spacing at intermediate framing members.
1595

Staples shall have a minimum crown width of 7/16 inch, measured outside the legs, and shall be installed with their crowns parallel to the long dimension of the framing members.

Staples for the attachment of gypsum lath and woven-wire lath shall have a minimum crown width of 3/4 inch, measured outside the legs.

SECTION BC 2307
LOAD AND RESISTANCE FACTOR DESIGN

2307.1 Load and resistance factor design. The [structural analysis] design and construction of wood elements and structures using load and resistance factor design [(LRFD) methods] shall be in accordance with [AF&PA NDS] ANSI/AWC NDS and [AF&PA SDPWS] AWC SDPWS.

2307.1.1 Wood structural panel shear walls. In Seismic Design Category D, where shear design values exceed 490 pounds per foot (7154 N/m), all framing members receiving edge nailing from abutting panels shall not be less than a single 3-inch (76 mm) nominal member or two 2-inch (51 mm) nominal members fastened together in accordance with AF&PA NDS to transfer the design shear value between framing members. Wood structural panel joint and sill plate nailing shall be staggered at all panel edges. See Sections 4.3.6.1 and 4.3.6.4.3 of AF&PA SDPWS for sill plate size and anchorage requirements.

SECTION BC 2308
CONVENTIONAL LIGHT-FRAME CONSTRUCTION

2308.1 General. The requirements of this section are intended for conventional light-frame construction. Other construction methods are permitted to be used provided a satisfactory design is submitted showing compliance with other provisions of this code. Interior nonload-bearing partitions, ceilings and curtain walls of conventional light-frame construction are not subject to the limitations of this section. Alternatively, compliance with AF&PA WFCM shall be permitted subject to the limitations therein and the limitations of this code Section 2308.2.

2308.1.1 Portions exceeding limitations of conventional light-frame construction. When portions of a building of otherwise conventional light-frame construction exceed the limits of Section 2308.2, those portions and the supporting load path shall be designed in accordance with accepted engineering practice and the provisions of this code. For the purposes of this section, the term “portions” shall mean parts of buildings containing volume and area such as a room or a series of rooms. The extent of such design need only demonstrate compliance of the nonconventional light-framed elements with other applicable provisions of this code and shall be compatible with the performance of the conventional light-framed system.

2308.1.2 Connectors and fasteners. Connectors and fasteners used in conventional light-frame construction shall comply with the requirements of Section 2304.10.

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of Section 2308 for conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12: 2308.2.1 through 2308.2.6.

1. Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings in Seismic Design Category D as determined in Section 1613, cripple stud walls shall be considered to be a story.
Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

2308.2.1 Stories. Structures of conventional light-frame construction shall be limited in story height in accordance with Table 2308.2.1.

<table>
<thead>
<tr>
<th>SEISMIC DESIGN CATEGORY</th>
<th>ALLOWABLE STORY ABOVE GRADE PLANE</th>

</thead>
<tbody>
<tr>
<td>A and B</td>
<td>Three stories</td>
</tr>
<tr>
<td>C</td>
<td>Two stories</td>
</tr>
<tr>
<td>D</td>
<td>One story</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm.

a. For the purposes of this section, for buildings assigned to Seismic Design Category D cripple walls shall be considered to be a story unless cripple walls are solid blocked and do not exceed 14 inches in height.

[2.−] 2308.2.2 Allowable floor-to-floor height. Maximum floor-to-floor height shall not exceed 11 feet, 7 inches (3531 mm). Exterior bearing wall heights and interior braced wall heights shall not exceed a stud height of 10 feet (3048 mm).

[3.−] 2308.2.3 Allowable loads. Loads shall be in accordance with Chapter 16 and shall not exceed the following:

1. Average dead loads shall not exceed 15 psf (718 N/m²) for combined roof and ceiling, exterior walls, floors and partitions.

Exceptions:

1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, Section 2308.6.10, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m²) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.

2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.

[3.−] 2. Live loads shall not exceed 40 psf (1916 N/m²) for floors.

Exception: Live loads for concrete slab-on-ground floors in Risk Categories I and II shall be not more than 125 psf.

[3.3.−] Ground snow loads shall not exceed 50 psf (2395 N/m²).

[4.−] Wind speeds shall not exceed 100 miles per hour (mph)(44 m/s) (3-second gust).

Exception: Wind speeds shall not exceed 110 mph (48.4 m/s) (3-second gust) for buildings in Exposure Category B that are not located in a hurricane-prone region.

2308.2.4 Basic design wind speed. The basic design wind speed, V, in miles per hour for determination of wind loads shall be as set forth in Table 1609.3. Values are ultimate design
second gust wind speeds in miles per hour at 33 feet (10 058 mm) above ground Exposure Category C.

[5.–Roof] 2308.2.5 Allowable roof span. Ceiling joist and rafter framing constructed in accordance with Section 2308.7 and trusses [and rafters] shall not span more than 40 feet (12 192 mm) between points of vertical support. A ridge board in accordance with Section 2308.7 or 2308.7.3.1 shall not be considered a vertical support.

[6.–] 2308.2.6 Risk category limitation. The use of the provisions for conventional light-frame construction in this section shall not be permitted for [Occupancy] Risk Category IV buildings assigned to Seismic Design Category B, C, or D, as determined in Section 1613.

[7. Conventional light-frame construction is limited in irregular structures in Seismic Design Category D, as specified in Section 2308.12.6.]

[2308.2.1 Basic wind speed greater than 100 mph (3-second gust). Where the basic wind speed exceeds 100 mph (3-second gust), the provisions of either AF&PA WFCM or ICC 600 are permitted to be used.]

[2308.2.2 Buildings in Seismic Design Category B, C, or D. Buildings of conventional light-frame construction in Seismic Design Category B or C, as determined in Section 1613, shall comply with the additional requirements in Section 2308.11. Buildings of conventional light-frame construction in Seismic Design Category D, as determined in Section 1613, shall comply with the additional requirements in Section 2308.12.]

[2308.3 Braced wall lines. Buildings shall be provided with exterior and interior braced wall lines as described in Section 2308.9.3 and installed in accordance with Sections 2308.3.1 through 2308.3.4.]

[2308.3.1 Spacing. Spacing of braced wall lines shall not exceed 35 feet (10 668 mm) o.c. in both the longitudinal and transverse directions in each story.]

[2308.3.2 Braced wall line connections. Wind and seismic lateral forces shall be transferred from the roofs and floors to braced wall lines and from the braced wall lines in upper stories to the braced wall lines in the story below in accordance with this section. Braced wall line top plates shall be fastened to joists, rafters or full-depth blocking above in accordance with Table 2304.9.1, Items 11, 12, 15 or 19 as applicable based on the orientation of the joists or rafters to the braced wall line. Braced wall line bottom plates shall be connected to joists or blocking below in accordance with Table 2304.9.1, Item 6, or to foundations in accordance with Section 2308.3.3. At exterior gable end walls, braced wall panel sheathing in the top story shall be extended and fastened to roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).]

[Exception: Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other approved methods providing equivalent lateral force transfer. Blocking shall be a minimum of 2 inches (51 mm) nominal in thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1, Item 11.]
[2308.3.3 Sill anchorage. Where foundations are required by Section 2308.3.4, braced wall line sills shall be anchored to concrete or masonry foundations. Such anchorage shall conform to the requirements of Section 2308.6, except that such anchors shall be spaced at not more than 4 feet (1219 mm) o.c. for structures over two stories above grade plane. The anchors shall be distributed along the length of the braced wall line. Other anchorage devices having equivalent capacity are permitted.]

[2308.3.3.1 Anchorage to all-wood foundations. Where all-wood foundations are used, the force transfer from the braced wall lines shall be determined based on calculation and shall have a capacity greater than or equal to the connections required by Section 2308.3.3.]

[2308.3.4 Braced wall line support. Braced wall lines shall be supported by continuous foundations.]

[Exception: For structures with a maximum plan dimension not over 50 feet (15 240 mm), continuous foundations are required at exterior walls only.]

[2308.4 Design of elements. Combining of engineered elements or systems and conventionally specified elements or systems is permitted subject to the following limits:]

[2308.4.1 Elements exceeding limitations of conventional construction. When a building of otherwise conventional construction contains structural elements exceeding the limits of Section 2308.2, these elements and the supporting load path shall be designed in accordance with accepted engineering practice and the provisions of this code.]

[2308.4.2 Structural elements or systems not described herein. When a building of otherwise conventional construction contains structural elements or systems not described in Section 2308, these elements or systems shall be designed in accordance with accepted engineering practice and the provisions of this code. The extent of such design need only demonstrate compliance of the nonconventional elements with other applicable provisions of this code and shall be compatible with the performance of the conventionally framed system.]

[2308.5 Connections and fasteners. Connections and fasteners used in conventional construction shall comply with the requirements of Section 2304.9.]

2308.3 Foundations and footings. Foundations and footings shall be designed and constructed in accordance with Chapter 18. Connections to foundations and footings shall comply with this section.

[2308.6] 2308.3.1 Foundation plates or sills. Foundation plates or sills resting on concrete or masonry foundations shall comply with Section 2304.3.1. Foundation plates or sills shall be bolted or anchored to the foundation with not less than ½-inch-diameter (12.7 mm) steel bolts or approved anchors suitable for use with pressure-treated plates spaced to provide equivalent anchorage as the steel bolts. Bolts shall be embedded [at least] not less than 7 inches (178 mm) into concrete or masonry.[, and] The bolts shall be located in the middle third of the width of the plate. Bolts shall be spaced not more than 6 feet (1829 mm) [apart. There] on center and there shall be [a minimum of] not less than two bolts or anchor straps per piece with one bolt or anchor strap located not more than 12 inches (305 mm) or less than 4 inches (102 mm) from each end of each piece. Bolts in sill plates of braced
Wall lines in structures over two stories above grade shall be spaced not more than 4 feet (1219 mm) on center. A properly sized nut and washer shall be tightened on each bolt to the plate.

**2308.3.2 Braced wall line sill plate anchorage in Seismic Design Category D.** Sill plates along braced wall lines in buildings assigned to Seismic Design Category D shall be anchored with anchor bolts with steel plate washers between the foundation sill plate and the nut, or approved anchor straps load-rated in accordance with Section 2304.10.3. Such washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to $\frac{3}{16}$ inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1¾ inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut. All steel shall be of appropriate corrosion resistance when in contact with pressure-treated wood.

**2308.4 Floor framing.** Floor framing shall comply with this section.

[**2308.7**] **2308.4.1 Girders.** Girders for single-story construction or girders supporting loads from a single floor shall be not less than 4 inches by 6 inches (102 mm by 152 mm) for spans 6 feet (1829 mm) or less, provided that girders are spaced not more than 8 feet (2438 mm) on center. [Spans for built-up 2-inch (51 mm) girders shall be in accordance with Table 2308.9.5 or 2308.9.6.] Other girders shall be designed to support the loads specified in this code. Girder end joints shall occur over supports. [Where a girder is spliced over a support, an adequate tie shall be provided. The ends of beams or girders supported on masonry or concrete shall not have less than 3 inches (76 mm) of bearing.]

Where a girder is spliced over a support, an adequate tie shall be provided. The ends of beams or girders supported on masonry or concrete shall not have less than 3 inches (76 mm) of bearing.

**2308.4.1.1 Allowable girder spans.** The allowable spans of girders that are fabricated of dimension lumber shall not exceed the values set forth in Table 2308.4.1.1(1) or 2308.4.1.1(2).

For SI, 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.
b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine-Fir.
c. Use for cases in which the roof live load is equal to or less than 20 psf.
d. Values are for 30 psf ground snow load.
For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

a. Spans are given in feet and inches.
b. Spans are based on minimum design properties for No. 2 grade lumber of Douglas Fir-Larch, Hem-Fir, Southern Pine and Spruce-Pine Fir.
c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.
d. NJ = Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by a approved framing anchor attached to the full-height wall stud and to the header.

e. Spans are calculated assuming the top of the header or girder is laterally braced by perpendicular framing. Where the top of the header or girder is not laterally braced (for example, cripple studs bearing on the header), tabulated spans for headers consisting of 2 x 8, 2 x 10, or 2 x 12 sizes shall be multiplied by 0.70 or the header or girder shall be designed.

[2308.8] **2308.4.2** Floor joists. [Span for floor joists shall be in accordance with Table 2308.8(1) or 2308.8(2). For other grades and or species, refer to the AF&PA Span Tables for Joists and Rafters.] Floor joists shall comply with this section.

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kPa.

Note: Check sources for availability of lumber in lengths greater than 20 feet.

a. End bearing length shall be increased to 2 inches.

**[2308.8.1]** 2308.4.2.2 Bearing. [Except where] The ends of each joist shall have not less than 1½ inches (38 mm) of bearing on wood or metal, or not less than 3 inches (76 mm) on masonry, except where supported on a 1-inch by 4-inch [(25.4 mm by 102 mm)] (25 mm by 102 mm) ribbon strip and nailed to the adjoining stud [the ends of each joist shall not have less than 1½ inches (38 mm) of bearing on wood or metal, or less than 3 inches (76 mm) on masonry].

**[2308.8.2]** 2308.4.2.3 Framing details. Joists shall be supported laterally at the ends and at each support by solid blocking except where the ends of the joists are nailed to a header, band or rim joist or to an adjoining stud or by other means. Solid blocking shall be not (be) less than 2 inches [(51 mm)] (51 mm) in thickness and the full depth of the joist. [Notches on the ends of joists shall not exceed one-fourth the hoist depth. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist, and the diameter of any such hole shall not exceed one-third the depth of the joist. Notches in the top or bottom of joists shall not exceed one-sixth the depth and shall not be located in the middle third of the span.] Joist framing from opposite sides of a beam, girder or partition shall be lapped at least 3 inches (76 mm) or the opposing joists shall be tied together in an approved manner. Joists framing into the side of a wood girder shall be supported by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

**2308.4.2.4 Notches and holes.** Notches on the ends of joists shall not exceed one-fourth the joist depth. Notches in the top or bottom of joists shall not exceed one-sixth the depth, shall not be longer than one-third the depth and shall not be located in the middle third of the span. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist and the diameter of any such hole shall not exceed one-third the depth of the joist. Holes bored in the middle third of the span shall be located at the center of the joist depth. Clear distance between holes & notches shall be a minimum of 2 inches (51 mm). See Figure 2308.4.2.4.
[2308.8.2.1] **2308.4.3 Engineered wood products.** Engineered wood products shall be installed in accordance with manufacturer’s recommendations. Cuts, notches and holes bored in trusses, structural composite lumber, structural glued-laminated members or I-joists are prohibited except where permitted by the manufacturer’s recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.

[2308.8.3] **2308.4.4 Framing around openings.** Trimmer and header joists shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 4 feet (1219 mm). The ends of header joists more than 6 feet (1829 mm) long shall be supported by framing anchors or joist hangers unless bearing on a beam, partition or wall. Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

**2308.4.4.1 Openings in floor diaphragms in Seismic Design Categories B, C, and D.** Openings in horizontal diaphragms in Seismic Design Categories B, C, and D with a dimension that is greater than 4 feet (1219 mm) shall be constructed with metal ties and blocking in accordance with this section and Figure 2308.4.4.1(1). Metal ties shall be not less than 0.058 inch (1.47 mm) (16 galvanized gage) in thickness by 1½ inches (38 mm) in width and shall have a yield stress not less than 33,000 psi (227 Mpa). Blocking shall extend not less than the dimension of the opening in the direction of the tie and blocking. Ties shall be attached to blocking in accordance with the manufacturer’s instructions but with not less than eight 16d common nails on each side of the header-joist intersection.

Openings in floor diaphragms in Seismic Design Category D shall not have any dimension exceeding 50 percent of the distance between braced wall lines or an area greater than 25 percent of the area between orthogonal pairs of braced wall lines (see Figure 2308.4.4.1(2)); or the portion of the structure containing the opening shall be designed in accordance with
accepted engineering practice to resist the forces specified in Chapter 16, to the extent such irregular opening affects the performance of the conventional framing system.

**FIGURE 2308.4.4.1(1)**
OPENINGS IN FLOOR AND ROOF DIAPHRAGMS

**FIGURE 2308.4.4.1(2)**
OPENING LIMITATIONS FOR FLOOR AND ROOF DIAPHRAGMS

**2308.4.4.2 Vertical offsets in floor diaphragms in Seismic Design Category D.** In Seismic Design Category D, portions of a floor level shall not be vertically offset such that the framing members on either side of the offset cannot be lapped or tied together in an approved manner in accordance with Figure 2308.4.4.2 unless the portion of the structure containing the irregular offset is designed in accordance with accepted engineering practice.

1609
**Exception:** Framing supported directly by foundations need not be lapped or tied directly together.

![Diagram showing floor joists and framing](image)

**FIGURE 2308.4.2**
PORTIONS OF FLOOR LEVEL OFFSET VERTICALLY

[2308.4.4.2] **2308.4.4 Supporting.** Bearing partitions parallel to joists shall be supported on beams, girders, doubled joists, walls or other bearing partitions. Bearing partitions perpendicular to joists shall not be offset from supporting girders, walls or partitions more than the joist depth unless such joists are of sufficient size to carry the additional load.

[2308.4.5] **2308.4.5 Joists supporting bearing partitions.** Bearing partitions parallel to joists shall be supported on beams, girders, doubled joists, walls or other bearing partitions. Bearing partitions perpendicular to joists shall not be offset from supporting girders, walls or partitions more than the joist depth unless such joists are of sufficient size to carry the additional load.

[2308.8.4] **2308.4.6 Lateral support.** Floor, attic, and roof ceiling framing with a nominal depth-to-thickness ratio greater than or equal to 5:1 shall have one edge held in line for the entire span. Where the nominal depth-to-thickness ratio of the framing member exceeds 6:1, there shall be one line of bridging for each 8 feet (2438 mm) of span, unless both edges of the member are held in line. The bridging shall consist of not less than 1-inch by 3-inch (25 mm by 76 mm) lumber, double nailed at each end, or equivalent metal bracing of equal rigidity, full-depth solid blocking or other approved means. A line of bridging shall also be required at supports where equivalent lateral support is not otherwise provided.

[2308.8.5] **2308.4.7 Structural floor sheathing.** Structural floor sheathing shall comply with the provisions of Section 2304.7.1.

[2308.8.6] **2308.4.8 Under-floor ventilation.** For under-floor ventilation, see Section 1203.4.

**2308.4.9 Floor framing supporting braced wall panels.** Where braced wall panels are supported by cantilevered floors or are set back from the floor joist support, the floor framing shall comply with Section 2308.6.7.

**2308.4.10 Anchorage of exterior means of egress components in Seismic Design Category D.** Exterior egress balconies, exterior stairways and ramps and similar means of egress components in structures assigned to Seismic Design Category D shall be positively anchored to the primary structure at not more than 8 feet (2438 mm) on center or shall be designed for lateral forces. Such attachment shall not be accomplished by use of toenails or nails subject to withdrawal.
2308.5 Wall construction. Walls of conventional light-frame construction shall be in accordance with this section.

[2308.9 Wall framing.]

[2308.9.1 Size] 2308.5.1 Stud size, height and spacing. The size, height and spacing of studs shall be in accordance with Table [2308.9.1] 2308.5.1. [except that utility grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls. Studs shall be continuous from a support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.]

Studs shall be continuous from a support at the sole plate to a support at the top plate to resist loads perpendicular to the wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Exception: Jack studs, trimmer studs and cripple studs at openings in walls that comply with Table [2308.9.5], 2308.4.1.1(1) or 2308.4.1.1(2).

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Increases in unsupported height are permitted where justified by an analysis.
b. Utility-grade studs shall not be spaced more than 16 inches on center or support more than a roof and ceiling, or exceed 8 feet in height for exterior walls and load-bearing walls or 10 feet for interior nonload-bearing walls.
c. Utility-grade studs shall not be spaced more than 16 inches on center or support more than a roof and ceiling, or exceed 8 feet in height for exterior walls and load-bearing walls.

d. Support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

[2308.9.2] 2308.5.2 Framing details. Studs shall be placed with their wide dimension perpendicular to the wall. Not less than three studs shall be installed at each corner of an exterior wall.

Exception: Exceptions:

1. In interior nonload-bearing walls and partitions that are not braced wall panels, studs are permitted to be set with the long dimension parallel to the wall.

2. At corners, two studs are permitted, provided that wood spacers or backup cleats of ⅛-inch-thick (9.5 mm) wood structural panel, ⅛-inch (9.5 mm) Type M “Exterior Glue” particleboard, 1-inch-thick (25 mm) lumber or other approved devices that will
serve as an adequate backing for the attachment of facing materials are used. Where fire-resistance ratings or shear values are involved, wood spacers, backup cleats or other devices shall not be used unless specifically approved for such use.

### 2308.5.3 Plates and sills

#### 2308.5.3.1 Bottom plate or sill

Studs shall have full bearing on a plate or sill. Plates or sills shall be not less than 2 inches (51 mm) nominal in thickness and have a width not less than the width of the wall studs.

#### [2308.9.2.1] 2308.5.3.2 Top plates

Bearing and exterior wall stud shall be capped with double top plates installed to provide overlapping at corners and at intersections with other partitions. End joints in double top plates shall be offset [at least] not less than 48 inches (1219 mm), and shall be nailed in accordance with [not less than eight 16d face nails on each side of the joint] Table 2304.10.1. Plates shall be a nominal 2 inches (51 mm) in depth and have a width [at least equal to] not less than the width of the studs.

**Exception:** A single top plate is permitted, provided that the plate is adequately tied at corners and intersecting walls by [at least] not less than the equivalent of a 3-inch by 6-inch (76 mm by 152 mm) by 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by six 8d (2½” × 0.113” (64 mm by 2.87 mm)) box nails or equivalent [provided] on each side of the joint. For the butt-jointed splice between adjacent single top plates, not less than the equivalent of a 3-inch by 12-inch (76 mm by 304 mm) by 0.036-inch-thick (0.914 mm) galvanized steel plate that is nailed to each wall or segment of wall by twelve 8d (2½” × 0.113-inch (64 mm by 2.87 mm)) box nails on each side of the joint shall be required, provided that the rafters, joists or trusses are centered over the studs with a tolerance of [no] not more than 1 inch (25 mm). The top plate shall not be required over headers that are in the same plane and in line with the upper surface of the adjacent top plates and are tied to adjacent wall sections as required for the butt joint splice between adjacent single top plates.

#### [2308.9.2.2 Top plates for studs spaced at 24 inches (610 mm).]

Where bearing studs are spaced at 24-inch (610 mm) intervals [and] top plates are less than two 2-inch by 6-inch (51 mm by 152 mm) or two 3-inch by 4-inch (76 mm by 102 mm) members and [where] the floor joists, floor trusses or roof trusses that they support are spaced at more than 16-inch (406 mm) intervals, such joists or trusses shall bear within 5 inches (127 mm) of the studs beneath or a third plate shall be installed.

#### [2308.9.2.3 Nonbearing] 2308.5.4 Nonload-bearing walls and partitions

In [nonbearing] nonload-bearing walls and partitions[3] that are not part of a braced wall panel, studs shall be spaced not more than [28] 24 inches [(711 mm)] (610 mm) [o.c. and] on center. In interior nonload-bearing walls and partitions, studs are permitted to be set with the long dimension parallel to the wall. Where studs are set with the long dimensions parallel to the wall, use of utility grade lumber or studs exceeding 10 feet (3048 mm) is not permitted. Interior [nonbearing] nonload-bearing partitions shall be capped with [no] not less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking [at least] not less than 16 inches (406 mm) in length.
and equal in size to the plate or by ½-inch by 1½-inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

**[2308.9.2.4 Plates or sills. Studs shall have full bearing on a plate or sill not less than 2 inches (51 mm) in thickness having a width not less than that of the wall studs.]**

**2308.5.5 Openings in walls and partitions.** Openings in exterior and interior walls and partitions shall comply with Sections 2308.5.5.1 through 2308.5.5.3.

**2308.5.5.1 Openings in exterior bearing walls.** Headers shall be provided over each opening in exterior bearing walls. The size and spans in Table 2308.4.1.1(1) are permitted to be used for one- and two-family dwellings. Headers for other buildings shall be designed in accordance with Section 2301.2, Item 1 or 2. Headers shall be of two pieces of nominal 2-inch (51 mm) framing lumber set on edge as permitted by Table 2308.4.1.1(1) and nailed together in accordance with Table 2304.10.1 or of solid lumber of equivalent size.

Wall studs shall support the ends of the header in accordance with Table 2308.4.1.1(1). Each end of a lintel or header shall have a bearing length of not less than 1½ inches (38 mm) for the full width of the lintel.

**[2308.9.3 Bracing.]** Braced wall lines shall consist of braced wall panels that meet the requirements for location, type and amount of bracing as shown in Figure 2308.9.3, specified in Table 2308.9.3(1), and are in line or offset from each other by not more than 4 feet (1219 mm). Braced wall panels shall start not more than 12½ feet (3810 mm) from each end of a braced wall line. Braced wall panels shall be clearly indicated on the plans. Construction of braced wall panels shall be by one of the following methods:

1. Nominal 1-inch by 4-inch (25 mm by 102 mm) continuous diagonal braces let into top and bottom plates and intervening studs, placed at an angle not more than 60 degrees (1.0 rad) or less than 45 degrees (0.79 rad) from the horizontal and attached to the framing in conformance with Table 2304.9.1.

2. Wood boards of ⅝ inch (15.9 mm) net minimum thickness applied diagonally on studs spaced not over 24 inches (610 mm) o.c.

3. Wood structural panel sheathing with a thickness not less than ⅜ inch (9.5 mm) for 16-inch (406 mm) or 24-inch (610 mm) stud spacing in accordance with Tables 2308.9.3(2) and 2308.9.3(3).

4. Fiberboard sheathing panels not less than ½ inch (12.7 mm) thick applied vertically or horizontally on studs spaced not over 16 inches (406 mm) o.c. where installed with fasteners in accordance with Section 2306.6 and Table 2306.6.

5. Gypsum board [sheathing ½ inch thick (12.7 mm) by 4 feet wide (1219 mm) wallboard or veneer base] on studs spaced not over 24 inches (610 mm) o.c. and nailed at 7 inches (178 mm) o.c. with nails as required by Table 2306.7.
6. Particleboard wall sheathing panels where installed in accordance with Table 2308.9.3(4).

7. Portland cement plaster on studs spaced 16 inches (406 mm) o.c. installed in accordance with Section 2510.

8. Hardboard panel siding where installed in accordance with Section 2303.1.6 and Table 2308.9.3(5).

For cripple wall bracing, see Section 2308.9.4.1. For Methods 2, 3, 4, 6, 7 and 8, each panel must be at least 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) apart and covering two stud spaces where studs are spaced 24 inches (610 mm) apart. For Method 5, each panel must be at least 96 inches (2438 mm) in length where applied to one face of a panel and 48 inches (1219 mm) where applied to both faces. All vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the stud except where waived by the installation requirements for the specific sheathing materials. Sole plates shall be nailed to the floor framing and top plates shall be connected to the framing above in accordance with Section 2308.3.2. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the braced wall panels.

**Figure 2308.9.3**
Basic Components of the Lateral Bracing System

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
[2308.9.3.1 Alternative bracing. Any bracing required by Section 2308.9.3 is permitted to be replaced by the following:]

1. In one-story buildings, each panel shall have a length of not less than 2 feet 8 inches (813 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with 7/8-inch minimum thickness (9.5 mm) wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Table 2304.9.1 and blocked at wood structural panel edges. Two anchor bolts installed in accordance with Section 2308.6 shall be provided in each panel. Anchor bolts shall be placed at each panel outside quarter points. Each panel end stud shall have a tie-down device fastened to the foundation, capable of providing an approved uplift capacity of not less than 1,800 pounds (8006 N). The tie-down device shall be installed in accordance with the manufacturer’s recommendations. The panels shall be supported directly on a foundation or on floor framing supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.]

2. In the first story of two-story buildings, each wall panel shall be braced in accordance with Section 2308.9.3.1, Item 1, except that the wood structural panel sheathing shall be provided on both faces, three anchor bolts shall be placed at one-quarter points, and tie-down device uplift capacity shall not be less than 3,000 pounds (13344 N).]

[2308.9.3.2 Alternate bracing wall panel adjacent to a door or window opening. Any bracing required by Section 2308.9.3 is permitted to be replaced by the following when used adjacent to a door or window opening with a full-length header:]

1. In one-story buildings, each panel shall have a length of not less than 16 inches (406 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with a single layer of 7/8-inch (9.5 mm) minimum thickness wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Figure 2308.9.3.2. The wood structural panel sheathing shall extend up over the solid sawn or glued-laminated header and shall be nailed in accordance with Figure 2308.9.3.2. A built-up header consisting of at least two 2 × 12s and fastened in accordance with Item 24 of Table 2304.9.1 shall be permitted to be used. A spacer, if used, shall be placed on the side of the built-up beam opposite the wood structural panel sheathing. The header shall extend between the inside faces of the first full-length outer studs of each panel. The clear span of the header between the inner studs of each panel shall be not less than 6 feet (1829 mm) and not more than 18 feet (5486 mm) in length. A strap with an uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to.
the inner studs opposite the sheathing. One anchor bolt not less than \( \frac{5}{8} \) inch (15.9 mm) diameter and installed in accordance with Section 2308.6 shall be provided in the center of each sill plate. The studs at each end of the panel shall have a tie-down device fastened to the foundation with an uplift capacity of not less than 4,200 pounds (18,480 N). Where a panel is located on one side of the opening, the header shall extend between the inside face of the first full-length stud of the panel and the bearing studs at the other end of the opening. A strap with an uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to the bearing studs. The bearing studs shall also have a tie-down device fastened to the foundation with an uplift capacity of not less than 1,000 pounds (4400 N). The tie-down devices shall be an embedded strap type, installed in accordance with the manufacturer’s recommendations. The panels shall be supported directly on a foundation that is continuous across the entire length of the braced-wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305-mm by 305-mm) continuous footing or turned-down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned-down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped not less than 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced-wall line.

[2. In the first story of two-story buildings, each wall panel shall be braced in accordance with Item 1 above, except that each panel shall have a length of not less than 24 inches (610 mm).]
[2308.9.4 Cripple walls. Foundation cripple walls shall be framed of studs not less in size than the studding above with a minimum length of 14 inches (356mm), or shall be framed of solid blocking. Where exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional story.]

[2308.9.4.1 Bracing. For the purposes of this section, cripple walls having a stud height exceeding 14 inches (356mm) shall be considered a story and shall be braced in accordance with Table 2308.9.3(1) for Seismic Design Category A, B or C. See Section 2308.12.4 for Seismic Design Category D.]

[2308.9.4.2 Nailing of bracing. Spacing of edge nailing for required wall bracing shall not exceed 6 inches (152 mm) o.c. along the foundation plate and the top plate of the cripple wall. Nail size, nail spacing for field nailing and more restrictive boundary nailing requirements shall be as required elsewhere in the code for the specific bracing material used.]

[2308.9.5 Openings in exterior walls.]

</table>

**Notes:**
- A: Spans are given in feet and inches (ft. - in.).
- B: Tabulated values are for No. 2-grade lumber.
- C: Building width is measured perpendicular to the edge. For widths between those shown, spans are permitted to be interpolated.
- D: Nj: Number of jack-end stud required to support each end. Where the number of required jack-end stud equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and in the header.
- E: Use 30 pounds per square foot ground snow load for cases in which ground snow load is less than 30 pounds per square foot and the roof live load is equal to or less than 20 pounds per square foot. |
[2308.9.5.1 Headers. Headers shall be provided over each opening in exterior bearing walls. The spans in Table 2308.9.5 are permitted to be used for one- and two-family dwellings. Headers for other buildings shall be designed in accordance with Section 2301.2, Item 1 or 2. Headers shall be of two pieces of nominal 2-inch (51 mm) framing lumber set on edge as permitted by Table 2308.9.5 and nailed together in accordance with Table 2304.9.1 or of solid lumber of equivalent size.]

[2308.9.5.2 Header support. Wall studs shall support the ends of the header in accordance with Table 2308.9.5. Each end of a lintel or header shall have a length of bearing of not less than 1½ inches (38 mm) for the full width of the lintel.]

[2308.9.6] 2308.5.5.2 Openings in interior bearing partitions. Headers shall be provided over each opening in interior bearing partitions as required in Section 2308.9.5. The spans in Table [2308.9.6] 2308.4.1.1(2) are permitted to be used. Wall studs shall support the ends of the header in accordance with Table [2308.9.5] 2308.4.1.1(1) or [2308.9.6] 2308.4.1.1(2), as [appropriate] applicable.

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Spans are given in feet and inches (9 in.

b. Tabulated values are for No. 2 grade lumber.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. Nj Number of jack studs required to support each end. Where the number of required jack studs equals one, the headers are permitted to be supported by an approved framing anchor attached to the full height wall stud and in the header.

[2308.9.7] 2308.5.5.3 Openings in interior [nonbearing] nonload-bearing partitions. Openings in [nonbearing] nonload-bearing partitions are permitted to be framed with single studs and headers. Each end of a lintel or header shall have a [length of] bearing length of not less than 1½ inches (38 mm) for the full width of the lintel.
2308.9.8 Pipes in walls. Stud partitions containing plumbing, heating or other pipes shall be so framed and the joists underneath so spaced as to give proper clearance for the piping. Where a partition containing such piping runs parallel to the floor joists, the joists underneath such partitions shall be doubled and spaced to permit the passage of such pipes and shall be bridged. Where plumbing, heating or other pipes are placed in or partly in a partition, necessitating the cutting of the soles or plates, a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1½ inches (38 mm) wide shall be fastened to each plate across and to each side of the opening with not less than six 16d nails.

2308.5.6 Cripple walls. Foundation cripple walls shall be framed of studs that are not less than the size of the studding above and not less than 14 inches (356 mm) in length, or shall be framed of solid blocking. Where exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional story. See Section 2308.6.6 for cripple wall bracing.

2308.5.7 Bridging. Unless covered by interior or exterior wall coverings or sheathing meeting the minimum requirements of this code, stud partitions or walls with studs having a height-to-least-thickness ratio exceeding 50 shall have bridging that is not less than 2 inches (51 mm) in thickness and of the same width as the studs fitted snugly and nailed thereto to provide adequate lateral support. Bridging shall be placed in every stud cavity and at a frequency such that no stud so braced shall have a height-to-least-thickness ratio exceeding 50 with the height of the stud measured between horizontal framing and bridging or between bridging, whichever is greater.

2308.5.8 Pipes in walls. Stud partitions containing plumbing, heating or other pipes shall be framed and the joists underneath spaced to provide proper clearance for the piping. Where a partition containing piping runs parallel to the floor joists, the joists underneath such partitions shall be doubled and spaced to permit the passage of pipes and shall be bridged. Where plumbing, heating or other pipes are placed in, or partly in, a partition, necessitating the cutting of the soles or plates, a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1½ inches (38 mm) in width shall be fastened to each plate across and to each side of the opening a minimum of 6 inches (152 mm) with not less than six 16d nails. See Figure 2308.5.8.
[2308.9.10] **2308.5.9 Cutting and notching.** In exterior walls and bearing partitions, any wood stud is permitted to be cut or notched to a depth not exceeding 25 percent of its the...
width of the stud. Cutting or notching of studs to a depth not greater than 40 percent of the width of the stud is permitted in [nonbearing] nonload-bearing partitions supporting no loads other than the weight of the partition. See Figure 2308.5.8.

[2308.9.11] 2308.5.10 Bored holes. [A hole] Bored holes not greater [in diameter] than 40 percent of the stud width [is] are permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the stud width [of the stud] are permitted in [nonbearing] nonload-bearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored. In no case shall the edge of [the] a bored hole be nearer than ⅝ inch (15.9 mm) to the edge of the stud. Bored holes shall not be located at the same section of stud as a cut or notch. See Figure 2308.5.8.

2308.5.11 Exterior wall sheathing. Except where stucco construction that complies with Section 2510 is installed, the outside of exterior walls of enclosed buildings, including gables, shall be sheathed with one of the materials of the minimum thickness specified in Table 2308.5.11. Fasteners shall be used that are designed in accordance with the requirements of Section 2304.10 or accepted engineering practice. Alternatively, sheathing materials and fasteners complying with Section 2304.6 shall be permitted.

2308.6 Wall bracing. Buildings shall be provided with exterior and interior braced wall lines as described in Sections 2308.6.1 through 2308.6.10.2.

2308.6.1 Braced wall lines. For the purpose of determining the amount and location of bracing required along each story level of a building, braced wall lines shall be designated as straight lines through the building plan in both the longitudinal and transverse direction and placed in accordance with Table 2308.6.1 and Figure 2308.6.1. Braced wall line spacing shall not exceed the distance specified in Table 2308.6.1. In structures assigned to Seismic Design Category D, braced wall lines shall intersect perpendicularly to each other.

</table>
For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

NP = Not Permitted.

a. This table specifies minimum requirements for braced wall panels along interior or exterior braced wall lines.
b. See Section 2308.6.3 for full description of bracing methods.
c. For Method GB, gypsum wallboard applied to framing supports that are spaced at 16 inches on center.
d. The required lengths shall be doubled for gypsum board applied to only one face of a braced wall panel.
e. Percentage shown represents the minimum amount of bracing required along the building length (or wall length if the structure has an irregular shape).

2308.6.2 Braced wall panels. Braced wall panels shall be placed along braced wall lines in accordance with Table 2308.6.1 and Figure 2308.6.1 and as specified in Table 2308.6.3(1). A braced wall panel shall be located at each end of the braced wall line and at the corners of intersecting braced wall lines or shall begin within the maximum distance from the end of the braced wall line in accordance with Table 2308.6.1. Braced wall panels in a braced wall line shall not be offset from each other by more than 4 feet (1219 mm). Braced wall panels shall be clearly indicated on the plans.

2308.6.3 Braced wall panel methods. Construction of braced wall panels shall be by one or a combination of the methods in Table 2308.6.3(1). Braced wall panel length shall be in accordance with Section 2308.6.4 or 2308.6.5.

<sup>c</sup> Where used to comply with Section 2308.6.

<sup>d</sup> Nail length must accommodate the sheathing and penetrate framing 1 1/2 inches.

---

**2308.6.4 Braced wall panel construction.** For Methods DWB, WSP, SFB, PBS, PCP and HPS, each panel must be not less than 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) on center and covering two stud spaces where studs are spaced 24 inches (610 mm) on center. Braced wall panels less than 48 inches (1219 mm) in length shall not contribute toward the amount of required bracing. Braced wall panels that are longer than the required length shall be credited for their actual length. For Method GB, each panel must be not less than 96 inches (2438 mm) in length where applied to one side of the studs or 48 inches (1219 mm) in length where applied to both sides.

Vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the studding except where waived by the installation requirements for the specific sheathing materials. Sole plates shall be nailed to the floor framing in accordance with Section 2308.6.7 and top plates shall be connected to the framing above in accordance with Section 2308.6.7.2. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the braced wall panels.

**2308.6.5 Alternative bracing.** An alternate braced wall (ABW) or a portal frame with hold-downs (PFH) described in this section is permitted to substitute for a 48-inch (1219 mm) braced wall panel of Method DWB, WSP, SFB, PBS, PCP or HPS. For Method GB, each 96-inch (2438 mm) section (applied to one face) or 48-inch (1219 mm) section (applied to both faces) or portion thereof required by Table 2308.6.1 is permitted to be replaced by one panel constructed in accordance with Method ABW or PFH.
2308.6.5.1 Alternate braced wall (ABW). An ABW shall be constructed in accordance with this section and Figure 2308.6.5.1. In one-story buildings, each panel shall have a length of not less than 2 feet 8 inches (813 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with ¾-inch (3.2 mm) minimum-thickness wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Table 2304.10.1 and blocked at wood structural panel edges. Two anchor bolts installed in accordance with Section 2308.3.1 shall be provided in each panel. Anchor bolts shall be placed at each panel outside quarter points. Each panel end stud shall have a hold-down device fastened to the foundation, capable of providing an approved allowable uplift capacity of not less than 1,800 pounds (8006 N). The hold-down device shall be installed in accordance with the manufacturer’s recommendations. The ABW shall be supported directly on a foundation or on floor framing supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned-down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned-down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.

Where the ABW is installed at the first story of two-story buildings, the wood structural panel sheathing shall be provided on both faces, three anchor bolts shall be placed at one-quarter points, and tie-down device allowable uplift capacity shall be not less than 3,000 pounds (13 344 N).

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.
2308.6.5.2 Portal frame with hold-downs (PFH). A PFH shall be constructed in accordance with this section and Figure 2308.6.5.2. The adjacent door or window opening shall have a full-length header.

In one-story buildings, each panel shall have a length of not less than 16 inches (406 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with a single layer of $\frac{3}{8}$-inch (9.5 mm) minimum-thickness wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Figure 2308.6.5.2. The wood structural panel sheathing shall extend up over the solid sawn or glued-laminated header and shall be nailed in accordance with Figure 2308.6.5.2. A built-up header consisting of at least two 2-inch by 12-inch (51 mm by 305 mm) boards, fastened in accordance with Item 24 of Table 2304.10.1, shall be permitted to be used. A spacer, if used, shall be placed on the side of the built-up beam opposite the wood structural panel sheathing. The header shall extend between the inside faces of the first full-length outer studs of each panel. The clear span of the header between the inner studs of each panel shall be not less than 6 feet (1829 mm) and not more than 18 feet (5486 mm) in length. A strap with an allowable uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to the inner studs opposite the sheathing. One anchor bolt not less than $\frac{5}{8}$ inch (15.9 mm) diameter and installed in accordance with Section 2308.3.1 shall be provided in the center of each sill plate. The studs at each end of the panel shall have a hold-down device fastened to the foundation with an allowable uplift capacity of not less than 3,500 pounds (15 570 N).

Where a panel is located on one side of the opening, the header shall extend between the inside face of the first full-length stud of the panel and the bearing studs at the other end of the opening. A strap with an allowable uplift capacity of not less than 1,000 pounds (4400 N) shall fasten the header to the bearing studs. The bearing studs shall also have a hold-down device fastened to the foundation with an allowable uplift capacity of not less than 1,000 pounds (4400 N). The hold-down devices shall be an embedded strap type, installed in accordance with the manufacturer’s recommendations. The PFH panels shall be supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom. Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned-down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned-down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped not less than 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.

Where a PFH is installed at the first story of two-story buildings, each panel shall have a length of not less than 24 inches (610 mm).
2308.6.6 **Cripple wall bracing.** Cripple walls shall be braced in accordance with Section 2308.6.6.1 or 2308.6.6.2.

2308.6.6.1 **Cripple wall bracing in Seismic Design Categories A, B and C.** For the purposes of this section, cripple walls in Seismic Design Categories A, B and C having a stud height exceeding 14 inches (356 mm) shall be considered a story and shall be braced in accordance with Table 2308.6.1. Spacing of edge nailing for required cripple wall bracing shall not exceed 6 inches (152 mm) on center along the foundation plate and the top plate of the cripple wall. Nail size, nail spacing for field nailing and more restrictive boundary nailing requirements shall be as required elsewhere in the code for the specific bracing material used.

2308.6.6.2 **Cripple wall bracing in Seismic Design Category D.** For the purposes of this section, cripple walls in Seismic Design Category D having a stud height exceeding 14 inches (356 mm) shall be considered a story and shall be braced in accordance with Table 2308.6.1. Where interior braced wall lines occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one-half times the lengths required by Table 2308.6.1. Where the cripple wall sheathing type used is Method WSP or DWB and this additional length of bracing cannot be provided, the capacity of WSP or DWB sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) on center.

2308.6.7 **Connections of braced wall panels.** Braced wall panel joints shall occur over studs or blocking. Braced wall panels shall be fastened to studs, top and bottom plates and at panel edges. Braced wall panels shall be applied to nominal 2-inch-wide (actual 1½-inch (38 mm)) or larger stud framing.
2308.6.7.1 Bottom plate connection. Braced wall line bottom plates shall be connected to joists or full-depth blocking below in accordance with Table 2304.10.1, or to foundations in accordance with Section 2308.6.7.3.

2308.6.7.2 Top plate connection. Where joists or rafters are used, braced wall line top plates shall be fastened over the full length of the braced wall line to joists, rafters, rim boards or full-depth blocking above in accordance with Table 2304.10.1, as applicable, based on the orientation of the joists or rafters to the braced wall line. Blocking shall be not less than 2 inches (51 mm) in nominal thickness and shall be fastened to the braced wall line top plate as specified in Table 2304.10.1. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.4.2.4 or 2308.7.4 shall be permitted.

At exterior gable end walls, braced wall panel sheathing in the top story shall be extended and fastened to the roof framing where the spacing between parallel exterior braced wall lines is greater than 50 feet (15 240 mm).

Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall over the full length of the braced wall line by blocking of the ends of the trusses or by other approved methods providing equivalent lateral force transfer. Blocking shall be not less than 2 inches (51 mm) in nominal thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.10.1. Notching or drilling of holes in blocking in accordance with the requirements of Section 2308.4.2.4 or 2308.7.4 shall be permitted.

Exception: Where the roof sheathing is greater than 9¼ inches (235 mm) above the top plate, solid blocking is not required where the framing members are connected using one of the following methods:

1. In accordance with Figure 2308.6.7.2(1).
2. In accordance with Figure 2308.6.7.2(2).
3. Full-height engineered blocking panels designed for values listed in AWC WFCM.
4. A design in accordance with accepted engineering methods.
2308.6.7.3 Sill anchorage. Where foundations are required by Section 2308.6.8, braced wall line sills shall be anchored to concrete or masonry foundations. Such anchorage shall conform...
to the requirements of Section 2308.3. The anchors shall be distributed along the length of the braced wall line. Other anchorage devices having equivalent capacity are permitted.

2308.6.7.4 Anchorage to all-wood foundations. Where all-wood foundations are used, the force transfer from the braced wall lines shall be determined based on calculation and shall have a capacity that is not less than the connections required by Section 2308.3.

2308.6.8 Braced wall line and diaphragm support. Braced wall lines and floor and roof diaphragms shall be supported in accordance with this section.

2308.6.8.1 Foundation requirements. Braced wall lines shall be supported by continuous foundations.

Exception: For structures with a maximum plan dimension not more than 50 feet (15240 mm), continuous foundations are required at exterior walls only.

For structures in Seismic Design Category D, exterior braced wall panels shall be in the same plane vertically with the foundation or the portion of the structure containing the offset shall be designed in accordance with accepted engineering practice and Section 2308.1.1.

Exceptions:

1. Exterior braced wall panels shall be permitted to be located not more than 4 feet (1219 mm) from the foundation below where supported by a floor constructed in accordance with all of the following:

   1.1. Cantilevers or setbacks shall not exceed four times the nominal depth of the floor joists.

   1.2. Floor joists shall be 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) on center.

   1.3. The ratio of the back span to the cantilever shall be not less than 2 to 1.

   1.4. Floor joists at ends of braced wall panels shall be doubled.

   1.5. A continuous rim joist shall be connected to the ends of cantilevered joists. The rim joist is permitted to be spliced using a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage), 1½ inches (38 mm) in width and 12 inches (305 mm) in length, fastened with six 16d common nails on each side. The metal tie shall have a yield stress not less than 33,000 psi (227 MPa).

   1.6. Joists at setbacks or the end of cantilevered joists shall not carry gravity loads from more than a single story having uniform wall and roof loads nor carry the reactions from headers having a span of 8 feet (2438 mm) or more.

2. The end of a required braced wall panel shall be allowed to extend not more than 1 foot (305 mm) over an opening in the wall below. This requirement is applicable to braced wall panels offset in plane and braced wall panels offset out of plane as
permitted by Exception 1. Braced wall panels are permitted to extend over an opening not more than 8 feet (2438 mm) in width where the header is a 4-inch by 12-inch (102 mm by 305 mm) or larger member.

2308.6.8.2 Floor and roof diaphragm support in Seismic Design Category D. In structures assigned to Seismic Design Category D, floor and roof diaphragms shall be laterally supported by braced wall lines on all edges and connected in accordance with Section 2308.6.7 (see Figure 2308.6.8.2(1)).

Exception: Portions of roofs or floors that do not support braced wall panels above are permitted to extend up to 6 feet (1829 mm) beyond a braced wall line (see Figure 2308.6.8.2(2)) provided that the framing members are connected to the braced wall line below in accordance with Section 2308.6.7.
2308.6.8.3 Stepped footings in Seismic Design Categories B, C and D. In Seismic Design Categories B, C and D, where the height of a required braced wall panel extending from foundation to floor above varies more than 4 feet (1219 mm), the following construction shall be used:

1. Where the bottom of the footing is stepped and the lowest floor framing rests directly on a sill bolted to the footings, the sill shall be anchored as required in Section 2308.3.

2. Where the lowest floor framing rests directly on a sill bolted to a footing not less than 8 feet (2438 mm) in length along a line of bracing, the line shall be considered to be braced. The double plate of the cripple stud wall beyond the segment of footing extending to the lowest framed floor shall be spliced to the sill plate with metal ties, one on each side of the sill and plate. The metal ties shall be not less than 0.058 inch (1.47 mm) (16 galvanized gage) by 1½ inches (38 mm) in width by 48 inches (1219 mm) with eight 16d common nails on each side of the splice location (see Figure 2308.6.8.3). The metal tie shall have a yield stress not less than 33,000 psi (227 MPa).

3. Where cripple walls occur between the top of the footing and the lowest floor framing, the bracing requirements for a story shall apply.

FIGURE 2308.6.8.3
STEPPED FOOTING CONNECTION DETAILS

2308.6.9 Attachment of sheathing. Fastening of braced wall panel sheathing shall be not less than that prescribed in Tables 2308.6.1 and 2304.10.1. Wall sheathing shall not be attached to framing members by adhesives.
2308.6.10 Limitations of concrete or masonry veneer. Concrete or masonry veneer shall comply with Chapter 14 and this section.

2308.6.10.1 Limitations of concrete or masonry veneer in Seismic Design Categories B and C. In Seismic Design Categories B and C, concrete or masonry walls and stone or masonry veneer shall not extend above a basement.

Exceptions:

1. In structures assigned to Seismic Design Category B, stone and masonry veneer is permitted to be used in the first two stories above grade plane or the first three stories above grade plane where the lowest story has concrete or masonry walls, provided that wood structural panel wall bracing is used and the length of bracing provided is one and one-half times the required length specified in Table 2308.6.1.

2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls.

3. Stone and masonry veneer is permitted to be used in both stories of buildings with two stories above grade plane, provided the following criteria are met:

   3.1. Type of brace in accordance with Section 2308.6.1 shall be WSP and the allowable shear capacity in accordance with Section 2306.3 shall be not less than 350 plf (5108 N/m).

   3.2. Braced wall panels in the second story shall be located in accordance with Section 2308.6.1 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 25 percent of the braced wall line length. Braced wall panels in the first story shall be located in accordance with Section 2308.6.1 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 45 percent of the braced wall line length.

   3.3. Hold-down connectors with an allowable capacity of 2,000 pounds (8896 N) shall be provided at the ends of each braced wall panel for the second story to the first story connection. Hold-down connectors with an allowable capacity of 3,900 pounds (17347 N) shall be provided at the ends of each braced wall panel for the first story to the foundation connection. In all cases, the hold-down connector force shall be transferred to the foundation.

   3.4. Cripple walls shall not be permitted.

2308.6.10.2 Limitations of concrete or masonry in Seismic Design Category D. In Seismic Design Category D, concrete or masonry walls and stone or masonry veneer shall not extend above a basement.
Exception: Stone and masonry veneer is permitted to be used in the first story above grade plane, provided the following criteria are met:

1. Type of brace in accordance with Section 2308.6.1 shall be WSP and the allowable shear capacity in accordance with Section 2306.3 shall be not less than 350 plf (5108 N/m).

2. The braced wall panels in the first story shall be located at each end of the braced wall line and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 45 percent of the braced wall line length.

3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable capacity of 2,100 pounds (9341 N).

4. Cripple walls shall not be permitted.

[2308.10] 2308.7 Roof and ceiling framing. The framing details required in this section apply to roofs having a [minimum] slope of not less than three units vertical in 12 units horizontal (25-percent slope) [or greater]. Where the roof slope is less than three units vertical in 12 units horizontal (25-percent slope), members supporting rafters and ceiling joists such as ridge board, hips and valleys shall be designed as beams.

[2308.10.1] Wind uplift. The roof construction shall have rafter and truss ties to the wall below. Resultant uplift loads shall be transferred to the foundation using a continuous load path. The rafter or truss to wall connection shall comply with Tables 2304.9.1 and 2308.10.1.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 1.61 km/hr, 1 pound = 0.454 Kg, 1 pound per foot = 14.5939 N/m.

- The uplift connection requirements are based on a 30-foot mean roof height located in Exposure B. For Exposure C or D and for other mean roof heights, multiply the above loads by the adjusted coefficients below.
- The uplift connection requirements are based on the framing being spaced 24 inches on center. Multiply by 0.87 for framing spaced 16 inches on center and multiply by 0.5 for framing spaced 12 inches on center.
- The uplift connection requirements include an allowance for 10 pounds of dead load.
- The uplift connection requirements do not account for the effects of overhangs. The magnitude of the above loads shall be increased by adding the overhang loads found in the table. The overhang loads are also based upon framing spaced 24 inches on center. The overhang loads given shall be multiplied by the overhang projection and added to the roof uplift value in the table.
- The uplift connection requirements are based upon wind loading on end zones as defined in Figure 6.2 of ASCE 7. Connection loads for connections located a distance of 20 percent of the least horizontal dimension of the building from the corner of the building are permitted to be reduced by multiplying the table connection values by 0.7 and multiplying the overhang load by 0.8.
- For wall to wall and wall to foundation connections, the capacity of the uplift connector is permitted to be reduced by 100 pounds for each full wall above. (For example, if a 500-pound rated connector is used on the roof framing, a 400-pound rated connector is permitted at the next floor level down.)
- Interpolation is permitted for intermediate values of basic wind speeds and roof spans.
- The rated capacity of approved tie-down devices is permitted to include up to a 50 percent increase for wind effects where allowed by material specifications.

1640
[2308.10.2] 2308.7.1 Ceiling joist spans. [Allowable spans] Spans for ceiling joists shall be in accordance with Table [2308.10.2(1)] 2308.7.1(1) or [2308.10.2(2)] 2308.7.1(2). For other grades and species, and other loading conditions, refer to the [AE&PA Span Tables for Joists and Rafters] AWC STJR.

**Check sources for availability of lumber in lengths greater than 20 feet.**

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = (47.8 N/m²) 0.0479 kPa.

a. Span exceeds 26 feet in length. [Check sources for availability of lumber in lengths greater than 20 feet.]

### [2308.10.3] 2308.7.2 Rafter spans.

[Allowable spans] **Spans** for rafters shall be in accordance with Table [2308.10.3(1)] 2308.7.2(1), [2308.10.3(2)] 2308.7.2(2), [2308.10.3(3)] 2308.7.2(3), [2308.10.3(4)] 2308.7.2(4), [2308.10.3(5)] 2308.7.2(5), or [2308.10.3(6)] 2308.7.2(6). For other grades and species and other loading conditions, refer to the [AF&PA Span Tables for Joists and Rafters] AWC STJR. The span of each rafter shall be measured along the horizontal projection of the rafter.

*Note a: Roof Live Load = 20 [pounds-per-square-foot] psf, Ceiling Not Attached to Rafters, L/A = 180*

**Table 2308.10.3(1) 2308.7.1(1)**

RAFTER SPANS FOR COMMON LUMBER SPECIES

Note: For the table, the dead load is 10 and 20 pounds per square foot. The spans are calculated considering the roof live load of 20 pounds per square foot and the ceiling not attached to the rafters with a live load of 180 pounds per square foot. The spans are provided in feet and inches. The table includes various species and grade combinations, providing the maximum rafter spans for different spacings. The table is structured to easily compare the spans for different combinations and species.

Maximum rafter spans:

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 4.89 kPa

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. Where ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the following factors:

<table>
<thead>
<tr>
<th>H/Hn</th>
<th>Rafter Span Adjustment Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 – 1</td>
<td>1.0</td>
</tr>
<tr>
<td>1/3 or less</td>
<td>1.0</td>
</tr>
</tbody>
</table>

where:

H = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.
Hn = Height of roof ridge measured vertically above the top of the rafter support walls.

b. Span exceeds 26 feet in length. Check sources for availability of lumber in lengths greater than 20 feet.

</table>

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 0.3048 m, 1 pound per square foot = (42.24 kPa) 0.0479 kPa.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. Where ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the following factors:

<table>
<thead>
<tr>
<th>H/H_s</th>
<th>Rafter Span Adjustment Factor</th>

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.9 N/m², 0.0479 kPa.

a. The tabulated rafter spans assume that ceiling joists are located at the bottom of the attic space or that some other method of resisting the outward push of the rafters on the bearing walls, such as rafter ties, is provided at that location. Where ceiling joists or rafter ties are located higher in the attic space, the rafter spans shall be multiplied by the following factors:

<table>

where:

- \( H_c \) = Height of ceiling joists or rafter ties measured vertically above the top of the rafter support walls.
- \( H_R \) = Height of roof ridge measured vertically above the top of the rafter support walls.

**[2308.10.4] 2308.7.3 Ceiling joist and rafter framing.** Rafters shall be framed directly opposite each other at the ridge. There shall be a ridge board [at least] not less than 1-inch (25 mm) nominal thickness at ridges and not less in depth than the cut end of the rafter. At valleys and hips, there shall be a single valley or hip rafter not less than 2-inch (51 mm) nominal thickness and not less in depth than the cut end of the rafter.

**[2308.10.4.1] 2308.7.3.1 Ceiling joist and rafter connections.** Ceiling joists and rafters shall be nailed to each other and the assembly shall be nailed to the top wall plate in accordance with Tables [2304.9.1] 2304.10.1 and [2308.10.4.1] 2308.7.5. Ceiling joists shall be continuous or securely joined where they meet over interior partitions and be fastened to adjacent rafters in accordance with Tables [2308.10.4.1] 2304.10.1 and [2304.9.4] 2308.7.3.1 to provide a continuous rafter tie across the building where such joists are parallel to the rafters. Ceiling joists shall have a bearing surface of not less than 1½ inches (38 mm) on the top plate at each end.

Where ceiling joists are not parallel to rafters, an equivalent rafter tie shall be installed in a manner to provide a continuous tie across the building, at a spacing of not more than 4 feet (1219 mm) [o.c.] on center. The connections shall be in accordance with Tables [2308.10.4.1] 2304.10.1 and [2304.9.4] 2308.7.3.1, or connections of equivalent capacities shall be provided. Where ceiling joists or rafter ties are not provided at the top of the rafter support walls, the ridge formed by these rafters shall also be supported by a girder conforming to Section [2308.4] 2308.8. Rafter ties shall be spaced not more than 4 feet (1219 mm) [o.c.] on center.

Rafter tie connections shall be based on the equivalent rafter spacing in Table [2308.10.4.1] 2308.7.3.1. Where rafter ties are spaced at 32 inches (813 mm) o.c., the number of 16d common nails shall be two times the number specified for rafters spaced 16 inches (406 mm) o.c., with a minimum of four 16d common nails where no snow loads are indicated. Where rafter ties are spaced at 48 inches (1219 mm) o.c., the number of 16d common nails shall be two times the number specified for rafters spaced 24 inches (610 mm) o.c., with a minimum of six 16d common nails where no snow loads are indicated. Rafter/ceiling joist connections and rafter/tie connections shall be of sufficient size and number to prevent splitting from nailing.] Rafter-to-ceiling joist connections and rafter tie connections shall be of sufficient size and number to prevent splitting from nailing.

Roof framing member connection to braced wall lines shall be in accordance with Section 2308.6.7.2.

</table>

For SI: 1 inch = 25.4 mm, 1 foot = [244] 304.8 mm, 1 pound per square foot = 47.8 N/m².

a. 40d box (5” × 0.162”) or 16d sinker (3.14” × 0.148”) nails are permitted to be substituted for 16d common (3.14” × 0.16”) nails.

b. Nailing requirements are permitted to be reduced 25 percent if nails are clinched.

c. Rafter tie heel joint connections are not required where the ridge is supported by a load-bearing wall, header or ridge beam.

d. When intermediate support of the rafter is provided by vertical struts or purlins to a load-bearing wall, the tabulated heel joint connection requirements are permitted to be reduced proportionally to the reduction in span.

e. Equivalent nailing patterns are required for ceiling joist to ceiling joist lap splices.

f. Connected members shall be of sufficient size to prevent splitting due to nailing.

g. For snow loads less than 30 pounds per square feet, the required number of nails is permitted to be reduced by multiplying by the ratio of actual snow load plus 10 divided by 40, but not less than the number required for no snow load.

2308.7.4 Notches and holes. Notching at the ends of rafters or ceiling joists shall not exceed one-fourth the depth. Notches in the top or bottom of the rafter or ceiling joist shall not exceed one-sixth the depth and shall not be located in the middle one-third of the span, except that a notch not [exceeding] more than one-third of the depth is permitted in the top of the rafter or ceiling joist not further from the face of the support than the depth of the member. Holes bored in rafters or ceiling joists shall not be within 2 inches (51 mm) of the top and bottom and their diameter shall not exceed one-third the depth of the member.

2308.7.5 Wind uplift. The roof construction shall have rafter and truss ties to the wall below. Resultant uplift loads shall be transferred to the foundation using a continuous load path. The rafter or truss to wall connection shall comply with Tables 2304.10.1 and 2308.7.5.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 1.61 km/hr, 1 pound = 0.454 Kg, 1 pound per foot = 14.5939 N/m

- The uplift connection requirements are based on a 30-foot mean roof height located in Exposure B. For Exposure C or D and for other mean roof heights, multiply the above loads by the adjustment coefficients below.
- The uplift connection requirements include an allowance for 10 pounds of dead load.
- The uplift connection requirements do not account for the effects of overhangs. The magnitude of the above loads shall be increased by adding the overhang loads found in the table. The overhang loads are also based on framing spaced 24 inches on center. The overhang loads given shall be multiplied by the overhang projection and added to the roof uplift value in the table.
- The uplift connection requirements are based upon wind loading on end zones as defined in Figure 28.5-1 of ASCE 7. Connection loads for connections located a distance of 20 percent of the least horizontal dimension of the building from the corner of the building are permitted to be reduced by multiplying the table connection value by 0.7 and multiplying the overhang load by 0.8.
- For wall-to-wall and wall-to-foundation connections, the capacity of the uplift connector is permitted to be reduced by 100 pounds for each full wall above. (For example, if a 500-pound rated connector is used on the roof framing, a 400-pound rated connector is permitted at the next floor level down).
- The rated capacity of approved tie-down devices is permitted to include up to a 60 percent increase for wind effects where allowed by material specifications.
- $V_{up}$ shall be determined in accordance with Section 1609.3.1.

#### 2308.10.4.3 Framing around openings

Trimmer and header rafters shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 4 feet (1219 mm). The ends of header rafters that are more than 6 feet (1829 mm) long in length shall be supported by framing anchors or rafter hangers unless bearing on a beam, partition or wall.

#### 2308.7.6.1 Openings in roof diaphragms in Seismic Design Categories B, C and D

In buildings classified as Seismic Design Category B, C or D, openings in horizontal diaphragms with a dimension that is greater than 4 feet (1219 mm) shall be constructed with metal ties and blocking in accordance with this section and Figure 2308.4.4.1(1). Metal ties shall be not less than 0.058 inch (1.47 mm) (16 galvanized gage) in thickness by 1½ inches (38 mm) in width and shall have a yield stress not less than 33,000 psi (227 Mpa). Blocking shall extend not less than the dimension of the opening in the direction of the tie and blocking. Ties shall be attached to blocking in accordance with the manufacturer’s instructions but with not less than eight 16d common nails on each side of the header-joint intersection.

#### 2308.10.5 Purlins

Purlins to support roof loads are permitted to be installed to reduce the span of rafters within allowable limits and shall be supported by struts to bearing walls. The maximum span of a 2-inch by 4-inch (51 mm by 102 mm) purlin shall be 4 feet (1219 mm). The maximum span of a 2-inch by 6-inch (51 mm by 152 mm) purlin shall be 6 feet (1829 mm), but in no case shall the purlin be smaller than the supported rafter. Struts shall be not less than 2-inch by 4-inch (51 mm by 102 mm) members. The unbraced length of struts shall not exceed 8 feet (2438 mm) and the slope of the struts shall be not less than 45 degrees (0.79 rad) from the horizontal.

#### 2308.10.6 Blocking

Roof rafters and ceiling joists shall be supported laterally to prevent rotation and lateral displacement in accordance with the provisions of Section 2308.8.3. Purlins shall be connected to braced wall lines in accordance with Section 2308.6.7.2.

#### 2308.10.7 Engineered wood products

Prefabricated wood I-joists, structural glued-laminated timber and structural composite lumber shall not be notched or drilled except where
permitted by the manufacturer’s recommendations or where the effects of such alterations are specifically considered in the design of the member by a registered design professional.

[2308.10.8] 2308.7.10 Roof sheathing. Roof sheathing shall be in accordance with Tables 2304.7(3) 2304.8(3) and 2304.7(5) 2304.8(5) for wood structural panels, and Tables 2304.7(1) 2304.8(1) and 2304.7(2) 2304.8(2) for lumber and shall comply with Section 2304.7.2 2304.8.2.

[2308.10.8.1] 2308.7.11 Joints. Joints in lumber sheathing shall occur over supports unless approved end-matched lumber is used, in which case each piece shall bear on at least two supports.

[2308.10.9] 2308.7.12 Roof planking. Planking shall be designed in accordance with the general provisions of this code. In lieu of such design, 2-inch (51 mm) tongue-and-groove planking is permitted in accordance with Table 2308.7.12. Joints in such planking are permitted to be randomly spaced, provided the system is applied to not less than three continuous spans, planks are center matched and end matched or splined, each plank bears on at least one support, and joints are separated by [at least] not less than 24 inches (610 mm) in adjacent pieces.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kN/m²; 1 pound per square inch = 0.00689 N/mm².

a. Spans are based on simple beam action with 10 pounds per square foot dead load and provisions for a 300-pound concentrated load on a 12-inch width of decking. Random layup is permitted in accordance with the provisions of Section 2308.10.9 2308.7.12. Lumber thickness is 1 1/2 inches [nominal] actual.

[2308.10.10] 2308.7.13 Wood trusses. Wood trusses shall be designed in accordance with Section 2303.4. Connection to braced wall lines shall be in accordance with Section 2308.6.7.2.

[2308.10.11] 2308.7.14 Attic ventilation. For attic ventilation, see Section 1203.2. For provisions related to cutting and notching of members, see Section 2308.7.4.

[2308.11 Additional requirements for conventional construction in Seismic Design Category B or C. Structures of conventional light frame construction in Seismic Design Category B or C, as determined in Section 1613, shall comply with Sections 2308.11.1 through 2308.11.3, in addition to the provisions of Sections 2308.1 through 2308.10.]

[2308.11.1 Number of stories. Structures of conventional light frame construction shall not exceed two stories above grade plane in Seismic Design Category C.]

[2308.11.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above a basement.]

[Exceptions:]

[1. Masonry stone and masonry veneer is permitted to be used in the first two stories above-grade plane or the first three stories above-grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B, provided that structural use panel wall bracing is used and the length of bracing provided is one and one-half times the required length as determined in Table 2308.9.3(1).]
[2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B or C.]

[3. Stone and masonry veneer is permitted to be used in both stories of buildings with two stories above grade plane in Seismic Design Categories B and C, provided the following criteria are met:]

[3.1. Type of brace per Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.3 shall be a minimum of 350 plf (5108 N/m).]

[3.2. Braced wall panels in the second story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 25 percent of the braced wall line length. Braced wall panels in the first story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 45 percent of the braced wall line length.]

[3.3. Hold-down connectors shall be provided at the ends of each braced wall panel for the allowable design of 2,000 pounds (8896 N). Hold-down connectors shall be provided at the ends of each braced wall panel for the first story to foundation connection with an allowable capacity of 3,900 pounds (17,347 N). In all cases, the hold-down connector force shall be transferred to the foundation.]

[3.4. Cripple walls shall not be permitted.]
with eight 16d common nails on each side of the splice location (see Figure 2308.11.3.2). The metal tie shall have a minimum yield of 33,000 pounds per square inch (psi) (227 MPa). Where cripple walls occur between the top of the footing and the lowest floor framing, the bracing requirements for a story shall apply.

[2308.11.3.3 Openings in horizontal diaphragms. Openings in horizontal diaphragms with a dimension perpendicular to the joist that is greater than 4 feet (1219 mm) shall be constructed in accordance with the following:

1. Blocking shall be provided beyond headers.

2. Metal ties not less than 0.058 inch (1.47 mm (16 galvanized gage)) by 1 1/2 inches (38 mm) wide with eight 16d common nails on each side of the header joist intersection shall be provided (see Figure 2308.11.3.3). The metal ties shall have a minimum yield of 33,000 psi (227 MPa).]
[2308.12 Additional requirements for conventional construction in Seismic Design Category D. Structures of conventional light-frame construction in Seismic Design Category D as determined in Section 1613, shall conform to Sections 2308.12.1 through 2308.12.8, in addition to the requirements for Seismic Design Category B or C in Section 2308.11.]

[2308.12.1 Number of stories. Structures of conventional light-frame construction shall not exceed one story above grade plane in Seismic Design Category D.]

[2308.12.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above a basement.]

[Exception: Stone and masonry veneer is permitted to be used in the first story above grade plane in Seismic Design Category D, provided the following criteria are met:]

1. Type of brace in accordance with Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.3 shall be a minimum of 350 plf (5108 N/m).

2. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c., but not less than 45 percent of the braced wall line.

3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable capacity of 2,100 pounds (9341 N).]
[4. Cripple walls shall not be permitted.]

[2308.12.3 Braced wall line spacing. Spacing between interior and exterior braced wall lines shall not exceed 25 feet (7620 mm).]

[2308.12.4 Braced wall line sheathing. Braced wall lines shall be braced by one of the types of sheathing prescribed by Table 2308.12.4 as shown in Figure 2308.9.3. The sum of lengths of braced wall panels at each braced wall line shall conform to Table 2308.12.4. Braced wall panels shall be distributed along the length of the braced wall line and start at not more than 5 feet (2438 mm) from each end of the braced wall line. Panel sheathing joints shall occur over studs or blocking. Sheathing shall be fastened to studs and top and bottom plates and at panel edges occurring over blocking. Wall framing to which sheathing used for bracing is applied shall be nominal 2 inch wide [actual 1 1/2 inch (38 mm)] or larger members. Cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a story for the purpose of this section and shall be braced as required for braced wall lines in accordance with Table 2308.12.4. Where interior braced wall lines occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one half times the lengths required by Table 2308.12.4. Where the cripple wall sheathing type used is Type S-W and this additional length of bracing cannot be provided, the capacity of Type S-W sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) o.e.]

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Minimum length of panel bracing of one face of the wall for S-W sheathing or both faces of the wall for G-P sheathing; h/w ratio shall not exceed 2:1. For S-W panel bracing of the same material on two faces of the wall, the minimum length is permitted to be one half the tabulated value but the h/w ratio shall not exceed 2:1 and design for uplift is required.

b. G-P = gypsum board, fiberboard, particleboard, lath and plaster or gypsum sheathing board. S-W = wood structural panels and diagonal wood sheathing.

c. Nailing as specified below shall occur at all panel edges at studs, at top and bottom plates and, where occurring, at blocking:

For plywood panel bracing: No. 12 gage (0.113 inch diameter) wire nails at 3 inches on center.

For panel bracing of the same material on two faces of the wall, the minimum length is permitted to be one half the tabulated value but the h/w ratio shall not exceed 2:1 and design for uplift is required.

[2308.12.5 Attachment of sheathing. Fastening of braced wall panel sheathing shall not be less than that prescribed in Table 2308.12.4 or 2304.9.1. Wall sheathing shall not be attached to framing members by adhesives.]

[2308.12.6 Irregular structures. Conventional light-frame construction shall not be used in irregular portions of structures in Seismic Design Category D. Such irregular portions of structures shall be designed to resist the forces specified in Chapter 16 to the extent such irregular features affect the performance of the conventional framing system. A portion of a structure shall be considered to be irregular where one or more of the conditions described in Items 1 through 6 below are present.]

[1. Where exterior braced wall panels are not in one plane vertically from the foundation to the uppermost story in which they are required, the structure shall be considered to be irregular (see Figure 2308.12.6(1)).]
[Exception: Floors with cantilevers or setbacks not exceeding four times the nominal depth of the floor joists (see Figure 2308.12.6(2)) are permitted to support braced wall panels provided:]

1. Floor joists are 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) o.c.

2. The ratio of the back span to the cantilever is at least 2:1.

3. Floor joists at ends of braced wall panels are doubled.

4. A continuous rim joist is connected to the ends of cantilevered joists. The rim joist is permitted to be spliced using a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1 1/2 inches (38 mm) wide fastened with six 16d common nails on each side. The metal tie shall have a minimum yield of 33,000 psi (227 Mpa).]

5. Joists at setbacks or the end of cantilevered joists shall not carry gravity loads from more than a single story having uniform wall and roof loads, nor carry the reactions from headers having a span of 8 feet (2438 mm) or more.

2. Where a section of floor or roof is not laterally supported by braced wall lines on all edges, the structure shall be considered to be irregular (see Figure 2308.12.6(3)).

[Exception: Portions of roofs or floors that do not support braced wall panels above are permitted to extend up to 6 feet (1829 mm) beyond a braced wall line (see Figure 2308.12.6(4)).]

3. Where the end of a required braced wall panel extends more than 1 foot (305mm) over an opening in the wall below, the structure shall be considered to be irregular. This requirement is applicable to braced wall panels offset in plane and to braced wall panels offset out of plane as permitted by the exception to Item 1 above in this section (see Figure 2308.12.6(5)).

[Exception: Braced wall panels are permitted to extend over an opening not more than 8 feet (2438 mm) in width where the header is a 4-inch by 12-inch (102 mm by 305 mm) or larger member.]

4. Where portions of a floor level are vertically offset such that the framing members on either side of the offset cannot be lapped or tied together in an approved manner, the structure shall be considered to be irregular (see Figure 2308.12.6(6)).

[Exception: Framing supported directly by foundations need not be lapped or tied directly together.]

5. Where braced wall lines are not perpendicular to each other, the structure shall be considered to be irregular (see Figure 2308.12.6(7)).

6. Where openings in floor and roof diaphragms having a maximum dimension greater than
50 percent of the distance between lines of bracing or an area greater than 25 percent of the area between orthogonal pairs of braced wall lines are present, the structure shall be considered to be irregular (see Figure 2308.12.6(8)).
FIGURE 2308.12.6(b)
FLOOR OR ROOF FAST SUPPORTED ON ALL EDGES

FIGURE 2308.12.6(c)
ROOF OR FLOOR EXTENSION BEYOND BRACED WALL LINE
[2308.12.7 Anchorage of exterior means of egress components. Exterio egress balconies, exterior exit stairways and similar means of egress components shall be positively anchored to the primary structure at not over 8 feet (2438 mm) o.c. or shall be designed for lateral forces. Such attachment shall not be accomplished by use of toenails or nails subject to withdrawal.]  

[2308.12.8 Sill-plate anchorage. Sill plates shall be anchored with anchor bolts with steel plate washers between the foundation sill plate and the nut, or approved anchor straps load rated in accordance with Section 1716.1. Such washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1 3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut.]  

2308.8 Design of elements. Combining of engineered elements or systems and conventionally specified elements or systems shall be permitted subject to the limits of Sections 2308.8.1 and 2308.8.2.  

2308.8.1 Elements exceeding limitations of conventional construction. Where a building of otherwise conventional construction contains structural elements exceeding the limits of Section 2308.2, these elements and the supporting load path shall be designed in accordance with accepted engineering practice and the provisions of this code.  

2308.8.2 Structural elements or systems not described herein. Where a building of otherwise conventional construction contains structural elements or systems not described in Section 2308, these elements or systems shall be designed in accordance with accepted engineering practice and the provisions of this code. The extent of such design need only demonstrate compliance of the nonconventional elements with other applicable provisions of this code and shall be compatible with the performance of the conventionally framed system.
SECTION BC 2309
WOOD FRAME CONSTRUCTION MANUAL

2309.1 Wood Frame Construction Manual. Structural design in accordance with the AWC WFCM shall be permitted for buildings assigned to Risk Category I or II subject to the limitations of Section 1.1.3 of the AWC WFCM and the load assumptions contained therein. Structural elements beyond these limitations shall be designed in accordance with accepted engineering practice.

§ 24. Chapter 24 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 24
GLASS AND GLAZING

SECTION BC 2401
GENERAL

2401.1 Scope. The provisions of this chapter shall govern the materials, design, construction and quality of glass, light-transmitting ceramic and light-transmitting plastic panels for exterior and interior use in both vertical and sloped applications in buildings and structures.

2401.2 Glazing replacement. The installation of replacement glass shall be as required for new installations. See Sections 28-101.4.1, 28-101.4.2, 28-101.4.3 and 28-101.4.4 of the Administrative Code for requirements relating to prior code buildings.

Exception: Permit or inspection is not required for certain glazing repair or replacement work as described in Title 1 of the Rules of the City of New York.

SECTION BC 2402
DEFINITIONS

2402.1 Definitions. The following terms shall, for the purposes of this chapter and as used elsewhere, are defined in this code, have the meanings shown herein

DALLE GLASS. [A decorative composite glazing material made of individual pieces of glass that are embedded in a cast matrix of concrete or epoxy.]

DECORATIVE GLASS. [A carved, leaded or Dalle glass or glazing material whose purpose is decorative or artistic, not functional; whose coloring, texture or other design qualities or components cannot be removed without destroying the glazing material and whose surface, or assembly into which it is incorporated, is divided into segments.]

HOISTWAY. The hoistway is the opening through a building or structure for the travel of elevators, dumbwaiters, or material lifts, extending from the pit floor to the roof or floor above.

SIDELIGHTS. SIDELITES. TRANSPARENT.
TRANSPARENT DOOR.

TRANSPARENT SAFETY GLAZING MATERIALS.

SECTION BC 2403
GENERAL REQUIREMENTS FOR GLASS

2403.1 Identification. Each pane shall bear the manufacturer’s label designating the type and thickness of the glass or glazing material. The identification shall not be omitted unless approved and an affidavit is furnished by the glazing contractor certifying that each [light] lite is glazed in accordance with approved construction documents that comply with the provisions of this chapter. Safety glazing shall be identified in accordance with Section 2406.3.

Each pane of tempered glass[, except tempered spandrel glass,] shall be permanently identified by the manufacturer. The identification label shall be acid etched, sand blasted, ceramic fired, laser etched, embossed or [shall be] of a type that, once applied, cannot be removed without being destroyed.[Tempered spandrel glass shall be provided with a removable paper marking by the manufacturer.]

**Exception:** Tempered spandrel glass shall be permanently labeled unless doing so would weaken, alter the performance of, or cause breakage of the spandrel glass, as determined by the manufacturer. Where the manufacturer makes such a determination, the tempered spandrel glass shall be provided with a removable paper marking by the manufacturer, and an affidavit shall be provided in accordance with this section.

2403.2 Glass supports. Where one or more sides of any pane of glass are not firmly supported, or are subjected to unusual load conditions, or as requested by the applicant, detailed construction documents, detailed shop drawings and analysis or test data [assuring] ensuring safe performance for the specific installation shall be prepared by [an architect or engineer] a registered design professional.

2403.3 Framing. To be considered firmly supported, the framing members for each individual pane of glass shall be designed so the deflection of the edge of the glass perpendicular to the glass pane shall not exceed \( \frac{1}{175} \) of the glass edge length or \( \frac{3}{4} \) inch (19.1 mm), whichever is less, when subjected to the larger of the positive or negative load where loads are combined as specified in Section 1605. Gaskets, washers, shims, seals or spacers shall be used where required to prevent contact of glass to metal components in framing and supports. The system shall allow for movement.

2403.4 Interior glazed areas. Where interior glazing is installed adjacent to a walking surface, the differential deflection of two adjacent unsupported edges shall not be greater than the thickness of the panels when a force of 50 pounds per linear foot (plf) (730 N/m) is applied horizontally to one panel at any point up to 42 inches (1067 mm) above the walking surface.

2403.5 Louvered windows or jalousies. Float, wired and patterned glass in louvered windows and jalousies shall be no thinner than nominal \( \frac{3}{16} \) inch (4.8 mm) and no longer than 48 inches (1219 mm). Exposed glass edges shall be smooth.
Wired glass with wire exposed on longitudinal edges shall not be used in louvered windows or jalousies. Where other glass types are used, the design shall be submitted to the department for approval.

Where other glass types are used, the design shall be submitted to the department for approval.

**SECTION BC 2404**

**WIND, SNOW, SEISMIC AND DEAD LOADS ON GLASS**

**2404.1 Vertical glass.** Glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain walls and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding. The load resistance of glass under uniform load shall be determined in accordance with ASTM E 1300. Glass and glazing assemblies shall meet the seismic requirements of ASCE 7. Glass in glazed curtain walls, glazed storefronts and glazed partitions shall meet the seismic requirements of ASCE 7, Section 13.5.9, as modified by Chapter 16. The load resistance of glass under uniform load shall be determined in accordance with ASTM E 1300. The glass breakage probability for load resistance shall be less than or equal to 8 lites per 1,000.

The design of vertical glazing shall be based on the following equation: Equation 24-1.

\[
F_{gw} \leq F_{ga}
\]

\[
0.6F_{gw} \leq F_{ga}
\]

(Equation 24-1)

where:

\[
F_{gw} = \text{Wind load on the glass due to basic design wind speed, } V, \text{ computed in accordance with Section 1609.}
\]

\[
F_{ga} = \text{Short duration load on the glass as determined in accordance with ASTM E 1300.}
\]

**2404.2 Sloped glass.** Glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunrooms, sloped roofs and other exterior applications shall be designed to resist the most critical combinations of loads as determined by Equations 24-2, 24-3 and 24-4.

\[
F_g = W - D
\]

(Equation 24-2)

\[
F_g = 0.6W + D + 0.5S
\]

(Equation 24-3)

where:

\[
D = \text{Glass dead load psf (kN/m²).}
\]
For glass sloped 30 degrees (0.52 rad) or less from horizontal, 

\[ F_g = 13 t_g \text{ (For SI: 0.0245 } t_g) \]

For glass sloped more than 30 degrees (0.52 rad) from horizontal, 

\[ F_g = 13 t_g \cos \theta \text{ (For SI: 0.0245 } t_g \cos \theta) \]

\( F_g \) = Total load, psf (kN/m\(^2\)) on glass.

\( S \) = Snow load, psf (kN/m\(^2\)) as determined in Section 1608.

\( t_g \) = Total glass thickness, inches (mm) of glass panes and plies.

\( W_i \) = Inward wind force, psf (kN/m\(^2\)) due to basic design wind speed, \( V \), as calculated in Section 1609.

\( W_o \) = Outward wind force, psf (kN/m\(^2\)) due to basic design wind speed, \( V \), as calculated in Section 1609.

\( \theta \) = Angle of slope from horizontal.

**Exception:** The performance grade rating of unit skylights and tubular daylighting devices shall be determined in accordance with Section 2405.5.

The design of sloped glazing shall be based on the following equation: Equation 24-5.

\[ F_g \leq F_{ga} \]

(Equation 24-5)

where:

\( F_g \) = Total load on the glass determined from the load combinations above by Equations 24-2, 24-3 and 24-4.

\( F_{ga} \) = Short duration load resistance of the glass as determined in accordance with ASTM E 1300 for Equations 24-2 and 24-3; or the long duration load resistance of the glass as determined in accordance with ASTM E 1300 for Equation 24-4.

### 2404.3 Wired, patterned and sandblasted glass.

#### 2404.3.1 Vertical wired glass. Wired glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to the following equation:

\[ F_{gw} < 0.5 F_{ge} \]

\[ 0.6 F_{gw} < 0.5 F_{ge} \]

(Equation 24-6)

where:

\( F_{gw} \) = Wind load on the glass due to basic design wind speed, \( V \), computed in accordance with Section 1609.

\( F_{ge} \) = Nonfactored load from ASTM E 1300 using a thickness designation for monolithic glass that is not greater than the thickness of wired glass.

#### 2404.3.2 Sloped wired glass. Wired glass sloped more than 15 degrees (0.26 rad) from vertical
in skylights, sunspaces, sloped roofs and other exterior applications shall be designed to resist the most critical of the combinations of loads from Section 2404.2.

For Equations 24-2 and 24-3:
\[ F_g < 0.5 F_{ge} \]  \hspace{1cm} (Equation 24-7)

For Equation 24-4:
\[ F_g < 0.3 F_{ge} \]  \hspace{1cm} (Equation 24-8)

where:
\[ F_g = \text{Total load on the glass as determined by Equations 24-2, 24-3 and 24-4.} \]
\[ F_{ge} = \text{Nonfactored load [from]} \text{ in accordance with ASTM E 1300.} \]

2404.3.3 Vertical patterned glass. Patterned glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to [the following equation:] Equation 24-9.

\[ F_{gw} < 1.0 F_{ge} \]  \hspace{1cm} (Equation 24-9)

where:
\[ F_{gw} = \text{Wind load on the glass due to basic design wind speed, } V, \text{ computed [per]} \text{ in accordance with Section 1609.} \]
\[ F_{ge} = \text{Nonfactored load [from]} \text{ in accordance with ASTM E 1300. The value for patterned glass shall be based on the thinnest part of the glass. Interpolation between nonfactored load charts in ASTM E 1300 shall be permitted.} \]

2404.3.4 Sloped patterned glass. Patterned glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunspaces, sloped roofs and other exterior applications shall be designed to resist the most critical of the combinations of loads from Section 2404.2.

For Equations 24-2 and 24-3:
\[ F_g < 1.0 F_{ge} \]  \hspace{1cm} (Equation 24-10)

For Equation 24-4:
\[ F_g < 0.6 F_{ge} \]  \hspace{1cm} (Equation 24-11)

where:
\[ F_g = \text{Total load on the glass as determined by Equations 24-2, 24-3 and 24-4.} \]
\[ F_{ge} = \text{Nonfactored load [from]} \text{ in accordance with ASTM E 1300. The value for patterned glass shall be based on the thinnest part of the glass. Interpolation between the nonfactored load charts in ASTM E 1300 shall be permitted.} \]

2404.3.5 Vertical sandblasted glass. Sandblasted glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors, and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding according to [the following equation:] Equation 24-12.
\[
F_g < 0.5 F_{gw}
\]
\[
0.6 F_{gw} < 0.5 F_{ge}
\]
(Equation 24-12)

where:

\[F_{gw} = \text{[Total] Wind load on the glass due to basic design wind speed, } V, \text{ computed in accordance with Section 1609.}\]

\[F_{ge} = \text{Nonfactored load [from] in accordance with ASTM E 1300. The value for sandblasted glass is for moderate levels of sandblasting.}\]

2404.4 Other designs. For designs outside the scope of this section, an analysis or test data for the specific installation shall be prepared by a registered design professional.

SECTION BC 2405
SLOPED GLAZING AND SKYLIGHTS

2405.1 Scope. This section applies to the installation of glass and other transparent, translucent or opaque glazing material installed at a slope more than 15 degrees (0.26 rad) from the vertical plane, including glazing materials in skylights, roofs and sloped walls.

2405.1.1 Glass in walking surfaces. Glass installed in the walking surface of floors, landings, stairs and similar locations shall be designed and engineered by a registered design professional and the design shall include the applicable provisions of ASTM E 2751.

2405.2 Allowable glazing materials and limitations. Sloped glazing shall be any of the following materials, subject to the listed limitations:

1. For monolithic glazing systems, the glazing material of the single [light] lite or layer shall be laminated glass with a minimum 30-mil (0.76 mm) polyvinyl butyral (or equivalent) interlayer, wired glass, light-transmitting plastic materials meeting the requirements of Section 2607 [heat-strengthened glass or fully tempered glass].

2. For multiple-layer glazing systems, [each light or] the exterior layer shall [consist of] be fully tempered glass and the bottom layer shall consist of any of the glazing materials specified in Item 1 above.

Annealed glass is permitted to be used as specified within Exceptions 2 and 3 of Section 2405.3.

Heat-strengthened glass or fully tempered monolithic glass is permitted to be used with screens, as specified in Section 2405.3.

For additional requirements for plastic skylights, see Section 2610. Glass-block construction shall conform to the requirements of Section [2401.2.5] 2110.1.

2405.3 Screening. Where used in monolithic glazing systems, heat-strengthened [glass] and fully tempered glass shall have screens installed below the glazing material. The screens and their fastenings shall: (1) be capable of supporting twice the weight of the glazing; (2) be firmly and substantially fastened to the framing members; and (3) be installed within 4 inches (102 mm) of...
the glass. The screens shall be constructed of a noncombustible material not thinner than No. 12 B&S gage (0.0808 inch) with mesh not larger than 1 inch by 1 inch (25 mm by 25 mm). In a corrosive atmosphere, structurally equivalent noncorrosive screen materials shall be used. Heat-strengthened glass, fully tempered glass and wired glass, when used in multiple-layer glazing systems as the bottom glass layer over the walking surface, shall be equipped with screening that conforms to the requirements for monolithic glazing systems.

**Exception:** In monolithic and multiple-layer sloped glazing systems, the following applies:

1. Fully tempered glass installed without protective screens where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane shall have the highest point of the glass 10 feet (3048 mm) or less above the walking surface.

2. Screens are not required below any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.

3. Any glazing material, including annealed glass, is permitted to be installed without screens in the sloped glazing systems of commercial or detached noncombustible greenhouses used exclusively for growing plants and not open to the public, provided that the height of the greenhouse at the ridge does not exceed 30 feet (9144 mm) above grade.

4. Screens shall not be required [within] in individual dwelling units in Occupancy Groups R-2 and R-3 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and the following conditions are met:

   4.1 Each pane of the glass is 16 square feet (1.5 m²) or less in area.

   4.2 The highest point of the glass is 12 feet (3658 mm) or less above any walking surface [or other accessible area].

   4.3 The glass thickness is $\frac{3}{16}$ inch (4.8 mm) or less.

5. Screens shall not be required for laminated glass with a 15-mil (0.38 mm) polyvinyl butyral (or equivalent) interlayer used [within] in individual dwelling units in Occupancy Groups R-2 and R-3 within the following limits:

   5.1. Each pane of glass is 16 square feet (1.5 m²) or less in area.

   5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface [or other accessible area].

**2405.4 Framing.** In Type I and II construction, sloped glazing and skylight frames shall be constructed of noncombustible materials. In structures where acid fumes deleterious to metal are incidental to the use of the buildings, approved pressure-treated wood or other approved noncorrosive materials are permitted to be used for sash and frames. Framing supporting sloped glazing and skylights shall be designed to resist the tributary roof loads in Chapter 16. Skylights set at an angle of less than 45 degrees (0.79 rad) from the horizontal plane shall be mounted [at least] not less than 4 inches (102 mm) above the plane of the roof on a curb constructed as required for the frame.
Skylights shall not be installed in the plane of the roof where the roof pitch is less than 45 degrees (0.79 rad) from the horizontal.

**Exception:** Installation of a skylight without a curb shall be permitted on roofs with a minimum slope of 14 degrees (three units vertical in 12 units horizontal) in Group R-3 occupancies. All unit skylights installed in a roof with a pitch flatter than 14 degrees (0.24 rad) shall be mounted [at least] not less than 4 inches (102 mm) above the plane of the roof on a curb constructed as required for the frame unless otherwise specified in the manufacturer’s [installation] instructions.

### 2405.5 Unit skylights and tubular daylighting devices

Unit skylights and tubular daylighting devices shall be tested and labeled as complying with AAMA/WDMA/CSA 101/I.S.2/A440 [Voluntary Performance Specification for Windows, Skylights and Glass]. The label shall state the name of the manufacturer, the approved [labeling] agency, the product designation and the performance grade rating as specified in AAMA/WDMA/CSA 101/I.S.2/A440. [¶] Where the product manufacturer has chosen to have the performance grade of the skylight rated separately for positive and negative design pressure, then the label shall state both performance grade ratings as specified in AAMA/WDMA/CSA 101/I.S.2/A440 and the skylight shall comply with Section 2405.5.2. [¶] Where the skylight is not rated separately for positive and negative pressure, then the performance grade rating shown on the label shall be the performance grade rating determined in accordance with AAMA/WDMA/CSA 101/I.S.2/A440 for both positive and negative design pressure[±] and the skylight shall conform to Section 2405.5.1.

#### 2405.5.1 [Unit skylights] Skylights rated for the same performance grade for both positive and negative design pressure

The design of [unit] skylights shall be based on [the following equation] [Equation 24-13].

\[ F_g \leq PG \]  
(Equation 24-13)

where:

- \( F_g \) = Maximum load on the skylight determined from Equations 24-2 through 24-4 in Section 2404.2.
- \( PG \) = Performance grade rating of the skylight.

#### 2405.5.2 [Unit skylights] Skylights rated for separate performance grades for positive and negative design pressure

The design of [unit] skylights rated for performance grade for both positive and negative design pressures shall be based on [the following equations] Equations 24-14 and 24-15.

\[ F_{g_i} \leq PG_{Pos} \]  
(Equation 24-14)

\[ F_{g_o} \leq PG_{Neg} \]  
(Equation 24-15)

where:

- \( PG_{Pos} \) = Performance grade rating of the skylight under positive design pressure[±];
- \( PG_{Neg} \) = Performance grade rating of the skylight under negative design pressure[±]; and
- \( F_{g_i} \) and \( F_{g_o} \) are determined in accordance with the following:

For \( W_n < D \) \( 0.6W_n \geq D \).
where:

\( W_o = \) Outward wind force, psf (kN/m\(^2\)) due to basic design wind speed, \( V \), as calculated in Section 1609.

\( D = \) The dead weight of the glazing, psf (kN/m\(^2\)) as determined in Section 2404.2 for glass, or by the weight of the plastic, psf (kN/m\(^2\)) for plastic glazing.

\( F_{gi} = \) Maximum load on the skylight determined from Equations 24-3 and 24-4 in Section 2404.2.

\( F_{go} = \) Maximum load on the skylight determined from Equation 24-2.

For \( W_o < D \) \( 0.6W_o < D \),

where:

\( W_o = \) The outward wind force, psf (kN/m\(^2\)) due to basic design wind speed, \( V \), as calculated in Section 1609.

\( D = \) The dead weight of the glazing, psf (kN/m\(^2\)) as determined in Section 2404.2 for glass, or by the weight of the plastic for plastic glazing.

\( F_{gi} = \) Maximum load on the skylight determined from Equations 24-2 through 24-4 in Section 2404.2.

\( F_{go} = \) 0.

SECTION BC 2406
SAFETY GLAZING

2406.1 Human impact loads. Individual glazed areas, including glass mirrors, in hazardous locations as defined in Section 2406.4 shall comply with Sections 2406.1.1 through 2406.1.4.

Exception: Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.

2406.1.1 Impact test. Except as provided in Sections 2406.1.2 through 2406.1.4, all glazing shall pass the impact test requirements of Section 2406.2.

2406.1.2 Plastic glazing. Plastic glazing shall meet the weathering requirements of ANSI Z97.1.

2406.1.3 Glass block. Glass-block walls shall comply with Section 2101.2.5.

2406.1.4 Louvered windows and jalousies. Louvered windows and jalousies shall comply with Section 2403.5.

2406.2 Impact test. Where required by other sections of this code, glazing shall be tested in accordance with CPSC 16 CFR Part 1201. Glazing shall comply with the test criteria for Category I or II, unless otherwise indicated in Table 2406.2(1).

| TABLE 2406.2(1) |

For SI: 1 square foot = 0.0929 m².

**Exception:** Glazing not [being used for] in doors or enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A or B as, unless otherwise indicated in Table 2406.2(2).

### 2406.3 Identification of safety glazing.

Except as indicated in Section 2406.3.1, each pane of safety glazing installed in hazardous locations shall be identified by a label specifying the labeler, whether the manufacturer or installer, and the safety glazing standard with which it complies, as well as the information specified in Section 2403.1. A label as defined in Section 202 and meeting the requirements of this section shall be permitted in lieu of the manufacturer’s designation.

**Exceptions:**

1. For other than tempered glass, labels are not required, provided the department approves the use of a certificate, affidavit or other evidence confirming compliance with this code.

2. Tempered spandrel glass [is permitted to] shall be identified [by the manufacturer with a removable paper label] in accordance with Section 2403.1.

### 2406.4 Hazardous locations.

[The following shall be considered specific hazardous locations requiring safety glazing materials:] The locations specified in Sections 2406.4.1 through 2406.4.7 shall be considered to be specific hazardous locations requiring safety glazing materials.
1. Glazing in swinging doors except jalousies (see Section 2406.4.1.).

2. Glazing in fixed and sliding panels of sliding door assemblies and panels in sliding and bifold closet door assemblies.

3. Glazing in storm doors.

4. Glazing in unframed swinging doors.

5. Glazing in doors and enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers. Glazing in any portion of a building wall enclosing these compartments where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above a standing surface.

6. Glazing in an individual fixed or operable panel adjacent to a door where the nearest exposed edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the walking surface.

Exceptions:

1. Panels where there is an intervening wall or other permanent barrier between the door and glazing.

2. Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with Section 2406.4, Item 7.

3. Glazing in walls perpendicular to the plane of the door in a closed position, other than the wall towards which the door swings when opened in one- and two-family dwellings or within dwelling units in Group R-2.

7. Glazing in an individual fixed or operable panel, other than in those locations described in preceding Items 5 and 6, which meets all of the following conditions:

7.1. Exposed area of an individual pane greater than 9 square feet (0.84 m²);

7.2. Exposed bottom edge less than 18 inches (457 mm) above the floor;

7.3. Exposed top edge greater than 36 inches (914 mm) above the floor; and

7.4. One or more walking surface(s) within 36 inches (914 mm) horizontally of the plane of the glazing.

Exception: Safety glazing for Item 7 is not required for the following installations:

1. A horizontal protective bar 1½ inches (38 mm) or more in height, capable of withstanding a horizontal load of 50 pounds plf (730 N/m) without contacting the glass, is installed on the accessible sides of the glazing 34 inches to 38 inches (864 mm to 965 mm) above the floor.

1682
2. The outboard pane in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 25 feet (7620 mm) or more above any grade, roof, walking surface or other horizontal or sloped (within 45 degrees of horizontal) (0.78 rad) surface adjacent to the glass exterior.

8. Glazing in guards and railings, including structural baluster panels and nonstructural in-fill panels, regardless of area or height above a walking surface.

9. Glazing in walls and fences enclosing indoor and outdoor swimming pools, hot tubs and spas where all of the following conditions are present:

9.1. The bottom edge of the glazing on the pool or spa side is less than 60 inches (1524 mm) above a walking surface on the pool or spa side of the glazing; and

9.2. The glazing is within 60 inches (1524 mm) horizontally of the water’s edge of a swimming pool or spa.

10. Glazing adjacent to stairways, landings and ramps within 36 inches (914 mm) horizontally of a walking surface; when the exposed surface of the glass is less than 60 inches (1524 mm) above the plane of the adjacent walking surface.

11. Glazing adjacent to stairways within 60 inches (1524 mm) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glass is less than 60 inches (1524 mm) above the nose of the tread.

Exception: Safety glazing for Item 10 or 11 is not required for the following installations where:

1. The side of a stairway, landing or ramp which has a guard or handrail, including balusters or in-fill panels, complying with the provisions of Sections 1013 and 1607.7; and

2. The plane of the glass is greater than 18 inches (457 mm) from the railing.

2406.4.1 [Exceptions: The following products, materials and uses shall not be considered specific hazardous locations:] Glazing in doors. Glazing in all fixed and operable panels of swinging, sliding and bifold doors shall be considered a hazardous location.

1. Openings in doors through which a 3-inch (76 mm) sphere is unable to pass.

2. Decorative glass in Section 2406.4, Item 1, 6 or 7.

3. Glazing materials used as curved glazed panels in revolving doors.

5. Glass block panels complying with Section 2101.2.5.

6. Louvered windows and jalousies complying with the requirements of Section 2403.5.
[7. Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.]

Exceptions:

1. Glazed openings of a size through which a 3-inch diameter (76 mm) sphere is unable to pass.
2. Decorative glazing.
3. Glazing materials used as curved glazed panels in revolving doors.

2406.4.2 Glazing adjacent to doors. Glazing in an individual fixed or operable panel adjacent to a door where the nearest vertical edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the walking surface shall be considered a hazardous location.

Exceptions:

1. Decorative glazing.
2. Where there is an intervening wall or other permanent barrier between the door and glazing.
3. Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with Section 2406.4.3.
4. Glazing in walls on the latch side of and perpendicular to the plane of the door in a closed position in one- and two-family dwellings or within dwelling units in Group R-2 occupancies.

2406.4.3 Glazing in windows. Glazing in an individual fixed or operable panel that meets all of the following conditions shall be considered to be a hazardous location:

1. The exposed area of an individual pane is greater than 9 square feet (0.84 m²).
2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor.
3. The top edge of the glazing is greater than 36 inches (914 mm) above the floor.
4. One or more walking surface(s) are within 36 inches (914 mm), measured horizontally and in a straight line, of the plane of the glazing.

Exceptions:

1. Decorative glazing.
2. Where a horizontal rail is installed on the accessible side(s) of the glazing 34 to 38 inches (864 to 965 mm) above the walking surface. The rail shall be capable of withstanding a horizontal load of 50 pounds per linear foot (730 N/m) without contacting the glass and be not less than 1½ inches (38 mm) in cross-sectional height.

3. Outboard panes in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 25 feet (7620 mm) or more above any grade, roof, walking surface or other horizontal or sloped (within 45 degrees of horizontal) (0.79 rad) surface adjacent to the glass exterior.

2406.4.4 Glazing in guards and railings. Glazing in guards and railings, including structural baluster panels and nonstructural in-fill panels, regardless of area or height above a walking surface, shall be considered to be a hazardous location.

2406.4.5 Glazing and wet surfaces. Glazing in walls, enclosures or fences containing or facing hot tubs, spas, whirlpools, saunas, steam rooms, bathtubs, showers and indoor or outdoor swimming pools where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) measured vertically above any standing or walking surface shall be considered a hazardous location. This shall apply to single glazing and all panes in multiple glazing.

Exception: Glazing that is more than 60 inches (1524 mm), measured horizontally and in a straight line, from the water’s edge of a bathtub, hot tub, spa, whirlpool or swimming pool.

2406.4.6 Glazing adjacent to stairways and ramps. Glazing where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface of stairways, landings between flights of stairs and ramps shall be considered a hazardous location.

Exceptions:

1. The side of a stairway, landing or ramp that has a guard complying with the provisions of Sections 1015 and 1607.8, and the plane of the glass is greater than 18 inches (457 mm) from the railing.

2. Glazing 36 inches (914 mm) or more measured horizontally from the walking surface.

2406.4.7 Glazing adjacent to the bottom stairway landing. Glazing adjacent to the landing at the bottom of a stairway where the glazing is less than 60 inches (1524 mm) above the landing and within a 60-inch (1524 mm) horizontal arc that is less than 180 degrees (3.14 rad) from the bottom tread nosing shall be considered a hazardous location.

Exception: Glazing that is protected by a guard complying with Sections 1015 and 1607.8 where the plane of the glass is greater than 18 inches (457 mm) from the guard.

2406.5 Fire department access panels. Fire department glass access panels shall be of [non-laminated] nonlaminated tempered glass. For insulating glass units, all panes shall be [non-laminated] nonlaminated tempered glass.

Exception: Fire department access panels that are openable and meeting size requirements of Section 903.2.11.1.
SECTION BC 2407
GLASS IN HANDRAILS AND GUARDS

2407.1 Materials. Glass used as structural balustrade panels in railings shall be constructed of either single fully tempered glass, laminated fully tempered glass or laminated heat-strengthened glass. Glazing in railing material that conforms to the provisions of Section 2406.1.1. For all glazing types, the minimum nominal thickness shall be ¼ inch (6.4 mm). Fully tempered glass and laminated glass shall comply with Category II of CPSC CFR 1201, listed in Chapter 35. and in-fill panels in railings shall be laminated glass constructed of fully tempered or heat-strengthened glass and shall comply with Category II or CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1. For all glazing types, the minimum nominal thickness shall be ¼ inch (6.4 mm).

Exception: For Group R-3 occupancies, single fully tempered glass complying with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1 shall be permitted to be used in handrails and guardrails where there is no walking surface beneath them or the walking surface is permanently protected from the risk of falling glass.

2407.1.1 Loads. The panels and their support system shall be designed to withstand the loads specified in Section [1607.7] 1607.8. [A safety factor of not less than four shall be used]. Glass guard elements shall be designed using a factor of safety of four.

2407.1.2 [Support. Each] Support and framing. Support and framing of glass used in handrails and guards shall comply with the requirements of Sections 2403.2 and 2403.3. In glass structural balustrade systems, each handrail or guard section shall be supported by a minimum of no fewer than three glass balusters or shall be otherwise supported to remain in place should one baluster panel fail. Glass balusters shall not be installed without an attached handrail or guard.

Exception: A top rail shall not be required where the glass balusters are laminated glass with two or more glass plies of equal thickness and the same glass type [when approved by the department]. The panels shall be designed to withstand the loads specified in Section 1607.7. An attached top rail or handrail is not required when panels are tested to remain in place as a barrier following impact or glass breakage in accordance with ASTM E2353, and designed to withstand the loads specified in Section 1607.8.

2407.1.3 Parking garages. Glazing materials shall not be installed in handrails or guards in parking garages except for pedestrian areas not exposed to impact from vehicles.

2407.1.4 Glazing in wind-borne debris regions. Glazing installed in in-fill panels or balusters in wind-borne debris regions shall comply with the following:

2407.1.4.1 [Balusters] Balusters and in-fill panels. Glass installed in exterior railing in-fill panels or balusters shall be laminated glass complying with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1.

2407.1.4.2 Glass supporting top rail. When the top rail is supported by glass, the assembly shall be tested according to the impact requirements of Section [1609.1.3] 1609.1.2. The top rail shall remain in place after impact.
SECTION BC 2408
GLAZING IN ATHLETIC FACILITIES

2408.1 General. Glazing in athletic facilities and similar uses subject to impact loads, which forms whole or partial wall sections or which is used as a door or part of a door, shall comply with this section.

2408.2 Racquetball and squash courts. Glazing in racquetball, squash courts and similar athletic facilities subject to impact loads shall comply with this section.

2408.2.1 Testing. Test methods and loads for individual glazed areas in racquetball and squash courts subject to impact loads shall conform to those of CPSC 16 CFR Part 1201 or ANSI Z97.1 [listed in Chapter 35], with impacts being applied at a height of 59 inches (1499 mm) above the playing surface to an actual or simulated glass wall installation with fixtures, fittings and methods of assembly identical to those used in practice.

Glass walls shall comply with the following conditions:

1. A glass wall in a racquetball or squash court, or similar use subject to impact loads, shall remain intact following a test impact.

2. The deflection of such walls shall be not greater than 1½ inches (38 mm) at the point of impact for a drop height of 48 inches (1219 mm).

Glass doors shall comply with the following conditions:

1. Glass doors shall remain intact following a test impact at the prescribed height in the center of the door.

2. The relative deflection between the edge of a glass door and the adjacent wall shall not exceed the thickness of the wall plus ½ inch (12.7 mm) for a drop height of 48 inches (1219 mm).

2408.3 [Gymnasium] Gymnasia and basketball courts. Glazing in multipurpose gymnasia, basketball courts and similar athletic facilities subject to human impact loads shall comply with Category II of CPSC 16 CFR Part 1201 or Class A of ANSI Z97.1 [listed in Chapter 35].

SECTION BC 2409
GLASS IN WALKWAYS, ELEVATOR HOISTWAYS AND ELEVATOR CARS

2409.1 Glass walkways. Glass installed as floors, landings, stairs and in similar locations shall be designed and engineered by a registered design professional and the design shall include the applicable provisions of ASTM E 2751 and the load requirements of Chapter 16. Such assemblies shall comply with the fire-resistance rating and marking requirements of this code where applicable.

2409.2 Glass in elevator hoistway enclosures. Glass in elevator hoistway enclosures and hoistway doors shall be laminated glass conforming to ANSI Z97.1 or CPSC 16 CFR Part 1201 and ASME A17.1, as modified by Appendix K of this code.
2409.1 Fire-resistance-rated hoistways. Glass installed in hoistways and hoistway doors where the hoistway is required to have a fire-resistance rating shall also comply with Section 715-716.

2409.1.2 Glass hoistway doors. The glass in glass hoistway doors shall be not less than 60 percent of the total visible door panel surface area as seen from the landing side.

2409.2 Glass visions panels. Glass in vision panels in elevator hoistway doors shall be permitted to be any transparent glazing material not less than 1/4 inches (6.4 mm) in thickness conforming to Class A in accordance with ANSI Z97.1 or Category II in accordance with CPSC 16 CFR Part 1201. The area of any single vision panel shall not be less than 12 square inches (0.008 m²), and the total area of one or more vision panels in any hoistway door shall be not more than 40 square inches (0.026 m²). See ASME A17.1, as modified by Appendix K of this code for additional requirements.

2409.3 Visions panels in elevator hoistway doors. Glass in vision panels in elevator hoistway doors shall be permitted to be any transparent glazing material not less than 1/4 inch (6.4 mm) in thickness conforming to Class A in accordance with ANSI Z97.1 or Category II in accordance with CPSC 16 CFR Part 1201. Glass in vision panels in elevator hoistway doors shall also comply with ASME A17.1, Section 2.11.7, as modified by Appendix K of this code for additional requirements.

2409.4 Glass in elevator cars. Glass in elevator cars shall be in accordance with ASME A17.1 section 2.14.1.8, as modified by Appendix K.

2409.4.1 Glass types. Glass in elevator car enclosures, glass elevator car doors and glass used for lining walls and ceilings of elevator cars shall be laminated glass conforming to Class A in accordance with ANSI Z97.1 or Category II in accordance with CPSC 16 CFR Part 1201. See ASME A17.1, as modified by Appendix K of this code for additional requirements.

Exception: Tempered glass shall be permitted to be used for lining walls and ceilings of elevator cars provided:

1. The glass is bonded to a nonpolymeric coating, sheeting or film backing having a physical integrity to hold the fragments when the glass breaks;

2. The glass is not subjected to further treatment such as sandblasting, etching, heat treatment or painting that could alter the original properties of the glass; And

3. The glass is tested to the acceptance criteria for laminated glass as specified for Class A in accordance with ANSI-Z97.1 or Category II in accordance with CPSC 16 CFR Part 1201.

2409.3.2 Surface area. The glass in glass elevator car doors shall be not less than 60 percent of the total visible door panel surface area as seen from the car side of the doors.
SECTION BC 2410
MARKING OF TRANSPARENT DOORS AND FIXED ADJACENT TRANSPARENT [SIDELIGHTS] SIDELITES

[2410.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.]

[SIDELIGHTS. Fixed transparent panels which form part of or are immediately adjacent to and within 6 feet horizontally of the vertical edge of an opening in which transparent doors are located. A sidelight shall consist of transparent material in which the transparent area above a reference line 18 inches (457 mm) above the adjacent ground, floor or equivalent surface is 80 percent or more of the remaining area of the pane above such reference line.]

[TRANSPARENT. The property of a material which is not opaque and through which objects lying beyond are clearly visible.]

[TRANSPARENT DOOR. A door, manually or power actuated, fabricated of transparent material, in which the transparent area above a reference line 18 inches (457 mm) above the bottom edge of the door is 80 percent or more of the remaining area of the door above such reference line.]

[TRANSPARENT SAFETY GLAZING MATERIALS. Materials which will clearly transmit light and also minimize the possibility of cutting or piercing injuries resulting from breakage of the material. Materials covered by this definition include laminated glass, tempered glass (also known as heat-treated glass, heat-toughened glass, case-hardened glass or chemically tempered glass), wired glass, and plastic glazing.]

[2410.2 2410.1 Requirement. Transparent doors and fixed adjacent [sidelights] sidelites shall be marked in accordance with [Section BC 2410.3 to 2410.5] Sections 2410.3 through 2410.4.

Exceptions:

1. One- and two-family dwellings.

2. Fixed adjacent transparent [sidelights] sidelites 20 inches (508 mm) or less in width with opaque stiles at least 1¾ inches (44 mm) in width.

3. Where the ground, floor or equivalent surface area in the path of approach to a fixed adjacent transparent [sidelight] sidelite from either side for a minimum distance of 3 feet (914 mm) from such [sidelight] sidelite is so arranged, constructed or designed as to deter persons from approaching such [sidelight] or a permanent barrier is installed in the path of approach, provided that:

   3.1 Decorative pools, horticultural planting or similar installations shall be considered as indicating that the ground, floor or equivalent surface area is not a path of approach.

   3.2 Planters, benches and similar barriers which are securely fastened to the floor or wall to prevent their removal shall be considered as blocking the path of approach provided they shall be not less than 18 inches (457 mm) in height from the ground,
floor or equivalent surface and extend across at least 2/3 of the total width of the glazed area of the sidelight.

4. Fixed adjacent transparent [sidelights] sidelites which are supported by opaque sill and wall construction of at least 18 inches (457 mm) above the ground, floor or equivalent surface immediately adjacent.

5. Display windows in any establishment, building or structure which fall within the definition of a [sidelight] sidelite if the top of the supporting sill and wall construction is not less than 18 inches (457 mm) above the ground, floor or equivalent surface immediately adjacent and the interior area is occupied with merchandise or similar displays to clearly indicate to the public that it is not a means of ingress or egress.

6. Opaque door pulls or push bars extending across at least two-thirds of the total width of the glazed area.

[2410.3] 2410.2 Locations. Transparent doors and fixed adjacent transparent [sidelights] sidelites shall be marked in two areas on the glass surface. One such area shall be located at least 30 inches (762 mm) but not more than 36 inches (914 mm) above the ground, floor or equivalent surface below the door or [sidelight] sidelite, and the other at least 60 inches (1524 mm) but not more than 66 inches (1676 mm) above the ground, floor or equivalent surface below the door or [sidelight] sidelite.

Exception: The use of horizontal separation bars, muntin bars or other equivalent bars at least one and 1½ inches (38 mm) in vertical dimension that extend across the total width of the glazed area and are located at least 40 inches (1016 mm) but not more than 50 inches (1270 mm) above the bottom of the door or [sidelight] sidelite is permitted in lieu of markings.

[2410.4] 2410.3 Design. The marking design shall be at least 4 inches (102 mm) in diameter if circular or 4 inches (102 mm) in its least dimension if elliptical or polygonal, or shall be at least 12 inches (305 mm) in horizontal dimension if the marking is less than 4 inches (102 mm) in its least dimension. In no event shall the vertical dimension of any marking including lettering be less than 1½ inches (38 mm) in height.

[2410.5] 2410.4 Materials. Markings may be comprised of, but are not limited to:

1. Muntin bars, separation bars or other equivalent bars;
2. Chemical etching;
3. Sandblasting;
4. Adhesive strips;
5. Decals; or
6. Paint, gilding or other opaque marking materials.
§ 25. Chapter 25 of the New York city building code, as amended by local law number 141 for the year 2013, sections 2501.1.1 and 2502.1 as amended by local law number 13 for the year 2014, section 2506.3 as added by local law number 13 for the year 2014, is amended to read as follows:

CHAPTER 25
GYPSUM BOARD, GYPSUM PANEL PRODUCTS AND PLASTER

SECTION BC 2501
GENERAL

2501.1 Scope.

[2501.1.1 General.] Provisions of this chapter shall govern the materials, design, construction and quality of gypsum board, gypsum panel products, lath, gypsum plaster, cement plaster, and cement board and reinforced gypsum concrete.

[2501.1.2] 2501.2 Performance. Lathing, plastering, gypsum board and gypsum panel product construction shall be done in the manner and with the materials specified in this chapter and the referenced standards listed in Chapter 35. When fire protection is required, such construction shall also comply with the provisions of Chapter 7.

[2501.1.3] 2501.3 Other materials. Other approved wall or ceiling coverings shall be permitted to be installed in accordance with the recommendations of the manufacturer and the approval of the commissioner.

SECTION BC 2502
DEFINITIONS

2502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere, have the meanings shown herein:

CEMENT BOARD. [A fiber reinforced cementitious panel most commonly used under flooring or as a tile backing board. Cement board shall include discrete nonasbestos fiber-cement interior substrate sheets or nonasbestos fiber-mat reinforced cement substrate sheets.]

CEMENT PLASTER. [A mixture of portland or blended cement, portland cement or blended cement and hydrated lime, masonry cement or plastic cement and aggregate and other approved materials as specified in this code.]  

EXTERIOR SURFACES. [Weather-exposed surfaces.]

GYPSUM BOARD. [Gypsum wallboard, gypsum sheathing, gypsum base for gypsum veneer plaster, exterior gypsum soffit board, predecorated gypsum board or water-resistant gypsum backing board complying with the standards listed in Tables 2506.2, 2507.2 and Chapter 35.]
GYPSUM PANEL PRODUCTS.

GYPSUM PLASTER. [A mixture of calcined gypsum or calcined gypsum and lime and aggregate and other approved materials as specified in this code.]

GYPSUM VENEER PLASTER. [Gypsum plaster applied to an approved base in one or more coats normally not exceeding ¼ inch (6.4 mm) in total thickness.]

INTERIOR SURFACES. [Surfaces other than weather-exposed surfaces.]

WEATHER-EXPOSED SURFACES. [Surfaces of walls, ceilings, floors, roofs, soffits and similar surfaces exposed to the weather except the following:]

1. Ceilings and roof soffits enclosed by walls, fascia, bulkheads or beams that extend a minimum of 12 inches (305 mm) below such ceiling or roof soffits.

2. Walls or portions of walls beneath an unenclosed roof area, where located a horizontal distance from an open exterior opening equal to at least twice the height of the opening.

3. Ceiling and roof soffits located a minimum horizontal distance of 10 feet (3048 mm) from the outer edges of the ceiling or roof soffits.

WIRE BACKING. [Horizontal strands of tautened wire attached to surfaces of vertical supports which, when covered with the building paper, provide a backing for cement plaster.]

SECTION BC 2503
RESERVED

SECTION BC 2504
VERTICAL AND HORIZONTAL ASSEMBLIES

2504.1 Scope. The following requirements shall be met where construction involves gypsum board, gypsum panel products or lath and plaster in vertical and horizontal assemblies.

2504.1.1 Wood framing. Wood supports for lath, gypsum board or gypsum panel products, as well as wood stripping or furring, shall be not less than 2 inches (51 mm) nominal thickness in the least dimension.

Exception: The minimum nominal dimension of wood furring strips installed over solid backing shall be not less than 1 inch by 2 inches (25 mm by 51 mm).

2504.1.2 Studless partitions. The minimum thickness of vertically erected studless solid plaster partitions of ⅜-inch (9.5 mm) and ¾-inch (19.1 mm) rib metal lath or ½-inch-thick (12.7 mm) long-length gypsum lath, gypsum board partitions or gypsum panel product shall be 2 inches (51 mm).
SELECTION BC 2505
SHEAR WALL CONSTRUCTION

2505.1 Resistance to shear (wood framing). Wood-frame shear walls sheathed with gypsum board, gypsum panel products or lath and plaster shall be designed and constructed in accordance with Section 2306.7 of this code and are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7.

2505.2 Resistance to shear (steel framing). Cold-formed steel-frame shear walls sheathed with gypsum board or gypsum panel products and constructed in accordance with the materials and provisions of Section 2210.6 of this code are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7.

SELECTION BC 2506
GYPSUM BOARD AND GYPSUM PANEL PRODUCT MATERIALS

2506.1 General. Gypsum board materials, gypsum panel products and accessories shall be identified by the manufacturer’s designation to indicate compliance with the appropriate standards referenced in this section and stored to protect such materials from the weather.

2506.2 Standards. Gypsum board materials and gypsum panel products shall conform to the appropriate standards listed in Table 2506.2 and Chapter 35 and, where required for fire protection, shall conform to the provisions of Chapter 7.

2506.2.1 Other materials. Metal suspension systems for acoustical and lay-in panel ceilings shall conform with Section \[803.9\] 808.1.

2506.3 Mold resistance. Gypsum board or cement board, used in an assembly for the following areas, shall have a mold resistance rating of 10 in accordance with ASTM D3273:

1. Interior faces of exterior walls of basements, cellars, and other below grade rooms.\[2\]
2. Walls and ceilings of spaces containing condensers, water tanks, water pumps, and pressure reduction valves.\[3\]
3. Walls and ceilings of laundry rooms.\[4\]
4. Portions of walls within 2 feet (610 mm) of kitchen sinks to a height of 4 feet (1219 mm) above the floor.\[5\]
5. Portions of walls within 2 feet (610 mm) of kitchen stoves to a height of 4 feet (1219 mm) above the floor.\[6\]
6. Walls of bathrooms that are not solely water closet compartments, other than walls specifically required to be cement board.\[7\]
7. Walls and ceilings in service sink closets and.\[8\]
8. Portions of walls within 2 feet (610 mm) of mop sinks or service sinks to a height of 4 feet (1219 mm) above the floor.

LATHING AND PLASTERING

2507.1 General. Lathing and plastering materials and accessories shall be marked by the manufacturer’s designation to indicate compliance with the appropriate standards referenced in this section and stored in such a manner to protect them from the weather.

2507.2 Standards. Lathing and plastering materials shall conform to the standards listed in Table 2507.2 and Chapter 35 and, where required for fire protection, shall also conform to the provisions of Chapter 7.

SECTION BC 2508
GYPSUM CONSTRUCTION

2508.1 General. Gypsum board, gypsum panel products and gypsum plaster construction shall be of the materials listed in Tables 2506.2 and 2507.2. These materials shall be assembled and installed in compliance with the appropriate standards listed in Tables 2508.1 and 2511.1.1, and Chapter 35.

2508.2 Limitations. Gypsum wallboard or gypsum plaster shall not be used in any exterior surface where such gypsum construction will be exposed directly to the weather. Gypsum wallboard shall not be used where there will be direct exposure to water or continuous high humidity conditions beyond the published recommendations of the manufacturer. Gypsum sheathing shall be installed on exterior surfaces in accordance with ASTM C 1280.

2508.2.1 Weather protection. Gypsum wallboard, gypsum lath or gypsum plaster shall not be installed until weather protection for the installation is provided.

2508.3 Single-ply application. Edges and ends of gypsum board and gypsum panel products shall occur on the framing members, except those edges and ends that are perpendicular to the framing members. Edges and ends of gypsum board and gypsum panel products shall be in moderate contact except in concealed spaces where fire-resistance-rated construction, shear resistance or diaphragm action is not required.

2508.3.1 Floating angles. Fasteners at the top and bottom plates of vertical assemblies, or the edges and ends of horizontal assemblies perpendicular to supports, and at the wall line are permitted to be omitted except on shear resisting elements or fire-resistance-rated assemblies. Fasteners shall be applied in such a manner as not to fracture the face paper with the fastener head.
2508.4 Joint treatment. Gypsum board and gypsum panel product fire-resistance-rated assemblies shall have joints and fasteners treated.

Exception: Joint and fastener treatment need not be provided where any of the following conditions occur:

1. Where the gypsum board or the gypsum panel product is to receive a decorative finish such as wood paneling, battens, acoustical finishes or any similar application that would be equivalent to joint treatment.

2. On single-layer systems where joints occur over wood framing members.

3. Square edge or tongue-and-groove edge gypsum board (V-edge), gypsum panel products, gypsum backing board or gypsum sheathing.

4. On multilayer systems where the joints of adjacent layers are offset from one to another.

5. Assemblies tested without joint treatment.

2508.5 Horizontal gypsum board or gypsum panel product diaphragm ceilings. Gypsum board or gypsum panel products shall be permitted to be used on wood joists to create a horizontal diaphragm ceiling in accordance with Table 2508.5.

<table>

</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.59 N/m.

a. Values are not cumulative with other horizontal diaphragm values and are for short-term [loading due to] wind or seismic loading. Values shall be reduced 25 percent for normal loading.

b. Values shall be reduced 50 percent in Seismic Design Categories D, E and F.

c. \(\frac{1}{4}\)-inch, No. 6 Type S or W screws are permitted to be substituted for the listed nails.

2508.5.1 Diaphragm proportions. The maximum allowable diaphragm proportions shall be 1\(\frac{1}{2}:1\) between shear resisting elements. Rotation or cantilever conditions shall not be permitted.
2508.5.2 Installation. Gypsum board or gypsum panel products used in a horizontal diaphragm ceiling shall be installed perpendicular to ceiling framing members. End joints of adjacent courses of gypsum board shall not occur on the same joist.

2508.5.3 Blocking of perimeter edges. [All perimeter] Perimeter edges shall be blocked using a wood member not less than 2-inch by 6-inch (51 mm by 152 mm) nominal dimension. Blocking material shall be installed flat over the top plate of the wall to provide a nailing surface not less than 2 inches (51 mm) in width for the attachment of the gypsum board or gypsum panel product.

2508.5.4 Fasteners. Fasteners used for the attachment of gypsum board or gypsum panel products to a horizontal diaphragm ceiling shall be as defined in Table 2508.5. Fasteners shall be spaced not more than 7 inches (178 mm) on center (o.c.) at all supports, including perimeter blocking, and not more than ⅜ inch (9.5 mm) from the edges and ends of the gypsum board or gypsum panel product.

2508.5.5 Lateral force restrictions. Gypsum board or gypsum panel products shall not be used in diaphragm ceilings to resist lateral forces imposed by masonry or concrete construction.

SECTION BC 2509
[GYPSUM BOARD IN] SHOWERS AND WATER CLOSETS

2509.1 Wet areas. Showers and public toilet walls shall conform to [Sections] Section 1210.2 and 1210.3.

2509.2 Base for tile. [Glass mat water resistant gypsum backing panels, discrete nonasbestos fiber cement interior substrate sheets or nonasbestos fiber mat reinforced cement substrate sheets in compliance with ASTM C 1178, C 1288 or C 1325 and installed in accordance with manufacturer recommendations shall be] Materials used as a base for wall tile in tub and shower areas and wall and ceiling panels in shower areas shall be of materials listed in Table 2509.2 and installed in accordance with the manufacturer’s recommendations. Water-resistant gypsum backing board shall be used as a base for tile in water closet compartment walls when installed in accordance with GA-216 or ASTM C 840 and [manufacturer] the manufacturer’s recommendations. Regular gypsum wallboard is permitted under tile or wall panels in other wall and ceiling areas when installed in accordance with GA-216 or ASTM C 840.

</tbody>
</table>

#### 2509.3 Limitations.
Water-resistant gypsum backing board shall not be used in the following locations:

1. Over a vapor retarder in shower or bathtub compartments.

2. Where there will be direct exposure to water or in areas subject to continuous high humidity.

3. On ceilings where frame spacing exceeds 12 inches (305 mm) o.c. for 1/4-inch thick (12.7 mm) water-resistant gypsum backing board and more than 16 inches (406 mm) o.c. for 5/8-inch thick (15.9 mm) water-resistant gypsum backing board.

#### SECTION BC 2510
**LATHING AND FURRING FOR CEMENT PLASTER (STUCCO)**

#### 2510.1 General.
Exterior and interior cement plaster and lathing shall be done with the appropriate materials listed in Table 2507.2 and Chapter 35.

#### 2510.2 Weather protection.
Materials shall be stored in such a manner as to protect them from the weather.

#### 2510.3 Installation.
Installation of these materials shall be in compliance with ASTM C 926 and ASTM C 1063.

#### 2510.4 Corrosion resistance.
Metal lath and lath attachments shall be of corrosion-resistant material.

#### 2510.5 Backing.
Back ing or a lath shall provide sufficient rigidity to permit plaster applications.

1. **Support of lath.** Where lath on vertical surfaces extends between rafters or other similar projecting members, solid backing shall be installed to provide support for lath and attachments.

2. **Use of gypsum backing board.** Gypsum backing for cement plaster shall be in accordance with Section 2510.5.2.1 or 2510.5.2.2.

3. **Use of gypsum board as a backing board.** Gypsum lath or gypsum wallboard shall not be used as a backing for cement plaster.
**Exception:** Gypsum lath or gypsum wallboard is permitted, with a water-resistive barrier, as a backing for self-furred metal lath or self-furred wire fabric lath and cement plaster where either of the following conditions occur:

1. On horizontal supports of ceilings or roof soffits.
2. On interior walls.

**2510.5.2.2 [Use of gypsum] Gypsum sheathing backing.** Gypsum sheathing is permitted as a backing for metal or wire fabric lath and cement plaster on walls. A water-resistive barrier shall be provided in accordance with Section 2510.6.

**2510.5.3 Backing not required.** Wire backing is not required under expanded metal lath or paperbacked wire fabric lath.

**2510.6 Water-resistive barriers.** Water-resistive barriers shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a water-resistive [vapor-permeable] barrier with a performance at least equivalent to two layers of [Grade D paper] water-resistive barrier complying with ASTM E 2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing (installed in accordance with Section 1405.4), has a means for draining water that enters the assembly to the exterior.

**Exception:** Where the water-resistive barrier that is applied over wood-based sheathing has a water resistance equal to or greater than that of [60-minute Grade D paper] a water-resistive barrier complying with ASTM E 2556, Type II and is separated from the stucco by an intervening, substantially nonwater-absorbing layer or drainage space.

**2510.7 Preparation of masonry and concrete.** Surfaces shall be clean, free from efflorescence, sufficiently damp and rough for proper bond. If the surface is insufficiently rough, approved bonding agents or a portland cement dash bond coat mixed in proportions of not more than two parts volume of sand to one part volume of portland cement or plastic cement shall be applied. The dash bond coat shall be left undisturbed and shall be moist cured not less than 24 hours.

**SECTION BC 2511 INTERIOR PLASTER**

**2511.1 General.** Plastering gypsum plaster or cement plaster shall be not less than three coats where applied over metal lath or wire fabric lath and not less than two coats where applied over other bases permitted by this chapter.

**Exception:** Gypsum veneer plaster and cement plaster specifically designed and approved for one-coat applications.

**2511.1.1 Installation.** Installation of lathing and plaster materials shall conform [with] to Table [2511.1] 2511.1.1 and Section 2507.
2511.1.1 INSTALLATION OF PLASTER CONSTRUCTION

<table>

</tr>
</tbody>
</table>

2511.2 Limitations. Plaster shall not be applied directly to fiber insulation board. Cement plaster shall not be applied directly to gypsum lath or gypsum plaster except as specified in Sections 2510.5.1 and 2510.5.2.

2511.3 Grounds. Where installed, grounds shall ensure the minimum thickness of plaster as set forth in ASTM C 842 and ASTM C 926. Plaster thickness shall be measured from the face of lath and other bases.

2511.4 Interior masonry or concrete. Condition of surfaces shall be as specified in Section 2510.7. Approved specially prepared gypsum plaster designed for application to concrete surfaces or approved acoustical plaster is permitted. The total thickness of base coat plaster applied to concrete ceilings shall be as set forth in ASTM C 842 or ASTM C 926. Should ceiling surfaces require more than the maximum thickness permitted in ASTM C 842 or ASTM C 926, metal lath or wire fabric lath shall be installed on such surfaces before plastering.

2511.5 Wet areas. Showers and public toilet walls shall conform to Sections 1210.2 and 1210.3. When wood frame walls and partitions are covered on the interior with cement plaster or tile of similar material and are subject to water splash, the framing shall be protected with an approved moisture barrier.

SECTION BC 2512
EXTERIOR PLASTER

2512.1 General. Plastering with cement plaster shall be not less than three coats when applied over metal lath or wire fabric lath or gypsum board backing as specified in Section 2510.5 and shall be not less than two coats when applied over masonry or concrete. If the plaster surface is to be completely covered by veneer or other facing material, or is completely concealed by another wall, plaster application need only be two coats, provided the total thickness is as set forth in ASTM C 926.

2512.1.1 On-grade floor slab. On wood [framed] frame or steel stud construction with an on-grade concrete floor slab system, exterior plaster shall be applied in such a manner as to cover, but not to extend below, the lath and paper. The application of lath, paper and flashing or drip screeds shall comply with ASTM C 1063.
2512.1.2 Weep screeds. A minimum 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage), corrosion-resistant weep screed with a minimum vertical attachment flange of 3½ inches (89 mm) shall be provided at or below the foundation plate line on exterior stud walls in accordance with ASTM C 926. The weep screed shall be placed a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas and be of a type that will allow trapped water to drain to the exterior of the building. The water-resistant barrier shall lap the attachment flange. The exterior lath shall cover and terminate on the attachment flange of the weep screed.

2512.2 Plasticity agents. Only approved plasticity agents and approved amounts thereof shall be added to portland cement or blended cements. When plastic cement or masonry cement is used, no additional lime or plasticizers shall be added. Hydrated lime or the equivalent amount of lime putty used as a plasticizer is permitted to be added to cement plaster or cement and lime plaster in an amount not to exceed that set forth in ASTM C 926.

2512.3 Limitations. Gypsum plaster shall not be used on exterior surfaces.

2512.4 Cement plaster. Plaster coats shall be protected from freezing for a period of not less than 24 hours after set has occurred. Plaster shall be applied when the ambient temperature is higher than 40°F (4°C), unless provisions are made to keep cement plaster work above 40°F (4°C) during application and 48 hours thereafter.

2512.5 Second-coat application. The second coat shall be brought out to proper thickness, rodded and floated sufficiently rough to provide adequate bond for the finish coat. The second coat shall have no variation greater than ¼ inch (6.4 mm) in any direction under a 5-foot (1524 mm) straight edge.

2512.6 Curing and interval. First and second coats of cement plaster shall be applied and moist cured as set forth in ASTM C 926 and Table 2512.6.

<table>
<thead>
<tr>
<th>COAT</th>
<th>MINIMUM PERIOD MOIST CURING</th>
<th>MINIMUM INTERVAL BETWEEN COATS</th>

</tr>
<tr>
<td>Finish</td>
<td>—</td>
<td>Note &lt;sup&gt;c&lt;/sup&gt;</td>
</tr>
</tbody>
</table>

<sup>a</sup> The first two coats shall be as required for the first coats of exterior plaster, except that the moist-curing time period between the first and second coats shall not be less than 24 hours. Moist curing shall not be required where job and weather conditions are favorable to the retention of moisture in the cement plaster for the required time period.

<sup>b</sup> Twenty-four-hour minimum interval between coats of interior cement plaster. For alternate method of application, see Section 2512.8.

<sup>c</sup> Finish coat plaster is permitted to be applied to interior cement base coats after a 48-hour period.

2512.7 Application to solid backings. Where applied over gypsum backing as specified in Section 2510.5 or directly to unit masonry surfaces, the second coat is permitted to be applied as soon as the first coat has attained sufficient hardness.

1703
2512.8 Alternate method of application. The second coat is permitted to be applied as soon as the first coat has attained sufficient rigidity to receive the second coat.

2512.8.1 Admixtures. When using this method of application, calcium aluminate cement up to 15 percent of the weight of the portland cement is permitted to be added to the mix.

2512.8.2 Curing. Curing of the first coat is permitted to be omitted and the second coat shall be cured as set forth in ASTM C 926 and Table 2512.6.

2512.9 Finish coats. Cement plaster finish coats shall be applied over base coats that have been in place for the time periods set forth in ASTM C 926. The third or finish coat shall be applied with sufficient material and pressure to bond and to cover the brown coat and shall be of sufficient thickness to conceal the brown coat.

SECTION BC 2513
EXPOSED AGGREGATE PLASTER

2513.1 General. Exposed natural or integrally colored aggregate is permitted to be partially embedded in a natural or colored bedding coat of cement plaster or gypsum plaster, subject to the provisions of this section.

2513.2 Aggregate. The aggregate shall be applied manually or mechanically and shall consist of marble chips, pebbles or similar durable, moderately hard (three or more on the Mohs hardness scale), nonreactive materials.

2513.3 Bedding coat proportions. The bedding coat for interior or exterior surfaces shall be composed of one part portland cement and one part Type S lime; or one part blended cement and one part Type S lime; or masonry cement; or plastic cement[^1] and a maximum of three parts of graded white or natural sand by volume. The bedding coat for interior surfaces shall be composed of 100 pounds (45.4 kg) of neat gypsum plaster and a maximum of 200 pounds (90.8 kg) of graded white sand. A factory-prepared bedding coat for interior or exterior use is permitted. The bedding coat for exterior surfaces shall have a minimum compressive strength of 1,000 pounds per square inch (psi) (6895 kPa).

2513.4 Application. The bedding coat is permitted to be applied directly over the first (scratch) coat of plaster, provided the ultimate overall thickness is a minimum of 7/8 inch (22 mm), including lath. Over concrete or masonry surfaces, the overall thickness shall be a minimum of ½ inch (12.7 mm).

2513.5 Bases. Exposed aggregate plaster is permitted to be applied over concrete, masonry, cement plaster base coats or gypsum plaster base coats installed in accordance with Section 2511 or 2512.

2513.6 Preparation of masonry and concrete. Masonry and concrete surfaces shall be prepared in accordance with the provisions of Section 2510.7.

2513.7 Curing of base coats. Cement plaster base coats shall be cured in accordance with ASTM C 926. Cement plaster bedding coats shall retain sufficient moisture for hydration (hardening) for 24 hours minimum or, where necessary, shall be kept damp for 24 hours by light water spraying.
SECTION BC 2514
REINFORCED GYPSUM CONCRETE

2514.1 General. Reinforced gypsum concrete shall comply with the requirements of ASTM C 317 and ASTM C 956.

2514.2 Minimum thickness. The minimum thickness of reinforced gypsum concrete shall be 2 inches (51 mm) except the minimum required thickness shall be reduced to 1½ inches (38 mm), provided the following conditions are satisfied:

1. The overall thickness, including the formboard, is not less than 2 inches (51 mm).
2. The clear span of the gypsum concrete between supports does not exceed 33 inches (838 mm).
3. Diaphragm action is not required.
4. The design live load does not exceed 40 pounds per square foot (psf) (1915 Pa).

2514.3 Limitations of use. Reinforced gypsum concrete shall not be used where exposed directly to the weather or where subject to frequent or continuous wetting. Precast units shall be protected by coverings or coatings from the weather and from contact with moisture during shipment and during storage at the work site.

§ 26. Chapter 26 of the New York city building code, as added by local law number 33 for the year 2007, sections 2602.1, 2603.3, 2603.4, 2603.5.1, 2603.5.2, 2603.5.4, 2603.5.7, 2603.8, 2603.9, 2604.1, 2604.2.1, 2604.2.2, 2604.2.3, 2604.2.4, 2606.4, 2606.7, 2606.10, 2606.12, 2607.4, 2607.5, 2608.1, 2608.2, 2609.3, 2610.7, 2611.1, 2613, and the figure in section 2603.8 as amended by local law number 141 for the year 2013, and section 2603.4.1.1 as amended by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 26
PLASTIC

SECTION BC 2601
GENERAL

2601.1 Scope. These provisions shall govern the materials, design, application, construction and installation of foam plastic, foam plastic insulation, plastic veneer, interior plastic finish and trim, [and] light-transmitting plastics and plastic composites, including plastic lumber. See Chapter 14 for requirements for exterior wall finish and trim.

2601.2 Exterior wall coverings. The use of plastics in exterior wall coverings is subject to the following limitations:
1. Exterior wall coverings containing plastics shall not be permitted on Type IV construction utilizing cross-laminated timber (CLT) or structural composite lumber (SCL) complying with Section 602.4.

2. Exterior wall coverings containing plastics shall not be permitted at exterior balconies and shall comply with Section 1406.3.

**Exception:** Combustible water-resistive barriers complying with Section 1403.5.1.

2601.2.1 Construction documents. Construction documents for exterior wall coverings required to be tested to NFPA 285 by this chapter shall comply with the requirements of Section 1401.2.

**SECTION BC 2602**

**DEFINITIONS**

2602.1 [General] Definitions. The following [words and terms shall, for the purposes of this chapter and as used elsewhere this code, have the meanings shown herein.] terms are defined in Chapter 2:

FIBER REINFORCED POLYMER. [A polymeric composite material consisting of reinforcement fibers impregnated with a fiber-binding polymer which is then molded and hardened.]

FIBERGLASS REINFORCED POLYMER. [A polymeric composite material consisting of glass reinforcement fibers impregnated with a fiber-binding polymer which is then molded and hardened.]

FOAM PLASTIC INSULATION. [A plastic that is intentionally expanded by the use of a foaming agent to produce a reduced-density plastic containing voids consisting of open or closed cells distributed throughout the plastic for thermal insulating or acoustical purposes and that has a density less than 20 pounds per cubic foot (pcf) (320 kg/m$^3$).]

LIGHT-DIFFUSING SYSTEM. [Construction consisting in whole or in part of lenses, panels, grids or baffles made with light transmitting plastics positioned below independently mounted electrical light sources, skylights or light-transmitting plastic roof panels. Lenses, panels, grids and baffles that are part of an electrical fixture shall not be considered as a light-diffusing system.]

LIGHT-TRANSMITTING PLASTIC ROOF PANELS. [Structural plastic panels other than skylights that are fastened to structural members, or panels or sheathing, and that are used as light-transmitting media in the plane of the roof.]

LIGHT-TRANSMITTING PLASTIC WALL PANELS. [Plastic materials that are fastened to structural members, or to structural panels or sheathing, and that are used as light-transmitting media in exterior walls.]

PLASTIC, APPROVED. [Any thermoplastic, thermosetting or reinforced thermosetting plastic material that conforms to combustibility classifications specified in the section applicable to the application and plastic type.]

PLASTIC COMPOSITE.
PLASTIC GLAZING. [Plastic materials that are glazed or set in frame or sash and not held by mechanical fasteners that pass through the glazing material.]

PLASTIC LUMBER.

THERMOPLASTIC MATERIAL. [A plastic material that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.]

THERMOSETTING MATERIAL. [A plastic material that is capable of being changed into a substantially nonreformable product when cured.]

WOOD/PLASTIC COMPOSITE.

SECTION BC 2603
FOAM PLASTIC INSULATION

2603.1 General. The provisions of this section shall govern the requirements and uses of foam plastic insulation in buildings and structures.

2603.2 Labeling and identification. Packages and containers of foam plastic insulation and foam plastic insulation components delivered to the job site shall bear the label of an approved agency showing the manufacturer’s name, [the] product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread [index] and smoke-developed indexes.

Exceptions:

1. Foam plastic interior trim shall comply with the flame spread and smoke-developed indexes as provided for in Section 2604.2.

2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved automatic sprinkler system shall be provided in both the room and that part of the building in which the room is located.

3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly shall be exempt from the flame spread requirements of this section provided the assembly with the foam plastic insulation satisfactorily passes [FM 4450] NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.

4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum
thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the thickness and density intended for use.

5. Foam plastic interior signs in covered mall buildings shall not be required to comply with the flame spread and smoke-developed indexes of this section, provided the signs comply with Section [402.4] 402.6.4.

2603.4 Thermal barrier. Except as provided for in Sections 2603.4.1 and 2603.9, foam plastic shall be changed ber DOB separated from the interior of a building by an approved thermal barrier of 1/2-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (120°C) after 15 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on FM 4880, UL 1040, NFPA 286 or UL 1715. Combustible concealed spaces shall comply with Section [748] 719 of this code.

**Exception:** Thermal barriers for exterior walls shall comply with Section 2603.5.2.

2603.4.1 Thermal barrier not required. The thermal barrier specified in Section 2603.4 is not required under the conditions set forth in Sections 2603.4.1.1 through [2603.4.1.13] 2603.4.1.14.

2603.4.1.1 Masonry or concrete construction. A thermal barrier is not required for foam plastic insulation installed in a masonry or concrete wall, floor or roof system where the foam plastic insulation is covered on each face by [a minimum of] not less than 1 inch (25 mm) thickness of masonry or concrete.

2603.4.1.2 Cooler and freezer walls. Foam plastic installed in a maximum thickness of 10 inches (254 mm) in cooler and freezer walls shall be permitted without thermal barrier, provided that the walls:

1. Have a flame spread index of 25 or less and a smoke-developed index of not more than 450, where tested in a minimum 4-inch (102 mm) thickness.

2. Have flash ignition and self-ignition temperatures of not less than 600°F and 800°F (316°C and 427°C), respectively.

3. Have a covering of not less than 0.032-inch (0.8 mm) aluminum or corrosion-resistant steel having a base metal thickness not less than 0.0160 inch (0.4 mm) at any point.

4. [Are] Be protected by an automatic sprinkler system in accordance with Section 903.3.1.1. Where the cooler or freezer is within a building, both the cooler or freezer and that part of the building in which it is located shall be sprinklered.

2603.4.1.3 Walk-in coolers. In nonsprinklered buildings, foam plastic having a thickness that does not exceed 4 inches (102 mm) and a maximum flame spread index of 75 is permitted without a thermal barrier in walk-in coolers or freezer units where the aggregate floor area does not exceed 400 square feet (37 m²) and the foam plastic is covered by a metal facing not less than 0.032-inch-thick (0.81 mm) aluminum or corrosion-resistant steel having a
minimum base metal thickness of 0.016 inch (0.41 mm). A thickness of up to 10 inches (254 mm) is permitted where protected by a thermal barrier.

2603.4.1.4 [Exterior walls—one-story] Exterior walls-one story buildings. For one-story buildings, foam plastic having a flame spread index of 25 or less, and a smoke-developed index of not more than 450, shall be permitted without thermal barriers in or on exterior walls in a thickness not more than 4 inches (102 mm) where the foam plastic is covered by a thickness of not less than 0.032-inch-thick (0.81 mm) aluminum or corrosion-resistant steel having a base metal thickness of 0.0160 inch (0.41 mm) and the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2603.4.1.5 Roofing. In construction classes that permit wood sheathing, foam plastic insulation under a roof assembly or roof covering shall be permitted without a thermal barrier, provided A thermal barrier is not required for foam plastic insulation that is a part of a Class A, B or C roof-covering assembly that [áticas] is installed in accordance with the code and the manufacturer’s instructions[. It shall be] and is either constructed as described in Item 1 or tested as described in Item 2.

1. The roof assembly is separated from the interior of the building by wood structural panel sheathing not less than 0.47 inch (11.9 mm) in thickness bonded with exterior glue, with edges supported by blocking, tongue-and-groove joints or other approved type of edge support, or an equivalent material. [A thermal barrier is not required for foam plastic insulation that is a part of a Class A, B or C roof-covering assembly, provided the]

2. The assembly with the foam plastic insulation satisfactorily passes [FM 4450] NFPA 276 or UL 1256.

2603.4.1.6 Attics and crawl spaces. Within an attic or crawl space where entry is made only for service of utilities, foam plastic insulation shall be permitted without thermal barrier if protected against ignition by 1½-inch-thick (38 mm) mineral fiber insulation; ¼-inch-thick (6.4 mm) wood structural panel, particleboard or hardboard; ½-inch (9.5 mm) gypsum wallboard, corrosion-resistant steel having a base metal thickness of 0.016 inch (0.4 mm); 1½-inch thick (38 mm) self-supported spray-applied cellulose insulation in attic spaces only or other approved material installed in such a manner that the foam plastic insulation is not exposed. The protective covering shall be consistent with the requirements for the type of construction.

2603.4.1.7 Doors not required to have a fire protection rating. Where pivoted or side-hinged doors are permitted without a fire protection rating, foam plastic insulation, having aflame spread index of 75 or less and a smoke-developed index of not more than 450, shall be permitted as a core material without a thermal barrier where the door facing is of metal having a minimum thickness of 0.032-inch (0.8 mm) aluminum or steel having a base metal thickness of not less than 0.016 inch (0.4 mm) at any point.

2603.4.1.8 Exterior doors in buildings of Group R-2 or R-3. In occupancies classified as Group R-2 or R-3, foam-filled exterior entrance doors to individual dwelling units that do
not require a fire-resistance rating shall be permitted without a thermal barrier, provided that the doors are faced with aluminum, steel, fiberglass, wood or other approved materials.

2603.4.1.9 Garage doors. Where garage doors are permitted without a fire-resistance rating and foam plastic is permitted as a core material, provided that the door facing shall be metal having a minimum thickness of 0.032-inch (0.8 mm) aluminum or 0.010-inch (0.25 mm) steel or the facing shall be minimum 0.125-inch-thick (3.2 mm) wood. Garage doors having facings other than those described above shall be tested in accordance with, and meet the acceptance criteria of DASMA 107.

2603.4.1.9.1 Garage doors in one- and two-family dwellings. Garage doors using foam plastic insulation complying with Section 2603.3 in detached and attached garages associated with one- and two-family dwellings need not be provided with a thermal barrier.

2603.4.1.10 Siding backer board. Foam plastic insulation of not more than 2,000 British thermal units per square foot (Btu/sq. ft.) (22.7 mJ/m²) as determined by NFPA 259 shall be permitted as a siding backer board with a maximum thickness of ½ inch (12.7 mm) without a thermal barrier, provided it is separated from the interior of the building by not less than 2 inches (51 mm) of mineral fiber insulation or equivalent or where applied as insulation over existing wall construction.

2603.4.1.11 Interior trim. Foam plastic used as interior trim in accordance with Section 2604 shall be permitted without a thermal barrier.

2603.4.1.12 Interior signs. Foam plastic used for interior signs in covered mall buildings in accordance with Section 402.16 of this code shall be permitted without a thermal barrier. Foam plastic signs that are not affixed to interior building surfaces shall comply with Chapter 8 of the New York City Fire Code.

2603.4.1.13 Type V construction. Foam plastic spray applied to a sill plate and joist header and rim joist in Type V construction is permitted without a thermal barrier, subject to all of the following:

1. The maximum thickness of the foam plastic shall be 3¼-inches (82.6 mm).

2. The density of the foam plastic shall be in the range of 1.5 to 2.0 pcf (24 to 32 kg/m³).

3. The foam plastic shall have a flame spread index of 25 or less and an accompanying smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723.

2603.4.1.14 Floors. The thermal barrier specified in Section 2603.4 is not required to be installed on the walking surface of a structural floor system that contains foam plastic insulation when the foam is covered by a minimum nominal ½-inch-thick (12.7 mm) wood structural panel or approved equivalent. The thermal barrier specified in Section 2603.4 is required on the underside of the structural floor system that contains foam plastic insulation when the underside of the structural floor system is exposed to the interior of the building.

Exception: Foam plastic used as part of an interior floor finish.
2603.5 Exterior walls of buildings of any height. Exterior walls of buildings of Type I, II, III or IV construction of any height shall comply with Sections 2603.5.1 through 2603.5.7. Exterior walls of cold storage buildings required to be constructed of noncombustible materials, where the building is more than one story in height, shall [also] comply with the provisions of Sections 2603.5.1 through 2603.5.7. Exterior walls of buildings of Type V construction shall comply with Sections 2603.2, 2603.3 and 2603.4.

2603.5.1 Fire-resistance-rated walls. Where the wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E 119 or UL 263 shall be provided to substantiate that the fire-resistance rating is maintained.

2603.5.2 Thermal barrier. Any foam plastic insulation shall be separated from the building interior by a thermal barrier meeting the following provisions [of Section 2603.4], unless special approval is obtained on the basis of Section 2603.9. For exterior walls, foam plastic shall be separated from the interior of a building by an approved thermal barrier of 5/8-inch (15.9 mm) Type X gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (120°C) after 20 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in accordance with criteria established by testing performed in accordance with FM 4880, UL 1040, NFPA 286 or UL 1715, where the thermal barrier shall remain in place for 20 minutes. Combustible concealed spaces shall comply with Section 718 of this code.

Exception: One-story buildings complying with Section 2603.4.1.4.

2603.5.3 Potential heat. The potential heat of foam plastic insulation in any portion of the wall or panel shall not exceed the potential heat expressed in Btu per square [feet] foot (mJ/m²) of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.5. The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square [feet] foot (mJ/m²).

Exception: One-story buildings complying with Section 2603.4.1.4.

2603.5.4 Flame spread and smoke-developed indexes. Foam plastic insulation, exterior coatings and facings shall be tested separately in the thickness intended for use, but not to exceed 4 inches (102 mm), and shall each have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723.

Exception: Prefabricated or factory-manufactured panels having minimum 0.020-inch (0.51 mm) aluminum facings and a total thickness of ¼-inch (6.4 mm) or less are permitted to be tested as an assembly where the foam plastic core is not exposed in the course of construction.

2603.5.5 [Test standard] Vertical and lateral fire propagation. The exterior wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. NFPA 285 design documentation of the tested exterior wall assembly shall be included on the submitted construction documents complying with Section 2601.2.1.
**Exceptions:**

1. One-story buildings complying with Section 2603.4.1.4.

2. Wall assemblies where the foam plastic insulation is covered on each face by not less than 1 inch (25 mm) thickness of masonry or concrete and meeting one of the following:
   
   2.1. There is no airspace between the insulation and the concrete or masonry.
   
   2.2. The insulation has a flame spread index of not more than 25 as determined in accordance with ASTM E 84 or UL 723 and the maximum airspace between the insulation and the concrete or masonry is not more than 1 inch (25 mm).

### 2603.5.5.1 Fireblocking

Exterior wall coverings containing foam plastic insulation shall be fireblocked in accordance with Section 718.2.6.1.

### 2603.5.6 Label required

The edge or face of each piece, package or container of foam plastic insulation shall bear the label of an approved agency. The label shall contain the manufacturer’s or distributor’s identification, model number, serial number or definitive information describing the product or materials’ performance characteristics and approved agency’s identification.

### 2603.5.7 Ignition

Exterior walls shall not exhibit sustained flaming where tested in accordance with NFPA 268. Where a material is intended to be installed in more than one thickness, tests of the minimum and maximum thickness intended for use shall be performed.

**Exception:** Assemblies protected on the outside with one of the following:

1. A thermal barrier complying with Section 2603.4.2

2. A minimum 1-inch (25 mm) thickness of concrete or masonry.

3. Glass-fiber-reinforced concrete panels of a minimum thickness of ¾-inch (9.5 mm).

4. Metal-faced panels having minimum 0.019-inch-thick (0.48 mm) aluminum or 0.016-inch-thick (0.41 mm) corrosion-resistant steel outer facings.

5. A minimum ¾-inch (22.2 mm) thickness of stucco complying with Section 2510.

6. A minimum ¼-inch (6.4 mm) thickness of fiber-cement lap, panel or shingle siding complying with Sections 1405.16 and 1405.16.1 or 1405.16.2.

### 2603.5.8 Special inspection

Foam plastic insulation in exterior wall coverings shall be subject to special inspection in accordance with Chapter 17.

### 2603.6 Roofing assembly

Foam plastic insulation meeting the requirements of Sections 2603.2, 2603.3 and 2603.4 shall be permitted as part of a roof-covering assembly, provided the assembly with the foam plastic insulation is a Class A, B or C roofing assembly where tested in accordance with ASTM E 108 or UL 790.
2603.7 [Plenums. Foam plastic insulation shall not be used as interior wall or ceiling finish in plenums except as permitted in Section 2604 or when protected by a thermal barrier in accordance with Section 2603.4.] Foam plastic insulation used as interior finish or interior trim in plenums. Foam plastic insulation used as interior wall or ceiling finish or as interior trim in plenums shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 and shall comply with one or more of Sections 2603.7.1, 2603.7.2 and 2607.3.

2603.7.1 Separation required. The foam plastic insulation shall be separated from the plenum by a thermal barrier complying with Section 2603.4 and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

2603.7.2 Approval. The foam plastic insulation shall exhibit a flame spread index of 25 or less and a smoke-developed index of 50 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use and shall meet the acceptance criteria of Section 803.1.2 when tested in accordance with NFPA 286. The foam plastic insulation shall be approved based on tests conducted in accordance with Section 2603.9.

2603.7.3 Covering. The foam plastic insulation shall be covered by corrosion-resistant steel having a base metal thickness of not less than 0.0160 inch (0.4 mm) and shall exhibit a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723 at the thickness and density intended for use.

2603.8 Protection against termites. In areas where the probability of termite infestation is very heavy in accordance with Figure 2603.8, extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below grade. The clearance between foam plastics installed above grade and exposed earth shall be [at least] not less than 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or preservative-treated wood.

2. An approved method of protecting the foam plastic and structure from subterranean termite damage is provided; or

3. On the interior side of basement and cellar walls.
2603.9 Special approval. Foam plastic shall not be required to comply with the requirements of Sections 2603.4 through 2603.7 or 2603.6 where specifically approved by the department based on large-scale tests such as, but not limited to, NFPA 286 (with the acceptance criteria of Section 803.2 803.1.2.1 of this code), FM 4880, UL 1040 or UL 1715. Such testing shall be related to the actual end-use configuration and be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as interior finish on the basis of special tests shall also conform to the flame spread and smoke-developed index requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

2603.10 Wind resistance. Foam plastic insulation complying with ASTM C 578 and ASTM C 1289 and used as exterior wall sheathing on framed wall assemblies shall comply with ANSI/FS 100 for wind pressure resistance and withstand the loads indicated in Chapter 16 of this code.

2603.11 Cladding attachment over foam sheathing to masonry or concrete wall construction. Cladding shall be specified and installed in accordance with Chapter 14 and the cladding manufacturer’s installation instructions or an approved design. Foam sheathing shall be attached to masonry or concrete construction in accordance with the insulation manufacturer’s installation instructions or an approved design. Furring and furring attachments through foam sheathing shall be designed to resist design loads determined in accordance with Chapter 16, including support of cladding weight as applicable. Fasteners used to attach cladding or furring through foam sheathing to masonry or concrete substrates shall be approved for application into masonry or concrete material and shall be installed in accordance with the fastener manufacturer’s installation instructions.

Exceptions:
1. Where the cladding manufacturer has provided approved installation instructions for application over foam sheathing and connection to a masonry or concrete substrate, those requirements shall apply.

2. For exterior insulation and finish systems, refer to Section 1408.

3. For anchored masonry or stone veneer installed over foam sheathing, refer to Section 1405.

2603.12 Cladding attachment over foam sheathing to cold-formed steel framing. Cladding shall be specified and installed in accordance with Chapter 14 and the cladding manufacturer’s approved installation instructions, including any limitations for use over foam plastic sheathing, or an approved design. Where used, furring and furring attachments shall be designed to resist design loads determined in accordance with Chapter 16. In addition, the cladding or furring attachments through foam sheathing to framing shall meet or exceed the minimum fastening requirements of Sections 2603.12.1 and 2603.12.2, or an approved design for support of cladding weight.

Exceptions:

1. Where the cladding manufacturer has provided approved installation instructions for application over foam sheathing, those requirements shall apply.

2. For exterior insulation and finish systems, refer to Section 1408.

3. For anchored masonry or stone veneer installed over foam sheathing, refer to Section 1405.

2603.12.1 Direct attachment. Where cladding is installed directly over foam sheathing without the use of furring, cladding minimum fastening requirements to support the cladding weight shall be as specified in Table 2603.12.1.

For SI: 1 inch = 25.4 mm; 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch = 0.00689 MPa.

DR = design required; o.c. = on center.
\textsuperscript{a} Steel framing shall be minimum 33 ksi steel for 33 mil and 43 mil steel and 50 ksi steel for 54 mil steel or thicker.
\textsuperscript{b} Screws shall comply with the requirements of AISI S240.
\textsuperscript{c} Foam sheathing shall have a minimum compressive strength of 15 pounds per square inch in accordance with ASTM C 578 or ASTM C 1289.

2603.12.2 Furred cladding attachment. Where steel or wood furring is used to attach cladding over foam sheathing, furring minimum fastening requirements to support the cladding weight shall be as specified in Table 2603.12.2. Where placed horizontally, wood furring shall be preservative-treated wood in accordance with Section 2303.1.9 or naturally durable wood and fasteners shall be corrosion resistant in accordance Section 2304.10.5. Steel furring shall have a minimum G60 galvanized coating.

For SI: 1 inch = 25.4 mm; 1 pound per square foot (psf) = 0.0479 kPa, 1 pound per square inch (psi) = 0.0689 MPa.

DR = design required; o.c. = on center.

a. Wood furring shall be Spruce-Pine-fir or any softwood species with a specific gravity of 0.42 or greater. Steel furring shall be minimum 33 ksi steel. Steel studs shall be minimum 33 ksi steel for 33 mil and 43 mil thickness and 50 ksi steel for 54 mil steel or thicker.

b. Screws shall comply with the requirements of AISI S240.

c. Where the required cladding fastener penetration into wood material exceeds 3/4 inch and is not more than 1 1/2 inches, a minimum 2-inch nominal wood furring shall be used or an approved design.

d. Foam sheathing shall have a minimum compressive strength of 15 pounds per square inch in accordance with ASTM C 578 or ASTM C 1289.

e. Furring shall be spaced not more than 24 inches on center, in a vertical or horizontal orientation. In a vertical orientation, furring shall be located over wall studs and attached with the required fastener spacing. In a horizontal orientation, the indicated 8-inch and 12-inch fastener spacing in furring shall be achieved by use of two fasteners into studs at 16 inches and 24 inches on center, respectively.

### SECTION BC 2604 INTERIOR FINISH AND TRIM

**2604.1 General.** Plastic materials installed as interior finish or trim shall comply with Chapter 8. Foam plastics shall only be installed as interior finish where approved in accordance with the special provisions of Section 2603.9. Foam plastics that are used as interior finish shall also meet the flame
spread and smoke-developed index requirements for interior finish in accordance with Chapter 8. Foam plastics installed as interior trim shall comply with Section 2604.2.

2604.2 Foam plastic interior trim. Foam plastic used as interior trim shall comply with Sections 2604.2.1 through 2604.2.4.

2604.2.1 Density. The minimum density of the interior trim shall be 20 pcf (320 kg/m³).

2604.2.2 Thickness. The maximum thickness of the interior trim shall be ½-inch (12.7 mm) and the maximum width shall be 8 inches (204 mm).

2604.2.3 Area limitation. The interior trim shall not constitute more than 10 percent of the specific wall or ceiling area to which it is attached.

2604.2.4 Flame spread. The flame spread index shall not exceed 75 where tested in accordance with ASTM E 84 or UL 723. The smoke-developed index shall not be limited.

Exception: When the interior trim material has been tested as an interior finish in accordance with NFPA 286 and complies with the acceptance criteria in Section 803.1.2.1 of this code, it shall not be required to be tested for flame spread index in accordance with ASTM E 84 or UL 723.

SECTION BC 2605
PLASTIC VENEER

2605.1 Interior use. Where used within a building, plastic veneer shall comply with the interior finish requirements of Chapter 8.

2605.2 Exterior use. Exterior plastic veneer, other than plastic siding, shall be permitted to be installed on the exterior walls of buildings of any type of construction in accordance with all of the following requirements:

1. Plastic veneer shall comply with Section 2606.4.

2. Plastic veneer shall not be attached to any exterior wall to a height greater than 50 feet (15 240 mm) above grade.

3. Sections of plastic veneer shall not exceed 300 square feet (27.9 m²) in area and shall be separated by [a minimum of] not less than 4 feet (1219 mm) vertically.

4. Fireblocking complying with Section 718.2.6.1 shall be installed.

Exception: The area and separation requirements and the smoke-density limitation are not applicable to plastic veneer applied to buildings constructed of Type VB construction, provided the walls are not required to have a fire-resistance rating.

2605.3 Plastic siding. [Plastic] Polypropylene siding and vinyl siding shall comply with the requirements of Sections 1404 and 1405.
2605.4 Special inspection. Plastic veneers shall be subject to special inspection in accordance with Chapter 17.

SECTION BC 2606
LIGHT-TRANSMITTING PLASTICS

2606.1 General. The provisions of this section and Sections 2607 through 2611 shall govern the quality and methods of application of light-transmitting plastics for use as light-transmitting materials in buildings and structures. Foam plastics shall comply with Section 2603. Light-transmitting plastic materials that meet the other code requirements for walls and roofs shall be permitted to be used in accordance with the other applicable chapters of the code.

2606.2 Approval for use. Sufficient technical data shall be submitted to substantiate the proposed use of any light-transmitting material, as approved by the department and subject to the requirements of this section.

2606.3 Identification. Each unit or package of light-transmitting plastic shall be identified with a mark or decal satisfactory to the commissioner, which includes identification as to the material classification.

2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E 84 or UL 723, or a maximum average smoke density rating not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635[1].

Class CC2: Plastic materials that have a burning rate of 2½-inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.

2606.5 Structural requirements. Light-transmitting plastic materials in their assembly shall be of adequate strength and durability to withstand the loads indicated in Chapter 16. Technical data shall be submitted to establish stresses, maximum unsupported spans and such other information for the various thicknesses and forms used as deemed necessary by the department.

2606.6 Fastening. Fastening shall be adequate to withstand the loads in Chapter 16. Proper allowance shall be made for expansion and contraction of light-transmitting plastic materials in accordance with accepted data on the coefficient of expansion of the material and other material in conjunction with which it is employed.
2606.7 Light-diffusing systems. Light-diffusing systems shall comply with Sections [2603.7.1 through 2603.7.5] 2606.7.1 through 2606.7.5. Light-diffusing systems shall not be installed in the following occupancies and locations:

1. Any room in which the net floor area per occupant is 20 square feet (1.86 m²) or less, or any room leading therefrom through which it is necessary for occupants to pass in order to reach the only exit.

2. Group I-2.

4. [Vertical exit enclosures] Interior exit stairways, ramps and exit passageways.

2606.7.1 Support. Light-transmitting plastic diffusers shall be supported directly or indirectly from ceiling or roof construction by use of noncombustible hangers. Hangers shall be [at least] not less than No. 12 steel-wire gage (0.106 inch) galvanized wire or equivalent.

Exception: Light-transmitting plastic diffusers used in suspended acoustical ceiling systems shall conform with the support requirements as set forth in Section [803.9] 808.1.

2606.7.2 Installation. Light-transmitting plastic diffusers shall comply with Chapter 8 unless the light-transmitting plastic diffusers will fall from the mountings before igniting, at an ambient temperature of [at least] not less than 200°F (111°C) below the ignition temperature of the panels. The panels shall remain in place at an ambient room temperature of 175°F (79°C) for a period of not less than 15 minutes.

2606.7.3 Size limitations. Individual panels or units shall not exceed 10 feet (3048 mm) in length nor 30 square feet (2.79 m²) in area.

2606.7.4 Fire suppression system. In buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, plastic light-diffusing systems shall be protected both above and below unless the sprinkler system has been specifically approved for installation only above the light-diffusing system. Areas of light-diffusing systems that are protected in accordance with this section shall not be limited.

2606.7.5 Electrical luminaires. Light-transmitting plastic panels and light-diffuser panels that are installed in approved electrical luminaires shall comply with the requirements of Chapter 8 unless the light-transmitting plastic panels conform to the requirements of Section 2606.7.2.

2606.8 Partitions. Light-transmitting plastics used in or as partitions shall comply with the requirements of Chapters 6 and 8.

2606.9 Bathroom accessories. Light-transmitting plastics shall be permitted as glazing in shower stalls, shower doors, bathtub enclosures and similar accessory units. Safety glazing shall be provided in accordance with Chapter 24.

2606.10 Awnings, patio covers and similar structures. Awnings constructed of light-transmitting plastics shall be constructed in accordance with provisions specified in Section 3105 and Chapter 32.
for projections. Patio covers constructed of light-transmitting plastics shall comply with Section 2606. Light-transmitting plastics used in canopies at motor fuel-dispensing facilities shall comply with Section 2606, except as modified by Section 406.5.3. 406.7.2.

2606.11 Greenhouses. Light-transmitting plastics shall be permitted in lieu of plain glass in greenhouses.

2606.12 Solar collectors. Light-transmitting plastic covers on solar collectors having noncombustible sides and bottoms shall be permitted on buildings not over three stories above grade plane or 9,000 square feet (836.1 m²) in total floor area, provided the light-transmitting plastic cover does not exceed 33.33 percent of the roof area for CC1 materials or 25 percent of the roof area for CC2 materials.

   Exception: Light-transmitting plastic covers having a thickness of 0.010 inch (0.3 mm) or less shall be permitted to be of any plastic material provided the area of the solar collectors does not exceed 33.33 percent of the roof area.

SECTION BC 2607
LIGHT-TRANSMITTING PLASTIC WALL PANELS

2607.1 General. Light-transmitting plastics shall be permitted to be used as wall panels in exterior walls, provided that the walls are not required to have a fire-resistance rating and the installation conforms to the requirements of this section. Such panels shall be erected and anchored on a foundation, waterproofed or otherwise protected from moisture absorption and sealed with a coat of mastic or other approved waterproof coating. Light-transmitting plastic wall panels shall comply with Section 2606.

   Exception: Light-transmitting plastics shall not be used as wall panels in exterior walls in occupancies in Groups A-1, A-2, H, I-2 and I-3.

2607.2 Installation. Exterior wall panels installed as provided for herein shall not alter the type of construction classification of the building.

2607.3 Height limitation. Light-transmitting plastics shall not be installed more than 75 feet (22 860 mm) above grade plane, except as allowed by Section 2607.5.

2607.4 Area limitation and separation. The maximum area of a single wall panel and minimum vertical and horizontal separation requirements for exterior light-transmitting plastic wall panels shall be as provided for in Table 2607.4. The maximum percentage of wall area of any story in light-transmitting plastic wall panels shall not exceed that indicated in Table 2607.4 or the percentage of unprotected openings permitted by Section 705.8, whichever is smaller.

   Exceptions:

   1. In structures provided with approved flame barriers extending 30 inches (760 mm) beyond the exterior wall in the plane of the floor, a vertical separation is not required at the floor except that provided by the vertical thickness of the flame barrier projection.
2. Veneers of approved weather-resistant light-transmitting plastics used as exterior siding in buildings of Type V construction in compliance with Section 1406.

3. The area of light-transmitting plastic wall panels in exterior walls of greenhouses shall be exempt from the area limitations of Table 2607.4 but shall be limited as required for unprotected openings in accordance with Section 705.8.

</table>

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

a. For combinations of plastic glazing and plastic wall panel areas permitted, see Section 2607.6.
b. For reductions in vertical separation allowed, see Section 2607.4.

#### 2607.5 Automatic sprinkler system. Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum percentage area of exterior wall in any story in light-transmitting plastic wall panels and the maximum square footage of a single area given in Table 2607.4 shall be increased 100 percent, but the area of light-transmitting plastic wall panels shall not exceed 50 percent of the wall area in any story, or the area permitted by Section 705.8 for unprotected openings, whichever is smaller. These installations shall be exempt from height limitations.

#### 2607.6 Combinations of glazing and wall panels. Combinations of light-transmitting plastic glazing and light-transmitting plastic wall panels shall be subject to the area, height and percentage limitations and the separation requirements applicable to the class of light-transmitting plastic as prescribed for light-transmitting plastic wall panel installations.

### SECTION BC 2608
LIGHT-TRANSMITTING PLASTIC GLAZING

#### 2608.1 Buildings of Type VB construction. Openings in the exterior walls of buildings of Type VB construction, where not required to be protected by Section 705, shall be permitted to be glazed or
equipped with light-transmitting plastic. Light-transmitting plastic glazing shall also comply with Section 2606.

2608.2 Buildings of other types of construction. Openings in the exterior walls of buildings of types of construction other than Type VB, where not required to be protected by Section 705, shall be permitted to be glazed or equipped with light-transmitting plastic in accordance with Section 2606 and all of the following:

1. The aggregate area of light-transmitting plastic glazing shall not exceed 25 percent of the area of any wall face of the story in which it is installed. The area of a single pane of glazing installed above the first story above grade plane shall not exceed 16 square feet (1.5 m²) and the vertical dimension of a single pane shall not exceed 4 feet (1219 mm).

   Exception: Where an automatic sprinkler system is provided throughout in accordance with Section 903.3.1.1, the area of allowable glazing shall be increased to a maximum of not more than 50 percent of the wall face of the story in which it is installed with no limit on the maximum dimension or area of a single pane of glazing.

2. Approved flame barriers extending 30 inches (762 mm) beyond the exterior wall in the plane of the floor, or approved vertical panels not less than 4 feet (1219 mm) in height, shall be installed between glazed units located in adjacent stories.

   Exception: Approved vertical panels not less than 3 feet (914 mm) in height or flame barriers extending 30 inches (762 mm) beyond the exterior wall shall be installed between glazed units located in adjacent stories in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

3. Light-transmitting plastics shall not be installed more than 75 feet (22 860 mm) above grade level.

   Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

SECTION BC 2609
LIGHT-TRANSMITTING PLASTIC ROOF PANELS

2609.1 General. Light-transmitting plastic roof panels shall comply with this section and Section 2606. Light-transmitting plastic roof panels shall not be installed in Groups H, I-2 and I-3. In all other groups, light-transmitting plastic roof panels shall comply with any one of the following conditions:

1. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. The roof construction is not required to have a fire-resistance rating by Table 601.

3. The roof panels meet the requirements for roof coverings in accordance with Chapter 15.

2609.2 Separation. Individual roof panels shall be separated from each other by a distance of not less than 4 feet (1219 mm) measured in a horizontal plane.
Exceptions:

1. The separation between roof panels is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. The separation between roof panels is not required in low-hazard occupancy buildings complying with the conditions of Section 2609.4, Exception 2 or 3.

2609.3 Location. Where exterior wall openings are required to be protected by Section 705.8, a roof panel shall not be installed within 6 feet (1829 mm) of such exterior wall.

2609.4 Area limitations. Roof panels shall be limited in area and the aggregate area of panels shall be limited by a percentage of the floor area of the room or space sheltered in accordance with Table 2609.4.

Exceptions:

1. The area limitations of Table 2609.4 shall be permitted to be increased by 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. Low-hazard occupancy buildings, such as swimming pool shelters, shall be exempt from the area limitations of Table 2609.4, provided that the buildings do not exceed 5,000 square feet (465 m²) in area and have a minimum fire separation distance of 10 feet (3048 mm).

3. Greenhouses that are occupied for growing plants on a production or research basis, without public access, shall be exempt from the area limitations of Table 2609.4 provided they have a minimum fire separation distance of 4 feet ([1219] 1220 mm).

4. Roof coverings over terraces and patios in Group R-3 occupancies shall be exempt from the area limitations of Table 2609.4.

For SI: 1 square foot = 0.0929 m².
SECTION BC 2610
LIGHT-TRANSMITTING PLASTIC SKYLIGHT GLAZING

2610.1 Light-transmitting plastic glazing of skylight assemblies. Skylight assemblies glazed with light-transmitting plastic shall conform to the provisions of this section and Section 2606. Unit skylights glazed with light-transmitting plastic shall [also] comply with Section 2405.5.

Exception: Skylights in which the light-transmitting plastic conforms to the required roof-covering class in accordance with Section 1505.

2610.2 Mounting. The light-transmitting plastic shall be mounted above the plane of the roof on a curb constructed in accordance with the requirements for the type of construction classification, but [at least] not less than 4 inches (102 mm) above the plane of the roof. Edges of the light-transmitting plastic skylights or domes shall be protected by metal or other approved noncombustible material, or the light-transmitting plastic dome or skylight shall be shown to be able to resist ignition where exposed at the edge to a flame from a Class B brand as described in ASTM E 108 or UL 790. The Class B brand test shall be conducted on a skylight that is elevated to a height as specified in the manufacturer’s instructions, but not less than 4 inches (102 mm).

Exceptions:

1. Curbs shall not be required for skylights used on roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) in occupancies in Group R-3 and on buildings with a nonclassified roof covering.

2. The metal or noncombustible edge material is not required where nonclassified roof coverings are permitted.

2610.3 Slope. Flat or corrugated light-transmitting plastic skylights shall slope [at least] not less than four units vertical in 12 units horizontal (4:12). Dome-shaped skylights shall rise above the mounting flange a minimum distance equal to 10 percent of the maximum [span] width of the dome but not less than 3 inches (76 mm).

Exception: Skylights that pass the Class B Burning Brand Test specified in ASTM E 108 or UL 790 shall have no minimum slope requirement.

2610.4 Maximum area of skylights. Each skylight shall have a maximum area within the curb of 100 square feet (9.3 m²).

Exception: The area limitation shall not apply where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or the building is equipped with smoke and heat vents in accordance with Section 910.

2610.5 Aggregate area of skylights. The aggregate area of skylights shall not exceed 33⅓ percent of the floor area of the room or space sheltered by the roof in which such skylights are installed where Class CC1 materials are utilized, and 25 percent where Class CC2 materials are utilized.
Exception: The aggregate area limitations of light-transmitting plastic skylights shall be increased 100 percent beyond the limitations set forth in this section where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or the building is equipped with smoke and heat vents in accordance with Section 910.

2610.6 Separation. Skylights shall be separated from each other by a distance of not less than 4 feet (1219 mm) measured in a horizontal plane.

Exceptions:

1. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. In Group R-3, multiple skylights located above the same room or space with a combined area not exceeding the limits set forth in Section 2610.4.

2610.7 Location. Where exterior wall openings are required to be protected in accordance with Section 705, a skylight shall not be installed within 6 feet (1829 mm) of such exterior wall.

2610.8 Combinations of roof panels and skylights. Combinations of light-transmitting plastic roof panels and skylights shall be subject to the area and percentage limitations and separation requirements of Section 2609 applicable to roof panel installations.

SECTION BC 2611
LIGHT-TRANSMITTING PLASTIC INTERIOR SIGNS

2611.1 General. Light-transmitting plastic interior wall signs shall be limited as specified in Sections 2611.2 through 2611.4. Light-transmitting plastic interior wall signs in covered and open mall buildings shall comply with Section 402.6.4. Light-transmitting plastic interior signs shall also comply with Section 2606.

2611.2 Aggregate area. The sign shall not exceed 20 percent of the wall area.

2611.3 Maximum area. The sign shall not exceed 24 square feet (2.2 m²).

2611.4 Encasement. Edges and backs of the sign shall be fully encased in metal.

SECTION BC 2612
PLASTIC COMPOSITES

2612.1 General. Plastic composites shall consist of either wood/plastic composites or plastic lumber. Plastic composites shall comply with the provisions of this code and with the additional requirements of Section 2612.

2612.2 Labeling and identification. Packages and containers of plastic composites used in exterior applications shall bear a label showing the manufacturer’s name, product identification and information sufficient to determine that the end use will comply with code requirements.
**2612.2.1 Performance levels.** The label for plastic composites used in exterior applications as deck boards, stair treads, handrails and guards shall indicate the required performance levels and demonstrate compliance with the provisions of ASTM D 7032.

**2612.2.2 Loading.** The label for plastic composites used in exterior applications as deck boards, stair treads, handrails and guards shall indicate the type and magnitude of the load determined in accordance with ASTM D 7032.

**2612.3 Flame spread index.** Plastic composites shall exhibit a flame spread index not exceeding 200 when tested in accordance with ASTM E 84 or UL 723 with the test specimen remaining in place during the test.

**Exception:** Materials determined to be noncombustible in accordance with Section 703.5.

**2612.4 Termite and decay resistance.** Plastic composites containing wood, cellulosic or any other biodegradable materials shall be termite and decay resistant as determined in accordance with ASTM D 7032.

**2612.5 Construction requirements.** Plastic composites shall be permitted to be used as exterior deck boards, stair treads, handrails and guards in buildings of Type VB construction.

**2612.5.1 Span rating.** Plastic composites used as exterior deck boards shall have a span rating determined in accordance with ASTM D 7032.

**2612.6 Plastic composite decking, handrails and guards.** Plastic composite decking, handrails and guards shall be installed in accordance with this code and the manufacturer’s instructions.

---

**[SECTION BC 2612]**

[Fiber-reinforced polymer AND FIBERGLASS REINFORCED POLYMER]

SECTION BC 2613

Fiber-reinforced polymer

**[2612.1] 2613.1 General.** The provisions of this section shall govern the requirements and uses of [fiber-reinforced polymer or fiberglass-reinforced polymer] fiber-reinforced polymer in and on buildings and structures.

**[2612.2] 2613.2 Labeling and identification.** Packages and containers of [fiber-reinforced polymer or fiberglass-reinforced polymer] fiber-reinforced polymer and their components delivered to the job site shall bear the label of an approved agency showing the manufacturer’s name, product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.

**[2612.3 Interior finish] 2613.3 Interior finishes.** [Fiber-reinforced polymer or fiber-glass reinforced polymer used as interior finish] Fiber-reinforced polymer used as interior finishes, decorative materials or trim shall comply with Chapter 8.

**2613.3.1 Foam plastic cores.** Fiber-reinforced polymer used as interior finish and which contains foam plastic cores shall comply with Chapter 8 and this chapter.
2612.4 Decorative materials and trim. Fiber-reinforced polymer or fiberglass reinforced polymer used as decorative materials or trim shall comply with Section 806.]

2612.5 Light-transmitting materials. [Fiber-reinforced polymer or fiberglass reinforced polymer] Fiber-reinforced polymer used as light-transmitting materials shall comply with Sections 2606 through 2611 as required for the specific application.

2612.6 Exterior use. [Fiber-reinforced] Fiber-reinforced polymer [or fiberglass reinforced polymer] shall be permitted to be installed on the exterior walls of buildings of any type of construction when such polymers meet the requirements of Section 2603.5 [and is fireblocked]. Fireblocking shall be installed in accordance with Section [717] 718. [The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613, respectively.]

Exceptions:

1. [When] Compliance with Section 2603.5 is not required when all of the following conditions are met:

1.1. [When the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 20 percent of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame spread index of 25 or less or when the area of the fiber reinforced polymer or the fiberglass reinforced polymer does not exceed 10 percent of the respective wall area, the fiber reinforced polymer or the fiberglass reinforced polymer shall have a flame spread index of 75 or less. The flame spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber reinforced polymer or the fiberglass reinforced polymer.]

The fiber-reinforced polymer shall not exceed an aggregate total of 20 percent of the area of the specific wall to which it is attached, and no single architectural element shall exceed 10 percent of the area of the specific wall to which it is attached, and no contiguous set of architectural elements shall exceed 10 percent of the area of the specific wall to which they are attached.

1.2. The fiber-reinforced polymer shall have a flame spread index of 25 or less.

The flame spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber-reinforced polymer.

1.3. Fireblocking complying with Section [717.2.6] 718.2.6 shall be installed.

1.4. The [fiber reinforced] fiber-reinforced polymer [or the fiberglass reinforced polymer] shall be installed directly to a noncombustible substrate or be separated from the exterior wall by one of the following materials: corrosion-resistant steel having a minimum base metal thickness of 0.016
inch (0.41 mm) at any point, aluminum having a minimum thickness of 0.019 inch (0.5 mm) or other approved noncombustible material.

[1.4. The fiber reinforced polymer or the fiberglass reinforced polymer shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads, wind loads and earthquake loads as specified in Sections 1608, 1609 and 1613, respectively.]

2. [When] Compliance with Section 2603.5 is not required when the fiber-reinforced polymer is installed on buildings that are 40 feet (12 190 mm) or less above grade,[, the fiber reinforced polymer or the fiberglass polymer shall meet the requirements of Section 1406.2 and shall comply with] when all of the following conditions are met:

2.1. The fiber-reinforced polymer shall meet the requirements of Section 1406.2.

2.2. Where the fire separation distance is 5 feet (1524 mm) or less, the area of the fiber-reinforced polymer shall not exceed 10 percent of the wall area. Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of the exterior wall coverage using fiber reinforced polymer or the fiber reinforced polymer.

2.3. The fiber-reinforced polymer shall have a flame spread index of 200 or less. The flame spread index requirement shall not be required for coatings or paints having a thickness of less than 0.036 inch (0.9 mm) that are applied directly to the surface of the fiber-reinforced polymer.

2.4. Fireblocking complying with Section [717.2.6] 718.2.6 shall be installed.

SECTION BC [2613] 2614 REFLECTIVE PLASTIC CORE INSULATION

[2613.1] 2614.1 General. The provisions of this section shall govern the requirements and uses of reflective plastic core insulation in buildings and structures. Reflective plastic core insulation shall comply with the requirements of Section [2613.2] 2614.2 and of one of the following: Section [2613.3] 2614.3 or [2613.4] 2614.4.

[2613.2] 2614.2 Identification. Packages and containers of reflective plastic core insulation delivered to the job site shall show the manufacturer’s or supplier’s name, product identification and information sufficient to determine that the end use will comply with the code requirements.
[2613.3] **2614.3 Surface-burning characteristics.** Reflective plastic core insulation shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested in accordance with ASTM E 84 or UL 723. The reflective plastic core insulation shall be tested at the maximum thickness intended for use and shall be tested using one of the mounting methods in Section 2613.3.1 or 2613.3.2. Test specimen preparation and mounting shall be in accordance with ASTM E 2599.

[2613.3.1 Mounting of test specimen.** The test specimen shall be mounted on 2-inch-high (51 mm) metal frames so as to create an air space between the unexposed face of the reflective plastic core insulation and the lid of the test apparatus.**

[2613.3.2 Specific testing. A set of specimen preparation and mounting procedures shall be used which are specific to the testing of reflective plastic core insulation.**

[2614.4] **2614.4 Room corner test heat release.** Reflective plastic core insulation shall comply with the acceptance criteria of Section 803.1.2.1 of this code when tested in accordance with NFPA 286 or UL 1715 in the manner intended for use and at the maximum thickness intended for use.

§ 27. Chapter 27 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

**CHAPTER 27**
**ELECTRICAL**

**SECTION BC 2701**
**GENERAL**

2701.1 Scope. This chapter governs the electrical components, equipment and systems used in buildings and structures covered by this code. Electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of the New York City Electrical Code.

**SECTION BC 2702**
**EMERGENCY AND STANDBY POWER SYSTEMS**

2702.1 Installation. Emergency power systems and standby power systems shall be installed in accordance with the New York City Electrical Code, NFPA 110 and NFPA 111.

2702.1.1 Fuel supply. Systems relying on fuel supplies shall have an on-premises fuel supply sufficient for not less than 6-hour full-demand operation of the system. However, natural gas from the public utility street main shall be permitted as the sole fuel supply for (i) emergency power systems serving Group R-2 occupancies and, (ii) emergency power systems where permitted by Appendix G of this code, and (iii) standby power systems, provided that an outside gas cut-off valve separate from other gas services is installed in accordance with Section E.6 of Appendix E of the New York City Fuel Gas Code.

2702.1.2 Stationary generators. Stationary emergency and standby power generators required by this code shall be listed in accordance with UL 2200 and shall comply with Sections 2702.1.2.1 through 2702.1.2.3.**
2702.1.2.1 Prohibited location. Emergency and standby power generators shall not be located in the same room as the main or primary electrical service equipment. Distribution associated with emergency and standby power systems shall not pass through the room containing the main or primary electrical service equipment.

2702.1.2.2 Enclosure. Emergency and standby generators within a building shall be located within a dedicated room separated by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

2702.1.2.2.1 Generator room contents. Equipment and fuel tanks located within the emergency generator room shall be limited to equipment and fuel tanks associated with the emergency and standby power systems. Piping within the room shall be limited to sprinkler piping.

Exceptions:

1. Uninterrupted conduits not associated with the emergency and standby power system may pass through the emergency generator room.

2. Piping associated with generator cooling systems may be located within the emergency generator room.

2702.1.2.3 Multiple generators. Multiple generators supplying emergency power system loads only, or supplying emergency power system equipment in combination with optional standby power loads as a common system may be located in the same room. Such generators may also share a common room, fuel [supplies] supply and other common equipment and systems.

2702.1.3 Capacity. The emergency and standby power systems shall have capacity and ratings that supply all equipment required to be operational at the same time.

2702.1.4 Protection of fire pumps. Where electrically powered fire pumps are connected to the emergency power system, overcurrent protection and feeder conductors shall be provided in accordance with the New York City Electrical Code. Automatic transfer switches shall be located in the same room as the fire pump as an integral part of the pump controller.

2702.1.5 Special inspection. The installation of a required emergency or standby power system shall be subject to special inspection in accordance with Section [1704] 1705.

2702.1.6 Registration. Fuel-burning equipment for an emergency or standby power system shall be registered with the Department of Environmental Protection in accordance with the requirements of Section 24-109 of the Administrative Code.

2702.1.7 Automatic transfer devices and power system feeders. Automatic transfer devices, emergency generators and emergency or standby power system feeders shall comply with Sections 2702.1.7.1 through [2707.1.7.2.1] 2702.1.7.2.1.
2702.1.7.1 Prohibited location. All automatic transfer devices and emergency power system feeders that serve emergency and required standby power system equipment shall not be located in the same room as the emergency power system equipment or the main or primary electrical service equipment. Where emergency and standby transfer devices are installed in accordance with Articles 700 and 701 of the New York City Electrical Code, automatic transfer devices for optional standby power systems shall not be installed in the same room.

2702.1.7.2 Enclosure. Any automatic transfer device that is not located at the load shall be located within a dedicated room separated by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712, or both.

2702.1.7.2.1 Automatic transfer device room. Equipment located within the automatic transfer device room shall be limited to equipment associated with the emergency or standby power systems. Piping within the room shall be limited to sprinkler piping.

2702.2 Where required. Emergency and standby power systems shall be provided where required by this section.

2702.2.1 Group A occupancies. Emergency power shall be provided for voice/alarm communication systems in Group A occupancies in accordance with Section 907.5.2.2.4 907.5.2.2.5.

2702.2.1.1 Prior code buildings. In prior code buildings, where a stationary generator is not otherwise required, the power source for emergency power to the voice/alarm communication system may be served by a gas generator or an uninterruptable power source (UPS) in accordance with the New York City Electrical Code.

2702.2.2 Smoke control systems. Standby power shall be provided for smoke control systems in accordance with Section 909.11.

2702.2.3 Exit signs. Emergency power shall be provided for exit signs in accordance with Section 1011.5.3 1013.6.3.

2702.2.4 Means of egress illumination. Emergency power shall be provided for means of egress illumination in accordance with Section 1006.3 1008.3.

2702.2.5 Accessible means of egress elevators. Standby power shall be provided for elevators that are part of an accessible means of egress in accordance with Section 1007.4 1009.4.

2702.2.6 Horizontal sliding doors. Standby power shall be provided for horizontal sliding doors in accordance with Section 1008.1.4.3 1010.1.4.3.

2702.2.7 Semiconductor fabrication facilities. Emergency power shall be provided for semiconductor fabrication facilities in accordance with Section 415.8.10 415.11.10.
2702.2.8 Membrane structures. Standby power shall be provided for auxiliary inflation systems in accordance with Section 3102.8.2. Emergency power shall be provided for exit signs in tents and membrane structures.

2702.2.9 Hazardous materials. Emergency or standby power shall be provided in occupancies with hazardous materials in accordance with [Section 414.5.4 and] the New York City Fire Code and Section 414.5.2 of this code.

2702.2.10 Highly toxic and toxic materials. Emergency power shall be provided for occupancies with highly toxic or toxic materials in accordance with the New York City Fire Code.

2702.2.11 Organic peroxides. Standby power shall be provided for occupancies with organic peroxides in accordance with the New York City Fire Code.

2702.2.12 Pyrophoric materials. Emergency power shall be provided for occupancies with silane gas in accordance with the New York City Fire Code.

2702.2.13 Covered and open mall buildings. [Standby] Emergency power shall be provided for voice/alarm communication systems in covered and open mall buildings in accordance with Section [402.14] 402.7.4.

2702.2.14 High-rise buildings. Emergency and standby power shall be provided in high-rise buildings in accordance with [Sections 403.4.7 and] Section 403.4.8.

2702.2.15 Underground buildings. Emergency and standby power shall be provided in underground buildings in accordance with [Sections] Section 405.8[ and 405.9].

2702.2.16 Group I-3 occupancies. Emergency power shall be provided for doors in Group I-3 occupancies in accordance with Section 408.4.2.

2702.2.17 Elevators. Standby power for elevators, including elevators provided to accommodate ambulance stretchers pursuant to Section 3002.4, shall be provided as set forth in Section 3003.1. [Controls, elevator cab light, ventilation and associated equipment required for elevator operation shall be connected to emergency power.]

2702.2.18 Airport traffic control towers. Standby power shall be provided in airport traffic control towers in accordance with Section [412.3.5] 412.3.9.

2702.2.19 Smokeproof enclosures and pressurized elevator [shaft] shafts. Standby power shall be provided for smokeproof enclosures as required by Section 909.20.6.2 and for pressurized elevator shafts provided in accordance with Section [708.14.2.5] 3006.1.

2702.2.20 Occupancy Groups B, E and R-1. Emergency and standby power shall be required [in] throughout those Group B, E and R-1 occupancies specified in this section:

1. Group B occupancies with occupied floor less than 75 feet (22 860 mm) above the lowest level of fire department vehicle access having a gross floor area over 15,000 square feet (1393.6 m²) [per] on each floor, or having a total gross floor area of 100,000 square feet (9290.3 m²) or more.
2. Group E occupancies with occupied floor less than 75 feet (22 860 mm) above the lowest level of fire department vehicle access having a gross floor area over 15,000 square feet (1393.6 m²) on each floor or having a total gross floor area of 100,000 square feet (9290.3 m²) or more.

3. All Group R-1 occupancies.

2702.2.20.1 Equipment requiring emergency power system. With respect to such Occupancy Groups B, E and R-1, the following equipment, where such equipment is required by this code, shall be provided with an emergency power system:

1. Exit signs and means of egress illumination required by Chapter 10;
2. Elevator car lighting;
3. Emergency voice/alarm communications systems, including Fire Department in-building Auxiliary Radio Communication systems (ARCs) provided where required or installed voluntarily in accordance with Section 917.916;
4. Automatic fire detection systems;
5. Fire alarm systems; and
6. Electrically powered fire pumps, including manual fire pumps, automatic fire pumps and sprinkler booster pumps.

2702.2.20.2 Equipment requiring standby power system. With respect to such Occupancy Groups B, E and R-1, the following equipment, where such equipment is required by this code, shall be provided with a standby power system:

1. Ventilating systems used for smoke venting or control;
2. Stair pressurization; and
3. At least three elevators in a building at one time with manual transfer to other elevators as required by Section 3003; and
4. Power and lighting for the fire command center required by Section 403.4.6.

2702.2.21 Continuously operating HVAC systems. Standby power systems shall be provided for fans or fan systems being designed in accordance with Section 607.5 of the New York City Mechanical Code and Section 717 of this code.

2702.2.22 Gas detection systems. Emergency power systems shall be provided for gas detection systems in accordance with Section 918.5.

2702.3 Maintenance. Emergency and standby power systems shall be maintained and tested in accordance with the New York City Fire Code and New York City Electrical Code.
2702.4 Required loads for optional standby power systems. In addition to any other loads, optional standby power systems shall be capable of providing power to the following standby and emergency power loads upon failure of the normal power supply:

1. Emergency lighting;
2. Fire alarm systems; and
3. Elevators as follows:
   3.1 For Group R-2 occupancies in buildings greater than 125 feet (38 100 mm) in height, at least one elevator serving all floors, or one elevator per bank where different banks serve different portions of the building; or
   3.2 For all other buildings having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, at least one elevator that serves all floors.

Exception: Backup power systems that provide backup power for non-accessory public telecommunications equipment, such as rooftop telecommunications antennas, cooling equipment, routers, etc., need not provide power to the standby and emergency power loads listed in this section.

2702.4.1 Additional optional standby power systems. Where a functioning emergency power system or required standby power system is in place and provides power to all required emergency or required standby power loads, any additional optional standby power system need not supply power to such emergency or required standby power loads.

2702.4.2 Compliance with NFPA 110 and UL 2200. Where an optional standby power system is required to supply emergency or required standby power loads, such power system shall comply with the UL 2200 listing and NFPA 110.

2702.4.3 Special inspection. Where an optional standby power system is required to supply emergency or required standby power loads, such power system shall be subject to special inspection in accordance with Section 1704.31 and the rules of the department.

§ 28. Chapter 29 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:
CHAPTER 29
PLUMBING SYSTEMS

SECTION BC 2901
GENERAL

2901.1 Scope. The New York City Plumbing Code shall govern the construction, erection, installation, alteration, repairs, relocation, replacement, addition to, use or maintenance of plumbing equipment and systems. Toilet and bathing rooms shall be constructed in accordance with Section 1210.

§ 29. Chapter 30 of the New York city building code, as added by local law number 33 for the year 2007, item 12 of section 3001.10 as amended by local law number 8 for the year 2008, sections 3003.1.1, 3003.1.2, 3003.1.3 and 3003.1.4 as amended by local law number 111 for the year 2013, sections 3001.11, 3002.8, 3007 and 3008 as added by, sections 3001.2, 3001.3, 3001.6, 3001.9, 3002.1, 3002.3, 3002.4, 3002.6, 3002.7, 3003.1, 3003.3.1, 3003.3.2, 3004, 3005.2.1, 3005.3.1 and 3006.4 as amended by, and sections 3009, 3010, 3011, 3012, 3013 and 3014 as renumbered and amended by local law number 141 for the year 2013, and section 3002.4.1 as amended by local law number 51 for the year 2014, is amended to read as follows:

CHAPTER 30
ELEVATORS AND CONVEYING SYSTEMS

SECTION BC 3001
GENERAL

3001.1 Scope. This chapter establishes the minimum safety requirements for and governs the design, construction, installation, alteration, maintenance, inspection, test and operation of elevators, dumbwaiters, escalators, moving walks, industrial lifts and loading ramps, mechanical parking equipment, console or stage lifts, power-operated scaffolds, amusement devices, platform lifts, and special hoisting and conveying equipment. This chapter and all the provisions of this code for new installations shall also apply to elevators in existing buildings moved to new hoistways. High-rise building elevators shall also conform to the provisions of Section 403 of this code.

Exception: Personnel and material hoists used for construction operations subject to the requirements of Chapter 33.

3001.2 Reference standards. Except as otherwise provided for in this code, the design, construction, installation, alteration, repair and maintenance of elevators and [other] conveying systems and their components shall conform to ASME A17.1/CSA B44 as modified by Appendix K, Chapter K1, ASME A17.2, ASME A17.3 as modified by Appendix K, Chapter K3, ASME A17.5, ASME A17.6, ASME A17.7/CSA B44.7, ASME A18.1, [ASME A17.3 as modified by Appendix K, Chapter K4,] ASME A90.1, ASME B20.1 as modified by Appendix K, Chapter K2, [ALI ALCTV, and] ANSI A10.4, ANSI E1.46, BSR 1.42,
ANSI/ICC A117.1, and ASCE 24 for construction in areas of special flood hazard areas established in Appendix G. Where this code makes reference to the nationally recognized standards ASME A17.1/CSA B44, ASME A17.3, and ASME B20.1, such standard(s) shall be as modified for New York City in accordance with Appendix K of this code.

3001.3 Accessibility. The following elevators and lifts shall conform to ICC A117.1:

1. Passenger elevators, including destination-oriented elevators, required to be accessible by Chapter 11;

2. Limited-Use/Limited-Application (LULA) elevators permitted to be installed on an accessible route pursuant to Section 1109.6.1;

3. Platform lifts permitted to be installed on an accessible route pursuant to Section 1109.7; and

4. Private residence elevators serving within an individual dwelling unit in Occupancy Groups R-2 and R-3 occupancies on an accessible route; and

5. Elevators provided in accordance with Sections 3002.4.3.2 and 3002.4.3.3.

3001.4 Change in use. A change in use of an elevator from freight to passenger, passenger to freight, or from one freight class to another freight class shall comply with Section 8.7 of ASME A17.1/CSA B44.

3001.5 Piping or ductwork. No piping or ductwork of any kind, except as permitted by ASME A17.1/CSA B44, Section 2.8, shall be permitted within hoistway or elevator enclosures except:

1. As required for the elevator installation; and

2. Low-voltage wiring less than 50 volts required for fire alarm systems required by this code.

3001.6 Elevator mirrors. A mirror shall be installed in each self-service passenger elevator in multiple dwellings. Such mirror shall be affixed and maintained in a manner sufficient to enable persons entering such elevator to view the inside thereof prior to entry to determine whether any person is in the elevator.

3001.7 Car switch operation. Elevators with car switch operation (manual operation) shall be provided with a signal system by means of which signals can be given from any landing whenever the elevator is desired at that landing.

3001.8 Prohibited devices. The following devices shall be prohibited:

3001.8.1 Manlifts. The installation of manlifts is prohibited.

3001.8.2 Sidewalk elevators. The installation of sidewalk elevators located outside the street line is prohibited.
3001.9 **Approved equipment.** All equipment listed in ASME A17.1[/-]/CSA B44, Section 8.3 as modified by New York City Building Code, Appendix K, Chapter K1, shall be [approved by] listed by an approved agency in accordance with Section 28-113.2.3 of the Administrative Code, Section 8.3.1 of ASME A17.1/CSA B44, and the rules of the department, and shall be approved by the commissioner.

3001.10 **Construction documents.** Applications for elevator, escalator, moving walkway and stairway, dumbwaiter, and similar equipment shall contain construction documents that include the following:

1. The location of all machinery, switchboards, junction boxes, and reaction points, with loads indicated;
2. The details of all hoistway conditions including bracket spacing;
3. The estimated maximum vertical forces on the guide rails on application of the safety device;
4. In the case of freight elevators for Class B or C loading, the horizontal forces on the guide-rail faces during loading and unloading; and the estimated maximum horizontal forces in a postwise direction on the guide-rail faces on application of the safety device;
5. The size and weight per foot of any rail reinforcements where provided;
6. Compliance with the accessibility features of this code;
7. The details of capability of the withstanding forces (impact) on door entrance assembly and retaining devices;
8. The withstanding hourly fire rating of the hoistway and the hoistway door assembly;
9. The impact loads imposed on machinery and sheave beams, supports and floors or foundations;
10. The impact load on buffer supports due to buffer engagement at the maximum permissible speed and load;
11. Where compensation tie down is applied, the load on the compensation tie down supports; and
12. The total static and dynamic loads from the governor, buffer and tension system.

3001.11 **Special provisions for prior code buildings.** Prior code buildings shall be permitted to comply with Section 3001.11.1.

3001.11.1 **Existing shafts.** Elevator cabs installed in existing shafts shall be permitted to be smaller than that required by this chapter where necessary to fit in the existing shaft[... unless a larger cab size is otherwise mandated pursuant to Section 1101.3...].
Exception: An existing elevator shaft shall be enlarged or a new elevator shaft shall be constructed to accommodate an elevator cab in compliance with Chapter 11 where the entire building is required to be accessible pursuant to either Item 1 of Section 1101.3.1, or Section 1101.3.2.

SECTION BC 3002
HOISTWAY ENCLOSURES

3002.1 Hoistway enclosure protection. Elevator, dumbwaiter and other hoistway enclosures shall be shaft enclosures complying with Section [708] 713.

3002.1.1 Definitions. The following terms are defined in Chapter 2:

HOISTWAY.

ZERO CLEARANCE VESTIBULE.

[3002.1.1] 3002.1.2 Opening protectives. Openings in hoistway enclosures shall be protected as required in Chapter 7.

Exception: The elevator car doors and the associated hoistway enclosure doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I Emergency Recall Operation in accordance with ASME A17.1/CSA B44, as modified by Appendix K, Chapter K1.

[3002.1.2] 3002.1.3 Hardware. Hardware on opening protectives shall be of an approved type installed as tested, except that approved interlocks, mechanical locks and electric contacts, door and gate electric contacts and door-operating mechanisms shall be exempt from the fire test requirements.

3002.2 Number of elevator cars in a hoistway.

1. Where four or more elevator cars serve all or the same portion of a building, the elevators shall be located in [at least] not fewer than two separate hoistways. [Not]

2. Where five or more elevators serve the same portion of a building, not more than four elevator cars shall be located in any single hoistway enclosure.

3. Elevators that service different [risers] rises shall be located in separate hoistways.

3002.3 Emergency signs. A sign shall be posted and maintained on every floor at the elevator landing. The sign shall read “IN FIRE EMERGENCY, DO NOT USE ELEVATOR. USE THE EXIT STAIRS.” The lettering shall be at least ½ inch (13 mm) block letters in red with white background or as otherwise approved by the commissioner. Such lettering shall be properly spaced to provide good legibility. The sign shall also contain a diagram showing the location where it is posted and the location and letter identification of the stairs on the floor. The sign shall be at least 10 inches by 12 inches (255 mm by 305 mm), located directly above a call button and securely attached to the wall or partition. The top of such sign shall not be [above] more than 6 feet (1829 mm) [from] above the floor level. The diagram on such sign may be omitted provided that signs containing such diagram are
posted in conspicuous places on the respective floor. In such case, the sign at the elevator landing shall be at least 2½ inches by 10 inches (64 mm by 254 mm) and the diagram signs shall be at least 8 inches by 12 inches (203 mm by 305 mm).

3002.3.1 Stair and elevator identification signs. Each stair and each bank of elevators shall be identified by an alphabetic letter. A sign indicating the letter of identification for the elevator bank shall be posted and maintained at each elevator landing directly above or as part of the sign specified in Section 3002.3. The stair identification sign shall be posted and maintained on the occupancy side of the stair door. The letter on the sign shall be at least 3 inches (76 mm) high, of bold type and of contrasting color from the background. Such signs shall be securely attached.

Exceptions:

1. The emergency sign shall not be required for elevators that are part of an accessible means of egress complying with Section [1007.4] 1009.4.

2. The emergency sign shall not be required for elevators that are used for occupant self-evacuation in accordance with Section 3008.

3002.4 Elevator required. In buildings five stories in height or more and buildings with four or more stories below grade plane, at least one elevator shall provide access to all floors.

3002.4.1 Standby power required for elevators. Standby power shall be provided to elevators in the following categories:

1. Elevator(s) in high-rise buildings covered by Section 403.1, other than Group R-2 occupancies, as required by Section [403.4.8.1] 403.4.8.4.1;

2. Elevator(s) in high-rise buildings in Group R-2 occupancies more than 125 feet (38 100 mm) in height, as required by Section [403.4.8.2] 403.4.8.4.2;

3. Elevator(s) in underground buildings, as required by Section [405.4.3] 405.8;

4. Elevator(s) in Groups B, E, and R-1 occupancies that are subject to Section 2702.2.20; and

5. Elevator(s) serving as accessible means of egress pursuant to Section [1007.4] 1009.4.

3002.4.2 Elevator car to accommodate ambulance stretcher. Where elevators are provided in buildings five or more stories above, or four or more stories [in height or more,] below grade plane, or underground buildings as described in Section 405.1, [at least] not fewer than one elevator subject to Section 3003.3 shall be provided with an elevator car of such a size and arrangement to accommodate an ambulance stretcher [24 inches 24 inches by 84 inches (610 mm by 2134 mm), with not less than [5 inch] 5 inch (127 mm) radius corners, in the horizontal, open position and shall be identified by the international symbol for emergency medical services (star of life). The symbol shall [not] be not less than 3 inches (76 mm) [high] in height and shall be placed on both jambs of the hoistway entrances on each floor. Standby power shall be required for such an elevator if it serves a building subject to Section 3002.4.1.
Exceptions:

1. An elevator serving not more than one individual dwelling unit in a building, regardless of height and number of stories of such a building, pursuant to Section 3002.4.3.1 or 3002.4.3.2.

2. Limited-Use/Limited-Application (LULA) elevators (25 feet maximum rise).

3002.4.3 Elevator serving individual dwelling unit. Elevators provided in individual dwelling units in buildings in Occupancy Groups R-2 and R-3 shall comply with Section 3002.4.3.1 through 3002.4.3.3, as applicable.

3002.4.3.1 Maximum rise of 60 feet (18,288 mm). A private residence elevator with 60 feet (18,288 mm) of maximum rise shall be permitted to serve within an individual dwelling unit provided the elevator car is in compliance with ASME A17.1/CSA B44, and Section 3001.3 of this code.

3002.4.3.2 Rise of over 60 feet (18,288 mm) but not more than 75 feet (22,860 mm). An elevator with 60 feet (18,288 mm) but not more than 75 feet (22,860 mm) of maximum rise shall be permitted to serve within an individual dwelling unit provided the elevator car is in compliance with Parts 2 or 3 of ASME A17.1/CSA B44 and Section 3001.3 of this code even if it does not serve on an accessible route within the dwelling unit.

3002.4.3.3 Maximum rise of more than 75 feet (22,860 mm). A passenger elevator shall be required to serve within an individual dwelling unit where the maximum rise is over 75 feet (22,860 mm). Such elevator shall comply with ASME A17.1/CSA B44, and Sections 3001.3 and 3002.4.2 of this code even if it does not serve on an accessible route within the dwelling unit.

3002.5 Emergency doors. Where an elevator is installed in a single blind hoistway or on the outside of a building, there shall be installed in the blind portion of the hoistway or blank face of the building, an emergency door in accordance with ASME A17.1/CSA B44.

3002.6 Prohibited doors[]. Doors, other than hoistway doors and the elevator car door, shall be prohibited at the point of access to egress from an elevator car unless such doors are readily openable from the car side without a key, tool, special knowledge or effort.

3002.7 Common enclosure with stairway. Elevators shall not be in a common shaft enclosure with a stairway.

   Exception: [Open] Elevators within open parking garages need not be separated from stairway enclosures.

3002.8 Glass in elevator enclosures. Glass in elevator enclosures shall comply with [Section 2409.1 and] ASME A17.1/CSA B44 and Section 2409.2 of this code.

3002.9 Plumbing and mechanical systems. Plumbing and mechanical systems shall not be located in an elevator hoistway enclosure.
Exceptions:

1. Floor drains, sumps and sump pumps shall be permitted at the base of the hoistway enclosure provided they are indirectly connected to the plumbing system.

2. Sprinklers shall be permitted when otherwise required.

SECTION BC 3003
[ELEVATOR] EMERGENCY OPERATIONS

3003.1 Standby power. In buildings and structures where standby power is required or furnished to operate an elevator, the operation shall be in accordance with Sections 3002.4.1 and 3003.1.1 through 3003.1.4.

3003.1.1 Manual transfer. Standby power shall be manually transferable to all elevators in each bank.

3003.1.2 One elevator. Where only one elevator is installed, the elevator shall automatically transfer to standby power within 60 seconds after failure of normal power.

3003.1.3 Two or more elevators. Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to standby power within 60 seconds after failure of normal power where the standby power source is of sufficient capacity to operate all elevators at the same time. Where the standby power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to standby power in sequence, return to the designated landing and disconnect from the standby power source. [After all elevators have been returned to the designated level, at least three elevators shall remain operable from the standby power source. For buildings with multiple banks of elevators, at least one elevator from each bank shall remain operable from the standby power source.

3003.1.4 Venting. Where standby power is connected to elevators, the machine room ventilation or air conditioning shall be connected to the standby power source.

3003.2 Fire-fighters’ emergency operation. Elevators shall be provided with Phase I emergency recall operation and Phase II emergency in-car operation [in accordance with] where required by ASME A17.1/CSA B44 as modified by Appendix K.

3003.3 Elevator in readiness. Requirements for elevator in readiness shall be as defined in Sections 3003.3.1 through 3003.3.2.

3003.3.1 Elevator in readiness for Fire Department emergency access[]. Except as provided in Section 3003.3.2, in buildings five stories in height or more, underground buildings as described in Section 405.1, and high-rise buildings, [all floors shall be served by at least one elevator that] at least one elevator shall be kept available for immediate use by the Fire Department during all hours of the night and day, including holidays, Saturdays and Sundays. The elevator in readiness shall serve all floors of the building. For buildings where a Fire Service Access Elevator (FSAE) is provided, the FSAE shall serve all floors of the building. There shall be available at all times a person competent to operate the elevator. However, an attendant shall
not be required for buildings with occupied floors of 150 feet (45 720 mm) or less above the lowest level of the Fire Department vehicle access that have elevators with automatic or continuous pressure operation with keyed switches meeting the requirements of ASME A17.1/CSA B44 as modified by Appendix K so as to permit sole use of the elevators by the Fire Department.

3003.3.2 Number of elevators. A number of elevators shall be kept available at every floor for the sole use of the Fire Department as required by Sections 3003.3.2.1 and 3003.3.2.2. This requirement shall apply to the following types of buildings:

1. High-rise buildings with occupancies classified in Groups A, B, E, I, F, H, M and S;
2. Buildings with Group B occupancies with a gross area of 200,000 square feet (18 581 m²); and
3. Buildings with a main use or dominant occupancy in Group R-1 or R-2.

Exception: In buildings that are five stories or more in height but are not one of the types of buildings described in Items 1 through 3 in Section 3003.3.2, at least one elevator car in such buildings shall be kept available for sole use by the Fire Department.

3003.3.2.1 Three or fewer elevators. Where a floor is serviced by three or fewer elevator cars, every car shall be kept available for sole use by the Fire Department.

3003.3.2.2 More than three elevators. Where a floor is serviced by more than three elevator cars, at least three elevator cars with a total rated load capacity of not less than 6,000 pounds (2722 kg) shall be kept available for the sole use of the Fire Department. Such cars shall include not more than two cars that service all floors and at least one other car in another bank servicing that floor. If the total load capacity of all cars servicing the floor is less than 6,000 pounds (2722 kg), all such cars shall be kept available for sole use of the Fire Department.

3003.3.3 Operation and control. Elevators that are kept for the sole use of the Fire Department and that have automatic or continuous pressure operation shall be controlled by keyed switches meeting the requirements of ASME [A17.1] A17.1/CSA B44.

3003.3.4 Other elevator cars. In high-rise buildings classified in Occupancy Groups A, B, E, F, H, I, M and S, in low-rise buildings classified in Occupancy Group B with a gross area of 200,000 square feet (18581 m²) or more and in buildings classified in Occupancy Group R-1 or R-2, all other automatically operated cars shall have manual operation capability.
[**3004.4 Plumbing and mechanical systems.** Plumbing and mechanical systems shall not be located in an elevator shaft.]

[**Exception:** Floor drains, sumps, and sump pumps shall be permitted at the base of the shaft provided they are indirectly connected to the plumbing system.]

[**3004.5 Control of smoke and hot gases.** Hoistways of elevators shall be provided with any one of the following means to prevent the accumulation of smoke and hot gases in case of fire in accordance with Sections 3004.5.1 through 3004.5.4.]

[**3004.5.1 Vents in the hoistway enclosures.** Hoistway enclosures may be vented in accordance with the following:]

1. **Location of vents.**

   1.1. The vents in the side of the hoistway enclosure below the elevator machine room floor or in the roof of the hoistway shall open either directly to the outer air or through noncombustible ducts to the outer air.

   1.2. The vents in the wall or roof of an overhead elevator machine room through the smoke hole in the top of the elevator hoistway shall be vented to the outer air through noncombustible ducts.

2. **Area of vents.** The area of vents in the hoistway or the elevator machine room and the smoke hole shall be not less than 3 1/2 percent of the area of the hoistway nor less than 3 square feet (0.28 m²) for each elevator car, whichever is greater. Such vents shall comply with the following requirements:

   2.1. **Open vents.** Of the total required vent area, not less than one third shall be permanently open or equipped with an openable hinged damper. The smoke hole shall be permanently open.

   2.2. **Closed vents.** The two thirds closed portion of the required vent area either in the hoistway enclosure or in the elevator machine room may consist of windows or skylights glazed with annealed glass not more than 1/8-inch (3.2 mm) thick. A closed damper that opens upon the activation of a smoke detector placed at the top of the hoistway shall be considered closed.

   [**Exception:** The total required open vent area shall not be required to be permanently open where all of the vent openings automatically open upon detection of smoke in the elevator lobbies or hoistway, upon power failure (except when provided with a code compliant standby power supply from an approved standby power source) or upon activation of a manual override control. The manual override control shall be capable of opening and closing the vents and shall be located in an approved location.]

[**3004.5.2 Mechanical ventilation of the hoistway enclosure.** Hoistway enclosures may be mechanically vented. The system of mechanical ventilation shall be of sufficient capacity to exhaust at least 12 air changes per hour of the volume of such hoistways through a roof or an
approved location on an exterior wall other than the lot line wall. Such system shall comply with
the following requirements:

[1. The smoke detector shall be placed at the top of the hoistway and shall activate the
mechanical ventilation system.]

[2. Such mechanical ventilation system shall not pass through the overnight sleeping areas
of a hotel, multiple dwelling, hospital or similar buildings.]

[3. Such mechanical ventilation system shall be equipped with a manual shut-off in or near
the elevator control panel at the designated level.]

[3004.5.3 Air pressurization of hoistway enclosure. Hoistways may be air pressurized. Where
such system is utilized, the air shall not cause erratic operation of the landing or car door
equipment, traveling cables, selector tapes, governor ropes, compensating ropes, or any other
components sensitive to excess movement or deflection.]

[3004.5.4 Alternate means. The commissioner may accept alternate means to prevent the
accumulation of smoke and hot gases in the hoistways and machine rooms in case of fire.]

SECTION BC [3005] 3004
CONVEYING SYSTEMS

[3005.1] 3004.1 General. Escalators, moving walks, conveyors, and
amusement devices shall comply with the provisions of Sections 3004.2 through 3004.5
as applicable.

[3005.2] 3004.2 Escalators and moving walks. Escalators and moving walks shall be constructed of
approved noncombustible and fire-retardant materials. This requirement shall not apply to electrical
equipment, wiring, wheels, handrails and the use of \( \frac{1}{28}\text{-inch} (0.9 \text{ mm}) \) wood veneers on balustrades
backed up with noncombustible materials.

[3005.2.1] 3004.2.1 Enclosure. Escalator floor openings shall be enclosed with shaft enclosures
complying with Section [708-] 713.

[3005.2.2] 3004.2.2 Escalators. Where provided in below-grade transportation stations,
escalators shall have a clear width of not less than 32 inches [(813 mm) minimum] (813 mm).

Exception: The clear width is not required in existing facilities undergoing alterations.

[3005.3] 3004.3 Conveyors. Conveyors and conveying systems shall comply with ASME B20.1.

[3005.3.1] 3004.3.1 Enclosure. Conveyors and related equipment connecting successive floors
or levels shall be enclosed with shaft enclosures complying with the requirements of Section
708-] Section 713.
[3005.3.2] 3004.3.2 Conveyor safeties. Power-operated conveyors, belts[,] and other material-moving devices shall be equipped with automatic limit switches[,] which will shut off the power in an emergency and automatically stop all operation of the device.

[3005.4] 3004.4 Reserved.

[3005.5] 3004.5 Amusement devices. Amusement devices shall [also] comply with rules of the department.

SECTION BC [3006.3005 ]
MACHINERY SPACES, MACHINE ROOMS, CONTROL SPACES
AND CONTROL ROOMS

[3006.1] 3005.1 Access. An approved means of access shall be provided to elevator machine rooms [and overhead machinery], control rooms, control spaces and machinery spaces.

[3006.2 Venting.] 3005.2 Temperature control. Elevator machine rooms, machinery spaces that contain [solid-state equipment] the driving machine, and control rooms or spaces that contain the operation or motion controller for elevator operation shall be provided with an independent ventilation or air-conditioning system to protect against the overheating of the electrical equipment. The system shall be capable of maintaining temperatures within the range established for the elevator equipment.

[3006.3] 3005.3 Pressurization. The elevator machine room [serving], control rooms or control space with openings into a pressurized elevator hoistway shall be pressurized upon activation of a heat or smoke detector located in the elevator machine room, control room or control space.

[3006.4] 3005.4 Machine rooms [and], control rooms, machinery spaces, and control spaces. Elevator machine rooms, control rooms, control spaces and machinery spaces shall be enclosed with fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both. The fire-resistance rating shall be not [be] less than the required rating of the hoistway enclosure served by the machinery. Openings in the fire barriers shall be protected with assemblies having a [fire protection] fire protection rating not less than that required for the hoistway enclosure doors.

Exception: [Where] For other than fire service access elevators and occupant evacuation elevators, where machine rooms [and], machinery spaces, control rooms and control spaces do not abut and have no openings to the hoistway enclosure they serve, the fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both, shall be permitted to be reduced to a 2-hour fire-resistance rating.

[3006.5 Sprinklers prohibited. Sprinklers are not permitted in elevator machine rooms.] 3005.5 Sprinklers and shunt trip. Sprinklers are not permitted in elevator machine rooms, machine spaces, control rooms and control spaces. Where elevator hoistways are protected with automatic sprinklers, a means installed in accordance with Section 21.4 of NFPA 72 as modified by Appendix Q shall be provided, where required, to disconnect automatically the main line power supply to the affected elevator prior to the application of water. This means shall not be self-resetting. The activation of
automatic sprinklers outside the hoistway, machine room, machinery space, control room or control space shall not disconnect the main line power supply.

[3006.6] 3005.6 Plumbing systems. Plumbing systems not related to elevator machinery shall not be located in elevator equipment rooms.

[3006.7] 3005.7 Elevator machinery noise control in multiple dwellings. Gear-driven machinery, gearless machinery, and motor generators located in an elevator machinery room or shaft on a roof, or on a floor other than a floor on grade, shall be supported on vibration isolator pads having a minimum thickness of ½ inch (12.7 mm).

SECTION BC 3006
ELEVATOR LOBBIES AND HOISTWAY OPENING PROTECTION

3006.1 Elevator, dumbwaiter and other hoistways. E1 elevator, dumbwaiter, and other hoistway enclosures shall be constructed in accordance with Section 713 and Chapter 30.

3006.1.1 Elevator lobby. Except as provided by Sections 403.6.1 and 403.6.2, an enclosed elevator lobby shall be provided in high-rise buildings at the following locations:

1. Elevators opening onto a fire-resistance-rated corridor, in all occupancy groups.

2. Elevators serving Group B occupancies. Elevators that serve four or more stories that contain space classified in occupancy Group B, inclusive of any lobby or entrance level, shall provide elevator lobbies at every level served by such elevator.

The lobby enclosure shall separate the elevator shaft enclosure doors from each floor by smoke partitions. In addition to the requirements in Section 710 for smoke partitions, doors protecting openings in the elevator lobby enclosure walls shall also comply with Section 710.5.2.3 and penetrations of the elevator lobby enclosure by ducts and air transfer openings shall be protected in accordance with Section 710.8. Elevator lobbies shall have at least one means of egress complying with Chapter 10 and other provisions within this code. Access to an exit on any story through an elevator lobby shall be permitted provided that access to at least one other required exit does not require passing through the elevator lobby.

Exceptions:

1. Enclosed elevator lobbies are not required at the street floor, provided the entire street floor is equipped with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. Elevators not required to be located in a shaft in accordance with Section 712 are not required to have enclosed elevator lobbies.

3. Enclosed elevator lobbies are not required where zero-clearance doors are provided at the hoistway opening in accordance with Section 3002.6. Such doors shall be tested in accordance with UL 1784 without an artificial bottom seal.
4. Enclosed elevator lobbies are not required on floors with less than 2,500 square feet (232 m²), provided that the commissioner accepts an alternative design or construction method that accomplishes the purposes of this section, or provided that the commissioner determines that compliance with this section is impracticable in whole or in part, whereby the commissioner may authorize an exemption from the requirements of this section.

5. Enclosed elevator lobbies are not required on Group R-2 occupied floors.

6. Enclosed elevator lobbies are not required where the elevator hoistway is pressurized in accordance with Section 3006.1.2.

7. Enclosed elevator lobbies are not required where the elevator serves only open parking garages in accordance with Section 406.5.

3006.1.11 Areas of rescue assistance. Areas of rescue assistance shall be provided as required in Section 1009.6.

3006.1.2 Enclosed elevator lobby. Where elevator hoistway pressurization is provided in lieu of required enclosed elevator lobbies, the pressurization system shall comply with this section except as provided by Sections 403.6.1 and 403.6.2.

3006.1.2.1 Pressurization requirements. Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.10 inches of water (25 Pa) and a maximum positive pressure of 0.25 inches of water (67 Pa) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

3006.1.2.2 Rational analysis. A rational analysis complying with Section 909.4 shall be submitted with the construction documents.

3006.1.2.3 Ducts for system. Any duct system that is part of the pressurization system shall be protected with the same fire-resistance rating as required for the elevator shaft enclosure.

3006.1.2.4 Fan system. The fan system provided for the pressurization system shall be as required by this section.

3006.1.2.4.1 Fire resistance. When located within the building, the fan system that provides the pressurization shall be protected with the same fire-resistance rating required for the elevator shaft enclosure.

3006.1.2.4.2 Smoke detection. The fan system shall be equipped with a smoke detector that will automatically shut down the fan system when smoke is detected within the system.
3006.1.2.4.3 Separate systems. A separate fan system shall be used for each elevator hoistway.

3006.1.2.4.4 Fan capacity. The supply fan shall either be adjustable with a capacity of at least 1,000 cfm (0.4719 m³/s) per door, or that specified by a registered design professional to meet the requirements of a designed pressurization system.

3006.1.2.5 Standby power. The pressurization system shall be provided with standby power from the same source as other required emergency systems for the building.

3006.1.2.6 Activation of pressurization system. The elevator pressurization system shall be activated upon activation of the building fire alarm system or upon activation of the elevator lobby smoke detectors. Where both a building fire alarm system and elevator lobby smoke detectors are present, each shall be independently capable of activating the pressurization system.

3006.1.2.7 Special inspection. Special inspection for performance shall be required in accordance with Section 909.18.8. System acceptance shall be in accordance with Section 909.19.

3006.1.2.8 Marking and identification. Detection and control systems shall be marked in accordance with Section 909.14.

3006.1.2.9 Control diagrams. Control diagrams shall be provided in accordance with Section 909.15.

3006.1.2.10 Control panel. A fire-fighter’s smoke control panel complying with Section 909.16 shall be provided.

3006.1.2.11 System response time. Hoistway pressurization systems shall comply with the requirements for smoke control system response time in Section 909.17.

SECTION BC 3007
FIRE SERVICE ACCESS ELEVATOR

3007.1 General. Where required by Section 403.6.1, every floor of the building shall be served by a fire service access elevator complying with Sections 3007.1 through 3007.8. Except as modified in this section, the fire service access elevator shall be installed in accordance with this chapter and [rules of the department.] ASME A17.1/CSA B44 as modified by Appendix K, Chapter K1.

3007.2 Automatic sprinkler system. The building shall be equipped throughout [by] with an automatic sprinkler system in accordance with Section 903.3.1.1, except as otherwise permitted by Section 903.3.1.1.1 and as prohibited by Section 3007.2.1.

3007.2.1 Prohibited locations. Automatic sprinklers shall not be installed in elevator machine rooms, machinery spaces, control rooms, control spaces, and elevator hoistways of fire service access elevators.
3007.2.2 Sprinkler system monitoring. The sprinkler system shall have a sprinkler control valve supervisory switch and a water-flow-initiating device provided for each floor that is monitored by the building’s fire alarm system.

3007.3 Water protection. An approved method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system shall be provided:

1. Where an elevator lobby is provided in accordance with Section 3007.6, with respect to the automatic sprinkler system outside of the enclosed elevator lobby.

2. Where a corridor is provided in accordance with Section 3007.6, Exception 2, with respect to the automatic sprinkler system outside of the corridor and with respect to the automatic sprinklers inside the corridor that are beyond 10 feet (3048 mm) of the entrance to the hoistway enclosure of the fire service access elevator.

3. Where neither an enclosed elevator lobby nor a corridor is provided in accordance with Section 3007.6, Exception 3, with respect to the automatic sprinklers that are located beyond 10 feet (3048 mm) of the entrance to the hoistway enclosure of the fire service access elevator.

3007.4 Reserved.

3007.5 Hoistway enclosures. The fire service access elevator hoistway shall be located in a shaft enclosure complying with Section [708] 713.

3007.5.1 Structural integrity of hoistway enclosures. The fire service access elevator hoistway enclosure shall comply with Sections 403.2.3.1 through 403.2.3.4.

3007.5.2 Hoistway lighting. When fire-fighters’ emergency operation is active, the entire height of the hoistway shall be illuminated at not less than 1 footcandle (11 lux) as measured from the top of the car of each fire service access elevator.

3007.6 Fire service access elevator lobby. The fire service access elevator shall open into a fire service access elevator lobby in accordance with Sections 3007.6.1 through 3007.6.5. Egress is permitted through the elevator lobby in accordance with Item 1 of Section [708.14.1] 1016.2.

Exceptions:

1. Where a fire service access elevator has two entrances onto a floor, the second entrance shall be permitted to open into an elevator lobby in accordance with Section [708.14.1] 3006.3.

2. A fire service access elevator lobby shall not be required on stories where the elevator opens to a corridor enclosed with a fire barrier, provided all doors opening onto such corridor are smoke and draft controlled doors complying with Section [715.4.3.1] 716.5.3.1 with the UL 1784 test conducted without the artificial bottom seal.

3. A fire service access elevator lobby shall not be required on stories that are less than 3,000 square feet ([914.4 m²]) containing only Group R-2 occupancies.
3007.6.1 Reserved.

3007.6.2 Lobby enclosure. The fire service access elevator lobby shall be enclosed with a smoke barrier having a fire-resistance rating of not less than [one-hour] 1 hour, except that lobby doorways shall comply with Section 3007.6.3.

Exception: Enclosed fire service access elevator lobbies are not required at the levels of exit discharge.

3007.6.3 Lobby doorways. Other than doors to the hoistway, elevator control room[4] or elevator control space, each doorway to a fire service access elevator lobby shall be provided with a ¾-hour fire door assembly complying with Section 715.4. The fire door assembly shall comply with the smoke and draft control door assembly requirements of Section 715.4. The fire door assembly shall comply with the UL 1784 test conducted without the artificial bottom seal.

3007.6.4 Lobby size. The enclosed fire service access elevator lobby shall be not less than 120 square feet (11 m²) in an area with a minimum dimension of 6 feet (1828 mm).

3007.6.5 Fire service access elevator symbol. A pictorial symbol of a standardized design designating which elevators are fire service access elevators shall be installed on each side of the hoistway door frame on the portion of the frame at right angles to the fire service access elevator lobby. The fire service access elevator symbol shall be designed as shown in Figure 3007.6.5 and shall comply with the following:

1. The fire service access elevator symbol shall be not less than 3 inches (76 mm) in height.

2. The helmet shall contrast with the background, with either a light helmet on a dark background or a dark helmet on a light background.

3. The vertical center line of the fire service access elevator symbol shall be centered on the hoistway door frame. Each symbol shall be not less than 78 inches (1981 mm), and not more than 84 inches (2134 mm) above the finished floor at the threshold.

3 inches (76 mm)
3007.7 **Elevator system monitoring.** The fire service access elevator shall be continuously monitored at the fire command center by a standard emergency service interface system meeting the requirements of NFPA 72 as modified by Appendix Q.

3007.8 **Electrical power.** The following features serving each fire service access elevator shall be supplied by both normal power and Type 60/Class 6/Level 1 standby power:

1. Elevator equipment.
2. Elevator hoistway lighting.
3. Ventilation and cooling equipment for elevator machine rooms, control rooms, machine spaces and machinery/ control spaces.
4. Elevator car lighting.

**Exception:** Standby power relying on natural gas as a fuel source need not be Class 6.

3007.8.1 **Protection of wiring or cables.** Wires or cables that are located outside of the elevator hoistway and machine room and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access elevators shall be protected by construction having a fire-resistance rating of not less than 2 hours, shall be a circuit integrity cable having a fire-resistance rating of not less than 2 hours, or shall be protected by a listed electrical protective system having a fire-resistance rating of not less than 2 hours.

**Exception:** Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operations.

3007.9 **Reserved.**
3008.1 General. Where elevators are to be used for occupant self-evacuation during fires, all passenger elevators for general public use shall comply with Sections 3008.1 through 3008.10. Where other elevators are used for occupant self-evacuation, [they] those elevators shall [also] comply with these sections.

3008.1.1 Additional exit stairway. Where an additional means of egress is required in accordance with Section 403.5.2, an additional exit stairway shall not be required to be installed in buildings provided with occupant evacuation elevators complying with Section 3008.1.

3008.1.2 Fire safety and emergency action plans. The building shall have approved fire safety and emergency action plans in accordance with the applicable requirements of the New York City Fire Code. The fire safety and emergency action plans shall incorporate specific procedures for the occupants using evacuation elevators.

3008.1.3 Operation. The occupant evacuation elevators shall be used for occupant self-evacuation in accordance with the occupant evacuation operation requirements set forth in rules of the department as per ASME A17.1/CSA B44 as modified by Appendix K of this code and the building’s fire safety and emergency action plans.

3008.2 Reserved.

3008.3 Automatic sprinkler system. The building shall be protected throughout by an approved, electrically-supervised automatic sprinkler system in accordance with Section 903.3.1.1, except as otherwise permitted by Section 903.3.1.1.1 and as prohibited by Section 3008.3.1.

3008.3.1 Prohibited locations. Automatic sprinklers shall not be installed in elevator machine rooms, machinery spaces, control rooms, control spaces[,] and elevator hoistways of occupant evacuation elevators.

3008.3.2 Sprinkler system monitoring. The sprinkler system shall have a sprinkler control valve supervisory switch and water flow initiating device provided for each floor that is monitored by the building’s fire alarm system.

3008.4 Water protection. An approved method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system outside the enclosed occupant evacuation elevator lobby shall be provided.

3008.5 Reserved.

3008.6 Hoistway enclosure protection. Occupant evacuation elevator hoistways shall be located in shaft enclosures complying with Section 708.13.

3008.6.1 Structural integrity of hoistway enclosures. Occupant evacuation elevator hoistway enclosures shall comply with Sections 403.2.3.1 through 403.2.3.4.
3008.7 Occupant evacuation elevator lobby. The occupant evacuation elevators shall open into an elevator lobby in accordance with Sections 3008.7.1 through 3008.7.6. Egress is permitted through the elevator lobby in accordance with Item 1 of Section [708.14.1] 1016.2.

3008.7.1 Access to interior exit stairway or ramp. The occupant evacuation elevator lobby shall have direct access from the enclosed elevator lobby to an interior exit stairway or ramp.

Exception: Access to an interior exit stairway or ramp shall be permitted to be through a protected path of travel protected with smoke partitions complying with Section 711. The protected path shall be separated from the enclosed elevator lobby through an opening protected by a smoke and draft control assembly in accordance with Section [711.5.2] 716.5.3.

3008.7.2 Lobby enclosure. The occupant evacuation elevator lobby shall be enclosed with a smoke barrier having a fire-resistance rating of not less than 1 hour, except that lobby doorways shall comply with Section 3008.7.3.

Exception: Enclosed occupant evacuation elevator lobbies are not required at the levels of exit discharge.

3008.7.3 Lobby doorways. Other than doors to the hoistway, and elevator machine rooms, machinery spaces, control rooms, and control spaces within the lobby enclosure smoke barrier, each doorway to an occupant evacuation elevator lobby shall comply with the smoke and draft control assembly requirements of Section [711.5.2] 716.5.3.1 with the UL 1784 test conducted without the artificial bottom seal. Such doorway shall not be required to have a fire-resistance rating.

3008.7.3.1 Vision panel. A vision panel shall be installed in each door assembly protecting the lobby doorway. The vision panel shall consist of glazing and shall be located to furnish clear vision of the occupant evacuation elevator lobby.

3008.7.3.2 Door closing. Each door assembly protecting the lobby doorway shall be automatic closing upon receipt of any fire alarm signal from the emergency voice/alarm communication system serving the building.

3008.7.4 Lobby size. Each occupant evacuation elevator lobby shall have minimum floor area as follows:

1. The occupant evacuation elevator lobby floor area shall accommodate, at 3 square feet (0.28 m²) per person, not less than 25 percent of the occupant load of the floor area served by the lobby.

2. The occupant evacuation elevator lobby floor area [also] shall accommodate one wheelchair space of 30 inches by 48 inches (760 mm by 1220 mm) for each 50 persons, or portion thereof, of the occupant load of the floor area served by the lobby.

Exception: The size of lobbies serving multiple banks of elevators shall have the minimum floor area approved on an individual basis and shall be consistent with the building’s fire safety and emergency action plans.
3008.7.5 **Signage.** An approved sign indicating elevators are suitable for occupant self-evacuation shall be posted on all floors adjacent to each elevator call station serving occupant evacuation elevators.

3008.7.6 **Two-way communication system.** A two-way communication system shall be provided in each occupant evacuation elevator lobby for the purpose of initiating communication with the fire command center or an alternate location approved by the Fire Department. The two-way communication system shall be designed and installed in accordance with Sections 1009.8.1 and 1009.8.2.

[3008.7.6.1 **Design and installation.** The two-way communication system shall be designed and installed in accordance with Sections 1007.8.1 and 1007.8.2.]

3008.8 **Elevator system monitoring.** The occupant evacuation elevators shall be continuously monitored at the fire command center or a central control point approved by the Fire Department and arranged to display all of the following information:

1. Floor location of each elevator car.
2. Direction of travel of each elevator car.
3. Status of each elevator car with respect to whether it is occupied.
4. Status of normal power to the elevator equipment, elevator machinery and electrical apparatus cooling equipment where provided, elevator machine room, control room and control space ventilation and cooling equipment.
5. Status of emergency or standby power system that provides backup power to the elevator equipment, elevator machinery and electrical cooling equipment where provided, elevator machine room, control room and control space ventilation and cooling equipment.
6. Activation of any fire alarm initiating device in any elevator lobby, elevator machine room, machine space containing a motor controller or electric driving machine, control space, control room or elevator hoistway.

3008.8.1 **Elevator recall.** The fire command center or an alternate location approved by the Fire Department shall be provided with the means to manually initiate a Phase I Emergency Recall of the occupant evacuation elevators in accordance with [rules of the department] ASME A17.1/CSA B44 as modified by Appendix K of this code.

3008.9 **Electrical power.** The following features serving each occupant evacuation elevator shall be supplied by both normal power and Type 60/Class 6/Level 1 standby power:

1. Elevator equipment.
2. Ventilation and cooling equipment for elevator machine rooms, control rooms, machinery and control spaces.
3. Elevator car lighting.
Exceptions:

1. Standby power relying on natural gas as a fuel source need not be Class 6.

2. Where Exception 2 of Section 403.5.2 is utilized, the standby power generating equipment need only be sized to satisfy the loads required to simultaneously operate those elevators identified in the timed egress analysis described in Exception 2.2.

3008.9.1 Protection of wiring or cables. Wires or cables that are located outside of the elevator hoistway, machine room, control room and control space and that provide normal or standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation and fire-detecting systems to fire service access and occupant evacuation elevators shall be protected by construction having a fire-resistance rating of not less than 2 hours, or shall be circuit integrity cable having a fire-resistance rating of not less than 2 hours, or shall be protected by a listed electrical circuit protective system having a fire-resistance rating of not less than 2 hours.

Exception: Wiring and cables to control signals are not required to be protected provided that wiring and cables do not serve Phase II emergency in-car operation.

3008.10 Emergency voice/alarm communication system. The building shall be provided with an emergency voice/alarm communication system. The emergency voice/alarm communication system shall be accessible to the Fire Department. The system shall be provided in accordance with Section 907.5.2.2.

3008.10.1 Notification appliances. [No] Not fewer than one audible and one visible notification appliance shall be installed within each occupant evacuation elevator lobby.

3008.11 Hazardous material areas. No building areas shall contain hazardous materials exceeding the maximum allowable quantities per control area as addressed in Section 414.2.

SECTION BC 3009
SERVICE EQUIPMENT CERTIFICATES

3009.1 Required. No service equipment shall be placed in operation until a service equipment certificate of compliance has been obtained in accordance with the provisions of this code.

3009.2 Posting of inspection certificate. At the time a service equipment Certificate of Compliance is issued, an inspection certificate issued by the commissioner shall be posted. No such inspection certificate shall be issued for elevators that are not subject to periodic inspections pursuant to this code. The inspection certificate shall be in such form as the commissioner shall determine by rule and shall be posted in a frame with a transparent cover in the car of every passenger and freight elevator and on or near every escalator and moving walk and power-operated scaffold.

3009.2.1 Alternate posting locations. In lieu of posting the inspection certificate in those locations specified in this section, the inspection certificate may be kept in the on-site building manager’s office. In such case, the building manager’s office must be open during normal business hours. In addition, notice must be posted in each location listed in Section 3009.2 and kept in a frame with a transparent cover, or a plaque or on the car operating panel, with an
indelible inscription, stating that the inspection certificate is located in the building manager’s office and identifying the location of such office.

3009.3 Temporary use certificates. The commissioner may issue temporary use certificates for any equipment or device regulated by this code, except power-operated scaffolds, provided that such partial use and operation may be made safely and without endangering public health, safety, and welfare and provided further that such temporary use certificate shall not be issued for a period of more than 30 calendar days, subject to renewal for additional 30-day periods at the discretion of the commissioner. Temporary use certificates for elevators shall also be conditioned upon compliance with the following:

1. The class of service to be permitted shall be designated on the temporary use certificate.

2. The hoistway shall be enclosed throughout in an enclosure complying with ASME A17.1/CSA B44 or with a temporary enclosure in accordance with the requirements for workers’ elevators (temporary elevators) of the Industrial Code of the State of New York, No. 23.

3009.3.1 Posting of temporary use certificate. The temporary use certificate shall be posted in a conspicuous location on, or adjacent to, the device covered by the certificate and shall state that the device has not been finally approved by the commissioner.

SECTION BC 3010
ELEVATOR, AMUSEMENT AND OTHER DEVICE OPERATORS

3010.1 Elevator operators. With the exception of automatic operation elevators, [continuous pressure elevators and sidewalk elevators], every passenger and freight elevator with a rise of more than one story shall be in the charge of a designated competent operator, who shall be at least 18 years old and selected with consideration of his or her abilities to perform his or her duties in a careful and competent manner. Such designated competent operator shall be instructed in the safe and proper operation of the equipment.

3010.2 Amusement device operators. Operators of amusement devices shall meet the requirements of rules of the department.

3010.3 Other device operators. Other devices regulated by this code shall, when deemed necessary by the commissioner to protect public safety, be in the charge of a designated competent operator conforming to such qualifications as the commissioner may prescribe, except that operators for workers’ hoists shall be assigned as required by the applicable provisions of ANSI A10.4.

3010.4 Sanction for unlawful operation. If the commissioner finds that any person engaged in operating an elevator, amusement, or other device is not competent to operate the elevator, amusement or other device, the owner, agent or lessee of such elevator, amusement, or other device shall, upon notice from the commissioner, discontinue the operation of such device by such operator.
SECTION BC 3011
ELEVATOR BEING SERVICED, REPAIRED, INSPECTED OR TESTED

3011.1 Signage. When an existing or new automatic passenger elevator in any building or structure is being serviced, repaired, inspected or tested by an elevator company, or elevator personnel, and there are no elevator personnel available to remain in the elevator car, “CAUTION” sign tapes shall be placed across the car door jamb. One strip of “CAUTION” sign tape shall be placed at a height of 18 inches (457 mm) above the car floor and another strip of “CAUTION” sign tape shall be placed at a height of 54 inches (1372 mm) above the car floor.

3011.1.1 Sign tape. The “CAUTION” sign tape shall be 3 inches (76 mm) in width with the words “CAUTION – DO NOT ENTER” repeated every 6 inches (152 mm). The lettering shall be black on yellow background. The letters shall be at least 2 inches (51 mm) high. Caution tape may be replaced with OSHA approved elevator barricades.

3011.1.2 Elevator out of service. When an elevator is out of service with the car door open at a landing prior to the elevator personnel arriving, Sections 3011.1 and 3011.1.1 shall apply.

SECTION BC 3012
ACCIDENTS

3012.1 Accidents. The owner of any device regulated by this chapter shall promptly notify the commissioner of every accident involving injury to any person requiring the services of [a physician] Emergency Medical Service (EMS) or damage to property or to apparatus exceeding $[1,000] 5,000 on, about, or in connection with such equipment, before commencing any repairs and shall afford the commissioner every facility for investigating such accident or damage. The commissioner shall make an investigation immediately thereafter, and shall prepare a full and complete report of such investigation. Such report shall give in detail all material facts and information available and the cause or causes as far as they can be determined. Such report shall be a public record. When an accident involves the failure or destruction of any part of the construction or operating mechanism of such equipment, no such equipment shall be used until it has been made safe, and re-inspected by the commissioner. The commissioner may order the discontinuance of such equipment until a new service equipment certificate has been issued by him or her for its use. No part shall be removed from the premises of the damaged construction or operating mechanism until permission to do so has been granted by the commissioner.

SECTION BC 3013
EXISTING INSTALLATIONS

3013.1 General. Existing installations shall be modified in accordance with Appendix K, Chapter K3.

SECTION BC 3014
INSPECTION AND TESTING

3014.1 Elevators and conveying systems. Inspection and testing of elevators and conveying systems shall be in accordance with Appendix K, including Table N1. Refer to Chapter 3 of Title 28 of the [Administrative Code] Administrative Code for additional requirements.

1758
**3014.2 Amusement devices.** Inspection and testing of amusement devices shall comply with rules of the department. Refer to Chapter 3 of Title 28 of the [Administrative Code](https://ny行政法规) for additional requirements. Installation of amusement devices shall be subject to the requirements for special and progress inspections.

§ 30. Chapter 31 of the New York city building code, as amended by local law number 141 for the year 2013, section 3113, as added by local law number 105 for the year 2018, is amended to read as follows:

**CHAPTER 31**

**SPECIAL CONSTRUCTION**

**SECTION BC 3101**

**GENERAL**

**3101.1 Scope.** The provisions of this chapter shall govern special building construction including membrane structures, temporary structures, pedestrian walkways and tunnels, automatic vehicular gates, awnings, canopies, sun control devices, marquees, signs, telecommunications towers and antennas, swimming pools and enclosures, sidewalk cafés, and fences.

**SECTION BC 3102**

**MEMBRANE STRUCTURES**

**3102.1 General.** The provisions of [this section](https://ny行政法规) Sections 3102.1 through 3102.8 shall apply to air-supported structures, air-inflated structures, membrane-covered cable structures, membrane-covered frame structures and tents, and tensile membrane structures, collectively known as membrane structures.

**3102.1.1 Certificates of Occupancy.** The duration of Certificates of Occupancy for air-inflated structures, air-supported structures, and tents [may](https://ny行政法规) shall be limited in accordance with the requirements of Chapter 1 of Title 28 of the [Administrative Code](https://ny行政法规).

**3102.1.2 Temporary installations.** In addition to the requirements of Section 3102 of this code, temporary installations of air-supported structures, air-inflated structures, membrane-covered cable structures, tensile membrane structures, membrane-covered frame structures and tents, collectively known as membrane structures shall comply with the requirements of Article 111 of Chapter 1 of Title 28 of the [Administrative Code](https://ny行政法规).

**3102.2 Definitions.** The following terms [shall](https://ny行政法规), for the purposes of this section and as used elsewhere in this code, have the meanings shown herein:

**AIR-INFLATED STRUCTURE.** [A structure that uses air pressurized membrane beams, arches or other elements to enclose space. Occupants of such a structure do not occupy the pressurized area used to support the structure.]

**AIR-SUPPORTED STRUCTURE.** [A building wherein the shape of the structure is attained and maintained by elevated air pressure and occupants of the structure are within the elevated pressure area. Air-supported structures are of two basic types:]

1759
Double skin. [Similar to a single skin, but with an attached liner that is separated from the outer skin and provides an airspace which serves for insulation, acoustic, aesthetic or similar purposes.]

Single skin. [Where there is only the single outer skin and the air pressure is directly against that skin.]

CABLE-RESTRAINED, AIR-SUPPORTED STRUCTURE. [A structure in which the uplift is resisted by cables or webbings which are anchored to either foundations or dead men. Reinforcing cable or webbing is attached by various methods to the membrane or is an integral part of the membrane. This is not a cable-supported structure.]

MEMBRANE-COVERED CABLE STRUCTURE. [A nonpressurized structure in which a mast and cable system provides support and tension to the membrane weather barrier and the membrane imparts stability to the structure.]

MEMBRANE-COVERED FRAME STRUCTURE. [A nonpressurized building wherein the structure is composed of a rigid framework to support a tensioned membrane which provides the weather barrier.]

NONCOMBUSTIBLE MEMBRANE STRUCTURE. [A membrane structure in which the membrane and all component parts of the structure are noncombustible.]

TENSILE MEMBRANE STRUCTURE.

TENT. [A nonpressurized membrane structure of a fabric weather barrier supported by poles and guys, in which the fabric weather barrier does not impart stability to the structure. Tents need not be fully enclosed on the sides.]

3102.3 Type of construction. Noncombustible membrane structures shall be classified as Type IIB construction. Noncombustible frame or cable-supported structures covered by an approved membrane in accordance with Section 3102.3.1 shall be classified as Type IIB construction. Heavy timber frame-supported structures covered by an approved membrane in accordance with Section 3102.3.1 shall be classified as Type IV construction. Other membrane structures shall be classified as Type V construction.

3102.3.1 Membrane and interior liner material. Membranes and interior liners shall be either noncombustible as set forth in Section [703.4] 703.5, or meet the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 and the manufacturer’s test protocol.

3102.4 Allowable floor areas. The area of a membrane structure shall not exceed the limitations [set forth in Table 503, except as provided] specified in Section 506.

3102.5 Maximum height. Membrane structures shall not exceed one story nor shall such structures exceed the height limitations in feet [set forth in Table 503 specified in Section 504.3]. Membrane structures may be erected above the roof of a building provided that such roof is of noncombustible construction required to have a fire-resistance rating.

Exception: Noncombustible membrane structures serving as roofs only.
3102.6 Mixed construction. Membrane structures shall be permitted to be utilized as specified in this section as a portion of buildings of other types of construction. Height and area limits shall be as specified for the type of construction and occupancy of the building.

3102.6.1 Noncombustible membrane. A noncombustible membrane shall be permitted for use as the roof or as a skylight of any building or atrium of a building of any type of construction provided such membrane is not less than 20 feet (6096 mm) above any floor, balcony or gallery, and meets the fire classification requirements of Section 1505 for roof assemblies.

3102.7 Engineering design. Membrane structures, except tensile membrane structures, shall be designed and constructed to sustain dead loads; loads due to tension or inflation; live loads including wind, snow or flood and seismic loads and in accordance with Chapter 16 and Appendix G.

3102.7.1 Lateral restraint. For membrane-covered frame structures, the membrane shall not be considered to provide lateral restraint in the calculation of the capacities of the frame members.

[Exception:] 3102.7.2 Design. Tents, air-inflated structures, and air-supported structures shall be designed by either an alternate engineering design approved by the commissioner or as follows:

1. Tents. Tents shall be guyed, supported, and braced to withstand a wind pressure of 10 psf (478.8 Pa) of projected area of the tent. The poles and their supporting guys, stays, stakes, fastenings, etc., shall be of sufficient strength and attached so as to resist wind pressure of 20 psf (957.6 Pa) of projected area of the tent.

2. Air-inflated structures and air-supported structures.

2.1 Air-inflated structures and air-supported structures shall be anchored to the ground or supporting structure by either ballast or positive anchorage, sufficiently and evenly distributed, and adequate to resist the inflation lift load, the aerodynamic lift load, and the drag (shear) load due to wind impact. The latter factors shall be based on a fastest mile wind speed of 70 mph (112.65 km/hr), and an estimated stagnation of not less than 0.5 q for structures on grade whose height is equal to, or less than, the width of the structure. For greater heights, or for elevated structures, increased anchorage shall be provided, justified by analytical and/or experimental data subject to approval by the commissioner.

2.2 The skin of the structure shall be of such strength, and the joints so constructed, as to provide a minimum dead load strip tensile strength at 70°F (21°C) of four times the 70 mph (121.65 km/hr) design load (inflation and aerodynamic loading). The joints shall provide a dead load strip tensile strength of 160°F (71°C) of twice the 70 mph (121.65 km/hr) design load (i.e., a factor of safety of 4 and 2,
respectively). In addition, the material shall provide a trapezoidal tear strength of 15 percent of the maximum design tensile load. Material and joint strengths shall be so certified by the manufacturer, justified by analytical and/or experimental data.

3102.7.3 Tensile membrane structures. The design and construction shall be in accordance with ASCE 55. The provisions of Sections 3102.1 through 3102.6 shall also apply.

3102.8 Inflation systems. Air-supported structures and air-inflated structures shall be provided with primary and auxiliary inflation systems to meet the minimum requirements of Sections 3102.8.1 through 3102.8.3.

3102.8.1 Equipment requirements. The primary inflation system shall consist of one or more blowers and shall include provisions for automatic control to maintain the required inflation pressures. Such system shall be so designed as to prevent overpressurization of the system.

3102.8.1.1 Auxiliary inflation system. In addition to the primary inflation system, in structures exceeding 1,500 square feet (140 m²) in area, an auxiliary inflation system shall be provided with sufficient capacity to maintain the inflation of the structure in case of primary system failure. The auxiliary inflation system shall operate automatically when there is a loss of internal pressure and when the primary blower system becomes inoperative. Initiation of auxiliary inflation system shall be indicated by an audible and visual alert at the entrance or a regularly attended location.

3102.8.1.2 Blower equipment. Blower equipment shall meet all of the following requirements:

1. Blowers shall be powered by continuous-rated motors at the maximum power required for any flow condition as required by the structural design.

2. Blowers shall be provided with inlet screens, belt guards and other protective devices as required by the commissioner to provide protection from injury.

3. Blowers shall be housed within a weather-protecting structure.

4. Blowers shall be equipped with backdraft check dampers to minimize air loss when inoperative.

5. Blower inlets shall be located to provide protection from air contamination. The location of inlets shall be approved.

3102.8.2 Standby power. Wherever an auxiliary inflation system is required, an approved standby power-generating system shall be provided. However, notwithstanding Section 2702.1, the standby power-generating system shall be equipped with a suitable means for automatically starting the generator set upon failure of the normal electrical service and for automatic transfer and operation of all of the required electrical functions at full power within 60 seconds of such service failure. Standby power shall be capable of operating independently for a minimum of
not less than 4 hours. Initiation of standby power shall be indicated by an audible and visual alert at the entrance or a regularly attended location.

3102.8.3 Support provisions. A system capable of supporting the membrane in the event of deflation shall be provided for in air-supported structures and air-inflated structures having an occupant load of 50 or more or where covering a swimming pool regardless of occupant load. Such support system shall be capable of maintaining the membranes [at least] not less than 7 feet (2134 mm) above the floor, seating area or surface of the water. When air-supported structures or air-inflated structures are used as a roof on Type I or II construction buildings, such support system shall be capable of maintaining the membranes not less than 20 feet (6096 mm) above the floor or seating area.

3102.9 Separation. No air-inflated structure, air-supported structure, or tent shall be erected closer than 20 feet (6096 mm) to any interior lot line nor closer than 30 feet (9144 mm) in any direction to an unprotected opening, required exterior stairway or corridor, or required exit door, on the same level or above the level of such structure. Such structure may abut another building on the same tax lot if the following conditions exist:

1. No unprotected openings or exits are located above or within 30 feet (9144 mm) of such structure.

2. No doors serving as a required exit are located between such structure and the abutted building.

3. The exterior wall of the abutted building meets the requirements of Section 705 for fire walls.

3102.10 Exits. In addition to the requirements of Chapter 10, travel distance to an exit from any point within a tent, air-supported structure, or air-inflated structure shall not exceed 75 feet (22 860 mm).

3102.10.1 Exit openings from tents. Exit openings from tents shall remain open unless covered by a flame-resistant curtain of a contrasting color to the tent. Such curtain shall be supported [at least] not less than 80 inches (2032 mm) above the floor level at the exit and, when open, no part of the curtain shall obstruct the exit.

3102.10.2 Exit openings from air-supported structures and air-inflated structures. Exit doors in air-supported structures and air-inflated structures shall close automatically against normal operational pressures. Opening force at the edge of such doors shall not exceed 15 pounds (6.80 kg), with the structure at operational pressure. Exit doors shall be located in frames constructed such that they will remain operative and support the weight of the pressurized membrane structure in a state of total collapse.

SECTION BC 3103
TEMPORARY STRUCTURES

3103.1 General. The provisions of [this section] Sections 3103.1 through 3103.4 shall apply to temporary tents, grandstands, platforms, reviewing stands, outdoor bandstands, stages and similar
miscellaneous structures erected for a period of 90 days or less. Such structures may be constructed of wood whether located inside or outside of the fire districts.

3103.1.1 Permit required. Temporary structures shall not be erected, operated or maintained for any purpose without obtaining a permit from the department in accordance with Section 28-111.1.1 of the Administrative Code.

**Exception:** No permit shall be required for:

1. The erection and use of temporary tents of less than 400 gross square feet (37 m²), for not more than 30 days.

2. The erection and use of temporary platforms, reviewing stands, outdoor bandstands, and similar miscellaneous structures that cover an area less than 120 square feet (11.16 m²), including connecting areas or spaces with a common means of egress or entrance, for not more than 30 days.

3103.2 Construction documents. A permit application and construction documents shall be submitted for each installation of a temporary structure. The construction documents shall include a site plan indicating the location of the temporary structure and information delineating the means of egress and the occupant load.

3103.3 Location. Temporary structures shall be located in accordance with the requirements of Table 602 based on the fire-resistance rating of the exterior walls for the proposed type of construction.

3103.4 Means of egress. Temporary structures shall conform to the means of egress requirements of Chapter 10 and shall have [a maximum] an exit access travel distance of 100 feet (30 480 mm) or less.

**SECTION BC 3104 PEDESTRIAN WALKWAYS AND TUNNELS**

3104.1 General. This section shall apply to connections between buildings such as pedestrian walkways or tunnels, located at, above or below grade level, that are used as a means of travel by persons. The pedestrian walkway shall not contribute to the building area or the number of stories or height of connected buildings.

3104.1.1 Application. Pedestrian walkways shall be designed and constructed in accordance with Sections 3104.2 through 3104.9. Tunnels shall be designed and constructed in accordance with Sections 3104.2 and 3104.10.

3104.2 Separate structures. [Connected buildings] Buildings connected by pedestrian walkways or tunnels shall be considered to be separate structures.

**Exceptions:**

1. Buildings that are on the same tax lot and considered as portions of a single building in accordance with Section 503.1.2.
2. For purposes of calculating the number of Type B units required by Chapter 11, structurally connected buildings and buildings with multiple wings shall be considered one structure.

3104.3 Construction. The pedestrian walkway shall be of a Construction Type that is at least equal to the higher type of the two buildings connected.

   **Exception:** Exterior pedestrian walkways serving as a required exit shall be constructed of noncombustible materials and comply with the fire-resistance rating requirements as set forth in Chapter 7.

3104.4 Contents. Only materials approved by the department shall be located in the pedestrian walkway. Decorations may be permitted in accordance with the *New York City Fire Code*.

3104.5 Connections of pedestrian walkways to buildings. The connection of a pedestrian walkway to a building shall comply with Section 3104.5.1, 3104.5.2, 3104.5.3 or 3104.5.4.

   **Exception:** Buildings that are on the same tax lot and considered as portions of a single building in accordance with Section 503.1.2.

   **[3104.5]** **3104.5.1 Fire barriers [between pedestrian walkways and buildings].** Pedestrian walkways shall be separated from the interior of the building by not less than 2-hour fire barriers constructed in accordance with Section 707 and Sections 3104.5.1.1 through 3104.5.1.3, or horizontal assemblies constructed in accordance with Section 712, or both. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the 10-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a ¾-hour fire protection rating in accordance with Section 715.

   **[Exception:** On pedestrian walkways (i) having a maximum height above grade of three stories or 40 feet (12 192 mm), whichever is less; or (ii) where protected by sprinklers, five stories or 55 feet (16 764 mm), whichever is less, the walls separating the pedestrian walkway from a connected building and the openings within the 10-foot (3048 mm) horizontal extension of the protected walls beyond the walkway are not required to have a fire barrier by this section where any of the following conditions exist:]

3104.5.1.1 Exterior walls. Exterior walls of buildings connected to pedestrian walkways shall be 2-hour fire-resistance-rated. This protection shall extend not less than 10 feet (3048 mm) in every direction surrounding the perimeter of the pedestrian walkway.

3104.5.1.2 Openings in exterior walls of connected buildings. Openings in exterior walls required to be fire-resistance-rated in accordance with Section 3104.5.1.1 shall be equipped with opening protectives providing a not less than ¾-hour fire protection rating in accordance with Section 716.
### 3104.5.1.3 Supporting construction. The fire barrier shall be supported by construction as required by Section 707.5.1.

### 3104.5.2 Alternative separation. The wall separating the pedestrian walkway and the building shall comply with Section 3104.5.2.1 or 3104.5.2.2 where:

1. The distance between the connected buildings is more than [10 feet (3048 mm)] 30 feet (9144 mm).

2. The pedestrian walkway and connected buildings [except for open parking garages] are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and the roof of the walkway is not more than 55 feet (16 764 mm) above grade connecting to the fifth, or lower, story above grade plane, of each building.

**Exception:** Pedestrian walkways accessory to open parking garages need not be equipped with an automatic sprinkler system.

### 3104.5.2.1 Passage of smoke. The wall [is] shall be capable of resisting the passage of smoke [or is constructed].

### 3104.5.2.2 Glass. The wall shall be constructed of a tempered, wired or laminated glass wall and doors [subject to the following] or glass separating the interior of the building from the pedestrian walkway. The glass shall be protected by an automatic sprinkler system in accordance with Section 903.3.1.1 that, when actuated, shall completely wet the entire surface of interior sides of the wall or glass. Obstructions shall not be installed between the sprinkler heads and the wall or glass. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.

[1.1. The wall or glass separating the interior of the building from the pedestrian walkway shall be protected by an automatic sprinkler system in accordance with Section 903.3.1.1 and the sprinkler system shall completely wet the entire surface of interior sides of the wall or glass when actuated.]

[1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates; and]

[1.3. Obstructions shall not be installed between the sprinkler heads and the wall or glass.]

### 3104.5.3 Open sides on walkway. [2. The] Where the distance between the connected buildings is more than [10 feet (3048 mm)] 30 feet (9144 mm), [and] the walls at the intersection of the pedestrian walkway and each building need not be fire-resistance-rated provided both sidewalls of the pedestrian walkway are [at least] not less than 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases. The roof of the walkway shall be located not more than 40 feet (12 160 mm) above grade plane, and the walkway shall only be permitted to connect to the third or lower story of each building.
Exception: Where the pedestrian walkway is protected with a sprinkler system in accordance with Section 903.3.1.1, the roof of the walkway shall be located not more than 55 feet (16,764 mm) above grade plane and the walkway shall only be permitted to connect to the fifth or lower story of each building.

3104.5.4 Exterior walls greater than 2 hours. Where exterior walls of connected buildings are required by Section 704.705 to have a fire-resistance rating greater than 2 hours, the walls at the intersection of the pedestrian walkway [shall] and each building need not be equipping throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1. fire-resistance-rated provided:

1. The pedestrian walkway [does not serve as a required exit] is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

2. The roof of the walkway is not located more than 55 feet (16,764 mm) above grade plane and the walkway connects to the fifth, or lower, story above grade plane of each building.

3104.6 Public way. Pedestrian walkways over a public way shall [also] comply with Chapter 32.

3104.7 Width. The unobstructed width of pedestrian walkways shall be not less than 36 inches (914 mm). The total width shall be not exceed greater than 30 feet (9144 mm).

3104.8 Egress. Access shall be provided at all times to a pedestrian walkway that serves as a required exit. Doors satisfying the requirements of Chapter 10 shall enclose each end of such pedestrian walkway. The width of such pedestrian walkway shall be at least equal to the width of the doors opening onto such pedestrian walkway, but in no case less than 44 inches (1118 mm). The floor level at doors shall be the same as that of the connected building.

Exception: The floor level at doors of open pedestrian walkways shall be at least not less than 7½ inches (191 mm) below the level of the door. Where the requirements of Chapter 11 are applicable, these differences in levels shall be accommodated by means of ramps in compliance with the provisions of Chapter 11.

3104.9 Exit access travel. The length of exit access travel shall not exceed be 200 feet (60,960 mm) or less.

Exceptions:

1. Exit access travel distance on a pedestrian walkway equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall not exceed be 250 feet (76,200 mm) or less.

2. Exit access travel distance on a pedestrian walkway constructed with both sides not less than 50 percent open shall not exceed be 300 feet (91,440 mm) or less.
3. Exit access travel distance on a pedestrian walkway constructed with both sides not less than 50 percent open, and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, shall not exceed 400 feet (122 m) or less.

3104.10 Tunneled walkway. Separation between the tunneled walkway and the building to which it is connected shall be not less than 2-hour fire-resistant construction and openings therein shall be protected in accordance with Table [745.4] 716.5.

SECTION BC 3105
AWNINGS, CANOPIES AND SUN CONTROL DEVICES

3105.1 General. Awnings, canopies, and sun control devices shall comply with the requirements of this section, the requirements of Chapter 32 for projections over public ways, and other applicable sections of this code.

Exception: Canopies projecting over public rights-of-way governed by Title 19 of the Administrative Code and rules of the New York City Department of Transportation.

3105.2 [Definition] Definitions. The following term [shall, for the purposes of this section and as used elsewhere] is defined in [this code, have the meaning shown herein.] Chapter 2:

RETRACTABLE AWNING. [A retractable awning is a cover with a frame that retracts against a building or other structure to which it is entirely supported.]

SUN CONTROL DEVICE.

3105.3 Design and construction. Awnings, canopies, and sun control devices shall be designed and constructed to withstand wind or other lateral loads and live loads as required by Chapter 16 with due allowance for shape, open construction and similar features that relieve the pressures or loads. Structural members shall be protected to prevent deterioration. Awnings and canopies shall have frames of noncombustible material, covered with fabric that meets the fire propagation performance criteria of Test Method 1 or Test Method 2, as appropriate, of NFPA 701 or has a flame spread index not greater than 25 when tested in accordance with ASTM E 84 or UL 723, or covered in plastic in accordance with Section 2605, sheet metal, or other equivalent material, and shall be either fixed, retractable, folding or collapsible. Sun control devices shall be constructed of noncombustible materials.

3105.4 Reserved.

SECTION BC 3106
MARQUEES

3106.1 General. Marquees shall comply with this section and other applicable sections of this code. Marquees projecting beyond the street line shall also comply with the requirements of Chapter 32. Signs placed on marquees shall also comply with Section 3107.

3106.2 Thickness. The maximum height or thickness of a marquee measured vertically from its lowest to its highest point shall not be limited.
Exception: Marquees projecting beyond the street line shall meet the height and thickness requirements of Chapter 32.

3106.3 Roof construction. Where the roof or any part thereof is a skylight, the skylight shall comply with the requirements of Chapter 24. Every roof and skylight of a marquee shall be drained in accordance with the provisions of the New York City Plumbing Code.

3106.4 Location prohibited. Every marquee shall be so located as not to interfere with the operation of any exterior standpipe, and such that the marquee does not obstruct the clear passage of stairways or exit discharge from the building or the installation or maintenance of street lighting.

3106.5 Construction. A marquee shall be supported entirely from the building and constructed of noncombustible materials. Marquees shall be designed as required in Chapter 16. Structural members shall be protected to prevent deterioration.

SECTION BC 3107
SIGNS

3107.1 General. Signs shall be designed, constructed and maintained in accordance with Appendix H.

SECTION BC 3108
RADIO, TELEVISION, AND TELECOMMUNICATIONS TOWERS AND ANTENNAS

3108.1 General. Subject to the provisions of Chapter 16 and the requirements of Chapter 15 governing the fire-resistance ratings of buildings for the support of roof structures, radio, television, and telecommunications towers and antennas shall be designed and constructed as herein provided. All such towers and antennas shall be collectively referred to as “towers” for the purposes of this section. Towers shall be designed and constructed in accordance with the provisions of TIA-222.

Exceptions:

1. Exceptions related to seismic design in Section 2.7.3 of TIA-222 shall not apply;

2. The specified values for seismic coefficients $S_s, S_f$ and Site Factors $F_a$ and $F_v$ shall comply with Section 1613.3; and

3. The horizontal extent of Topographic Category 2, escarpments, shall be 16 times the height of the escarpment.

3108.2 Location and access. Towers shall be located and equipped with step bolts and ladders so as to provide ready access for inspection purposes. Guy wires or other accessories shall not cross or encroach upon any street or other public space, or over above-ground electric utility lines, or encroach upon any privately owned property without written consent of the owner of the encroached-upon property, space or above-ground electric utility lines. Towers shall be equipped with climbing and working facilities in compliance with TIA-222. See applicable OSHA, FCC and EPA regulations relating to limitations on access to tower sites.
3108.3 Construction. Towers shall be constructed of approved corrosion-resistant noncombustible material. The minimum type of construction of isolated radio towers not more than 100 feet (30 480 mm) in height shall be Type IIB.

3108.4 Loads. Towers shall be designed to resist wind loads in accordance with [TIA/EIA-222] TIA-222 and Chapter 16 of this code. The design criteria shall not be less stringent than required by Chapter 16. Consideration shall be given to conditions involving wind load on ice-covered sections.

3108.4.1 Dead load. Towers shall be designed for the dead load plus ice load.

3108.4.2 Wind load. Towers shall be provided with adequate foundations and anchorage designed to resist two times the calculated wind load.

3108.4.3 Earthquake load. Towers shall be provided with adequate foundations and anchorage designed to resist two times the calculated earthquake load.

3108.5 Grounding. Towers shall be permanently and effectively grounded in accordance with the New York City Electrical Code.

SECTION BC 3109
SWIMMING POOLS, SWIMMING POOL ENCLOSURES, AND SAFETY DEVICES

3109.1 General. Swimming pools, swimming pool enclosures, and swimming pool safety devices shall comply with the requirements of this section and other applicable sections of this code.

3109.2 Definitions. The following terms [shall, for the purposes of this section and as used elsewhere in this code, have the meaning shown herein.] are defined in Chapter 2:

BARRIER, TEMPORARY. [An approved temporary fence, permanent fence, the wall of a permanent structure, any other structure, or any combination thereof that prevents access to the swimming pool by any person not engaged in the installation or construction of the swimming pool during its installation or construction.]

SWIMMING POOL. [Any indoor or outdoor swimming, wading, spa, or special-purpose pool.]

[Exceptions:]

1. Portable, freestanding wading pools containing water less than 24 inches (610 mm) in depth.

2. Float tanks or relaxation tanks sized for use by one person at a time.

3. Pools used for religious purposes.

4. Spa pools used for prescribed medical therapy or rehabilitation and under medical supervision.]
SWIMMING POOL, PRIVATE. [A swimming pool that is accessory to a one- or two-family dwelling, or to a single-dwelling unit of a multiple dwelling, and that is solely for the use of the occupants for noncommercial purposes.]

SWIMMING POOL, PUBLIC. [A swimming pool that is not a private swimming pool. Public swimming pools include swimming pools that are accessory to bathing establishments as such term is defined in the New York City Health Code, whether owned or operated by city agencies, or commercial interests or private entities, including, but not limited to, public or private schools, corporations, hotels, motels, camps, apartment houses, condominiums, country clubs, gymnasia and health establishments.]

3109.3 Pool [Safety and Accessibility] safety and accessibility. Public and private swimming pools shall comply with the requirements for safety and accessibility as provided in this section.

3109.3.1 Entrapment protection. Entrapment protection shall be provided in compliance with this section.

3109.3.1.1 Suction entrapment avoidance. Suction outlets shall be designed and installed in accordance with ANSI/APSP-7.

3109.3.2 Swimming pool and spa alarms. Swimming pool and spa alarms shall comply with Sections 3109.3.2.1 through 3109.3.2.4.

3109.3.2.1 Applicability. All swimming pools and spas shall be equipped with an approved pool alarm. Pool alarms shall comply with ASTM F 2208 and shall be installed, used and maintained in accordance with the manufacturer’s instructions and this section.

Exceptions:

1. A hot tub or spa equipped with a safety cover that complies with ASTM F 1346.
2. A swimming pool (other than a hot tub or spa) equipped with an automatic power safety cover that complies with ASTM F 1346.

3109.3.2.2 Multiple alarms. A pool alarm must be capable of detecting entry into the water at any point on the surface of the swimming pool. If necessary to provide detection capability at every point on the surface of the swimming pool, more than one pool alarm shall be provided.

3109.3.2.3 Alarm activation. Pool alarms shall activate upon detecting entry into the water and shall sound poolside and inside the building.

3109.3.2.4 Prohibited alarms. The use of personal immersion alarms shall not be construed as compliance with this section.

3109.3.3 Water circulation, water treatment and drainage. The supply, circulation, treatment, and drainage of water for swimming pools shall meet the requirements of the New York City Plumbing Code.
3109.3.4 **Electrical precautions.** No overhead electrical conductors shall be installed within 15 feet (4572 mm) of any swimming pool. All metal fences, enclosures, or railings that might become electrically charged as a result of contact with broken overhead conductors or from any other cause near, or adjacent to, a swimming pool shall be grounded in accordance with the provisions of lightning protection in the *New York City Electrical Code*.

3109.3.5 **Facilities for people with disabilities.** Facilities for people with physical disabilities shall be provided where required by Chapter 11 of this code.

3109.4 **Public swimming pools.** Public swimming pools shall comply with the requirements for safety and accessibility as provided in Sections 3109.3 and 3109.4.

[Exceptions] **Exception:** A swimming pool with a power safety cover or a spa with a safety cover complying with ASTM F 1346.

3109.4.1 **Barrier height and clearances.** Public swimming pools shall be completely enclosed by a fence, wall, building, or other solid barrier, or any combination thereof, [at least] not less than 6 feet (1829 mm) in height. Openings in the enclosure and pedestrian access gates shall not permit the passage of a 4-inch-diameter (102 mm) sphere. The enclosure shall be equipped with self-closing and self-latching gates.

**Exception:** Enclosures shall be [at least] not less than 4 feet (1219 mm) in height when surrounding wading pools with water less than 24 inches (610 mm) in depth.

3109.4.2 **Gates.** Gates shall comply with Sections 3109.4.2.1 through 3109.4.2.3.

3109.4.2.1 **Self-closing; opening configuration.** All gates shall be self-closing. In addition, if the gate is a pedestrian access gate, the gate shall open outward, away from the pool.

3109.4.2.2 **Self-latching; location of latch handle.** All gates shall be self-latching, with the latch handle located within the enclosure (i.e., on the pool side of the enclosure) and [at least] not less than 40 inches (1016 mm) above grade. If the latch handle is located less than 54 inches (1372 mm) from the bottom of the gate, the latch handle shall be located [at least] not less than 3 inches (76 mm) below the top of the gate, and neither the gate nor barrier shall have any opening greater than 0.5 inch (12.7 mm) within 18 inches (457 mm) of the latch handle.

3109.4.2.3 **Locking.** All gates shall be securely locked with a key, combination or other child proof lock sufficient to prevent access to the swimming pool through such gate when the swimming pool is not in use or supervised.

3109.4.3 **Other laws.** In addition to the requirements of this section, any other, more stringent requirements for the construction and design of swimming pool and barriers that may be provided for in Article 165 of the *New York City Health Code*, as administered by the New York City Department of Health and Mental Hygiene, shall also be applicable.

3109.5 **Private swimming pools.** Private swimming pools shall comply with the requirements for safety and accessibility as provided in Section 3109.3 and this section.
Exception: An above-ground private swimming pool which has a maximum water depth of 4 feet (1219 mm) and an area not exceeding 500 square feet (46.45 m²) that is accessory to an R-3 occupancy and is privately used for noncommercial purposes shall not be required to comply with Sections 3109.3.1, 3109.3.2, 3109.5.2, 3109.5.3 and 3109.5.4.

3109.5.1 Barrier height and clearances. The top of the barrier enclosing a private swimming pool shall be at least not less than 48 inches (1219 mm) above grade measured on the side of the barrier that faces away from the swimming pool. The maximum vertical clearance between grade and the bottom of the barrier shall be not greater than 2 inches (51 mm) measured on the side of the barrier that faces away from the swimming pool. Where the top of the pool structure is above grade, the barrier is authorized to be erected at grade level or mounted on top of the pool structure. The maximum and the vertical clearance between the top of the pool structure and the bottom of the barrier shall be not greater than 4 inches (102 mm).

3109.5.1.1 Openings. Openings in the barrier shall not allow passage of a 4-inch-diameter (102 mm) sphere.

3109.5.1.2 Solid barrier surfaces. Solid barriers which do not have openings shall not contain indentations or protrusions except for normal construction tolerances and tooled masonry joints.

3109.5.1.3 Closely spaced horizontal members. Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is less than 45 inches (1143 mm), the horizontal members shall be located on the swimming pool side of the fence. Spacing between vertical members shall be not exceed greater than 1¾ inches (44 mm) in width. Where there are decorative cutouts within vertical members, spacing within the cutouts shall be not exceed greater than 1¾ inches (44 mm) in width.

3109.5.1.4 Widely spaced horizontal members. Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is 45 inches (1143 mm) or more, spacing between vertical members shall be not exceed greater than 4 inches (102 mm). Where there are decorative cutouts within vertical members, spacing within the cutouts shall be not exceed greater than 1¾ inches (44 mm) in width.

3109.5.1.5 Chain link dimensions. Maximum mesh Mesh size for chain link fences shall be not greater than a 2¼ inch square (57 mm square) unless the fence is provided with slats fastened at the top or the bottom which reduce the openings to not more than 1¾ inches (44 mm).

3109.5.1.6 Diagonal members. Where the barrier is composed of diagonal members, the spacing between parallel opening formed by the diagonal members shall be not more not greater than 1¾ inches (44 mm).

3109.5.1.7 Gates. Gates shall comply with Sections 3109.5.1.1 through 3109.5.1.6 and Sections 3109.5.1.7.1 through 3109.5.1.7.3.
3109.5.1.7.1 Self-closing; opening configuration. All gates shall be self-closing. In addition, if the gate is a pedestrian access gate, the gate shall open outward, away from the pool.

3109.5.1.7.2 Self-latching; location of latch handle. All gates shall be self-latching, with the latch handle located within the enclosure (i.e., on the pool side of the enclosure) and [at least] not less than 40 inches (1016 mm) above grade. In addition, if the latch handle is located less than 54 inches (1372 mm) from the bottom of the gate, the latch handle shall be located [at least] not less than 3 inches (76 mm) below the top of the gate, and neither the gate nor barrier shall have any opening greater than 0.5 inch (12.7 mm) within 18 inches (457 mm) of the latch handle.

3109.5.1.7.3 Locking. All gates shall be securely locked with a key, combination or other child proof lock sufficient to prevent access to the swimming pool through such gate when the swimming pool is not in use or supervised.

3109.5.1.8 Dwelling wall as a barrier. Where a wall of a dwelling serves as part of the barrier, one of the following shall apply:

1. Doors with direct access to the pool through that wall shall be equipped with an alarm that produces an audible warning when the door and/or its screen, if present are opened. The alarm shall be listed in accordance with UL 2017. The audible alarm shall activate within 7 seconds and sound continuously for a minimum of 30 seconds immediately after the door and/or its screen, if present, are opened and be capable of being heard throughout the house during normal household activities. The alarm shall automatically reset under all conditions. The alarm shall be equipped with a manual means, such as touchpad or switch, to temporarily deactivate the alarm for a single opening. Such deactivation shall last no more than 15 seconds. In dwellings not required to be accessible Type B units, the deactivation switch shall be located 54 inches (1372 mm) or more above the threshold of the door. In dwellings required to be accessible Type B units, the deactivation switch(es) shall be located at [54 inches (1372 mm) maximum and] 48 inches (1219 mm) [minimum] above the threshold of the door.

2. The swimming pool shall be equipped with a power safety cover which complies with ASTM F 1346.

3. The door providing access to the swimming pool from the dwelling shall open inward, away from the swimming pool, and shall be self-closing and have a self-latching device. The release mechanism of the self-latching device shall be located no less than 54 inches (1372 mm) from the bottom of the door. In dwellings required to be accessible Type B units, the release mechanism shall be located at 48 inches (1219 mm) above the threshold of the door.

3109.5.1.9 Pool structure as barrier. Where an above-ground private swimming pool structure is used as a barrier or where the barrier is mounted on top of the pool structure, and the means of access is a ladder or steps, then the ladder or steps either shall be capable of being secured, locked or removed to prevent access, or the ladder or steps shall be surrounded
by a barrier [which] meets the requirements of Sections 3109.5.1.1 through 3109.5.1.8. [When] Where the ladder or steps are secured, locked or removed, any opening created shall not allow the passage of a 4-inch-diameter (102 mm) sphere.

### 3109.5.2 Indoor swimming pools.
Walls surrounding indoor private swimming pools shall not be required to comply with Section 3109.5.1.8.

### 3109.5.3 Prohibited locations.
Barriers shall be located so as to prohibit permanent structures, equipment or similar objects from being used to climb the barriers.

### 3109.5.4 Construction requirements.
Private swimming pools shall be constructed so as to be water tight and easily cleaned. They shall be built of nonabsorbent materials with smooth surfaces and shall be free of open cracks and open joints.

#### 3109.5.4.1 Walls.
The walls of swimming pools shall be vertical for [at least] not less than the top 30 inches (762 mm) below the normal water level. The junctions between the side walls and the bottom shall be coved. A swimming pool overflow shall be provided meeting the requirements of the *New York City Plumbing Code*.

#### 3109.5.4.2 Bottom slopes.
The bottom of the swimming pool shall slope downward toward the main drains. The slope in shallow areas with depths less than 5 feet (1524 mm) shall not exceed 1 unit vertical in 12 units horizontal (8-percent slope). In portions of the swimming pool with depth greater than 5 feet (1524 mm), the slope shall not be steeper than 1 unit vertical in 3 units horizontal (33-percent slope).

#### 3109.5.4.3 Ladders.
There shall be a ladder or steps with handrails at the deep end and at the shallow end of every swimming pool. Ladders and steps shall have no-slip treads. All ladders shall be rigidly installed and shall be constructed of corrosion-resistant materials.

#### 3109.5.4.4 Walkways.
Every swimming pool shall have a walkway [at least] not less than 5 feet (1524 mm) wide around its entire perimeter. The walkway shall have a nonslip surface and shall be constructed to drain away from the swimming pool.

#### 3109.5.4.5 Handholds.
Every swimming pool shall be constructed so that either the overflow gutter, if provided, or the tops of the side walls afford a continuous handhold for bathers.

#### 3109.5.4.6 Markings.
Permanent markings showing the depth of the shallow end, break points, diving depth and deep end shall be provided so as to be visible from both inside and outside the swimming pool.

#### 3109.5.4.7 Diving boards and towers.
Diving towers shall be rigidly constructed and permanently anchored. The depth of the water below a diving board shall be [at least] not less than 102 inches (2591 mm) for a board 39 inches (991 mm) or less above the water. For a diving board more than 39 inches (991 mm) and not more than 118 inches (2997 mm) above the water, the depth of the water below the board shall be [at least] not less than 144 inches (3658 mm). For a diving board or platform more than 118 inches (2997 mm) above the water, the depth of the water below the board shall be [at least] not less than 192 inches (4877 mm).
Indoor swimming pools shall provide [at least] not less than 144 inches (3658 mm) overhead clearance above all diving boards.

3109.6 Temporary barriers. An outdoor swimming pool, including an in-ground, above-ground or on-ground pool, hot tub or spa shall be surrounded by a temporary barrier during installation or construction. Such barrier shall remain in place until a permanent fence in compliance with Section 3109.4 is provided for public swimming pools, or a barrier in compliance with Section 3109.5 is provided for residential private pools.

Exceptions:

1. Above-ground or on-ground residential swimming pools where the pool structure is the barrier in compliance with Section 3109.

2. Spas or hot tubs with a safety cover which complies with ASTM F 1346, provided that such safety cover is in place during the period of installation or construction of such hot tub or spa. The temporary removal of a safety cover as required to facilitate the installation or construction of a hot tub or spa during periods when at least one person engaged in the installation or construction is present is permitted.

3109.6.1 Height. The top of the temporary barrier shall be [at least] not less than 48 inches (1219 mm) above grade measured on the side of the barrier which faces away from the swimming pool.

3109.6.2 Replacement by a permanent barrier. A temporary barrier shall be replaced by a complying permanent barrier within either of the following periods:

1. 90 days of the date of issuance of the building permit for the installation or construction of the swimming pool; or

2. 90 days of the date of commencement of the installation or construction of the swimming pool.

3109.6.2.1 Replacement extension. Subject to the approval of the code enforcement official, the time period for completion of the permanent barrier may be extended for good cause, including, but not limited to, adverse weather conditions delaying construction.

SECTION BC 3110
AUTOMATIC VEHICULAR GATES

3110.1 General. Automatic vehicular gates shall comply with the requirements of [this section] Sections 3110.2 through 3110.4 and other applicable sections of this code.

3110.2 Definitions. The following term [shall, for the purposes of this section and as used elsewhere] is defined in [this code, have the meaning shown herein.] Chapter 2:

VEHICULAR GATE. [A gate that is intended for use at a vehicular entrance or exit and that is not intended for use by pedestrian traffic.]
3110.3 **Vehicular gates intended for automation.** Vehicular gates intended for automation shall be designed, constructed and installed to comply with the class of gate in accordance with the requirements of ASTM F 2200.

3110.3.1 **Entrapment protection.** Defined classes of gates shall be subject to the entrapment protection provisions per UL 325.

3110.4 **Vehicular gate operators.** Vehicular gate operators, when provided, shall be listed in accordance with UL 325.

**SECTION BC 3111
SIDEWALK CAFÉS**

3111.1 **General.** Sidewalk cafés provided beyond the building line shall comply with the requirements of this section, the New York City Zoning Resolution, the Commissioners of the Department of Consumer Affairs and Department of Transportation, and with the projection limitations of Chapter 32 of this code.

3111.2 **Enclosures.** Enclosed sidewalk cafés shall be constructed of noncombustible material. The walls of such enclosures shall not extend more than 8 feet (2438 mm) above the sidewalk. Light-transmitting plastic glazing complying with Section 2606 shall be permitted as glazing within such walls. Light-transmitting plastic skylight glazing complying with Section 2610 may be installed in the roofs of such enclosures.

3111.3 **Awnings.** Awnings supported entirely from the building may be placed over unenclosed sidewalk cafés provided they are at least not less than 8 feet (2438 mm) clear above the sidewalk and within the limits specified by the Commissioner of the Department of Consumer Affairs. Such awnings shall be in compliance with Section 3105 of this code.

3111.4 **Obstructions prohibited.** No part of any awning, enclosure, fixture, equipment or removable platform of a sidewalk café shall be located:

1. Beneath a fire escape so as to obstruct operation of fire escape drop ladders or counter-balanced stairs;
2. So as to obstruct any exit from a building;
3. So as to obstruct any cellar access hatch or areaway;
4. So as to interfere with any vent or other mechanical ventilation outlet or inlet; or
5. So as to interfere with or obscure any standpipe connections, hydrant or associated signage in any way that would hinder its use by the Fire Department.

**Exception:** Upon special application, the commissioner may permit an easily removable, prominently designated platform, designed in accordance with Section 3111.5, to cover a cellar entrance or areaway that is not used as a required means of egress.
3111.5 Removable platforms. Removable platforms of sidewalk cafés shall be constructed in accordance with the requirements of this section.

3111.5.1 Continuity. Removable platforms shall be constructed to provide for a continuous unbroken and level floor without openings or cracks so as to prevent any material or liquid from falling through to the area beneath.

3111.5.2 Maintenance. No papers, trash or other materials may be permitted to accumulate in the area beneath the floor of any removable platform.

3111.6 Accessibility. Sidewalk cafés and access thereto shall comply with Chapter 11.

3111.7 Assembly seating. Unless separated from seating inside the building by fire partitions complying with Section [708] 713, the seating for enclosed sidewalk cafés shall be added to that inside the building in order to determine whether a place of assembly certificate of operation is required.

3111.8 Rules. In addition to the requirements specified herein, the commissioner may promulgate such additional rules necessary to secure safety.

SECTION BC 3112
FENCES

3112.1 Permitted heights. Fences are permitted to be erected to a maximum height of 10 feet (3048 mm) above the ground.

Exceptions:

1. In residence districts, as established by the New York City Zoning Resolution, fences are permitted to be erected to a maximum height of 4 or 6 feet (1829 mm) above the ground, depending upon its location on the zoning lot.

2. Fences in residence districts used in conjunction with nonresidential buildings and public playgrounds, excluding buildings accessory to dwellings, are permitted to be erected to a maximum height of 15 feet (4572 mm) above the ground.

3. Higher fences may be permitted by the commissioner where required for the enclosure of public playgrounds, school yards, parks, and similar public facilities.

SECTION BC 3113
PHOTOVOLTAIC PANELS AND MODULES

3113.1 General. Photovoltaic panels and modules shall comply with the requirements of this code, the New York City Electrical Code, the Zoning Resolution and the New York City Fire Code.

3113.1.1 Rooftop-mounted photovoltaic panels and modules. Photovoltaic panels and modules installed on a roof or as an integral part of a roof assembly shall comply with the requirements of the New York City Fire Code and Chapter 15 of this code.
SECTION BC 3114
[LARGE] LARGE WIND TURBINES

3114.1 General. Large wind turbines shall be designed and constructed in accordance with this section.

3114.2 Definitions. The following [words and] terms [shall for the purposes of this section have the meanings shown herein.] are defined in Chapter 2:

[Large] LARGE WIND TURBINE. [A turbine with a swept area greater than 200 m².]

[large] LARGE WIND TURBINE TOWER. [A structure that supports a large wind turbine.]

3114.3 Design standards. A large wind turbine shall be designed in accordance with standards adopted by rules of the commissioner. Such standards shall include but need not be limited to standards relating to the design of large wind turbines that are developed by the American Wind Energy Association, the New York State Energy Research and Development Authority, the California Energy Commission, the European Wind Turbine Certification, the British Wind Energy Association, the International Electrotechnical Commission, the National Renewable Energy Laboratory, or the Underwriters Laboratory.

3114.4 Wind speed. A large wind turbine shall be designed to withstand winds of up to and including 130 mph (58.1 m/s) or such higher wind load as may be specified in this code or the design standard for such turbine pursuant to Section 3114.3.

3114.5 Brakes and locks. Where necessary for public safety, the commissioner may require that a large wind turbine shall be equipped with a redundant braking system and a passive lock, including aerodynamic overspeed controls and mechanical brakes.

3114.6 Visual appearance. A large wind turbine shall be white, off-white, grey, or another non-obtrusive color specified by the commissioner.

3114.8 Access. Access to a large wind turbine shall be limited as follows:

1. Access to electrical components of a large wind turbine shall be prevented by a lock.

2. A large wind turbine tower shall not be climbable, except by authorized personnel, up to a height of 10 feet (3048 mm) measured from the base of such tower.

3114.9 Noise. A large wind turbine shall be designed to comply with the sound level limit of [section] Section 24-232.1 of the [Administrative Code] Administrative Code.

3114.10 Shadow flicker. The commissioner shall by rule establish shadow flicker limitations for large wind turbines for the purpose of limiting, to the extent practicable, such flicker on buildings adjacent to such turbines.

3114.11 Signal interference. The commissioner shall establish rules governing large wind turbines for purpose of minimizing, to the extent practicable, interference by such turbines with radio, telephone, television, cellular or other similar signals.
3114.12 Setback. No part of a large wind turbine or large wind turbine tower shall be located within a horizontal distance of a property line that is equal or less than one-half the height of such turbine, including such tower, measured from the base of such tower or, if there is no such tower, the base of such turbine.

Exception: A turbine or tower for which each owner of property adjacent to such property line has entered into a written agreement providing that such turbine or tower or a part thereof may be located closer to such property line than this section allows.

SECTION BC [3113] 3115
SMALL WIND TURBINES

[3113.1] 3115.1 General. In addition to other applicable requirements in this code, other law or rule, and established by the commissioner, small wind turbines shall be designed and constructed in accordance with this section.

[3113.2] 3115.2 Definitions. The following terms shall for the purposes of this section have the meanings shown herein:

SMALL WIND TURBINE. [A turbine with a swept area smaller than 200 m\(^2\) that generates a voltage below 1000 V (AC) or 1500 V (DC).]

SMALL WIND TURBINE TOWER. [A structure that supports a small wind turbine.]

[3113.3] 3115.3 Design standards. A small wind turbine shall be designed in accordance with standards adopted by rules of the commissioner. Such standards shall include but need not be limited to standards relating to the design of small wind turbines that are developed by the American Wind Energy Association, the New York State Energy Research and Development Authority, the California Energy Commission, the Small Wind Certification Council, the British Wind Energy Association, the International Electrotechnical Commission, the National Renewable Energy Laboratory, or the Underwriters Laboratory.

[3113.4] 3115.4 Wind speed. A small wind turbine shall be designed to withstand winds of up to and including 130 mph (58.1 m/s) or such higher wind load as may be specified in this code or the design standard for such turbine pursuant to Section 3113.3.

[3113.5] 3115.5 Brakes and locks. Where deemed necessary by the commissioner, a small wind turbine shall be equipped with a redundant braking system and a passive lock, including aerodynamic overspeed controls and mechanical brakes.

[3113.5.1] 3115.5.1 Locking before hurricane or strong wind conditions. If a hurricane or strong wind conditions are expected, the commissioner may order that small turbines equipped with passive locks be stopped and locked.

[3113.6] 3115.6 Visual appearance. A small wind turbine shall be white, off-white, grey, or another non-obtrusive color specified by the commissioner.

[3113.7] 3115.7 Lighting. A small wind turbine shall not be artificially lighted.
Exception: Lighting that is required by this code or other applicable laws or rules, provided that such lighting is shielded in accordance with rules promulgated by the commissioner.

[3443.8] 3115.8 Access. Access to a small wind turbine shall be limited as follows:

1. Access to electrical components of a small wind turbine shall be prevented by a lock.

2. A small wind turbine tower shall not be climbable, except by authorized personnel, up to a height of 10 feet (3048 mm) measured from the base of such tower.

[3443.9] 3115.9 Noise. A small wind turbine shall be designed in accordance with applicable sections of the New York City [noise control code] Noise Control Code.

[3443.10] 3115.10 Shadow flicker. The commissioner shall by rule establish shadow flicker limitations for small wind turbines for the purpose of limiting, to the extent practicable, such flicker on buildings adjacent to such turbines.

[3443.11] 3115.11 Signal interference. The commissioner shall establish rules governing small wind turbines for purpose of minimizing, to the extent practicable, interference by such turbines with radio, telephone, television, cellular or other similar signals.

[3443.12] 3115.12 Setback. No part of a small wind turbine or small wind turbine tower shall be located within a horizontal distance of a property line that is equal or less than one-half the height of such turbine, including such tower, measured from the base of such tower or, if there is no such tower, the base of such turbine.

Exception: Turbines or towers for which each owner of property adjacent to such property line has entered into a written agreement providing that such turbine or tower or a part thereof may be located closer to such property line than this section allows.

§ 31. Chapter 32 of the New York city building code, as added by local law number 33 for the year 2007, sections 3201.9 and 3202.2.2.3 as added by and section 3202.4 as amended by local law number 109 for the year 2013, section 3202.2.1.9 as added by local law number 28 for the year 2012, sections 3201.2, 3201.8, 3202.1.3, 3202.2.1, 3202.2.1.1, 3202.2.1.2, 3202.2.1.4.3, 3202.2.1.4.5, 3202.2.1.4.6 as amended by and 3202.2.2.4, 3202.4.1 and 3202.5 as added by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 32
ENCROACHMENTS INTO THE PUBLIC RIGHT-OF-WAY

SECTION BC 3201
GENERAL

3201.1 Scope. The provisions of this chapter shall govern the encroachment of structures into the public right-of-way.

3201.1.1 Encroachments removable. All encroachments permitted beyond the street line by the provisions of this chapter shall be constructed so that they may be removed at any time without
endangering the structural safety or fire safety of the building except that footings as permitted under Section 3202.1.1 of this code need not be removable.

3201.2 Measurement. The projection of any structure or portion thereof shall be the distance measured horizontally from the lot line to the outermost point of the projection.

3201.3 Other laws. The provisions of this chapter shall not be construed to permit the violation of other laws regulating the use and occupancy of public property.

3201.3.1 Restrictions on construction and projections on certain streets, parkways, boardwalks and beaches. Notwithstanding the provisions of this chapter, it shall be unlawful to build, erect, or make areaways, steps or other encroachments or projections prohibited by Sections 19-131, 19-132, 19-135, 18-109, 18-112 and 18-113 of the Administrative Code.

3201.4 Drainage. Drainage water collected from a roof, awning, canopy or marquee, other than canvas and flexible material, and condensate from mechanical equipment shall not flow over a public walking surface.

3201.5 Permission revocable. Any permission, expressed or implied, permitting the construction of encroachments within the area of the street under the provisions of this chapter shall be revocable, except footings as permitted under Section 3202.1.1.

3201.6 Existing projections. Any part of a building that projects beyond a street line on January 1, 1938, may be maintained as constructed until its removal is directed in accordance with applicable law.

3201.7 Alteration of existing encroachments. Alterations to existing encroachments beyond the street line may be permitted in whole or in part, provided that such alterations conform with the requirements of this chapter.

3201.7.1 Fences, guards and railings. Elements of existing fences, guards and railings shall not be increased in height, thickness, spacing or opacity.

Exceptions:

1. Fences, guards and railings that are required to comply with other requirements of this code, including Chapters 10 and 16.

2. Buildings or structures designated by the Landmarks Preservation Commission, where such fences, guards or railings are approved by the Landmarks Preservation Commission.

3201.8 Definitions. As used in this chapter, the following terms shall have the following meanings:

AREAWAY. A space below grade adjacent to a building open to the outer air and enclosed by walls.

CURB LINE. The line coincident with the face of the street curb adjacent to the roadway.
FOOTING. [A foundation element consisting of an enlargement of a foundation pier or foundation wall, wherein the soil materials along the side of and underlying the element may be visually inspected prior to and during its construction.]

PROJECTING SIGN. [A sign other than a wall sign, which projects from and is supported by a wall of a building or structure.]

SIGN. [Any letter, figure, character, mark, plane, point, marquee sign, design, poster, pictorial, picture, stroke, stripe, line, trademark, reading matter or illuminated service, which shall be constructed, placed, attached, painted, erected, fastened or manufactured in any manner whatsoever, so that the same shall be used for the attraction of the public to anyplace, subject, person, firm, corporation, public performance, article, machine or merchandise, whatsoever, which is displayed in any manner outdoors. Every sign shall be classified and conform to the requirements of that classification as set forth in this chapter.]

STREET. [A thoroughfare, including sidewalks and roadways, dedicated or devoted to public use by legal mapping or other lawful means, or a public way.]

STREET LINE. [A lot line separating a street from other land.]

VAULT. [Any space below the surface of a street, that is covered over, except those openings that are used exclusively as places for descending, by means of steps, to the cellar or basement of any building.]

3201.9 Department of Transportation approval. Any encroachment into the public right-of-way that exceeds the limitation provided for in this chapter shall require the approval of the Department of Transportation.

SECTION BC 3202
ENCROACHMENTS

3202.1 Encroachments below grade. Encroachments below grade shall comply with Sections 3202.1.1 through 3202.1.6.

3202.1.1 Footings. Exterior wall and column footings may be constructed to project beyond the street line not more than 12 inches (305 mm), provided that the top of the footing is not less than 8 feet (2438 mm) below the ground or sidewalk level. Foundation walls required to support permitted projections may be constructed to project not more than the permitted projection beyond the street line.

3202.1.1 Footings for temporary barriers or shields in flood hazard areas or shaded X-Zones. In flood hazard areas or shaded X-Zones, continuous footings for the support and attachment of temporary, removable dry floodproofing barriers or shields may be constructed to project beyond the street line not more than 12 inches (305 mm) both at grade and below grade.
3202.1.2 Vaults. Vaults may be permitted in accordance with the New York City Charter and [Chapter] Title 19 of the Administrative Code. Such vaults shall comply with the provisions of this code and other applicable laws and rules.

3202.1.3 Areaways. Areaways shall be protected by grates, guards or other approved means, subject to approval by the Commissioner of the Department of Transportation.

3202.1.4 Tunnels between buildings. Tunnels connecting buildings and projecting beyond street lines may be constructed subject to the approval of the Commissioner of the Department of Transportation. Such tunnels shall comply with the provisions of this code and other applicable laws and regulations.

3202.1.5 Sidewalk supports. Exterior foundation walls are permitted to be constructed with a ledge that projects beyond the street line not more than 4 inches (102 mm) to support sidewalk construction, provided that:

1. the top of the ledge is not more than 8 inches (203 mm) below the ground or sidewalk level; and
2. bottom of the ledge is not more than 24 inches (610 mm) below the ground or sidewalk level.

3202.1.6 Insulation. Insulation required to comply with the New York City Energy Conservation Code shall be permitted to encroach into the public right of way not more than 6 inches (152 mm) beyond the face of the structural element being insulated.

3202.2 Encroachments above grade. Encroachments into the public right-of-way above grade shall be prohibited except as provided for in Sections 3202.2.1 through [3202.2.3] 3202.2.5.

3202.2.1 Encroachments subject to the area limitations. Encroachments that are subject to area limitations are those elements listed in Sections 3202.2.1.1 through 3202.2.1.9, generally of an architectural character, that form an integral part of the building facade. The aggregate area of all such elements constructed to extend beyond the street line shall not exceed 10 square feet (0.93 m²) within any 10 feet (3048 mm) by 10 feet (3048 mm) square area of wall [except that a veneer may be applied to the entire facade of a building erected before December 6, 1968, if such veneer does not project more than 4 inches (102 mm) beyond the street line]. The area of any such projection shall be measured at that vertical plane, parallel to the wall, in which the area of the projection is greatest. This plane of measurement may be at the street line, the line of maximum projection or any point in between. For the purpose of measuring the projected area of a balcony, air spaces of less than 6 inches (152 mm) between closely spaced railing or guards elements shall contribute to the area of the projection.

[Exception:] Exceptions:

1. The aggregate area of all elements subject to area limitations that includes a balcony or associated railings and brackets shall not exceed 24 square feet (2.2 m²) in any 240 square foot (22.3 m²) area on a given story.
2. The aggregate area of elements on existing buildings or structures designated by the Landmarks Preservation Commission as landmarks or within historic districts shall not be limited provided that such elements are approved by the Landmarks Preservation Commission.

3202.2.1.1 Entrance details. Entrance details, including steps and doors when fully open, may be constructed to project beyond the street line not more than 18 inches (457 mm). Entrance steps that project beyond the street line shall be guarded at each end by railings at least 3 feet (914 mm) high or by other members of the entrance detail providing equivalent protection.

3202.2.1.2 Architectural details. Details such as cornices, eaves, bases, sills, headers, band course, opening frames, rustications, applied ornament or sculpture, grilles, windows when fully open, air conditioning units, and other similar elements may be constructed:

1. To project not more than 4 inches (102 mm) beyond the street line when less than 10 feet (3048 mm) above the ground or sidewalk level.

2. To project not more than 10 inches (254 mm) beyond the street line when more than 10 feet (3048 mm) above the ground or sidewalk level.

Exceptions:

1. Replacement or restoration of historical architectural details that are, or were:

   1.1. located more than 10 feet (3048 mm) above the sidewalk and that project more than 10 inches (254 mm), on existing buildings or structures designated by the Landmarks Preservation Commission, may be permitted provided they do not exceed the historic projections and provided that they are approved by the Landmarks Preservation Commission; or

   1.2. located 10 feet (3048 mm) or less above the sidewalk, and that project more than 4 inches (102 mm), on existing buildings or structures designated by the Landmarks Preservation Commission, may be permitted provided they do not exceed the historic projections and provided that they are approved by the Landmarks Preservation Commission, and further provided that if the projection exceeds 18 inches (457 mm), the applicant demonstrates to the Department of Transportation’s satisfaction that the replacement or restoration will not adversely impact the use of the public right of way.

2. New architectural details on new or existing buildings, additions or structures subject to the jurisdiction of the Landmarks Preservation Commission, that are more than 10 feet (3048 mm) above the sidewalk and that project more than 10 inches (254 mm) and no more than 3 feet (914 mm), may be permitted provided that the Landmarks Preservation Commission finds that the proposed...
detail is appropriate to the historic character of the historic district or landmarked building, structure or site.

**3202.2.1.3 Balconies.** Balconies, including railings and supporting brackets, no parts of which are less than 10 feet (3048 mm) above the ground or sidewalk level, may be constructed to project not more than 2 feet 6 inches (762 mm) beyond the street line. When permitted by the provisions of this code, fire escapes that are part of a required exit may be constructed to project not more than 4 feet 6 inches (1372 mm) beyond the street line provided no part, including any movable ladder or stair, is lower than 10 feet (3048 mm) above the ground or sidewalk level when not in use.

**3202.2.1.4 Marquees.** Marquees may be constructed to project beyond the street line provided that they comply with Section 3106 and Sections 3202.2.1.4.1 through 3202.2.1.4.5.

**3202.2.1.4.1 Height.** Marquees shall receive structural support only from the building and shall be at least 10 feet (3048 mm) above the ground level or sidewalk.

**3202.2.1.4.2 Projection.** Marquees shall project no closer to the curb line than 2 feet (610 mm).

**3202.2.1.4.3 Thickness.** Marquees shall be no thicker nor shall the fascia be higher than 3 feet (914 mm) when measured vertically from its lowest to its highest point.

**3202.2.1.4.4 Dimensions.** Dimensions shall include all decoration but shall exclude any tension supports suspending the marquee from the wall.

**3202.2.1.4.5 Occupancy restrictions.** Marquees may be erected on:

1. Buildings of an essentially public nature, including but not limited to the following:

   1.1. Public buildings, including schools.

   1.2. Theatres.

   1.3. Hotels.

   1.4. Terminals.

   1.5. Large department stores.

   1.6. Supermarkets.

   1.7. Multiple dwellings.

   1.8. Office buildings

2. Warehouses or markets in one of the following established market areas:
2.1. **Bronx.**

2.1.1. Edgewater Road and Halleck Street between Lafayette Avenue and East Bay Avenue.

2.1.2. Lafayette Avenue between Edgewater Road and the Bronx River.

2.1.3. East Bay Avenue between Halleck Street and the Bronx River.

2.1.4. Hunt’s Point Avenue between East Bay Avenue and the Bronx River.

2.1.5. Exterior Street between East 149th Street and East 157th Street.

2.1.6. Cromwell Avenue between East 150th Street and East [153rd] 153rd Street.

2.1.7. East 150th Street between Exterior Street and River Avenue.

2.1.8. Westchester Avenue between St. Ann’s Avenue and Bergen Avenue.

2.1.9. Brook Avenue between East 150th Street and East 156th Street.

2.1.10. Bergen Avenue between East 149th Street and East 156th Street.

2.1.11. East 152nd Street between Bergen Avenue and Brook Avenue.

2.2. **Brooklyn.**

2.2.1. North 6th Street between Berry Street and Wythe Avenue.

2.3. **Manhattan.**

2.3.1. John Street to Fulton Street between South Street and Front Street.

2.3.2. Fulton Street to Dover Street between South Street and Water Street.

2.3.3. South Street and Front Street between John Street and Dover Street.

2.3.4. Water Street between Fulton Street and Dover Street.

2.3.5. Horatio Street to West 14th Street between West Street and 9th Avenue.

2.3.6. West Street, Washington Street, Greenwich Street

2.3.7. 9th Avenue and 10th Avenue between Horatio Street and West 14th Street.
2.3.8. West 16th Street, north side, and West 17th Street, south side, between 10th Avenue and 11th Avenue.

2.3.9. West 24th Street to West 26th Street, south side, between 11th Avenue and 12th Avenue.

2.3.10. West 27th Street, north side, to West 28th Street between 11th Avenue and 12th Avenue.

2.3.11. 12th Avenue and St. Claire Place between 125th Street and 132nd Street.

2.3.12. 12th Avenue, west side, between 132nd Street and 133rd Street.

2.4. Queens.

2.4.1. 95th Avenue, north side, between Sutphin Boulevard and 148th Street.

3202.2.1.4.6 Change of occupancy. When the occupancy or use of a building with a marquee is changed to an occupancy or use for which a projecting marquee is not permitted, the marquee shall be removed.

Exception: For buildings subject to the jurisdiction of the Landmarks Preservation Commission, Section 3202.2.1.4.6 shall not apply when the Landmarks Preservation Commission makes a determination that the removal of the marquee would be inappropriate to the architectural character of the building or historic district.

3202.2.1.4.7 Other agency approvals. An applicant wishing to erect a marquee shall provide proof that the Commissioners of the Departments of Transportation, Consumer Affairs, and Environmental Protection have not permitted the use of a space or structure on or under the sidewalk beneath the proposed marquee in such a manner that the construction of the proposed marquee shall interfere with the removal or repair of any such permitted use or structure.

3202.2.1.5 Light fixtures. Light fixtures that are supported entirely from the building may be constructed to project not more than 2 feet (610 mm) beyond the street line, provided no part of the fixture is less than 8 feet (2438 mm) above the ground or sidewalk level.

3202.2.1.6 Flagpoles. Flagpoles that are supported entirely from the building may be constructed to project not more than 18 feet (5486 mm) beyond the street line, but not closer than 2 feet (610 mm) to the curb line, provided that no part of the flagpole is less than 15 feet (4572 mm) above the ground or sidewalk level.

3202.2.1.7 Wall signs. Wall signs may be constructed to project not more than 12 inches (305 mm) beyond the street line when conforming to the requirements of this code and Section H111 of Appendix H.
3202.2.1.8 Projecting signs. All permitted projecting signs may be constructed to project not more than 10 feet (3048 mm) beyond the street line, but not closer to the curb line than 2 feet (610 mm), when conforming to the requirements of this code and Section H112 of Appendix H, and provided that no part of the sign is less than 10 feet (3048 mm) above the ground or sidewalk level.

Exceptions: Permanent projecting signs are prohibited on buildings in the areas indicated below:

1. Borough of Manhattan.
   
   1.1. Projecting signs. No permanent projecting sign shall be erected on any building on:

   1.1.1. 5th Avenue between Washington Square north and 110th Street;
   1.1.2. 34th Street between Park Avenue and 7th Avenue;
   1.1.3. Madison Avenue between 23rd Street and 96th Street;
   1.1.4. 57th Street between Lexington Avenue and Broadway;
   1.1.5. Vanderbilt Avenue between 42nd Street and 47th Street;
   1.1.6. Park Avenue between 32nd Street and 40th Street;
   1.1.7. Park Avenue between 45th Street and 96th Street;
   1.1.8. 33rd Street between Lexington Avenue and 5th Avenue;
   1.1.9. 35th through 41st Streets between Lexington Avenue and 5th Avenue;
   1.1.10. 43rd through 56th Streets between Lexington Avenue and 5th Avenue;
   1.1.11. 58th Street between Lexington Avenue and 5th Avenue;
   1.1.12. 60th Street between Lexington Avenue and 5th Avenue;
   1.1.13. Nassau Street between Wall Street and Frankfort Street; or

   1.2. Illuminated projecting signs. No permanent illuminated projecting sign shall be erected on any building on:

   1.2.1. 72nd Street between Central Park West and River Drive.

2. Borough of Brooklyn.
2.1. Projecting signs. No permanent projecting sign shall be erected on any building on:

2.1.1. Fulton Street between Flatbush Avenue and Joralemon Street and Willoughby Street.

2.2. Illuminated projecting signs. No permanent illuminated projecting sign shall be erected on any building on:

2.2.1. Fulton Street between Flatbush Avenue and Prospect Street and Henry Street;

2.2.2. Washington Street between Myrtle Avenue and Prospect Street;

2.2.3. Court Street between Fulton Street and Livingston Street;

2.2.4. Pierrepont Street between Fulton Street and Clinton Street;

2.2.5. Montague Street between Court Street and Clinton Street;

2.2.6. Remsen Street between Court Street and Clinton Street; or

2.2.7. Joralemon Street between Court Street and Clinton Street.

3202.2.1.9 Sun control devices. Sun control devices constructed in accordance with Section 3105 and supported entirely from the building may project beyond the street line not more than 2 feet 6 inches (762 mm), provided that no part of the sun control device is less than 8 feet (2438 mm) above the ground or sidewalk level. Any portion of a sun control device that is located over a sidewalk vault and is more than 10 inches (254 mm) beyond the street line and less than 40 feet above the ground or sidewalk shall be removable or retractable to less than 10 inches (254 mm) beyond the street line.

3202.2.2 Encroachments not subject to area limitations.

3202.2.2.1 Ramps. When a building erected prior to December 6, 1969, is altered to provide access to individuals who use wheelchairs, ramps constructed to provide such access may, with the approval of the commissioner, project beyond the street line for a distance of not more than 44 inches (1118 mm). Ramps shall comply with the applicable provisions of Chapter 11.

3202.2.2.2 Bridges between buildings. Bridges connecting buildings and projecting beyond street lines may be permitted in accordance with applicable law. Such bridges shall be of a construction class that is at least equal to the higher class of the two buildings connected and shall otherwise comply with the provisions of this code and other applicable laws and rules.

3202.2.2.3 Flood shield supports. In [areas of special flood hazard] flood hazard areas or shaded X-Zones, permanent attachments to building façades necessary for the support and attachment of temporary, removable dry floodproofing barriers or shields may be constructed to project beyond the street line for a distance of not more than 6 inches (152 mm).
3202.2.4 Curb cuts. The lowering of any curb or the change of grade of any sidewalk for the purpose of providing a driveway across such curb or sidewalk shall be constructed in accordance with the specifications prescribed in Sections 406.7.6 and 406.7.7. All sidewalks and driveways or portions thereof that are structurally supported shall be designed for loads prescribed in Chapter 16.

3202.2.4.1 Curb cut removal. Vehicular access curb cuts that can no longer serve as vehicular access across a curb or sidewalk, including where an existing building served by such a curb cut is demolished, shall be removed and the curb and sidewalk shall be restored in accordance with standards of the Department of Transportation. The commissioner may order such removal and restoration. The commissioner shall limit the length of any curb cut for the purpose of providing a driveway across such curb or sidewalk, when in the opinion of the commissioner the actual use or intended use of such driveway would endanger the public. Where the vehicular use of such driveway, in the opinion of the commissioner is dangerous to the public, the commissioner shall order the owner to discontinue use of such driveway and restore the curb and sidewalk in accordance with standards of the Department of Transportation. Upon the failure of the owner to comply with any of the orders provided for in Section 3202.2.4, in such cases where the restoration of such curb cuts are needed to facilitate department of transportation work, the commissioner may inform the commissioner of transportation of such failure to comply and may request the cooperation of the commissioner of transportation acting under his or her authority pursuant to Section 2903(b)(7) of the New York City Charter in the enforcement of this section.

3202.2.3 Awnings. Awnings constructed in accordance with Section 3105 and supported entirely from the building may project beyond the street line as follows:

3202.2.3.1 Store front awnings. Store front awnings may project beyond the street line not more than 8 feet (2438mm), provided no part of the awning is less than 8 feet (2438 mm) above the ground or sidewalk level, except for a flexible valance which may be not less than 7 feet (2134 mm) above the ground or sidewalk level, and provided that the awning box or cover does not project more than 12 inches (305 mm).

3202.2.3.2 Awnings over windows or doors. Awnings over windows or doors may project beyond the street line not more than 5 feet (1524 mm), provided that no part of the awning is less than 8 feet (2438 mm) above the ground or sidewalk level.

3202.2.5 Exterior wall covering systems for prior code buildings. For prior code buildings, exterior insulation and associated cladding systems (i.e. rain screens, EIFS, etc.) may be applied to the entire facade of a building provided such exterior wall covering system is needed to comply with the requirements of the New York City Energy Conservation Code and does not project more than 8 inches (203 mm) beyond the street line. Exterior wall coverings shall comply with Chapter 14.
Exceptions:

1. A veneer may be applied to the entire facade of a building erected before December 6, 1968, provided such veneer does not project more than 4 inches (102 mm) beyond the street line.

2. Exterior wall covering systems projecting not more than 10 inches (254 mm) beyond the street line shall be permitted to cover the façade of a prior code building provided they are located more than 10 feet (3048 mm) above grade and are necessary to comply with the New York City Energy Conservation Code.

3. The department may approve exterior wall covering systems projecting not more than 12 inches (305 mm) beyond the street line provided they are necessary to comply with the New York City Energy Conservation Code, are substantiated with engineering calculations demonstrating need and practical difficulty, and provided that the applicant demonstrates to the Department of Transportation’s satisfaction that the projection of the wall covering system will not adversely impact the use of the public right of way.

3202.3 [Reserved.]

3202.4 Temporary encroachments. Encroachments of temporary nature shall comply with Sections 3202.4.1 and 3202.4.3] 3202.3.1 through 3202.3.3.

[3202.4.1] 3202.3.1 Sidewalk cafés. Enclosures for sidewalk cafés, where permitted by the Commissioner of the Department of Consumer Affairs pursuant to applicable law and constructed in compliance with Section 3111, may be constructed beyond the street line.

[3202.4.2] 3202.3.2 [Storm] Temporary storm enclosures. [Storm enclosures projecting not more than 18 inches (457 mm) beyond the street line] Construction of temporary storm enclosures must comply with the requirements of this code, including the fire-resistance rating of the building to which it is appurtenant, and Chapter 11. Such enclosures may be permitted during the period between November 15 and the following April 15 and must be removed at the end of this period. [Such enclosures shall be removed at the end of this period. Construction of storm enclosures must comply with the requirements of this code including the fire resistance rating of the building to which it is appurtenant and Chapter 11 of this code.]

3202.3.2.1 Temporary storm enclosures for eating and drinking establishments. Provided a minimum clear unobstructed sidewalk width of 5 feet is maintained, temporary storm enclosures for eating and drinking establishments with a projection of not more than 25 square feet (2.32 m²) in area and door maneuvering clearances complying with Chapter 11, and related reference standards, including Section 404 (Doors and Doorways) of ICC A117.1, may be permitted.

3202.3.2.2 Temporary storm enclosures for other establishments. Temporary storm enclosures projecting not more than 18 inches (457 mm) beyond the street line may be permitted at other establishments.
Temporary flood shields, stairs and ramps in flood hazard areas and shaded X-Zones. In flood hazard areas and shaded X-Zones, temporary flood shields, stairs and ramps shall comply with Sections G308.6 and G308.7 of Appendix G of the New York City Building Code and shall be permitted in accordance with plans approved by the department subject to the following conditions:

1. Such flood shields, stairs and ramps shall project no more than one foot (305 mm) beyond the street line.

2. Such flood shields, stairs and ramps shall be removed in a timely manner after a flood event.

§ 32. Section BC 3301 of the New York city building code, as added by local law number 33 for the year 2007, section 3301.1, section 3301.2, and sections 3301.4 through 3301.8 as amended by local law number 141 for the year 2013, section 3301.3 as amended by local law number 81 for the year 2017, section 3301.9 as added by local law number 47 for the year 2013, and sections 3301.11.1.1 through 3301.11.1.3 and section 3301.11.1.5 as added by local law number 206 for the year 2017, section 3301.11.4 as amended by local law number 10 for the year 2020, section 3301.12 as added by local law number 204 for the year 2017, and section 3301.13 as added by local law number 81 for the year 2017, is amended to read as follows:

SECTION BC 3301
GENERAL

3301.1 Scope. The provisions of this chapter shall govern the conduct of all construction or demolition operations with regard to the safety of the public and property. For regulations relating to the safety of persons employed in construction or demolition operations, OSHA standards shall apply.

3301.1.1 Responsibility for safety. Nothing in this chapter shall be construed to relieve persons engaged in construction or demolition operations from complying with other applicable provisions of law, nor is it intended to alter or diminish any obligation otherwise imposed by law on any party engaged in a construction or demolition operation, including but not limited to the owner, construction manager, general contractor, sub contractors, material men, registered design professionals, or other party to engage in sound design and engineering, safe construction or demolition practices, including but not limited to debris removal, and to act in a reasonable and responsible manner to maintain a safe construction or demolition site.

3301.1.2 Fire code. In addition to the requirements of this chapter, construction or demolition operations shall also be conducted in conformance with the New York City Fire Code.
3301.3 Manufacturer specifications. [All equipment shall be used in accordance with the specifications of the manufacturer, where such specifications exist, and the requirements of this code. Where there is a discrepancy, the stricter requirement shall apply.] See Section 3301.6.1.

3301.4 Sizes. All sizes and dimensions prescribed in this chapter are minimum requirements, unless otherwise specified. Lumber sizes are nominal or commercial except where stated otherwise.

3301.2 Safety measures and standards. Contractors, construction managers, and subcontractors engaged in construction or demolition operations shall institute and maintain all safety measures required by this chapter and provide all equipment or temporary construction installations necessary to safeguard the public and property affected by such contractor’s operations.

3301.3 Site safety managers, coordinators and [superintendent of construction] construction superintendents. A site safety manager or site safety coordinator must be designated and present at the construction or demolition of a major building in accordance with Section 3310. A [superintendent of construction] construction superintendent is required for the construction or demolition of [such other] buildings as identified in Section 3301.13.3.

3301.4 Inspection. Structures, temporary construction installations, materials, operations, and equipment shall be inspected as required by this code, and records of such inspections shall be maintained as required by this code.

3301.4.1 Inspection of equipment where the code does not specifically require an inspection. Where this code does not [provide for specific inspection criteria] specifically require an inspection, any equipment, except hand tools, that would affect the safety of the public and property when operated shall be inspected by a competent person designated by the contractor using the equipment before the equipment is used at the site and on a periodic basis thereafter throughout the duration of the job. [A record of such inspections shall be kept at the site.] The results of the inspection shall be documented in an inspection checklist signed and dated by the competent person who performed the inspection.

3301.5 Unsafe conditions [and equipment]. Any structure, temporary construction installation, material, operation, or equipment found to be defective or unsafe, and posing a risk to the public and property, shall be immediately secured and corrected, or removed from the site.

3301.6 Design, sizes, and capacity of materials, structures, temporary construction, and equipment. Design, sizes, and capacities of materials, structures, temporary construction, and equipment shall be in accordance with the requirements of Sections 3301.6.1 through 3301.6.3.

3301.6.1 Design. Whenever design is specifically required by the provisions of this chapter, such design shall be in accordance with the requirements of this code and executed by, or under, the supervision of a registered design professional who shall cause his or her seal and signature to be affixed to such documents that may be required for the work.

[Exception: Where this chapter specifically indicates that the design may be executed by another individual.]
3301.6 Manufacturer specifications, design, and capacity. The permit holder, or where there is no permit holder, the contractor or other entity causing the work to be performed, shall ensure compliance with manufacturer specifications, design documents, and capacity restrictions in accordance with Sections 3301.6.1 through 3301.6.5 and other applicable sections of the code. Where there is a discrepancy between a manufacturer specification, design document, capacity restriction, or other applicable code section, the more stringent requirement shall apply.

3301.6.1 Manufacturer specifications. During construction or demolition operations, structures, building systems or components, temporary construction installations, materials, and equipment shall be installed, removed, and utilized in accordance with the specifications of their manufacturer, where such specifications exist.

3301.6.2 Design requirements. Whenever design is required by this chapter, the design shall be in accordance with the requirements of this code. This requirement does not alleviate any other design requirements imposed by law or the manufacturer.

3301.6.3 Designer. Where design is required by this chapter, the design shall be executed by or under the supervision of a registered design professional, who shall cause his or her seal and signature to be affixed to such documents that may be required for the work.

Exception: Where this chapter specifically indicates that the design may be executed by another individual.

3301.6.4 Capacity. No structure, building system or component, temporary construction installation, material, or equipment, including any partially or fully completed element or section, shall be utilized in excess of its capacity.

3301.6.5 Design documents. Whenever design is required by this chapter, the design shall be indicated in plans and specifications and other written, graphic and pictorial documents that are prepared or assembled for describing the design, location, physical characteristics, and other elements of the project. Design documents shall be complete and of sufficient clarity to indicate the location and entire nature and extent of the work proposed, and shall show in detail that the work conforms to the provisions of this code and other applicable laws and rules.

3301.7 Documents to be kept maintained on site. Where this chapter requires documents, including but not limited to construction documents, submittal documents, shop drawings, inspection reports, logs, checklists, meeting records, pre-construction surveys, designation letters, site safety plans, fire safety and evacuation plans, tenant protection plans, occupant protection plans, or monitoring plans, copies of such documents shall be maintained at the site for the duration of the job and made available to the commissioner upon request. Copies of such aforementioned required construction documents or other design drawings shall also be maintained by the permit holder and
the designer. Copies of [such aforementioned] required inspection records, including but not limited to reports, logs, or checklists, shall also be maintained by the permit holder and the entity that performed the inspection. Copies of [such aforementioned] required plans shall also be [kept] maintained by the permit holder and the entity that developed the plan. Copies of all other documents required by this chapter shall also be maintained by the permit holder.

[Exception:] 3301.7.1 Other obligations. Where this chapter requires [inspection reports, logs, checklists, site safety plans, fire safety and evacuation plans, tenant protection plans, occupant protection plans, or monitoring plans] documents to be maintained by [a] another specified entity [other than the permit holder], such [reports, logs, checklists, or plans] documents shall be maintained by such specified entity.

3301.7.2 Manufacturer specifications. Where compliance with manufacturer specifications is required by this chapter, copies of such manufacturer specifications shall be available at the site and made available to the commissioner upon request. Manufacturer specifications that can be readily downloaded from the manufacturer’s website or that are stored in an electronic format acceptable to the commissioner shall satisfy the requirements of this section. A serial number, make and model number, or other similar identification shall be maintained in a legible condition on the item for which the manufacturer specification is required such that the identification can be used to match the item to the manufacturer specification.

Exception: Where this chapter specifically requires that the manufacturer specifications for a specific item be physically maintained at the site, downloadable or electronically formatted manufacturer specifications will not satisfy the accessibility and availability requirements of this section.

3301.8 [Accidents] Incidents and damage to adjoining property. The department shall be notified immediately by the permit holder, or a duly authorized representative, of [an accident] any incident at a construction or demolition site, or of any damage to adjoining property caused by construction or demolition activity at the site. Where required by Section 3301.13.11 or Section 3310.8.2.1, incidents or damage to adjoining property shall instead be reported by the construction superintendent or the site safety manager or coordinator.

3301.8.1 Additional notifications. Nothing in this section shall diminish or relieve other notification requirements imposed by this chapter, including but not limited to, notifications by the site safety manager, site safety coordinator, concrete safety manager, or hoisting machine operator.

[3301.8.1] 3301.8.2 Use and tampering prohibited. Following an [accident] incident, no person shall permit any of the following without the permission of the commissioner, or without a lawful order from the New York [City Police or Fire Department] city police or fire department:

1. Use or operation of any equipment or structure damaged or involved in the [accident] incident; or
2. Removal or alteration of any equipment, structure, material, or evidence related to the [accident] incident.
**Exception:** Immediate emergency procedures taken to secure structures, temporary construction installations, operations, or equipment that pose a continued imminent danger or to facilitate assistance for persons who are trapped or who have sustained bodily injury.

3301.9 [Required signs] **Signs at a construction or demolition site.** Signs shall be posted at a construction or demolition site in accordance with Sections 3301.9.1 through [3301.9.5] 3301.9.8. It is the responsibility of the permit holder for the underlying construction or demolition work, or where there are no active permits, the building owner, to ensure such signs are posted and maintained at the site in accordance with Sections 3301.9.1 through 3301.9.8, and to ensure that such signs are updated in a timely fashion to reflect any revised information.

3301.9.1 Fence project information panel. Where a site is enclosed with a fence in accordance with Section 3307.7, a project information panel meeting the requirements of Sections 3301.9.1.1 through 3301.9.1.6 shall be posted. Required project information panels shall be in place throughout the duration that the fence remains at the site.
Exception:

1. At a site where the project permit was issued or renewed prior to July 1, 2013, signs meeting the requirement of Section 3301.9.3 may be posted in lieu of a project information panel. Such signs shall be removed and a project information panel in accordance with the requirements of this section installed upon date of the first permit renewal on or after July 1, 2013.

2. Project information panels at government-owned sites or at sites with government funding may be modified in accordance with department rule.

3. Signs posted at construction or demolition sites for one-, two- or three-family dwellings may comply with Section 3301.9.3 in lieu of this section.

3301.9.1.1 Project information panel content. Project information panels shall contain the following information:

1. A rendering, elevation drawing, or zoning diagram of the building exterior that does not contain logos or commercially recognizable symbols;

2. A title stating “Work in Progress:” and specifying the intended type(s) of zoning use(s) (e.g. Residential, Commercial, Manufacturing, Retail, Office, Hospital, School);

3. Anticipated project completion date;

4. The corporate name, address, and telephone number of the owner of the property;

5. Website address or phone number to contact for project information;

6. The corporate name and telephone number of the general contractor, or for a demolition site, the demolition contractor;

7. The statement, in both English and Spanish, “TO ANONYMOUSLY REPORT UNSAFE CONDITIONS AT THIS WORK SITE, CALL 311.”; and

8. A copy of the primary project permit, with accompanying text “To see other permits issued on this property, visit: www.nyc.gov/buildings.” The permit shall be laminated or encased in plastic covering to protect it from the elements or shall be printed directly onto the project information panel.

Exception: A rendering, elevation drawing, or zoning diagram of the building exterior is not required for demolition projects.

3301.9.1.2 Posting of project information panels. A project information panel shall be posted on the fence on each perimeter fronting a public thoroughfare. Where such perimeter is more than 150 feet (45 720 mm) in length, a project information panel shall be posted at each corner. Such panels shall be posted on the fence at a height of 4 feet (1219 mm) above the ground, with such distance measured from the ground to the bottom edge of the panel.
3301.9.1.3 Project information panel material. Project information panels shall be constructed out of a durable and weatherproof material such as vinyl, plastic, or aluminum, and such material shall be flame retardant in accordance with NFPA 701 or listed under UL 214.

3301.9.1.4 Project information panel specifications. Project information panels shall be 6 feet (1829 mm) wide and 4 feet (1219 mm) high, with the content required by Section 3301.9.1.1 arranged in accordance with Figures 3301.9.1.4(1) and 3301.9.1.4(2). The content required by Section 3301.9.1.1, Items 2 through 7 shall be written in the Calibri font or similar sans serif font style, with letters a minimum of 1 inch (25 mm) high, as measured by the upper case character. Such letters shall be white, on a blue background, with such blue color of a shade matching Pantone 296, or RGB 15, 43, 84, or CMYK 100, 88, 38, 35.

Exceptions:

1. The dimensions for a project information panel posted in conjunction with a demolition project shall be 2 feet 4 inches (711 mm) wide and 4 feet (1219 mm) high, in accordance with Figure 3301.9.1.4(1).

2. For construction sites with a street frontage less than 60 feet (18 288 mm), the dimensions for a project information panel, other than that posted in conjunction with a demolition project, shall be 55 inches (1397 mm) wide and 36.5 inches (927 mm) high, in accordance with Figure 3301.9.1.4(3).

FENCE PROJECT INFORMATION PANEL LAYOUT

FIGURE 3301.9.1.4(3)
FENCE PROJECT INFORMATION PANEL LAYOUT FOR SMALL LOTS

3301.9.1.5 Updating content. When content required by Section 3301.9.1.1 changes, the project information panel shall be updated.
3301.9.1.6 Maintenance of project information panels. Project information panels shall be maintained so that the panel remains legible, securely attached, and free of sharp edges, protruding nails, or similar hazards. Content required by Section 3301.9.1.1 shall not be obscured by panel attachments, including but not limited to grommets or grommet holes.

3301.9.2 Sidewalk shed parapet information panel. Where a sidewalk shed is installed, a sidewalk shed parapet information panel meeting the requirements of Sections 3301.9.2.1 through 3301.9.2.6 shall be posted. Required sidewalk shed parapet information panels shall be in place throughout the duration that the sidewalk shed remains at the site.

[Exceptions:]

1. At a site where the sidewalk shed permit was issued or renewed prior to July 1, 2013, signs meeting the requirement of Section 3301.9.4 may be posted in lieu of a sidewalk shed parapet panel. Such signs shall be removed and a sidewalk shed parapet panel in accordance with the requirements of this section installed upon date of the first permit renewal on or after July 1, 2013.

2. Signs posted at construction or demolition sites for one-, two-, or three-family dwellings may comply with Section 3301.9.4 in lieu of this section.

3301.9.2.1 Sidewalk shed parapet information panel content. Sidewalk shed parapet information panels shall [comply with the requirements of either section 3301.9.2.1.1 or 3301.9.2.1.2., as applicable:]
3301.9.2.2 Posting of sidewalk shed parapet information panels. Sidewalk shed parapet information panels shall be posted on the parapet that runs along the long axis of the sidewalk shed. Where a sidewalk shed extends along multiple street frontages, not including incidental extensions at a street corner, a parapet information panel shall be posted along each long axis. Such [sign] sidewalk shed parapet information panel:

1. Shall not be posted above or below the level of the parapet; and

2. [Shall be posted at least 3 feet (914 mm) and no more than 6 feet (1828 mm) from the left edge of the sidewalk shed parapet.] Shall be posted, as viewed from the perspective of an individual on the sidewalk opposite the long axis of the sidewalk shed and facing the sidewalk shed[—or], in a location that is at least 3 feet (914 mm) but no more than 6 feet (1218 mm) to the right of the left edge of the sidewalk shed parapet, or where the sidewalk shed parapet extends beyond the projection of the property line, in a
location that is at least 3 feet (914 mm) but no more than 6 feet (1218 mm) to the right of the projection of the property line through the left side of the sidewalk shed; or

3. Where a project information panel in accordance with Section 3301.9.1 is posted on the fence, the horizontal center of the sidewalk shed parapet information panel shall be in line with a vertical plane drawn through the horizontal center of the project information panel [and the sidewalk shed parapet shall be posted] on the fence in accordance with Figure 3301.9.2.2.
3301.9.2.3 Sidewalk shed parapet information panel material. Sidewalk shed parapet information panels shall be constructed out of a durable and weatherproof material such as vinyl, plastic, or aluminum, and such material shall be flame retardant in accordance with NFPA 701 or listed under UL 214.

3301.9.2.4 Sidewalk shed parapet information panel specifications. Sidewalk shed parapet information panels shall be 3 feet (914 mm) high and 6 feet (1829 mm) wide, with the content required by Section 3301.9.2.1 arranged in accordance with [Figures 3301.9.2.1(1) or 3301.9.2.1(2)] Figure 3301.9.2.1. The sign shall have a white background. The content required by [item number 1 of] Section [3301.9.2.1.1]_3301.9.2.1 must be written in Calibri font or similar sans serif font style, and such letters shall be blue, with such blue color a shade matching Pantone 296, or RGB 15, 43, 84, or CMYK 100, 88, 38, 35.

3301.9.2.5 Updating content. When content required by Section 3301.9.2.1 changes, the sidewalk shed parapet information panel shall be updated.

3301.9.2.6 Maintenance of sidewalk shed parapet information panels. Sidewalk shed parapet information panels shall be maintained so that the panel remains legible, securely attached, and free of sharp edges, protruding nails, or similar hazards. Content required by Section 3301.9.2.1 shall not be obscured by sign attachments, including but not limited to grommets or grommet holes.
[3301.9.2.7 Best construction site management program. The department shall have the authority to create standards established by rule for the acceptance of a program that ensures best construction site management practices, and to set forth the basis and process for removal of such acceptance and for the removal of the program’s name and logo from the sidewalk shed parapet panel located at a particular site.]

[3301.9.3 Existing fence signs and signs at construction or demolition sites for one-, two- or three-family dwellings. Where a site is enclosed with a fence in accordance with Section 3307.7, and a project information panel is not required in accordance with Section 3301.9.1, a sign or signs meeting the requirements of Section 3301.9.3.1 through 3301.9.3.3 shall be posted. Required signs shall be in place throughout the duration that the fence remains at the site.]

[3301.9.3.1 Sign content and posting. One or more signs needed to accommodate the following information shall be posted on the fence on each perimeter fronting a public thoroughfare at a height of no more than 12 feet (3658 mm) above the ground, with such distance measured from the ground to the top of the sign:]

[1. The name, address, and telephone number of the owner of the property;]

[2. The name, address, and telephone number of the general contractor, or for a demolition site, the demolition contractor; and]

[3. The statement, in both English and Spanish, “TO ANONYMOUSLY REPORT UNSAFE CONDITIONS AT THIS WORK SITE THAT ENDANGER WORKERS, CALL 311.”]

[3301.9.3.2 Maintenance of fence signs. Fence signs shall be maintained so that the sign remains legible, securely attached, and free of sharp edges, protruding nails, or similar hazards.]

[3301.9.3.3 Fence sign specifications. Fence signs shall be constructed of ¾ inch (19 mm) plywood or material of equivalent strength, durability and weatherproofing, including but not limited to sheet metal, aluminum, vinyl, or plastic. The letters on such signs shall be black on a white background. Such signs shall be no larger than that needed to accommodate the information required by Section 3301.9.3.1 in letters no less than 3 inches (76 mm) high.]

3301.9.3 Reserved.

[3301.9.4 Existing sidewalk shed signs and signs at construction or demolition sites for one-, two- or three-family dwellings. Where a sidewalk shed is installed, and a sidewalk shed parapet panel is not required in accordance with Section 3301.9.2, a sign readily visible from the street shall be posted on the parapet that runs along the long axis of the sidewalk shed. Such sidewalk shed sign shall be in place throughout the duration that the sidewalk shed remains at the site. Such sidewalk shed sign shall include:]

[1. The corporate name, address, and telephone number of the sidewalk shed permit holder;]

[2. The sidewalk shed permit number; and]
3301.9.4 Reserved.

3301.9.5 Other temporary signs required by law. [Signs] Other temporary signs required by law to be displayed at a construction or demolition site shall be posted within the site, readily visible to workers, and shall not be posted in any location readily visible to the public unless otherwise required by law.

3301.9.6 Obscured lawful signs. When a protective structure constructed in accordance with Section 3307 obscures from view a lawful and existing sign, a temporary sign may be posted on such protective structure. The temporary sign shall comply with the following requirements:

1. The temporary sign shall be securely fastened to the protective structure at a location directly in front of such business storefront;

2. The temporary sign shall be limited to a maximum height of 4 feet (1219 mm) and shall not exceed the square footage of the obscured lawful sign;

3. The temporary sign shall not project from the side or face of the protective structure;

4. When affixed to a sidewalk shed, the temporary sign shall not extend above or below the sidewalk shed parapet;

5. The temporary sign shall not be hung under the deck of a sidewalk shed or protective structure; and

6. Except where the sidewalk shed obscures a lawful projecting sign, the temporary sign shall not be placed on the end of a sidewalk shed that is perpendicular to the building.

3301.9.7 Other signs prohibited. Except as specified by Sections 3301.9.1 through 3301.9.6 or as otherwise authorized by law, no sign, information, pictorial representation, or any business or advertising message shall be posted on any construction or demolition equipment or temporary construction installation, including but not limited to, protective structures.

3301.9.8 Illuminated signs prohibited. No illuminated business or advertising sign shall be permitted on any construction or demolition equipment or temporary construction installation, including but not limited to, protective structures.

[3301.10 Obscured lawful signs. When a protective structure is constructed in accordance with Section 3307, a temporary sign may be posted on such protective structure when the structure is adjacent to any building and obscures from view a lawful and existing sign. The temporary sign shall comply with the following requirements:]

[1. The temporary sign shall be securely fastened to the face of the protective structure at a location directly in front of such business storefront;]
[2. No projecting temporary signs shall be permitted, and all temporary signs shall be limited to a maximum height of 4 feet (1219 mm), and when affixed to a sidewalk shed, shall not project above the parapet;]

[3. No temporary signs shall be permitted on the ends of any protective structure, unless the lawful and existing sign would otherwise be obscured from view by a deck or parapet of a sidewalk shed or bridge; and]

[4. No temporary signs shall project below the deck of any sidewalk shed.]

3301.10 Reserved.

3301.11 Site safety orientation and refresher. Each permit holder at a site that requires a site safety manager, site safety coordinator, or construction superintendent shall ensure that each construction or demolition worker employed or otherwise engaged at such site by the permit holder or performing subcontracted work for or on behalf of such permit holder receives a site safety orientation and refresher in accordance with the requirements of Sections 3301.11.1 through 3301.11.5.

3301.11.1 Site safety orientation. Each worker employed or otherwise engaged at such site by the permit holder or performing subcontracted work for or on behalf of such permit holder shall receive a site safety orientation before such worker commences any construction or demolition work at such site.

3301.11.2 Site safety refresher. Each worker employed or otherwise engaged at such site by the permit holder or performing subcontracted work for or on behalf of such permit holder shall receive a site safety refresher if such worker (i) has performed construction or demolition work at such site for one year or more and (ii) one year or more has elapsed since such worker received a site safety orientation or refresher with respect to such site.

3301.11.3 Site safety orientation and refresher to be conducted by qualified person. Site safety orientations and refreshers required by this section shall be conducted by a qualified person designated by the permit holder. Such qualified person shall have the ability to communicate with each worker who takes part in such orientation or refresher.

3301.11.4 Site safety orientation and refresher content. Site safety orientations and refreshers required by this section shall include a review of safety procedures at such site and any hazardous activities to be performed at such site. In addition, information pertaining to the site safety training required by Section 3321 shall be made available to each worker in the designated citywide languages, as such term is defined in Section 23-1101 of the Administrative Code, and any other language as may be required by rule of the department, in a form and manner established by the department.

3301.11.5 Records. A record of all orientations conducted for the site shall be maintained by the permit holder and kept at the site. Such record shall include for each such orientation or refresher:

1. The date and time of such orientation or refresher;

2. The name, title and company affiliations of each worker who participated; and
3. The name, title and company affiliation of the qualified person who conducted such orientation or refresher, along with such person’s signature.

3301.12 Pre-shift safety meetings. Each permit holder at a site that requires a site safety manager, site safety coordinator, or construction superintendent shall ensure that each construction or demolition worker employed or otherwise engaged at such site by the permit holder or performing subcontracted work for or on behalf of such permit holder takes part in a safety meeting at the beginning of such worker’s shift, but before such worker commences any construction or demolition work in such shift, in accordance with the requirements of Sections 3301.12.1 through 3301.12.3.

Exception: Where other sections of this code or rules promulgated thereunder specify pre-task or pre-shift meetings for specific types of work, those requirements shall instead apply.

3301.12.1 Pre-shift safety meeting to be conducted by a competent person. Pre-shift safety meetings shall be conducted at the beginning of each worker’s shift, but before such worker commences any construction or demolition work in such shift, by a competent person designated by the permit holder, or where so authorized by the permit holder, by a competent person designated by the subcontractor. Such competent person shall have the ability to communicate with each worker who takes part in such meeting.

3301.12.2 Pre-shift safety meeting content. The pre-shift safety meeting shall include a review of activities and tasks to be performed during the shift, including specific safety concerns or risks associated with fulfilling such work.

3301.12.3 Records. The permit holder shall maintain, for each worker, a record of one pre-shift safety meeting per week. Such record shall include for each such meeting:

1. The date and time of each such meeting;
2. The name, title and company affiliation of each worker who participated; and
3. The name, title and company affiliation of the competent person who conducted such meeting, along with such person’s signature.

3301.13 Scope. This section sets forth requirements for construction superintendents at certain construction or demolition sites.

3301.13.1 Site safety plan. For jobs that require the designation of a primary construction superintendent pursuant to Section 3301.13.3, a site safety plan that meets the applicable requirements of Article 110 of Chapter 1 of Title 28 of the Administrative Code shall be kept on site and made available to the department upon request.

3301.13.2 Definitions. For the purposes of this section, the following terms shall have the following meanings:

Approved documents. For the purpose of this section, approved documents include construction documents as defined by this code, and any and all documents that set forth the location and entire nature and extent of the work proposed with sufficient clarity and detail to show that the proposed work conforms to the provisions of this code and other applicable laws.
and rules. In addition to construction documents, such documents include, but are not limited to, shop drawings, specifications, manufacturer’s instructions and standards that have been accepted by the design professional of record or such other design professional retained by the owner for this purpose.

**Construction superintendent.** An individual registered with the department and responsible for all duties as defined in this section.

**Job.** A design and construction/demolition undertaking consisting of work at one building or structure, as well as related site improvements and work on accessory structures. A job may consist of one or more plan/work applications, and may result in the issuance of one or more permits.

**Permit holder.** The individual who receives the primary department-issued permit for the job.

**3301.13.3 Designation of primary construction superintendent.** The permit holder shall designate a primary construction superintendent, and notify the department of such designation, prior to the commencement of work, [in a form and manner acceptable to the department.] for the following types of jobs:

1. The construction of a new building;
2. The full demolition of an existing building;
3. An alteration to an existing building that involves one or more of the following:
   3.1 A vertical enlargement;
   3.2 A horizontal enlargement;
   3.3 The alteration or demolition of more than 50 percent of the gross floor area of the building during the course of work over any [12-month] period;
   3.4 The removal of one or more floors during the course of work over any [12-month] period;
   3.5 Work that requires a special inspection for underpinning; or
   3.6 Work that requires a special inspection for the protection of sides of excavations; or
4. Other jobs that pose an enhanced risk to the public and property, as determined by the commissioner.

**Exceptions:** Notwithstanding the above, a construction superintendent is not required for:

1. Work listed in Section 3310.1, for which a site safety manager or coordinator must be designated.
2. Work which solely involves the construction of a new 1-, 2-, or 3-family building.
3301.13.4 **Change of designation.** The permit holder must immediately notify the department[, in a form and manner acceptable to the department,] of any permanent change to the primary construction superintendent.

3301.13.5 **Alternate construction superintendent.** In the event the primary construction superintendent is temporarily unable to perform their duties, an alternate construction superintendent, designated by the permit holder [and acceptable to and acting on behalf of the primary construction superintendent], must [fulfill the duties of the primary construction superintendent] act in place of the primary construction superintendent and carry out all duties and responsibilities assigned to the construction superintendent by this chapter and rules promulgated by the commissioner. In the event that an alternate construction superintendent will be acting in place of the primary construction superintendent for a period longer than two consecutive weeks, the permit holder must notify the department[, in a form and manner acceptable to the department,] of such [change] circumstance.

3301.13.6 **Limitations on the designation of primary or alternate construction superintendents.** An individual may only be designated as a primary or alternate construction superintendent for that number of jobs for which he or she can adequately perform all required duties. No individual may be designated as the primary construction superintendent on more than ten jobs.

3301.13.7 **Duties of construction superintendents.** The duties of a construction superintendent shall include:

1. Acting in a reasonable and responsible manner to maintain a safe job site and [assure] ensure compliance with this chapter and any rules promulgated thereunder at each job site for which the construction superintendent is responsible;

2. To the extent that a registered design professional or special inspection agency is not responsible, the construction superintendent must [assure] ensure compliance with the approved documents at each job site for which the construction superintendent is responsible;

3. Fulfilling the duties of a superintendent of construction assigned by Chapter 1 of Title 28 of the Administrative Code at each job site for which the construction superintendent is responsible; and

4. Visiting each job site for which the construction superintendent is responsible each day when active work is occurring.

**Exception:** The construction superintendent is not required to be present at the site during the following activities, provided no other work is in progress:

1. Surveying that does not involve the disturbance of material, structure, or earth;

2. Use of a hoist exterior to the building to transport personnel only;
3. Use of a [material] hoist that is fully enclosed within the perimeter of the building to transport personnel or material;

4. [Finish trowelling of concrete floors;] Work limited to finish troweling of concrete floors;

5. [When personnel are provided for temporary heat, light, or water] Work limited to providing the site with temporary heat, light, or water; or

6. [Truck deliveries to the site where the sidewalk is closed and the entrance gate is within that closed sidewalk area.] Truck deliveries to the site, provided the delivery occurs within the site while the gate is closed and flagpersons are provided to direct traffic while the truck is entering and exiting the site.

3301.13.8 Inspection. Each time the construction superintendent visits a job site for which he or she is responsible, the construction superintendent must inspect all areas and floors where construction or demolition work, and ancillary activity, is occurring, and:

1. Verify work is being conducted in accordance with sound construction/demolition practices;

2. Verify compliance with the approved documents; and

3. Verify compliance with this [section] chapter and any rules promulgated thereunder.

3301.13.9 Correcting unsafe conditions. In the event the construction superintendent discovers work at a job site for which he or she is responsible that is not being conducted in accordance with sound construction/demolition practices, not in compliance with approved documents, or not in compliance with this [section] chapter and any rules promulgated thereunder, the construction superintendent must immediately notify the person or persons responsible for creating the unsafe condition, order the person or persons to correct the unsafe condition, and take all appropriate action to ensure the unsafe condition is corrected. Where an unsafe condition relates to an item which a registered design professional or special inspection agency is responsible for implementing or verifying, the construction superintendent must also notify the responsible registered design professional or special inspection agency of the unsafe condition. All such unsafe conditions, notices, orders, and corrective work must be recorded in the log required by Section 3301.13.13.

3301.13.10 Notification of conditions to the department. The construction superintendent must immediately notify the department[., in a form and manner acceptable to the department,] when he or she discovers, at any job site for which the construction superintendent is responsible, any of the conditions listed in Section 3310.8.2.1. Notification to the department does not relieve the construction superintendent of their obligations under Section 3301.13.9.

3301.13.11 Reporting of [accidents] incidents and damage to adjoining property. The construction superintendent must immediately notify the department[., in a form and manner acceptable to the department,] of any [accident] incident at any job site for which the construction
superintendent is responsible, or any damage to adjoining property caused by construction or demolition activity at the job site.

3301.13.12 Competent person. The construction superintendent must designate a competent person for each job site for which the construction superintendent is responsible and ensure such competent person is present at the designated job site at all times active work occurs. The designation of a competent person does not alter or diminish any obligation imposed upon the construction superintendent. The competent person must carry out orders issued by the construction superintendent; be able to identify unsanitary, hazardous or dangerous conditions; take prompt corrective measures to eliminate such conditions; immediately report to the construction superintendent incidents at the job site or any damage to adjoining property caused by construction or demolition activity at the job site; and be able to effectively communicate workplace instructions and safety directions to all workers at the site.

3301.13.13 Log. The construction superintendent must maintain a log at each job site for which the construction superintendent is responsible. Such log must be made available to the commissioner upon request. The construction superintendent must complete such log prior to departing the job site and shall sign and date each day’s log entry. Such log must be organized and recorded in a form and manner acceptable to the department. Such log must contain, at a minimum, the following information:

1. The presence of the construction superintendent at the job site as evidenced by their printed name and signature and a notation indicating the times of arrival at, and departure from the site, which must be recorded immediately after arriving at the site and immediately prior to leaving the site, respectively;

2. The general progress of work at the site, including a summary of that day’s work activity;

3. The construction superintendent’s activities at the site, including areas and floors inspected;

4. Any unsafe condition(s) observed pursuant to Section 3301.13.9, and the time and location of such unsafe condition(s);

5. Orders and notice given by the construction superintendent pursuant to Section 3301.13.9, including the names of individuals issued orders or notices, any refusals to comply with orders or respond to notices given, follow up action taken by the construction superintendent, and where the condition giving rise to the order or notice is corrected, the nature of the correction;

6. Any violations, stop work orders, or summonses issued by the department, including date issued and date listed or dismissed;

7. Any incidents or damage to adjoining property caused by construction or demolition activity at the site; and

8. The name of the competent person designated in accordance with Section 3301.13.12, along with an accompanying signature of the competent person. If the construction
superintendent assigns a new competent person, the date and time of this change, along with the name of the new competent person, must be recorded, accompanied by the signature of the new competent person. If the construction superintendent is not at the site when this occurs, the new competent person must instead make the log entry, which the construction superintendent must sign and date upon his or her next visit to the job site.

3301.13.14 [Disciplinary actions. Construction superintendents are subject to the provisions of Section 28–401.19 of the Administrative Code.] Reserved.

3301.13.15 [Cooperation required. Construction superintendents must comply with the provisions of Section 28–401.20 of the Administrative Code.] Reserved.

3301.13.16 Obligation of others. Nothing in this [rule] section is intended to alter or diminish any obligation otherwise imposed by law on others, including but not limited to, the owner, permit holder, construction manager, general contractor, contractor, materialman, architect, engineer, land surveyor, site safety manager, site safety coordinator, concrete safety manager, or other party involved in a construction project to engage in sound engineering, design, and construction practices, and to act in a reasonable and responsible manner to maintain a safe job site.

3301.13.17 Registration and qualifications of construction superintendents. Construction superintendents shall register with the department, in a form and manner acceptable to the department, and shall meet any qualifications set forth in rules by the department.

3301.13.17 Licensing of construction superintendents. No person shall perform the duties and responsibilities of a construction superintendent, including but not limited to serving as a primary construction superintendent or as an alternate construction superintendent, unless such person is licensed as a construction superintendent in accordance with Article 428 of Title 28 of the Administrative Code.

3301.13.18 Release of the construction superintendent. The department may release the construction superintendent from the job when the construction superintendent demonstrates, to the satisfaction of the commissioner, that the job is substantially complete.

3301.14 Contractor shall inform personnel. General contractors and subcontractors shall state to their directly employed personnel at the construction or demolition site, prior to such directly employed person commencing work at the site, that they are to follow all safety regulations at all times and that they are required to obey and implement all orders and directives issued by the general contractor/subcontractor, the general contractor’s/subcontractor’s designee, the construction superintendent, and the worker’s direct supervisor relating to safety requirements. Where a site safety manager or coordinator is required, the general contractor or subcontractor shall also state to their directly employed personnel at the site, prior to such directly employed person commencing work at the site, that the site safety manager or coordinator is responsible for monitoring compliance with laws and rules governing site safety; and shall inform their supervisory personnel at the site, prior to such supervisor commencing work at the site, of the name and responsibilities of the site safety manager or coordinator.

§ 33. Section BC 3302, as amended by local law number 141 for the year 2013, section 3302.1 as amended by local law number 219 for the year 2019, local law number 119 for the
year 2019, local law number 3 for the year 2018, and local law number 196 for the year 2017, is amended to read as follows:

SECTION BC 3302
DEFINITIONS

3302.1 Definitions. The following [words and terms shall, for the purposes of this chapter, have the following meanings.] terms are defined in Chapter 2:

100-HOUR TRAINING PROGRAM. [A program that (i) includes 100 or more hours of training in technical subjects relating to a construction trade, including an apprenticeship program registered with the New York State Department of Labor, (ii) is approved by OSHA, the United States Department of Labor, the New York State Department of Education or the New York State Department of Labor and (iii) provides training that the department determines is equivalent to or exceeds the training required to comply with Section 3321.]

[ACCIDENT. An occurrence directly caused by construction or demolition activity or site conditions that result in one or more of the following:

8. A fatality to a member of the public, or

9. Any type of injury to a member of the public; or

10. A fatality to a worker; or

11. An injury to a worker that requires transport by emergency medical services or requires immediate emergency care at a hospital or offsite medical clinic; or

12. Any complete or partial structural collapse or material failure; or

13. Any complete or partial collapse or failure of pedestrian protection, scaffolding, hoisting equipment, or material handling equipment; or

14. Any material fall exterior to the building or structure.]

ACTIVELY PROCTORED ONLINE TRAINING. [Online training that satisfies each of the following conditions:]

[1. The person responsible for conducting such training confirms the identification of the person taking such training in a manner established by the department.]

[2. While such training is being conducted, the site of such training is actively observed by or on behalf of the person responsible for conducting such training.]

[3. Such training complies with any other requirements the department establishes by rule.]

ADJUSTMENT (SCAFFOLD). [The calibration or modification of a scaffold, including any part or component, that does not meet the definition of installation, removal, repair, maintenance, or use, and does not constitute normal use or operation of the scaffold.]
ALTERATION. See Section 28-101.5 of the Administrative Code.

ARCHITECT. See Section 28-101.5 of the Administrative Code.

ARTICULATING BOOM CRANE. A power-operated machine for lifting or lowering a load and moving it horizontally that utilizes a boom consisting of a series of folding pin-connected structural members, typically manipulated to extend or retract by power from hydraulic cylinders, with or without a hoisting mechanism integral to the machine.

AXIS OF ROTATION. The vertical axis around which the crane superstructure rotates.

AXLE. The shaft or spindle with which or about which a wheel rotates. On truck and wheel-mounted cranes, it refers to an automotive type of axle assembly, including housing, gearing, differential, bearings and mounting appurtenances.

BASE (MOUNTING). The base or carrier on which the rotating superstructure is mounted, such as a truck, crawler or platform.

BEARER (PUTLOG). A horizontal transverse scaffold member (which may be supported by legs or runners) upon which the scaffold platform rests and joins scaffold uprights, posts, poles, and similar members.

BOOM (CRANE OR DERRICK). A section or strut, of which the heel (lower end) is affixed to a base, carriage or support, and whose upper end supports a cable and sheaves where the load is lifted by means of wire rope and a hook.

BOOM POINT. The outward end of the top section of the boom, containing the hoist sheave assembly.

BRAKE. A device used for retarding or stopping motion by friction or power means.

BUCKET HOIST. A power- or manually operated suspended bucket contained by guide rails used for raising or lowering material, exclusively and is controlled from a point outside the conveyance.

CABLEWAY. A power-operated system for moving loads in a generally horizontal direction in which the loads are conveyed on an overhead cable, track or carriage.

CEMENTED SOIL (CHAPTER 33).

CERTIFICATE OF APPROVAL. A certificate issued by the department upon review and approval of the engineering and testing of a specific make and model of hoisting equipment to ensure compliance with the applicable provisions of this code and its referenced standards.

CERTIFICATE OF OPERATION. A certificate issued by the department annually upon satisfactory inspection of the hoisting equipment holding a certificate of approval to ensure that the equipment continues to be in compliance with this code and its referenced standards.

CERTIFICATE OF ON-SITE INSPECTION. A certificate issued by the department based on a site-specific approval of the placement, founding and operation of hoisting equipment.
CLAMSHELL. [A shovel bucket with two jaws that clamp together by their own weight when it is lifted by a closing line.]

CLIMBER CRANE.

[CLIMBING/JUMPING. The raising or lowering of a tower or climber crane to different floors or levels of a building or structure.]

COHESIVE SOIL (CHAPTER 33).

COMMERCIAL TRUCK MOUNTED CRANE (BOOM TRUCK). [A crane consisting of a rotating superstructure (center post or turntable), boom, operating machinery, and one or more operator’s stations mounted on a frame attached to a commercial truck chassis, usually retaining a payload hauling capability whose power source usually powers the crane. Its function is to lift, lower, and swing loads at various radii.]

COMPETENT PERSON. [One who is capable of identifying existing and predictable hazards in the surroundings or conditions that are unsanitary, hazardous or dangerous, and who has authorization to take prompt corrective measures to eliminate such hazards.]

COMPLETED STEEL FLOOR (CHAPTER 33).

CONCRETE WASHOUT WATER. [Wastewater from the rinsing of equipment used to mix, transport, convey, and/or place concrete. Such equipment shall include, but not be limited to, concrete buckets, concrete hose lines and pumps, boots, shovels, finishing tools, wheelbarrows, motorized concrete carts, concrete pour funnels and the chute of concrete mixer trucks.]

[Exceptions:

1. This term shall not include wastewater from the rinsing of equipment involved in the preparation, conveyance or application of concrete that is:

   1.1 mixed on site if the total quantity of concrete is less than or equal to one and one half cubic yards (1.146m$^3$), or

   1.2 from bagged ready mix if the total quantity of concrete is less than or equal to sixty (60) eighty pound (36.287 kg) bags, or eighty (80) sixty pound (27.215 kg) bags, or the equivalent.

2. This term shall not include wastewater from the rinsing of the wheels, undercarriage or chassis of concrete mixer trucks.]

CONSTRUCTION. [The excavation, erection, alteration, and repair of buildings or any component parts, including all operations incidental thereto.]

CORNER SCAFFOLD (ANGLE SCAFFOLD). [A suspended scaffold consisting of an assembly of two or more platforms connected nonlinerally and designed and manufactured to fit around a corner or a projecting part of a building.]
COUNTERWEIGHT. [Weight used to supplement the weight of the machine in order to provide stability for lifting loads.]

CRANE. [A power-operated machine for lifting or lowering a load and moving it horizontally which utilizes wire rope and in which the hoisting mechanism is an integral part of the machine. The definition of a crane shall also include articulating boom crane, regardless of whether it has a hoisting mechanism integral to the machine.]

CRAWLER CRANE. [A crane consisting of a rotating superstructure with a power plant, operating machinery, and boom, mounted on a base and equipped with crawler treads for travel. Its function is to lift, lower, and swing loads at various radii.]

CRITICAL PICK. [The attachment and detachment of loads from the hook of hoisting equipment used to hoist or lower loads on the outside of a building that involves one or more of the following:]

1. An article that is at or above 95 percent of approved rated capacity of the hoisting equipment or rigging equipment;
2. An article that is asymmetrical and is not provided with standard rigging ears;
3. An article that has a wind sail area exceeding 500 square feet (46 m²);
4. A pick that may present an added risk because of clearance, drift, or other interference;
5. An article that is fragile or of thin shell construction and is not provided with standard rigging ears;
6. A pick that requires multiple power-operated hoisting equipment (tandem pick); or
7. A pick that requires out of the ordinary rigging equipment, methods, or setup.]

CURB LEVEL.

DEBRIS. [Rubbish, waste, discarded material, or the remains of something broken down, demolished, or destroyed.]

DEBRIS NET or NETTING. [A netting of a fine mesh of a size and strength sufficient to catch debris, such as falling tools and materials.]

DEDICATED PILE DRIVER.

DEMOLITION. [Full or partial demolition.]

Full demolition. [The dismantling, razing, or removal of all of a building or structure, including all operations incidental thereto.]

Partial demolition. [The dismantling, razing, or removal of structural members, floors, interior bearing walls, and/or exterior walls or portions thereof, including all operations incidental thereto.]
DERRICK. [An apparatus consisting of a mast or equivalent member held at the end by guys or braces, with or without a boom, for use with a hoisting mechanism and operating ropes, for lifting or lowering a load and moving it horizontally.]

DEWATERING. [The removal of surface or ground water from a site by pumping or evaporation.]

DIRECT AND CONTINUING SUPERVISION. [See Section 28-401.3 of the Administrative Code.]

DIRECT EMPLOY. [See Section 28-401.3 of the Administrative Code.]

DISMANTLING. [The final process of taking apart, piece by piece, in a specific sequence, the components of a crane. Dismantling shall include climbing and jumping.]

DRUM. [The cylindrical member around which a rope is wound for raising and lowering the load or boom.]

DRY (SOIL, CHAPTER 33). [ENGINEER. See Section 28-101.5 of the Administrative Code.]

EQUIPMENT. [ Implements used to facilitate construction or demolition work.]

ERECION. [The assembly and placement of crane sections and components into place, including all operations incidental thereto. Erection shall include climbing and jumping.]

EXCAVATION. [The removal of earth from its natural position; except for any incidental removal that occurs during the course of auguring, drilling, vibrating, or driving.]

FISSURED (SOIL, CHAPTER 33).

GRANULAR SOIL (CHAPTER 33).

GUARDRAIL SYSTEM (SCAFFOLD). [A vertical barrier as described in Section 3314.8 consisting of, but not limited to, top rails, mid rails and posts, erected to prevent falling from a scaffold platform or walkway to lower levels.]

GUID. [A rope used to steady or secure the mast or other members in the desired position.]

HANDHELD DEVICE (DEMOLITION). [Equipment, mechanical or non-mechanical, utilized to physically demolish a building or structure, or elements of a building or structure, that is held, lifted, moved, and operated by a single person. A handheld device shall also include any item accessory to such equipment, including but not limited to a compressor, regardless of if such accessory item is held, lifted, moved, and operated by a single person. A handheld device does not include remote controlled equipment.]

HEAVY DUTY SCAFFOLD. [A supported scaffold capable of supporting loads of up to 75 pounds per square foot (366.15 kg/m2), and not more than those imposed by workers and heavy material, including but not limited to stone.]
HEAVY DUTY SIDEWALK SHED. [A sidewalk shed designed to carry a live load of at least 300 pounds per square foot (1465 kg/m²).]

HISTORIC STRUCTURE. [A building or structure which is a designated New York City landmark or interior landmark, is located within a designated New York City historic district, or is listed on the New York State or National Register of Historic Places.]

HOISTING EQUIPMENT. [Equipment used to raise and lower personnel and/or material with intermittent motion. Hoisting equipment does not include scaffolds, mast climbers, and elevators.]

HOISTING MACHINE. [A power operated machine used for lifting or lowering a load, utilizing a drum and a wire rope, excluding elevators. This shall include but not be limited to a crane, derrick, cableway and hydraulic lifting system, and articulating booms.]

HOISTING MECHANISM. [A hoist drum and rope reeving system used for lifting and lowering loads.]

INDUSTRIAL ROPE ACCESS. [The use or rope access equipment in which a person descends or ascends on a rope, or traverses along a rope, and in which the ropes are used as the primary means of support and positioning. Industrial rope access does not include window washing.]

INCIDENT.

INSTALLING/INSTALLATION/INSTALL (SCAFFOLD). [The initial installation or reinstallation of a scaffold at a site.]

    Initial installation (scaffold). [The initial assembly, set up, or placement of a scaffold at a site.]

    Reinstallation (scaffold). [The addition, relocation, or removal of any part, component, or attachment to a scaffold at a site, including but not limited to counterweights, tie-backs, anchorages, or connections to the building or structure, that occurs subsequent to the initial installation, and which does not otherwise occur in an automated, automatic fashion, as part of the normal use of the scaffold.]

JIB. [An extension attached to the boom point to provide added boom length for lifting specified loads. The jib may be in line with the boom or offset to various angles in the vertical plane of the boom.]

JUMP (JUMPING or CLIMBING). [The process of adding or removing mast or tower sections to equipment that has already been erected.]

[LAY. That distance measured along a wire rope in which one strand makes one complete helical convolution about the core or center.]

LAYERED (SOIL, CHAPTER 33).

LIGHT DUTY SCAFFOLD. [A supported scaffold capable of supporting loads of up to 25 pounds per square foot (122.05 kg/m²), and not more than those imposed by workers and lightweight material, including but not limited to wood or paint.]
LIGHT DUTY SIDEWALK SHED. [A sidewalk shed designed to carry a live load of at least 150 pounds per square foot (732.3 kg/m²).]

LIMITED SITE SAFETY TRAINING (SST) CARD. [A card that is issued before the SST full compliance date, in a form and manner established by the department and that satisfies each of the following conditions:]

[1. Such card is issued by an SST provider to a person who submits an application to such provider demonstrating, in a form and manner established by the department, that such applicant satisfies the requirements of Item 1.1, 1.2 or 1.3:]

[1.1. Such applicant has successfully completed (i) an OSHA 10-hour class and (ii) 20 additional SST credits specified by the department, including eight SST credits relating to safeguarding against the dangers posed by falling workers and objects.]

[1.2. Such applicant has successfully completed an OSHA 30-hour class.]

[2. If such applicant completed the training to comply with Item 1.1, 1.2 or 1.3 but did not complete such training within the five years preceding submission of such application, such applicant has, in the one-year period preceding submission of such application, completed at least eight SST credits specified by the department.]

[3. Such card is issued by an SST provider who does not require applicants to submit any information except for (i) the information necessary to establish that the requirements in Item 1 have been satisfied, as specified by the department, (ii) a photograph of the applicant and (iii) such additional information as the department may allow by rule.]

[4. Such card expires on the day before the SST full compliance date and is not renewable.]

LOAD BLOCK, LOWER.

LOAD BLOCK, UPPER.

LOAD RATINGS. [Crane and derrick ratings in pounds (kilograms) established by the manufacturer in accordance with standards set forth in rules promulgated by the commissioner.]

LOAD RATING CHART. [A full and complete range of manufacturer’s crane load ratings at all stated operating radii, boom angles, work areas, boom lengths and configurations, jib lengths and angles (or offset), as well as alternative ratings for use and nonuse of optional equipment on the crane, such as outriggers and extra counterweights, that affect ratings.]

LOAD (WORKING). [The external load, in pounds (kilograms), applied to the crane or derrick, including the weight of auxiliary load attaching equipment, such as lower load blocks, shackles and slings.]

[LOWER LOAD BLOCK. The assembly of hook or shackle, swivel, sheaves, pins and frame suspended by the hoisting ropes.]
MAINTENANCE (SCAFFOLD). [Regular or periodic upkeep as specified by the manufacturer to keep the scaffold, including all parts or components, in like new condition and safe working order, and that does not otherwise meet the definition of an installation, removal, or repair.]

MAJOR BUILDING. [An existing or proposed building 10 or more stories or 125 feet (38.100 mm) or more in height, or an existing or proposed building with a building footprint of 100,000 square feet (30.480 m²) or more regardless of height, or an existing or proposed building so designated by the commissioner due to unique hazards associated with the construction or demolition of the structure.]

MANUFACTURE DATE [({Crane}) (CRANE)]. [For a particular crane, the earlier of the following dates:]

[1. The date the crane was originally manufactured for its intended purpose.]

[2. The date that the oldest major component of the crane was originally manufactured.]

MAST CLIMBER. [A powered device consisting of an elevating platform mounted on a base or chassis and mast, that when erected is capable of supporting personnel, material, equipment and tools on a deck or platform that is capable of traveling vertically in infinitely adjustable increments to reach the desired work level.]

MATERIAL HANDLING EQUIPMENT. [A power or manually operated platform, bucket, car or cage that moves horizontally and is mainly used for transporting material during construction, alteration, repair or demolition of a building or structure.]

MATERIAL HOIST (MATERIAL HOISTING EQUIPMENT). [A power or manually operated platform, bucket, car or cage that moves vertically and is used for raising or lowering material exclusively during construction, alteration, repair or demolition of a building or structure, and is controlled from a point outside the conveyance.]

MECHANICAL DEMOLITION EQUIPMENT. [Mechanically driven or powered equipment that is utilized to physically demolish a building or structure, or elements of a building or structure, either within or exterior to the building or structure, or that is utilized to move debris or material within the building or structure. Mechanical demolition equipment shall not include mechanically driven or powered equipment that is utilized to move debris or material outside of the building or structure.]

MEDIUM DUTY SCAFFOLD. [A supported scaffold capable of supporting loads of up to 50 pounds per square foot (244.1 kg/m²), and not more than those imposed by workers and moderate material, including but not limited to brick and pipe.]

[MINOR ALTERATIONS. See Section 105.4.2 of the Administrative Code.]

MOBILE CRANE. [A commercial truck mounted crane, crawler crane, wheel mounted crane (multiple control stations), or wheel mounted crane (single control station).]

MOBILE SCAFFOLD. [A powered or unpowered, portable, easter, track or wheel mounted supported scaffold.]

MOIST (SOIL, CHAPTER 33).
MULTIPOINT ADJUSTABLE SUSPENDED SCAFFOLD. [A suspended scaffold consisting of a platform(s) that is suspended by more than two ropes from overhead supports and equipped with a means to raise and lower the platform to the desired work levels.]

ORDINARY REPAIRS. [See Section 105.4.2 of the Administrative Code.]

OSHA. [The United States Department of Labor Occupational Safety and Health Administration.]

OSHA 10-HOUR CLASS. [A class that includes 10 or more hours in construction industry safety and health that is intended for workers and satisfies the following conditions:]

1. Such class is (i) approved by OSHA and conducted in accordance with the OSHA outreach training program or (ii) an equivalent 10 or more hour class approved by the department.

2. Such class consists of in-person training, actively proctored online training or, if such training is conducted before the effective date of the local law that added this definition, online training.

OSHA 30-HOUR CLASS. [A class that includes 30 or more hours in construction industry safety and health that is intended for supervisors and satisfies the following conditions:]

1. Such class is (i) approved by OSHA and conducted in accordance with the OSHA outreach training program or (ii) an equivalent 30 or more hour class approved by the department.

2. Such class consists of in-person training, actively proctored online training or, if such training is conducted before the effective date of the local law that added this definition, online training.

OUTRIGGER (CRANE). [Extendable or fixed members attached to the mounting base that rest on supports at the outer ends used to support the crane.]

OUTRIGGER (SCAFFOLD). [The structural member of a supported scaffold used to increase the base width of a scaffold in order to provide support for and increased stability of the scaffold.]

OUTRIGGER BEAM (THRUSTOUT). [The structural member of a suspended scaffold or outrigger scaffold that provides support for the scaffold by extending the scaffold point of attachment to a point out and away from the structure or building.]

OUTRIGGER SCAFFOLD. [A supported scaffold consisting of a platform resting on outrigger beams (thrustouts) projecting beyond the wall or face of the building or structure, the inboard ends of which are secured inside the building or structure.]

PERSONNEL HOIST. [A mechanism and its hoistway, equipped with a car that moves vertically on guide members, used for hoisting or lowering workers or workers and materials for the construction, alteration, or demolition of a building, structure, or other work.]

PILE DRIVER.

PLASTIC (SOIL, CHAPTER 33).
PLATFORM. [A work surface elevated above lower levels. Platforms can be constructed using individual wood planks, fabricated planks or fabricated decks.]

POWER BUGGIES. [An automotive vehicle designed or used for the transportation of materials on or about construction or demolition sites. It shall not include automobiles, motor trucks, general purpose tractors, or excavating or material handling machinery.]

QUALIFIED PERSON. [A person who, by possession of a recognized degree, certificate or professional standing, or who by knowledge, training, and experience, has demonstrated his or her ability to solve or resolve problems related to the subject matter, the work or the project.]

[REGISTERED DESIGN PROFESSIONAL. An architect or engineer.]

REMOVING/REMOVAL/REMOVE (SCAFFOLD). [The final process of taking apart a scaffold in a specific sequence and removing it from the site.]

REPAIR (SCAFFOLD). [Work performed to restore a scaffold, or any part or component, to like new condition and safe working order following decay, wear, or damage. The definition of repair shall also include the replacement of a part or component.]

REPLACEMENT (SCAFFOLD). [A repair involving the exchange or substitution of one part or component with another identical or similar part or component in order to restore a scaffold, or any part or component, to like new condition and safe working order following decay, wear, or damage.]

ROPE. [A continuous line of material comprised of a number of twisted or braided strands of fiber (natural or synthetic) or metal wire.]

ROTATING TELEHANDLER.

RUNBACK STRUCTURE. [A temporary system of hoistway landing runways, vertical supports and horizontal diaphragms designed to bridge between the hoistway and the parent structure and to transmit both vertical and horizontal loads to the supporting structure and/or foundation.]

SAFETY NETTING SYSTEM (SAFETY NETTING). [Debris or structural nets, installed vertically or horizontally, along with all supports, components, and connections.]

Horizontal safety netting. [A safety netting system, installed horizontally, consisting of structural netting lined with debris netting.]

Vertical safety netting. [A safety netting system, installed vertically, consisting of debris netting.]

SCAFFOLD. [Any temporary elevated platform and its supporting structure (including points of anchorage) used for supporting workers or workers and material, including but not limited to supported scaffolds, suspended scaffolds, and mobile scaffolds.]

SCAFFOLD CONTROLLING ENTITY. [The contractor or other entity that exercises responsibility for the site where the scaffold is located.]
SELF-ERECTING TOWER CRANE.

SHORE, MULTI-STAGE.

SINGLE-POINT ADJUSTABLE SUSPENDED SCAFFOLD. [A suspended scaffold consisting of a platform suspended by one rope from an overhead support and equipped with means to permit the movement of the platform to desired work levels.]

SITE SAFETY TRAINING (SST) CARD. [A card that is issued in a form and manner established by the department and that satisfies each of the following conditions:]

[1. Such card is issued by an SST provider to a person who submits an application to such provider demonstrating, in a form and manner established by the department, that such applicant satisfies the requirements of Item 1.1, 1.2 or 1.3:]

[1.1. Such applicant has successfully completed (i) an OSHA 10-hour class and (ii) 30-45 additional SST credits specified by the department, including eight SST credits relating to safeguarding against the dangers posed by falling workers and objects.]

[1.2. Such applicant has successfully completed (i) an OSHA 30-hour class and (ii) 10-25 additional SST credits specified by the department, including eight SST credits relating to safeguarding against the dangers posed by falling workers and objects.]

[1.3. Such applicant has successfully completed a 100-hour training program.]

[2. If such applicant completed the training to comply with Item 1.1, 1.2 or 1.3 but did not complete such training within the five years preceding submission of such application, such applicant has, in the one-year period preceding submission of such application, completed at least eight SST credits specified by the department.]

[3. Such card is issued by an SST provider who does not require applicants to submit any information except for (i) the information necessary to establish that the requirements in Item 1 have been satisfied, as specified by the department, (ii) a photograph of the applicant and (iii) such additional information as the department may allow by rule.]

[4. Such card expires five years after issuance and is renewable upon a showing by the applicant that such applicant has, in the one-year period preceding submission of such renewal application, successfully completed eight SST credits specified by the department.]

SITE SAFETY TRAINING (SST) CREDIT. [One hour of training that satisfies each of the requirements of Item 1, 2 and 3:]

[1. Such training relates to a topic identified by department rule.]

[2. If such training is conducted on or after the effective date of the local law that added this definition, such training is in-person training or actively proctored online training.]

[3. If such training is conducted on or after March 1, 2018, such training is conducted by an SST provider.]
SITE SAFETY TRAINING (SST) FULL COMPLIANCE DATE. [March 1, 2021.]

SITE SAFETY TRAINING (SST) PROVIDER. [An entity that satisfies the requirements of Items 1 and 2:]

[1. Such person satisfies the conditions of Item 1.1, 1.2, 1.3 or 1.4:]

[1.1. Such entity is a not-for-profit organization with a history of at least three years of experience in providing construction-related workforce development, construction-related education or site safety training, which may be demonstrated by submitting training logs to the department or in a form and manner otherwise determined by the department, and training offered by such entity is offered by a person who has (i) successfully completed all applicable OSHA or department requirements for conducting OSHA 10-hour classes and OSHA 30-hour classes and is authorized to conduct such classes and (ii) if such person is conducting training for SST credits other than training that is part of an OSHA 10-hour class or OSHA 30-hour class, such person demonstrates sufficient knowledge of this chapter in a form and manner established by the department. Such entity shall not be required to demonstrate any professional standing, approval, licensure, accreditation or certification, including approval, licensure, accreditation or certification pursuant to paragraph (2) of subdivision d of section 105-03 of subchapter E of chapter 100 of title 1 of the rules of the city of New York, as in effect on January 1, 2018, beyond showing that such entity and a person offering training on behalf of such entity satisfy the requirements set forth in the preceding sentence. Where the department provides content, developed in accordance with department-approved course requirements, for the delivery of SST credits, such entity shall deliver SST credits in accordance with such content. Where the department does not provide content for the delivery of SST credits, such entity shall be responsible for the development of content in accordance with department-approved course requirements. Such content and the delivery of such content may be subject to approval or audit by the department.]

[1.2. Such entity is providing training through a 100-hour training program.]

[1.3. Such entity has been approved by the department to conduct a 40-hour course approved by the department pursuant to Article 402 of Chapter 4 of Title 28 of the Administrative Code.]

[1.4. The department may establish by rule additional ways for an entity to satisfy the requirements of this Item 1. If the department elects to promulgate such rules, an entity shall be deemed to satisfy this Item 1 if such entity satisfies the requirements set forth in such rules or if such entity satisfies the requirements set forth in Item 1.1, 1.2 or 1.3.]

[2. On and after the SST full compliance date, such entity has certified to the department that such entity satisfies at least one of the following conditions:]

[2.1. Such entity has a language access plan for training that relates to SST credits such entity offers and such plan complies with requirements established by an agency or office designated by the mayor.]
Such entity satisfies each of the following conditions:

1. Such entity is able to provide instruction in a language that students understand.

2. If a student’s vocabulary is limited, such entity will accommodate that limitation.

3. A person offering training on behalf of such entity is fluent in the training language or will use translators or interpreters and any such translators or interpreters will have a background in occupational safety and health.

SITE SAFETY TRAINING (SST) SECOND COMPLIANCE DATE. [December 1, 2019, or, if the department publishes a finding by September 1, 2019, that there is insufficient capacity to provide the training required by Section 3321 of the New York City building code to the workers who would need such training, a later date established by the department, provided that such date is not later than June 1, 2020.]

SITE SAFETY TRAINING (SST) SUPERVISOR CARD. [A card that satisfies each of the following conditions:]

1. Such card is issued in a form and manner established by the department to a person who demonstrates that such person has an SST card and has successfully completed an OSHA 30-hour class.

2. Such card expires five years after issuance and is renewable upon a showing by the applicant that such applicant has, in the one-year period preceding such submission of such renewal application, successfully completed 16 SST credits specified by the department.

SITE SAFETY TRAINING (SST) TASK FORCE. [The task force established pursuant to Section 28-103.28 of the Administrative Code.]

SOIL AND FOUNDATION WORK (SOIL OR FOUNDATION WORK). [Excavation, fill, grading, augering, boring, or drilling, whether in soil or rock, or the installation or removal of foundations, piles, underpinning, sheeting, shoring, or supports of excavation.]

STABLE (ROCK, CHAPTER 33).

STAIR TOWER (SCAFFOLD STAIRWAY/TOWER).

STANDARD GUARDRAIL SYSTEM (SCAFFOLD). [See “Guardrail system (scaffold).”]

STAND-OFF BRACKET (SUSPENDED SCAFFOLD).

STRIPPING OPERATIONS. [Removal on the floor of any parts of the concrete formwork including shoring, bracing, and other supports.]

STRUCTURAL NET (STRUCTURAL NETTING). [A system of nets capable of complying with the prototype test described in ANSI A10.11.]
SUBMERGED SOIL (CHAPTER 33).

SUPERSTRUCTURE. [The rotating upper frame structure of the machine and the operating machinery mounted thereon.]

SUPPORTED SCAFFOLD. [One or more platforms supported by outrigger beams, brackets, poles, legs, uprights, posts, frames, including prefabricated frames that are mechanized but not motorized, or any similar rigid support, including back structures connecting hoistways to buildings, and including structures where sidewalk protection is constructed as an integral part of the apparatus.]

SUSPENDED SCAFFOLD. [One or more platforms suspended by ropes or other means from an overhead structure.]

SUSPENDED SCAFFOLD FOREMAN. [An individual, male or female, designated by and working under the direct and continuing supervision of a licensed master or special rigger, or a licensed master or special sign hanger, in accordance with the rules of the department.]

[SUSTAINED WIND. Winds with a 1 minute average duration lasting for a 1-hour period or longer.]

SWING. [Rotation of the superstructure for movement of loads in a horizontal direction about the axis of rotation.]

TELEHANDLER.

[TEMPORARY CONSTRUCTION. Bracing, shoring, or other elements not part of the permanent structure and which are installed to facilitate construction or demolition work.]

TEMPORARY CONSTRUCTION INSTALLATIONS.

TEMPORARY SITE SAFETY TRAINING (SST) CARD. [A card that is issued in a form and manner established by the department and that satisfies each of the following conditions:]

[1. Such card is issued by an SST provider to a person who demonstrates that such person has successfully completed an OSHA 10-hour class and who is a new entrant to the construction or demolition work force as determined by such provider pursuant to department rules.]

[2. Such card expires six months after issuance and is not renewable.]

TOOL. [See “Equipment.”]

[TOWER. A vertical structural frame consisting of columns and bracing that are capable of supporting working and dynamic loads and transmitting them to the support(s).]

TOWER CRANE. [A power-operated hoisting machine that utilizes a vertical tower with a rotating superstructure and includes a load boom (jib) in order to lift or lower a load and move it horizontally.]

TRANSIT. [The moving or transporting of a crane from one job site to another.]
TRAVEL. [The function of the machine moving from one location to another on a job site.]

TRENCH.

TWO-POINT SUSPENDED SCAFFOLD (SWING STAGE). [A suspended scaffold consisting of a platform supported by hangers (stirrups) suspended by two ropes from overhead supports and equipped with means to permit the raising and lowering of the platform to desired working levels.]

TYPE A SOIL (CHAPTER 33).

TYPE B SOIL (CHAPTER 33).

TYPE C SOIL (CHAPTER 33).

UNCONFINED COMpressive STRENGTH (SOIL, CHAPTER 33).

UNENCLOSED PERIMETER. [Any exterior portion of a building that is not solidly enclosed with the permanent façade, including the windows; or any exterior edge of a roof that is not enclosed with its permanent parapet or guardrail.]

USE/USING (SCAFFOLD). [Any work or activity performed on or from the scaffold. In addition, for a suspended scaffold, the use of the scaffold shall include the operation of the scaffold at the site, provided during such operation any vertical or horizontal relocation of the scaffold does not require a modification to the counterweight, or does not require the placement, relocation, or removal of any anchorage, attachment, outrigger beam, tie-back, or connection to the building or structure.]

WALKABLE FLOOR (CONCRETE CONSTRUCTION). [A floor where the concrete slab has been poured and the formwork stripped.]

WALKABLE FLOOR (PRECAST CONCRETE CONSTRUCTION). [A floor where the frame is erected and the precast concrete floor is fixed in place.]

WALKABLE FLOOR (STEEL CONSTRUCTION). [A floor where the frame is erected and the deck is tack welded or fixed in place.]

WHEEL MOUNTED CRANE (MULTIPLE CONTROL STATIONS). [A crane consisting of a rotating superstructure, operating machinery, and operator's station and boom, mounted on a crane carrier equipped with axles and rubber-tired wheels for travel, a power source(s), and having separate stations for driving and operating. Its function is to lift, lower, and swing loads at various radii.]

WHEEL MOUNTED CRANE (SINGLE CONTROL STATION). [A crane consisting of a rotating superstructure, operating machinery, and boom, mounted on a crane carrier equipped with axles and rubber-tired wheels for travel, a power source, and having a single control station for driving and operating. Its function is to lift, lower, and swing loads at various radii.]

WORKING DECK (CONCRETE CONSTRUCTION). [The level where the floor is being formed.]
WORKING DECK (DEMOLITION). [The level where the floor is being broken up.]

WORKING DECK (PRECAST CONCRETE CONSTRUCTION). [The level where the floor is being placed.]

WORKING DECK (STEEL CONSTRUCTION). [The floor where the metal decking and steel components are being placed before concrete is poured.]

§ 34. Section BC 3303, of the New York city building code, as amended by local law number 141 for the year 2013, section 3303.2.3.1 as amended by local law number 18 for the year 2014, section 3303.5.4 as amended by local law number 38 for the year 2015, section 3303.10 as amended by local law number 154 for the year 2017, section 3303.10.1 as amended by local law number 106 for the year 2019, and section 3303.10.2 as amended by local law number 116 for the year 2019, is amended to read as follows:

SECTION BC 3303
SAFEGUARDS AND MAINTENANCE OF SITE

3303.1 Scope. Sites shall be safeguarded and maintained in accordance with the provisions of this section to protect the public and property.

3303.2 Utilities. Utilities at a site shall meet the requirements of Sections 3303.2.1 through 3303.2.5.

3303.2.1 Existing services. The location of all existing utilities and service lines shall be determined and adequate measures taken, or devices provided, to safeguard the public and property before such utilities are disturbed.

3303.2.2 Maintaining essential services. See Section 3303.9.

3303.2.3 Electrical work. All temporary electrical equipment and wiring shall meet the requirements of the New York City Electrical Code, and shall be maintained in compliance with such requirements. Portions of permanent electrical installations may be used for temporary operations provided the requirements of the New York City Electrical Code are met.

3303.2.3.1 Temporary lighting for construction sites. Temporary lighting for construction sites shall use high-efficacy lamps with the following minimum efficacies:

1. 60 lumens per watt for lamps over 40 watts;
2. 50 lumens per watt for lamps over 15 watts but less than or equal to 40 watts; and
3. 40 lumens per watt for lamps 15 watts or less.
**3303.2.4 Sanitary facilities.** Sanitary facilities shall be provided during construction or demolition activities in accordance with the *New York City Plumbing Code*.

**3303.2.5 Removing, relocating, or interrupting services.** If any utility is to be removed, relocated, or have its service interrupted, the utility company or city agency affected shall be notified at least 72 hours in advance.

**3303.2.6 Disconnecting, capping, and certifications.** Prior to the removal of any service, the utility connection shall be disconnected and capped, and certifications to that effect issued by the representative utility company shall be filed with the department.

**3303.3 Watchperson.** Where an individual building being constructed or demolished has a footprint of between 5,000 square feet (1524 m²) and 40,000 square feet (12 192 m²), a competent watchperson shall be on duty at the site during all hours when operations are not in progress, from the time when the foundation is poured to when all work has concluded and the certificate of occupancy or temporary certificate of occupancy has been issued. Where the building has a footprint of more than 40,000 square feet (12 192 m²), at least one additional watchperson shall be on duty for each additional 40,000 square feet (12 192 m²) of building footprint, or fraction thereof. The watchperson shall be familiar with emergency notification procedures to the Fire Department, shall possess a valid security guard registration with the State of New York, shall hold a valid [fire guard] watchperson certificate from the Fire Department, and [for a major building shall have completed the training required by Section 3310.10] shall have completed a course that is at least 10-hours in length and approved by OSHA in construction industry safety and health.

**Exceptions:**

1. Where the square footage of the building footprint requires two or more watchpersons, the number of watchpersons may be reduced, subject to the approval of the commissioner, where:
   1.1. [An alarm or] A video monitoring system is in place, or where the layout of the building allows a continuous line of sight across the entire building; and
   1.2. At least one watchperson is provided.

2. The building is being actively monitored in accordance with a fire safety and evacuation plan approved by the Fire Department in accordance with the *New York City Fire Code*.

**3303.4 Housekeeping.** Housekeeping at a site shall be in accordance with Sections 3303.4.1 through [3303.4.9] 3303.4.11.

**3303.4.1 Slipping and tripping hazards.** Slipping and tripping hazards in areas used by the public shall be minimized in accordance with Sections 3303.4.1.1 and 3303.4.1.2.

**3303.4.1.1 Maintenance of public areas.** All areas used by the public shall be maintained free from ice, snow, grease, debris, equipment, materials, projections, tools, or other items, substances, or conditions that may constitute a slipping, tripping, or other hazard.
3303.4.1.2 Location of hose lines, wires, ropes, pipes, chains and conduits. Hose lines, wires, ropes, pipes, chains, and conduits shall be located so that they will not constitute a tripping hazard to the public. Where it is necessary to carry such across sidewalks, or any public way, they shall either be suspended at least 8 feet (2438 mm) above ground or, if left on the ground, suitable chamfered planks or a pedestrian bridge shall be provided to cover such.

3303.4.2 Containers. Sufficient containers, including but not limited to waste dumpsters, debris boxes, and skip boxes, shall be available for the storage of all debris or waste. Such containers shall comply with the following requirements:

1. Containers shall be made of metal, flame-retardant plastic, or other noncombustible material [acceptable to the commissioner]. [Such containers shall also comply with the following:] 

[4.] 2. Containers with wheels shall be secured at the end of the workday by rope, cable, or chocking at the wheels in order to prevent movement.

[2.] 3. Containers shall not be placed at the edge of [the building] an unenclosed perimeter at any time, except when being moved from the floor or building.

[3.] 4. Containers holding debris or waste shall be covered at the end of the workday and at any time when full to near the rim. [Containers] However, containers need not be covered when they are empty and not in use, or while stored in a fully enclosed space at the end of the workday and not full to near the rim.

Exception: Combustible debris shall not be permitted to accumulate and shall be removed from the site in accordance with Section 3303.5.1.

3303.4.3 Reserved.

3303.4.4 Control of debris. Control of debris during construction and demolition work shall include the following measures specified in Sections 3303.4.4.1 through 3303.4.4.3.

[4.] 3303.4.4.1 Daily cleaning. All [floors, roofs, and working decks] areas of the construction or demolition site shall be cleaned of debris at least daily, and a daily inspection made by a competent person to verify such has occurred. If the building is a major building, such inspection shall be noted in the site safety log.

3303.4.4.2 Cleaning near unenclosed perimeters. Areas that are at least 10 feet (3048 mm) from an unenclosed perimeter, as measured in all directions from the unenclosed perimeter, shall be cleaned of debris periodically throughout the day.

Exception: In locations where unenclosed perimeter protection has been temporarily removed, the requirements of Section 3308.10 shall apply.

[4.] 3303.4.4.3 Securing debris that cannot be removed by the end of the shift. Debris that cannot be removed from the site by the end of the shift shall be...
1. [placed] Placed in containers meeting the requirements of [this section] Section 3303.4.2; or

2. [shall be secured] Secured overnight to protect the public and property and shall be removed from the site or placed in containers meeting the requirements of Section 3303.4.2 at the beginning of the next shift. For demolition operations, debris stored overnight on grade or earth, and neatly piled to prevent dislodgement, tipping, or spillage, shall be considered to be in compliance with this section.

Exception: Combustible debris shall not be permitted to accumulate and shall be removed from the site in accordance with Section 3303.5.1.

3303.4.5 Storage and safeguarding of materials and equipment during construction or demolition. Material and equipment [stored] located at a site during construction or demolition operations shall comply with Sections 3303.4.5.1 and 3303.4.5.2.

3303.4.5.1 Open and exposed areas. [When not being used, material] Material or equipment located on a working deck, unenclosed floor, roof, ground area, or similar exposed area shall be secured [against] or otherwise safeguarded to prevent dislodgement by wind [or], vibration, accidental impact, or other means.

3303.4.5.2 Storage near unenclosed perimeters. [All] When not being used, material or equipment [not being used] shall be stored at least 10 feet (3048 mm), measured along all horizontal dimensions, from all unenclosed perimeters [of the building or structure,] as measured in all directions from the unenclosed perimeter. [Such material] Material or equipment shall also be secured or safeguarded in accordance with the requirements of Section 3303.4.5.1.

Exceptions: Provided the material or equipment is secured against [accidental movement] dislodgement by wind, vibration, accidental impact, or other means, in lieu of the 10-foot (3048 mm) set back distance:

1. Material or equipment that weighs 750 pounds (340.2 kg) or more may be stored at least 5 feet (1524 mm) from the unenclosed perimeter.

2. Where the gross floor area is less than 1,000 square feet (304.8 m²), material or equipment, regardless of weight, may be stored at least 5 feet (1524 mm) from the unenclosed perimeter.

3. Where located on a floor [or working deck] that is at or above the level of the horizontal safety netting in accordance with Section 3308, material or equipment may be stored at least 2 feet (610 mm) from the unenclosed perimeter.

4. Material related to concrete operations may overhang the unenclosed perimeter of the building or structure, provided:

   4.1. The material is banded with a minimum of two equally spaced bands to prevent dislodgement;
4.2. The material is braced and secured in place by positive means as indicated on the site safety plan, or where there is no site safety plan, in accordance with drawings prepared by a registered design professional;

4.3. The material overhangs by no more than one-third of its length;

4.4. The material is stored in an area designated on the site safety plan, or where there is no site safety plan, in an area designated on drawings prepared by a registered design professional;

4.5. Such designated area is broom swept and cleared of all materials, equipment, and debris prior to the temporary removal of the vertical netting and placement of overhanging material in the designated area;

4.6. The perimeter of such designated area, except for the perimeter along the unenclosed perimeter, is protected by vertical netting meeting the requirements of Section 3308.5 or an alternative system acceptable to the commissioner;

4.7. Horizontal safety netting meeting the requirements of Section 3308.6 is provided at a level not more than two stories or 30 feet (9144 mm) below the overhanging material, whichever is less, with such nets in place for the full time the material is overhanging, except that the nets may be pulled in at the immediate time the material is being hoisted or lowered where such nets would conflict with the hoisting or lowering operation; and

4.8. The material is relocated on the next workday.

3303.4.6 Storage of combustible material and equipment. Storage of combustible material and other material and equipment that may present a fire hazard shall comply with the New York City Fire Code.

3303.4.7 Storage near sidewalks, walkways, and pathways. Material stored adjacent to a sidewalk, walkway, or pathway that remains open to the public shall not be piled higher than 3 feet (914 mm), or where a solid fence or barrier is provided, to within one foot (305 mm) of the top of such fence or barrier. For the purposes of this section, the term “adjacent to” shall be any area that is within a horizontal distance that is equal to or less than the vertical height of the piled material.

Exception: Material stored within a dumpster or similar solid container, provided such material is not piled above the top of such dumpster or container.

3303.4.8 Machinery. All exposed, electrically charged, moving or otherwise dangerous parts of machines and construction or demolition equipment shall be located, guarded, shielded, or barricaded so as to prevent contact by the public.
3303.4.9 Internal combustion-powered equipment. In addition to the requirements of this chapter, the use of internal combustion-powered equipment shall comply with the New York City Fire Code.

3303.4.10 Stairs, hallways, and other means of egress. Stairs, hallways, pathways, and other means of egress, including but not limited to ladders used to facilitate access to a working level, shall not be encumbered by debris, material, or equipment.

3303.4.11 Daily inspection of housekeeping. A daily inspection shall be made by a competent person to verify compliance with the housekeeping requirements of Sections 3303.4.1 through 3303.4.10. If the building is a major building, the occurrence of this inspection shall be noted in the site safety log. If the building is not a major building but requires a construction superintendent, the occurrence of this inspection shall be noted in the construction superintendent’s log.

3303.5 Removal of material and debris. Material and debris shall be removed in a manner that prevents injury or damage to the public or property.

3303.5.1 Removal of combustible debris. Combustible debris shall not be permitted to accumulate, and shall be removed from the site at reasonable intervals in accordance with the requirements of the New York City Fire Code.

3303.5.2 Dropping or throwing prohibited. No material, debris, or equipment shall be intentionally dropped or thrown from a building or structure.

3303.5.3 Clogging. Precautions shall be taken to prevent concrete or mortar washings, sand, grit, or any other material that would cause clogging from entering a sewer, drain, vault, or subsurface structure. Concrete washout water shall also meet the requirements of Section 3303.15.

3303.5.4 Air pollution. The provisions of the Air Pollution Control Code shall apply in order to prevent dust from becoming airborne.

3303.5.5 Chutes. Chutes used in association with the removal of materials shall comply with Sections 3303.5.5.1 through 3303.5.5.5.

3303.5.5.1 Enclosures. Chute enclosures shall comply with the following requirements:

1. Material chutes that are at an angle of more than 45 degrees (0.79 rad) with the horizontal shall be entirely enclosed on all sides, except for openings at the floor levels for the receiving of materials. Such openings shall not exceed 48 inches (1219 mm) in height, measured along the wall of the chute, and all openings, except the top opening, shall be closed and secured when not in use.

2. Chutes at an angle of less than 45 degrees (0.79 rad) with the horizontal may be open on the upper side.

3303.5.5.2 Chute construction. Chute construction shall comply with the following requirements:
1. Every chute used to convey debris from a building or structure shall be rigidly supported and braced throughout its height.

2. Non-manufactured chutes less than 24 inches (610 mm) in maximum dimension shall be constructed of not less than 1-inch (25.4 mm) (nominal) wood, or ⅛-inch thick (3.18 mm) steel, or a material of equivalent strength and durability acceptable to the commissioner. Chutes more than 24 inches (610 mm) in maximum dimensions shall be constructed of not less than 2-inch (51 mm) (nominal) wood, or 3/16-inch thick (4.76 mm) steel, or a material of equivalent strength and durability acceptable to the commissioner.

3. Chutes shall be provided with a metal impact plate where material is forced to change direction while falling.

4. A gate shall be provided at the lower end of every chute to control the loading of material into trucks and to close the chute at all other times. Splash boards or baffles shall be erected to prevent materials from rebounding into the street or under the sidewalk shed.

5. A bumper or curb at least 4 inches by 4 inches (102 by 102 mm) in section shall be provided at each chute opening where such opening is level with, or below, the floor or platform. Every space between the chute and the edge of the opening in the floor or platform shall be solidly planked.

6. Chutes that are over 75 feet (22 860 mm) in height, or utilized in Group I occupancy, shall also comply with the requirements of Section 3303.5.5.3.

3303.5.5.3 Fire-retardant construction. When used in the following applications, all chutes constructed of combustible material shall be covered on the exterior with corrugated steel sheeting having a minimum thickness of 24 gauge through their entire height. Alternatively, chutes shall be constructed of noncombustible material:

1. Chutes exceeding 75 feet (22 860 mm) in height.

2. Alteration, repair or partial demolition of buildings where the main use or dominant occupancy is in Group I.

3303.5.5.3 Chute construction where the chute is over 75 feet in height, or utilized in Group I occupancy. Chutes that exceed 75 feet (22 860 mm) in height, or that are used in an occupied building where the main use or dominant occupancy is in Group I, shall either:

1. Be constructed of noncombustible material; or

2. Where constructed of combustible material, the combustible material of the chute shall be covered on the exterior of the chute with corrugated steel sheeting having a minimum thickness of 24 gauge through the entire height of the chute.

3303.5.5.4 Supports. All structural supports of material chutes shall be of noncombustible material.
3303.5.5.5 Design and permit. No chute shall be installed until a permit has been issued by the commissioner on the basis of drawings prepared by a registered design professional.

Exception: Design and permit is not required for a chute that [is] meets all of the following criteria:

1. [Installed] The chute is installed on the exterior of a building or structure at a height of 40 feet (12 192 mm) or less [in height] above the level of the adjoining ground;

2. [Has been designed by a manufacturer] The chute is a manufactured product and is installed in accordance with the manufacturer’s [design] specifications; and

3. [Does] The chute does not attach to or impart a load on a scaffold.

3303.6 Escape hatches. Where portable fuel fired heaters or other heating equipment are used to provide temporary heating during the placing of concrete for a floor, an escape hatch shall be provided. [The escape hatch shall extend from the floor where the concrete is being placed and through at least one story immediately below such floor.] The escape hatch shall be located as near to the center of the building or structure as practical.

Exception: Exceptions:

1. An escape hatch is not required where either the concrete placement floor or heating floor is the ground floor.

2. An escape hatch is not required provided at least one permanent stairway is available for use on the floor where [such] the concrete [placement] is [occurring and that such stairway is enclosed from the ceiling to the floor of the floor where such concrete placement is occurring and from the ceiling to the floor immediately below such floor with the permanent fire rated enclosure for the stair or a] being placed and the stair shaft is enclosed from the top of the floor where concrete is being placed to at least the top of the heating floor with either its permanent construction, a temporary smoke proof 1-hour fire rated assembly, or a 1-hour fireproof tarp wrapped tightly around the stair shaft so that no smoke can penetrate.

3303.6.1 Required ladders and [metal] shields. The escape hatch shall be constructed with at least two fixed, vertical ladders enclosed in a [metal] solid non-combustible shield. The ladders shall extend from a distance of 3 feet (914 mm) above the floor where the concrete is being placed to [either] at least [two stories] the story below the heating floor, or to the ground floor, whichever is less. The [metal] solid non-combustible shield shall enclose the ladders on all sides from the top of the floor where the concrete is being placed to at least the top of the heating floor [next below]. The inside dimensions between faces of the shield shall be not less than 3 feet 8 inches (1118 mm).

Exception: Extension ladders may be utilized where the horizontal dimension between the faces of the shields is equal to or greater than one-quarter the height of the shaft.
3303.6.2 Shield space and decking. Any gap between the shield and the perimeter of the opening in the floor under construction and also between the shield and the perimeter of the opening in the floor next below shall be decked over with 2-inch (51 mm) or heavier planking covered with plywood or sheet metal so as to make the decking smoke tight. At the termination of the ladders, the opening in the floor shall be covered completely with 2-inch (51 mm) planking or other material of equivalent strength.

3303.7 Fire prevention and fire protection. Firefighting equipment, fire fighting access at the construction or demolition site, and the conduct of all construction or demolition operations affecting fire prevention and fire fighting shall comply with the New York City Fire Code and the provisions of Sections 3303.7.1 through 3303.7.7.

3303.7.1 Water supply. A water supply for fire protection shall be provided in accordance with the New York City Fire Code.

3303.7.1.1 Large footprint construction. For a building that has a footprint of 100,000 square feet (30 480 m²) or more, regardless of the height of the building, and the building is substantially enclosed, permanent or temporary fire hydrants available for fire department use shall be provided during the course of construction:

1. Within 50 feet (15 240 mm) of the main entrance; and

2. Along the perimeter of the building, with the hydrants located so that there is at least one hydrant along every 250 feet (76 200 mm) of building perimeter, and with no hydrant more than 50 feet (15 240 mm) from the exterior wall.

3303.7.2 Fire extinguishers. Fire extinguishers shall be provided in accordance with the New York City Fire Code.

3303.7.3 Smoking. Smoking shall be prohibited at all construction and demolition sites. No smoking signs shall be posted at the site in accordance with the provisions of the New York City Fire Code.

3303.7.4 Sprinkler systems. Existing sprinkler systems in buildings undergoing an alteration or demolition shall comply with the requirements of Section 3303.7.4.1 through 3303.7.4.3.

3303.7.4.1 Sprinklers during alteration. Existing sprinkler systems in buildings undergoing an alteration shall be maintained in accordance with Section 3303.9, except as provided in Section 3303.7.4.3. The red paint required pursuant to Section 903.6 [of this code] shall be maintained during any alteration operation.

3303.7.4.2 Sprinklers during demolition. When existing sprinkler systems with fire department hose connections are present in buildings undergoing full or partial demolition, such systems shall be maintained as a nonautomatic sprinkler system, except as provided in Section 3303.7.4.3. When demolition starts, the sprinkler risers shall be capped immediately below the floor being demolished so as to maintain the sprinkler system on all lower floors for Fire Department use. Cutting and capping of sprinklers during demolition work shall be performed only by a licensed master plumber or licensed master fire suppression piping
contractor who has obtained a permit for such work. Fire department hose connections shall be kept free from obstruction and shall be marked by a metal sign reading “Sprinkler Connection” and by a red light at night. The red paint required pursuant to Section 903.6 [of this code] shall be maintained during any demolition operations.

3303.7.4.3 Removal of damaged sprinklers. Requests for a variance from the sprinkler requirements of this section shall be limited to requests to remove a damaged or inoperative sprinkler system or a portion of such system in connection with demolitions or gut rehabilitations. Applications for construction document approvals for such requests shall be filed with the department by a registered design professional in accordance with the following procedure:

1. The filed application shall include a complete report prepared by the professional describing the extent of the damage and attesting as to why the system cannot be restored; and

2. The variance shall not be approved by the department without the concurrence of the Fire Department as follows:

   2.1. The applicant shall file the request for variance with the Fire Department;

   2.2. The Fire Department shall review and recommend any necessary safety measures required as a condition of granting the variance; and

   2.3. The applicant shall submit the Fire Department’s recommendation to the department along with proof of satisfactory implementation of such safety measures.

3303.7.5 Standpipe systems. Standpipe systems shall meet the requirements of Section 3303.8.

3303.7.6 Floor numbering and floor elevation. During new building construction, a vertical or horizontal enlargement, or a demolition operation that results in the removal of one or more floors in a building that is greater than 420 feet (128 m) in height above grade, or in any building, regardless of height, with non-sequential floor numbers, the following shall be provided:

1. A sign at each hoistway landing prominently displaying the designated floor number and elevation above grade.

2. A sign at each stair landing prominently displaying the designated floor number and elevation above grade.

3. A sign or other acceptable marking immediately adjacent to the standpipe hose outlet on each floor indicating the elevation above grade of the standpipe hose outlet and, in multizone standpipe buildings, the zone of the riser (low, mid, high).

4. A chart of the entire building listing the designated floor number and the elevation above grade of the standpipe hose outlet on each floor. The chart shall be posted in each construction elevator or hoist, and at such ground floor locations as specified in the New York City Fire Code.
3303.7.7 Special provisions for Type IV construction. In addition to the fire prevention and fire protection requirements imposed by this code, the New York City Fire Code, and other applicable law, the following provisions shall also apply during the construction of structures categorized as Type IV construction by Chapter 6 of this code.

3303.7.7.1 Interior exit stair enclosures. Notwithstanding the requirements of Section 3303.11, no wooden structural components shall be installed until the permanent stairs and interior exit stair enclosures have been constructed to a height of at least two floors above the topmost working deck, or to their full height, and enclosed with their permanent fire protected rated material. A temporary or permanent self-closing door that meets the requirements of Section 715 shall be installed at each level as soon as a walkable surface is in place at that floor level. Openings in the interior exit stair enclosures at levels where a walkable surface has not been placed shall be protected with guardrails that meet the requirements of Section 3308.7. The top of the interior exit stair enclosures, if not permanently enclosed, shall be covered with a tarp or other temporary weather protection. The stair shall be provided with temporary or permanent handrails. Permanent signs, markings, or anti-slip materials in the stairs are not required during construction.

3303.7.7.2 Standpipes. A permanent or temporary standpipe system meeting the requirements of Sections 905 and 3303.8 shall be provided in each interior exit stair enclosure and kept in a state of readiness at all times for use by firefighting personnel, even if the site does not otherwise trigger the standpipe requirements of Section 3303.8, Item 1. The standpipe system shall be in place prior to the installation of wooden structural components and shall serve all levels where the interior exit stair enclosure has been constructed. No standpipe shall be considered to be in a state of readiness unless it is painted red in accordance with the provisions of Section 905.11. The standpipe system shall be maintained as a dry system and provided with an air pressurized alarm system in accordance with Section 3303.8.1. Where the building will not be provided with a permanent standpipe at the end of construction, the temporary standpipe system shall be removed once the sprinkler system for the building has been signed off.

3303.7.7.3 Progressive installation of enclosures and fire protection elements. Fire-rated enclosures (e.g. corridors, fire compartmentalization, fire-rated doors), noncombustible exterior walls, heat detectors required by Section 3303.7.7.5, and sprinkler systems, if required for the building, shall be installed as soon as practical, and in no case shall they lag more than two floors below the topmost walkable surface. Sprinkler systems shall be temporary or permanent and shall be maintained as a dry system during construction. Openings in the façade for hoists or material loading platforms are permitted provided the opening is covered at the end of the shift with a flame resistant tarp made tight so that no smoke can penetrate.

3303.7.7.4 Temporary protection of structural connections. Where a structural connection between a girder and column is not provided with its permanent fire-rated enclosure or protection, it shall be protected by a temporary 1-hour rated enclosure or protection. Such temporary enclosure or protection shall be installed as soon as practical after the connection has been made, and no later than by the end of the shift.

3303.7.7.5 Heat detectors. Heat detectors shall be provided throughout the site. Such detectors shall send alerts to a dedicated monitoring location, either at the site or at a remote location.
location that is monitored continuously, including days, nights, weekends, and holidays. The
monitor shall be familiar with emergency contact procedures, the locations of heat detectors
at the site, and shall be able to alert the New York City Fire Department as necessary and
provide the fire department with the location of any heat detector that has been activated.

3303.7.7.6 Watchperson. A watchperson meeting the requirements of Section 3303.3 shall
be on duty during all times specified by Section 3303.3, even if the building has a footprint of
less than 5,000 sq ft (1524 m²).

3303.7.7.7 Site safety orientation and refresher. The site safety orientation and refresher
required by Section 3301.11 shall contain instruction on site specific fire hazards, fire safety
safeguards, and fire safety procedures.

3303.7.7.8 Pre-shift safety meetings. The pre-shift safety meetings required by Section
3301.12 shall contain instruction on fire hazards, fire safety safeguards, and fire safety
procedures applicable to the individual worker.

3303.7.7.9 Chutes. Chutes shall comply with the requirements of Section 3303.5.5.3 even if
the building does not otherwise meet the trigger thresholds of Section 3303.5.5.3.

3303.7.7.10 Doors. Except when required to facilitate the active passage of personnel,
material, debris, or equipment, fire rated doors shall be kept closed at all times, and all other
doors shall be closed during non-working hours.

3303.7.7.11 Control of saw dust and combustible debris. Sawdust shall be vacuumed as
operations proceed. Combustible debris, including but not limited to sawdust and scrap
lumber, shall be removed from the site as required by Section 3303.5.1.

3303.7.7.12 Storage of lumber. During non-working hours, lumber shall be stored on the
ground or street, or shall be stored in a fully enclosed room meeting its permanent fire rating.
No more than 1920 ft³ (54.37 m³) of lumber shall be stored at the site at any one time.

Exception: Columns may be stored on the topmost working deck provided they are to be
installed at the start of the next shift.

3303.8 Standpipe systems during construction, alteration or demolition. During construction,
alteration or demolition operations, standpipe systems shall comply with the following:

1. When, during the course of the construction of a new building, the topmost working deck
reaches a height of 75 feet (22 860 mm) or greater above the ground in a building for which
a standpipe system will be required, a permanent or temporary standpipe system meeting
the requirements of Section 905 shall be kept in a state of readiness at all times for use by
fire [-] fighting personnel. The standpipe system shall serve all floors where the permanent
stairs are required per Section 3303.11 that are at least 4 stories or 40 feet (12 192 mm) below
the topmost working deck, whichever is less. No standpipe shall be considered to be in a state
of readiness unless it is painted red in accordance with the provisions of Section 905.11 of
this code. When freezing conditions may be encountered, the system in whole, or the part
of the system subject to freezing conditions, shall be maintained as a dry system.

1840
2. Existing standpipe systems in structures undergoing a full demolition shall be maintained as dry standpipes. At the commencement of demolition, the standpipe risers shall be capped above the outlet on the floor immediately below the floor being demolished so as to maintain the standpipe system on all lower floors for Fire Department use. Cutting and capping of standpipes during demolition work shall be performed only by a licensed master plumber or licensed master fire suppression piping contractor who has obtained a permit for such work. Standpipe hose, nozzles and spanners are not required to be maintained and may be removed at any time. The red paint required pursuant to Section 905.11 [of this code] shall be maintained during any demolition operations. All existing house check valves shall remain in place until completion of the demolition work.

3. When, during the course of the construction of a new building which will have a occupiable space at a depth of 75 feet (22 860 mm) or greater below the level of the ground in a building for which a standpipe system will be required, a permanent or temporary standpipe system meeting the requirements of Section 905 shall be installed and shall be kept in a state of readiness at all times for use by fire [-] fighting personnel. The standpipe system shall serve all stories below grade and shall be installed as soon as [a temporary or permanent stair is installed below grade] the foundation is in place and the first elevated slab has been erected. No standpipe shall be considered to be in a state of readiness unless it is painted red in accordance with the provisions of Section 905.11[of this code]. When freezing conditions may be encountered, the system in whole, or the part of the system subject to freezing conditions, shall be maintained as a dry system.

4. When, during the course of alteration or partial demolition operations in a building for which a standpipe system is required, the standpipe system shall be maintained in accordance with Section 3303.9. In an unoccupied building, an existing wet standpipe system may be maintained as a dry system subject to the approval of the commissioner and the commissioner of the fire department, and also provided the standpipe system is equipped with an air pressurized alarm system meeting the requirements of Section 3303.8.1. No standpipe shall be considered to be in a state of readiness unless it is painted red in accordance with the provisions of Section 905.11[of this code].

4.1. If the alteration work results in the addition of new stories to the structure at a height of 75 feet (22 860 mm) or greater above the level of the ground, the requirements of Item 1 of this section shall apply to such new stories during the course of the alteration operation.

4.2. If the alteration work results in the addition of new occupiable space at a depth of 75 feet (22 860 mm) or greater below the level of the ground, the requirements of Item 3 of this section shall apply to such new occupiable space below grade during the course of the alteration operation.

3303.8.1 Air pressurized alarm system for dry standpipe systems during construction or demolition operations. Dry standpipe systems utilized during construction or demolition operations shall be provided with an air pressurized alarm system as set forth in Items 1 through 5 below. The provisions of NFPA 14, Chapter 12, as modified in Appendix Q, shall also apply.
1. Full demolitions. In buildings and structures undergoing a full demolition, all existing standpipes shall be maintained in a state of readiness as a dry system in accordance with Item 2 of Section 3303.8 and shall be provided with an air pressurized alarm system.

2. New construction, alteration, and partial demolition. Where a dry standpipe system is utilized during new construction, alteration, or partial demolition operations, such standpipe system shall be provided with an air pressurized alarm system.

3. Submission of application. An application to install an air pressurized alarm system shall be filed by a registered design professional and a permit obtained by a licensed master plumber or licensed master fire suppression piping contractor. A licensed electrician shall obtain all required electrical permits in accordance with Chapter 3 of Title 27 of the Administrative Code.

4. Specifications. The following provisions shall apply to the air pressurized alarm system:

4.1. Pressure. Pressure shall be maintained in the standpipe and cross connections at all times and shall not exceed 25 psig (172 kPag) by utilizing nitrogen or an air compressor with an air dryer. The supervisory pressure shall be as determined by a registered design professional.

4.2. Automatic air pressurized alarm activation. The alarm shall be automatically activated when the pressure drops below the supervisory pressure or rises above the maximum pressure of 25 psig (172 kPag). When the alarm is activated, notification shall be made to the Fire Department in accordance with the New York City Fire Code, all work at the site shall cease, except as provided in Item 4.2.1, and an investigation of the entire standpipe system and air compressor shall be immediately performed to determine the cause of the alarm. Unless authorized by the Fire Department, no construction or demolition work shall resume until the standpipe system is repaired and the appropriate pressure is restored, except that any repairs to the standpipe system needed to restore the required pressure shall be undertaken immediately and the standpipe system restored as soon as possible. There shall be compliance with the requirements of the New York City Fire Code while the standpipe system is out of service. Upon completion of repairs to the standpipe system, a full inspection of such system shall be performed, which shall include, among other things, visually tracing the standpipe, including risers, cross connections and fire department connections to verify that no breach exists and checking all gauges of the standpipe system to ensure the standpipe system has been restored to a state of readiness.

4.2.1. Notwithstanding the provisions of Item 4.2, the activation of the alarm shall not require the cessation of work necessary for the completion of concrete pouring operations in progress at the time of alarm activation, where such cessation would cause a cold joint that would impair the structural integrity of the finished construction. The continuation of such operations shall be permitted only until an orderly termination of such operations can be effectuated. The site safety manager or coordinator shall record the names and locations of any employees necessary for the completion of the concrete pouring operations and provide them to the Fire Department personnel who arrive on the scene.
4.3. Air compressor. The air compressor shall be designed to automatically cut in and cut out at the supervisory pressure and shall be tied into the standpipe system between the fire department connections and the house check valves. The air compressor shall utilize an air dryer during times when freezing conditions exist to condition the air entering the dry standpipe system.

4.4. Alarm. The standpipe alarm system shall utilize pressure switches and control equipment to annunciate a local audible alarm on site that can be heard during working and non-working hours. The audible signal of the horn shall be at least 15 dBA above the ambient noise level but no more than 110 dBA.

4.5. Power supply. The standpipe alarm system shall be connected to an active, dedicated power supply at all times.

4.6. Check valves. Check valves shall be installed to prevent water from entering the air compressor.

4.7. Locks and caps. All control valves shall be chained and locked in the appropriate position and shall be provided with capped outlets. All hose valves shall also be provided with capped outlets.

4.8. Fire Department connections. Three inch (76 mm) iron hose plugs with gaskets in Fire Department connection swivels shall be provided.

4.9. Drainage. Provisions shall be made to drain water in any trapped sections of the dry standpipe system that are subject to freezing.

4.10. Manual air release connection. A minimum 2.5-inch (64 mm) connection located immediately downstream of the fire department connection check valve shall be provided and piped to a location immediately adjacent to the fire department connections. This line shall be fitted with a 2.5-inch (64 mm) hose valve and shall allow for release of the pressurized air from the dry standpipe system. The number of air release valves provided shall be such that the air pressure shall be released in no more than 3 minutes, which shall be verifiable by an actual air release test performed at the time of the initial installation.

4.11. Construction documents. Plans shall identify all standpipe risers, cross connections, fire department connections, any intermediate check valves that have to be removed, proposed location of the air release connections, designation of the supervisory pressure, complete information regarding the alarm system, and procedures for the safe pressurization and depressurization of the system.

4.12. Signage. Signage shall be provided at all fire department connections indicating that the dry standpipe system is pressurized and showing the location of the manual air release.

4.13. Pressure gauges. A system of pressure gauges shall be installed at the compressor and at the most remote points of the system from the compressor.

1843
5. Planned removal from service of standpipe system and standpipe air pressurized alarm. Whenever the standpipe system is to be placed out of service for the addition of a new section to the system, removal of an existing section as demolition operations progress, or other planned event, the standpipe alarm may be temporarily deactivated subject to compliance with the requirements of the New York City Fire Code. Where a site safety manager or coordinator is required by this code, all alarm activations, inspections, and repairs shall be logged into the log book maintained by such site safety manager or coordinator. If the standpipe system is not returned to a state of readiness and the alarm reactivated within 2 hours of such planned removal from service, all construction or demolition work at the site shall cease, unless otherwise approved by the Fire Department.

3303.8.2 Free from obstruction. Fire department hose connections shall be kept free from obstruction and shall be marked by a metal sign reading, “Standpipe Connection” and by a red light at night.

3303.8.3 Use of standpipes for purposes other than supplying water for firefighting. Standpipes may be used for a purpose other than to supply water for firefighting operations, including but not limited to supplying water or compressed air for construction or demolition operations, subject to the approval of the Fire Department and provided at least one standpipe riser is maintained at all times for firefighting operations. Where the standpipe is used to supply water for construction or demolition operations and freezing conditions may occur, the standpipe shall be completely drained after use to prevent freezing.

3303.9 Elements to be maintained in existing buildings. Required means of egress, existing structural elements, fire protection devices, and sanitary safeguards shall be maintained at all times during construction or demolition operations in existing buildings. Required means of egress shall not be obstructed in any manner that would destroy the full effectiveness of such means of egress.

Exception: Where adequate alternate provisions are provided in accordance with the requirements of this code, or where the element is temporarily or permanently disconnected, removed, or demolished in accordance with the requirements of this code and of the agency or authority having jurisdiction to temporarily or permanently disconnect, remove, or demolish such element. Such alternative means, disconnection, removal, or demolition shall be shown on the approved plans. Fire protection systems, including but not limited to sprinklers, standpipes, and fire alarms, shall only be taken out of service in accordance with the requirements of the New York City Fire Code.

3303.10 Operations in occupied buildings. When construction or demolition activity occurs in an occupied building, barricades, signs, drop cloths, and other protective means shall be installed and maintained as necessary to provide reasonable protection for the occupants against hazard and nuisance. Such protective means shall be indicated on an occupant protection plan, or where a tenant protection plan is required by Section 3303.10.1, on a tenant protection plan.

3303.10.1 Tenant protection plan. In buildings containing any occupied dwelling units, including newly constructed buildings that are partially occupied where work is still ongoing within the building, all alteration, construction, or partial demolition work shall be performed in accordance with a tenant protection plan as required by Article 120 of Title 28 of the Administrative Code.
3303.10.2 Inspections of tenant protection plan. The owner shall notify the department in writing at least 72 hours prior to the commencement of any work requiring a tenant protection plan. The department shall conduct an inspection of 10 percent of such sites within seven days after the commencement of such work to verify compliance with the tenant protection plan. The department shall conduct follow up inspections of such sites every 180 days until such construction is completed to verify compliance with the building code and tenant protection plan. Thereafter, the department shall conduct an inspection within 10 days of receipt of a complaint concerning such work.

3303.10.3 Enforcement of tenant protection plan. If work is not being performed in accordance with the tenant protection plan, the commissioner may issue a stop work order pursuant to [section] Section 28-207.2 of the [administrative code] Administrative Code.

3303.11 Stairs during construction or demolition. [During construction and demolition stairs shall comply with the following:] Stairs shall meet the requirements of Section 3303.11.1 through 3303.11.3 during construction or demolition work.

[1. During the course of construction of a new building, or in spaces being added to an existing building, at least one permanent stair shall be brought to within a distance of 40 feet (12 192 mm) or 4 floors below the working deck at all times. In all other locations where permanent stairs will be required, a temporary or permanent stair shall be brought to within a distance of 40 feet (12 192 mm) or 4 floors below the working deck at all times.]

[2.] 3303.11.1 Existing stairs. Stairs in an existing building undergoing alteration or a partial demolition shall be maintained in accordance with Section 3303.9. Stairs in a building undergoing a full demolition shall comply with Section 3306.9.9.

3303.11.2 Stairs during building construction or enlargements. During new building construction or the enlargement of an existing building, stairs shall be provided at all locations where a permanent stair will be required and shall serve all floors. At least one of the provided stairs must be of permanent construction for its full length; in all other locations, the stairs may be of temporary or permanent construction.

Exceptions:

1. Where a floor is open to the public, all stairs required for egress from the floor must be of their permanent construction from that floor to the ground level.

2. Stairs are not required where the floor is closed to the public and the floor is less than 4 stories or 40 feet (12 192 mm) below the topmost working deck, whichever is less.

3. During the construction or enlargement of a building whose primary structural system consists of structural steel, where it is not feasible to provide one or more permanent stairs to serve all floors that are at least 4 stories or 40 feet (12 192 mm) below the topmost working deck, whichever is less, all stairs shall be of their permanent construction up to the level of the topmost completed steel floor, and temporary stairs, acceptable to the commissioner, shall be brought up in all locations to serve all remaining floors that are at least 4 stories or 40 feet (12 192 mm) below the topmost
working deck, whichever is less. At a minimum, the temporary stairs shall be made of non-combustible material, be equipped with adequate handrails, be provided with landings that are level with the adjoining floor, and have riser height and tread depths that are uniform, within ¼ inch (6 mm), for each flight of stairs.

3303.11.3 Lighted and kept free of obstructions. All stairs in a building undergoing construction or demolition shall be lighted at all times, and shall be kept free of equipment, debris, and material in accordance with Section 3303.4.10.

3303.12 Elevators and hoists during construction or demolition. Elevators and hoists [during construction or demolition work] shall meet the requirements of Sections 3303.12.1 through 3303.12.5 during construction or demolition work.

3303.12.1 [Publically] Publicly accessible floors. Existing elevators serving [publically] publicly accessible floors in a building undergoing construction or demolition work shall be maintained in accordance with Section 3303.9.

3303.12.2 Floors closed to the public. [All] When required by Sections 3303.12.2.1 through 3303.12.2.4, floors closed to the public in a new or existing building undergoing construction or demolition work shall be served by, at least, either:

1. An elevator provided with Phase I and Phase II recall meeting the requirements of Chapter 30, which shall be kept in readiness at all times for Fire Department use; or

2. A hoist meeting the requirements of Section 3318, which shall be available at all times for [fire department] Fire Department use.

[Exceptions] Exception: An elevator or hoist is not required during the course of construction or demolition [for:] of [4–A] a building that does not require a permanent elevator.

[2. Floors that are located within a vertical distance of seven stories or 75 feet (22 860 mm) or less from the working deck.]

3303.12.2.1 Initial installation of an elevator or hoist during the construction or enlargement of a building whose height will exceed 75 feet. During the construction or enlargement of a building, once the topmost working deck exceeds 75 feet (22 860 mm) in height above the lowest level of the ground, all floors that are closed to the public and within 40 feet (12 192 mm) above the lowest level of the ground shall be served by an elevator or hoist meeting the requirements of this section. Where this measurement lands between floors, the measurement shall be rounded such that the elevator or hoist is brought up to serve the higher floor.

3303.12.2.2 Increasing the height of the elevator or hoist during the construction or enlargement of a building. During the construction or enlargement of a building, when the topmost working deck exceeds 75 feet (22 860 mm) in height above the lowest level of the ground and subsequent to complying with Section 3303.12.2.1, all floors that are closed to the public and that are at least 4 stories or 48 feet (14 630 mm) below the topmost working
deck, whichever is less, or for a building whose primary structural system consists of structural steel, at least 4 stories or 64 feet (19,507 mm) below the topmost working deck, whichever is less, shall be served by an elevator or hoist meeting the requirements of this section. However, no more than two weeks after the topmost working deck has become a walkable floor, a hoist or elevator meeting the requirements of this section shall be brought up to serve all remaining floors in the building that are closed to the public.

3303.12.2.3 During demolition. During the demolition of a building where one or more floors are removed from the building, all floors in the building that are closed to the public and that are more than 7 stories or 75 feet (22,860 mm) below the topmost working deck, whichever is less, shall be served by an elevator or hoist meeting the requirements of this section.

3303.12.2.4 Other instances. During the alteration of a building that would require a permanent elevator and where the scope of work does not constitute an enlargement or involve the removal of one or more floors from the building, all floors in the building that are closed to the public shall be served by an elevator or hoist meeting the requirements of this section.

3303.12.3 Deep excavations. Where the proposed lowest level of a building with a footprint of 10,000 square feet (3,048 m²) or greater is constructed at a depth greater than 75 feet (22,860 mm), a hoist meeting the requirements of Section 3318 shall be available at all times for Fire Department use once such floor has been poured and set the foundation is in place and the first elevated slab has been erected. The hoist shall serve the level at grade and all stories below grade.

Exception: Subject to the approval of the commissioner, alternate means available at all times for Fire Department use, including but not limited to a vehicular ramp, shall be provided.

3303.12.4 Converting elevators. Where an existing elevator is converted from passenger or freight use, the department shall be notified in accordance with the requirements of Chapter 30.

3303.12.5 Hoist travel. If the travel of the hoist cannot be increased or decreased to fulfill the requirements of this section due to inclement weather, it shall be increased by the end of the next working day.

3303.12.6 Stretcher accommodation. Where a hoist is provided, it must be capable of accommodating two standing individuals and a stretcher that is 84 inches in length by 24 inches in width (2,134 mm by 610 mm).

3303.13 Interrupted or abandoned and discontinued operations. Where construction or demolition work has been interrupted or abandoned and discontinued, the owner of the site shall ensure the site is secured, protected, and maintained to safeguard the public and property, and that the site is in compliance with the requirements of Sections 3303.13.1 through 3303.13.3.

3303.13.1 Fencing. A fence meeting the requirements of Section 3307 shall be maintained throughout the duration of time that operations at the site are interrupted or abandoned and discontinued.
3303.13.2 Safety monitoring plan. Where work has been interrupted or abandoned and discontinued for a period of at least three months, a safety monitoring plan satisfactory to the commissioner shall be prepared by a qualified person on behalf of the owner of the property and submitted to the department by the owner. Such safety monitoring plan shall be specific to the site, shall identify safeguards to be instituted and maintained to secure the site, and shall specify monitoring to be performed during the duration of suspension of work. The owner of the property shall be responsible for ensuring compliance with such plan.

3303.13.3 Filling and grading. Where work has been interrupted or abandoned and discontinued for a period of at least three months, all open excavations shall be filled and graded to eliminate all steep slopes, holes, obstructions or similar sources of hazard. Fill shall consist of clean, noncombustible material. The final surface shall be graded in such a manner as to drain the lot, eliminate pockets in the fill, and prevent the accumulation of water without damaging any foundations on the premises or on adjoining property.

Exception: Filling and grading is not required for abandoned, discontinued, or interrupted excavations that are:

1. Secured in accordance with Section 3303.13.2, and
2. Inspected periodically by an engineer to verify continued stability of the excavation, with a record of such inspections signed, sealed, and dated by the engineer.

3303.14 Water conditions. The requirements of Sections 3303.14.1 through 3303.14.5 shall be followed to control the accumulation of water.

3303.14.1 Drainage. No condition shall be created as a result of construction or demolition operations that will interfere with natural surface drainage. Water courses, drainage ditches, etc., shall not be obstructed by debris, refuse, waste building materials, earth, stones, tree stumps, branches, or other objects that may interfere with surface drainage or cause the impoundment of surface waters.

3303.14.2 Protection of foundations. Provision shall be made to prevent the accumulation of water or water damage to any foundations on the premises or to adjoining property.

3303.14.3 Drainage of excavations. All excavations shall be drained, and the drainage shall be maintained as long as the excavation continues or remains. Where necessary, pumping shall be used, provided proper permits are obtained from the New York City Department of Environmental Protection.

3303.14.4 Clogging. The requirements of Section 3303.5.3 shall apply.

3303.14.5 Dewatering. The contractor or other entity performing the soil or foundation work shall dewater the site, as needed, for the progress of the work, and shall take all necessary measures to prevent settlement, slope failure, and damage to buildings, structures, and property affected by the dewatering operations.
3303.14.5.1 Dewatering plan. Where dewatering is performed to drawdown or control the level of the water table, the dewatering operation shall proceed in accordance with a site specific plan developed by a registered design professional. The dewatering plan must incorporate all the conditions and findings identified in the geotechnical report required by Section 1803.6, the evaluation analysis required by Section 1817, and the preconstruction survey required by Section 3309.4.3. At a minimum, the plan shall indicate:

1. Height of the water table, including all seasonal fluctuations;
2. Anticipated schedule of dewatering operations;
3. The location of wells, settlement tanks, observation points, and dewatering equipment;
4. Maximum discharge;
5. Permissible drawdown outside of the limits of the excavation;
6. Thresholds for anticipated settlement;
7. Thresholds for anticipated lateral movement; and
8. The program to monitor and control water table drawdown and settlement/movement of affected structures, property, and temporary construction installations. Program criteria to be specified shall include, but not be limited to, the monitoring frequency, plan to periodically test the discharge from the pumps to determine if the water being extracted contains unanticipated fine grain soil or sand, plan to account for fluctuations in the water table (due to seasonal conditions, weather, or other factors), reporting requirements for the monitoring program, and procedures to be implemented when thresholds are exceeded.

3303.15 Concrete washout water. Concrete washout water shall not be allowed to enter any sewer, catch basin, drain, or body of water or to leach into the ground.

3303.15.1 Collection and containment. All concrete washout water shall be collected and contained in or on the concrete mixer truck or in pre-manufactured watertight containers specifically designed and fabricated for the purpose of collecting and containing concrete washout water on-site. Such containers shall be of sufficient quantity and size to accommodate all rinsing operations required on-site so as not to delay the timely return of concrete ready mix trucks to the concrete plant and shall be protected from breach or overflow at all times.

3303.15.2 Location. Rinsing operations and concrete washout water containers shall not be located less than 30 feet from any sewer, drain, catch basin, or body of water without the written approval of the commissioner.

3303.15.3 Disposal. Collected concrete washout water shall be transported off site for treatment and disposal or contained on site until completely evaporated. Any hardened concrete remaining after evaporation shall be disposed of, reused or recycled.
3303.16 Contractors sheds and offices. Contractors sheds and offices located within 30 feet (9144 mm) of new construction, existing buildings, or another contractor shed or office shall be made of metal or other noncombustible material.

[Exception: Contractor sheds and offices located within a building and protected from weather may use fire retardant treated wood, provided the shed does not exceed one story in height and 120 square feet (36.58 m²) in area and is at least 30 feet (9144 mm) from another shed.]

3303.16 Worker sheds, contractor sheds, contractor offices, and similar structures. Worker sheds, contractor sheds, contractor offices, and similar structures shall:

1. Be provided with a hardwire or battery powered smoke detector that meets the requirements of this code and the New York City Fire Code;

2. Be equipped with an automatic sprinkler system or a non-water automatic fire-extinguishing system, including a dry-chemical extinguishing system, that meets the requirements of this code and the New York City Fire Code, when the shed or office is installed or predominantly used to facilitate work at a building that requires an automatic sprinkler system;

3. Meet the door width, travel distances, and occupancy load requirements of Chapter 10 of the building code; and

4. Be constructed to comply with either 4.1, 4.2, or 4.3:

   4.1. Meet the requirements of this code for Types I or II fire-resistance-rated construction where:

       4.1.1. Located within a building or structure; or

       4.1.2. Located 30 feet (9144 mm) or less from another building or structure within the fire district.

   4.2. Meet the requirements of this code for Type III fire-resistance-rated construction where:

       4.2.1. Located outside of a building or structure; and

       4.2.2. Located more than 30 feet (9144 mm) from another building or structure within the fire district.

   4.3. Meet the requirements of this code for Type III fire-resistance-rated construction where:

       4.3.1. Located outside of a building or structure; and

       4.3.2. Located outside of the fire district.

3303.16.1 Permit required. No worker shed, contractor shed, contractor office, or similar structure shall be
installed until a permit for the shed or office has been issued by the commissioner in accordance with the requirements of Chapter 1 of Title 28 of the Administrative Code.

**Exception:** A permit is not required for a worker shed, contractor shed, contractor office, or similar structure that does not exceed 1 story in height and 120 square feet (36.58 m²) in area, and further provided that the shed, office or similar structure is located more than 30 feet (9144 mm) from another shed, or office, or similar structure.

**3303.16.2 Utility hookups.** No electrical, plumbing, or other utility hook up shall be made to a worker shed, contractor shed, contractor office, or similar structure until a permit for the hookup has been issued by the commissioner in accordance with the requirements of Chapter 1 of Title 28 of the Administrative Code. Where required by Chapter 4 of Title 28 of the Administrative Code, the utility hookup must be made by or under the direct and continuing supervision of a licensed individual.

§ 35. Section BC 3304 of the New York city building code, as amended by local law number 141 for the year 2013, section 3304.3.3 as amended by local law number 65 for the year 2018, is amended to read as follows:

**SECTION BC 3304
SOIL AND FOUNDATION WORK**

**3304.1 Scope.** The provisions of this section shall apply to all soil and foundation work, including but not limited to drilling or excavations made for the purposes of taking earth, sand, gravel, rock, or other material, as well as to soil and foundation work related to accessory uses such as garages, pools, and decks, and also to the underpinning or bracing of buildings or structures, in order to safeguard the public and property from such work. In addition to the requirements of this section, the applicable sections of Chapter 18 shall also apply to soil and foundation work.

**Exceptions:** This section shall not apply to:

1. Soil or foundation work not related to the underpinning or bracing of an existing building or structure, and which is performed in connection with utility or infrastructure work occurring within a public right of way, including but not limited to the construction, alteration, maintenance, repair, or demolition of bridges, streets, sidewalks, highways, railroads, subways, water tunnels, or utility lines.

2. Soil or foundation work on cemetery grounds for burials.

3. Soil or foundation work performed within an industrial or commercial quarry, plant, or yard and not related to the construction or demolition of a building or structure on the property of such quarry, plant, or yard.

**3304.1.1 Measurements.** The depth of all soil and foundation work shall be measured from the level of the adjacent ground surface to the lowest point of the soil and foundation work. The height of all soil and foundation work shall be measured from the level of the adjacent ground surface to the highest point of the soil and foundation work. Where soil and foundation work occurs within
a basement or cellar, the soil and foundation work shall be measured from the level of the adjacent slab.

3304.1.2 Safety of the public and property. Soil and foundation work shall be performed and, as necessary, supported, in a manner to prevent injury to the public, damage to property, or collapse, subsidence, or uncontrolled loss of earth or rock.

3304.2 Support of excavation drawings. The sides of all excavations, including related or resulting embankments, shall be supported as specified on drawings. Such drawings shall be site specific and shall clearly illustrate all related protection and support of the excavation, including but not limited to sloping, stepping, sheeting, shoring, bracing, guardrail systems, and fences as required by Section 3304.4, with all dimensions indicated. Such drawings shall also indicate any utilities or public infrastructure impacted by the excavation. The drawings shall be prepared by a registered design professional who has demonstrated knowledge or experience in the design of retaining structures or bracing systems for the support of excavation.

Exceptions:

1. Drawings for the support of excavation are not required for an excavation:

   1.1. That occurs 5 feet (1524 mm) or less in depth, provided:

      1.1.1. The excavation also occurs more than 5 feet (1524 mm) from all footings and foundations; or

      1.1.2. Where the excavation occurs within five feet (1524 mm) or less from a footing or foundation, such excavation does not occur below the level of the footing or foundation.

   1.2. Where the sides of the excavation are sloped not steeper than 45 degrees (0.79 rad) or stepped so that the average slope is not steeper than 45 degrees (0.79 rad) with no step more than 5 feet (1524 mm) high, provided such slope or step begins at least five feet (1524 mm) from all footings and foundations.

   1.3. Where a trench box is utilized in accordance with the manufacturer’s specifications, provided the manufacturer specifications are available onsite.

2. Support of excavation drawings can be prepared by a qualified person for an excavation occurring in conjunction with the construction or demolition of an exterior in-ground pool, provided such pool is an accessory to a one-, two-, or three-family home, is limited to 400 square feet (121.92 square meters) in area, and provided that the distance from the edge of the pool to any building, structure, or lot line is greater than the depth of the deepest portion of the pool.

3. Where demolition drawings are required by Section 3306.5, separate support of excavation drawings for the removal of the foundation are not required, provided such detail is shown on the demolition drawings.
3304.2 Permit. A permit shall be obtained prior to the commencement of soil or foundation work when required by Chapter 1 of Title 28 of the *Administrative Code*.

3304.3 Notification. Prior to the commencement of soil or foundation work, notification shall be provided as follows.

3304.3.1 Notification of the department. No soil or foundation work within the property line shall commence unless the permit holder, or where there is no permit holder the person causing the soil or foundation work to be made, notifies the department, via phone or electronically, at least 24 hours, but no more than 48 hours prior to the commencement of such work. The notification shall state the date that such soil or foundation work is to commence and include a “Call before you dig” confirmation number verifying compliance with the notification requirements of Section 3304.3.7. Should the notification date fall on a weekend or official holiday, the permit holder, or where there is no permit holder the person causing the soil or foundation work to be made, shall notify the department on the last business day before the commencement date.

In the event that the soil or foundation work does not begin on the date provided in the notification to the department, the permit holder, or where there is no permit holder the person causing the soil or foundation work to be made, shall notify the department of its cancellation not more than 24 hours prior to but no later than the date for which the soil or foundation work was scheduled. Should the cancellation date fall on a weekend or an official holiday, the permit holder, or where there is no permit holder the person causing the soil or foundation work to be made, shall notify the department on the next business day after the intended commencement date. The permit holder, or where there is no permit holder the person causing the soil or foundation work to be made, shall notify the department of a new intended commencement date pursuant to the provisions above.

[The commissioner may issue a stop work order if there is a failure to provide notice as required in this section and if the work is found to violate any of the provisions of this code, the *New York City Zoning Resolution*, or other applicable laws or rules. Upon the issuance of such stop work order, the work shall be stopped for a minimum of three business days to enable the department to take any other appropriate action to ensure that the earthwork is being performed in a safe manner. The earthwork shall not recommence until the stop work order has been lifted.]

Exceptions: Notification to the department is not required for the following:

1. Hand excavation work that extends less than 5 feet (1524 mm) in depth and is 2 feet (610 mm) or more from an existing footing or foundation. This exception shall not apply to any hand excavation work performed anywhere in existing or demolished basements or cellars that adjoin existing foundations.

2. Excavations for a geotechnical investigation that do not exceed 10 feet (3048 mm) in length, width, or diameter, and that are conducted under the supervision of a registered design professional.
3. Emergency work performed by the Department of Housing Preservation and Development (HPD) or other agency as directed by the commissioner or work on unsafe buildings performed by HPD or other agency pursuant to a precept.

4. Soil or foundation work related to gardening or landscaping work, provided no excavation occurs to a depth of 5 feet or greater (1524 mm); and either:

4.1. The excavation occurs more than 5 feet (1524 mm) from all footings and foundations; or

4.2. Where the excavation occurs within 5 feet (1524 mm) or less from a footing or foundation, such excavation does not occur below the level of the footing or foundation.

5. Soil or foundation work related to the pouring of a slab or pavement, provided no excavation to a depth greater than 2 feet (610 mm) occurs in conjunction with such work.

6. Where notification is required by Section 3306.3, separate notification for the removal of a foundation is not required.

3304.3.2 Notification of adjoining property owners. When an excavation to a depth of 5 feet to 10 feet (1524 mm to 3048 mm) is to be made within 10 feet (3048 mm) of an adjacent footing or foundation, or when any excavation over 10 feet (3048 mm) is to be made anywhere on a site, the person causing the excavation to be made shall provide written notice to the owners of the adjoining property not less than 10 days prior to the scheduled starting date of the excavation. The written notice shall provide a description of the work to be performed, the timeframe and schedule, and the contact information of the person causing the excavation to be made, and the contact information of the department.

Exception: Notification is not required where the excavation is set back from the edge of the adjacent footing or foundation or adjoining property by a ratio of 2 horizontal to 1 vertical, as measured from the deepest point of the excavation.

3304.3.3 Notification to the Department of Environmental Protection. Whenever soil or foundation work, for any purpose, is proposed to a depth greater than 50 feet (15240 mm) in the borough of the Bronx or on or north of 135th Street in the borough of Manhattan, or greater than 100 feet (30480 mm) is proposed in the borough of Brooklyn, Queens, or Staten Island or south of 135th Street in the borough of Manhattan, the owner of the premises, engineer, architect or contractor shall notify the New York City Department of Environmental Protection prior to commencement of such activity in accordance with Section 24-367 of the [Administrative Code] and any rules promulgated thereunder. The issuance of any permit or approval by the department shall not relieve the applicant, owner, engineer, architect or contractor of the obligation to comply with any notification or permitting requirements of the New York City Department of Environmental Protection. Whether or not a permit is required from the department for work, including but not limited to drilling for borings or geothermal wells, the owner of the premises, engineer, architect or contractor shall still comply with the
notification and permitting requirements of the New York City Department of Environmental Protection.

3304.3.4 Excavations requiring permit from the New York State Department of Environmental Conservation. Whenever [drilling or excavation] soil or foundation work is planned deeper than 500 feet (152 m) below grade, a permit may be required from the New York State Department of Environmental Conservation. The issuance of any permit or approval by the department shall not relieve the applicant of the obligation to comply with any approval or permitting requirements of the New York State Department of Environmental Conservation. Whenever any drilling for borings or geothermal wells is planned, the owner of the premises or the contractor shall notify the New York State Department of Environmental Conservation prior to commencement of such activity to determine if a permit is necessary.

3304.3.5 Notification [and permit requirements] and approval of the New York City Transit Authority, the Metropolitan Transportation Authority, and the Port Authority of New York and New Jersey. Whenever an excavation of any depth is proposed within 200 feet (60 960 mm) of any [subway or tunnel] facility, infrastructure, or property under the jurisdiction of the New York City Transit Authority, the Metropolitan Transportation Authority, or the Port Authority of New York and New Jersey, including but not limited to rail and subway lines, stations, station entrance and access points, bridges, tunnels, bus depots, access roads, fan plants, pump rooms, substations, shops and yards, duct lines, and easements, an approval [and permit] shall be obtained from such authority having jurisdiction. The owner of the premises or the contractor shall notify the authority having jurisdiction prior to commencement of any such activity. The issuance of any permit or approval by the department shall not relieve the applicant of the obligation to comply with any approval [or permitting] requirements of the New York City Transit Authority, the Metropolitan Transportation Authority, or the Port Authority of New York and New Jersey.

3304.3.6 Notification and permit requirements of the New York City Fire Department. Soil or foundation work that is to be done with the use of explosives shall also be subject to the notification and permit requirements set forth in the New York City Fire Code.

3304.3.7 Call before you dig notification. “Call before you dig” notification shall be provided in accordance with the requirements of 16 NYCRR Part 753. The notification must address all street frontages associated with the soil and foundation work.

3304.4 Protection of sides of excavations. The sides of excavations shall be protected in accordance with the requirements of Sections 3304.4.1 through 3304.4.6.

[3304.4.1 Support of excavation. The sides of all excavations, including related or resulting embankments, that are 5 feet (1524 mm) or greater in depth or height shall be supported in accordance with one or more of the following means. Where required by Section 3304.2, such means shall be indicated on drawings:]

[1. Sheeting, shoring, bracing, or by other retaining structures as may be necessary to prevent the sides of the excavation from caving in before permanent supports are provided. Such methods of protection shall be subject to special inspection in accordance with the provisions of Chapter 17; or]
[2. Excavation sides sloped not steeper than 45 degrees (0.79 rad) or stepped so that the average slope is not steeper than 45 degrees (0.79 rad) with no step more than 5 feet (1524 mm) high, provided such slope or step does not endanger any structure or temporary construction, including subsurface structures. Slopes or steps steeper than 45 degrees (0.79 rad), or steps more than 5 feet (1524 mm) high shall be permitted only where the registered design professional preparing the drawings required by Section 3304.2 determines, based upon the completion of a geotechnical investigation report acceptable to the commissioner, that the slopes or steps will be stable.]

[Exception: For a rock cut excavation, no protection is required, provided a registered design professional determines the rock cut will not be subject to shearing and will not otherwise be unstable before permanent supports are provided. Otherwise, the rock cut shall be stabilized in accordance with drawings prepared by the registered design professional.]

3304.4.1 Support of excavation construction documents. Means of supporting excavations, including related or resulting embankments, rock faces, and soil slopes, shall be indicated on construction documents. Such means of supporting excavations shall be installed and maintained in accordance with the construction documents. The construction documents shall be prepared by a registered design professional who has demonstrated knowledge or experience in the design of retaining structures or bracing systems for the support of excavation. Where the excavation exceeds 20 feet (6096 mm) in depth, the registered design professional shall be a New York State licensed professional engineer.

Exceptions: Construction documents indicating the means of supporting the excavation are not required if:

1. The excavation meets the conditions specified in Items 1.1 through 1.4:
   
   1.1. Is less than 5 feet (1524 mm) in depth;
   
   1.2. Occurs above the level of the water table;
   
   1.3. Occurs more than 5 feet (1524 mm) from all streets, sidewalks, tunnels, railroad tracks, public right of ways, and retaining walls; and
   
   1.4. Occurs either:
      
      1.4.1. More than 5 feet (1524 mm) from all footings and foundations; or
      
      1.4.2. When within 5 feet (1524 mm) or less from a footing or foundation, does not extend below the level of the footing or foundation.

2. The excavation meets the conditions specified in Items 2.1 through 2.3:

   2.1. Occurs more than 5 feet (1524 mm) from all footings, foundations, streets, sidewalks, tunnels, railroad tracks, public right of ways, and retaining walls;

   2.2. Does not exceed 20 feet (6096 mm) in depth; and
2.3. Either:

2.3.1. The slope of the excavation does not exceed 1.5 horizontal to 1 vertical (34 degrees measured from the horizontal), with no benching allowed; or

2.3.2. A registered design professional determines the soil type, and the excavation is properly sloped or benched for the soil type in accordance with the requirements of Section 3304.4.2. Determination of the soil type shall be based upon a site specific evaluation, and documentation of the determination, signed and sealed by the registered design professional, shall be kept at the site.

3. A trench box is utilized in accordance with the manufacturer’s specifications, provided a physical copy of the manufacturer specifications are available onsite.

4. It is a trench that complies with Table 3304.4.1, including all notes to the table.

5. The excavation is performed in conjunction with the installation or removal of an exterior in-ground pool, provided such pool is an accessory to a one-or two-family home, is limited to 400 square feet (121.92 square meters) in area, and further provided that the distance from the edge of the pool to any building, structure, or lot line is greater than the depth of the deepest portion of the pool.

6. Where demolition drawings are required by Section 3306.5, separate support of excavation construction documents for the removal of the foundation are not required, provided the details required for a support of excavation drawing are instead shown on the demolition drawings.

### Table 3304.4.1

</tbody>
</table>

**Notes to Table 3304.4.1:**

1. All timber or equivalent substitute to have bending strength of 850 psi or above.

2. The depth of the trench shall be considered the depth from top of grade, not top of shoring structure should a portion of the support of excavation be by benching or sloping methods.

3. Table shall not be utilized if any of the following are met:
   a. Trench exceeds the specified dimensions.
   b. Stored material or structures are present within a distance equal to the depth of the trench.
c. Equipment surcharge loading exceeds 20,000 lb (9071.85 kg).

d. Surcharge load exceeds 2 ft (610 mm).
e. Cross bracing is subject to any vertical load that meets or exceeds a load equivalent to a 240-lb (109 kg) gravity load distributed over the center 12 ft (305 mm) in of the bracing member.

3304.4.1.1 Content of support of excavation construction documents. Support of excavation construction documents shall, at a minimum:

1. Be specific to the site;

2. Be fully dimensioned;

3. Account for the entire scope of work;

4. Indicate all items required by Section 107.8;

5. Indicate soil or rock type and bearing capacity;

6. Indicate the water table elevation;

7. Indicate if dewatering is needed, and if a dewatering plan is required by Section 3303.14.5, note that a dewatering plan is required and the depth at which the dewatering plan must be put into effect. Further, where a dewatering plan is required by Section 3303.14.5, note the depth at which work must stop if a dewatering plan has not been provided; such depth must be equal to or shallower than the depth specified for the dewatering plan to be put into effect;

8. Indicate the support of excavation, including but not limited to sloping, benching, sheeting, shoring, and bracing;

9. For an excavation in rock, any supplemental support of the rock face;

10. Indicate all structures, utilities, infrastructure, and subsurface structures impacted by the soil or foundation work;

11. Indicate the design load imposed for temporary construction installations, material, and equipment, including but limited to sidewalk sheds, scaffolds, runback structures, cranes, excavators, and stored or piled material, and note that all temporary construction installations or equipment that will impose a load on the support of excavation in excess of the design load imposed must be reviewed for acceptability by the designer of the support of excavation;

12. Indicate the sequence of the excavation operation and the installation and removal of the support of excavation, including all relevant phasing, and including the depth at which support of excavation must be installed;

13. Account for the provisions of Section 3304.4.5;

14. Reference the monitoring plan, where a monitoring plan is required;
15. Specify required inspections and inspection intervals for the support of excavation, including special inspections; and

16. Where slurry is utilized to support the excavation, the information required by Section 3304.12 shall also be indicated.

3304.4.1.2 Geotechnical analysis and relevant reports. The support of excavation construction documents shall be developed based upon site specific testing and analysis performed by a registered design professional who has demonstrated knowledge or experience in geotechnical evaluation. The support of excavation construction documents must incorporate all the conditions and findings identified in the geotechnical report required by Section 1803.6, the evaluation analysis required by Section 1817, and the preconstruction survey required by Section 3309.4.3.

3304.4.2 Rainstorms. See Section 3304.5.1.

3304.4.2 Limitation on sloping and benching. Where sloping or benching is utilized to support an excavation, the slope or bench step shall be appropriate for conditions at the site, including but not limited to soil type, environmental conditions, and surcharge loads. In no case shall the maximum slope or bench step for an excavation that is 5 feet (1524 mm) or greater in depth exceed the values specified in Table 3304.4.2. For layered soil conditions, the most restrictive value among the soil types present at the excavation location shall be utilized unless otherwise specified by the registered design professional and indicated on the construction documents required by Section 3304.4.1.

Exception: The limitations of Table 3304.4.2 shall not apply to excavations made in Class 1a, 1b, or 1c rock, as classified by Chapter 18, provided the geotechnical report required by Section 1803.6 substantiates the safety of the proposed slope, cut, or bench step, and further provided that the resulting slope, cut, or bench step, as well as any supplemental support of the rock face, is indicated on the construction documents required by Section 3304.4.1.

3304.4.3 Fence. Every site with an excavation shall be enclosed with a fence that meets the requirements of Section 3307.7.

3304.4.4 Guardrail system. All open edges of an excavation that are 6 feet (1829 mm) or greater in depth shall be protected by a guardrail system meeting the requirements of Sections 3308.7.1 through 3308.7.5, or by a solid enclosure at least 3 feet 6 inches (1067 mm) high. For the purpose of a guardrail system installed in accordance with this section to protect the open edge of an excavation, the term “floor” in Sections 3308.7.1 through 3308.7.5 shall mean “ground.”

Exceptions:

1. The toeboard, when installed in conjunction with such excavation guardrail system, shall consist, at a minimum, of 1-inch × 6 inches (25 mm by 152 mm) lumber or metal plank and shall be at least 5½ inches (140 mm) high.

2. A toeboard is not required where the sheeting, shoring, bracing, or any other support of excavation extends at least 5½ inches (140 mm) 3½ inches (89 mm) above the top of the excavation.

3. A guardrail system or a solid enclosure is not required where access to the adjoining area is precluded.

4. A guardrail system or a solid enclosure is not required where side slopes are three horizontal by one vertical (33-percent slope) or flatter.

In lieu of a guardrail system, wells, pits, excavation shafts, or similar excavations may be protected by an adequate cover capable of supporting, without failure, at least twice the weight of persons, equipment, and materials that may be imposed on the cover at any one time, or where located in roadways and vehicular aisles, at least twice the maximum axle load of the largest vehicle expected to cross over the cover. The cover shall be secured when installed so as to prevent accidental displacement by the wind, equipment, or persons, and shall be color coded or marked with the word "HOLE" or "COVER" to provide warning of the hazard.

5. The edges of ramps shall be protected in accordance with Section 3315.
3304.4.1 Openings. To provide necessary openings for intermittent operations, one or more sections of the guardrail system or solid enclosure may be hinged or supported in sockets. When supported in sockets, rails shall be so constructed that they cannot be jolted out. A button or hook may be used to hold the guardrail system or solid enclosure in a fixed position. [Substantial] As an alternative to hinged or socketed sections, substantial chains or ropes may be used to guard such openings in such guardrail system or solid enclosure. Where so used, the chains or ropes shall [be taut at the same] meet the tautness and height requirements as the rails of [the] a standard guardrail system.

3304.4.5 Placing of soil or foundation work equipment and excavated material. Excavated material and superimposed loads, including but not limited to equipment and trucks used for soil or foundation work, shall not be placed closer to the edge of the excavation than a distance equal to one and one-half times the depth of such excavation unless the sides of the excavation have been sloped or sheet piled (or sheeted) and shored to withstand the lateral force imposed by such superimposed loads, or [a] the registered design professional has determined the side of the excavation can adequately support the load imposed, with such support or determination shown on [drawings] construction documents required by Section [3304.2] 3304.4.1. In the case of open excavations with side slopes, the edge of excavation shall be taken as the [see] top of the slope.

3304.4.6 Installation of protection. Required protection for the sides of the excavation shall be installed as the excavation advances. The placement of permanent structures or fill in areas requiring support of excavation shall not begin until the support of excavation has been completed for such areas.

3304.5 Inspections. Soil and foundation work shall be inspected in accordance with the requirements of Sections 3304.5.1 [through 3304.5.3] and 3304.5.2.

3304.5.1 Rainstorms. All sides or slopes of excavations or embankments shall be inspected after rainstorms, or any other hazard-increasing event, and safe conditions shall be restored.

3304.5.2 Support of excavation. Methods employed to protect the sides of excavations meeting the requirements of Item 1 of Section 3304.4.1 shall be subject to special inspections in accordance with Chapter 17.]

3304.5.3 Slurry. The requirements of Section 3304.12 shall apply.]

3304.5.2 Special inspections. Special inspections shall be performed in accordance with Chapter 17.

3304.6 Retaining walls. The requirements of [Section] Article 305 of Title 28 of the Administrative Code, as well as Sections 1806 and 3309 of the building code shall apply as applicable.

3304.7 Access. Every excavation shall be provided with at least one safe means of ingress and egress that is kept available at all times. For a trench that has a depth of 4 feet (1219 mm) or greater, and with a width of 15 feet (4572 mm) or less, as measured between the soil, forms, or structure at the bottom of the trench, one or more stairways, ladders, ramps, or other safe means of ingress and egress shall be located in the trench so as to require no more than 25 feet (7620 mm) of lateral travel.
3304.8 Drainage. The requirements of Section 3303.14 shall apply.

3304.9 Utilities. The requirements of Section 3303.2 shall apply.

3304.10 Dewatering. [The person causing the soil or foundation work to be performed shall dewater the site, as needed, for the progress of the work. Measures shall be taken to prevent settlement, slope failure, and damage to adjacent buildings, structures, and property affected by dewatering operations.] The requirements of Section 3303.14 shall apply.

3304.11 Underpinning requirements. The requirements of Section 1814 and Section 3309 shall apply.

3304.12 Slurry. Where slurry is utilized to support an excavation, trench, or drilled or bored hole, slurry mix proportions and installation procedures shall be provided by a registered design professional on signed and sealed design and installation procedures. The installation procedures shall account for all imposed loads, including those from the earth, adjacent structures, and adjacent equipment. [The use of slurry to support excavations shall be subject to special inspection in accordance with Section 1704.20. Where such construction methods are used to install foundation elements, the new foundation elements installed as part of such operations shall be subject to special inspection as a permanent installation in accordance with the applicable sections of this chapter, including but not limited to special inspection for concrete, and welding.] Where construction documents are required for the support of excavation by Section 3304.4.1, slurry mix proportions, slurry installation procedures, and slurry parameters necessary for stability, including but not limited to viscosity, unit weight, fluid loss, sand content, and pH, shall be indicated on such construction documents. The use of slurry to support excavations shall be subject to special inspection in accordance with Chapter 17.

§ 36. Section BC 3305 of the New York city building code, as added by local law number 141 for the year 2013, is amended to read as follows:

SECTION BC 3305
MATERIAL PLACEMENT AND INSTALLATION

3305.1 Scope. [The placement and installation of structural steel, concrete formwork, aluminum, and masonry shall be in accordance with the requirements of this section.] Materials shall be placed and installed in accordance with the requirements of this section and in a manner such that the safety of the public and property will not be endangered.

3305.1.1 Handling and storing materials. Materials to be placed or installed shall be handled and stored in such a manner as to prevent damage to the material, including but not limited to:

1. Being shipped and handled in a manner to avoid permanent deformation to the material or damage to protective coatings;

2. Being protected against corrosion that results in a loss of structural integrity; and

3. Not being dropped, thrown, or dragged.
3305.1.2 **Rigging.** The requirements of Section 3316.9 and rules promulgated by the commissioner shall apply to the conduct of all rigging operations.

3305.2 **Structural steel assembly.** Structural steel assembly shall be in accordance with the requirements of AISC 360 and the requirements of Chapter 22 and Sections 3305.2.1 through 3305.2.8 of this code.

3305.2.1 **Shop drawings.** [Shop drawings shall include the location of oversized, short slotted, and long slotted holes.] The requirements of Section 2205.3.1 shall apply.

3305.2.2 **Field connections.** The requirements of Section [2205.6.2] 2205.3.2 shall apply.

3305.2.3 **Handling and storing materials.** Structural steel members shall not be dropped, thrown, or dragged. All structural steel members shall be shipped and handled in a manner to avoid injury to protective coatings or permanent deformations of the members. Materials shall be protected against damage and corrosion that results in a loss of section. **Repair of damage.** Any damage to protective coatings shall be repaired prior to the application of fireproofing, the placement of concrete around the steel, or any other action that would otherwise conceal the steel. Any loss of section, bends, crimps or other evidence of permanent deformations shall be repaired by methods approved by the registered design professional of record or the piece shall be rejected.

3305.2.4 **Placing of structural members.** During the placing of a structural member, the load shall not be released from the hoisting rope until the member is securely supported.

3305.2.4.1 **Open web steel joists.** Open web steel joists that are hoisted singly shall be transferred from their place of storage directly to their permanent location and safely secured. No load shall be placed on open web steel joists until they are permanently fastened in place or otherwise secured in accordance with methods approved by the registered design professional of record.

3305.2.4 Open web steel joists. The placement and installation of open web steel joists shall comply with the requirements of Sections 3305.2.4.1 through 3305.2.4.3.

3305.2.4.1 **Attached to support structure.** Open web steel joists shall be attached to the support structure, at least at one end on both sides of the seat, immediately upon placement in the final erection position and before additional joists are placed.

**Exception:** Open web steel joists that have been pre-assembled into panels with bridging shall be attached to the structure at each panel corner with sufficient bolted or welded connections before the hoisting cables are released.

3305.2.4.2 **Connection to bays.** Connections of individual open web steel joists to steel structures in bays of 40 feet (12 192 mm) or more shall be fabricated to allow for field bolting of connections during erection.

**Exception:** Open web steel joists that have been pre-assembled into panels.
3305.2.4.3 Landing and placing loads. The landing and placing of loads on open web steel joists shall be in accordance with the following requirements:

1. No load shall be placed on open web steel joists until they are permanently fastened in place or otherwise secured in accordance with methods approved by the registered design professional of record, and the special inspector responsible for the open web steel joists has signed and dated a report indicating compliance with the requirements of this item.

2. During the construction period, the contractor shall ensure that all loads placed on the steel are distributed so as not to exceed the carrying capacity of any open web steel joist.

3. Except as provided in item number 5 below, no construction loads are allowed on the steel joists until all bridging is installed and anchored and all joist-bearing ends are attached.

4. The weight of a bundle of joist bridging shall not exceed a total of 1,000 pounds (454 kg). A bundle of joist bridging shall be placed on a minimum of three steel joists that are secured at one end. The edge of the bridging bundle shall be positioned within 1 foot (305 mm) of the secured end.

5. No bundle of decking may be placed on steel joists until all bridging has been installed and anchored and all joist-bearing ends attached, unless all of the following conditions are met:
   5.1. The contractor has first determined from a qualified person and documented in a site-specific erection plan that the structure or portion of the structure is capable of supporting the load;
   5.2. The bundle of decking is placed on a minimum of three steel joists;
   5.3. The joists supporting the bundle of decking are attached at both ends;
   5.4. At least one row of bridging is installed and anchored;
   5.5. The total weight of the bundle of decking does not exceed 4,000 pounds (1816 kg); and
   5.6. Placement of the bundle of decking shall be in accordance with item number 6 below.

6. The edge of the construction load shall be placed within 1 foot (305 mm) of the bearing surface of the joist end.

3305.2.5 [Tag lines. While structural members or assemblies are being hoisted, a tag line or tag lines shall be used, as needed, to prevent uncontrolled movement.] Reserved.
3305.2.6 Erection of trusses. Trusses shall be braced or guyed, as necessary, for the safety of the structure.

3305.2.7 Erection of frames. Structural frames shall be properly braced with shores, guyed cables, turnbuckles, or other devices, as necessary, for the safety of the structure.

3305.2.8 Permanent flooring and steel erection in tiered buildings. The permanent floors of such buildings or other structures shall be installed as soon as possible as the erection of structural steel members progresses. In no case shall there be more than eight stories, floors or equivalent levels or 120 feet (36 576 mm), whichever is less, between the working deck and the uppermost permanent floor.

Exception: Where otherwise designed, in accordance with the approved construction documents, by the registered design professional of record.

3305.3 Concrete formwork. Concrete formwork shall be in accordance with the requirements of Sections 3305.3.1 through 3305.3.7.

3305.3.1 General requirements. The design, fabrication and erection of forms shall comply with the requirements of Sections 3305.3.1.1 through 3305.3.1.6.

3305.3.1.1 Safe support of loads. Formwork, including all related braces, shoring, framing, and auxiliary construction, shall be proportioned, erected, supported, braced, and maintained so that it will safely support all vertical and lateral loads that might be applied until such loads can be supported by the permanent construction.

3305.3.1.2 Vertical and lateral loads. Vertical and lateral loads shall be carried to the ground by the formwork system, by the new construction after it has attained adequate strength for that purpose, or by existing structures. Forms and their supports shall be designed so as not to damage previously placed structures.

3305.3.1.2.1 Use of existing structures to support vertical or lateral loads. The use of existing structures to support vertical or lateral loads imposed by concrete construction operations shall require an evaluation by a registered design professional of the adequacy of the existing structure [for] to support the loads to be imposed [by a registered design professional]. The registered design professional shall prepare design drawings documenting the findings of the evaluation, indicate the location of formwork elements, and the interface between the formwork and the existing structure. Concrete operations that utilize a stay form adjacent to a party wall, that place concrete against insulation in a seismic gap, or that utilize similar methods shall be assumed to impose a load on an existing structure, and shall always require an evaluation by a registered design professional in accordance with the requirements of this section.

3305.3.1.3 Bracing. Forms shall be properly braced or tied together so as to maintain position and shape, and shall conform to the sizes and shapes of members as shown on the design drawings.
3305.3.1.4 Ramps, runways and platforms. Ramps, runways, and platforms utilized in connection with concrete placement shall comply with Section 3315.

3305.3.1.5 Design. Concrete formwork shall be designed in accordance with Section 3305.3.2.

3305.3.1.6 Forms for prestressed and post-tensioned concrete. Forms for prestressed and post-tensioned concrete members shall be designed and constructed to permit movement of the member without damage during application of the prestressing or post-tensioning forces, or during installation of the prestressing steel.

3305.3.2 Design of concrete formwork. Design of formwork, including but not limited to forms, proprietary formwork products, shores, and shoring foundations, shall comply with ACI 318, Section [6.4.5] 26.11, and the requirements of Sections 3305.3.2.1 through 3305.3.2.8 of this code.

3305.3.2.1 Design drawings. Site-specific formwork design drawings prepared by a registered design professional shall be required in the following cases:

1. For concrete formwork in a structure classified as a major building; [or]
2. Wherever the shore or form height exceeds 14 feet (4267 mm); [or]
3. Wherever the total vertical load on the forms exceeds 150 pounds per square foot (732 kg/m²); [or]
4. Wherever power buggies are used; [or]
5. Wherever multi-stage shores are used; [or]
6. Wherever the slab thicknesses or beam heights equal or exceed 10 inches (254 mm); [or]
7. Wherever there are concentrated loads exceeding 2000 pounds (907 kg) imposed on the formwork; or
8. Wherever there are loads imposed on existing structures in accordance with Section 3305.3.1.2.1.

Exception: Design drawings prepared by a registered design professional are not required for formwork installed in conjunction with slabs supported directly on grade or footings where such slab or footing does not impart any load on an adjacent structure.

3305.3.2.2 Vertical loads. Vertical loads shall include the total dead and live loads. Dead load shall include the weight of the formwork plus the weight of the reinforcement and fresh concrete. Live load shall allow for the weight of the workers and equipment, with allowance for impact, but in no case shall be less than 20 pounds per square foot (98 kg/m²).
3305.3.2.3 Lateral concrete pressure. Design of forms, ties and bracing shall satisfy the minimum lateral pressures of fresh concrete specified in Table 3305.3.2.3. Maximum rate of placement shall be shown on the design drawings.

3305.3.2.4 External [lateral] loads. Braces and shores shall be designed to resist all external [lateral] loads, including, but not limited to, wind, cable tensions, inclined supports, dumping of concrete, and starting and stopping of equipment. In no case shall the assumed value of lateral load [due to wind, dumping of concrete, and equipment] acting in any direction at each floorline be less than 100 plf applied along the edge or 2 percent of total dead load of the floor, whichever is greater. Except for foundation walls that are poured against a rigid backing, wall forms shall be designed for a minimum lateral load of 10 pounds per square foot (49 kg/m²), and bracing for wall forms shall be designed for a lateral load of at least 100 pounds per linear foot (148.8 kilograms per linear meter) of wall, applied at the top. The lateral load acting on walls greater than 14 feet (4267 mm) high shall be determined by analysis of conditions applicable to the site and building.

TABLE 3305.3.2.3
MINIMUM LATERAL PRESSURES TO BE ASSUMED FOR FRESH CONCRETE WEIGHING 150 POUNDS PER CUBIC FOOT

<table>

</table>

For SI: 1 inch = 25.4 mm, 1 foot per second = 0.305 m/s, 1 pound per cubic foot = 16.02 kg/m³, 1 pound per square foot = 4.882 kg/m², °C = (°F-32)/1.8.

where:

- $R$ = rate of placement, feet per hour.
- $T$ = temperature of concrete in the forms, °F.
- $h$ = height of fresh concrete above point considered, feet.

a. Allowances for change in lateral pressure shall be made for concrete weighing other than 150 pcf; for concrete containing pozzolanic additions or cements other than Type I, for concrete having slumps greater than 6 inches, or for concrete consolidated by revibration or external vibration of forms.

b. Where retarding admixtures are employed under hot weather conditions, an effective value of temperature less than that of the concrete in the forms shall be used in the above formula.

c. If retarding admixtures are used in cold weather, the lateral pressure may be assumed as that exerted by a fluid weighing 150 pcf.

3305.3.2.5 Special loads. The formwork shall be designed for any special conditions of construction likely to occur, such as asymmetrical placement of concrete, impact of machine-delivered concrete, uplift and concentrated loads.
3305.3.2.6 Shoring and bracing. Shoring and bracing shall comply with Sections 3305.3.2.6.1 through 3305.3.2.6.4.

3305.3.2.6.1 Approval. When patented or commercial devices that are not susceptible to design are used for shoring, bracing, or splicing, they shall be approved by the commissioner.

3305.3.2.6.2 Splices. Splices shall develop the full strength of the spliced members.

3305.3.2.6.3 Bracing. Where shore height exceeds 10 feet (3048 mm), or when necessary to provide structural stability, diagonal bracing shall be provided. Struts, anchored into masonry or to panel joints of adjacent braced bays may be used to prevent buckling of individual members not supported by the diagonal bracing, but bracing an entire tier of shores with struts without diagonal bracing shall be prohibited unless the system can be demonstrated to be braced by other rigid construction.

3305.3.2.6.4 Unbraced length of shores. The unbraced length of shores shall not exceed the maximum length determined in accordance with the requirements of this code for the structural material used.

3305.3.2.7 Foundations. Foundations for shores more than 10 feet (3048 mm) high and supported on the ground shall be designed by a registered design professional.

3305.3.2.8 Settlement. Formwork shall be so constructed that vertical adjustments can be made to compensate for take-up and settlements. Wedges, jacks or other positive means shall be provided for this purpose.

3305.3.3 Formwork inspection and observation. Formwork shall be inspected and observed in accordance with the requirements of Sections 3305.3.3.1 [and 3305.3.3.2] through 3305.3.3.

3305.3.3.1 Inspection by contractor. Formwork, including shores, reshores, braces and other supports, shall be inspected prior to placement of reinforcing steel to verify the adequacy and proper installation of the formwork, and where construction documents and form design drawings are provided, that they conform to the construction documents and form design drawings. Subsequently, during and after concreting, periodic inspections shall be performed to detect incipient problems, and the elevations, camber, and vertical alignment of formwork systems shall be inspected using tell-tale devices. Such inspections shall be performed by a qualified person designated by the contractor; nothing shall prohibit the concrete safety manager from performing such inspection where so designated. Subsequently, inspections shall be performed by such person periodically during the placement of concrete. During and after concreting, the elevations, camber, and vertical alignment of formwork systems shall be inspected using tell-tale devices. A record of all such inspections shall be kept at the site available to the commissioner. The results of such inspections shall be documented in an inspection report signed and dated by the qualified person who performed the inspection. The names of the persons responsible for such inspections and the foreman in charge of the formwork shall be posted in the field office.
3305.3.3.2 Formwork observation. In addition to the inspections by the contractor required pursuant to Section 3305.3.3.1, visual observations of the formwork for the general conformance with the design intent shall be performed by:

1. The formwork designer;
2. An employee of the formwork designer under his or her direct supervision;
3. A registered design professional retained by the formwork designer; or
4. An employee of such retained registered design professional under the direct supervision of such retained registered design professional.

Exceptions: Formwork observation pursuant to Section 3305.3.3.2 shall not be required for:

1. Formwork that does not require design drawings pursuant to Section 3305.3.2.1; and
2. One- two- and three-family dwellings and accessory uses to such buildings.

3305.3.3.2.1 Intervals. Formwork shall be observed at intervals permitting observation of representative configurations throughout the project duration. The formwork designer shall maintain a log of such observations at the construction site. At a minimum, observations shall be made:

1. Immediately after formwork related incidents or violations are issued; and
2. When concrete construction operations are significantly modified such as changes to form materials, concrete placement cycle, or form and support layout prior to use of the change.

3305.3.3.2.2 Discrepancies from the formwork design. Where the individual performing the formwork observation pursuant to Section 3305.3.3.2 discovers a discrepancy from the formwork design, such discrepancy shall be immediately brought to the attention of the concrete contractor. The concrete contractor shall be responsible for correcting the discrepancy. In addition, the site safety manager, site safety coordinator, and concrete safety manager, as applicable, shall be notified of discrepancies from the formwork design that relate to site safety. Follow-up observations to confirm corrective action has been taken shall be made by the formwork designer or his or her qualified designee pursuant to Section 3305.3.3.2.

3305.3.3.2.3 Hazardous formwork conditions. Where an observed formwork condition hazardous to life, safety, or health is not immediately corrected by the responsible contractor, the formwork designer or his or her qualified designee pursuant to Section 3305.3.3.2 shall immediately report such hazardous formwork condition and such failure to correct the hazardous formwork condition to the commissioner.

3305.3.3.3 Special inspection. The requirements of Chapter 17 shall apply.
3305.4 Construction. Concrete formwork, including but not limited to forms, shores, and shoring foundations, shall be constructed in conformance with the design drawings, where such drawings are required by Section 3305.3.2.1, and shall also be constructed to comply with the requirements of Sections 3305.3.4.1 through 3305.3.4.5.

3305.3.4.1 Field-constructed lap splices. Field-constructed lap splices, other than approved devices, shall not be used more often than for every other shore under slabs or for every third shore under beams and shall develop the full strength of the members. Such spliced shores shall be uniformly distributed throughout the work. Splices shall not be located near the midheight of the shores unless lateral support is provided, nor midway between points of lateral support.

3305.3.4.2 Vertical shores. Vertical shores incorporated in multi-stage shores shall be set plumb and in alignment with lower tiers so that loads from upper tiers are transferred directly to the lower tiers, or adequate transfer members shall be provided. Provision shall be made to transfer the lateral loads to the ground or to completed construction of adequate strength. Vertical shores shall be so erected that they cannot tilt, and shall have firm bearing. Inclined shores and the bearing ends of all shores shall be braced against slipping or sliding. The bearing surfaces shall be cut square and have a tight fit at splices.

3305.3.4.3 Runways. Runways for moving equipment shall be provided with struts or legs as required and shall be supported directly on the formwork or structural member and not on the reinforcement.

3305.3.4.4 Unsafe conditions. Any unsafe condition or necessary adjustment revealed by inspection shall be remedied immediately. If, during construction, any weakness develops and the formwork shows any undue settlement or distortion, the work shall be stopped, the affected construction removed if permanently damaged, and the formwork strengthened.

3305.3.4.5 [Perimeter formwork] Formwork interconnection. Horizontal formwork deck panels and beam formwork [located within 16 feet (4877 mm) from the building perimeter] shall be positively [attached] connected to all formwork support systems [at a minimum]. Connections located within 16 feet (4877 mm) from the building perimeter shall be installed continuously throughout the day as the formwork is installed and shall be in place prior to the end of the shift.

3305.5 Removal of forms and shoring. The removal of forms and shoring shall comply with the requirements of Sections 3305.3.5.1 through 3305.3.5.6.

3305.3.5.1 Removal schedule. Before starting construction, the contractor shall develop a procedure and schedule for removal of shores and installation of reshores and for calculating the loads transferred to the structure during the process.

3305.3.5.1.1 Data and analysis. The structural analysis and concrete strength data used in planning and implementing form removal and reshoring shall be furnished by the registered design professional responsible for the removal schedule to the commissioner when so requested.
3305.3.5.1.2 Support and removal. No construction loads shall be supported on, nor any shoring removed from, any part of the structure under construction except when that portion of the structure in combination with the remaining forming and shoring system has sufficient strength to support safely its weight and the loads placed thereon.

3305.3.5.1.3 Concrete strength. Sufficient strength shall be demonstrated by structural analysis of the proposed loads, the strength of the forming and shoring system, and concrete strength data. Concrete strength data shall be based on tests of field-cured cylinders [or, when approved by the commissioner, on other procedures for evaluating concrete strength]. As an alternative, the concrete strength is permitted to be estimated using the maturity method performed in accordance with ASTM C1074, provided that the strength is at least 500 psi (3447.38 kPa) higher than the specified compressive strength necessary for formwork or shoring removal, as applicable. Other procedures for evaluating concrete strength are also permitted when approved by the commissioner.

3305.3.5.2 Construction loads. No construction loads exceeding the combination of superimposed dead load plus specified live load shall be supported on any unshored portion of the structure under construction, unless analysis indicates adequate strength to support such additional loads.

3305.3.5.3 Prestressed members. Form supports for prestressed concrete members shall not be removed until sufficient prestressing has been applied to prestressed members to carry their dead load, [and] anticipated construction loads, and prestress transfer forces.

3305.3.5.4 Manner of removal. Forms shall be removed in such a manner as to [assure] ensure the complete safety of the public and property.

3305.3.5.5 Shores support. Where the structure as a whole is supported on shores, beam and girder sides, columns and similar vertical forms may be removed after the concrete is sufficiently hard to withstand damage from the removal. In no case shall the supporting forms or shoring be removed until the members have acquired sufficient strength to safely support [safely] their weight and the load thereon.

3305.3.5.6 Control tests. The results of control tests, including concrete cylinder specimens prepared in accordance with ASTM C 31, cast-in-place cores, or other device that will produce test specimens representative of the condition of the concrete in place, of suitable size and proportions, and approved by the registered design professional of record shall be evidence that the concrete has attained sufficient strength or the strength as may be specified on the drawings.

3305.3.6 Reshoring. Reshoring shall be provided to support the construction where forms and shores are stripped before the concrete has attained sufficient strength to support the superimposed loads due to construction above. Reshoring shall comply with Sections 3305.3.6.1 through 3305.3.6.8.

3305.3.6.1 Reshores limitations. Reshores shall comply with the requirements of Sections 3305.3.6.1.1 through 3305.3.6.1.7.
3305.3.6.1.1 Secureness of reshores. Reshores of wood or metal shall be screw adjusted or jacked and locked and wedged to make them secure. Reshores shall not be jacked or screwed so tightly that they preload the floor below or remove the normal deflection of the slab above.

3305.3.6.1.2 Reshores in proximity to unenclosed perimeters. Reshores within 10 feet (3048 mm) of an unenclosed perimeter of a building shall be secured to prevent them from falling off the building.

3305.3.6.1.3 Wedges. Wedges shall not be used within 10 feet (3048 mm) of the façade or at such other locations as determined by the commissioner.

3305.3.6.1.4 Stresses. In no case shall shores be so located as to alter the pattern of stresses determined in the original structural analysis or to induce tensile stresses where reinforcing bars are not provided.

3305.3.6.1.5 Angle to surface. Reshores shall be perpendicular to the surface that they are supporting.

3305.3.6.1.6 Adjusting devices. Adjusting devices shall not be used if heavily rusted, bent, dented, rewelded or having broken weldments or other defects.

3305.3.6.1.7 Metal shoring and accessory parts. Metal shoring and accessory parts shall be fully operative when in use.

3305.3.6.2 Site safety provisions. Reshoring shall comply with the requirements of Sections 3305.3.6.2.1 through 3305.3.6.2.3.

3305.3.6.2.1 Emergency. Extra shores or material and equipment that might be needed in an emergency shall be furnished.

3305.3.6.2.2 Stripping. Care shall be taken while stripping is underway to ensure that material does not fall off the building.

3305.3.6.2.3 Building materials. Building materials shall be properly piled and tied or contained.

3305.3.6.3 Bracing. Lateral bracing shall be provided during reshoring operations, and reshores shall be located as close as practical to the same position on each floor to provide continuous support from floor to floor.

3305.3.6.4 Reshoring beam and girder construction. Where reshoring of beam and girder construction is required, the forms shall not be removed from more than one girder at a time, and the girder shall be reshored before any other supports are removed. After the supporting girders are reshored, the form shall be removed from one beam with its adjacent slabs and the beam shall be reshored before any other supports are removed. Slabs spanning 10 feet (3048 mm) or more shall be reshored along the centerline of the span.
3305.3.6.5 Reshoring flat slabs. Where reshoring of flat-slab construction is required, the formwork cannot be stripped until the concrete has acquired sufficient strength to safely support its weight and the load thereon, or temporary preshores are provided supporting the slab at intervals of no more than 8 feet (2438 mm) on center to be replaced by reshores prior to placing concrete on the floor above. Reshores must be installed and remain in place until the concrete reaches full or sufficient strength to sustain the superimposed loads to which the concrete will be subjected.

3305.3.6.6 Stripping operation. Debris generated as a result of stripping operations shall be immediately contained and removed at reasonable intervals. Stripping operations on concrete structures shall not be performed more than three stories below the story being formed.

3305.3.6.7 Prestressed construction. Solid safety shields shall be provided at end anchorages of prestressing beds, or where necessary, for protection against breakage of prestressing strands, cables, or other assemblies during prestressing or casting operations.

3305.3.6.8 Reshoring schedule. A signed and sealed reshoring schedule shall be provided and maintained at the construction site whenever reshoring is employed.

Exception: A separate reshoring schedule is not required when the required reshoring information is covered on the approved construction documents prepared by the applicant of record.

3305.3.7 Alternate methods. The contractor may submit alternate methods of stripping, shoring, reshoring, and strength control for approval by the registered design professional of record, subject to review by the commissioner.

3305.4 Precast concrete construction. Precast concrete members shall be adequately braced and supported during erection to ensure proper alignment and structural integrity until permanent connections are completed.

3305.4.1 Cracking or deflections. Any cracking or deflections inconsistent with the design drawings observed during handling shall be subject to assessment by a registered design professional prior to erection.

3305.4.2 Design of temporary shores. Temporary shores shall be designed by a registered design professional.

[3305.4] 3305.5 Aluminum erection. In addition to the requirements of Section 2002, the erection of aluminum used for structural purposes shall comply with the requirements of Sections [3305.4.1] 3305.5.1 through [3305.4.4] 3305.5.4.

[3305.4.1] Plumb. All framework shall be carried up true and plumb.] 3305.5.1 Reserved.

[3305.4.2] 3305.5.2 Temporary bracing. Temporary bracing shall be provided to support all loads imposed upon the framework during construction that are in excess of those for which the framework was designed.
Temporary connections. As erection progresses, the work shall be securely bolted or welded to resist all dead loads, wind, and erection stresses.

Alignment. The structure shall be properly aligned before riveting, permanent bolting, or welding is performed.

Masonry erection. The requirements of Section 2104.6 shall apply.

Wood construction. The requirements of Section 2304 shall apply.

8. Section BC 3306 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

SECTION BC 3306
DEMOLITION

Scope. All full demolition and partial demolition operations shall be performed in accordance with the requirements of this section so that the safety of the public and property will not be endangered by demolition operations.

Protection of pedestrians and adjoining property. Demolition operations shall not commence until the applicable pedestrian and adjoining property protection is in place as required by Sections 3307, 3308, and 3309. In addition, safety zones and measures to prevent access shall be implemented as required by Sections 3306.2.1 and 3306.2.2.

Safety zone. A safety zone shall be provided around all demolition areas to prevent persons other than workers from entering such zone. Where demolition occurs on the exterior of a building, such zone shall be approved by the commissioner prior to the commencement of demolition.

Preventing access. The permit holder, or where there is no permit holder, the person causing the demolition work to be performed, shall institute and maintain measures to prevent persons other than workers from entering areas where demolition work is occurring, debris is stored, or equipment is located.

Safety zone for exterior demolition. Where demolition work occurs on the exterior of a building, the permit holder, or where there is no permit holder, the person causing the demolition work to be performed, shall institute and maintain a safety zone around the site to prevent persons other than workers from entering such safety zone. Where the safety zone precludes access to the entire demolition site, it shall be considered to satisfy the requirements of Section 3306.2.1.

Exception: A safety zone is not required for the following types of work. Relief from the safety zone requirements does not grant relief from applicable pedestrian and adjoining property protection required by Sections 3307, 3308, and 3309, nor from the requirements of Section 3306.2.1.
1. **Demolition work** whose scope is limited to a minor alteration or ordinary repair, and is accomplished without any mechanical demolition equipment, other than handheld devices.

2. Work whose scope is limited to the alteration, maintenance, or repair of a façade, and which does not constitute a façade recladding as defined in rules promulgated by the commissioner, and is accomplished without any mechanical demolition equipment, other than handheld devices.

3. Demolition work accomplished without any mechanical demolition equipment, other than handheld devices, provided the entire exposure where demolition work is to occur is covered by either:
   
   3.1. A supported scaffold with netting and guardrails in accordance with Section 3314.8; or
   
   3.2. A site specific engineered enclosure system in accordance with Section 3309.17.

3306.2.2.1 **Approval of the commissioner.** Where a safety zone is required by Section 3306.2.2, it shall be approved by the commissioner.

3306.2.2.2 **Size of safety zone for mechanical demolition.** Where mechanical demolition equipment, other than handheld devices, is to be used for the full or partial demolition of a building, the safety zone shall be equal to or greater than half the height of the building to be demolished; such safety zone may be reduced by the same ratio as the building is being demolished.

[Exception: Approval of the commissioner is not required for a safety zone established for demolition on the exterior of a building, provided the work is a minor alteration or ordinary repair and is accomplished without any mechanical demolition equipment, other than handheld devices.]

3306.3 **Notification.** The permit holder shall notify the department and adjoining property owners prior to the commencement of full and partial demolition operations in accordance with Sections 3306.3.1 and 3306.3.2.

**Exceptions:**

1. Notification to the department or adjoining property owners is not required for partial demolition operations limited to the interior components of a building provided no mechanical demolition equipment, other than handheld devices, are used.

2. Notification to the department or adjoining property owners is not required for partial demolition that occurs on the exterior of a building, provided such work is a minor alteration or ordinary repair, and is accomplished without any mechanical demolition equipment, other than handheld devices.

3306.3.1 **Notification of the department.** The permit holder shall notify the department via phone or electronically at least 24 hours, but no more than 48 hours prior to the commencement
of such work. If the notification date falls on a weekend or official holiday, the permit holder shall notify the department on the last business day before the commencement date.

3306.3.2 Notification of adjoining property owners. Adjoining property owners shall be notified of upcoming demolition operations in writing no less than 10 days prior to the scheduled starting date of the demolition. The written notice shall provide a description of the work to be performed, the timeframe and schedule, and contact information of the person causing the demolition work and of the department. Demolition or removal work that is to be done with the use of explosives shall also be subject to the notification requirements set forth in the New York City Fire Code.

3306.4 Mechanical demolition equipment. Where mechanical demolition equipment, other than handheld devices, is to be used in the full or partial demolition of a building or structure, or is to be used within a structure to remove debris or move material, approval of the commissioner for the use of the mechanical demolition equipment must be obtained prior to the commencement of demolition operations.

Exception: Approval of the commissioner is not required where the structure has been demolished to grade and mechanical equipment, located on the ground or a slab on grade, is utilized to remove the slab or foundation of the structure or to remove debris or move material.

3306.5 Submittal documents for demolition. Full and partial demolition operations shall be conducted in accordance with submittal documents. Such submittal documents shall comply with Sections 3306.5.1 through [3306.5.3] 3306.5.7.

Exceptions: Section 3306.5 shall not apply to:

1. Demolitions performed as emergency work pursuant to Section 28-215.1 of the Administrative Code when such work is monitored by a qualified person with experience in demolition operations who is employed by the city agency that has been directed to perform or arrange for the performance of such work. If the department or such city agency determines that there is a need for supervision of the work by a registered design professional, such city agency shall retain a registered design professional or cause a registered design professional to be retained to supervise the demolition operations.

2. The full demolition of a detached one-, two-, or three-family dwelling, or both halves of a semi-detached one-, two-, or three-family dwelling, or a detached accessory [use structure to a one-, two-, or three-family dwelling, provided such dwelling or accessory [use structure is three stories or fewer in height, and also provided that the demolition is to be accomplished without any mechanical demolition equipment, other than handheld devices.

3. The removal, with mechanical demolition equipment, of foundations and landscaping elements, including but not limited to foundation walls, slabs, stoops, driveways, or pools supporting or accessory to a detached or semi-detached one-, two-, or three-family dwelling.

4. The full demolition of a fully detached building that is three stories or fewer and with a floor area of 5,000 square feet (464.5 m²) or less per story, provided such demolition is to
be accomplished without any mechanical demolition equipment, other than handheld devices.

4. The removal, with mechanical demolition equipment, of the remaining slab or foundation of a structure described in exemption 2 or 3 above once the structure has been demolished to grade, or the removal of landscaping elements, on grade parking or driveways, or pools that are accessory to a structure described in exemption 2 or 3 above, provided during all such removal work the mechanical demolition equipment is located on the ground or a slab on grade.

5. Partial demolition operations accomplished without any mechanical demolition equipment, other than handheld devices, provided such work is a minor alteration or ordinary repair.

6. Demolition operations that do not require a permit.

3306.5.1 Required documents. Submittal documents shall be approved by the department before demolition work begins. Such submittal documents shall be signed, sealed, and submitted by a registered design professional and shall contain, at a minimum, the following:

1. Basic structure of the building, or portion thereof, to be demolished, including general sizes and types of main structural members and an identification of the general structural lateral system;

2. A statement that the condition of the existing structure to be demolished has been assessed and a determination regarding whether it is a weakened structure in accordance with Section 3306.7;

3. Plans, sections, and details of the building or portion thereof, to be demolished clearly showing the extent and sequence of the demolition, including, but not limited to:

3.1. Work involving a full demolition, a demolition performed in conjunction with work that meets the requirements of Article 101.4.5 of Title 28 of the Administrative Code, a demolition that results in the demolition of more than 50 percent of the gross floor area of the building during the course of work over any 12-month period, or a demolition that results in the removal of one or more floors during the course of work over any 12-month period, a clear and detailed demolition sequence provided in narrative and illustrated in the plans shall also be provided. All phases shall be designated by a number or letter to clearly depict the required sequence of the work. Structural stability must be demonstrated through all phases of demolition. A “preparation phase” must be included indicating but not limited to the following: glass removal, sealing of windows, removal of equipment/fixtures, and cutting of services. A note must indicate that any required permits for termination of services will be obtained, including necessary Fire Department and Department of Buildings variances.

3.2. Work involving a full demolition, or for a partial demolition that razes a portion of a building to grade, plan and section views detailing the end-of-demolition conditions, including any remaining foundation elements and means of stabilizing those elements
and the adjoining property via complete backfill, berms, shoring/bracing, or a similar approved method, shall be provided.

3.3. Work involving a demolition that involves the removal of foundation elements, a detailed section showing the elevation of the footings of the building being demolished as it relates to the footings of all adjoining property shall be provided.

3.4. Work involving a demolition that involves an excavation component or the removal of foundation elements, a sequence showing coordination between the demolition work and the installation of sheeting, shoring, underpinning, berming, backfill, or other methods of supporting excavations and/or adjoining property shall be provided.

4. Bracing, [and] shoring, and other stabilization measures necessary to support all demolition operations, and adjoining ground, or structures, as needed, through all sequences of the demolition, If shoring, bracing, or other stabilization measures must be taken prior to demolition, a clear and detailed sequence of this work, along with clear identification that this work is required to be performed prior to the start of any demolition activity shall be included;

5. Where interior walls are to be demolished, a statement shall be provided indicating that the removal of the interior walls has been coordinated with the load capacity of the exterior walls and floors;

6. Partitions required for the stability of the structure or required for egress shall be clearly indicated on the plans, and the sequence of operations shall indicate when the partitions can be safely removed;

7. Where mechanical demolition equipment, other than handheld devices, is to be used, a listing and description of all such proposed equipment to be used in the demolition, including the scope of equipment work and positioning of equipment on the existing structure. The description of the equipment shall include the gross weight of the equipment and calculations showing the adequacy of the existing structure to support loads imposed by such equipment. Any conditions imposed on the use or position of the equipment must be noted. If more than one piece of demolition equipment is proposed to be used at the same time, the effect of the simultaneous loads imposed on the existing structure shall be described and investigated. The plans may allow for alternate types of equipment within the same weight range and type. Such alternatives must be listed on the plans. A list of cranes to be utilized, if applicable, must also be provided, including their location along with a note that any department-required permit for the crane shall be obtained; [and]

8. A description of compliance with the applicable provisions of Sections 3306.8 and 3306.9 of this code;

9. A statement regarding whether the building where demolition operations are to occur shares a party wall or party foundation with an adjoining structure;

10. For demolition work that occurs on the exterior of a building, or for demolition operations that will disturb elements shared between buildings, including but not limited to party walls
or party foundations, the adjoining properties shall be indicated, with property lines, addresses, block and lot numbers, stories and heights of all buildings, and horizontal offset dimensions of all adjacent structures from the property lines of structure being demolished and from the structure clearly shown. Any encroachments on adjoining property, including but not limited to fencing, barriers, or safety zones, along with a note stating that permission shall be obtained from the adjoining property owner, shall also be clearly indicated;

11. Pedestrian protection, unenclosed perimeter protection, or adjoining property protection installed in accordance with Sections 3307, 3308, or 3309, including but not limited to, as applicable:

11.1. Fencing/gates, including type, location, and dimensions, as well as the location of the project information sign on the fence;

11.2. Sidewalk sheds, including locations and dimensions;

11.3. Supported scaffolding and netting, including heights above the building being demolished, details of anchorage to building, and netting type; and

11.4. Adjoining roof, mechanical equipment, and yard protection, including types, locations, and dimensions.

12. The boundaries of the demolition work zone and demolition safety zone, as required by Section 3306.2, and the method of defining those zones and preventing access (e.g. fencing, barriers, etc.);

13. All means and methods of debris removal from the point of demolition to the public roadway (carting), including openings in floors, chutes, etc, as well as the location of any debris sorting operation and barriers to separate the operation from other demolition activity;

14. Means of egress for all phases of the demolition;

15. The elevator or hoist in readiness, if required;

16. Measures to protect, stabilize, and brace, as necessary, fire escapes, cornices, flues, and chimneys;

17. Where fire separation elements are to be breached or diminished during demolition operations in an occupied building, or between adjoining occupied or unoccupied buildings, temporary measures to maintain fire separation;

18. The methods of remediating adjoining lot line walls, including weatherproofing, repair, floor-to-wall anchorage, etc.;

19. A listing of required special inspections;

20. Application numbers for associated filings (e.g. fencing, pedestrian protection, adjoining property protection, scaffolding, netting, underpinning, support of excavation, etc.); and
21. Reference to the monitoring plan, when a monitoring plan is required by Section 3306.12.

[Exception: For a partial demolition using mechanical demolition equipment, the bracing and
shoring details required by Item 2 above may be included on signed and sealed shop drawings
to be kept on site, separate and apart from the submittal documents, provided the allowance
for shop drawings is designated on the submittal documents.]

3306.5.1.1 Submittal documents for full or partial demolition using mechanical
equipment other than handheld. Submittal documents for full or partial demolition using
mechanical equipment other than handheld shall be signed, sealed and submitted by a
registered design professional.

3306.5.2 Maintenance of submittal documents. The approved set of submittal documents shall
be kept at the site at all times and be accessible for inspection in accordance with Section 3301.7.
It shall be a violation of this code to use mechanical equipment, whether handheld or other than
handheld, to perform full or partial demolitions unless the approved submittal documents
required by Section 3306.5.1 are available for inspection. Failure to make submittal documents
available on site may result in the issuance of a stop work order.

3306.5.3 Filing requirements. Where submittal documents are required in connection with full
or partial demolition in accordance with Section 3306.5, applications shall be filed by the
registered design professional in accordance with Article 104 of Chapter 1 of Title 28 of the
Administrative Code and shall be approved prior to issuance of the work permit.

3306.5.4 Assessment of structure to be demolished. Submittal documents required by Section
3306.5 shall be based upon an assessment of the structure where demolition operations are to
occur. The assessment shall be performed by a registered design professional. The assessment
shall, at a minimum, consist of an interior and exterior physical inspection of the structure where
demolition operations are to occur, in which all areas to be demolished are accessed during the
inspection. The results of the assessment shall be documented in an assessment report prepared
by the person who performed the assessment. If the assessment was performed by a registered
design professional other than the registered design professional who prepares the submittal
documents, the report shall be provided to the registered design professional who prepares the
submittal documents.

3306.5.5 Assessment of adjoining structures. Where a bearing masonry or wood framed
building shares a party wall or party foundation with a building that is to undergo a full
demolition, a demolition performed in conjunction with work that meets the requirements of
Section 101.4.5 of Title 28 of the Administrative Code, a demolition that results in the demolition
of more than 50 percent of the gross floor area of the building during the course of work
over any 12-month period, or a demolition that results in the removal of one or more floors during
the course of work over any 12-month period, the submittal documents required by Section
3306.5 shall be based upon an assessment of such bearing masonry or wood framed building. The
assessment shall be performed by a registered design professional. The assessment shall, at a
minimum, consist of an interior and exterior visual inspection of the structure where demolition
operations are to occur. The results of the assessment shall be documented in an assessment report
prepared by the person who performed the assessment. If the assessment was performed by a
registered design professional other than the registered design professional who prepares the

submitting documents, the report shall be provided to the registered design professional who prepares the submitting documents.

**3306.5.6 Review of pertinent plans and records.** Submittal documents required by Section 3306.5 shall be based upon a review of all pertinent plans and records of the structure where demolition operations are to occur. In addition, where a building is to undergo a full demolition, a demolition performed in conjunction with work that meets the requirements of Section 101.4.5 of Title 28 of the Administrative Code, a demolition that results in the demolition of more than 50 percent of the gross floor area of the building during the course of work over any 12-month period, or a demolition that results in the removal of one or more floors during the course of work over any 12-month period, the submittal documents shall further be based upon a review of all pertinent plans and records of all adjoining structures. The review shall be performed by the registered design professional who prepares the submittal documents.

**3306.5.7 Incorporate all other relevant reports.** The demolition submittal documents must incorporate all the conditions and findings identified in the geotechnical report when such report is required by Section 1803.6, the evaluation analysis when such analysis is required by Section 1817, the assessment reports required by Section 3306.5.4 and 3306.5.5, and the preconstruction survey when such survey is required by Section 3309.4.3.

**3306.6 Special inspection.** Demolition shall be subject to special inspection in accordance with Chapter 17.

**3306.7 Demolition of weakened structures.** Where a structure to be demolished has been partially wrecked or weakened by fire, flood, explosion, age, or other causes, it shall be shored or braced to the extent necessary to permit orderly full demolition or partial demolition without collapse. The necessary measures to ensure a safe demolition shall be determined by the owner’s registered design professional and shall be approved by the commissioner.

**Exception:** Shoring or bracing are not required for the full demolition of a building, subject to the approval of the commissioner, provided:

1. The demolition is conducted with mechanical demolition equipment, other than handheld devices; and
2. No demolition operation occurs, or equipment is located, within the structure of the building.

**3306.8 Demolition sequence.** Any structural member that is being dismembered shall not support any load other than its own weight. No wall, chimney, or other structural part shall be left in such condition that it may collapse or be toppled by wind, vibration or any other cause. The method of removal of any structural member shall not destabilize remaining members. All handling and movement of material or debris shall be controlled such that it will not develop unaccounted impact loads on the structure.

**3306.8.1 Structural steel, reinforced concrete, and heavy timber buildings.** Structural steel, reinforced concrete, and heavy timber buildings, or portions thereof, shall be demolished column
length-by-column length and tier-by-tier. Structural members shall be chained or lashed in place to prevent any uncontrolled swing or drop.

**Exception:** Where the design applicant who prepared the submittal documents required by Section 3306.5 has demonstrated the adequacy of alternate means of demolition through plans, calculations, or the establishment of safety zones, as appropriate, the commissioner may accept such alternative means of demolition.

### 3306.8.2 Masonry buildings with wooden floors.
Demolition of masonry buildings with wooden floors shall comply with the following requirements:

1. Demolition of walls and partitions shall proceed in a systematic manner, and all work above each tier of floor beams shall be completed before any of the supporting structural members are disturbed.

2. Sections of masonry walls shall not be loosened or permitted to fall in such masses as to affect the carrying capacity of floors or the stability of structural supports.

3. No section of masonry wall with a height [more than 22 times its thickness ratio greater than 22] shall be permitted to stand without [bracing] the wall being braced. Such bracing shall be designed by a registered design professional.

### 3306.9 Safeguards.
Demolition shall be conducted in accordance with the requirements of Sections 3306.9.1 through 3306.9.16.

1. **3306.9.1 Utilities and service lines.** The requirements of Section 3303.2 shall apply.

2. **3306.9.2 Party wall exits, fire exits.** The requirements of Section 3303.9 shall apply.

3. **3306.9.3 Dust.** Dust producing operations shall be wetted down to the extent necessary to control the dust.

4. **3306.9.4 Water accumulation.** The requirements of Section 3303.14 shall apply.

5. **3306.9.5 Temporary elevators and standpipe systems.** The requirements of Sections 3303.8 and 3303.12 shall apply.

6. **3306.9.6 Sprinkler systems.** The requirements of Section 3303.7.4 shall apply.

7. **3306.9.7 Use of explosives.** The use of explosives in demolition operations shall conform to the requirements and limitations imposed by the *New York City Fire Code* and Section 3312.

8. **3306.9.8 Hazards to be removed.** Prior to the commencement of demolition operations, hazards shall be removed in accordance with Sections 3306.9.8.1 through 3306.9.8.4.

   - **3306.9.8.1 Combustible content.** Prior to the commencement of demolition operations, the area authorized to be demolished by the work permit shall be thoroughly cleaned of combustible content and debris, including but not limited to building contents and exterior finishes, down to the structural elements.
3306.9.8.2 Asbestos. Prior to the commencement of demolition operations, all asbestos shall be removed from the area authorized to be demolished by the department work permit, and certification to that effect shall be filed with the department and the Department of Environmental Protection. Such asbestos removal shall be in accordance with Section 28-106 of the Administrative Code and rules promulgated by the commissioner of the Department of Environmental Protection.

3306.9.8.3 Glass. Prior to the commencement of demolition operations, all glass located in the area authorized to be demolished by the work permit, including but not limited to glass in windows, doors, skylights, and fixtures, shall be removed.

Exception: Demolition operations relating to the alteration, maintenance, or repair of a façade.

3306.9.8.4 Steam and fuel. Prior to the commencement of demolition operations, all pipes, tanks, boilers, or similar devices containing steam or fuel and located in the area authorized to be demolished by the work permit shall be purged of such steam or fuel.

Exception: Pipes, tanks, boilers, or similar devices containing steam or fuel located in the area authorized to be demolished by the work permit and which will not be disturbed during the course of the demolition operation may, in lieu of being purged, be safeguarded so as to prevent their being damaged during the course of demolition operations.

3306.9 Stairs. All enclosed vertical shafts and stairs shall be maintained enclosed at all floors except the [uppermost] topmost floor being demolished, and all work on the [uppermost] topmost floor shall be completed before stair and shaft enclosures on the floor below are disturbed. All hand rails and banisters shall be left in place until actual demolition of such floor is in progress.

3306.9.10 Floors. The safeguards of Sections 3306.9.10.1 through 3306.9.10.3 shall apply to demolition operations involving floors.

3306.9.10.1 Bearing partitions and headers. No bearing partition shall be removed from any floor until the floor framing system on the floor above has been removed and lowered. All header beams and headers at stair openings and chimneys shall be carefully examined and, where required, shall be shored from the cellar floor through successive floors. All operations shall be continually monitored by a qualified person designated by the permit holder as the work progresses to detect any hazards that may develop.

3306.9.10.2 Floor openings not to aggregate more than 25 percent of the gross floor area. Openings in any floor shall not aggregate more than 25 percent of the area of that floor unless it can be shown by submission from a registered design professional to the satisfaction of the commissioner that larger openings will not impair the stability of the structure.

3306.9.10.3 [Protection of floor] Covering of floor openings. Floor openings used for the removal of debris shall comply with Section 3306.9.12.1. Every opening not used for the removal of debris in any floor shall be clearly marked and solidly planked over by planking not less than 2 inches (51 mm) in thickness, or equivalent solid material, [and] laid close.
3306.9.11 Storage of material. Material shall not be stored on catch platforms, working platforms, floors, or stairways of any structure, except that any one floor of a building to be demolished may be used for the temporary storage of material when such floor can be evaluated by a registered design professional and proven to be of adequate strength to support one and one-half times the load to be superimposed. Such evaluation by the registered design professional shall be maintained by the permit holder and made available to the department upon request.

3306.9.11.1 Avoid interference. Storage spaces shall not interfere with access to any stairway or passageway, and suitable barricades shall be provided so as to prevent material from sliding or rebounding into any space accessible to the public. All material shall be safely stored or piled in such storage locations in a manner that will not overload any part of the structure or create any hazard.

3306.9.11.2 Examination of connections. Before any material is stored on any floor, the existing flooring adjacent to bearing walls, shear walls, beams and columns shall be removed and the connections of the floor framing system to the bearing walls, shear walls, beams and columns shall be carefully examined by a competent person designated by the permit holder to ascertain their condition and adequacy to support such material. If the connections are found to be in poor condition or inadequate to support the stored material, no material shall be deposited on the floor until these connections are shored from the cellar floor through each successive floor or otherwise strengthened to safely support such material.

3306.9.11.3 Removal of floor slabs for storage. In buildings of noncombustible construction, floor slabs to an elevation of not more than 25 feet (7620 mm) above the legally established curb level may be removed to provide temporary storage for debris, provided that:

1. The stored debris is piled with sufficient uniformity to prevent lateral displacement of interior walls or columns as determined by a registered design professional.

2. The height of the piled material will not burst the exterior walls due to horizontal loading as determined by a registered design professional.

3. The operation does not otherwise endanger the stability of the structure.

3306.9.11.4 Cellar or basement storage. Debris stored in the cellar or basement shall not be piled above the level of the adjacent exterior grade unless the demolition contractor provides sheet-piling, shoring, bracing, or such other means necessary to insure the stability of the walls and to prevent any wall from collapsing due to horizontal loading created by the debris as determined by a registered design professional. Where debris is stored against a party wall, the requirements of Section 3306.9.11.5 shall also apply.

3306.9.11.5 Examination of party walls. Party walls shall be carefully examined by a competent person designated by the permit holder to ascertain the condition and adequacy of the party wall prior to the placement of any material that will impose a load upon such party wall. If the party wall is to be found to be in poor condition or inadequate to support the stored material, no material shall be deposited on the floor until the party wall is
shored or otherwise strengthened as determined by a registered design professional to safely support such material.

3306.9.12 Removal of material. Debris, bricks, and similar material shall be removed through openings in the floors of the structure, or by means of chutes, buckets, or hoists that comply with the provisions of this chapter.

3306.9.12.1 [Protection of floor] Floor openings used for the removal of debris. Every opening in a floor used for the removal of debris shall be tightly enclosed with a shaftway, extending from floor to floor, with such shaftway enclosed with:

1. Planking not less than 2 inches (51 mm) in thickness, or equivalent solid material; or

2. Where the opening is used for the removal of noncombustible material, wire mesh may be utilized in lieu of planking, provided such mesh is not less than number 18 [gage] gauge wire mesh, with openings in the wire no longer than ½ inch (13 mm), and also provided that the wire mesh is securely attached, in accordance with drawings developed by a registered design professional, to the shaftway so that the wire mesh enclosure in any location does not deflect more than 2 inches (51 mm) when a force of at least 200 pounds (890 n) is applied along any horizontal portion of such wire mesh enclosure.

Exceptions:

1. In buildings not more than six stories or 75 feet (22 860 mm) in height, whichever is less, a shaftway is not required. Instead openings in the floor shall be clearly marked and solidly planked over while not in use by planking not less than 2 inches (51 mm) in thickness, or equivalent solid material, and laid close.

2. A shaftway is not required at the working deck. Instead, openings in the working deck shall be clearly marked and solidly planked over while not in use by planking not less than 2 inches (51 mm) in thickness, or equivalent solid material, [and] laid close.

3306.9.12.1.1 Temporary removal of protection. Wherever [such protection] a shaftway or planking required by Section 3306.9.12.1 has been temporarily removed to permit debris removal, the floor opening shall be protected by a guardrail system that meets the requirements of Sections 3308.7.1 through 3308.7.5. Such protection required by Section 3306.9.12.1 shall be promptly replaced in position upon the ceasing of such work at the end of each workday.

3306.9.12.2 Protection of wall openings. In any buildings more than 25 feet high (7620 mm), any window or other exterior wall opening that is within 20 feet (6096 mm) of a floor opening used for the passage of debris from levels above shall be solidly boarded up or otherwise substantially covered, unless such window or opening is so located as to preclude the possibility of any person being injured by material that may fall from such window or opening.
3306.9.12.3 **Chutes.** Chutes used in association with the removal of materials shall comply with Section 3303.5.5.

3306.9.13 **Rodent extermination.** A licensed exterminator shall effectively treat the premises for rodent extermination as per the requirements of the Department of Health and Mental Hygiene.

**Exception:** Partial demolition operations.

3306.9.14 **Chimneys.** Where brick or masonry chimneys cannot be safely toppled or dropped, all materials shall be dropped down on the inside of such chimneys.

3306.9.15 **Partitions.** Partitions required for the stability of the structure or required for egress, as identified in the submittal documents required by Section 3306.5, shall be clearly marked prior to the commencement of demolition operations. Such partitions shall not be removed until a competent person designated by the permit holder has determined the demolition sequence, as identified in the submittal documents, has reached the point the partitions can be safely removed, and authorizes their removal.

3306.9.16 **Temporary weather protection.** Temporary weather protection shall be installed and maintained by the demolition contractor, as necessary, to protect building systems or elements that may be susceptible to exposure to the weather during periods where the permanent weather protection has been breached, diminished, or is not yet in place. Such building systems or elements include, but are not limited to, walls, party walls, roofs, areas of missing brick, loose lain brick, and exposed electrical conduit.

3306.10 **Removal of foundations and slabs.** Where a building, or any portion, has been demolished to grade, the floor slab or foundation of such building, or portion, shall be removed and the site backfilled to grade.

**Exceptions:**

1. Cellar floors may remain provided the cellar floor slab is broken up to the extent necessary to provide ground drainage and prevent accumulation of water, and also provided that all fixtures or equipment that would cause voids in the fill are removed.

2. Where portions of a foundation, underpinning, or similar elements, other than a cellar floor, are to remain and be covered with backfill, a waiver approved by the commissioner shall be obtained. Drawings prepared by a registered design professional depicting the remaining buried structure shall be submitted with the waiver request.

3. Where a floor slab or foundation is to remain and not be backfilled, a waiver approved by the commissioner shall be obtained. Such request for waiver shall be accompanied by a statement and drawings prepared by a registered design professional demonstrating the necessity for retaining the existing floor slab or foundation for future construction or site remediation, as well as demonstrating positive cellar drainage to an approved place of disposal.
**3306.10.1 Evaluation of fill on adjoining foundations.** Where the installation of fill will impart a load on an adjoining foundation, a registered design professional shall evaluate the foundation prior to the placement of the fill. If necessary, sheeting, shoring, or bracing shall be provided as indicated by the registered design professional.

**3306.11 Completion of demolition operations.** All work required for structural stability and permanent waterproofing of adjacent buildings must be completed prior to demolition sign-off.

**3306.12 Monitoring of adjoining structures during demolition.** Where a bearing masonry or wood framed building shares a party wall or party foundation with a building that is to undergo a full demolition, a demolition performed in conjunction with work that meets the requirements of Section 101.4.5 of Title 28 of the Administrative Code, a demolition that results in the demolition of more than 50 percent of the gross floor area of the building during the course of work over any 12-month period, or a demolition that results in the removal of one or more floors during the course of work over any 12-month period, such bearing masonry or wood framed building shall be monitored during the demolition operation. The monitoring shall be in accordance with a monitoring plan prepared or accepted by the registered design professional who prepared the submittal documents in accordance with Section 3306.5. The monitoring plan shall be acceptable to the commissioner and shall include but not be limited to, the monitoring frequency, reporting requirements for the monitoring program, anticipated movement and settlement thresholds, and procedures to be implemented when thresholds are exceeded.

**3306.13 Additional monitoring required by the commissioner.** When, in the opinion of the commissioner, a demolition operation poses a potential hazard to an adjacent building, elevations of the building under demolition or the adjacent building, or both, shall be recorded or other monitoring procedures shall be implemented by a registered design professional at intervals of 24 hours or less as determined by the commissioner to ascertain if movement has occurred.

§ 38. Section BC 3307 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

**SECTION BC 3307**

**PROTECTION OF PEDESTRIANS**

**3307.1 Scope.** Pedestrians shall be protected during construction or demolition activities as required by this section and by the Department of Transportation.

**3307.2 Streets, including bicycle lanes and sidewalks, as well as walkways[,] and pathways.** Streets, including bicycle lanes and sidewalks, as well as walkways and pathways, either within the public way or within a site, shall meet the requirements of Sections 3307.2.1 through 3307.2.6, and the requirements of the Department of Transportation.

**3307.2.1 Obstruction of streets, including bicycle lanes and [or] sidewalks.** The requirements of the Department of Transportation shall apply with regard to the closing of streets [or], including bicycle lanes and sidewalks, or to the obstruction of any part thereof.
3307.2.2 Temporary public walkway in the street. Where authorized by the Department of Transportation, a temporary walkway open to the public may be provided in the street in front of the site. Such temporary walkway shall be protected in accordance with the requirements of the Department of Transportation. Department of Transportation authorization is required where a temporary walkway and a temporary or permanent bicycle lane will share the same space.

3307.2.3 Temporary public walkway within the site. Where authorized by the commissioner, a temporary walkway open to the public may be provided through a site that is otherwise fenced and closed to the public. Such temporary walkway shall be:

1. Protected by a sidewalk shed, or where acceptable to the commissioner, provided with overhead protection and lighting equivalent to that afforded by a sidewalk shed;

2. Enclosed along the side facing the site with a solid fence that meets the requirements of Section 3307.7. Where the sidewalk shed or equivalent overhead protection extends beyond [the height of the fence] 8 feet (2438 mm) in height, the fence shall extend to the top of the overhead protection, or the gap between the top of the fence and the overhead protection shall be enclosed with a wire screen comprised of not less than number 18 [gage] gauge wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension; and

3. Enclosed along the side facing the street [with a wire screen comprised of not less than number 18 gage wire mesh, or equivalent synthetic netting, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm), or where a special hazard exists, protected] in accordance with Section 3307.4.7.

3307.2.4 Pathways. Where a means of ingress/egress to [the property remains] a building or structure remains open to the public during the course of construction or demolition, [walkways, pathways, and similar areas within the property line that provide a path of travel between the required means of ingress/egress and the public sidewalk or temporary walkway shall remain open.] an adequate pathway shall be provided between such means of ingress/egress and the sidewalk, or in lieu of the sidewalk, the temporary public walkway provided in accordance with Section 3307.2.2.

3307.2.5 Foot bridges. Where foot bridges are utilized as part of a sidewalk, walkway, or pathway, they shall be provided with guardrails for the entire length, and shall have cleats to prevent slipping. Where planks are used to pave the walkway of the foot bridge, the planks shall be laid close and securely fastened to prevent displacement. Planks shall be of uniform thickness, and all exposed ends of ramps shall be provided with beveled fillers to eliminate tripping hazards.

3307.2.6 Requirements for sidewalks, temporary walkways, foot bridges, and pathways. Sidewalks, walkways, foot bridges, and pathways that remain open to the public shall be accessible and shall be provided with:

1. A continuous clear path, free of obstruction, at least 5 feet (1524 mm) in width;
2. A durable walking surface capable of supporting all imposed loads and in no case shall the design live loads be less than 150 pounds per square foot ([732.3] 732.4 kg/m²);

3. Mirrors at all blind corners; Mirrors at locations where a pedestrian’s or bicyclist’s view is obstructed, including but not limited to blind corners, blind turns, and points where fencing or similar barriers project into a sidewalk, temporary walkway, foot bridge, or pathway;

4. For a temporary walkway or foot bridge where there is a change in elevation along the walkway or footbridge, a ramp with a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope) with a level landing at least 5 feet long at the top and bottom of each run, and if there is a total rise greater than 6 inches (152 mm), handrails; and

5. For a temporary walkway or foot bridge where the running slope of such walkway or foot bridge is steeper than one unit vertical in 20 units horizontal (5-percent slope) and there is a total rise greater than 6 inches (152 mm), handrails.

**Exception:** Where it is not possible to provide the continuous clear path to the extent required by Item 1 above, the sidewalk, temporary walkway, or pathway shall be kept open to the extent required by the Department of Transportation, and shall also comply with applicable provisions of ICC A117.1, the ADA Accessibility Guidelines for Buildings and Facilities and/or the ADA Accessibility Guidelines for Pedestrian Facilities in the Public Right-of-Way, as applicable.

3307.3 Sidewalk sheds and fences. Sidewalk sheds shall be provided as required by Section 3307.6. Fences shall be provided as required by Section 3307.7.

3307.4 Warning signs, personnel, and barriers. Warning signs, personnel, or barriers shall be provided to protect the public from hazards generated by construction or demolition activity in or adjacent to a public way as set forth in Sections 3307.4.1 through 3307.4.7.

3307.4.1 Obstructions and openings. Obstructions or openings located in a public way shall be marked and guarded by barriers, flags, or signs in accordance with the requirements of the Department of Transportation.

3307.4.2 Dangerous areas. In areas where special danger to the public exists, including but not limited to vehicle entrances and exits, hoisting areas, points of storage of explosives or highly flammable material, blasting areas, or discharge ends of chutes, descriptive warning signs shall be provided in accordance with the requirements of the Department of Transportation.

3307.4.3 Vehicular traffic. Whenever any work is being performed over, on, or in close proximity to a highway, street, or similar public way, control and protection of traffic shall be provided by barriers, signals, signs, flagperson, or other devices, equipment, and personnel in accordance with the requirements of the Department of Transportation.

3307.4.4 Areas open to persons other than workers. A flagperson shall be provided whenever intermittent operations are conducted on, or adjacent to, areas open to use by persons other than
workers, or when dangerous operations, such as blasting, may affect such areas. Where required by the Department of Transportation, designated personnel shall also be provided in addition to flag persons.

3307.4.5 Additional signs. In addition to the requirements of this section, information panels and signs shall also be provided as required by [Sections] Section 3301.9 [and 3301.10].

3307.4.6 Prohibited signs. [No illuminated business or advertising sign shall be permitted on any protective structure required by this section. Other than as specified in Sections 3301.9 or 3301.10 there shall be no sign, information, pictorial representation, or any business or advertising messages posted on a sidewalk shed, bridge, fence, or other protective structure listed in this section that is erected at the construction or demolition site.] See Section 3301.9.

3307.4.7 Work or storage zones. Where work or storage related to the construction or demolition of a building or structure is occurring adjacent to a sidewalk shed or equivalent overhead protection, and such area is not closed with a fence in accordance with Section 3307.7 or a permanent façade, a solid barrier extending at least 4 feet (1219 mm) in height from the level of the ground shall be provided. The space between the top of the barrier and the deck of the overhead protection shall be enclosed with a wire screen comprised of not less than number 18 gage wire mesh, or equivalent synthetic netting, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm).

[Exception: In the area where a material hoist, personnel hoist, hoistway, or chute is located, the solid barrier shall extend from level of the ground to the deck of the overhead protection.]

3307.4.7 Work or storage zones. Where work or storage related to the construction or demolition of a building or structure is occurring adjacent to a sidewalk shed or equivalent overhead protection, and such work or storage area is not contained within the enclosed and fenced area of the site as specified in Section 3307.7, fencing, barriers, or netting complying with items 1, 2, or 3 of this section shall be provided to separate the sidewalk, walkway, foot bridge, or pathway from the work or storage area.

1. In an area where a material hoist, personnel hoist, hoistway, chute, or hoisting zone is located, a solid opaque fence or barrier shall be provided. Such fence or barrier shall be securely attached to the sidewalk shed or equivalent overhead structure, and shall extend from the level of the ground to the deck of the sidewalk shed or equivalent overhead protection.

2. In an area where a special hazard exists, including but not limited to areas of high pile storage or areas where operations that produce sparks or debris are occurring, such as cutting or grinding, a fence or barrier shall be provided. Such fence or barrier shall be securely attached to the sidewalk shed or equivalent overhead structure, and shall extend from the level of the ground to the deck of the sidewalk shed or equivalent overhead protection. Portions of the fence or barrier at a height of 4 feet (1219 mm) or less shall be comprised of solid opaque material. Portions of the fence or barrier above a height of 4 feet (1219 mm) shall be comprised of material sufficient to protect the public from the special hazard and shall be transparent so as to allow a clear view into and from the area protected by the sidewalk shed or equivalent overhead protection, for example, chain link.
fencing, neatly framed panels consisting of nonfrangible acrylic paneling, or wire screen comprised of not less than number 18 gauge wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension.

3. In all other instances, one of the following shall be provided:

3.1 A chain link fence that is at least 8 feet (2438 mm) high;

3.2 A solid barrier that is at least 32 inches (813 mm) high, topped by a chain link fence extending to a height of at least 8 feet (2438 mm) above the level of the ground; or

3.3 A wire screen comprised of not less than number 18 gauge wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension. Such wire screen or synthetic netting shall extend from the ground to a height of at least 8 feet (2438 mm) above the level of the ground and shall be securely attached to the sidewalk shed or equivalent overhead protection. A solid barrier that is at least 32 inches (813 mm) high may be installed in lieu of bringing the netting fully to the ground, provided the bottom of the netting is also securely attached to the solid barrier.

3307.5 Watchperson and flagperson. Watchpersons shall be provided as required by Section 3303.3. Flagpersons shall be provided as required by Section 3307.4.

3307.6 Sidewalk sheds. Sidewalk sheds shall be provided as required by this section to protect pedestrians from construction or demolition operations.

3307.6.1 Permit. No sidewalk shed shall be installed without a permit in accordance with the requirements of Chapter 1 of Title 28 of the Administrative Code.

3307.6.2 Where required. A sidewalk shed shall be installed and maintained to protect all sidewalks, walkways, and pathways within the property line of a site, and all public sidewalks that abut the property, as follows:

1. When such sidewalk, walkway, or pathway is to be located immediately below a scaffold, mast climber, or chute. The sidewalk shed shall be installed prior to the installation of such equipment and shall not be removed until such equipment has been dismantled and/or removed from the area being protected;

2. When a structure higher than 40 feet (12 192 mm) or greater is to be constructed, and the sidewalk, walkway, or pathway is within a perpendicular distance from the new structure that is equal to or less than half the height of the new structure. The sidewalk shed shall be installed when the structure reaches the planned height of the shed. Such shed shall not be removed until the structure is enclosed, all exterior work has been completed and the sash is glazed above the second story, the façade has been cleaned down, and all
exterior chutes, scaffolds, mast climbers, and hoisting equipment have been dismantled and removed from the site;

3. When a portion of a façade over 40 feet (12 192 mm) above curb level is to be constructed, altered, maintained, or repaired, or a vertical or horizontal enlargement is to occur at a height over 40 feet (12 192 mm) above curb level, and the sidewalk, walkway, or pathway is within a perpendicular distance from the structure that is equal to or less than half the height of such façade work or vertical or horizontal enlargement. The sidewalk shed shall be installed prior to the commencement of work at a height greater than 40 feet (12 192 mm) above curb level. Such shed shall not be removed until the building is enclosed, all exterior work has been completed and the sash is glazed above the second story, the façade has been cleaned down, and all exterior chutes, scaffolds, mast climbers, and hoisting equipment have been dismantled and removed from the site; or

4. When a structure higher than 25 feet (7620 mm) is to undergo a full demolition, or when exterior partial demolition, other than that performed in conjunction with the construction, alteration, maintenance, or repair of a façade, is to occur at a height greater than 25 feet (7620 mm) above curb level, and the sidewalk, walkway, or pathway is within a perpendicular distance from the structure that is equal to or less than half the height of the demolition work. The sidewalk shed shall be installed prior to the commencement of demolition work. Such shed shall remain in place until the building has been razed to the height of the shed, or where the building is not being fully demolished, until all demolition work has been completed and all exterior chutes, scaffolds, mast climbers, and hoisting equipment have been dismantled and removed from the site.

Exceptions: Except where specifically required by the commissioner to protect the public from unique hazards at the site, sidewalk sheds are not required for:

1. Sidewalks, walkways, and pathways, or portions thereof, that are closed [for their full width] to the public.

2. Temporary walkways in accordance with Section 3307.2.3 that are provided with lighting and overhead protection equivalent to that afforded by a sidewalk shed.

3. Inspections, including a façade inspection, provided no work occurs during the inspection.

4. Sign hanging occurring by or under the direct and continuing supervision of a licensed sign hanger.

5. Window washing.

6. Work confined to the roof of an existing building, provided [the] that:

   6.1 The edge of the roof is enclosed to a height of 42 inches (1067 mm) with a solid parapet [or vertical safety netting meeting the requirements of Section 3308.5; or]
6.2 Such parapet is of sufficient strength to resist accidental impact during construction;

6.3 The work does not exceed the height of the parapet or is set back from the edge of the roof at a distance that is equal to or greater than half the height of the work; and

6.4 No work occurs on the parapet itself, and no material is placed or stored on the parapet during the course of the work.

7. Subject to the approval of the commissioner, work of limited scope and duration provided that:

7.1 During the course of the work the area immediately under the work zone is temporarily closed to the public by means of barriers, cones, or caution tape, and flagpersons are provided to direct pedestrian traffic;

7.2 At the end of the day the façade of the building is left in a safe condition and fully enclosed; and

7.3 There is compliance with Section 3307.2.1.

8. Locations where a cantilevered platform has been installed, provided that:

8.1 The cantilevered platform is approved by the commissioner;

8.2 The cantilevered platform provides overhead protection equivalent to a sidewalk shed; and

8.3 The cantilevered platform is installed below the level of work to be performed, excluding work performed at the first story.

9. Areas along an exposure that are located more than 5 feet (1524 mm) beyond those required for compliance with Item 1 of Section 3307.6.2, provided that:

9.1 The work is limited to the alteration, maintenance, or repair of a façade, and does not constitute a façade recladding as defined in rules promulgated by the commissioner; and

9.2 The entire exposure where façade work is to occur is covered by either:

9.2.1 A supported scaffold with netting and guardrails in accordance with Section 3314.8; or

9.2.2 A site specific engineered enclosure system in accordance with Section 3309.17.

3307.6.3 Area to be protected. The decking of the sidewalk shed shall extend [the]:
1. The full length of the area that falls within the zone specified in Section 3307.6.2, plus an additional 5 feet (1524 mm) beyond such length, or to within 18 inches (457 mm) of the curb line, whichever is less; or where the sidewalk shed is installed to protect against an unenclosed façade, work, or equipment that is greater than 100 feet (30 480 mm) above the ground, the decking of the sidewalk shed shall extend the full length of the area that falls within the zone specified in Section 3307.6.2, plus an additional 20 feet (6096 mm) on both ends beyond such length, or to within 18 inches (457 mm) of the curb line, whichever is less.

2. The decking of the sidewalk shed shall also extend the full width of the sidewalk, walkway, or pathway that remains open to the public falls within the zone specified in Section 3307.6.2, except for a clearance to avoid existing obstructions, not to exceed 18 inches (457 mm) along the curb and not to exceed 1 inch (25 mm) along the face of the building or structure.

Exceptions:

1. Where the sidewalk shed is installed to protect against an unenclosed façade, work, or equipment that is greater than 100 feet (30 480 mm) above the ground, the shed shall protect the full length of the area specified in Section 3307.6.2, plus an additional 20 feet (6096 mm) on both sides beyond such length, or to the curb line, whichever is less. Where it is not possible to bring the deck tightly against the face of an abutting building, structure, or fence, the deck shall be brought to within 1 inch (25 mm) of the face of such building, structure, or fence, with the resulting gap sealed or covered by material of sufficient manner and strength capable of trapping falling debris.

2. Openings in the deck to avoid tree trunks and branches, provided such opening is brought as close to the tree as practical without damaging the tree.

3307.6.4 Design and construction of sidewalk sheds. Sidewalk sheds shall be designed and constructed in accordance with the requirements of Sections 3307.6.4.1 through 3307.6.4.11.

3307.6.4.1 [Designer] Design required. All sidewalk sheds shall be designed by a registered design professional. The sidewalk shed design shall be detailed on plans developed by the registered design professional. The plans shall be specific to the site and shall, at a minimum, include a plan view and an elevation view, with full dimensions, detailing:

1. The site;

2. The sidewalk shed;

3. Design load of the sidewalk shed (e.g. light duty, heavy duty);

4. All obstructions at the site that may interfere with the sidewalk shed, including but not limited to those listed in Section 3307.6.4.9;

5. Dunnage, blocking, or other founding material for the sidewalk shed, including details necessary to satisfy the requirements of Item 2.3 of Section 3307.6.4.10;
6. Anchorage of the sidewalk shed to the sidewalk or building, if necessary;

7. Materials or items to be placed or stored on the sidewalk shed, if authorized, in accordance with the requirements of Section 3307.6.4.2.2;

8. Any items connected to or attached to the sidewalk shed;

9. Locations, dimensions, and connection details of all signage, including parapet information panels, to be installed on the sidewalk shed; and

10. Location of any scaffolds and reference to a related application, if applicable.

[Exception: Sidewalk sheds that conform to a design approved by the commissioner or the Board of Standards and Appeals, provided the shed is installed at the site in accordance with the standard design.]

3307.6.4.2 Design loads. All sidewalk sheds shall be designed as a heavy duty sidewalk shed to carry a live load of at least 300 pounds per square foot ([1464.6 kg/m²] 1464.7 kg/m²). However, where the shed is installed to protect from work performed at a height of less than 100 feet (30 480 mm) above the ground, the sidewalk shed may be designed as a light duty sidewalk shed to carry a live load of at least 150 pounds per square foot ([732.3] 732.4 kg/m²), provided that no item is stored or placed upon the shed.

3307.6.4.2.1 Wind and other loads. The effect of wind and other loads on the sidewalk shed, and any item placed or attached on or to the shed, shall be considered in the design in accordance with Chapter 16.

3307.6.4.2.2 Storage. Storage on sidewalk sheds shall be as follows:

1. No item shall be stored or placed upon a sidewalk shed designed as a light duty sidewalk shed under Section 3307.6.4.2.

2. [No material shall] Material may be stored or placed upon a sidewalk shed designed as a heavy duty sidewalk shed under Section 3307.6.4.2, [unless the] provided conditions 2.1 through 2.4 are met:

2.1. The shed is designed for such storage, with such areas of storage or placement clearly designated on the drawings.

2.2. Where an item is to be stored or placed upon a heavy duty sidewalk shed, and such storage or placement is not in excess of 150 pounds per square foot ([732.3] 732.4 kg/m²) on any square foot area of the sidewalk shed, the design live load of 300 pounds per square foot ([1464.6 kg/m²] 1464.7 kg/m²) need not be increased.

2.3. Where an item is to be stored or placed upon a heavy duty sidewalk shed, and such storage or placement is in excess of 150 pounds per square foot ([732.3] 732.4 kg/m²) on any square foot area of the sidewalk shed, such shed shall be designed to carry:
2.1. The live load of 300 pounds per square foot (1464.6 kg/m²) required of a heavy duty sidewalk shed; and

2.2. The load of the item to be placed or stored upon the shed, minus 150 pounds per square foot (732.4 kg/m²).

2.4. The decking of the sidewalk shed does not consist of light-transmitting plastic material.

3307.6.4.3 Materials. Sidewalk sheds shall be constructed out of wood, steel, or other material possessing equivalent strength and suitability.

3307.6.4.4 Vertical members and beams. Vertical members and beams of the sidewalk shed shall conform with the following:

1. Vertical members and beams shall be adequately braced and connected to prevent displacement or distortion of the framework.

2. The vertical members of the sidewalk shed shall be plumb, with a tolerance of L/100, with “L” measured as the distance from the ground to the first [X-brace] cross brace or bottom of the beam.

3. Vertical members shall not be placed into the street unless approved by the Department of Transportation and protected in accordance with Department of Transportation requirements.

4. Vertical members placed on the sidewalk shall not be placed closer than 18 inches (455 mm) from the face of the [curbline] curb line.

5. Vertical members shall be placed at least 7 feet (2134 mm) from the edge of a curb cut or vehicular access point, or where placed closer, the vertical members nearest the curb cut or vehicular access point shall be protected against displacement by vehicles, or shall be identified with high visibility marking.

6. Vertical members, cross bracing, struts, and similar lateral support shall be placed in such a manner that the sidewalk, walkway, or pathway continues to comply with the requirements of Section 3307.2.6 and avoids interference in accordance with Section 3307.6.4.9.

7. Where the sidewalk shed is installed in conjunction with the construction of a new major building, a horizontal span of at least 10 feet (3048 mm), as measured down the length of the sidewalk, walkway, or pathway, shall be provided between all vertical members, except where a shorter span is needed to avoid the curb or obstructions in accordance with Section 3307.6.4.9; and all cross bracing, struts, and similar lateral support between vertical members shall be placed a minimum of 8 feet (2438 mm) above the level of the sidewalk, walkway, or pathway. However, cross bracing, struts, and similar lateral support between vertical members may be placed lower where it is installed to guard against a tripping hazard in accordance with Item 2.5 of Section [2.5].
3307.6.4.10. Mast sections, box towers, or similar elements used as vertical members shall, for the purposes of this item, be considered to be one vertical member, provided its base does not exceed 24 inches by 24 inches (610 x 610 mm). In the alternative, a sidewalk shed that is of a model whose prototype won a design competition recognized by the city may be installed instead.

8. Where the decking of the sidewalk shed consists of light-transmitting plastic material, all cross bracing, struts, and similar lateral support between vertical members shall be placed a minimum of 8 feet (2438 mm) above the level of the sidewalk, walkway, or pathway. However, cross bracing, struts, and similar lateral support between vertical members may be placed lower where it is installed to guard against a tripping hazard in accordance with Item 2.5 of Section 3307.6.4.10.

3307.6.4.5 Deck. The deck of the sidewalk shed shall conform with the following:

1. The deck shall consist of 2-inch (51 mm) thick wood plank or equivalent material, or shall consist of light-transmitting plastic material, which shall include an anti-slip walking surface integral to the material or as an applied coating.

2. The deck shall be capable of sustaining the loads required by Section 3307.6.4.2.

3. The deck shall be solid, or shall consist of planking or panels laid close and made tight.

4. Where the edge of the sidewalk shed abuts a building or structure, the decking shall be brought tight to the face of the building or structure. Exception: Where it is not possible to bring the deck tightly against the face of the building or structure, the deck shall be brought to within 1 inch (25 mm) of the face of the building or structure, with the resulting gap sealed or covered by material of sufficient manner and strength capable of trapping falling debris. Where wood plank is used, corrugated metal or equivalent material shall be installed under the deck to catch fine grain material.

5. The deck of the sidewalk shed shall be brought tight to the face of any abutting building, structure, or fence, except for permissible gaps in accordance with Section 3307.6.3.

3307.6.4.6 Parapet. A vertical parapet at least 3 feet 6 inches (1067 mm) high, but no more than 4 feet (1219 mm) high, as measured from the deck of the sidewalk shed, shall be constructed along all edges of the sidewalk shed. Such parapet shall consist of solid plywood, corrugated metal, a galvanized wire screen consisting of not less than No. 16 steel wire gauge with a ½ inch (13 mm) debris mesh, or other equivalent material, and galvanized wire screen not less than No. 16 steel wire gauge with a ½ inch (13 mm) mesh. Parapets shall be securely attached to the shed with braced uprights. Parapet braces shall be made of metal. Temporary removal of a portion of the parapet is permitted for the handling of material, provided the parapet is immediately restored at the end of the handling operation.

Exceptions:
1. A parapet is not required along the edge of the sidewalk shed that abuts a building or structure.

2. A parapet is not required along the edge of a sidewalk shed that abuts an area that is closed to the public.

3. In lieu of a vertical parapet, angled protection of identical construction to a parapet that inclines outward at an angle of 45 degrees (0.79 rad) may be utilized provided such protection is securely attached to the deck, and provided the angled protection extends to a point that intersects a line drawn 3 feet 6 inches (1067 mm) above the level of the deck.

4. Where the sidewalk shed is installed in conjunction with the full or partial demolition of a building or structure, other than work limited to a façade project, the parapet shall consist of plywood or other equivalent solid material.

3307.6.4.7 Height. The passageway under the shed shall have a minimum clear ceiling height of 8 feet (2438 mm).

Exception: Lights that extend no more than 8 inches (203 mm) below the level of the deck shall be excluded from the clear ceiling height measurement.

3307.6.4.8 Lighting. Sidewalk shed lighting shall be in conformance with the following:

1. The underside of sidewalk sheds shall be illuminated at all times either by daylight or electric light. The level of illumination shall be uniformly distributed along the entire length of the shed with a minimum of 1 foot-candle (11 lux) measured at the level of the walking surface with a minimum luminous efficacy of 45 lumens per watt or greater and be rated to operate at temperatures of 5°F (-15°C) and higher.

2. All lamps shall be enclosed in water-resistant and vandal-resistant fixtures, and all lamps, wiring, and accessory components shall conform to the requirements of the New York City Electrical Code.

3. Photosensors may be used to control electric lighting according to the amount of daylight available. All photosensors shall be equipped for fail-safe operation ensuring that if the sensor or control fails, the lamps will provide the lighting levels required by this section.

3307.6.4.9 Avoid interference. Sidewalk sheds shall be installed and located so to not unreasonably obstruct, either visually or physically, traffic, curb cuts, curb ramps, vehicular access points, street lighting poles, traffic lights or signs, fire hydrants, fire department connections, water sampling stations, bus shelters, or other street furniture, trees, adjacent
show windows, [or] means of ingress/egress, subway entrances, or access points to vaults, manholes, or other underground structures.

3307.6.4.10 Founding. Sidewalk shed founding shall be in accordance with the following:

1. The surface upon which the shed [rests] ultimately bears, such as the street, sidewalk, or ground, shall be capable of supporting the design loads of the sidewalk shed, including any item placed or stored upon the shed, without damage, settlement, or deformation to such surface.

2. Vertical members of the sidewalk shed shall bear upon base plates, mud sills, dunnage, or other adequate firm foundation. Such items shall be:
   2.1. Made of suitable firm material. Supports such as barrels, boxes, loose brick, loose stone, hollow block, or other unstable materials shall not be used.
   2.2. Capable of transmitting and distributing the load imposed by the sidewalk shed vertical member to the underlying surface.
   2.3. Secured against movement in any direction. When consisting of several pieces of material, such as multiple wood blocks, the material shall be nailed or otherwise positively connected together to prevent dislodgement. When more than 1 inch (25 mm) thick, the material shall be nailed or otherwise positively connected to the sidewalk shed vertical member.
   2.4. Installed in such a manner that the sidewalk shed vertical member is fully supported across all horizontal dimensions.
   2.5. Installed in such a manner that no portion extends more than 1.5 inches (38 mm) beyond any horizontal edge of the sidewalk shed vertical member, or where it extends beyond such distance, is adequately guarded or barricaded to prevent tripping hazards; the installation of cross bracing, struts, and similar lateral support between the corresponding vertical members of the sidewalk shed will satisfy this requirement.

3307.6.4.11 Color. Sidewalk sheds erected on or after July 1, 2013, shall [be painted the color of hunter green.] meet the following color requirements:

1. Solid parapet panels shall be hunter green.
2. Mesh parapet panels shall be hunter green or metallic gray.
3. Portions of parapet panel framing members visible to the public shall be hunter green. This includes side and back portions of such parapet panel framing members that may be visible through mesh panels.
4. Vertical members, cross bracing, and other metallic components shall be hunter green or metallic gray.
Exception: Sidewalk sheds that are of a model whose prototype won a design competition recognized by the city may be white in color.

3307.6.5 Installation, adjustment, maintenance, repair, use, inspection, and removal of sidewalk sheds. Sidewalk sheds shall be installed, adjusted, maintained, repaired, used, inspected, and removed in accordance with the following requirements.

3307.6.5.1 Safe condition. Sidewalk sheds shall be maintained in a safe condition and used in a manner that eliminates hazards to the public. Any hazardous conditions or defects discovered with the sidewalk shed shall immediately be brought to the attention of the permit holder for the shed.

3307.6.5.2 Supervision of installation, adjustment, repair, and removal. The installation, adjustment, repair, or removal of a sidewalk shed shall be performed under the supervision of a competent person designated by the permit holder for the sidewalk shed.

3307.6.5.3 Responsibility for maintenance and use. Sidewalk sheds shall be maintained and used by the general contractor, or where there is no general contractor, the contractor causing the work to be performed, or where there is no active work, the building owner.

3307.6.5.4 Storage or placement of items. No item shall be stored or placed upon a sidewalk shed unless such shed has been designed for such storage or placement in accordance with Section 3307.6.4.2.2. Where such shed has been so designed, items shall be stored or placed only in the area designated on the drawings for storage. Any item placed or stored upon a sidewalk shed shall be secured in a manner to prevent dislodgement, displacement by wind, and shall be distributed so as not to exceed the design limits of the sidewalk shed.

3307.6.5.5 Cleaning. The decks of sidewalk sheds shall be broom swept and cleaned of material daily while active work is occurring at the site.

3307.6.5.6 Sharp edges. Where located in an area that could pose a danger to the public, bolts and screws without a cap, and sharp edges, shall be protected to prevent injury to the public.

3307.6.5.7 Installation inspection. Upon completion of the installation of a sidewalk shed, the shed shall be inspected by a qualified person designated by the designer, the permit holder for the shed, or a third party acceptable to both the designer and the permit holder to verify that the sidewalk shed is in a safe condition and has been installed in accordance with drawings and the requirements of this chapter. [Following the inspection, the qualified person who inspected the sidewalk shed shall prepare, sign, and date an installation inspection report. A new installation inspection report shall be prepared each time the sidewalk shed is reinstalled at the site.]

3307.6.5.8 Periodic inspection. [Six months following the initial installation inspection, and every six months thereafter, the sidewalk shed shall be inspected by a qualified person designated by the designer, the permit holder for the shed, or a third party acceptable to both the designer and the permit holder to verify that the sidewalk shed is in a safe condition and is in compliance with drawings and the requirements of this chapter. Following the inspection, the qualified person who inspected the sidewalk shed shall prepare, sign, and date an]
A periodic inspection of the sidewalk shed shall be performed six months following the last installation, adjustment, or repair inspection required by Section 3307.6.5.7 or 3307.6.5.9, or where no such inspection has occurred within six months, six months following the last periodic inspection. The periodic inspection shall be performed by a qualified person designated by the designer, the permit holder for the shed, or a third party acceptable to both the designer and the permit holder to verify that the sidewalk shed is in a safe condition and is in compliance with drawings and the requirements of this chapter.

3307.6.5.9 Inspection following an adjustment or repair. Following a repair or adjustment at a site, the sidewalk shed shall be inspected by a qualified person designated by the designer, the permit holder for the shed, or a third party acceptable to both the designer and the permit holder to verify the adequacy of the repair or adjustment and to verify the sidewalk shed is in a safe condition and is in compliance with drawings and the requirements of this chapter. [The results of the inspection shall be recorded, signed, and dated by the person who performed the inspection.]

3307.6.5.10 Daily inspection. Sidewalk sheds shall be visually inspected daily by a person designated by the general contractor, or where there is no general contractor, the contractor causing the work to be performed, or where there is no active work, by the building owner to verify:

1. The lights are functioning;
2. No brace or rail is hanging unattached at one or more ends;
3. No portions of the support structure are disconnected;
4. No section of parapet is missing; and
5. All legs remain on their support and are supported to the ground, and any wood blocking is free of visible rot.

Exception: The inspections for a scaffold suspended or supported above a sidewalk shed shall be in accordance with Section 3314.

3307.6.5.10.1 Daily inspection report. A written record of such inspections shall be maintained by the contractor or owner, with such record signed and dated by the person who performed the inspection. Defects discovered as a result of the inspection shall immediately be brought to the attention of the permit holder for the shed.

3307.6.5.11 Inspection reports. The results of an inspection required by Sections 3307.6.5.7 through 3307.6.5.10 shall be recorded in an inspection report that is prepared, signed, and dated by the person who performed the inspection. In lieu of compliance with the requirements of Section 3301.7, copies of the inspection reports required by Sections 3307.6.5.7 through 3307.6.5.10 shall be maintained at the site by the general contractor, or where there is no general contractor, the contractor causing the work to be performed, or where there is no active work, by the building owner.
3307.6.5.12 Discovery of defects. Defects discovered during the course of performing an inspection required by Sections 3307.6.5.7 through 3307.6.5.10 shall immediately be brought to the attention of the permit holder for the shed.

[3307.6.5.11] 3307.6.5.13 Notification of removal. The permit holder for the shed shall notify the department no more than two business days following the complete removal of a sidewalk shed.

3307.6.5.14 Signage. Only signage, including parapet information panels, allowed by Section 3301.9, and indicated on the sidewalk shed design drawings in accordance with Section 3307.6.4.1, shall be installed on the sidewalk shed. Sidewalk shed signage shall only be installed, adjusted, maintained, repaired, and removed by the permit holder for the shed or an entity authorized by the permit holder.

3307.7 Fences. All sites where a new building is being constructed, or a building is being demolished to grade, shall be enclosed with a fence. Fences shall also be installed to fully or partially enclosed sites, as necessary, where there exists an open excavation, an unenclosed portion of a building accessible at grade, or other hazard to the public. Such fences shall be at least 8 feet (2438 mm) high, built solid for their entire length, out of wood or other suitable material, and shall be returned at the ends to the extent necessary to effectively close off the site.

Exceptions: The commissioner may approve the use of a chain link fence to:

1. Secure a site where work has been interrupted or abandoned and discontinued, and a registered design professional has certified that all construction or demolition equipment and material that pose a hazard to the safety of the public and property have been removed from the site or safely secured. Prior to the resumption of work, the chain link fence shall be replaced by a solid fence meeting the requirements of this section.

2. Secure portions of a site where a one-, two-, or three-family building that is 40 feet (12 192 mm) or less in height, or a commercial building 40 feet (12 192 mm) or less in height, is being constructed or demolished and such building is setback at least 15 feet (4572 mm) from sidewalks or spaces accessible to the public and 5 feet (1524 mm) from adjoining buildings or structures.

3307.7.1 Location of fence. Where the fence is installed to fully enclose a site, the fence shall be constructed along the inside edge of the sidewalk or walkway and along the edges of the property line. Where a fence is installed to partially enclose a site, the fence shall be installed as necessary to prevent public access to any excavation or unenclosed portion of the building accessible at grade. Fences shall be installed and located so to not unreasonably obstruct, either visually or physically, traffic, curb cuts, curb ramps, vehicular access points, street lighting poles, traffic lights or signs, fire hydrants, fire department connections, water sampling stations, bus shelters, or other street furniture, trees, [ref] means of ingress/egress, or access points to vaults, manholes, or other underground structures.

Exceptions:
1. Fences may encroach onto the sidewalk in accordance with Department of Transportation requirements.

2. A fence is not required to be installed along the party wall of an adjoining property, provided no material is stored along such wall during the course of work.

3307.7.2 Gates. Gates shall be sliding or shall swing into areas not accessible to the public, and shall be provided only where required for access to the site or to facilitate the work. Gates shall consist of the same material and construction as the rest of the fence. Gates shall be kept closed at all times except during actual loading and unloading operations, when individuals or vehicles are actively entering or leaving the site, or as needed to facilitate active work around the gate.

   **Exception:** Where approved by the commissioner, chain link gates may be utilized in a solid fence.

3307.7.3 Viewing panels. Viewing panels shall be provided in solid fences erected on or after July 1, 2013, at a rate one for every 25 linear feet (7.6 m) per frontage, with a minimum of one per frontage. Viewing panels shall be 12 inches by 12 inches (305 by 305 mm) in size and shall be blocked with plexiglass or an equivalent nonfrangible material. The top of the viewing panel shall be located no more than 6 feet (1829 mm) above the level of the ground, and the bottom of the viewing panel shall be located no less than 3 feet (914 mm) above the level of the ground.

3307.7.4 Chain link fences or gates. Where a chain link fence or gate is utilized, the following requirements shall apply:

   1. The fence or gate shall be made of new materials or, where salvaged, the fence shall be in good condition;

   2. The fence posts shall be of galvanized steel pipe of a diameter that provides rigidity. Posts shall be suitable for setting in concrete footings, for driving into the ground, or for inserting in precast concrete blocks. Such posts shall be spaced in a manner that maintains the required rigidity to form a safe exterior fence;

   3. The fence or gate shall be constructed of woven, galvanized steel wire mesh and shall be of sufficient strength and rigidity to prevent access to the site; and

   4. The fence or gate shall be covered with an opaque sturdy cloth “windscreen” fabric or equivalent netting at all locations. Fabric or equivalent netting shall be securely attached to the fence or gate in accordance with manufacturer specifications. The fabric, or equivalent netting, and the fence shall be maintained in a neat, rigid and taut appearance.

3307.7.5 Design of fences. Fence installations shall be designed by a registered design professional. The effect of wind on the fence shall be considered in the design in accordance with Chapter 16.

   **[Exceptions:]**
3307.7.6 Installation and removal of fences. Fences required by this section shall be installed prior to the commencement of work. Such required fences shall not be removed until:

1. The site has been filled and graded and all hazards to the public removed; or

2. The façade has been enclosed, with all doors and windows installed, and all exterior work, except for incidental work including but not limited to landscaping, painting, weatherproofing, or installation of signs or fixtures, has been completed.

3307.7.7 Condition of fences. All fences and related windscreens or netting shall be installed, adjusted, repaired, and maintained in a sound condition, free of protruding or loose nails, wood, or metal, and with posts in an upright position restrained to prevent the fence from leaning or overturning.

3307.7.8 Inspection of fences. Fences and related windscreens or netting shall be visually inspected at least once a week, or where a sidewalk shed is installed at the site, daily, by a person designated by the general contractor, or where there is no general contractor, the contractor causing the work to be performed, or where there is no active work, by the building owner to verify the fence and related windscreens or netting remains in a safe condition in accordance with Section 3307.7.7.

3307.7.8.1 Inspection reports. The results of the inspection shall be recorded in an inspection report that is prepared, signed, and dated by the person who performed the inspection. In lieu of compliance with the requirements of Section 3301.7, copies of the inspection report shall be maintained at the site by the general contractor, or where there is no general contractor, the contractor causing the work to be performed, or where there is no active work, by the building owner.

3307.7.8.2 Discovery of defects. Defects discovered during the course of performing the inspection shall immediately be brought to the attention of the permit holder for the fence.

[3307.7.8] 3307.7.9 Color. Fences erected on or after July 1, 2013, shall be painted hunter green.

Exception: Where the sidewalk shed installed at the site is of a model whose prototype won a design competition recognized by the city, the fence may be painted the same color as the shed.

3307.8 Maintaining Department of Transportation pedestrian and bicyclist protection in place. Notwithstanding other provisions of law, pedestrian and bicyclist protection required by the Department of Transportation shall be maintained in place and kept in good order for the entire length of time pedestrians and/or bicyclists may be endangered.
3307.9 Removing protection at conclusion of work. Public property shall be left in as good a condition following the completion of the construction or demolition work as it was before such work was commenced. Except where otherwise required by this code, the owner or the owner’s agent shall, upon the completion of the construction or demolition work, immediately remove all sidewalk sheds, fences, guard rails, temporary walkways, material, and other obstructions in or adjacent to the public way.

3307.10 Facilitating city work. In the event a duly authorized city agency must repair, maintain, or install city property, including but not limited to intersection control signs, electrical equipment, traffic signals, lane markings, sewer and water manholes, bus shelters, street lighting, other street furniture, or fire hydrants, at a location where pedestrian protection required by this chapter is located, such pedestrian protection shall be removed as directed by the department of buildings as long as the removal is deemed to be safe and, if necessary, suitable appropriate pedestrian protection that does not interfere with the work of such city agency is installed.

§ 39. Section BC 3308 of the New York city building code, as added by local law number 141 for the year 2013, is amended to read as follows:

SECTION BC 3308
[PROTECTION OF UNENCLOSED PERIMETERS] UNENCLOSED PERIMETER PROTECTION

3308.1 Scope. [Safety netting systems and guardrail systems shall be provided as required by this section to protect unenclosed perimeters.] Protection shall be provided along unenclosed perimeters as required by this section and rules promulgated by the commissioner, including but not limited to safety netting systems, guardrail systems, cocoon systems, climbing formwork, and enclosure panels. Except where this section authorizes the temporary removal of unenclosed perimeter protection, no work shall occur, nor shall materials be stored on any level where required unenclosed perimeter protection is not installed.

3308.2 Permit. [A permit is not required for the installation of safety netting systems and guardrail systems that are in accordance with this section. A permit is required for alternative methods granted under Section 3308.8, including but not limited to cocoon systems, climbing formwork, and enclosure panels.] A permit is required for the installation of unenclosed perimeter protection.

Exceptions: A permit is not required for:

1. Vertical safety netting systems that are in accordance with Sections 3308.5;

2. Horizontal safety netting systems that are in accordance with Section 3308.6; or

3. Guardrail systems that are in accordance with Section 3308.7.

3308.3 [Safety netting design] Design and documentation of unenclosed perimeter protection. [Safety netting] Unenclosed perimeter protection shall be designed and provided with documentation in accordance with Sections 3308.3.1 through 3308.3.5.
**Exception:** The requirements of Sections 3308.3.1, and 3308.3.3 through 3308.3.5, shall not apply to guardrail systems. The requirements of Section 3308.7 shall apply to guardrail systems.

3308.3.1 Design. [Safety netting systems] Unenclosed perimeter protection shall be designed by a registered design professional to meet temporary loads, including but not limited to wind, as prescribed in Chapter 16. The registered design professional shall take the supporting structure into account when designing the installation and shall include details of connections, anchorages, and supports. The minimum loads for vertical net cables required by Section 3308.5.3 need not be added to wind loads in determining the maximum lateral force, but in no event shall the maximum design load for the cables be less than that required by Section 3308.5.3. A reduction in the surface area due to the openings in vertical or horizontal net fabric or partially enclosed perimeter panel is permitted provided that the force at design wind speed is derived from manufacturers’ test data or other testing or methods acceptable to the commissioner.

3308.3.2 Site safety plans. Details of the [safety netting systems] unenclosed perimeter protection shall also be shown on the site safety plan, where such plan is required by [Section 3310] this chapter.

3308.3.3 Make and model. The make and model of [vertical and horizontal netting] unenclosed perimeter protection, along with the connections and supports, shall be acceptable to the registered design professional responsible for the design of the [safety netting systems] unenclosed perimeter protection in accordance with Section 3308.3.1. The make and model, along with acceptance of the make and model by such registered design professional, shall be indicated as a note on the drawings, or in the form of a signed, sealed, and dated letter from such registered design professional that is kept with the drawings.

3308.3.4 Flame retardant. Vertical and horizontal safety netting used for unenclosed perimeter protection shall be flame retardant in accordance with NFPA 701. Documentation of such shall be provided by the manufacturer and shall be noted on the drawings by the registered design professional responsible for the design of the safety netting systems in accordance with Section 3308.3.1, or shall be recorded by such registered design professional in the form of a signed, sealed, and dated letter from such registered design professional, with such letter kept with the drawings.

3308.3.5 Tensile strength. The tensile strength for the structural net utilized in connection with [the] a horizontal safety netting system shall be noted on the drawings by the registered design professional responsible for the design of the safety netting systems in accordance with Section 3308.3.1, or shall be recorded by such registered design professional in the form of a signed, sealed, and dated letter from such registered design professional, with such letter kept with the drawings. Where required by Section 3308.6.3, the strength shall be confirmed by testing; the results of the test shall be documented in the form of a signed, sealed, and dated letter from the registered design professional responsible for the design of the safety netting systems in accordance with Section 3308.3.1. Such letter shall be kept with the drawings.

3308.4 Responsibility and supervision. The permit holder for the project, or where a permit is required by Section 3308.2, the [permit] holder of such permit, shall be responsible for complying with the requirements of Section 3308. A competent person designated by such responsible permit holder shall supervise the installation, reinstallation, [inspection,] adjustment, maintenance, repair,
and temporary or permanent removal of all [safety netting systems and guardrail systems] unenclosed perimeter protection, along with any support, connection, or component[, or alternative methods granted under Section 3308.8]. The inspection of unenclosed perimeter protection shall be conducted in accordance with the requirements of Section 3308.9.3.

[Exception: Where this section requires another entity to perform an inspection.]

3308.5 Vertical safety netting systems. Vertical safety netting shall be installed, [and] maintained [to cover], and provided along all unenclosed perimeters.

Exceptions:

1. Vertical safety netting is not required [at the] for:
   1.1. [Story] The story at grade, provided it is less than 6 feet (1829 mm) above the level of the adjoining ground or structure; or
   1.2. The working deck; or
   1.3. Any story in concrete construction where the formwork has not been stripped, provided such floor is no more than four stories or 40 feet (12 192 mm) below the working deck, whichever is less; or
   1.4. Any story in steel construction where the concrete slab has not been placed, provided that no work, other than steel erection or metal deck placement, is occurring on that story.

2. Vertical safety netting is not required at a [level] location where a supported scaffold [covers the full width of the unenclosed perimeter,] has been installed provided the scaffold is decked [and flush against] even with the building at such level where the unenclosed perimeter exists, with no gap between the scaffold deck and the building deck greater than 3 inches (76 mm), and also provided that the scaffold is provided with netting and guardrails in accordance with Section 3314.8.

3. Vertical safety netting is not required to protect an unenclosed window opening, provided such window opening is enclosed with a sill not less than [2] 3 feet 6 inches ([762] [1067] mm) in height [and protected with vertical mullions or piers with a maximum opening of 5 feet (1524 mm) and a noncorrosive wire cable capable of withstanding a load of at least 200 pounds (890 n) applied in any direction except upward].

4. Vertical safety netting is not required for a building whose final height will be no more than 4 stories or 40 feet (12 192 mm) [or less] in height, whichever is less.

5. Vertical safety netting is not required for a minor alteration or ordinary repair.

6. Vertical safety netting is not required at a location where an equivalent alternative system acceptable to the commissioner, including but not limited to cocoon systems, climbing formwork, or enclosure panels, has been installed.
3308.5.1 Openings. The largest opening area for debris netting when used vertically shall not be larger than 1 square inch ((25.4) 645 mm²), with no opening larger than 1 inch (25 mm) in the vertical or horizontal dimensions and 1 ½ inch (38 mm) in any other dimension.

3308.5.2 Height. Where required, vertical safety netting shall extend to cover all openings in the unenclosed perimeter to a height of at least 60 inches (1524 mm) above the floor or, where installed at the roof level, the roof.

3308.5.3 Cables. Vertical safety netting shall be secured to noncorrosive wire cable capable of withstanding a load of at least 200 pounds (90.7 kg) applied in any direction except upward. The cables shall be located at a height of 60 inches (1524 mm), 42 inches (1067 mm), 21 inches (533 mm), and 0 inches (0 mm) above the level of the floor or, where installed at the roof level, the roof. Where the vertical safety netting extends above 60 inches (1524 mm) in height, a cable shall also be placed at the top of the netting, with intermediate cables between the 60 inch (1524 mm) cable and the top cable as needed to satisfy the design requirements of Section 3308.3.

Exceptions: In lieu of a cable:

1. At 60 inches (1524 mm) or above, a toprail made of wood, pipe, or structural angle meeting the requirements of Section 3308.7.3.
2. At 42 inches (1067 mm) and 21 inches (533 mm), midrails made of wood, pipe, or structural angle meeting the requirements of Section 3308.7.3.
3. At 0 inches (0 mm), a toeboard meeting the requirements of Sections 3308.7.2 and 3308.7.3, provided the net is secured to the toeboard.

3308.5.3.1 Zero cable. Zero cables shall be secured to the deck and be maintained in contact with the deck such that debris cannot accumulate nor pass beneath the cable.

3308.5.4 Taut systems. Where the vertical safety netting relies upon a taut system, the net and cables shall be maintained taut. A positive tensioning system such as a turnbuckle shall be provided to keep the cable taut.

3308.5.5 Friction connections. Wood installations that utilize a friction connection are not permitted.

3308.5.6 Temporary removal. Vertical safety netting may be temporarily removed in the immediate area where active loading or unloading operations are occurring, or where perimeter work is occurring, provided that:

1. A controlled access zone is established to prevent unauthorized personnel from entering the area where the nets are removed; and

2. Immediately prior to the removal of the nets the floor is broom swept and cleared of all material, equipment, and debris to a distance of at least 10 feet (3048 mm), in all directions, from the area where the vertical nets will be removed.
[Exceptions: The following material does not have to be removed to a distance of at least 10 feet (3048 mm), in all directions:]

[1. Material and equipment related to the loading or unloading operation or perimeter work.]

[2. Stored materials in accordance with Section 3303.4.5.2.]

[3308.5.6.1 Restoring nets. The vertical safety nets shall be reinstalled immediately following the end of active loading or unloading operations, or active work, or at the end of the workday, whichever occurs sooner.]

3308.5.6 Temporary removal. The requirements of Section 3308.10 shall apply.

3308.5.6.1 Supplemental requirement for removal of toeboard or zero cable. The toeboard or zero cable may be temporarily removed to facilitate the placement and curing of a concrete floor slab, provided no other work occurs on such floor, and provided an alternative measure is utilized to secure the bottom of the netting as close to the deck as practical.

3308.5.7 Permanent removal. Vertical safety netting systems may be removed from floors where the façade has been installed and all such openings in the façade, including for windows, have been permanently enclosed to a height of at least 60 inches (1524 mm) above the floor. Vertical safety netting systems may be removed from the roof where the final parapet or guardrail has been installed.

3308.6 Horizontal safety netting systems. Horizontal safety netting shall meet the requirements of Sections 3308.6.1 through 3308.6.4.

3308.6.1 Where required. Horizontal safety netting shall be installed and maintained as follows.

3308.6.1.1 During construction. When, during the course of new building construction, or during the vertical or horizontal enlargement of an existing building, the [uppermost] topmost walkable floor reaches a height of six stories or 75 feet (22 860 mm), whichever is less, above the level of the ground or an adjoining roof, horizontal safety netting shall be provided at a level not more than two stories or 30 feet (9144 mm), whichever is less, below:

1. In concrete structures: the stripping floor; or

2. In steel structures: at the [uppermost] topmost story where the concrete floor slab has been [poured] placed.

Exception: When tarpaulins encase one or more floors immediately below the finished concrete floor in order to maintain temporary heat, the horizontal netting may be located no more than three floors below the finished concrete floor.

3308.6.1.2 During demolition. When the demolition of the exterior walls or the roof of a building occurs at a height greater than [6] six stories or 75 feet (22 860 mm), whichever is less, horizontal safety netting shall be provided at a level not more than two stories or 30 feet
(9144 mm), whichever is less, below the story from which the exterior walls and roof are being removed.

**Exception:** Demolition of exterior walls only for the purposes of the alteration, maintenance, or repair of a façade shall be in accordance with Section 3308.6.1.3.

**3308.6.1.3 During façade [construction] alteration, maintenance, or repair.** Where unique hazards associated with the [construction] alteration, maintenance, or repair of a façade exist to the public and property, horizontal safety netting shall be provided as required by the commissioner.

**3308.6.1.4 Alternative systems.** Alternative systems may be used in lieu of horizontal safety netting in accordance with the requirements of Sections 3308.6.1.4.1 or 3308.6.1.4.2.

**3308.6.1.4.1 Supported scaffold alternative.** [In lieu of horizontal safety netting in accordance with Sections 3308.6.1.1 through 3308.6.1.3, a supported scaffold may be utilized provided such supported scaffold covers the full width of the unenclosed perimeter.] Horizontal safety netting is not required at a location where a supported scaffold has been installed provided the scaffold is decked [and flush against] even with the building at the level where [work is occurring,] the horizontal safety net would otherwise be required to be installed and all levels above where the horizontal nets would otherwise be required, with no gap between the scaffold deck and the building deck greater than 3 inches (76 mm), and also provided that the scaffold is provided with netting and guardrails in accordance with Section 3314.8.

**3308.6.1.4.2 Other alternative systems.** Horizontal safety netting is not required at a location where an equivalent alternative system acceptable to the commissioner, including but not limited to cocoon systems or climbing formwork, covers the full height of the unenclosed perimeter at and above all levels where horizontal nets are required.

**3308.6.1.5 Hoisting area.** Where approved by the commissioner, horizontal safety netting may be omitted in designated crane, derrick, or hoisting areas.

**3308.6.1.6 Temporary removal.** [Horizontal safety netting may be temporarily removed in the immediate area where active loading or unloading operations are occurring, or where perimeter work is occurring, or to relocate the nets to a higher level, provided that no concrete work, including formwork placement or stripping, no structural steel placement or assembly, and no work within 10 feet (3048 mm) from an unenclosed perimeter of the building occurs on levels above the horizontal safety netting. Horizontal safety nets shall be reinstalled immediately following the end of active loading or unloading operations, or active work, or at the end of the workday, whichever occurs sooner.] The requirements of Section 3308.10 shall apply.

**3308.6.1.7 Permanent removal.** Horizontal safety netting systems may be permanently removed as follows:

1. Horizontal safety netting systems installed for the construction of a building in accordance with Section 3308.6.1.1 may be removed after all concrete has been
placed at the highest level and all concrete stripping work at the highest level has been completed.

2. Horizontal safety netting systems installed for the demolition of a building in accordance with Section 3308.6.1.2 may be removed after the demolition has progressed to within six stories or 75 feet (22 860 mm), whichever is less, above the ground or adjoining roof level.

3. Horizontal safety netting systems installed for façade work in accordance with Section 3308.6.1.3 may be removed after all façade work above the level of the nets has been completed.

3308.6.2 Horizontal safety netting systems requirements. Horizontal safety netting systems shall meet the requirements of Sections 5, 6.3, 6.4, 6.5, 6.6, 7, 8, 10.1, 10.4, 10.5, 10.6, 10.7, 11, and 13 of ANSI/ASSE ANSI/ASSP A10.11, as modified as follows.

3308.6.2.1 Personnel net. Throughout the standard, the term “personnel net” shall be amended to read “structural net.”

3308.6.2.2 Should and shall. Throughout the standard, the term “should” shall be amended to read “shall.”

3308.6.2.3 Entanglement. The phrase, “and to minimize entanglement of the persons head, arms, and legs when arresting the fall,” shall be deleted from Section 6.3 of ANSI/ASSE ANSI/ASSP A10.11.

3308.6.2.4 Arresting a fall. The phrase “when arresting a fall,” shall be deleted from Section 6.4 of ANSI/ASSE ANSI/ASSP A10.11.

3308.6.2.5 Size of debris net openings. Section 6.6 of ANSI/ASSE ANSI/ASSP A10.11 shall be amended by adding a new sentence at the end of the section, as follows, “However, in no case shall the largest opening area for debris netting when used horizontally be larger than ½ square inch (12.7 323 mm²), with no opening larger than ½ inch (13 mm²) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension.”

3308.6.2.6 Projection of nets. The phrase, “as to capture falling personnel” in Section 10.6 of ANSI/ASSE ANSI/ASSP A10.11 shall be amended to read “as to capture falling material.”

3308.6.2.7 Supports. The phrase, “or personnel” in Section 10.7 of ANSI/ASSE ANSI/ASSP A10.11 shall be amended to read, “or material.”

3308.6.2.8 Inspection. Section 11.1 of ANSI/ASSE ANSI/ASSP A10.11 shall be deleted in its entirety and replaced with the following, “Horizontal safety netting systems shall be inspected in accordance with Section 3308.9.3.”

3308.6.2.9 Dates tested. The phrase “Dates inspected” in Item 5 of Section 11.4 of ANSI/ASSE ANSI/ASSP A10.11 shall be amended to read “Dates tested.”
3308.6.2.10 Moving. Section 11.4 of ANSI/ASSE ANSI/ASSP A10.11 shall be amended to add a new Item 9, which shall read, “Dates nets were moved to a higher or lower level.”

3308.6.2.11 Cleaning. Section 13.2 of ANSI/ASSE ANSI/ASSP A10.11 shall be deleted and replaced with the following: “Horizontal safety netting shall not be used for storing material. Horizontal netting shall be cleaned, at least daily, to remove any items that fall into the nets.”

3308.6.3 Tensile strength test. The tensile strength of netting mesh and/or twine of a structural net utilized in conjunction with a horizontal safety netting system shall be confirmed by testing in accordance with ASTM D 5034 or ASTM D 5035. The testing criteria shall be developed by the registered design professional who designed the safety netting system in accordance with Section 3308.3. Such testing shall occur prior to the installation of the net at the site for any net that has previously been used, and for any net that has been installed at the site for two years and every two years thereafter. Nets that do not meet the specified tensile strength as required by Section 3308.3.5 shall not be utilized or shall be replaced.

3308.6.4 Identification of nets. Structural netting shall be identified in accordance with Section 7 of ANSI/ASSE ANSI/ASSP A10.11. Debris netting shall be identified by a letter or other documentation from the manufacturer stating the description and model. The identification for structural netting and debris netting shall be kept at the site until the netting is removed.

3308.7 Guardrail system. A guardrail system shall be installed, maintained, and provided along all unenclosed perimeters.

Exceptions: A guardrail system is not required at:

1. The story at grade, provided that it is less than 6 feet (1829 mm) above the level of the adjoining ground or structure.

2. Locations where vertical safety netting is installed in accordance with Section 3308.5.

3. Locations where a supported scaffold covers the full width of the unenclosed perimeter, has been installed provided the scaffold is decked and flush against the building at such level where the unenclosed perimeter exists, with no gap between the scaffold deck and the building deck greater than 3 inches (76 mm), and also provided that the scaffold is provided with netting and guardrails in accordance with Section 3314.8.

4. Locations where an equivalent alternative system acceptable to the commissioner, including but not limited to cocoon systems, climbing formwork, or enclosure panels, has been installed.

3308.7.1 Components. Guardrail systems shall include a toprail, midrail, toeboard, and posts.

3308.7.2 Height of railings and toeboard. Toprails, midrails, and toeboards shall be located as follows:
1. The top of the toprail shall be located at a height of 39 to 45 inches (991 and 1143 mm) above the floor.

2. The midrail shall be located at a height approximately midway between the toprail and the floor, or where more than one midrail is utilized, each shall be located equidistant from each other, the floor, and the toprail.

3. The toeboard shall be at least 3 ½ inches (89 mm) high and shall be installed so that there is not more than a ¼ inch (6 mm) gap between the floor and the bottom of the toeboard.

**Exception:** When conditions warrant, the height of the toprail may exceed the 45-inch (1143 mm) height provided additional midrails are installed so that there is no vertical gap larger than 24 inches (610 mm) between any toeboard, midrail, or toprail.

### 3308.7.3 Dimensions and materials.

Toprails, midrails, toeboards, and posts shall have the following dimensions and be constructed out of the following materials:

1. **Toprails shall, at a minimum, consist of:**
   
   1.1. 2 inch by 4 inch (51 mm by 102 mm) 1500 [lb-ft/in²] foot pounds per square inch (1.05 kgf/mm [2] 2) fiber (stress grade) construction grade lumber;
   
   1.2. 1 ½ inch (38 mm) nominal diameter ([schedule] Schedule 40) pipe;
   
   1.3. 2 inch by 2 inch by [⅜ inch] (51 mm by 51 mm by 10 mm) structural angle; or
   
   1.4. ¼ inch (6 mm) diameter [non corrosive] noncorrosive wire cable made of mild plow steel.

2. **Midrails shall, at a minimum, consist of:**
   
   2.1. 1 inch by 6 inch (25 mm by 152 mm) 1500 [lb-ft/in²] foot pounds per square inch (1.05 kgf/mm [2] 2) fiber (stress grade) construction grade lumber;
   
   2.2. 1 ½ inch (38 mm) nominal diameter ([schedule] Schedule 40) pipe;
   
   2.3. 2 inch by 2 inch by [⅜ inch] (51 mm by 51 mm by 10 mm) structural angle; or
   
   2.4. ¼ inch (6 mm) diameter [non corrosive] noncorrosive wire cable made of mild plow steel.

3. **Toeboards shall, at a minimum, consist of:**
   
   3.1. 1 inch by [6] 4 inch (25 mm by [452] 102 mm) lumber; or
   
   3.2. Metal plank at least 3½ inches (89 mm) high.
4. Toprails, midrails, and toeboards shall be securely fastened to upright posts spaced not more than 8 feet (2438 mm) apart. Such posts shall, at a minimum, consist of:

4.1. 2 inch by 4 inch (51 mm by 102 mm) 1500 [lb-ft/in²] foot pounds per square inch (1.05 kgf/mm [²]) fiber (stress grade) construction grade lumber;

4.2. 1½ inch (38 mm) nominal diameter (Schedule 40) pipe;

4.3. 2 inch by 2 inch by [3/8 in] (51 mm by 51 mm by 10 mm) structural angle; or

4.4. A building column.
Exceptions:

1. Guardrail systems designed by a registered design professional capable of withstanding, without failure:

   1.1. A force of at least 200 pounds (890 N) applied within 2 inches (51 mm) of the top edge, in any outward or downward direction, at any point along the top edge. Where the force is applied in a downward direction, the top edge shall not deflect more than 6 inches (152 mm) and in no case to a height less than 39 inches (991 mm) above the floor; and

   1.2. A load of at least 50 pounds (222 N) applied in any downward or horizontal direction at any point along the toeboard.

2. Posts supporting wire cable toprails and midrails, as well as the toeboards utilized in connection with such wire cable toprails and midrails, may be spaced more than 8 feet (2438 mm) apart provided that the posts are spaced such that where a force of 200 pounds (890 N) is applied in a downward direction along the top edge, the top edge shall not deflect more than 6 inches (152 mm) and in no case to a height less than 39 inches (991 mm) above the floor.

3308.7.4 Horizontal gap. The guardrail system shall be installed so that there exists no horizontal gap larger than 1 inch (25 mm) as measured along the perimeter of the building from the edge of the guardrail system to any building column or façade.

3308.7.5 Tensioning system. When made of wire cable, toprails and midrails shall be provided with a positive tensioning system, such as a turnbuckle, to keep the cable taut.

3308.7.6 Dislodgement. Guardrail systems shall be secured to prevent dislodgement by impact or wind.

[3308.7.7 Temporary removal. Guardrail systems may be temporarily removed in the immediate area where active loading or unloading operations are occurring, or where perimeter work is occurring, provided that:

[1. A controlled access zone is established to prevent unauthorized personnel from entering the area where the guardrail system is removed; and]

[2. Immediately prior to the removal of the guardrail system the floor is broom swept and cleared of all materials and equipment to a distance of at least 10 feet (3048 mm), in all directions, from the area where the guardrail system will be removed, except for material and equipment related to the loading or unloading operation or perimeter work or stored in accordance with Section 3303.4.5.2.]

[3308.7.7.1 Restoring guardrails. The guardrail system shall be reinstalled immediately following the end of active loading or unloading operations, or active work, or at the end of the workday, whichever occurs sooner.]

[Exception: Where material overhangs overnight in accordance with Section 3303.4.5.2.]
3308.7.7 Temporary removal. The requirements of Section 3308.10 shall apply.

3308.7.8 Permanent removal. Guardrail systems installed to protect unenclosed perimeters may be removed where vertical safety netting systems meeting the requirements of Section 3308.5 have been installed.

[3308.8 Modifications and alternative systems. The commissioner may, based upon a written request from a registered design professional, modify the requirements for safety netting systems and guardrail systems required by this section, including but not limited to the installation of alternative systems, provided such modification or alternative system meets or exceeds the level of safety afforded to the public and property by safety netting systems and guardrail systems installed in accordance with this section.]

[3308.8.1 Request content. A request submitted under Section 3308.8 shall include:]

[1. Details of the modification or alternative system to be utilized;]

[2. Any stipulations;]

[3. Demonstration that the request meets or exceeds the level of safety afforded to the public and property by safety netting systems and guardrail systems installed in accordance with this section;]

[4. Where applicable, a description of the practical difficulty of complying with code requirements;]

[5. Where applicable, a reference to the site safety monitoring program; and]

[6. Where an alternative system is proposed, a minimum level of inspection in accordance with the recommendations of the manufacturer of the alternative system.]

3308.8 Modifications. The commissioner may, based upon a written request from a registered design professional, modify the requirements for unenclosed perimeter protection in accordance with Section 28-103.3 of the Administrative Code.

3308.9 Unenclosed perimeter protection inspection, use, adjustment, maintenance, and repair. [Safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] Unenclosed perimeter protection shall be inspected, used, adjusted, maintained, repaired, and replaced in accordance with the design drawings, manufacturer recommendations specifications, and the requirements of this code. Where there is a discrepancy, the stricter standard shall apply.

3308.9.1 Safe condition. [Safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] Unenclosed perimeter protection shall be maintained in a safe condition and used in a manner that eliminates hazards to the public and property. Any hazardous conditions or defects discovered with such shall immediately be brought to the attention of the responsible permit holder under Section 3308.4.

3308.9.2 Precautions. Precautions shall be taken to prevent [safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] unenclosed perimeter
protection from being damaged by sunlight, abrasion, sand, rust, welding, cutting operations, chemicals, and airborne contaminants, where such systems are susceptible to damage by such.

3308.9.3 Inspections. [Safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] Unenclosed perimeter protection shall be inspected for compliance with this code, manufacturer specifications, and required drawings at least daily, as well as before and after each removal and restoration in accordance with Section 3308.10.3, and after each impact loading event, installation, reinstallation, adjustment, maintenance, or repair of [such] the unenclosed perimeter protection or any part or component of such. Where the job requires a site safety manager or coordinator in accordance with Section 3310, the inspection shall be performed by the site safety manager or coordinator, and a written record of such inspection maintained as part of the site safety log. Where the job does not require a site safety manager or coordinator, the inspection shall be performed by a competent person designated by the permit holder in accordance with Section 3308.4, with a record of such inspection prepared, initialed, and dated by such competent person.

3308.9.4 Removing from service. [Safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] Unenclosed perimeter protection showing signs of mildew, corrosion, wear, tears, breaks, frays, damage, or deterioration that may substantially affect the strength of such shall be immediately removed from service.

3308.9.5 Repair. Repairs to [safety net systems, guardrail systems, and alternative systems authorized under Section 3308.8] unenclosed perimeter protection shall be in accordance with the specifications of the manufacturer of such and shall provide the original manufacturer factor of safety, or where [none exists] manufacturer specifications do not exist, shall be repaired in accordance with specifications developed by the registered design professional responsible for the design of the [safety netting systems] unenclosed perimeter protection in accordance with Section 3308.3.1.

Exception: Structural nets and debris nets shall not be repaired.

3308.9.6 Vacuum cleaning. Areas in the vicinity of operations related to the installation, reinstallation, adjustment, maintenance, repair, temporary removal, or permanent removal of unenclosed perimeter protection systems that produce or typically produce small debris shall be vacuumed as the operation progresses. Examples of operations that produce small debris include, but are not limited to, the installation or removal of fasteners for a vertical netting system, chipping to expose curtain wall clips, preparation of the slab to install or receive exterior walls, and chopping or core drilling at perimeter for mechanical risers. Vacuum equipment shall be tethered or otherwise secured to prevent the equipment from falling.

3308.10 Temporary removal of unenclosed perimeter protection. Unenclosed perimeter protection, or portions thereof, may be temporarily removed in the immediate area where active loading or unloading operations are occurring, or to the extent necessary to facilitate active work at the perimeter, including but not limited to inspections or the relocation of unenclosed perimeter protection to a higher level, provided there is compliance with the following items:

1. All material, equipment, and debris on the floor is secured against dislodgement by wind or accidental impact:
2. A controlled access zone is established to prevent unauthorized personnel from entering the area where the unenclosed perimeter protection has been removed;

3. Prior to removal the floor is cleared of all material, equipment, and debris to a distance of at least 10 feet (3048 mm) in all directions from the area where the unenclosed perimeter protection is to be removed, except for material or equipment that is related to the active loading or unloading operation or active work at the perimeter, or that is stored in accordance with Section 3303.4.5.2;

4. Immediately prior to removal the floor is broom-swept to a distance of at least 10 feet (3048 mm) in all directions from the area where the unenclosed perimeter protection is to be removed and, in addition, areas in the immediate vicinity of the unenclosed perimeter protection are vacuumed, including areas around zero cables, toeboards, and spaces where trapped debris may have accumulated;

5. During removal operations areas are vacuumed as required by Section 3308.9.6;

6. A competent person supervises the operation as required by Section 3308.10.2;

7. Where vertical safety netting, guardrails, or equivalent alternative systems are removed, the removal does not extend past the column bays where the active loading or unloading operations are occurring or where active work at the perimeter is occurring; and

8. Where horizontal safety netting or equivalent alternative systems are removed, none of the following types of work occurs at or above the level where the horizontal safety netting or equivalent alternative system has been removed:

8.1. Concrete work, including formwork placement or stripping;

8.2. Structural steel placement or assembly; or

8.3. Any other work within 10 feet (3048 mm) from an unenclosed perimeter of the building.

3308.10.1 Restoring unenclosed perimeter protection. Unenclosed perimeter protection shall be reinstalled immediately following the end of the active loading or unloading operation or active work at the perimeter, or at the end of the shift, whichever occurs sooner. Immediately prior to restoring a guardrail system, vertical netting system, or equivalent alternative system, areas in the vicinity of the edge shall be vacuumed, and other areas to a distance of at least 10 feet (3048 mm), in all directions from the area where the unenclosed perimeter protection is removed, shall be broom-swept. Vacuum equipment shall be tethered or otherwise secured to prevent the equipment from falling.
Exceptions:

1. Where material overhangs overnight in accordance with Section 3303.4.5.2, guardrails shall be reinstalled the next work day immediately following the relocation of the material.

2. Where a toeboard or zero cable has been temporarily removed to facilitate the placement and curing of a concrete floor slab, the toeboard or zero cable shall be reinstalled as soon as practical.

3308.10.2 Competent person. The competent person designated in accordance with Section 3308.4 shall supervise the temporary removal and reinstallation of unenclosed perimeter protection, including all ancillary activities, such as preparing the area for the removal of the unenclosed perimeter protection, and shall ensure compliance with the requirements of Section 3308.10.

3308.10.3 Inspection. An inspection shall be performed immediately prior to the removal of unenclosed perimeter protection to verify compliance with the provisions of Section 3308.10. An inspection shall be performed immediately prior to restoring a guardrail system, vertical netting system, or equivalent alternative system to verify compliance with the cleaning provisions of Section 3308.10.1. An inspection shall be performed immediately after unenclosed perimeter protection is restored to verify compliance with this code, manufacturer specifications, and required drawings. These inspections shall be performed by the site safety manager, site safety coordinator, or competent person in accordance with Section 3308.9.3, and recorded in accordance with Section 3308.9.3.

§ 40. Section BC 3309 of the New York city building code, as amended by local law number 141 for the year 2013, section 3303.9.1 as amended by local law 97 for the year 2017, is amended to read as follows:

SECTION BC 3309
PROTECTION OF ADJOINING PROPERTY

3309.1 Protection required. Adjoining public and private property, including persons thereon, shall be protected from damage and injury during construction or demolition work in accordance with the requirements of this section. Protection must be provided for footings, foundations, party walls, chimneys, skylights and roofs as specified by this section. Provisions shall also be made to control water run-off and erosion during construction or demolition activities. Where the New York City Department of Environmental Protection has issued a stormwater construction permit for a covered development project, such run-off and erosion controls shall be installed and maintained in accordance with the rules of the Department of Environmental Protection and this code.

3309.1.1 Notification. Where a construction or demolition project will require access to adjoining property in accordance with this section, written notification shall be provided to the adjoining property owner at least 60 calendar days prior to the commencement of work. Such
notification shall describe the nature of work, estimated schedule and duration, details of inspections or monitoring to be performed on the adjoining property, protection to be installed on the adjoining property, and contact information for the project. Where no response is received, a second written notification shall be made no more than 45 calendar days, and not less than 30 calendar days, prior to the commencement of work.

3309.2 License to enter adjoining property. The responsibility of affording any license to enter adjoining property shall rest upon the owner of the adjoining property involved; and in case any tenant of such owner fails or refuses to permit the owner to afford such license, such failure or refusal shall be a cause for the owner to dispossess such tenant through appropriate legal proceedings for recovering possession of real property. Nothing in this chapter shall be construed to prohibit the owner of the property undertaking construction or demolition work from petitioning for a special proceeding pursuant to Section 881 of the Real Property Actions and Proceedings Law.

3309.3 Physical examination. When permission to enter upon adjoining property has been obtained, a physical examination of such property shall be conducted by the person causing the construction or demolition operations prior to the commencement of the operations and at reasonable periods during the progress of the work. Observed conditions shall be recorded by the person causing the construction or demolition operations, and such records shall be made available to the department upon request.

3309.4 Soil or foundation work affecting adjoining property. Whenever soil or foundation work occurs, regardless of the depth of such, the person who causes such to be made shall, at all times during the course of such work and at his or her own expense, preserve and protect from damage any adjoining structures, including but not limited to footings and foundations, provided such person is afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect the adjoining buildings and property, and to perform such work thereon as may be necessary for such purpose. If the person who causes the soil or foundation work is not afforded a license, such duty to preserve and protect the adjacent property shall devolve to the owner of such adjoining property, who shall be afforded a similar license with respect to the property where the soil or foundation work is to be made.

3309.4.1 Additional safeguards during excavation. The following additional requirements shall apply during excavation:

1. The person causing the excavation shall support the vertical and lateral load of the adjoining structure by proper foundations, underpinning, or other equivalent means where the level of the foundations of the adjoining structure is at or above the level of the bottom of the new excavation.

2. Where the existing adjoining structure is below the level of the construction or demolition, provision shall be made to support any increased vertical or lateral load on the existing adjoining structure caused by the construction or demolition.

3. Where the construction or demolition will result in a decrease in the frost protection for an existing foundation below the minimums established in Section 1805.3.1.
the existing foundation shall be modified as necessary to restore the required frost protection.

**3309.4.2 Support of party walls.** Where a party wall will be affected by excavation, regardless of the depth, the person who causes the excavation to be made shall preserve such party wall at his or her own expense so that it shall be, and shall remain, in a safe condition. Where an adjoining party wall is intended to be used by the person causing an excavation to be made, and such party wall is in good condition and sufficient for the uses of the existing and proposed buildings, it shall be the duty of such person to protect such party wall and support it by proper foundations, so that it shall be and remain practically as safe as it was before the excavation was commenced.

**3309.4.3 Preconstruction survey.** No excavation work to a depth of 5 feet to 10 feet (1524 mm to 3048 mm) within 10 feet (3048 mm) of an adjacent building, or an excavation over 10 feet (3048 mm) anywhere on the site shall commence until the person causing an excavation to be made has documented the existing conditions of all adjacent buildings in a preconstruction survey. In addition to the preconstruction survey, a geotechnical report in accordance with Section 1803.6, and an evaluation analysis in accordance with Section 1817, shall be prepared when required by Chapter 18.

**3309.4.4 Monitoring.** During the course of excavation work the following shall be monitored in accordance with Section 3309.16:

1. Buildings that are within a distance from the edge of the excavation that is equal to or less than the maximum depth of the excavation.

2. Historic structures that are contiguous to or within a lateral distance of 90 feet (27432 mm) from the edge of the lot where an excavation is occurring.

**Exception:** Monitoring is not required for excavations to a depth of five feet (1523 mm) or less, provided:

1. The excavation occurs more than 5 feet (1524 mm) from all footings and foundations; or

2. Where the excavation occurs within five feet (1524 mm) or less from a footing or foundation, such excavation does not occur below the level of the footing or foundation.

**3309.4.5 Potential hazard.** When, in the opinion of the commissioner, a potential hazard exists as a result of soil or foundation work, elevations of the adjacent buildings shall be recorded or other monitoring procedures shall be implemented by a registered design professional at intervals of 24 hours or less as determined by the commissioner to ascertain if movement has occurred.

**3309.5 Underpinning or alternate methods of support of buildings and adjacent property.** Whenever underpinning or an alternate method of support of buildings and adjacent property is required to preserve and protect an adjacent property from construction, demolition, or excavation
work, the person who causes such work shall, at his or her own expense, underpin or otherwise support the adjacent building and property provided such person is afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect the adjoining buildings and property, and to perform such work thereon as may be necessary for such purpose. If the person who causes the construction, demolition, or excavation work is not afforded a license, such duty to preserve and protect the adjacent property shall devolve to the owner of the adjoining property, who shall be afforded a similar license with respect to the property where the construction, demolition, or excavation is to be performed.

3309.6 Subsurface operations affecting adjacent properties. Whenever subsurface operations, other than excavation or fill, are conducted that may impose loads or movements on adjoining property, including but not limited to the driving of piles, compaction of soils, or soil solidification, the effects of such operations on adjoining property and structures shall be monitored in accordance with Section 3309.16.

**Exception:** Monitoring during underpinning or alternate methods of support of buildings and adjacent property shall be in accordance with Section [1814] 1817.

3309.6.1 Change in ground water level. Where placement of a foundation will cause changes in the ground water level under adjacent buildings, the effects of such changes on the stability and settlement of the adjacent foundations shall be investigated and provision shall be made to prevent damage to such buildings.

3309.6.2 Potential hazard. When, in the opinion of the commissioner, a potential hazard exists as a result of subsurface operations, elevations of the adjacent buildings shall be recorded by a registered design professional at intervals of 24 hours or less as determined by the commissioner to ascertain if movement has occurred.

3309.7 Retaining structures. [When the regulation of a lot requires the ground on such lot to be raised or lowered and kept higher than the ground of the adjoining lot, provided the ground of such adjoining lot is not maintained at a grade lower than in conformity with the street or streets on which it is situated; or where an excavation has been made or a fill placed on any lot meeting the curb level requirements; and the adjoining land is maintained at a grade in conformity with or lower than the streets or streets on which it is situated; and is without permanent structures other than frame sheds or similar structures, a retaining structure shall be constructed for the safe support of adjoining ground, unless the bank between the adjoining properties is maintained at a safe angle of repose. Any necessary retaining wall shall be built and maintained jointly by the owners on each side, unless otherwise agreed to by both owners.] The requirements of Article 305 of Chapter 3 of Title 28 of the Administrative Code shall apply to the regulation of retaining structures.

[3309.7.1 Surplus retaining structures. Where any owner maintains his or her ground either higher or lower than the legal regulation prescribed in the Administrative Code, the surplus retaining structure that may be necessary to support such height or provide for such excavation shall be made at the sole expense of such owner, and any additional thickness that may be required shall be built on the land of such owner.]
3309.7.2 Removal of retaining structures. Any retaining structure erected as provided above, standing partly on the land of each owner, may be removed by either owner when the original reason for the erection of such retaining structure ceases to exist.

3309.8 Adjoining walls. When any construction or demolition operation exposes or breaches an adjoining wall, including load bearing and nonload-bearing walls as well as party walls and non-party walls, the person causing the construction or demolition operation shall, at his or her own expense, perform the following:

1. Maintain the structural integrity of such walls and adjoining structure, and have a registered design professional investigate the stability and condition of the wall and adjoining structure, and take all necessary steps to protect such wall and structure.

2. Maintain all required fire exits and passageways or provide substitutions meeting the requirements of this code.

3. Cut off close to the walls all beams in party walls, remove stub ends without weakening existing masonry, clean beam pockets of loose mortar, bend over all wall anchors at the beam ends in the standing wall, and brick-up all open beam holes with sound brick and compatible mortar.

4. During demolition operations, where the floor beams of the adjacent building bear on the party wall, the person causing the demolition shall ascertain that such beams are anchored into the wall and, where such anchorage is lacking, shall provide anchorage or otherwise brace the standing wall.

5. During demolition operations, all nonload-bearing chimney breasts, projections and any other debris exposed on party walls shall be examined and monitored by the person causing the demolition. Removal of such items shall be made under the supervision of a registered design professional only if the stability of the adjacent building or structure will not be affected. All openings shall be bricked up flush on the exterior exposed side of the party wall. All masonry that is in poor condition shall be pointed and patched.

3309.9 Weatherproof integrity of adjoining buildings. Where the waterproof integrity of an adjoining wall or building has been impaired due to construction or demolition operations, the person causing the construction or demolition operations shall, at his or her own expense, provide all necessary measures to permanently waterproof the adjoining wall or building in order to establish or restore the weatherproof integrity of such adjoining wall or building. This shall include, but is not limited to:

1. Bending over and flashing all roofing material of adjoining buildings;

2. Sealing and permanently waterproofing all doors or other openings in party walls;

3. Properly sealing all cornices, where cut;

4. Pointing up and making waterproof any walls and parapets and any walls that have been disturbed;
5. Removing all exposed furring, lath, and plaster on party walls; and

6. Removing, replacing, and firmly anchoring any loose wall material.

**3309.10 Protection of roofs.** Whenever any building is to be constructed or demolished above the roof of an adjoining building, it shall be the duty of the person causing such work to protect from damage at all times during the course of such work and at his or her own expense the roof, skylights, other roof outlets, and equipment located on the roof of the adjoining building, and to use every reasonable means to avoid interference with the use of the adjoining building during the course of such work, provided such person causing such work is afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect the adjoining building and perform such work thereon as may be necessary for such purpose; otherwise, the duty of protecting the roof, skylights, other roof outlets, and equipment on the roof of the adjoining building shall devolve upon the owner of such adjoining building.

Adjoining roof protection shall be secured to prevent dislodgement by wind. Where construction or demolition work occurs at a height of at least 48 inches (1219 mm) above the level of the adjoining roof, adjoining roof protection shall consist of 2 inches (51 mm) of flame-retardant foam under 2 inches (51 mm) of flame-retardant wood plank laid tight and covered by flame-retardant plywood, or shall consist of equivalent protection acceptable to the commissioner, and shall [extend to a distance of at least 20 feet (508 mm) from the edge of the building being constructed or demolished] cover all areas of the adjoining roof that are within a horizontal distance from the building being constructed or demolished equal to the height of the highest working level of the building being constructed or demolished, to a maximum of 20 feet (6096 mm), or to a greater maximum when ordered by the commissioner due to a unique hazard at the site.

**Exceptions:**

1. Adjoining roof protection is not required along an exposure where a site specific engineered enclosure system that is acceptable to the commissioner and meets the requirements of Section 3309.17 has been installed to cover the entire exposure where work is occurring.

2. Where vents, equipment, or similar obstructions are present on the roof, the roof protection shall be elevated to avoid interference, or an equivalent elevated system, designed by a registered design professional, shall be installed.

3. Occupiable spaces on an adjoining roof, such as a roof terrace, observation deck, rooftop bar, or residential balcony, that will not be closed during the work, shall instead be protected in accordance with Section 3309.13.

**3309.11 Protection of trees.** No trees outside the property line within the public right-of-way shall be disturbed or removed without the permission of the commissioner of the department of parks and recreation. Protection meeting the requirements of the department of parks and recreation shall be provided for all such trees, and written notification shall also be made to the department of parks and recreation at least 48 hours prior to commencement of such work.
3309.11.1 Deleterious, caustic, or acid materials. No deleterious, caustic, or acid materials shall be dumped or mixed within 10 feet (3048 mm) of any tree within the public right-of-way, nor shall salt for the removal of ice or snow be applied when runoff will drain to a tree within the public right-of-way.

Exceptions:

2. Mixing, delivery, or placement of concrete from a concrete mixer or concrete truck.

3. Application of de-icing materials as necessary to prevent slipping and tripping hazards in areas accessible to the public during periods where freezing conditions are to be encountered.

3309.12 Protection of chimneys. Any person having the duty to alter or maintain chimneys of any adjoining building under and pursuant to the provisions of this code, the New York City Mechanical Code, the New York City Fuel Gas Code, or other applicable laws and rules shall be afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect such adjoining building and perform such work thereon as may be necessary for such purpose; otherwise, such duty shall devolve upon the owner of such adjoining building.

3309.13 Protection of adjoining equipment and spaces. Whenever a [major] building is constructed or demolished, it shall be the duty of the person causing such work to protect from damage, at all times during the course of such work and at his or her own expense, all mechanical, electrical, and similar equipment on the adjoining property [that are within 20 feet (508 mm) from an unenclosed perimeter of the major building], and to protect all [publicly] publicly accessible spaces on the adjoining property [that are within 20 feet (508 mm) from an unenclosed perimeter of the major building], and also to use every reasonable means to avoid interference with the use of such equipment and spaces during the course of such construction or demolition work, provided such person causing such work is afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect the adjoining property and perform such work thereon as may be necessary for such purpose; otherwise, the duty of protecting such adjoining equipment and spaces shall devolve upon the owner of such adjoining property.

Adjoining equipment and space protection shall be secured to prevent dislodgement by wind. Where the construction or demolition work requires a site safety plan in accordance with Section 3301.13 or 3310 and access to the equipment or space is not precluded, adjoining equipment and space protection shall be designed to provide a level of overhead protection equivalent to that provided by a sidewalk shed in accordance with Section 3307, and shall cover all adjoining equipment or spaces that are within a horizontal distance from the building being constructed or demolished equal to the height of the highest working level of the building being constructed or demolished, to a maximum of 20 feet (6096 mm), or to a greater maximum when ordered by the commissioner due to a unique hazard at the site.

[Exception:] Exceptions:

1. Equipment on an adjoining roof shall be protected in accordance with Section 3309.10.
2. Adjoining equipment and space protection is not required along an exposure where a site specific engineered enclosure system, acceptable to the commissioner, and meeting the requirements of Section 3309.17, has been installed to cover the entire exposure where work is occurring.

3309.14 Protection of windows. Whenever exterior construction or demolition work occurs, and such work results in an unenclosed perimeter, it shall be the duty of the person causing such work to protect from damage, at all times during the course of such work and at his or her own expense, all windows on adjoining private property that face such work and are 20 feet (508 mm) or less from an unenclosed perimeter, provided such person causing such work is afforded a license in accordance with the requirements of Section 3309.2 to enter and inspect the adjoining property and perform such work thereon as may be necessary for such purpose; otherwise, the duty of protecting the adjoining windows shall devolve upon the owner of such adjoining building.

Where the window provides required means of natural lighting, natural ventilation, or egress, such protection shall not be allowed to interfere with such required means.

Exceptions: Window protection is not required for:

1. Minor alterations and ordinary repairs.

2. Work performed on a one-, two- or three-family detached house or accessory use to such.

3. [Where all] Locations where the unenclosed [perimeters are] perimeter of the building under construction or demolition is protected along the entire exposure by vertical netting that meets the requirements of Section 3308.5, [or an approved alternate system, that extends to cover the full height and width of the unenclosed perimeter, or a supported scaffold covers the full width of the unenclosed perimeter, provided the scaffold is decked and flush against the building at such level where the unenclosed perimeter exists, with no gap between the scaffold and the building greater than 3 inches (76 mm), and also provided that the scaffold is provided with netting and guardrails in accordance with Section 3314.8] supported scaffolding provided with guardrails and netting in accordance with Section 3314.8, or an equivalent alternative system acceptable to the commissioner.

3309.15 Modifications and alternate methods. The commissioner may, in accordance with Section 28-103.3 of the Administrative Code, and based upon a written request from a registered design professional, modify the requirements for adjoining property protection required by this section, including but not limited to authorizing the installation or use of alternative methods[, provided such modification or alternative method meets or exceeds the level of surveying, monitoring, inspection, or protection, as applicable, afforded to the public and property by this section, and also provided the insurance requirements of Sections 103 and 105 of Title 28 of the Administrative Code are satisfied] of surveying, monitoring, inspection, or protection.

[3309.15.1 Request content. A request submitted under Section 3309.15 shall include:

1. Details of the modification or alternative methods to be utilized;]
2. Any stipulations;

3. Demonstration that the request meets or exceeds the level of surveying, monitoring, inspection, or protection, as applicable, afforded to the public and property by this section;

4. Where applicable, a description of the practical difficulty of complying with code requirements;

5. Where applicable, a reference to the site safety monitoring program; and

6. Where such request is made because an adjoining property owner has not afforded a license in accordance with the requirements of Section 3309.2, the request shall contain a notarized letter from the owner of the property where the project is to commence, or a duly authorized representative, certifying notification has been made to seek a license in accordance with the requirements of Section 3309.1.1.

3309.16 Monitoring plan. Where monitoring is required by Section 3309, such monitoring shall be in accordance with a monitoring plan developed by a registered design professional and acceptable to the commissioner. The monitoring plan shall be specific to the structures to be monitored and operations to be undertaken, and shall specify the scope and frequency of monitoring, acceptable tolerances, and reporting criteria for when tolerances are exceeded. Monitoring plans shall also comply with the applicable requirements of Chapter 18 and Sections 3303, 3304, and 3306.

3309.17 Site specific engineered enclosure system. Site specific engineered enclosure systems authorized by this section shall meet the following requirements:

1. The engineered enclosure system shall be designed by a registered design professional. The design shall be specific to the site and shall meet all temporary load requirements, including but not limited to wind, as prescribed in Chapter 16;

2. The engineered enclosure system shall be acceptable to the commissioner;

3. The engineered enclosure system shall be positioned exterior of the building under construction or demolition and shall cover all areas along the exposure where work is occurring or openings in the building are present;

4. The lowest horizontal level of the engineered enclosure system shall be designed to meet the design loads required for a sidewalk shed in accordance with Section 3307.6.4.2, shall be positioned such that it is located at or below the lowest level of work and openings in the building along the exposure, and shall be brought tight to the face of the building under construction or demolition, except that a gap, not to exceed 1 inch (25 mm), along the face of the building is permissible, provided the resulting gap is sealed or covered by material of sufficient manner and strength capable of trapping falling objects;

5. The vertical surfaces of the engineered enclosure system shall be covered fully by material capable of stopping material or debris generated by the work. Such vertical covering shall be brought tight to the face of the engineered enclosure system. Where necessary to control
material or debris, the material shall be rigid and solid, or shall, at a minimum, be a rigid galvanized welded wire screen of not less than No. 16 steel wire gauge, with no opening larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension, backed by fine debris netting located interior of the steel wire screen;

6. The engineered enclosure system shall be installed, inspected, repaired, maintained, adjusted, used, and removed as indicated on the plans for the engineered enclosure system. Inspections shall be performed, at a minimum, following each installation or reinstallation, each day while in use, periodically while not in use, prior to forecasted inclement weather events, and subsequent to inclement weather events; and

7. A controlled access zone, acceptable to the commissioner, or protection in accordance with Sections 3309.10 or 3309.13, shall be provided to protect the adjoining property whenever the engineered enclosure system is installed or removed, and when otherwise warranted during repairs, maintenance, or adjustments. Such controlled access zone or protection shall be indicated on the plans for the engineered enclosure system.

§ 41. Section BC 3310 of the New York city building code, as amended by local law number 141 for the year 2013, section 3310.10 as amended by local law number 196 for the year 2017, and section 3310.10.1 as amended by local law number 206 for the year 2017, is amended to read as follows:

SECTION BC 3310
REQUIREMENTS FOR THE CONSTRUCTION OR DEMOLITION OF MAJOR BUILDINGS

3310.1 Scope. This section shall apply to:

1. The construction of a new major building;

2. The vertical or horizontal enlargement of a major building;

3. The full or partial demolition of a major building;

4. The alteration, maintenance, or repair of a façade of a major building, provided the building is more than 14 stories or 200 feet (60 960 mm) in height, whichever is less, and also provided the façade work requires a sidewalk shed to be installed; and

5. Any construction or demolition work, including the alteration, maintenance, or repair of a façade, in a building so designated by the commissioner.

Exception: The requirements of this section shall not apply to partial demolition operations limited to the interior components of a major building, provided no mechanical demolition equipment, other than handheld devices, are used.
3310.1.1 Applicability of other laws. Nothing contained herein shall diminish or supersede any other applicable city, state, or federal regulation. Nothing in this section shall relieve persons engaged in construction or demolition work of their obligations under this chapter, including but not limited to Sections 3301.1 and 3301.2, or from complying with other applicable provisions of law.

3310.2 Major buildings. See the definition of “Major building” in [Section 3302] Chapter 2.

3310.3 Site safety plan. No permit shall be issued for the type of work listed in Section 3310.1 until a site safety plan that meets the requirements of Article 110 of Chapter 1 of Title 28 of the Administrative Code has been approved by the department.

3310.4 Site safety monitoring program. For a project that requires a site safety plan, the general contractor shall enact and maintain a site safety monitoring program to implement such site safety plan. The site safety monitoring program shall, at a minimum, comply with Sections 3310.5 through 3310.10.

Exception: Subject to the approval of the commissioner, a site safety monitoring program may be waived, reduced, or modified in accordance with Section 3310.11.

3310.5 Site safety manager or coordinator to be designated. One or more site safety managers shall be designated, as necessary, to ensure [monitor] compliance with the site safety plan and all site safety requirements as specified in this chapter and rules promulgated by the commissioner. Such site safety manager or managers shall be designated by the owner, agent, construction manager, or general contractor. All such entities shall agree to designate one such site safety manager as the primary site safety manager, or where there is only one site safety manager, such manager shall automatically be designated as the primary site safety manager. Such site safety manager(s) shall be certified by the department in accordance with Article 402 of Chapter 4 of Title 28 of the Administrative Code.

[Exception: Exceptions:

1. One or more site safety coordinators, certified by the department in accordance with the requirements of Article 403 of Chapter 4 of Title 28 of the Administrative Code, may be designated in lieu of a site safety manager for the construction, vertical or horizontal enlargement, or full or partial demolition of a major building, provided such building:

   [1.] 1.1. Is less than 15 stories or 200 feet (60 960 mm) in height, whichever is less; and

   [2.] 1.2. Has a building footprint of 100,000 square feet (30 480 m²) or less.

2. Façade or roof projects that comply with Section 3310.12.

3310.5.1 Notification to the department of the primary manager or coordinator. The department shall be notified of the primary site safety manager or coordinator prior to the commencement of work. In the event that an alternate site safety manager or coordinator will be acting [as] in place of the primary site safety manager or coordinator for a period longer than two
consecutive weeks, the department must be so notified. Any permanent change of the primary site safety manager or coordinator requires immediate notification to the department.

3310.5.2 Presence at the site. For the construction or alteration of a building, the site safety manager or coordinator shall be present at the site during all times while active work is occurring and through all phases of work, beginning with excavation and continuing until the building is enclosed and the sidewalk shed removed.

For the demolition of a building, the site safety manager or coordinator shall be present at the site during all times while active work is occurring and through all phases of work, beginning with the removal of any glass, asbestos, or façade and, for a full demolition, continuing until the site has been backfilled to grade, or for a partial demolition until the building is enclosed and the sidewalk shed removed.

Exceptions:

1. The site safety manager or coordinator is not required to be present at the site during the following activities, provided no other work is in progress:
   1.1 Surveying that does not involve the disturbance of material, structure, or earth;
   1.2 Use of a hoist exterior to the building to transport personnel only;
   1.3 Use of a hoist that is fully enclosed within the perimeter of the building to transport personnel or material;
   1.4 Finish trowelling of concrete floors (work limited to finish troweling of concrete floors);
   1.5 When personnel are provided for temporary heat, light, or water (work limited to providing the site with temporary heat, light, or water); or
   1.6 Truck deliveries to the site where the sidewalk is closed and the entrance gate is within that closed sidewalk area (truck deliveries to the site, provided the delivery occurs within the site while the gate is closed and flagpersons are provided to direct traffic while the truck is entering and exiting the site).

2. Subject to the approval of the commissioner, the requirement for a site safety manager, or where a site safety coordinator is authorized by this code, a site safety coordinator, may be waived entirely, or reduced to a part time basis with such part time basis determined by the commissioner, in accordance with Section 3310.11.

3310.5.3 Acting alternate site safety manager or coordinator. Where the primary site safety manager or coordinator is unable to be at the site, an alternate site safety manager or coordinator shall act in place of the primary site safety manager or coordinator and carry out all duties and responsibilities assigned to the site safety manager or coordinator by this chapter and rules promulgated by the commissioner. Such shall be recorded in the site safety log as
required by Section 3310.8.4.2, and where required by Section 3310.5.1 notification shall be provided to the department.

3310.5.4 Limitation on primary site safety manager or coordinator serving at another site. No site safety manager or coordinator designated as the primary site safety manager or coordinator at a site shall serve as a site safety manager or coordinator at any other site.

Exceptions:

1. A site safety manager or coordinator designated as the primary site safety manager or coordinator at a site may serve as a [nonprimary] non-primary site safety manager or coordinator at another site, provided there is no work requiring the presence of such individual in accordance with Section 3310.5.2 occurring at the site for which the individual has been designated as the primary site safety manager or coordinator.

2. [Subject to the approval of the commissioner, a] A site safety manager [or coordinator] may be designated as the primary site safety manager [or coordinator at] for two or more sites, provided all sites [have had their requirement for a primary site safety manager or coordinator reduced by the commissioner to a part time basis in accordance with Section 3310.11] meet the criteria set forth in Section 3310.12.

3310.6 Reserved.

3310.7 Contractor shall inform personnel. [General contractors and subcontractors shall state to their directly employed personnel at the construction or demolition site, prior to such directly employed person commencing work at the site, that they are to follow all safety regulations at all times and that they are required to obey and implement all orders and directives relating to safety requirements issued by the general contractor/subcontractor or the general contractor’s/subcontractor’s designee. Where a site safety manager or coordinator is required, the general contractor or subcontractor shall also state to their directly employed personnel at the site, prior to such directly employed person commencing work at the site, that the site safety manager or coordinator is responsible for monitoring compliance with laws and rules governing site safety; and shall inform their supervisory personnel at the site, prior to such supervisor commencing work at the site, of the name and responsibilities of the site safety manager or coordinator. Nothing in this section shall relieve persons engaged in construction or demolition work from their obligations under this chapter, including but not limited to Sections 3301.1 and 3301.2, and from complying with other applicable provisions of law.] The requirements of Section 3301.14 shall apply.

3310.8 Site safety manager’s and coordinator’s duties. The site safety manager or coordinator shall monitor compliance with the safety requirements of this chapter and any rules promulgated thereunder by performing the duties required by Sections 3310.8.1 through [3310.8.6] 3310.8.5 and by performing all other safety duties assigned by the owner or general contractor to meet legal requirements.

3310.8.1 Meetings. The site safety manager or coordinator shall, at a minimum, meet on a weekly basis with the designated representative of each subcontractor to ascertain that all subcontractors are complying with the applicable provisions of this chapter.
3310.8.2 Notification of violations. In the event the site safety manager or coordinator discovers a violation of this chapter and any rules promulgated thereunder, he or she shall immediately notify the person or persons responsible for creating the violation, whether these persons are employed by the general contractor or by subcontractors. If the site safety manager or coordinator is unable to obtain the cooperation of these persons in correcting the violation, he or she shall immediately inform the direct supervisor of the person or company responsible for creating the violation and request that the supervisor order the necessary corrective action. If such supervisor is not present at the site or is otherwise unavailable, the site safety manager or coordinator shall notify any other supervisory personnel of the permit holder or any other responsible manager or officer of the permit holder. All such violations and corrective work shall be recorded in the daily log.

3310.8.2.1 Notification of conditions to the department. The site safety manager or coordinator shall immediately notify the department directly if he or she discovers any of the following conditions in the routine performance of the job:

1. A person is operating a crane, derrick, or hoisting equipment on the site without a permit and refuses to desist from operating the equipment;

2. A crane is being operated by an unlicensed operator and such unlicensed operator refuses to desist from operating the crane;

3. No flagperson is present during crane operation where required by this chapter;

4. Sidewalk sheds required by the site safety plan are not in place during construction or demolition activity;

5. Permits have not been issued for the sidewalk sheds;

6. The designer and/or supplier of sidewalk sheds has not certified that the sheds have been erected in accordance with the approved drawings;

7. Any accident as defined by this chapter has occurred;

8. Required standpipe is not in place at each story below the construction or demolition floor;

9. Required standpipe valves are not in place at each story below the construction or demolition floor;

10. Required standpipe is not capped;

11. Required standpipe is not connected to a water source or fire department connection;

12. Required standpipe fire department hose connection is obstructed;

13. Required standpipe fire department hose connections are not marked by a red light and a sign reading, “Standpipe Connection”;
14. A breach exists in the required standpipe risers, cross connections, or fire department connections;

15. The standpipe alarm activates; or

16. [When a building over 75 feet (22.86 m) is being constructed or demolished and at least one elevator in a state of readiness or one hoist is not available for Fire Department access per Section 3303.12] Stairs are not provided in accordance with Section 3303.11; or

17. An elevator or hoist is not available in accordance with Section 3303.12.

3310.8.2.1.1 Responsibility. Upon proper notification to the department of the existence of any of the above-noted circumstances, any responsibility the site safety manager or coordinator has under this code arising out of, relating to, or as a result of the existence of that circumstance, shall cease.

3310.8.3 Inspections. It shall be the responsibility of the site safety manager or coordinator to inspect personally, on a regular basis throughout the day while active work is occurring, the site to ensure compliance with the requirements of this chapter. At a minimum, inspections shall consist of those prescribed in rules promulgated by the commissioner, with such inspections performed personally by an individual certified by Chapter 4 of Title 28 of the Administrative Code as a site safety manager or coordinator.

3310.8.3.1 Site safety manager or coordinator standpipe inspection responsibilities. The site safety manager or coordinator shall, at a minimum, in accordance with rules promulgated by the department, conduct daily checks to ensure that a standpipe system is available and in a state of readiness at all times for use by firefighting personnel, by verifying:

1. That valves are in place at each story below the construction floor;

2. That standpipes are connected to a water source or fire department connection; and

3. That fire department hose connections are free from obstruction and are marked by a red light and sign that reads, “Standpipe Connection.”

3310.8.3.1.1 Weekly checks. The site safety manager or coordinator shall also, in accordance with such rules, conduct weekly checks to verify that no breach exists by visually tracing the standpipe, including risers, cross connections and fire department connections.

3310.8.3.1.2 Record of inspections. A record of all such inspections shall be maintained by such site safety manager or coordinator in the site safety log.

3310.8.3 Inspections. Site safety inspections shall be performed and documented as required by Sections 3310.8.3.1 through 3310.8.3.4.
3310.8.3.1 **Spot checks.** The safety manager or coordinator shall personally perform spot checks of the site on a regular basis throughout the day for compliance with the site safety plan, the requirements of this chapter, and any rules promulgated thereunder.

3310.8.3.2 **Enumerated inspections.** The following inspections shall be performed by the site safety manager or coordinator, or by one or more individuals designated by the site safety manager or coordinator and certified as a site safety manager or coordinator in accordance with Chapter 4 of Title 28 of the *Administrative Code*:

1. Daily, weekly, and other checks as specified in rules promulgated by the commissioner.

2. Daily checks to ensure that a standpipe system is available and in a state of readiness at all times for use by firefighting personnel by verifying:
   
   2.1. That valves are in place at each story below the construction floor;
   
   2.2. That standpipes are connected to a water source or fire department connection; and
   
   2.3. That fire department hose connections are free from obstruction and are marked by a red light and sign that reads, “Standpipe Connection.”

3. Weekly checks to verify that no breach exists in the standpipe system by visually tracing the standpipe, including risers, cross connections and fire department connections.

3310.8.3.3 **Delegation.** Nothing in this code shall be read to prohibit the site safety manager from delegating enumerated inspections to an individual certified as a site safety coordinator at a site where a primary site safety manager is required; however, the site safety manager or coordinator may not delegate their general responsibility to perform spot checks of the site throughout the day. Delegation does not relieve the site safety manager or coordinator from the responsibility to ensure such inspections are adequately performed.

3310.8.3.4 **Record of inspections.** A record of all such inspections shall be maintained by such site safety manager or coordinator in the site safety log in accordance with Section 3310.8.4.

3310.8.4 **Site safety log.** A site safety log shall be maintained and kept at the site. The log, or where there is more than one log, the logs in total, shall, at a minimum, contain the following information:

1. Date and location of inspections performed in accordance with Section 3310.8.3;

2. Date and names of individuals met with to satisfy the requirements of Section 3310.8.1;

3. Any unsafe acts and/or conditions, and dates and locations of said unsafe acts and/or conditions;
4. Companies and representatives notified of unsafe acts and/or conditions;

5. Dates of notification of unsafe acts and/or conditions;

6. Dates of correction of unsafe acts and/or conditions and nature of correction;

7. Any [accident as defined by this chapter] incident;

8. Any violations, stop work orders, or summonses issued by the department, including date issued and date lifted or dismissed;

9. Dates and location where horizontal and vertical safety netting have been installed, replaced and/or repaired;

10. Date horizontal safety netting is removed; [and]

11. Date when building reaches a height of 75 feet (22 860 mm)[; and]

12. Date when the building is topped off.

3310.8.4.1 Recording inspections in the site safety log. Inspections shall be recorded by the end of the day by the site safety manager or coordinator who performed the inspection. The site safety log, or where there is more than one log, each individual log, shall be completed and signed by the site safety manager or coordinator, and if the inspection is performed by another individual, by the site safety manager or coordinator who performed the inspection [and by the site safety manager or coordinator designated as the primary site safety manager or coordinator in accordance with Section 3310.5.1].

Exception: Where a part time site safety manager or coordinator is approved by the commissioner in accordance with Section 3310.11, the site safety manager or coordinator shall sign the log when he or she arrives at the site and leaves the site, and all entries in the site safety log shall be completed and signed prior to leaving the site.

3310.8.4.2 Recording change in site safety manager or coordinator. If at any point during the day an alternate site safety manager or coordinator acts as the primary site safety manager, this shall be noted in the log, and the [acting primary] alternate site safety manager shall log in. If a site safety manager or coordinator is relieved of his or her responsibilities at the site, or a site safety manager or coordinator leaves the site for any reason, this shall be indicated in the site safety log, and another site safety manager or coordinator shall assume the duties of such relieved or absent site safety manager or coordinator by signing in.

3310.8.5 Permit log. Any equipment brought onto the job that requires permits, as well as a description of the equipment, where it is to be located, permit number, issue and expiration date of the permit, and certificate of inspection, if required, shall be entered on a separate permit log that shall be maintained at the site by the site safety manager or coordinator and kept at the site.

3310.8.6 [Reasonable prudence. In addition to the above requirements, the site safety manager or coordinator shall use reasonable prudence to ensure that safety is maintained at the site as job conditions dictate.] Reserved.
3310.9 Additional site safety personnel. The following additional personnel shall be employed to oversee concrete operations at a major building and such other classes of buildings or operations as the commissioner may designate by rule. These personnel shall coordinate directly with the [primary] site safety manager or coordinator [designated in accordance with Section 3310.5.1]. In all instances, the [designated primary] site safety manager or coordinator retains responsibility for ensuring compliance with the provisions of Section 3310 of this code and all applicable rules, and for signing the site safety log. The name and contact information of the additional site safety personnel shall be recorded in the site safety log.

3310.9.1 Concrete safety manager. A concrete safety manager shall be designated by the concrete contractor at those sites where the concrete portion of the project involves the pouring of a minimum of 2,000 cubic yards of concrete or such lesser amount as the commissioner may determine by rule. Concrete safety managers shall have five years of experience in concrete operations and shall have satisfactorily completed, within the five calendar years prior to registration, a thirty hour course approved by the commissioner that is sufficient to qualify the individual as a competent person under OSHA standards to oversee concrete operations, including such topics as formwork design, construction and stripping operations, rebar handling, and rigging. Concrete safety managers shall register with the department in the same manner as construction superintendents, and shall provide evidence of meeting the eligibility requirements set forth herein. No person shall perform the duties of a concrete safety manager without being registered as such with the department. The commissioner shall promulgate rules establishing the duration that such registration shall be valid and the requirements for renewal of the registration. The concrete safety manager shall be present during all concrete operations. For purposes of this section, “concrete operations” shall mean the pouring of concrete and the construction and stripping of concrete forms and related activities as specified by the commissioner.

3310.10 Orientation and training. All workers employed at a major building site shall receive orientation and training as required by this section and [section] Section 3321.

3310.10.1 Orientation. The requirements of Section 3301.11 shall apply.

3310.11 Modifications to the site safety monitoring program. The commissioner may, based upon a written request from a registered design professional, waive, reduce, or modify the requirements for the site safety monitoring program for a job of a limited scope or duration [provided such waiver, reduction, or modification is not detrimental to the safety of the public and property, or that alternative means of protection for the public and property meeting or exceeding those afforded by this section are provided. A submission under this section may include, but not be limited to, a request to reduce or modify the type or frequency of inspections performed by the site safety manager or coordinator, or to allow a part time site safety manager or coordinator, or to waive the requirement for a site safety manager or coordinator.] in accordance with Section 28-103.3 of the Administrative Code.

[3310.11.1 Request content. A request submitted under Section 3310.11 shall include:]

[1. Details of the modification or alternative methods to be utilized;]

[2. Any stipulations;]
3. A description of the work to be undertaken, for example:

3.1. Type of work;

3.2. Anticipated sequence and schedule;

3.3. The anticipated number of suspended scaffold drops;

3.4. Material handling and hoisting activities to be undertaken and equipment to be utilized;

3.5. The extent of demolition activities and equipment to be utilized;

3.6. Impact on the standpipe or sprinklers;

3.7. Use of welding, torches, or similar equipment;

3.8. Proximity to adjoining buildings or areas accessible to the public.

4. Demonstration that the request is not detrimental to the safety of the public and property, or that alternative means of protection for the public and property meet or exceed those afforded by this section are provided;

5. A description of the practical difficulty of complying with the site safety monitoring program requirements set forth in Section 3310;

6. Where the request is to reduce or modify the type or frequency of inspections performed by the site safety manager or coordinator, a proposed alternative list of site safety inspections;

7. Where the request is to allow a part-time site safety manager or coordinator, a proposed schedule for the site safety manager or coordinator, as well as a proposed list of duties and site safety inspections to be performed by the site safety manager or coordinator while he or she is present at the site; and

8. Where the request involves a waiver of the site safety monitoring program or a request to allow a part-time site safety manager or coordinator, a signed, dated, and notarized affidavit from a contractor or licensee stating he or she will be responsible for ensuring compliance with the site safety provisions of this code at the site at all times the site safety manager or coordinator is not present, with emergency contact information for such contractor or licensee provided.

3310.12 Façade projects. Where authorized in accordance with rules promulgated by the commissioner for a project whose scope is limited to the alteration, maintenance, or repair of a façade or roof, the inspection, documentation, reporting, and other activities required by Sections 3310.5 through 3310.9 may instead be assigned to a qualified person. The qualified person shall also perform all other duties assigned by rules promulgated by the commissioner. The qualified person shall work under the direct and continuing supervision of a site safety manager, or a licensed master or special
rigger, and shall meet all training and experience prerequisites established by rules promulgated by the commissioner.

§ 42. Section BC 3311 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

SECTION BC 3311
EXPLOSIVE POWERED AND PROJECTILE TOOLS

3311.1 Scope. Explosive powered tools, including but not limited to powder-actuated tools and projectile tools, used in connection with the construction or demolition of a building or structure shall be in accordance with the requirements of this section.

3311.2 Projectile tools. Projectile tools shall comply with the requirements of Sections 3311.2.1 through 3311.2.3.

3311.2.1 Basic requirements. Design and construction of the tool must be such as to safely retain all internal pressures that may occur during its operation. The discharge mechanism shall be such that the projectile cannot be discharged by dropping the tool. The discharge mechanism shall be such that the discharge of each projectile shall be dependent on a separate and distinct act by the operator, and all safety features shall be durable.

A tool shall have such other characteristics as the commissioner may find necessary. Such other characteristics may include devices and materials external to the tool itself but associated with its function, and may also include, in respect to high velocity projectile tools, the basic requirements set forth above for explosive powered tools that discharge projectiles with comparable velocities.

3311.2.2 Maintenance. Every projectile tool shall be properly maintained. No such tool shall be used if any part necessary to retain internal pressures or to prevent accidental discharge of a projectile is not in sound and operable condition.

3311.2.3 Operation. The operation of projectile tools shall comply with the following:

1. A projectile tool shall be operated only by an authorized operator who shall be the owner, lessee, or other person having custody of the tool, or any other person whom he or she may authorize to operate it.

2. While a projectile tool is in the care and custody of an authorized operator, no other person shall handle or in any way utilize or modify it.

3. No authorized operator of a projectile tool shall leave it unattended while it is in a condition to discharge a projectile.

4. No person shall use a projectile tool for any purpose other than that for which it was manufactured.

5. No person shall point a projectile tool at another person or hold it at an angle that allows the projectile to fly free.
6. No person shall use a projectile tool in such a way as to endanger persons who may be in the vicinity.

**3311.3 Explosive powered tools.** The provisions of ANSI A10.3, as modified in Section 3311.4, shall apply to explosive powered tools, including but not limited to powder-actuated tools. The storage, handling and use of explosives shall also comply with the *New York City Fire Code* and Section 3307.4.2.

**3311.4 Modifications to ANSI A10.3.** The text of ANSI A10.3 shall be modified as indicated in Sections 3311.4.1 through 3311.4.12.

**3311.4.1 ANSI A10.3, Section 4.2.2.** Delete Sections 4.2.2.2, 4.2.2.3 and 4.2.2.4 in their entirety and modify Section 4.2.2.1 to read as follows:

4.2.2.1 Medium-velocity tools, indirect-acting (piston) type, as defined in Section 3, shall not be used.

**3311.4.2 ANSI A10.3, Section 4.2.3.** Delete Sections 4.2.3.2, 4.2.3.3 and 4.2.3.4 in their entirety and modify Section 4.2.3.1 to read as follows:

4.2.3.1 High velocity tools, direct-acting or indirect-acting type, as defined in Section 3, shall not be used.

**3311.4.3 ANSI A10.3, Section 4.3.** Delete Section 4.3 in its entirety.

**3311.4.4 ANSI A10.3, Section 5.5.** Add a new section 5.5 to read as follows:

5.5 Selection of load. No employer shall knowingly furnish to an employee for use in a tool any cartridge or load not suitable for safe use in that tool, whether by reason of excessive power, improper design or poor material. The operator shall use due care to select the proper cartridges or power loads, or other means of controlling the force of the explosion so that the tool develops no more than the necessary pressure to bring about the desired penetration. In doing so, the operator shall be guided by the manufacturer’s specifications.

5.5.1 Proper load. When doubt exists as to proper load, the operator shall make a trial shot to test the surface and the strength of the material to be penetrated. The trial shot shall be made with the lowest power level and then increasing strength until a proper fastening is made. During this test, the operator and all bystanders shall adhere to all safety rules including but not limited to, wearing goggles and hard hats required for the job.

**3311.4.5 ANSI A10.3, Section 7.9.** Add the following sentence at the beginning of Section 7.9:

7.9 The operator shall always verify the thickness and type of material into which the stud, pin or fastener is to be driven.

**3311.4.6 ANSI A10.3, Section 9.4.** Add a new section 9.4 to read as follows:

9.4 Storage of power loads shall be in accordance with the requirements of the *New York City Fire Code* and regulations of the Fire Department.
3311.4.7 ANSI A10.3, Section 10.3.1. Add a new Section 10.3.1 to read as follows:

10.3.1 The authorized instructors’ card shall list the specific models of powder-actuated tools for which training may be given.

3311.4.8 ANSI A10.3, Section 10.6. Add a new section 10.6 to read as follows:

10.6 All authorized instructors shall hold a Certificate of Fitness issued by the Fire Department.

3311.4.9 ANSI A10.3, Section 11.4.1. Add a new section 11.4.1 to read as follows:

11.4.1 The qualified operator’s card shall list the specific models of powder-actuated tools that may be used.

3311.4.10 ANSI A10.3, Section 11.6. Add a new Section 11.6 to read as follows:

11.6 All qualified operators shall hold a Certificate of Fitness issued by the Fire Department.

3311.4.11 ANSI A10.3, Section 12. Delete Section 12 in its entirety and add a new Section 12 to read as follows:

12 Equipment acceptance.

12.1 Powder-actuated tools using ammunition (power loads) shall be approved by the commissioner or other approved agency.

12.2 Labeling. A certificate or label indicating that the tool is approved shall be attached to the toolbox or operator’s manual and shall be made available for inspection upon request of the commissioner.

3311.4.12 ANSI A10.3, Section 13. Add a new Section 13 to read as follows:

13 Fire Department requirements.

13.1 The requirements of the New York City Fire Code and regulations of the Fire Department shall apply.

§ 43. Section BC 3313 of the New York city building code, as amended by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC 3313
FLAMMABLE AND COMBUSTIBLE MIXTURES, COMPRESSED GASES, AND OTHER HAZARDOUS MATERIALS

3313.1 General. The transportation, handling, storage, installation, connection, ventilation, and use of all volatile flammable oils, flammable and combustible mixtures, compressed gases, and other
hazardous materials shall comply with the New York City Fire Code, and shall also be safeguarded in accordance with the requirements of Section 3307.4.2.

§ 44. Section BC 3314 of the New York city building code, as added by local law number 141 for the year 2013, section 3314.20 as amended by chapter 18 of the laws of 2016, is amended to read as follows:

SECTION BC 3314
Scaffolds

3314.1 Scope. Scaffolds utilized in conjunction with the construction or demolition of a building or structure shall be erected and maintained in accordance with the requirements of this section so that the safety of public and property will not be endangered by falling material, debris, or equipment, or by collapse of the scaffold.

Exceptions:

1. The requirements of this section shall not apply to window washing equipment permanently anchored to the building and subject to the jurisdiction of the New York State Department of Labor. However, this exemption shall not apply when such equipment is used for activities other than window washing.

2. Mast climbers are only required to comply with the requirements of Section 3314.19.

3314.1.1 Height. For the purposes of this section, the height of a scaffold shall be measured from the base of the scaffold to the top of the uppermost vertical member of the scaffold, with any temporary structure, but not any permanent structure, on which the scaffold rests included in the height measurement.

3314.2 Permit. Prior to the installation and use of a scaffold, the contractor or licensee who is to install the scaffold, or a designated representative of the installer, shall obtain a permit for such scaffold. The permit requirements of this section are independent of the design requirements of Section 3314.3. Sections 3314.3.1 through 3314.3.4 may require a scaffold to be designed even if Section 3314.2 does not require a permit for such scaffold.

Exceptions:

1. A permit is not required for a two-point, single tier, suspended scaffold suspended from a parapet using C-hooks.

2. A permit is not required for a suspended scaffold provided Items 2.1 through 2.3 are complied with:

   2.1. The scaffold is installed and used in conjunction with a construction, alteration, or demolition project that holds a valid permit from the department for such project;

   2.2. The site is closed to the public and enclosed with a fence in accordance with Section [3307] 3307.7; and
2.3. The installation, use, and removal of the scaffold is confined within the site or over an area protected by sidewalk sheds or roof protection.

3. [Window washing equipment that is permanently anchored to the building or structure by a davit.] A permit is not required for a single tier nonadjustable suspended scaffold whose platform is 40 square feet (3720 mm$^2$) or less in size.

4. A permit is not required for a supported scaffold, provided Items 4.1 through 4.6 are complied with:

   4.1 The scaffold is not an outrigger scaffold (thrust out);
   4.2 No hoisting equipment with a manufacturer’s rated capacity greater than 2,000 pounds (907 kg) will be located on the scaffold;
   4.3 The scaffold will not be loaded, or designed to be loaded, in excess of 75 pounds per square foot (366.15 kg/m$^2$) (e.g. a light duty scaffold, a medium duty scaffold, or a heavy duty scaffold); [and]
   4.4 The scaffold is less than 40 feet (12 192 mm) in height;

4.5 Side-arm or end-arm scaffold brackets are used exclusively for the support of workers; and

4.6 Where the scaffold has a height-to-base ratio (including outriggers supports, if used) of more than four to one (4:1), it is restrained in accordance with Section 3314.9.1.

3314.3 Design. Scaffolds shall be designed[,] as follows[,] in accordance with Sections 3314.3.1 through 3314.3.4. The design requirements of this section are independent of the permit requirements of Section 3314.2. Sections 3314.3.1 through 3314.3.4 may require a scaffold to be designed even if Section 3314.2 does not require a permit for such scaffold.

3314.3.1 Supported scaffolds and outrigger scaffolds (thrust out). Supported scaffolds and outrigger scaffolds (thrust out) shall be designed by a registered design professional. Where the scaffold is to be located upon a sidewalk shed, the requirements of Section 3307.6.4.2.2 shall also apply.

Exception: Design is not required for a supported scaffold, provided Items 1 through 6 are complied with:

1. The scaffold is not an outrigger scaffold (thrust out);
2. No hoisting equipment with a manufacturer’s rated capacity greater than 2,000 pounds (907 kg) will be located on the scaffold;
3. The scaffold will not be loaded, or designed to be loaded, in excess of 75 pounds per square foot (366.15 kg/m$^2$) (e.g. a light duty scaffold, a medium duty scaffold, or a heavy duty scaffold);
4. The scaffold is less than 40 feet (12.192mm) in height;

5. Side-arm or end-arm scaffold brackets are used exclusively for the support of workers; and

[6. The scaffold is a light-duty scaffold, a medium-duty scaffold, or a heavy-duty scaffold.]

6. Where the scaffold has a height-to-base ratio (including outriggers supports, if used) of more than four to one (4:1), it is restrained in accordance with Section 3314.9.1.

3314.3.2 Suspended scaffolds. Suspended scaffolds shall be designed by a registered design professional.

Exceptions:

1. Design is not required for a single tier nonadjustable suspended scaffold whose platform is 40 square feet [42.192 mm] (3720 mm²) or less in size.

2. In lieu of a registered design professional, a two-point, single tier, suspended scaffold may be designed by a licensed rigger provided Items 2.1 and 2.2 are complied with and either Items 2.2.1 or 2.2.2 are complied with:

   2.1. The scaffold or scaffold outrigger beam or suspension member support structure is not anchored to the building or structure, other than tiebacks; and

   2.2. The scaffold will not be loaded, or designed to be loaded, in excess of 75 pounds per square foot (366.15 kg/m²); and either

   2.2.1. The scaffold utilizes c-hooks; or

   2.2.2. The distance from floor or roof on which the support structure is located to the top of the outrigger beam or suspension member support structure is less than 15 feet (4572 mm).

3. In lieu of a registered design professional or a licensed rigger, a two-point, single tier, suspended scaffold meeting the requirements of Item 2 of these exceptions that is used exclusively for sign hanging work may be designed by a licensed sign hanger.

3314.3.3 Drawings. Where design is required by this section, the drawings shall be specific to the site and shall, at a minimum, include a plan view and an elevation view, with full dimensions, detailing:

1. The scaffold and location of the scaffold;

2. The base structure (e.g. roof and parapet, sidewalk shed);

[2.] 3. Connections and attachments to the base structure, including but not limited to anchorages, fastenings, tie-ins, tie-backs, and lifelines;
[3.] 4. Any temporary or permanent structural modifications required to the base structure;

[4.] 5. Netting with specific type and manufacturer indicated, overhead protection, or any other equipment attached to the scaffold. The effect of wind on the netting shall be accounted for in the design of the scaffold;

[5.] 6. Any hoisting equipment located on the scaffold;

[6.] 7. Platform levels, support centers, and offsets, along with the maximum number of levels to be loaded simultaneously and the maximum loads to be imposed;

8. Temporary construction, such as platforms, runback structures, other scaffolds, mast climbers, cranes, derricks, hoists, horizontal netting, cocoon systems, climbing formwork, sidewalk sheds, fences, and barricades that may present interference for the scaffold;

[7.] 9. For a suspended scaffold, ropes, number of clips, and counterweights, [as well as] outrigger beams, c-hooks, or other support devices, blocking, saddles, or equivalent, and the rated load of the scaffold motor (hoist) as established by the manufacturer;

[8.] 10. For a suspended scaffold [that], the location of the scaffold during out of service periods, and if the scaffold will not be lowered to the street, [or deck of the] sidewalk shed, building setback, equivalent adequate structure, or ground [at the end of the shift] during out of service periods, how the scaffold will be secured while work is not being performed; [and]

[9.] 11. For a supported scaffold, structural members, as well as the founding of the scaffold, including but not limited to sidewalk sheds, floors, roofs, or ground;

12. References to related job numbers (e.g. the sidewalk shed upon which the scaffold rests, the underlying permit for façade or construction work); and

13. Where anchors are utilized:

13.1. Type of anchor and manufacturer of anchor;

13.2. Procedures for the installation, maintenance, and use of the anchor as specified by the manufacturer of the anchor; and

13.3. Procedures for the testing and inspection of the anchor as specified by the manufacturer of the anchor, as well as special inspection requirements when special inspection is required by Chapter 17.

3314.3.4 Loads imposed. [Where a supported scaffold sits on a sidewalk shed or other temporary structure, the scaffold drawings shall be accompanied by a loads imposed letter signed, sealed, and dated by a registered design professional. The letter shall detail the loads to be imposed by the scaffold onto the base structure and indicate that the registered design professional has reviewed the adequacy of the base structure to sustain the load imposed.] Where a supported scaffold requiring design in accordance with Section 3314.3.1 imparts a load on a temporary or
permanent structure, including but not limited to a sidewalk shed, roof, setback, or vault, the design drawings required by Section 3314.3.3 shall either be:

1. Sealed and stamped “reviewed for loads imposed” by the registered design professional responsible for the underlying structure and contain a note signed and sealed by such registered design professional indicating that either no structural modifications are required to the underlying structure, or indicating that structural modifications to the underlying structure have been incorporated into the drawings for the underlying structure;

2. Accompanied by a signed and sealed letter from the registered design professional responsible for the underlying structure indicating that he or she has reviewed the scaffold drawings for loads imposed on the underlying structure, with the drawing numbers and drawing dates referenced, and a statement indicating that either no structural modifications are required to the underlying structure, or indicating that structural modifications to the underlying structure have been incorporated into the drawings for the underlying structure; or

3. For a project where there is no registered design professional responsible for the underlying structure, a signed and sealed letter from the registered design professional who developed the design drawings required by Section 3314.3.3 indicating that he or she has investigated the underlying structure, and a statement indicating that either no structural modifications are required to the underlying structure, or indicating that structural modifications to the underlying structure have been incorporated into the plans required by Section 3314.3.3.

3314.4 Installation, inspection, repair, maintenance, adjustment, use, and removal of scaffolds. Scaffolds shall be installed, inspected, repaired, maintained, adjusted, used, and removed in accordance with the specifications of the manufacturer, where such specifications exist, and the requirements of Sections 3314.4.1 through 3314.4.8.

3314.4.1 Installation and removal. Scaffolds shall be installed and removed in accordance with the requirements of Sections 3314.4.1.1 through 3314.4.1.5. Where modifications to the base structure are required to support the scaffold, the scaffold shall not be installed until such modifications have been completed.

3314.4.1.1 Supervision of suspended scaffold installation and removal. Suspended scaffolds shall be installed and removed by or under the direct and continuing supervision of a licensed rigger.

Exceptions: In lieu of direct and continuing supervision by a licensed rigger:

1. The installation and removal of a suspended scaffold utilized exclusively for sign hanging work may be performed by or under the direct and continuing supervision of a licensed sign hanger.

2. The installation and removal of a suspended scaffold may be supervised by a competent person designated by the scaffold permit holder, or where there is no
scaffold permit holder, designated by the scaffold controlling entity, provided such scaffold is installed and removed in conjunction with:

2.1. The construction of a new building;

2.2. The full demolition of an existing building;

2.3. The vertical or horizontal enlargement of an existing building; or

2.4. The alteration, maintenance, or repair of a façade of a major building where a site safety plan is required by Section 3310.3.

3. The lateral relocation of a wheel or track mounted scaffold and tiebacks may be supervised by a competent person designated by the scaffold controlling entity, provided the design developed by the registered design professional allows for such relocation, and also provided such lateral relocation occurs without the addition or removal of any part, component, attachment, counterweight, anchorage, or connection to the base building or structure, other than tie-backs so long as such tie-backs are placed as designated on the approved plan.

3314.4.1.2 Supervision of supported scaffold installation and removal. The installation and removal of a supported scaffold shall be supervised by a competent person designated by the contractor installing or removing the scaffold.

3314.4.1.3 Supervisor to be present at the site. The licensee or competent person supervising the installation or removal of a scaffold shall be present at the site during all installation and removal work and shall have the ability to communicate with all individuals involved in the installation or removal work. Where only one person is installing or removing a scaffold, such person shall be deemed to be the supervisor present at the site and must have the qualifications and training required by this chapter to serve as a supervisor for such work.

Exception: The licensed rigger or sign hanger does not have to be present at the site, provided a suspended scaffold foreman is present at the site during all installation and removal work and provided such suspended scaffold foreman has the ability to communicate with all individuals involved in the installation or removal work.

3314.4.1.4 Training. All individuals involved in the installation or removal of a supported scaffold or an adjustable suspended scaffold, including the person supervising such work, shall have been trained as required by Section 3314.4.5.

3314.4.1.5 Notification of adjustable suspended scaffold installation and removal. Prior to the initial installation of the adjustable suspended scaffold at a site, and prior to the final removal of the adjustable suspended scaffold at a site, the department shall be notified at least 24 hours, but not more than 48 hours, prior to such installation or removal. Should the notification date fall on a weekend or official holiday, the notification shall be made on the last business day before the commencement date of the installation or removal. Such notification:
1. Where the installation or removal occurs under the direct and continuing supervision of a licensed rigger or sign hanger, shall be made by such licensee; or

2. Where the installation or removal does not occur under the direct and continuing supervision of a licensed rigger or sign hanger, shall be made by the designer of the scaffold.

3314.4.2 Use of scaffolds. Scaffolds shall be used in accordance with the requirements of Sections 3314.4.2.1 through 3314.4.2.5.

3314.4.2.1 Supervision of suspended scaffold use. Suspended scaffolds shall be used by or under the direct and continuing supervision of a licensed rigger.

Exceptions:

1. In lieu of direct and continuing supervision by a licensed rigger, the use of a suspended scaffold utilized exclusively for sign hanging work may be performed by or under the direct and continuing supervision of a licensed sign hanger.

2. In lieu of direct and continuing supervision by a licensed rigger, the use of a suspended scaffold may be supervised by a competent person designated by the scaffold controlling entity, provided such scaffold is used in conjunction with:

   2.1. The construction of a new building;

   2.2. The full demolition of an existing building;

   2.3. The vertical or horizontal enlargement of an existing building; or

   2.4. The alteration, maintenance, or repair of a façade of a major building where a site safety plan is required by Section 3310.3.

3. Where a scaffold is used by or under the direct and continuing supervision of a licensed rigger, a registered design professional who is not in the direct employ of the licensee or business of the licensee may ride on a suspended scaffold to perform inspections provided the registered design professional:

   3.1. Does not perform construction, maintenance, repair, or demolition work from the scaffold;

   3.2. Does not operate the scaffold; and

   3.3. Is familiar with the use of the scaffold, safety equipment, and emergency procedures.

4. Where a scaffold is used by or under the direct and continuing supervision of a licensed rigger, a specialty crew who is not in the direct employ of the licensee or business of the licensee may use the suspended scaffold, provided:
4.1. The work requires a specialty trade, including but not limited to work with hazardous materials or chemicals;

4.2. The crew is in accordance with rules promulgated by the commissioner; and

4.3. The members of the crew are approved by the commissioner.

3314.4.2.2 Supervision of supported scaffold use. The use of a supported scaffold shall be supervised by a competent person designated by the scaffold controlling entity.

3314.4.2.3 Installer who is not the scaffold controlling entity. Where the contractor or licensee that installed the scaffold is not the scaffold controlling entity, the installer shall have no supervisory responsibility for the use of the scaffold.

3314.4.2.4 Supervisor to be present at the site. The licensee or competent person supervising the use of a scaffold shall be present at the site during all times the scaffold is in use and shall have the ability to communicate with all individuals using the scaffold; however, such supervisor does not need to be on the scaffold.

   Exception: The licensed rigger or sign hanger does not have to be present at the site, provided a suspended scaffold foreman is present at the site during all times the scaffold is in use and provided such suspended scaffold foreman has the ability to communicate with all individuals using the scaffold. Such suspended scaffold foreman does not need to be on the scaffold.

3314.4.2.5 [Users] Training. All individuals using a supported scaffold or an adjustable suspended scaffold, including the person supervising such use, shall have been trained as required by Section 3314.4.5.

3314.4.3 Inspections. Scaffolds shall be inspected in accordance with the requirements of Sections 3314.4.3.1 through 3314.4.3.6.

3314.4.3.1 Inspection prior to the installation of a suspended scaffold. Prior to the installation of a suspended scaffold, all suspended scaffold support devices, including but not limited to outrigger beams and C-hooks, along with the support surface/structure upon which they rest (e.g. roof, parapet), shall be inspected by a qualified person. The qualified person shall:

   1. Where the installation or removal occurs under the direct and continuing supervision of a licensed rigger or sign hanger, be designated by such licensee; or

   2. Where the installation or removal does not occur under the direct and continuing supervision of a licensed rigger or sign hanger, be designated by the designer of the scaffold.

   Exception: An inspection is not required for a [non-adjustable] nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.
3314.4.3.1.1 Special provision for parapet clamps. Where parapet clamps are to be utilized, the qualified person who inspects the support surface/structure as required by Section 3314.4.3.1 shall be a registered design professional. The registered design professional shall confirm, based on the inspection and evaluation of the support surface/structure, that the support surface/structure is capable of supporting the loads to be imposed, including any eccentric load introduced by the parapet clamp.

3314.4.3.1.2 Documentation of parapet clamp inspection and evaluation. Documentation of the inspection and evaluation required by Section 3314.4.3.1.1 shall be included with the installation inspection report required by Section 3314.4.3.2.1. Such documentation shall be signed, sealed, and dated by the registered design professional that performed the inspection and evaluation.

3314.4.3.2 Installation inspection for suspended scaffolds. Upon completion of the installation of a suspended scaffold, the scaffold, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold shall be inspected prior to use to verify that they are in a safe condition and, where design is required, installed in accordance with the design drawings. The individual performing the inspection shall have completed the training required by Section 3314.4.5.3 and shall be:

1. Where the scaffold was designed by a licensed rigger or sign hanger, or installed by or under the direct and continuing supervision of a licensed rigger or sign hanger:
   1.1. The licensee; or
   1.2. A suspended scaffold foreman; or

2. Where the scaffold was not designed by a licensed rigger or sign hanger, or installed by or under the direct and continuing supervision of a licensed rigger or sign hanger:
   2.1. The scaffold designer;
   2.2. An employee of the scaffold designer under his or her direct supervision;
   2.3. A registered design professional retained by the scaffold designer; or
   2.4. An employee of such retained registered design professional under the direct supervision of such retained registered design professional.

Exceptions: An installation inspection is not required for:

1. A nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed; or

2. The lateral relocation of a wheel or track mounted scaffold and tiebacks, provided the design developed by the registered design professional allows for such relocation, and also provided such lateral relocation occurs without the addition or removal of any part, component, attachment, counterweight, anchorage, or connection to the base building or structure, other than tie-backs. Following such
lateral relocation, the scaffold, and any re-installed tie-back, shall be inspected and documented under the requirements of Section 3314.4.3.4.

3314.4.3.2.1 Installation inspection report. The results of the inspection shall be documented in an installation inspection report signed and dated by the person who performed the inspection. The scaffold shall not be used until it has passed such inspection and the installation inspection report has been completed.

Exception: An installation inspection report is not required for a nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.

3314.4.3.3 Installation inspection for supported scaffolds. Upon completion of the installation of a supported scaffold, the scaffold, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold, shall be inspected prior to use to verify that they are in a safe condition and, where design is required, installed in accordance with the design drawings. Such inspection shall be performed by a qualified person who has completed the training required by Section 3314.4.5.1 and who is designated by the designer, the installer, or a third party acceptable to both the designer and the installer. The results of the inspection shall be documented in an installation inspection report signed and dated by the person who performed the inspection. The scaffold shall not be used until it has passed such inspection and the installation inspection report has been completed.

Exceptions:

1. Where additional components or attachments are installed to an existing supported scaffold, or where existing deck planking or guardrails are relocated to a different level or location, the installation inspection and installation inspection report shall be limited to such components or attachments and related anchorages.

2. An inspection and report is not required for a supported scaffold that, pursuant to Section 3314.3.1, is not required to be designed.

3314.4.3.4 Pre-shift inspection for a suspended scaffold. Suspended scaffolds shall be inspected prior to each shift, and after any occurrence which could affect a scaffold’s structural integrity, in accordance with a pre-shift inspection checklist that meets the requirements of Section 3314.4.3.4.2. The scaffold shall not be used until it has passed such inspection and the results have been documented on the checklist. The checklist shall be kept at the site by the scaffold controlling entity.

Exception: A pre-shift inspection is not required for a nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.

3314.4.3.4.1 Responsibility for performing the inspection and signing the checklist. The inspection required by Section 3314.4.3.4 shall be performed by, and the checklist required by Section 3314.4.3.4.2 shall be signed and dated by, the licensee, suspended scaffold foreman, or competent person who is onsite and responsible for supervising the scaffold under the provisions of Section 3314.4.2. Such individual shall have completed the training required by Section 3314.4.5.3.
3314.4.3.4.2 Pre-shift inspection checklist contents. The pre-shift inspection checklist shall be based on the manufacturer requirements for the inspection of the scaffold, where such requirements exist, and shall, at a minimum, include an inspection prior to each shift to verify the scaffold [remains], all components of and attachments to the scaffold, and all supports and anchorages of the scaffold, remain in a safe condition for use, and shall also include a comprehensive inspection following high winds. Such checklist shall be:

1. Where the scaffold was designed by a licensed rigger or sign hanger, or installed by or under the direct and continuing supervision of a licensed rigger or sign hanger, developed by the licensee; or

2. Where the scaffold was not designed by a licensed rigger or sign hanger, or installed by or under the direct and continuing supervision of a licensed rigger or sign hanger, developed by the registered design professional who designed the scaffold.

Exception: A pre-shift inspection checklist is not required for a nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.

3314.4.3.5 Pre-shift inspection for a supported scaffold. Prior to each shift, and after any occurrence which could affect a scaffold’s structural integrity, the supported scaffold shall be inspected by the competent person supervising the use of the scaffold in accordance with Section 3314.4.2.2 to verify the scaffold [remains], all components of and attachments to the scaffold, and all supports and anchorages of the scaffold, remain in a safe condition for use. Such competent person shall have completed the training required by Section 3314.4.5.2. The results of the inspection shall be documented in a pre-shift inspection report signed and dated by the person who performed the inspection. The scaffold shall not be used until it has passed such inspection and the pre-shift inspection report has been completed.

Exception: An inspection report is not required for a supported scaffold that is not required to be designed under Section 3314.3.1.

3314.4.3.6 Inspection following a site repair or adjustment. Following a repair or adjustment to a scaffold at a site, the portion adjusted or repaired shall be inspected by the person who supervised the adjustment or repair in accordance with Sections 3314.4.6 or 3314.4.7 to verify the adequacy of such adjustment or repair. A description of the adjustment or repair, and the results of the inspection, shall be recorded, signed, and dated by such supervisor and kept with the inspection report required by Sections 3314.4.3.4 or 3314.4.3.5. The scaffold shall not be used until it has passed such inspection and the results of the inspection have been documented.

Exceptions:

1. The scaffold may be used prior to the inspection where authorized in accordance with Section 3314.4.4.7.

2. An inspection and report is not required for a nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.
3314.4.4 Safeguards. The safeguards required by Sections 3314.4.4.1 through [3314.4.4.8] 3314.4.4.12 shall be observed at all times.

3314.4.4.1 Safe working order. Scaffolds, including all components of and attachments to the scaffold, and all supports and anchorages of the scaffold, shall be provided to the site in a safe working order by their respective owner, with no known hazardous conditions, defective repairs, or maintenance problems that could compromise the safety of the public and property. All scaffolds shall be kept in a safe condition at the site by the scaffold controlling entity. Every damaged or weakened scaffold shall be immediately repaired or secured and shall not be used until satisfactory repairs have been completed, and the scaffold is inspected under the provisions of Section 3314.4.3.

3314.4.4.2 Loads. At no time shall a scaffold be loaded beyond the capacity of the scaffold or the ground or structure upon which it rests or is supported. Loads shall not be concentrated so as to cause stresses in excess of the allowable values designated for the applicable material described in this code.

3314.4.4.3 Capacity. Scaffolds shall meet the following capacity requirements.

3314.4.4.3.1 Scaffold and components. Each scaffold, and its components, shall be capable of supporting, without failure, its own weight and at least four times the maximum intended load applied or transmitted to it. Where applicable, scaffolds and their connections to the building or structure shall be designed to meet the anticipated loads during construction or demolition work, including wind loads as prescribed in Chapter 16.

3314.4.4.3.2 Suspension rope on nonadjustable suspended scaffolds. Each suspension rope, including connecting hardware, used on nonadjustable suspended scaffolds shall be capable of supporting, without failure, at least six times the maximum intended load applied or transmitted to the rope.

3314.4.4.3.3 Suspension rope on adjustable suspended scaffolds. Each suspension rope, including connecting hardware, used on adjustable suspension scaffolds shall be capable of supporting, without failure, at least six times the maximum intended load applied or transmitted to that rope with the scaffold operating at the rated load of the hoist.

3314.4.4.3.4 Direct connections to roofs, floors, and counterweights. Direct connections to roofs and floors, and counterweights used to balance adjustable suspension scaffolds, shall be capable of resisting at least four times the tipping moment imposed by the scaffold operating at the rated load of the hoist.

3314.4.4.4 Stable and secure. The scaffold and all materials and equipment located on or used from the scaffold shall be kept stable and secure at all times to prevent the scaffold from losing balance, overturning, or collapsing, and to prevent any object from falling from the scaffold.

3314.4.4.5 Dislodgement. Material and equipment susceptible to dislodgment shall not be stored on a scaffold while work is not being performed.
3314.4.4.6 Winds. Where sustained winds or wind gusts at the site exceed 30 miles per hour, the installation, repair, maintenance, adjustment, use, [and] operation, and removal of scaffolds located on the roof or setback of a building, exterior to a building or structure, on a working deck, or in an area with an unenclosed perimeter shall cease and the scaffold shall be secured. If the manufacturer or designer of the scaffold recommends work to cease at a lower wind speed, such recommendation shall instead apply. Wind speed shall be determined based on data from the nearest United States weather bureau reporting station, or an anemometer located at the site, freely exposed to the wind, and calibrated in accordance with ASTM D5096[02]. No scaffold installation, repair, maintenance, adjustment, use, operation, or removal work shall commence where the weather forecast indicates the work will not be able to be safely completed and the scaffold secured before sustained winds or wind gusts exceed the thresholds established by this section.

3314.4.4.7 Use during installation, repairs, maintenance, adjustments, or removal. Only personnel, materials, and uses authorized by the person responsible for supervising the installation, repair, maintenance, adjustment, or removal of a scaffold shall be located on and using the scaffold during such work.

3314.4.4.8 Noncombustible construction. With the exception of the planking, the following scaffolds shall be constructed of noncombustible materials:

1. Exterior scaffolds exceeding 75 feet (22 860 mm) in height.
2. Interior scaffolds exceeding 21 feet (6.4 m) (6401 mm) in height.
3. All scaffolds used in the alteration, repair, or partial demolition of buildings in Occupancy Groups I-1 to I-4.

3314.4.4.9 Capacity identification for suspended scaffolds. Suspended scaffold motors shall contain a plate from the manufacturer of the motor indicating the rated load of the motor. Swaged attachments or spliced eyes on wire suspension ropes shall be tagged in accordance with the requirements of Section 3314.11.8. Identification required by this section shall be maintained so as to be legible during the life of the element. Missing or illegible identification shall be replaced by a qualified person in accordance with the requirements of the manufacturer of the component or the testing entity authorized by Section 3314.11.8.

3314.4.4.10 Prohibition on shore or lean-to scaffolds. The use of shore or lean-to scaffolds is prohibited.

3314.4.4.11 Accumulation of debris. Debris shall not be allowed to accumulate on platforms.

3314.4.4.12 Precautions while working around powerlines. The clearance between scaffolds and power lines shall be as specified in Table 3314.4.4.12. Scaffolds shall not be erected, used, dismantled, altered, or moved such that they or any conductive material handled on them might come closer to exposed and energized power lines than as specified in Table 3314.4.4.12.
**Exception:** Scaffolds and materials may be closer to power lines than specified in Table 3314.4.4.12 where such clearance is necessary for performance of work, and only after the utility company, or electrical system operator, has been notified of the need to work closer and the utility company, or electrical system operator, has deenergized the lines, relocated the lines, or installed protective coverings to prevent accidental contact with the lines.

3314.4.5 Training. Only those who are qualified to install, adjust, maintain, repair, use, or remove a scaffold, and are trained in accordance with the requirements of this section, shall perform such work or supervise such work. No person shall knowingly permit or cause an individual who does not have the experience and training required by this section to install, adjust, modify, repair, use, or remove a scaffold.

3314.4.5.1 Training for supported scaffold installers, adjusters, repairers, maintainers, inspectors, or removers. Workers who install, adjust, repair, maintain, inspect, or remove a supported scaffold that is 40 feet (12 192 mm) or more in height, including the person supervising such, shall, at a minimum, have completed a department-approved training program or course that is at least 32 hours long and shall complete a department-approved 8-hour refresher program or course every 4 years thereafter. Workers who install, adjust, repair, maintain, or remove a sidewalk shed that provides a base for a supported scaffold that is 40 feet (12 192 mm) or more in height, including the person supervising such, are subject to the above requirements.

Exceptions:

1. The installation, adjustment, maintenance, repair, or removal of a supported scaffold performed by an employee of a public utility, including the person supervising such, where such supported scaffold is located within the interior of a structure owned or operated by such utility, and when such utility has a training safety program or course of not less than 32 hours for its employees who perform such scaffold work.
2. Where existing supported scaffold deck planking or guardrails are being relocated to a different level of the scaffold in accordance with the design, such may be performed by individuals who have completed the training required by Section 3314.4.5.2.

3314.4.5.2 Training for supported scaffold users. Individuals who use a supported scaffold, including the person supervising such, shall, at a minimum, have completed a department-approved training program or course that is at least 4 hours long and, every four years thereafter, retake the 4-hour training program or course.

Exceptions:

1. Employees of a public utility performing work while using a supported scaffold, including the person supervising such, provided that such employees are trained to be able to recognize the hazards associated with the type of supported scaffold being used and to understand the procedures to control those hazards.

2. A registered design professional who has not completed the training may use a supported scaffold to perform inspections provided the registered design professional does not perform construction, maintenance, repair, or demolition work from the scaffold.

3. The use of a stair tower/scaffold stairway/scaffold stair tower that is not connected to a scaffold work platform and is dedicated to providing temporary ingress or egress to the building or structure.

3314.4.5.3 Training for suspended scaffold supervisors. Individuals who exercise supervisory responsibility in accordance with the requirements of Sections 3314.4.1 through 3314.4.4 for the installation, adjustment, repair, maintenance, use, or removal of a suspended scaffold shall, at a minimum, have completed a department-approved training program or course that is at least 32 hours long and, four years following completion of the 32-hour program or course, and every four years thereafter, complete a department-approved 8-hour refresher program or course.

Exception: Individuals supervising the installation, adjustment, modification, repair, use, or removal of a single tier nonadjustable suspended scaffold whose platform is 40 square feet (3720 mm²) or less in size.

3314.4.5.4 Training for suspended scaffold installers, adjusters, repairers, maintainers, users, [inspectors,] or removers. Individuals who install, adjust, repair, maintain, use, [inspect,] or remove a suspended scaffold shall, at a minimum, have completed a department-approved training program or course that is at least 16 hours long and, four years following completion of the 16-hour program or course, and every four years thereafter, complete a department-approved 8-hour refresher program or course.
Exceptions:

1. A registered design professional who has not completed the training may ride on a suspended scaffold to perform inspections provided the registered design professional does not perform construction, maintenance, repair, or demolition work from the scaffold, or operate the scaffold, and provided the registered design professional is familiar with the use of the scaffold, safety equipment, and emergency procedures.

2. Individuals who install, adjust, repair, maintain, use, or remove a single tier nonadjustable suspended scaffold, whose platform is 40 square feet (3720 mm$^2$) or less in size.

3. A person who possesses a valid challenge examination certificate issued prior to January 1, 2014, need not take a new 16-hour initial program or course but shall be required to complete the 8-hour refresher program or course every 4 years, beginning from the date of enactment of this code.

3314.4.5.5 Course providers. Training programs or courses required by this section shall be conducted by a registered New York State Department of Labor apprenticeship training program or by an educational institution or school chartered, licensed or registered by the New York State Department of Education or by a provider approved by the department and presented by an instructor acceptable to the commissioner.

3314.4.5.6 Course curriculums. All training programs or courses required by this section shall be based on the scaffold requirements of this chapter and shall include, but not be limited to, instruction on the type of scaffold the training covers and associated hazards, common causes of scaffold accidents and steps to avoid such accidents, scaffold components, scaffold connections to a structure, scaffold inspection, the maximum intended load and load-handling capacities of scaffolds, and the prevention of overload conditions. Curriculums for scaffold users shall be focused on the proper use of the scaffold. Curriculums for scaffold installers, adjusters, maintainers, repairers, and removers shall be focused on the proper execution of such work. Curriculums in excess of eight hours in length shall include a significant portion of hands-on training.

3314.4.5.7 Evaluation. Successful completion of a training program or course that is more than 4 hours in length shall be based upon a written performance evaluation. For courses that are 16 hours or greater in length, successful completion shall also be based upon passage of a hands-on performance evaluation.

3314.4.5.8 Certificate card. Successful completion of the training program or course shall be evidenced by a wallet size certificate card issued by the training provider and acceptable to the commissioner. Such certificate card shall be readily available to the commissioner upon request and shall contain, at a minimum, the name and photograph of the individual to whom it was issued, as well as any other information required pursuant to rules promulgated by the commissioner for a department approved training course.
3314.4.5.9 Grace period. For individuals who fail to complete the required refresher program or course within any 4-year period, a refresher program or course shall be considered timely if completed within 1 year after the expiration date of the last previously completed initial or refresher program or course. During such period, such individual shall not perform or supervise any activity for which the lapsed training is required to perform or supervise such activity until such individual has successfully completed such refresher program or course. Where more than 1 year has lapsed, such individual shall be required to successfully recomple the initial training program or course.

3314.4.6 Adjustments. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be adjusted under the supervision of a competent person designated by the contractor or licensee who installed the scaffold. Individuals who perform adjustments, and the person supervising such, shall be trained in accordance with Section 3314.4.5. Following the adjustment, the scaffold shall be inspected in accordance with Section 3314.4.3.6.

Exception: Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be adjusted in accordance with the requirements of Section 3307.6.

3314.4.7 Repairs. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be repaired under the supervision of a competent person designated by the equipment owner. Individuals who perform repairs, and the person supervising such, shall be trained in accordance with Section 3314.4.5. Following the repair, the scaffold shall be inspected in accordance with Section 3314.4.3.6.

Exceptions:

1. Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be repaired in accordance with the requirements of Section 3307.6.

2. Components and attachments may be replaced under the supervision of a competent person designated by the contractor or licensee who installed the scaffold.

3314.4.8 Maintenance. Scaffolds, all components of and attachments to the scaffold, and all supports and anchorages of the scaffold installed at a site shall be maintained in a good condition by a qualified person designated by the scaffold controlling entity. Individuals maintaining a scaffold shall have been trained in accordance with Section 3314.4.5. Individuals who maintain an adjustable suspended scaffold hoist shall also have been trained and authorized by the manufacturer of the scaffold hoist. A description of the maintenance shall be recorded, signed, and dated by the person who performed the maintenance and kept with the inspection checklist or report required by Sections 3314.4.3.4 or 3314.4.3.5.

Exceptions:

1. Where a sidewalk shed provides the base for a supported scaffold, the sidewalk shed shall be maintained in accordance with the requirements of Section 3307.6.
2. A description of the maintenance is not required for a nonadjustable suspended scaffold that, pursuant to Section 3314.3.2, is not required to be designed.

3314.5 Platform construction. Platforms on all working levels of a scaffold shall be fully planked or decked between the front uprights and the guardrail system supports in accordance with Sections 3314.5.1 through [3314.5.6] 3314.5.7.

Exception: Platforms used solely as walkways or used solely by workers installing or removing the scaffold shall be planked to the extent necessary to ensure the safety of the public and property.

3314.5.1 Platform spacing. Each platform unit (e.g., scaffold plank, fabricated plank, fabricated deck, or fabricated platform) shall be installed so that the space between adjacent units and the space between the platform and the uprights is no more than 1 inch (25 mm) wide except where a qualified person can demonstrate that a wider space is necessary.

3314.5.2 Maximum span for wood plank. All lumber used in scaffolds or their supports shall be at least equal in strength and quality to construction grade lumber in accordance with Section 2301. See Table 3314.5.2 for the maximum span for scaffold planks.

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 47.88 Pa, 1 foot = 304.8 mm.

3314.5.3 Minimum overhang. The end of a platform shall extend over the centerline of its support a minimum of 6 inches (152 mm) unless cleated or otherwise restrained by hooks or equivalent means.

3314.5.4 Maximum cantilever. The maximum cantilever shall be as follows.

3314.5.4.1 Ten feet or less. The end of a platform 10 feet (3048 mm) or less in length shall not extend over the centerline of its support more than 12 inches (305 mm) unless the platform and its tiedown are designed by a qualified person or the platform has guardrails to prevent access to the cantilevered end.

3314.5.4.2 More than ten feet. The end of a platform more than 10 feet (3048 mm) in length shall not extend over the centerline of its support more than 18 inches (457 mm) unless the platform and its tiedown are designed by a qualified person or the platform has guardrails to prevent access to the cantilevered end.
3314.5.5 **Platform tiedown.** All platforms shall be tied down or otherwise positively restrained by hooks or equivalent means to prevent dislodgment in all directions.

3314.5.6 **Platform deflection.** Platforms shall not deflect more than 1/60 of the span when loaded.

3314.5.7 **Unsuitable platforms.** Unstable objects shall not be used as working platforms.

3314.6 **Footings and anchorage.** The footings and anchorage for every scaffold shall be sound and rigid, capable of carrying the maximum load without excessive settlement or deformation and secure against movement in any direction. Supports such as barrels, boxes, loose brick, loose stone, or other unstable materials shall not be used.

3314.6.1 **Safe points of anchorage.** Safe points of anchorage include structural members of a building. Window washing anchors, window frames, mullions, handrails, standpipes, vents and other piping systems, electrical conduit, counterweights or similar elements shall not be used as anchors or braceback points.

**Exception:** Window washing anchor points that are part of the base building structure may be utilized as an anchor or braceback point for a scaffold, subject to the approval of the commissioner. The anchor points shall be inspected by a registered design professional prior to use to verify their ability to support all loads imposed. At the end of the job, the anchor points shall be restored to their original condition, any damage repaired, and inspected by a registered design professional to verify such. A report verifying such restoration and inspection shall be prepared by the registered design professional and submitted to the department.

3314.6.2 **Lifeline anchorage.** Vertical lifelines shall be fastened to a fixed safe point of anchorage, and shall be independent of the scaffold, and shall be protected from sharp edges and abrasion. Horizontal lifelines shall only be utilized where the individual who designed the scaffold in accordance with Section 3314.3 has determined vertical lifelines are not feasible (for example, lower platforms of a multi-level suspended scaffold). Where utilized, horizontal lifelines shall be secured to two or more structural members of the scaffold, or they may be looped around both suspension and independent suspension lines (on scaffolds so equipped) above the hoist and brake attached to the end of the scaffold. Horizontal lifelines shall not be attached only to the suspension ropes. Vertical and horizontal lifelines shall be protected from sharp edges and abrasion.

3314.6.3 **Lifelines and suspension ropes.** Vertical lifelines, tiebacks, and suspension ropes shall each be attached to a different point of anchorage.

3314.6.4 **Scaffolds supported on structure.** Loads from supported and suspended scaffolds imposed on an existing roof or floor or similar structure shall:

1. Not be concentrated so as to cause stresses in excess of the allowable values designated for the applicable material described in this code; or

2. Be distributed with dunnage or shoring so as to prevent such load from exceeding the allowable values designated for the applicable material described in this code.
3314.7 **Outrigger beams.** Outrigger beams shall be made of structural metal or equivalent strength material and shall be restrained to prevent movement.

3314.7.1 **Overhang.** The overhang of outrigger beams shall not exceed that specified by the design and the inboard length of beam shall be at least one and one-half times the outboard length unless otherwise designed by a registered design professional.

3314.7.2 **Placement.** Outrigger beams shall be placed so that the suspension ropes will hang vertically.

3314.7.3 **Outrigger beam end of suspension ropes.** Suspension ropes shall be securely fastened to the outrigger beams by steel shackles, thimbles, or equivalent means.

3314.7.4 **Load end of wire suspension ropes.** The load end of wire suspension ropes shall be equipped with proper size thimbles and secured by eyesplicing or equivalent means. Where applicable, such equivalent means shall be in accordance with Section 3314.11.8.

3314.8 **Guardrail system and debris netting.** The open sides and ends of scaffold platforms shall be provided with a guardrail system that meets the requirements of Section 3314.8.1 and debris netting that meets the requirements of Section 3314.8.2.

**Exceptions:**

1. A guardrail system and debris netting are not required while the scaffold is being installed or removed but shall be in place before the scaffold is used.

2. A guardrail system and debris netting is not required along the edge of a scaffold facing a building or structure, provided the distance from the edge of the scaffold platform to the face of the building or structure is:

   2.1. For an outrigger scaffold, 3 inches [80 mm] (76 mm) or less;

   2.2. For a scaffold used in conjunction with plastering and lathing operations, 18 inches [460 mm] (457 mm) or less; or

   2.3. For all other scaffolds, 14 inches [360 mm] (356 mm) or less.

3. [Notwithstanding the provisions of Sections 3308.6.1.4 and 3314.9.4, debris] Debris netting is not required along the perimeter of a scaffold [provided such perimeter where the scaffold is set back from all adjoining property and areas that remain open to the public at a distance that is equal to or greater than half the height of scaffold, except where the scaffold is installed to provide an alternative to demolition safety zones, sidewalk sheds, safety netting, or adjoining property protection in accordance with Sections 3306, 3307, 3308, 3309, or the scaffold is installed at the edge of an unenclosed perimeter in accordance with Section 3314.9.4.

4. [Notwithstanding the provisions of Sections 3308.6.1.4 and 3314.9.4, debris] Debris netting is not required for a scaffold [which] that does not require a design in accordance with Section 3314.3, except where the scaffold is installed to provide an alternative to
demolition safety zones, sidewalk sheds, safety netting, or adjoining property protection in accordance with Sections 3306, 3307, 3308, or 3309, or the scaffold is installed at the edge of an unenclosed perimeter in accordance with Section 3314.9.4.

5. A guardrail system and debris netting is not required for a supported scaffold whose topmost platform is 6 feet (1829 mm) or less above the level of the ground or floor, except as otherwise required by Section 3314.9.4.

3314.8.1 Guardrail system. Where required by Section 3314.8, the guardrail system for a scaffold shall meet the requirements of Section 3308.7.1 through 3308.7.7.

Exceptions: For the purposes of this section:

1. The term “floor” in Sections 3308.7.1 through 3308.7.7 shall mean “platform.”

2. The height of the toprail, as prescribed in Section 3308.7.2, may be as low as 38 inches (965 mm) in a guardrail system utilized in connection with a scaffold, and such toprail may deflect to a height of not less than 38 inches (965 mm) when designed in accordance with Exception 1 to Section 3308.7.3.

3. Alternate guardrail systems under Exception 1 to Section 3308.7.3 may be designed by the designer of the scaffold or the manufacturer of the scaffold to be capable of withstanding, without failure, a force of at least:

   3.1. For toprails or equivalent members, a force applied in any downward or horizontal direction at any point along its top edge of at least 100 pounds (445 [N] for guardrail systems installed on single-point adjustable suspended scaffolds or two-point adjustable suspended scaffolds, and at least 200 pounds (890 [N] for guardrail systems installed on all other scaffolds.

   3.2. For midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent members, a force applied in any downward or horizontal direction at any point along the midrail or other member of at least 75 pounds (333 [N] for guardrail systems with a minimum 100 pound (445 [N] toprail capacity, and at least 150 pounds (666 [N] for guardrail systems with a minimum 200 pound (890 [N] toprail capacity.

   3.3. For toeboards, a force of at least 50 pounds (222 [N]) applied in any downward or horizontal direction at any point along the toeboard.

   4. Where intermediate supports, such as ballisters or additional rails are used, they shall not be more than 19 inches (483 mm) apart.

3314.8.2 Debris netting. Where required by Section 3314.8, the scaffold shall be enclosed with a debris netting consisting of a wire screen comprised of not less than number 18 [gage] gauge wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension. Such netting shall be securely
attached to the scaffold and shall enclose all open sides, ends, and bottom of the scaffold for the full height of all platform levels where work is occurring, or when on the upper level of a supported scaffold or when on a suspended scaffold, to the height of the toprail. The effect of wind on the netting shall be accounted for in the design of the scaffold, where such design is required by Section 3314.3.

**[Exception: Exceptions]**

1. Netting is not required to protect the bottom of the scaffold platform provided the netting is securely fastened to the scaffold deck and the scaffold platform planks are laid tight or the deck of the scaffold is solid.

2. Where netting is provided on the upper level of a supported scaffold, or when provided on a suspended scaffold, the netting need only extend to the height of the toprail.

3. Where the scaffold is installed as an alternative to sidewalk sheds, vertical nets, or adjoining property protection in accordance with Sections 3307, 3308, and 3309 respectively, the netting shall enclose the scaffold for its full height.

**3314.9 Supported scaffold.** Supported scaffolds shall meet the requirements of Sections 3314.9.1 through 3314.9.4:

**3314.9.1 Height-to-base ratio.** A supported scaffold with a height-to-base ratio (including outriggers supports, if used) of more than four to one (4:1) shall be restrained from tipping by guying, tying, bracing or equivalent means as follows:

1. Guys, ties, or braces shall be installed at locations where horizontal members support both inner and outer legs.

2. Guys, ties, or braces shall be installed in accordance with the manufacturer’s recommendations, or as designed in accordance with Section 3314.3, or at a minimum, in accordance with the design drawings required by Section 3314.3, or where design is not required, in accordance with the manufacturer’s specifications. If design is not required and there are no manufacturer’s specifications, the first guy, tie or brace shall be installed at a horizontal member and not more than a distance [four] times the least plan dimension from the base support and be repeated vertically at locations of horizontal members every 20 feet (6096 mm) or less thereafter for scaffolds 3 feet (914 mm) wide or less, and every 26 feet (7925 mm) or less thereafter for scaffolds greater than 3 feet (914 mm) wide. In every instance, the capacity of requirements of Section 3314.4.4.3 shall apply, which may necessitate guys, ties or braces being installed at smaller intervals.

3. The top guy, tie, or brace shall be placed no further than four times the least plan dimension from the top. Such guys, ties, or braces shall be installed at each end of the scaffold and at horizontal intervals not to exceed 30 feet (9144 mm) measured from one end (not both) towards each other.
3. Guys, ties, braces, or outriggers shall be used to prevent tipping of supported scaffolds in all circumstances where an eccentric load, such as a cantilevered work platform, is applied or is transmitted to the scaffold.

3314.9.2 Foundation. Supported scaffold poles, legs, posts, frames and uprights shall bear on base plates and mud sills or other adequate firm foundation to distribute the weight of the scaffold into the ground, structure, or sidewalk shed upon which it rests. Unstable objects shall not be used to support scaffolds or platform units.

3314.9.3 Plumb. Supported scaffold poles, legs, posts, frames, and uprights shall be plumb and braced to prevent swaying and displacement. The tolerance shall not exceed L/100, where L is the distance measured from the ground or grade elevation to the first cross brace or bottom of the first bearer or frame horizontal member.

3314.9.4 Supported scaffolds at the edge. Supported scaffolds located on a floor, working deck, or roof and located within a distance from the edge of the roof or an unenclosed perimeter that is equal to or less than [1.5] one and one-half times the height of the scaffold shall:

1. Be positively anchored or tied-back, and with all wheels or rollers secured by rope, cable, or chocking at the wheels in order to prevent movement; and

2. Have all sides of the scaffold facing an unenclosed perimeter or the edge of a roof within a distance that is equal to or less than [1.5] one and one-half times the height of the scaffold provided with guardrails and debris netting in accordance with Section 3314.8; or

3. Have all material and equipment susceptible to dislodgement, and not being actively held by a person, secured in a manner to prevent dislodgement by wind or accidental impact.

**Exception:** The above requirements shall not apply where vertical safety netting that meets the requirements of Section 3308.5, or an approved alternate system, extends to cover the full height and width of all unenclosed perimeters within a distance from the scaffold equal to or less than [1.5] one and one-half times the height of the scaffold.

3314.10 Suspended scaffold. Suspended scaffolds shall meet the requirements of Sections 3314.10.1 through [3314.10.11] 3314.10.14.

3314.10.1 Suspended elements to be kept vertical and parallel. Suspended scaffolds shall be installed and used in such a manner that the ropes or similar suspension elements are vertical and/or in a plane parallel to the wall at all times.

**Exception:** Ropes or similar suspension elements do not have to be vertical and/or in a plane parallel to the wall provided such occurs in accordance with design drawings prepared by a registered design professional. Such design drawings shall be based on an investigation of the support surface/structure (e.g. roof, parapet) and anchorage of the scaffold conducted by such registered design professional. A signed, sealed, and dated report prepared by the registered design professional documenting such investigation shall accompany the design drawings.
**3314.10.2 Support.** All suspended scaffold support devices, such as outrigger beams, C-hooks, parapet clamps, and similar devices shall be supported by surfaces/structures (e.g., roof, parapet) capable of supporting at least [4] **four** times the load imposed on them by the scaffold operating at the rated load of the hoist. The support shall be inspected prior to installation in accordance with the requirements of Section 3314.4.3.1.

**3314.10.3 Outrigger beam location.** Outrigger beams shall be placed perpendicular to the face of the building or structure.

**Exception:** Where a licensed rigger or registered design professional can demonstrate to the commissioner’s satisfaction that it is not possible to place an outrigger beam perpendicular to the face of the building or structure, the outrigger beam may be placed at a different angle, provided opposing angle tiebacks are used.

**3314.10.4 Outrigger beam stabilization.** The inboard ends of the suspended scaffold outrigger beam shall be stabilized by bolts or other direct connections to the floor or roof deck, or they shall have their inboard ends stabilized by counterweights.

**Exception:** Multipoint adjustable suspended scaffolds shall not be stabilized by counterweights.

**3314.10.5 Outrigger beams secured by tiebacks.** Outrigger beams which are not stabilized by bolts or other direct connections to the floor or roof deck shall be secured by tiebacks.

**[3314.10.5] 3314.10.6 Outrigger beam installation.** Outrigger beams shall be installed with all bearing supports perpendicular to the beam centerline and shall set and maintain the web in a vertical position. The shackle or clevis with which the rope is attached to the outrigger beam shall be placed directly over the centerline of the stirrup.

**[3314.10.6] 3314.10.7 Counterweight material.** Only those items specifically designed as counterweights shall be used to counterweight scaffold systems. Counterweights shall be made of a nonflowable material. Sand, gravel and similar materials that can be easily dislocated shall not be used. Construction materials such as, but not limited to, masonry units and rolls of roofing felt, shall not be used as counterweights.

**[3314.10.7] 3314.10.8 Counterweight securement.** Counterweights shall be secured by mechanical means to the outrigger to prevent accidental dislodgment.

**[3314.10.8] 3314.10.9 Counterweight removal.** Counterweights shall not be removed from an outrigger beam until the scaffold is disassembled.

**3314.10.10 Tiebacks.** Tiebacks shall be equivalent in strength to the suspension ropes. Tiebacks shall be secured to a structurally sound anchorage on the building or structure in accordance with Section 3314.6.

**[3314.10.9] 3314.10.11 Horizontal tieback location.** Horizontal tiebacks shall be installed perpendicular to the face of the building or structure, or opposing angle tiebacks shall be installed. Single tiebacks installed at an angle are prohibited.
**3314.10.12 Support devices.** Suspended scaffold support devices, such as C-hooks, cornice hooks, roof hooks, roof irons, parapet clamps or other similar devices shall meet the following requirements:

1. Support devices shall be made of steel, wrought iron or materials of equivalent strength.
2. Such devices shall be supported by bearing blocks.
3. Support devices shall be secured against movement by tiebacks installed perpendicular to the face of the building or structure or by opposing angle tiebacks installed and secured to a structurally sound point of anchorage as prescribed in Section 3314.6.
4. Tieback rope shall be at least equal in strength to the suspension rope.

**3314.10.13 Securing suspended scaffolds.** At the end of the shift, and when otherwise required by Section 3314.4.4.6, the suspended scaffold shall be cleared of all equipment and material susceptible to dislodgement and shall be lowered to the street, [or deck of the] sidewalk shed, or other location specified in the design drawings required by Section 3314.3.3, or shall be secured to the roof, [or] building, or other structure in accordance with the design drawings required by Section 3314.3.3.

**3314.10.14 Stand-off brackets prohibited.** The installation or use of a stand-off bracket is prohibited.

**3314.11 Suspension rope.** Suspension ropes on suspended scaffolds shall meet the requirements of Section 3314.11.1 through 3314.11.8.

**3314.11.1 Wraps of rope.** When winding drum hoists are used on a suspended scaffold, they shall contain not fewer than four wraps of the suspension rope at the lowest point of scaffold travel. When other types of hoists are used, the suspension ropes shall be long enough to allow the scaffold to be lowered to the level below without the rope end passing through the hoist, or the rope end shall be configured or provided with means to prevent the end from passing through the hoist.

**3314.11.2 Repaired rope.** The use of repaired wire rope as suspension rope is prohibited.

**3314.11.3 Rope replacement.** Ropes shall be replaced or removed if any of the following conditions exist, and as otherwise prescribed by rule of the department:

1. Any physical damage that impairs the function and strength of the rope.
2. Presence of kinks that might impair the tracking or wrapping of the rope around the drums or sheaves.
3. Presence of abrasion, corrosion, scrubbing, flattening or peening causing the loss of more than one-third of the original diameter of the outside wires.
4. Heat damage caused by a torch or any damage caused by contact with electrical wires.
5. Evidence that the secondary brake has been activated during an overspeed condition and has engaged the suspension rope.

[3314.11.3] 3314.11.4 Shielding. Suspension ropes shall be shielded from heat-producing processes.

[3314.11.4] 3314.11.5 Corrosive substances. When acids or other corrosive substances are used on a scaffold, the ropes shall be shielded, treated to protect against corrosive substances, or made of a material that will not be damaged by the corrosive substance being used.

[3314.11.5] 3314.11.6 Suspended scaffold welding precautions for arcing prevention. Precautions shall be taken to prevent the possibility of arcing through the suspension wire rope during welding operations.

[3314.11.5.1] 3314.11.6.1 Insulated thimble. An insulated thimble shall be used to attach each suspension wire rope to its hanging support. Excessive suspension wire rope and any additional independent lines from grounding shall be insulated.

[3314.11.5.2] 3314.11.6.2 Insulating material. The suspension wire rope shall be covered with insulating material extending at least 4 feet (1219 mm) above the hoist. If there is a tail line below the hoist, it shall be insulated to prevent contact with the platform. The portion of the tail line that hangs free below the scaffold shall be guided or retained or both so that it does not become grounded.

[3314.11.5.3] 3314.11.6.3 Protective covers. Each hoist shall be covered with insulated protective covers.

[3314.11.5.4] 3314.11.6.4 Grounding conductor. In addition to a work lead attachment required by the welding process, a grounding conductor shall be connected from the scaffold to the structure. The size of the connector shall be at least the size of the welding process work lead, and this conductor shall not be in series with the welding process or the work piece.

[3314.11.5.5] 3314.11.6.5 Disconnected grounding lead. If the scaffold grounding lead is disconnected at any time, the welding machine shall be shut off or the welding lead shall be removed from the scaffold.

[3314.11.5.6] 3314.11.6.6 Welding rod or lead. An active welding rod or uninsulated welding lead shall not be allowed to make contact with the scaffold or its suspension system.

[3314.11.6] 3314.11.7 Wire rope clips. Wire rope clips used on suspended scaffolds shall be in accordance with Sections 3114.11.7.1 through 3314.11.7.4.

3314.11.7.1 Minimum number of clips to be installed. Where wire clips are used on suspended scaffolds, there shall be a minimum of three wire rope clips installed a minimum of six rope diameters apart.

3314.11.7.2 Installed to manufacturer specifications. The clips shall be installed according to the manufacturer’s specifications.
3314.11.7.3 **Retightening of clips.** The clips shall be retightened to the manufacturer’s specifications after initial loading. [U-bolt clips shall not be used at the point of suspension.] Clips shall be inspected and retightened to the manufacturer’s specifications at the start of each work shift thereafter.

3314.11.7.4 **U-bolt clips.** When U-bolt clips are used, the U-bolt shall be placed over the dead end of the rope and the saddle shall be placed over the live end of the rope.

   **Exception:** U-bolt clips shall not be used at the point of suspension.

3314.11.8 **Swaged attachments or spliced eyes.** Swaged attachments or spliced eyes on wire suspension ropes shall not be used unless they are made by the wire rope manufacturer or a qualified person. Where swaged attachments or spliced eyes are made by a qualified person, a representative sample of the assembly shall be tested under the supervision of a licensed rigger or a registered design professional to confirm the assembly will supply the clamping force specified by the wire rope manufacturer or the manufacturer of the hardware. Swaged attachments or spliced eyes shall be provided with a tag by the wire rope manufacturer or the testing entity indicating the capacity of the assembly.

   **Exception:** J-bolts shall be designed by a manufacturer and installed in accordance with the manufacturer’s specifications.

3314.12 **Wood pole scaffolds.** Wood pole scaffolds shall meet the requirements of Sections 3314.12.1 through 3314.12.9.

   **3314.12.1 Standard designs.** All wood pole scaffolds 40 feet (12 192 mm) high or less shall be constructed in accordance with the minimum nominal sizes and maximum spacings shown in Tables 3314.12.1 (1) through 3314.12.1 (6). Wood pole scaffolds more than 40 feet (12 192 mm) high shall be designed in accordance with Section 3314.3.

*Note: For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.88 Pa.*

a. Total base dimension in both directions to be at least 25 percent of height.

### 3314.12.2 Erection and removal.
When a new working level is desired, the existing planks shall be left undisturbed until the new working level is framed. As the platform level is abandoned with the progress of the work, all members other than the planking, railing and toeboards shall be left intact. When removing a scaffold, the sequence of removing the members shall be the reverse of that used in erection.

### 3314.12.3 Materials and construction for wood pole scaffolds.
Wood pole scaffold materials and construction shall comply with the following requirements:
1. All lumber used in wood pole scaffolds or their supports shall be at least equal in strength and quality to construction grade lumber in accordance with Section 2301.

2. All lumber and timber shall be fastened at the various joints with sufficient nails or bolts of a suitable size to produce a secure joint capable of withstanding the design load. Table 3314.12.3 provides minimum requirements for size and number of nails. All nails shall be driven full length.

3. Any other suitable material, or dimensions other than those indicated, may be used for wood pole scaffold construction provided it is at least equivalent in strength and suitability to the comparable wood scaffold it is designed to replace, and approval of the commissioner has been obtained.

</tbody>
</table>

**3314.12.4 Poles.** Wooden scaffold poles shall be plumb and the foot ends shall be secured against lateral movement. Where wood poles are spliced, the squared end of the upper section shall bear uniformly on the squared end of the lower section and the two ends shall be rigidly fastened together with two or more wood splice plates, each at least 4 feet (1219 mm) in length. The plates shall be placed at right angles to each other, shall overlap the abutting ends of the pole equally, and shall have a combined sectional area not less than 50 percent of the cross sectional area of the pole. Splicing of adjacent poles shall be staggered. Splices shall be close to ledgers, but so located as not to interfere with the fastenings.
3314.12.5 Bracing. Wood pole scaffolds shall be braced and stayed to prevent movement away from the building. Diagonal or equivalent bracing shall be provided to prevent the poles from moving in a direction parallel to the building face and shall be so installed that every spliced section of every pole is braced to adjacent poles.

3314.12.6 Planking. Planking shall comply with Items 1 through 3.

1. Where planks are butted end to end, parallel putlogs or bearers shall be provided not more than 8 inches (203 mm) apart so that the butted ends rest on separate putlogs or bearers. Ends shall be nailed or cleated.

2. Where platform planks are used with overlapping ends, the ends of both the upper and lower planks shall overlap the putlog or bearer by at least 6 inches (152 mm).

3. Planks shall be laid close together and shall be of sufficient length to extend over three bearers.

3314.12.7 Connections. Ledgers shall not be spliced between poles but shall overlap the poles at each end by at least 4 inches (102 mm). Where ledgers lap each other, bearing-blocks attached to the pole shall be provided to support the ledger.

3314.12.7.1 Braces. The ends of all wooden braces shall overlap the nailed fastenings by an amount sufficient to prevent the ends of the braces from splitting.

3314.12.8 Putlogs for single pole scaffolds. All putlogs shall be set with the greater dimension vertical and shall be long enough to project beyond the outer edge of the poles by at least 12 inches (305 mm). Putlogs shall be supported on the ledger and located against the side of the poles and fastened to either the pole or the ledger. The other end of the putlog shall rest in the wall of the building, with at least a 4 inch (102 mm) bearing, and shall not be notched or cut down, except for light duty scaffolds, which may be notched or cut down to fit into a space made by the removal of a brick. In such cases, the notch shall be made on the top of the putlog just deep enough to permit it to be inserted in the hole in the wall.

3314.12.9 Bearers for independent pole scaffolds. Bearers shall be set with their greater dimensions vertical, and shall be long enough to project over the ledgers beyond the outer row of poles by at least 12 inches (305 mm) and beyond the inner row of poles by at least 2 inches (51 mm). Bearers shall be supported on the ledgers, located against the sides of the poles and fastened to the ledgers.

3314.13 Fabricated frame scaffolds. Fabricated frame scaffolds shall meet the requirements of Sections 3314.13.1 through 3314.13.3.

3314.13.1 Bracing. Frames and panels shall be braced by cross, horizontal or diagonal braces or a combination thereof, which secure vertical members together laterally.

3314.13.2 Vertical joining. Frames and panels shall be joined together vertically by coupling or stacking pins or equivalent means. Where uplift can occur, the frames or panels shall be locked together vertically by pins or equivalent means.
3314.13.3 Frame scaffold brackets. Brackets used to support cantilevered loads shall be seated with side-brackets parallel to the frame and end-brackets at 90 degrees (1.57 rad) to the frames shall not be bent or twisted from these positions and shall be used only to support light duty loads [as defined in Section 3302.1] of up to 25 pounds per square foot (122.05 kg/m²), unless the design provisions of Section 3314.3 have been met.

3314.14 Outrigger scaffolds (thrust out). Outrigger scaffolds (thrust out) shall not be used for loading in excess of 50 pounds per square foot (244.1 kg/m²) (medium duty).

3314.14.1 Outrigger beams. The fulcrum point of the beam shall rest on a secure bearing at least 6 inches (152 mm) in each horizontal dimension. The beam shall be secured against movement and shall be securely braced against tipping at both the fulcrum point and the inboard end.

3314.14.2 Inboard supports. The inboard ends of outrigger beams shall be securely fixed to resist all vertical, horizontal and torsional forces. Pull-out tests for adhesive and expansions anchors, if used, shall be approved by the commissioner.

3314.15 Two-point adjustable suspended scaffolds. Two-point adjustable suspended scaffolds shall meet the requirements of Sections 3314.15.1 through 3314.15.7.

3314.15.1 Width and support. Two-point adjustable suspended platforms shall be at least 20 inches (508 mm) but not more than 36 inches (914 mm) in width unless designed by a registered design professional. Each end of the platform shall be supported by a stirrup or hanger that meets the requirements of Section 3315.15.2, and the platform shall be securely fastened thereto. Not more than two hangers or stirrups shall be used to support one scaffold.

3314.15.2 Hangers or stirrups. Hangers or stirrups shall be of steel or wrought iron. Each such hanger shall be formed to properly fit the platform and the hoist mechanism. The hanger or stirrup shall be placed at least 6 inches (152 mm) but not more than 18 inches (457 mm) from the end of the platform [unless the manufacturer specifies otherwise].

**Exception:** Alternative spacing from the end of the platform may be utilized where the manufacturer so specifies and such alternative spacing is indicated on design drawings developed by a registered design professional.

3314.15.3 Fiber suspension rope. The use of fiber rope shall be limited to light duty two-point adjustable suspended scaffolds. Fiber rope shall be at least equivalent in strength and suitability to \[\frac{3}{4}\] ¾-inch (19 mm) grade #1 unspliced manila rope.

3314.15.3.1 Corrosive substances. Fiber rope susceptible to damage from corrosive substances shall not be permitted for or near any work involving the use of corrosive substances.

3314.15.3.2 Upper block. Fiber rope shall not be used where the upper block is more than 100 feet (30 480 mm) or ten stories, whichever is less, above the ground or roof setback.

3314.15.3.3 Fit. All blocks shall fit the size of rope they carry, and shall be constructed so as not to chafe the rope.
3314.15.4 **Combination.** Two or more two-point adjustable suspended scaffolds shall not be combined into one by bridging the distance between them or by any other form of connection.

3314.15.5 **Number of workers.** Not more than two [workers] people shall be permitted [to work] on one scaffold at one time except where the scaffold is designed to hold more. Written permission from the commissioner shall be required for more than two [workers] people on the scaffold.

3314.15.6 **Device to raise, lower, and hold the scaffold.** Every two-point adjustable suspended scaffold shall be equipped with a device to raise, lower or hold the scaffold in position.

3314.15.7 **Platforms.** The platforms of every two-point adjustable suspended scaffold shall be ladder-type, plank-type, beam-type, light-metal type, or another type acceptable to the commissioner.

3314.16 **Corner and angle scaffolds.** Corner and angle scaffolds shall comply with the requirements of Sections 3314.16.1 through 3314.16.4.

3314.16.1 **Motors.** As many motors as needed shall be provided to maintain the stability of the platform under all operating conditions.

3314.16.2 **Maximum number of people.** The number of people allowed on a corner or angle scaffold shall not be more than the number of motors required to keep the scaffold stable, unless otherwise designed by a registered design professional.

3314.16.3 **Additional information.** In addition to the information required by Section 3314.3, corner and angle scaffolds shall also contain load capacity and distribution charts and a certification from the registered design professional that he/she has reviewed the manufacturer’s design calculations and testing or prepared sufficient calculations of his/her own and found them to conform to this code.

3314.16.4 **Inspection.** The equipment setting for corner and angle scaffolds shall be inspected by the department prior to its use. Additional inspection by the department shall be required each time the equipment is moved to a different position.

3314.17 **Multiple-point adjustable suspended scaffolds.** Multiple-point adjustable suspended scaffolds shall comply with the following:

1. All multiple-point adjustable suspended scaffolds shall be supported by wire ropes. The use of fiber ropes is not permitted;

2. Provision shall be made to prevent supports from slipping off the ends of outrigger beams;

3. Platform bearers shall be of metal; and

4. During raising or lowering, the levels of the various sections of the scaffolds shall be kept uniform and the differential height between sections shall be minimized.

3314.18 **Manually propelled, free-standing scaffolds.** All manually propelled free-standing scaffolds shall meet the following requirements:

1978
1. Work platforms shall be tightly planked for the full width of the scaffold, except for necessary entrance openings. Planks shall be secured in place;

2. Platforms shall have a guardrail system;

3. Where a ladder is used to approach a platform, the ladder shall be secured to the scaffold;

4. Handholds shall be provided for safe passage from the ladder to the platform;

5. Unless temporarily braced to an adjacent structure, the ratio of the platform height to the least base dimension shall be such as to \[\text{ensure}\] stability, but in no case shall such height be more than four times the least base dimension;

6. Provisions shall be made to prevent the scaffold from falling during movement from one location to another;

7. While the scaffold is in use, it shall rest upon a stable footing and shall stand plumb. The casters or wheels shall be locked in position; and

8. While the scaffold is being moved, no person shall be permitted to ride on it, and all tools, equipment and material shall be removed.

3314.19 Mast climbers. Mast climbers shall be designed, constructed, permitted, installed, adjusted, maintained, repaired, used, operated, inspected, and removed in accordance with rules promulgated by the commissioner.

3314.20 Public housing construction projects. No scaffolding permit issued for construction projects on public housing developments provided by the New York city housing authority shall be renewed unless the commissioner determines that such scaffolding is being used as part of an ongoing construction project. The commissioner shall promulgate such rules and regulations as shall be necessary to implement the provisions of this section.

An "ongoing" construction project" shall mean any construction project during which persons employed in construction work are utilizing such scaffolding at least two days per week, or have utilized such scaffolding for at least two days per week at any time over the course of the six months immediately preceding a request to renew a scaffolding permit.

§ 45. Section BC 3315 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:
SECTION BC 3315
STRUCTURAL RAMPS, RUNWAYS, AND PLATFORMS

3315.1 Ramps and runways. Ramps and runways (including elevated walkways) shall comply with the requirements of Sections 3315.1.1 through 3315.6, as well as rules promulgated by the commissioner.

3315.1.1 Construction. All runways and ramps shall be constructed, braced and supported to resist lateral displacement and all vertical loads, including impact.

3315.1.2 For motor vehicle use. Runways and ramps for the use of motor vehicles may consist of an earthen fill or be structurally supported. Such runways and ramps shall have a clear width of not less than 12 feet (3658 mm) with timber solid curbs or barriers at least 8 inches by 8 inches (203 mm by 203 mm) placed parallel to, and secured to, the sides of the runway or ramp. The flooring of structurally supported ramps shall consist of no smaller than 3-inch (76 mm) planking full size, undressed, or equivalent material, with spans designed for the loads to be imposed. Runways and ramps used by both motor vehicles and persons must also comply with requirements for runways and ramps used by persons. Runways and ramps dedicated exclusively to motor vehicles do not have to comply with requirements for runways and ramps used by persons.

3315.1.3 For use by persons. Runways and ramps for the use of workers used by persons shall be at least 1 foot 6 inches (457 mm) 2 feet (610 mm) in clear width. Where used for wheelbarrows, handcarts, or hand-trucks, runways and ramps shall be at least 3 feet (914 mm) in clear width. Flooring shall consist of at least 2-inch (51 mm) planking spanning as permitted by Table 3314.5.2, laid close, butt-joined and securely fastened.

3315.1.4 Slope limitations. Ramps shall have a slope not steeper than one in four. If the slope is steeper than one in eight, the ramp shall be provided with cleats spaced not more than 14 inches (356 mm) apart and securely fastened to the planking to afford a foothold. Spaces in the cleats may be provided for the passage of the wheels of vehicles. The total rise of a continuous ramp used by workers persons carrying material or using wheelbarrows, hand-carts, or hand-trucks shall not exceed 12 feet (3658 mm) unless broken by horizontal landings at least 4 feet (1219 mm) in length.

3315.1.5 Guardrail required. A guardrail meeting the requirements of Sections 3308.7.1 through 3308.7.7 shall be provided in any of the following circumstances:

1. On all edges of the runway or ramp that are located more than 5 feet (1524 mm) above the ground or floor; and] Where an unprotected side or edge is 6 feet (1829 mm) or more above the ground, floor, or other lower level;

2. Along any portion of the runway or ramp that is used by persons and abuts motor vehicle traffic;

3. Along any portion of the runway or ramp where a person may thereby be exposed to harm from adjoining machinery, electrical equipment, or other hazardous equipment.
For the purposes of [this section] Section 3315.1.5, the term “floor” in Sections 3308.7.1 through 3308.7.7 shall mean “runway or ramp.”

3315.1.6 Netting required. Where it is possible for the public to pass under, or next to, runways or ramps, the space between the top rail and the toeboard shall be enclosed with a wire screen composed of not less than [No.] number 18 steel wire gauge wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension.

3315.1.7 Signage required. At every access point to a runway or ramp, a sign shall be posted indicating whether the runway or ramp, or a portion thereof, is intended for use by motor vehicles or by persons.

3315.2 Platforms. Platforms shall comply with the requirements of Sections 3315.2.1 through 3315.2.3.

3315.2.1 Planking. Platforms used as working areas, or for the unloading of wheelbarrows, hand trucks, or carts shall have a floor consisting of at least 2-inch (51 mm) planking spanning as permitted by Table 3314.5.2. Platforms for the use of motor trucks shall have a floor of at least 3-inch (76 mm) planking, full size, undressed or equivalent materials with spans designed for the loads to be imposed. Planking shall be laid close and shall be butt-joined and securely fastened.

Exceptions:

1. Where the platform is to be used to support loads in excess of 75 psf (366.2 kg/m²), or is intended for a use as specified in rules promulgated by the commissioner, the platform shall be designed by a registered design professional.

2. Where the platform is to be used by motorized equipment, including but not limited to trucks, power buggies, fork lifts, or scissor lifts, the platform shall be designed by a registered design professional.

3315.2.2 Guardrail required. A guardrail meeting the requirements of [Section] Section 3308.7.1 through [Section] Section 3308.7.7 shall be provided on all open sides of platforms located more than 5 feet (1524 mm) above the ground or floor, in any of the following circumstances:

1. Where an unprotected side or edge is 6 feet (1829 mm) or more above the ground, floor, or other lower level;

2. Along any portion of the runway or ramp that abuts motor vehicle traffic; or

3. Along any portion of the runway or ramp where a person may thereby be exposed to harm from adjoining machinery, electrical equipment, or other hazardous equipment.
For the purposes of this section, Section 3315.2.2, the term “floor” in Sections 3308.7.1 through 3308.7.7 shall mean “platform.”

**Exception:** In lieu of a guardrail, the side of the platform used for the loading or unloading of vehicles may be protected by a timber solid curb or barrier at least 8 inches by 8 inches (203 mm by 203 mm) for motor trucks or 4 inches by 4 inches (102 mm by 102 mm) for wheelbarrows and hand-trucks.

3315.2.3 Netting required. Where it is possible for the public to pass under, or next to, platforms, the space between the top rail and the toboard shall be enclosed with a wire screen composed of not less than No. 18 steel wire mesh, or equivalent synthetic netting that is flame retardant in accordance with NFPA 701, with openings in the wire or synthetic mesh no larger than ½ inch (13 mm) in the vertical or horizontal dimensions and ¾ inch (19 mm) in any other dimension.

3315.3 Special requirements where motorized equipment is used. Runways, ramps, platforms, and other surfaces upon which motorized equipment, including but not limited to trucks, power buggies, fork lifts, or scissor lifts, is operated shall also meet the following minimum requirements:

1. They shall be designed by a qualified person.

2. They shall be able to sustain, without failure, at least four times the maximum live load for which they are intended.

3. The minimum width, inside of curbs or barriers, for any ramp, runway, or platform shall be 2 feet (610 mm) wider than the outside width of any motorized equipment operated thereon without passing, and 3 feet (914 mm) wider than twice such width in the places where passing occurs.

4. All runways shall be essentially level transversely.

5. Curbs or barriers shall be furnished along all motorized equipment traffic paths that are nearer than 10 feet (3048 mm) horizontally to any unenclosed area, shaft, or other open space into which or through which a fall of more than 12 inches (305 mm) from such surface is possible, except as set forth in numbered Item 5.

6. Where curbs or barriers are not required because the motorized equipment is operated on a surface not over 12 inches (305 mm) above another surface, the lower surface shall be strong enough to sustain the loaded vehicle in the event of a fall thereon.

7. Curbs or barriers may be omitted at actual dumping points more than 12 inches (305 mm) above other surfaces if the edge over which dumping occurs is provided with bumpers or other means that will effectively stop the motorized equipment from running over the edge while dumping.

8. Curbs or barriers must be at least 7 inches (178 mm) high, securely fastened, and capable of resisting side impact, and shall be equivalent to at least 2 inch by 8 inch (51 mm
by 203 mm) plank set on edge against uprights securely fastened and braced at not more than 4-foot (1219 mm) intervals.

§ 46. Section BC 3316 of the New York city building code, as added by local law number 33 for the year 2007, section 3316.9 as added by local law 141 for the year 2013, is amended to read as follows:

SECTION BC 3316
HOISTING EQUIPMENT AND MATERIAL HANDLING EQUIPMENT

3316.1 Scope. Hoisting equipment and material handling equipment shall meet and be used in accordance with the requirements of this section and rules promulgated by the commissioner. Material hoists and bucket hoists shall also meet the requirements of Section 3317, personnel hoists shall also meet the requirements of Section 3318, and cranes and derricks shall also meet the requirements of Section 3319. Certain material handling equipment listed in Section 3320 shall also meet the requirements of that section.

Exceptions: The requirements of this section, as well as Sections 3317 through 3320, shall not apply to:

1. Scaffolds. Scaffolds shall comply with the requirements of Section 3314. However, hoisting equipment utilized on scaffolds shall be subject to the requirements of this section.

2. Mast climbers. Mast climbers shall comply with rules promulgated by the commissioner. However, hoisting equipment utilized on mast climbers shall be subject to the requirements of this section.

3. Elevators. Elevators shall comply with the requirements of Chapter 30.

4. Hoisting equipment and material handling equipment, including but not limited to cranes or derricks, used in industrial or commercial plants or yards, other than those used for the construction or demolition of the facility.

5. Hoisting equipment and material handling equipment on ships or barges, including but not limited to floating cranes, floating derricks, and cranes and derricks used on floating equipment.

6. An automotive wrecker, tow truck, or mechanic’s truck with a hoisting device when used to clear vehicular wrecks, haul vehicles, or used in activities related to the maintenance and repair of construction- or demolition-related vehicular equipment. However, this exception shall not apply to the use of such equipment to perform other tasks, including but not limited to hoisting earthwork equipment for the purpose of placing or extracting the earthwork equipment from an excavation.

7. Helicopters. Helicopter lifts shall require a permit from the fire department.
8. Tree trimming or tree removal equipment. However, this exception shall not apply to the use of hoisting equipment capable of lifting or lowering other loads, including but not limited to a crane utilized in conjunction with tree trimming or tree removal.

3316.2 Requirements. Hoisting equipment and material handling equipment, including [its] supports and runback structures, shall be installed, operated, used, and maintained to eliminate hazard to the public or to property. [It shall be unlawful to operate any such equipment that is not provided with a positive means for preventing the unauthorized operation of such machine. The means whereby such machines may be made inoperative shall be accepted by the department.]

[3316.3 Notification of hoisting accidents. The owner or person directly in charge of any hoisting equipment shall immediately notify the commissioner following any accident involving hoisting equipment. Following an incident, no person shall permit either of the following, without the permission of the commissioner:

1. Use of such hoisting equipment; or
2. Removal of the hoisting equipment or any part thereof from the area of the job site.]

3316.3 Notification of incidents involving hoisting equipment or material handling equipment. The requirements of Section 3301.8 shall apply.

3316.3.1 Additional notification requirement for hoisting machines. In addition to the requirements of Section 3301.8, the operator of a hoisting machine shall immediately notify the department, in a form and manner acceptable to the commissioner, of any incident involving the use of the hoisting machine, or of any damage to adjoining property caused by the use of the hoisting machine.

3316.4 Permit for power operated hoisting equipment. [Permits for hoisting equipment shall comply with the requirements of Sections 3316.4.1 through 3316.4.5.] No power operated hoisting equipment, including supports and runback structures, shall be installed until the equipment user has obtained a permit in accordance with the requirements of Chapter 1 of Title 28 of the Administrative Code.

Exceptions:

1. A hoisting equipment permit is not required for equipment that is exempted from the requirements of Sections 3316.1 or 3319.1.

2. A hoisting equipment permit is not required for equipment, other than a crane, derrick, bucket hoist, material hoist, personnel hoist, or industrial rope access equipment, used exclusively to make deliveries to the site or service the site, and not used to perform construction or demolition work.

3. A hoisting equipment permit is not required for a power-operated, nonguided hoist with a maximum capacity of one ton or less and installed on new construction, or on alterations where the operation of the hoist is confined within the property and the site is protected in accordance with Section 3307.
4. A hoisting equipment permit issued under the provisions of this section is not required for cranes and derricks. Permits for cranes and derricks shall be in accordance with Section 3319.3.

[3316.4.1 Acceptance of equipment. Hoists and all premanufactured runback structures shall be approved for use by the commissioner or other agency acceptable to the commissioner.

[Exception: Cranes and derricks shall meet the requirements of Section 3319.3.]

[3316.4.2 Posting of permits. Permits, or duplicates of the permits, shall be posted in a conspicuous location in the car or on the equipment.

[3316.4.3 Construction documents. Copies of the written permit application and approved construction documents shall be kept at the site and made available to the commissioner upon request.

[3316.4.4 Permit signage. Following the receipt of a permit to install a hoist, the permit holder shall post a sign that meets the requirements of Section 3301.9.6. Such sign shall be clearly visible from the street.

[3316.4.5 Other temporary signage. Other than as specified in Section 3301.10, there shall be no information, pictorial representation, or any business or advertising messages posted on the hoisting equipment or runback structure.

3316.5 Design, [construction] installation, and inspection. Hoisting equipment and material handling equipment, including its supports and runback structures, shall be designed, [constructed] installed, and inspected in accordance with the manufacturer’s specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

3316.6 Rope inspection and replacement. All ropes used in hoisting equipment and material handling equipment shall meet the inspection and replacement requirements specified in the manufacturer’s specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

3316.7 Operation. [Only operators designated by the person causing such hoisting equipment to be used shall operate such hoisting machinery. Operators and signalmen/signalwomen shall be qualified for the operation they perform. The operator shall be responsible for making the machine inoperative before he or she leaves the machine.] Hoisting equipment and material handling equipment, including supports and runback structures, shall be operated in accordance with the manufacturer’s specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

[3316.7.1 Use. Hoisting equipment, its supports and runback structures shall be operated in compliance with the manufacturing specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.]
3316.7.1 Operators and signalpersons. Operators and signalpersons shall be qualified for the operation they perform. Only operators designated by the equipment user shall operate hoisting equipment and material handling equipment. Operators of hoisting machines shall be licensed where required by Article 405 of Title 28 of the Administrative Code. Signalpersons shall be trained or certified where required by Section 3316.9.2 of this code. Operators of hoisting equipment and material handling equipment shall familiarize themselves with manufacturer specifications and applicable plans for the hoisting equipment prior to operating the hoisting equipment at the site and whenever such specifications or plans are revised or amended.

3316.7.2 Use during installation, jumping, dismantling or alteration. Personnel and building materials connected with or related to the building project shall not be moved by the hoisting equipment or material handling equipment while such equipment is being installed, jumped, dismantled, or altered.

3316.7.3 Preventing unauthorized operation. It shall be unlawful to operate any hoisting equipment or material handling equipment that is not provided with a positive means for preventing the unauthorized operation of such equipment. The means whereby the equipment may be made inoperative shall be acceptable to the department.

3316.7.4 Securing equipment. The operator of the hoisting equipment or material handling equipment shall park and secure the equipment at the end of the shift and as weather or site conditions otherwise warrant. The operator of the hoisting equipment or material handling equipment shall make the equipment inoperative before leaving the equipment.

3316.7.5 Loading. Loading of hoisting equipment and material handling equipment shall be conducted in accordance with the following requirements:

1. The equipment shall not be loaded in excess of the rated load specified by the manufacturer. When necessary, allowable loads shall be reduced to take into account effects of wind, ground condition, and operating speed.

2. Rated load capacities shall be conspicuously posted or displayed on the equipment. Load charts shall be accessible to the operator at all times and to the commissioner upon request.

3. All loads shall be properly trimmed and secured to prevent the dislodgment of any part during raising, lowering, swinging or transit.

4. Suspended loads shall be securely slung and properly balanced before they are set in motion.

5. The operator shall ascertain the weight of the load prior to lifting or lowering the load.

3316.7.6 Refueling. Refueling of hoisting equipment and material handling equipment shall be conducted in accordance with the following requirements:

1. The engine shall be stopped during refueling, except as otherwise provided in rules promulgated by the commissioner.
2. Open lights, flames, or spark-producing devices shall be kept at a safe distance while refueling an internal combustion engine.

3. No person shall smoke or carry lighted smoking material in the immediate vicinity of the refueling area.

4. “No smoking” signs shall be conspicuously posted in all fueling or fuel storage areas.

5. Fuel shall be kept in containers that meet the requirements of the New York City Fire Department.

6. All other requirements of the New York City Fire Department and the New York City Department of Environmental Protection shall be satisfied.

3316.7.7 Work area control. The equipment user shall provide and maintain measures, including but not limited to warning signs, barriers, or flagpersons, to prevent the public from coming into contact with or passing under hoisting equipment or material handling equipment.

Exception: For cranes or derricks, the work area shall be controlled in accordance with rules promulgated by the commissioner.

3316.7.8 Wind and weather. Hoisting equipment located on the roof or setback of a building, exterior to a building or structure, on a working deck, or in an area with an unenclosed perimeter, is subject to the following wind and weather restrictions.

Exception: Cranes and derricks shall not be subject to the requirements of this section. Wind and weather restrictions for cranes and derricks shall be in accordance with the requirements of Section 3319.13 and rules promulgated by the commissioner.

3316.7.8.1 Start of work. No operator of hoisting equipment shall start a pick when:

1. The wind speed exceeds 30 mph (3-second gust), the threshold specified by the manufacturer of the hoisting equipment, or the threshold indicated on plans, whichever is lower; or

2. As otherwise warranted by weather conditions or weather forecasts.

3316.7.8.2 In-service. During picks it is the responsibility of the operator of the hoisting equipment to safely bring the pick to a stop and safely land the load when:

1. The wind speed exceeds 30 mph (3-second gust), the threshold specified by the manufacturer of the hoisting equipment, or the threshold indicated on plans, whichever is lower; or

2. As otherwise warranted by weather conditions or weather forecasts.

3316.7.8.3 Out-of-service. At the end of the shift, or as weather conditions otherwise warrant, the operator of the hoisting equipment must properly park or secure the hoisting equipment.
for occurring or forecasted winds in accordance with the specifications of the manufacturer of the hoisting equipment and applicable plans.

3316.7.8.4 Assembly/disassembly. The assembly/disassembly of hoisting equipment, including but not limited to the installation, jumping, or dismantling of the hoisting equipment, shall not begin when:

1. The wind speed exceeds 30 mph (3-second gust), the threshold specified by the manufacturer of the hoisting equipment to be assembled/disassembled, the threshold specified by the manufacturer of the assist equipment, or the threshold indicated on plans, whichever is lower;

2. The wind speed is forecast to exceed 30 mph (3-second gust), the threshold specified by the manufacturer of the hoisting equipment to be assembled/disassembled, the threshold specified by the manufacturer of the assist equipment, or the threshold indicated on plans, whichever is lower, before the assembly/disassembly operation can be safely completed and the hoisting equipment and all assist equipment can be parked and secured; or

3. As otherwise warranted by weather conditions or weather forecasts.

3316.7.8.5 Determining wind speed. Wind speed shall be determined based on data from the nearest United States weather bureau reporting station, or an anemometer located at the site, freely exposed to the wind, and calibrated in accordance with ASTM D5096-02.

   Exception: For cranes and derricks, the requirements of Section 3319.13 shall apply.

3316.7.8.6 Assist equipment. The requirements of Sections 3316.7.8.1 through 3316.7.8.5 shall also apply to assist equipment utilized in conjunction with the assembly/disassembly of hoisting equipment.

3316.8 Maintenance and repair. Hoisting equipment and material handling equipment, including its supports and runback structures, shall be maintained and repaired in compliance with the manufacturer’s specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

3316.9 Rigging. The attachment and detachment of articles from hoisting equipment used to hoist or lower articles by or under the direct and continuing supervision of a licensed rigger in the city shall be performed in accordance with the requirements of Sections 3316.9.1 through 3316.9.3.

3316.9.1 Supervision. The hoisting or lowering of any suspended article on the outside of any building in the city shall be performed by or under the direct and continuing supervision of a licensed rigger.

   Exceptions:

1. In lieu of a licensed rigger, the hoisting or lowering of a sign may be performed by or under the direct and continuing supervision of a licensed sign hanger.

1988
2. Suspended scaffold operations shall meet the requirements of Section 3314.

3. In lieu of a licensed rigger, the hoisting or lowering of any suspended article on the outside of any building in the city may be performed by or under the supervision of a competent person designated by the contractor using the equipment provided the following conditions are met:

   3.1 The hoisting or lowering occurs in conjunction with:

       3.1.1 The construction of a new building;
       3.1.2 The full demolition of an existing building;
       3.1.3 The vertical or horizontal enlargement of an existing building; or
       3.1.4 The alteration, maintenance, or repair of a façade of a major building where a site safety plan is required by Section 3310.3.

   3.2 All individuals involved in the work are certified or trained in accordance with Section 3316.9.2, where such certification or training is required;

   3.3 The hoisting or lowering does not meet the definition of industrial rope access;

   3.4 The article being hoisted or lowered is not a boiler or tank;

   3.5 The article being hoisted or lowered is not related to the assembly, jumping, or disassembly of a tower crane; and

   3.6 Where the hoisting or lowering operation meets the definition of a critical pick, such critical pick is:

       3.6.1 Performed in accordance with a plan developed by either a:

           3.6.1.1 Licensed master rigger; or

           3.6.1.2 Registered design professional who has demonstrated knowledge or experience with safe loads and computation thereof, types of rigging, size and strength of ropes, cables, blocks, and any other rigging equipment to be used during the critical pick; and

       3.6.2 Immediately prior to the pick, onsite verification is made to ensure conformance with the plan by either:

           3.6.2.1 The licensed master rigger who developed the plan;

           3.6.2.2 The registered design professional who developed the plan; or
3.6.2.3 A registered design professional employed by and working under the direct supervision of the registered design professional who developed the plan.

4. Where the hoisting or lowering is performed under the direct and continuing supervision of a licensed rigger, a specialty crew who is not in the direct employ of the licensee or business of the licensee may be utilized, provided:

4.1 The work requires a specialty trade, including but not limited to work with hazardous materials or chemicals;

4.2 The crew is in accordance with rules promulgated by the commissioner; and

4.3 The members of the crew are approved by the commissioner.

3316.9.1.1 Supervisor. The individual supervising the hoisting or lowering in accordance with Section 3316.9.1 shall:

1. Be present at the site during all times articles are being attached or detached rigged for hoisting or lowering or are being hoisted or lowered;

2. Have the ability to communicate with all individuals involved with such work; and

3. Be in the line of sight of either the:

   3.1 Attaching operation;

   3.2 Detaching operation, or

   3.3 The hoisting equipment.

3316.9.2 Certification or training. All individuals who attach or detach articles from the hook of hoisting equipment in conjunction with members of the rigging crew engaged in the hoisting or lowering of any suspended article on the outside of any building in the city, the supervisor of such individuals, and signalpersons communicating with such individuals, shall, eighteen months after the effective date of this section, either:

1. Possess a valid certification for both rigging and signaling. The certification shall be from an organization acceptable to the commissioner and issued by a rigging and signaling certification program that is accredited by the National Commission for Certifying Agencies (NCCA) or the American National Standards Institute (ANSI). The certification shall be valid for a term of no more than five years before it has to be renewed and shall cover areas including, but not limited to, the inspection and use of rigging hardware, basic rigging techniques, signaling, and hazards associated with rigging. The certification for a supervisor shall, in addition to the foregoing, include calculations and problem solving with respect to rigging; or

2. Have completed an initial department-approved training course, and four years following the completion of the initial training course, and every four years thereafter, complete a
department-approved refresher course. The courses shall be in accordance with the following:

2.1 The initial training course for [individuals who attach or detach articles from the hook of hoisting equipment and] members of the rigging crew, including signalpersons communicating with such crew, shall be, at a minimum, 16 hours long, with the refresher course, at a minimum, 8 hours long. The initial training course for a supervisor shall be, at a minimum, 32 hours long, with the refresher course, at a minimum, 16 hours long.

2.2 The training course shall be conducted by a registered New York State Department of Labor apprenticeship training program or by an educational institution or school chartered, licensed or registered by the New York State Department of Education or by a provider approved by the department and presented by an instructor acceptable to the commissioner.

2.3 Training courses and refresher courses shall cover areas including, but not limited to, the inspection and use of rigging hardware, basic rigging techniques, signaling, and hazards associated with rigging. The training course and refresher course for a supervisor shall, in addition to the foregoing, include calculations and problem solving with respect to rigging. The training course and refresher course, both for crew members and supervisors, shall include a significant portion of hands on training.

2.4 Successful completion of the initial training course and refresher course shall be based upon passage of a written and a practical exam.

2.5 Successful completion of the initial training course and refresher course shall be evidenced by a wallet size certificate card issued by the training provider and acceptable to the commissioner. Such certificate card shall be readily available to the commissioner upon request and shall contain, at a minimum, the following information:

2.5.1 The name of the individual to whom it was issued;

2.5.2 A photograph of the individual to whom it was issued; and

2.5.3 Any other information required pursuant to rules promulgated by the commissioner for a department approved training course.

2.6 For individuals who fail to complete the required refresher course within any 4 year period, a refresher course shall be considered timely if completed within 1 year after the expiration date of the last previously completed initial or refresher course. During such period, such individual shall not perform or supervise any activity for which the lapsed training is required to perform or supervise such activity until such individual has successfully completed such refresher course. Where more than 1 year has lapsed, such individual shall be required to successfully recomplete the initial training course.
Exceptions: Training or certification is not required for:

1. Individuals working under the direct and continuing supervision of a licensed rigger or sign hanger.

2. The loading or unloading of a material delivery truck provided the material is loaded or unloaded only between the ground and the truck, or vice versa, and also provided that the material is not raised more than 12 feet (3658 mm) above the bed of the truck during the loading or unloading process.

3. The use of hoisting equipment that has a manufacturer’s rated capacity of 2,000 pounds (907 kg) or less.

4. The use of equipment that is exempted from the requirements of Section 3316.1 or Section 3319.1 of the building code.

5. The use of industrial rope access equipment, which shall instead meet the requirements of Section 3316.9.3.

3316.9.3 Industrial rope access. Any person using industrial rope access methods to descend or ascend outside a building, including the individual supervising such, must be certified by either the Society of Professional Rope Access Technicians (“SPRAT”) or the Industrial Rope Access Trade Association (“IRATA”), or an equivalent acceptable to the department. Only hand tools, securely attached to a person, may be carried by such person during the use of industrial rope access methods. Any other tools or equipment must be separately hoisted or lowered.

3316.10 Special provisions for cableways. The construction, installation, inspection, maintenance, and use of cableways shall be in accordance with rules promulgated by the commissioner.

§ 47. Section BC 3317 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC 3317
MATERIAL HOISTS AND BUCKET HOISTS

3317.1 Scope. Material hoists and bucket hoists shall meet and be used in accordance with the requirements of this section, and Section 3316, and rules promulgated by the commissioner.

Exception: Equipment that is exempted from the requirements of Section 3316.1.

[3317.2 Permit. The equipment user or his or her designated representative shall obtain a written permit issued by the commissioner on the basis of construction documents, drawings and specifications prior to erecting or installing all power-operated, material hoists, including any runback structure or supports.]

[Exception: Power operated, nonguided material hoists with a maximum capacity of one ton or less and installed on new construction, or on alterations where the operation of the hoist is confined within the property and the site is protected in accordance with Section 3307.]
3317.2 Permit. Material hoists and bucket hoists shall require a permit in accordance with Section 3316.4.

3317.3 Design[5] and inspection [and—operation]. Material hoists, bucket hoists and their components shall be designed[.] and inspected[—and—operated] in accordance with rules promulgated by the commissioner.

3317.4 Construction. Material hoists, bucket hoists and their components shall be constructed in compliance with the manufacturing specifications, the requirements of this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

Upon completion of the installation of the hoisting equipment and/or its runback structure, an inspection report verifying that the hoist has been installed in accordance with the design drawings, construction documents and specifications shall be prepared by the designer, installer or an approved inspection agency designated by both the designer and installer.

3317.5 Operation. Notwithstanding any other provision of law, material hoists with a manufacturer’s capacity over one ton shall be operated only by persons holding a Class A or B hoisting machine operators license except during installation, jumping, dismantling or alteration operations.

3317.6 Making safety devices inoperative. No person shall at any time make any required safety device or electrical protective device inoperative except when necessary during tests, inspections, and maintenance.

Immediately upon completion of the tests, inspections, and maintenance, such devices shall be restored to their normal operating condition in conformance with the applicable requirements of this section.

§ 48. Section BC 3318 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

SECTION BC 3318
PERSONNEL HOISTS

3318.1 Scope. Personnel hoists shall meet and be used in accordance with the requirements of this section, [and] Section 3316, and rules promulgated by the commissioner.

Exception: Equipment that is exempted from the requirements of Section 3316.1.

3318.2 Permit. [The equipment user or his or her designated representative shall obtain a written permit issued by the commissioner on the basis of construction documents, drawings and specifications prior to erecting or installing all power-operated, material hoists, including any runback structure or supports.] Personnel hoists shall require a permit in accordance with Section 3316.4.

3318.3 Design and inspection. Personnel hoists and their components shall be designed and inspected in accordance with rules promulgated by the commissioner.
3318.4 Construction. Personnel hoists and their components shall be constructed in compliance with the manufacturer’s specifications, this code, and rules promulgated by the commissioner. If there is a discrepancy, the stricter requirement shall be met.

Upon completion of the installation of the hoisting equipment and/or its runback structure, an inspection report verifying that the hoist has been installed in accordance with the design drawings, construction documents and specifications shall be prepared by the designer, installer or third-party designated by both the designer and installer and acceptable to the commissioner.

3318.5 Operation. Personnel hoists and their components shall be operated in accordance with this code and rules promulgated by the commissioner.

When the hoist is equipped with manual controls, the hoist shall be operated by a [competent] qualified operator. Only the operator authorized by the equipment user shall operate the hoist.

3318.6 Making safety devices inoperative. No person shall at any time make any required safety device or electrical protective device inoperative except when necessary during tests, inspections and maintenance.

Immediately upon completion of the tests, inspections and maintenance, such devices shall be restored to their normal operating condition in conformance with the applicable requirements of this section.

§ 49. Section BC 3319 of the New York city building code, as added by local law number 33 for the year 2007, section 3319.8 as added by local law number 46 for the year 2008, section 3319.2, item 9 of section 3319.8.1, items 1 and 4 of section 3319.8.8, and sections 3319.8.2 and 3319.8.3 as amended by local law 14 for the year 2018, section 3319.9 as added by local law number 45 for the year 2008, section 3319.10 as added by local law number 44 for the year 2008, section 3319.11 as added by local law number 77 for the year 2017, section 3319.12 as added by local law number 79 for the year 2017 and renumbered by local law number 13 for the year 2018, a section 3319.13 as added by local law number 3 for the year 2018, a section 3319.13 as added by local law number 13 for the year 2018, is amended to read as follows:

SECTION BC 3319
CRANES AND DERRICKS

3319.1 Scope. [The construction, installation, inspection, maintenance and use of cranes and derricks shall be in conformance with the requirements of this section, Section 3316, and with rules promulgated by the commissioner.] Cranes and derricks shall meet and be used in accordance with the requirements of this section, Section 3316, and rules promulgated by the commissioner.
Exceptions: The requirements of this section shall not apply to:

1. Equipment that is exempted from the requirements of Section 3316.1.

2. Material delivery trucks when used to load and unload material, provided such material is loaded or unloaded only between the ground and the truck, or vice versa, and also provided that the material is not raised more than 12 feet (3658 mm) above the bed of the truck during the loading or unloading process.

3. Excavation or earth-moving equipment, including but not limited to power shovels, excavators, wheel loaders, backhoes, loader backhoes, and truck loaders. However, this exception shall not apply when such equipment is used to lift or lower a suspended load more than 12 feet (3658 mm) above the level of the ground. This exception further shall not apply to equipment designed primarily to lift or lower a suspended load, including but not limited to a mobile crane with a clamshell.

4. Excavation or earth-moving equipment equipped with a pile driving attachment. However, this exception shall not apply when such equipment is configured to lift or lower a suspended load not related to the pile driving operation. This exception further shall not apply to dedicated pile drivers, nor shall it apply to equipment designed primarily to lift or lower a suspended load, including but not limited to a mobile crane with a pile driving attachment.

5. Drilling equipment, including but not limited to augers, churn-drills, dedicated drilling rigs, and excavators equipped with a drilling attachment. However, this exception shall not apply when such equipment is configured to lift or lower a suspended load not related to the drilling operation. This exception further shall not apply to equipment designed primarily to lift or lower a suspended load, including but not limited to a mobile crane with a drilling attachment.

6. Digger derricks used in conjunction with the installation, alteration, maintenance, or removal of electric or telecommunication transmission/distribution lines and associated equipment.

7. Demolition equipment, including but not limited to vertical concrete chippers and high reach demolition equipment. However, this exception shall not apply when such equipment is configured to lift or lower a suspended load. This exception further shall not apply to equipment designed primarily to lift or lower a suspended load, including but not limited to a crane assisting with demolition operations.

8. Powered industrial trucks (forklifts). However, this exception shall not apply when such equipment is used to lift or lower a suspended load.

9. Aerial work platforms, including but not limited to vehicle-mounted aerial devices for lifting personnel, and self-propelled elevating work platforms. However, this exception shall not apply when such equipment is configured to both lift or lower a suspended load and function as an aerial work platform. This exception further shall not apply to
equipment designed primarily to lift or lower a suspended load, including but not limited to a mobile crane equipped with a manbasket.

10. Concrete pumping equipment not capable of lifting or lowering any suspended loads.

11. Machinery that hoists by using a come-a-long or chainfall.

12. Roustabouts.

3319.2 Personnel. Personnel shall comply with Sections 3319.2.1 through 3319.2.3.

3319.2.1 Hoisting machine operators. The hoisting machine operator shall be licensed as required by Chapter 4 of Title 28 of the Administrative Code.

3319.2.2 Riggers. Rigging work must be supervised in accordance with Section 3316.9.1 and where required, riggers must be licensed in accordance with Chapter 4 of Title 28 of the Administrative Code.

3319.2.3 Lift directors. Lift directors shall be designated, and perform the duties assigned to them, in accordance with rules promulgated by the commissioner. Such duties shall include, but not be limited to, ensuring compliance with approved plans, traffic and pedestrian controls, and weather restrictions.

3319.3 Requirements. No owner or other person shall authorize or permit the operation of any crane or derrick without a certificate of approval, a Certificate of Operation and a Certificate of On-site Inspection.

[Exceptions:

1. The requirements of this section shall not apply to excavating or earth-moving equipment, except cranes used with clamshells.

2. The requirements of this section shall not apply to cranes or derricks performing an emergency use pursuant to the lawful order of the head of any department.

3. The requirements of this section shall not apply to mobile cranes, including jibs and any other extensions to the boom not exceeding 50 feet (15 240 mm) in length and with a manufacturer’s rated capacity of 3 tons (2722 kg) or less.

4. The requirements of this section shall not apply to mobile cranes, including jibs and any other extensions, exceeding 50 feet (15 240 mm) but not exceeding 135 feet (41 148 mm) in length, and with a manufacturer’s rated capacity of 3 tons (2722 kg) or less, except that a Certificate of Operation, as provided for in Section 3319.5, shall be required. The requirement for a Certificate of Operation shall not apply to such a crane used exclusively as a man basket. The commissioner may, by rule, exempt other mobile cranes of limited size from any or all requirements of this section.

5. The requirements of this section shall not apply to hoisting machines permanently mounted on the bed of material delivery trucks that are used exclusively for loading and
unloading such trucks, provided that the length of boom does not exceed the length of the truck bed by more than 5 feet (1524 mm) and that any material transported thereon shall not be raised more than 2 feet (610 mm) in the unloading process. Operators of such equipment shall be exempt from licensing requirements described in Chapter 4 of Title 28 of the Administrative Code.

6. The requirements of this section shall not apply to cranes or derricks used in industrial or commercial plants or yards not used for the construction of the facility. Floating cranes, floating derricks, and cranes and derricks used on floating equipment shall also be exempt from the requirements of this section. Operators of such equipment shall be exempt from the licensing requirements described in Chapter 4 of Title 28 of the Administrative Code.

7. The requirements of this section shall not apply to augurs, churn-drills and other drilling equipment not used for hoisting any objects. Operators of such equipment shall be exempt from the licensing requirements described in Chapter 4 of Title 28 of the Administrative Code.

8. The requirements of this section shall not apply to derricks having a maximum rated capacity not exceeding 1 ton (907 kg).

9. The requirements of this section shall not apply to mechanic’s truck with a hoisting device when used in activities related to the maintenance and repair of construction-related equipment.

10. The requirements of this section shall not apply to articulating boom cranes that do not have an integral hoisting mechanism, and that are used exclusively for loading and unloading of trucks or trailers, provided that the length of boom does not exceed 135 feet (41,148 mm) and that any material transported thereon shall not be raised more than 100 feet (30,480 mm) in the unloading process. Operators of such equipment shall be exempt from licensing requirements described in Chapter 4 of Title 28 of the Administrative Code.

3319.3 Certificates required. No owner, equipment user, or other person shall authorize or permit the use or operation of a crane or derrick that does not possess and/or is not in conformance with a certificate of approval, certificate of operation, and certificate of on-site inspection. The certificates are valid only if the conditions and statements contained in the approved application are complied with, and the crane or derrick is used or operated in conformance with the provisions of this code and the rules applicable thereto.

Exceptions: The requirement for a certificate of approval, certificate of operation, and a certificate of on-site inspection shall not apply to the following:

1. Cranes or derricks performing an emergency use pursuant to the lawful order of the head of any department.

2. Cranes or derricks with a manufacturer’s rated capacity of 1 ton (907 kg) or less.
3. Mobile cranes, including jibs and any other extensions to the boom, not exceeding 50 feet (15,240 mm) in length and with a manufacturer’s rated capacity of 3 tons (2,722 kg) or less.

4. Mobile cranes, including jibs and any other extensions to the boom, exceeding 50 feet (15,240 mm) but not exceeding 135 feet (41,148 mm) in length, and with a manufacturer’s rated capacity of 3 tons (2,722 kg) or less, except that a certificate of operation, as provided for in Section 3319.5, shall be required.

5. Mobile cranes of a limited size and capacity, or performing a limited use, and exempted from the requirements for a certificate of approval, certificate of operation, or a certificate of on-site inspection in accordance with rules promulgated by the commissioner.

3319.4 Certificate of [Approval] approval. Certificates of [Approval] approval shall comply with the following:

1. The manufacturer, owner, or a designated representative of the manufacturer or owner, of a crane or derrick for which a [Certificate of Approval] certificate of approval is sought, or for which an existing certificate of approval is to be amended, shall file an application for such [Certificate of Approval] certificate of approval or amendment, and provide such information as set forth in rules promulgated by the commissioner.

2. Upon the department’s approval of the application described in Item 1 above, the department shall issue a [Certificate of Approval] certificate of approval for the equipment and an approval of the submitted load rating chart. The manuals, load rating charts, and other information submitted with the application are considered part of the certificate of approval.

3. A new Certificate of Approval shall be required when a crane or derrick is modified or altered to increase the boom length, jibs or any extensions to the boom beyond the maximum approval length or when the load ratings are increased. The certificate of approval shall be required to be amended when a crane or derrick is modified or altered to:

3.1 Increase the boom length, jibs, or any extensions to the boom beyond the maximum approval length;

3.2 Increase the load ratings beyond the maximum approval; or

3.3 As otherwise specified in accordance with rules promulgated by the commissioner.

3319.5 Certificate of [Operation] operation. Certificates of [Operation] operation shall comply with the following:

[1. The commissioner shall issue the initial Certificate of Operations for the crane or derrick with Certificate of Approval upon satisfactory inspection and test indicating that such crane or derrick is in a safe operating condition. The initial Certificate of Operations shall expire 1 year from the date of issuance.]

[2. The owner of a crane or derrick covered by the Certificate of Operations shall renew the Certificate of Operations each year.]
3. If the owner of the covered crane or derrick applies for renewal of a certificate of operation within not more than 60 nor less than 30 days prior to the date of its expiration, such owner may continue to use the covered crane or derrick until the department grants or denies a new certificate.

4. When a crane or derrick configuration is changed to increase the boom length, jibs or any extensions to the boom beyond the maximum approval length or when the load ratings are increased, a new Certificate of Operations shall be required. In such a case, the crane or derrick may not be operated until the new Certificate of Operations is obtained.

5. When a component, as defined in rules promulgated by the commissioner, is replaced or added to the crane or derrick, the certificate of operation shall be amended to reflect such change.

6. A certificate of operation is also required to be amended when otherwise specified in rules promulgated by the commissioner.

7. No crane or derrick subject to one or more of the conditions listed in items 5 or 6 above shall operate until an amended certificate of operation has been issued by the department.
3319.6 Certificate of on-site inspection. Certificates of on-site inspection shall comply with the following:

1. The equipment user, or his or her designated representative, shall obtain a Certificate of On-site Inspection for the use of any crane or derrick used for construction or demolition purposes at each job site. Such application for the Certificate of On-site Inspection shall include information set forth in rules promulgated by the commissioner.

2. Upon approval of the application, a copy of such approval shall be given to the applicant. It shall be unlawful to operate the equipment that is the subject of the approval until it has been inspected and found to be satisfactory by the department as set forth in rules promulgated by the commissioner. Upon inspection and a finding of satisfactory compliance, the approval shall be deemed a Certificate of On-site Inspection, which shall expire one year from the date of issuance. A Certificate of On-site Inspection may be renewed in accordance with rules promulgated by the commissioner.

3. The Certificate of On-site Inspection is valid only if the conditions and statements contained in the approved application are complied with, and the crane or derrick is operated in conformance with the provisions of this section and the rules applicable thereto.

4. A Certificate of On-site Inspection is not required for cranes or derricks performing work exempted from such requirement by rules promulgated by the commissioner.

1. An engineer, designated by the equipment user of a crane or derrick for which an initial certificate of on-site inspection is sought, or for which an existing certificate of on-site inspection is intended to be amended or renewed, shall file an application for such certificate of on-site inspection and provide such information as set forth in rules promulgated by the commissioner.

2. The commissioner shall issue, renew, or amend a certificate of on-site inspection upon satisfactory inspection and testing indicating that such crane or derrick is configured and located in accordance with the approved application.

3. A certificate of on-site inspection shall be valid for a period of one year, or until the end of the job, whichever is less.

3319.7 Temporary certificates. The commissioner may issue temporary certificates of approval, operation, and on-site inspection for any crane or derrick during the pendency of an application for such the certificate and upon inspection, analysis, and testing as the commissioner may deem necessary. The commissioner may place appropriate restrictions on a crane or derrick operating under a temporary certificate, and may revoke such temporary certificates if the underlying application is denied.

3319.8 Special provisions for tower and climber cranes. Tower and climber cranes shall comply with the requirements of Sections 3319.8.1 through 3319.8.8.

Exceptions: The requirements of Sections 3319.8.1 through 3319.8.8 shall not apply to:
1. The installation of a tower crane foundation, anchor stool, and first mast section, provided such installations are in accordance with rules promulgated by the commissioner.

2. The assembly or disassembly of a self-erecting tower crane, provided the assembly/disassembly proceeds in accordance with rules promulgated by the commissioner.

3319.8.1 Plan for the erection, jumping, [climbing,] and dismantling of tower [or climber] cranes. An erection, jumping, [climbing,] and dismantling plan for tower [or climber] cranes, other than truck and crawler mounted tower cranes, shall be submitted to the department by a licensed engineer. The plan must be prepared by a licensed engineer in conjunction with a licensed rigger and must be in compliance with the manufacturer’s recommendation for erection, jumping, [climbing,] or dismantling of the specific crane where such manufacturer’s recommendations exist. The plan must be filed with the certificate of on-site inspection application as required by Section 3319.3. No erection, jumping, [climbing,] or dismantling of a tower [or climber] crane shall take place without the prior issuance of a certificate of on-site inspection by the cranes and derricks unit. The plan shall include the following:

1. Identification of the equipment proposed to be used[4], including all machines proposed to be used in the erection or dismantling;

2. A detailed identification of the assemblies and components required for the erection and dismantling of the equipment;

3. Location of the equipment, sidewalk sheds (or Department of Transportation street closing permits, if applicable), surrounding buildings, protection for their roofs and the pick-up points, loads, and radius of swing of all loads. In addition, the safe load from the approved load radius chart shall be submitted for lift radius;

4. A weight list of all assemblies and components proposed to be lifted. Components are to be clearly marked with their weight painted on the assembly or stamped on metal tags attached to the assembly. The manufacturer of the [climber or] tower crane shall certify the weight of assemblies and components. Alternately, in lieu of painted weight markings or metal tags, or when the manufacturer’s certification is not available, the licensed engineer applicant shall certify an erection, jumping, [climbing,] or dismantling weight list indicating how such weights were determined;

5. The center of gravity of all asymmetrical components shall be located and shown;

6. A sequence of operation detailing the erection, jumping, [climbing,] and dismantling, along with the rigging materials to be used in such operations;

7. The certification of the calibration as required in Item 6 of Section 3319.8.8; and

8. Cranes or derricks located either within the lot line or on the street and used to erect, jump, [climb,] or dismantle a tower [or climber] crane shall be indicated[4].
3319.8.2 Safety coordination meeting. The [general contractor] equipment user must hold a safety coordination meeting prior to the initial erection, as well as the dismantling or initial jump down, of a [climber or] tower crane. No work related to the erection, [climbing] jumping or dismantling of the tower [or climber] crane may be performed without the safety coordination meeting having taken place. The following parties must be present at the safety coordination meeting:

1. [General contractor] Equipment user or designee;
2. Professional engineer of record for the crane or designee;
3. Licensed master[1] or tower [or climber] crane rigger and rigger foreman;
4. Site safety manager or coordinator, if required for the job by Chapter 33 of [the] this code;
5. Licensed crane operator and oiler; and
6. Any other parties the department deems necessary.

3319.8.3 Pre-jump safety meeting. The [general contractor] equipment user must coordinate a pre-jump safety meeting no more than 24 hours prior to each instance of a tower [or climber] crane jump [or climb]. No work related to the jumping [or climbing] of the tower [or climber] crane may be performed without the pre-jump safety meeting having taken place. The following parties must be present at the pre-jump safety meeting:

1. [General contractor] Equipment user or designee;
2. Licensed master[1] or tower [or climber] crane rigger and rigger foreman;
3. Site safety manager or coordinator, if required for the job by Chapter 33 of [the building] this code;
4. Licensed crane operator and oiler;
5. “Jumping” crew and back-up personnel;
6. Flagman/woman where required;
7. Signalman/woman and communications personnel; and
8. Any other parties the department deems necessary.

[3319.8.4 Department notification.]
3319.8.4.1 Meeting notifications. The general contractor must notify the department at least 48 hours in advance of any safety coordination meeting or pre-jump safety meeting. No work related to the erecting, jumping, climbing, or dismantling of the tower or climber crane is to be performed without prior notice of the meeting having been given to the department.

3319.8.4.2 Time schedule. A time schedule including date and time of day that the erection, jumping, climbing, or dismantling is proposed to take place shall be provided as soon as it is known by the general contractor.

3319.8.4 Department notification. The equipment user shall notify the department at least 48 hours in advance of the erection, jumping, or dismantling of a tower crane. No work related to the erecting, jumping, or dismantling of the tower crane is to be performed without such notification having been given to the department. The notification shall include the following information:

1. A time schedule including date and time of day that the erection, jumping, or dismantling is proposed to take place;
2. The names and contact information of the licensed master or tower crane rigger; and
3. The name and contact information of the company performing the erection, dismantling, or jumping work.

3319.8.5 Safety coordination and pre-jump safety meeting topics. The following topics are to be covered during safety coordination and pre-jump safety meetings:

1. Scope of work;
2. Roles and responsibilities;
3. Rigging to be used and the specific sequence of operations;
4. Inspection of all rigging equipment, materials, and tools prior to work;
5. Review of all equipment, including but not limited to, collars, ties, and bolts;
6. Permit validity;
7. Qualifications and training of personnel;
8. Relevant weather warnings;
9. Compliance with the manufacturer’s manual; and
10. Softening mechanisms, if using nylon slings.

3319.8.6 Meeting log. The general contractor, equipment user, or his or her designee, and/or the company erecting, jumping, climbing, or dismantling the tower or climber crane shall keep a log on site and available to the department at all times that shall include:
1. The dates and times of all safety coordination meetings and pre-jump safety meetings held;

2. The names, titles, and company affiliations of all those present at the meetings;

3. A summary of what was discussed during each meeting, including specific tasks and the name of the person to whom they were assigned;

4. A list of the decisions made at the meeting; and

5. Certification of worker training pursuant to Section 3319.10.

3319.8.7 Inspection and certification by the engineer of record. Prior to jumping [or climbing] a tower [or climber] crane, the engineer of record for the crane must provide the department with a certified, signed, and sealed report stating that:

1. He or she (or his or her designee) has inspected the crane installation prior to the pre-jump safety meeting, and providing the date of inspection;

2. He or she has found no hazardous conditions during the crane inspection or any other condition within his or her purview that adversely affects the safety of erection, dismantling, [climbing,] or jumping operations;

3. The crane is installed according to the plans approved by the department as well as in accordance with the manufacturer’s specifications to the extent applicable; and

4. The appropriate technical testing records for the crane, including torque, plumb, and magnetic particle or other appropriate reports comply with safety requirements and with the manufacturer’s specifications.

3319.8.8 Erection, jumping, [climbing,] and dismantling operations. The erection, jumping, [climbing,] and dismantling operations for tower [and climber] cranes shall be subject to the following requirements:

1. The licensed master, tower [or climber] crane rigger, and the rigger foreman[.] shall be present at the [job] site during erection, jumping, [climbing,] and dismantling of the tower [or climber] crane;

2. Cranes or derricks located either within the lot line or on the street, and used to erect, jump, [climb,] or dismantle tower [or climber] cranes, shall be subject to certificate of on-site inspection requirements;

3. A load radius chart approved by department shall be posted in the cabin of the crane;

4. The approved erection, jumping, [climbing,] or dismantling procedure and sequence, with weights of assemblies and components clearly marked, shall be given by the equipment user to the licensed operator of the crane or derrick and to the rigger prior to commencement of the work;
5. No tower or climber crane shall be placed, erected or disassembled in any roadway, sidewalk, or street unless a permit is first obtained from the New York City Department of Transportation;

6. All accepted or approved installed safety devices on a crane involved in the erection, jumping, or dismantling procedure shall have been calibrated within the time period provided by department rules or manufacturer’s specifications; and

7. The safety devices of the tower or climber crane shall be inspected by the licensed crane operator as part of the inspection procedure.

3319.9 Slings. Slings shall be used in accordance with the following requirements and any rules promulgated by the commissioner.

3319.9.1 Use of nylon synthetic slings in conjunction with tower crane erection, jumping, climbing, and dismantling. Nylon synthetic slings shall only be used in conjunction with tower crane erection, jumping, climbing, and dismantling if the manufacturer’s manual specifically states or recommends the use of nylon synthetic slings. Nylon synthetic slings shall not be used unless softening mechanisms have been applied to all sharp edges.

3319.9.2 Discarded rope. Discarded rope shall not be used for slings.

3319.10 Worker training. The training of workers engaged in the erection, jumping, or dismantling of a tower crane, including the licensed rigger and the rigger foreman, shall be in accordance with the requirements of Section 3319.10.1 and 3319.10.2. Exceptions: The requirements of this section shall not apply to:

1. The installation of a tower crane foundation, anchor stool, and first mast section.

2. The assembly or disassembly of a self-erecting tower crane, provided workers engaged in the assembly/disassembly operation have been trained in accordance with rules promulgated by the commissioner.

3319.10.1 Training Requirements. All workers engaged in the erection, jumping, climbing, rigging, or dismantling of a tower crane, including the licensed rigger and the rigger foreman, shall have satisfactorily completed a department-approved training course of not less than thirty hours. Such course shall, at a minimum, include instruction on fall protection, crane assembly and disassembly, pre-lift planning, weights and materials, the use of slings, lifting/lowering loads, signaling and other proper means of communication with the crane operator, crane and hoist inspections, rigging requirements, and generally how to avoid accidents with cranes and hoists. The commissioner may by rule identify additional types of cranes for which such training is necessary. Any person who, within the three years prior to the effective date of this section, has successfully completed at least a thirty-hour training course need not take a second thirty-hour course, provided such person can provide to the department a dated certificate as set forth in this section evidencing completion of such a training course. Such person shall, however, take a department-approved eight-hour re-certification course.
course within three years of the initial course and every three years thereafter. Successful completion of the training or re-certification course shall be evidenced by a dated certificate issued by the provider of the training or re-certification course. The certificate shall include such information as specified by the department by rule. The certificate, or a valid wallet card version thereof, shall be readily available to the commissioner upon request.

3319.10.1.1 Training providers. Such training or refresher course shall be conducted (i) pursuant to a registered New York state department of labor training program, or (ii) by a provider approved by the department.

3319.10.2 Certification. Prior to erecting, jumping, climbing or dismantling the climber or tower crane, or other crane type the commissioner specifies by rule, the master climber or tower crane rigger shall certify in the meeting log, described in Section 3319.8.6, that the rigger foreman and all other members of the “jumping crew” and back-up personnel have satisfactorily completed all training requirements.

3319.11 Crane location device. No crane operation that requires a certificate of on-site inspection, and other such types of crane operations where identified in rules promulgated by the commissioner, shall commence unless the crane is equipped with a global positioning system, or other similar device, that is approved by the department and capable of transmitting the location of the crane to which it is attached to the department. Where no such system or device has been approved by the department, (i) no crane operation subject to the provisions of this section shall commence until after the department has been notified by the equipment user, in a form and manner approved by the commissioner, of the date upon which the crane will arrive at the site, and (ii) upon the conclusion of the work, the equipment user shall also notify the department, in a form and manner approved by the commissioner, of the date of the departure of the crane from the site.

Exception: Crane operations that utilize tower or climber cranes and require submission of an erection, jumping, climbing and dismantling plan to the department by a licensed engineer.

3319.12 Crane event recorder. No certificate of operation for a crane shall be issued or renewed on or after January 1, 2019, unless the crane is equipped with an event recorder that is supplied by the crane manufacturer, or by a dealer, distributor, vendor, or third-party authorized crane manufacturer.

Exception: Cranes where the manufacturer certifies to the department that an event recorder cannot be installed on the crane due to a technological limitation.

3319.12.1 Data to be recorded. At a minimum, the event recorder shall collect the following data:

1. Crane configuration;
2. Any overload condition;
3. Status of limit switches; and
4. Operator overrides.
3319.12.2 Data to be made available to commissioner upon request. Data collected by the event recorder shall be made available to the commissioner upon request.

3319.13 Measuring wind. Wind speed during crane or derrick operations shall be determined in accordance with the requirements of Table 3319.13. Options 1, 2, and 3 in Table 3319.13 shall be in accordance with the requirements of Sections 3319.13.1 through 3319.13.3, respectively.

</tbody>
</table>

3319.13.1 Option 1: Anemometer on the crane or derrick. An anemometer provided by the crane or derrick manufacturer, or an entity acceptable to such manufacturer, and installed at the top of the boom or at the location specified by such manufacturer. The anemometer must measure a 3-second gust wind. A real time display of the anemometer must be available to the hoisting machine operator in the crane cab or at the operator’s station. Such anemometer is to be considered an operational aid and must be checked prior to each shift as required by department rules.

Exception: Where the manufacturer is no longer in business, or the manufacturer or an entity acceptable to such manufacturer is unable to provide the anemometer, the anemometer may be approved by the department.
3319.13.2 Option 2: Anemometer at the site. An anemometer located at a high point of the site approximate to the height and location of the crane or derrick boom/jib, freely exposed to the wind, and calibrated in accordance with ASTM D5096-02. The anemometer must measure a 3-second gust wind. A real time display of the anemometer must be available to the hoisting machine operator at the operator’s station, or a person designated by the hoisting machine operator must be provided to monitor the display and alert the hoisting machine operator when measurements near, meet, or exceed the thresholds specified in the approved wind action plan. Such anemometer is to be considered an operational aid and must be checked prior to each shift as required by department rules.

3319.13.3 Option 3: Nearest weather station. The most recent gust wind speed reported at the nearest National Weather Service weather station. The equipment user must establish a system to ensure the hoisting machine operator is notified when reported wind gusts near, meet, or exceed the thresholds specified in the approved wind action plan. An acceptable system may include engaging a metrological service to provide a text or similar alert to a person designated by the equipment user when wind thresholds are neared, met, or exceeded, and have such designated person notify the hoisting machine operator.

[3319.13] 3319.14 Age limitations for cranes. Only cranes having an age of less than 25 years from the manufacture date may be used in New York City. Notwithstanding the provisions of Section 3319.5, the certificate of operation for a crane with an age greater than 25 years from the manufacture date shall be deemed to have expired.

Exceptions:

1. A crane with an age of 25 years or greater from the manufacture date that is (i) in use on a project on January 1, 2019 or (ii) not in use on January 1, 2019, but for which an application for a certificate of on-site inspection has been approved as of January 1, 2019, may continue to be used until completion of the project for which it is being used or the project for which such certificate of onsite inspection was issued.

2. Where a crane with an age of less than 25 years from the manufacture date at the time the department approved the application for a certificate of on-site inspection is being used on a project and will reach an age of 25 years or greater from the manufacture date during such project, such crane may be used for the duration of that project or until it reaches 28 years of age, whichever occurs earlier.

3. The commissioner may approve the use of a crane with an age of 25 years or greater from the manufacture date for up to a maximum of five years, not to exceed 30 years from the manufacture date, when records as required by rule of the department are deemed sufficient by the commissioner to establish that such crane meets the manufacturer’s standards for use.

4. This section shall not apply to equipment used for pile driving or clamshell work.

§ 50. Section BC 3320 of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows: 2009
SECTION BC 3320
ADDITIONAL REQUIREMENTS FOR CERTAIN MATERIAL HANDLING EQUIPMENT

3320.1 Scope. Material handling equipment shall meet and be used in accordance with the requirements of this section. Conveyors, trucks, power buggies, lift and fork trucks, hand propelled vehicles, mixing machines, and jacks shall meet and be used in accordance with the requirements of this section, Section 3316, and rules promulgated by the commissioner.

Exception: Equipment that is exempted from the requirements of Section 3316.1.

3320.2 Requirements. Material handling equipment shall be installed, operated, and maintained to eliminate hazard to the public or to property. It shall be unlawful to operate any such equipment that is not provided with a positive means for preventing the unauthorized operation of such machine. The means whereby such machines may be made inoperative shall be acceptable to the commissioner.

3320.3 Operation. Only operators designated by the person causing such machinery to be used shall operate material handling machinery. Operators and signalmen/signalwoman shall be experienced at the operation they perform. The operator shall be responsible for making the machine inoperative before he or she leaves the machine.

3320.3.1 Loading. Loading of material handling equipment shall be conducted in accordance with the following requirements:

1. Material handling equipment shall not be loaded in excess of the rated load specified by the manufacturer. When necessary, manufacturer load ratings shall be reduced to take into account effects of wind, ground condition and operating speed.

2. Rated load capacities and required charts shall be conspicuously posted on all material handling equipment or on the site and shall be available to the commissioner at all times.

3. All loads shall be properly trimmed to prevent the dislodgment of any part during raising, lowering, swinging or transit.

4. Suspended loads shall be securely slung and properly balanced before they are set in motion.

3320.3.2 Refueling. Refueling of material handling equipment shall be conducted in accordance with the following requirements:

1. The engine shall be stopped during refueling, except as otherwise provided in rules promulgated by the commissioner.

2. Open lights, flames, or spark-producing devices shall be kept at a safe distance while refueling an internal combustion engine.
3. No person shall smoke or carry lighted smoking material in the immediate vicinity of the refueling area.

4. “No smoking” signs shall be conspicuously posted in all fueling or fuel storage areas.

5. Fuel shall be kept in containers that meet the requirements of the Fire Department.

6. All other requirements of the Fire Department shall be satisfied.

3320.3 **Reserved.**

[3320.4 **Notification of accidents involving material handling equipment.** The owner or person directly in charge of any material handling equipment shall immediately notify the commissioner following any accident involving material handling equipment. In such a case, no person shall permit either of the following without the permission of the commissioner:

1. Use of such material handling equipment; or

2. Remove of the material handling equipment or any part thereof from the area of the job site.]

3320.4 **Reserved.**

3320.5 **Conveyors.** Conveyors shall meet the requirements of Sections 3320.5.1 through 3320.5.3.

3320.5.1 **Walkways.** Walkways along belt conveyors or bucket conveyors shall be kept free of materials and, where 5 feet (127 mm) or more above the ground, shall be provided with a [standard guardrail and standard toeboard] guardrail system that meets the requirements of [Section 3307.8] Sections 3308.7.1 through 3308.7.7 along the outside of the walkway. The [standard guardrail and standard toeboard] guardrail system may be omitted on the side toward the belt if the walkway is located adjacent to the conveyor.

3320.5.2 **Trippers.** Where trippers are used to control discharge, a device for throwing the belt or bucket drive into neutral shall be installed at each end of the runway.

3320.5.3 **Spillage.** Where conveyor belts cross any traveled way, trays shall be installed to catch spillage and overhead protection shall be provided for persons or traffic passing beneath.

3320.6 **Trucks.** Trucks shall meet the requirements of Sections 3320.6.1 and 3320.6.2.

3320.6.1 **Maintenance.** All parts and accessories of trucks shall be kept in repair. Brakes shall be maintained so that the vehicle with full load may be held on any grade that may be encountered on the job. Provision shall be made for the immediate application of wheel blocks to trucks traversing ramps steeper than one in ten.

3320.6.2 **Loading.** Trucks shall not be loaded beyond the manufacturer’s rated capacity, nor beyond the legal load limit, where applicable. The loads shall be trimmed before the truck is set in motion to prevent spillage. Loads that project beyond the sides of the truck, or that may be dislodged in transit, shall be removed or securely lashed in place.
3320.7 **Power buggies.** Power buggies shall meet the requirements of Sections 3320.7.1 and 3320.7.2.

3320.7.1 **Responsibilities of employers and workers.** Employers and workers shall have the following responsibilities regarding power buggies:

1. **Every [person]** contractor causing a power buggy to be used shall provide trained and **[competent]** qualified operators and shall carry out or enforce all provisions of this section pertaining to the use, operation and maintenance thereof.

2. No person other than the operator assigned by the employer shall operate a power buggy. A power buggy shall be in the charge and custody of the operator assigned, and no other person shall in any way interfere with or handle it, nor shall the operator cause or permit any other person to do so.

3. No power buggy shall be operated unless it is in good operating condition and is so constructed that it is stable under conditions of normal use.

3320.7.2 **Operation and construction.** Power buggies shall be operated and constructed in accordance with the requirements of Sections 3320.7.2.1 through 3320.7.2.4.

3320.7.2.1 **Brakes.** Every power buggy shall be provided with brakes and tire surfaces capable of bringing it to a full stop within 25 feet (635 mm) on a level surface that is similar to the one on which it will be used and at full rated load and maximum design speed. Brakes shall be capable of being fixed in engagement to hold the full load stationary on a 25 percent grade.

3320.7.2.2 **Accidental starting.** All movement controls of every power buggy shall be so arranged or shielded that they cannot be inadvertently engaged or the buggy accidentally set in motion.

3320.7.2.3 **Parking on grades.** No power buggy shall be left unattended on any grade sufficiently steep to cause it to coast if free of engine and brake resistance.

3320.7.2.4 **Use on ramps, runways and platforms.** Power buggies shall not be used on ramps, runways, or platforms that do not meet the requirements of Section 3315.

3320.8 **Lift and fork trucks.** Lift and fork trucks shall meet the requirements of Sections 3320.8.1 through 3320.8.4.

3320.8.1 **Load capacity.** A metal plate with readily legible etched or stamped figures giving the capacity rating in pounds shall be attached to every lift or fork truck.

3320.8.2 **Maintenance.** All parts and accessories of lift or fork trucks shall be kept in repair and with brakes adequate to maintain the fully loaded vehicle on any grade that may be encountered on the job.
3320.8.3 Loading. No lift or fork truck shall be loaded beyond its capacity rating. No hand-operated pallet truck loaded so that any point on the load is at a greater height than 4 feet 6 inches (114 mm) above the floor shall be moved by pushing unless handled by two persons.

3320.8.4 Prohibited use. No lift or fork truck shall be in motion when the loaded forks are elevated higher than necessary to clear obstructions, except as may be required for positioning, picking up, or depositing the load.

3320.9 Hand propelled vehicles. Hand propelled vehicles shall be constructed and braked to withstand the loads to be carried and shall be maintained in repair. Vehicles with loose parts shall not be used.

3320.10 Mixing machines. Where the public may have access to the working area near charging skips, [standard guardrails [that meet the requirements of Section 3307.8] or other adequate protection in accordance with the New York City Department of Transportation shall be erected to enclose the area under the raised skip and the mixing machine. Each time before raising or lowering the charging skip, the operator shall ascertain that no one is in the danger zone.

3320.11 Jacks. Jacks shall meet the requirements of Sections 3320.11.1 through 3320.11.5.

3320.11.1 Marking. The rated capacity of every jack shall be legibly marked in a prominent location on the jack by casting or stamping. The manufacturer shall designate the intended supporting point of the load and the maximum permissible length of lever and force applied.

3320.11.2 Overtravel to be limited. Every jack shall, where practicable, be provided with a positive stop to prevent overtravel; otherwise an indicator to clearly show overtravel shall be provided on the jack.

3320.11.3 Maintenance. Lubrication and operation of jacks shall be in accordance with the recommendations of the manufacturer.

3320.11.4 Foundations. Jacks shall rest on a firm, level foundation adequate to support the load.

3320.11.5 Blocking required. When the object has been lifted to the desired height, blocking or cribbing shall be immediately placed under it if the jack does not have built-in safety devices such as stop-rings, locknuts or place-in cylinder sleeves.

3320.12 Cableways. The construction, installation, inspection, maintenance and use of cableways shall be in conformance with rules.

§ 51. Chapter 35 of the New York city building code, as added by local law number 141 for the year 2013, is REPEALED, and a new Chapter 35 is added to read as follows:
### CHAPTER 35
**REFERENCED STANDARDS**

### SECTION BC 3501
**GENERAL**

**3501.1 General.** This chapter lists the standards that are referenced in various sections of this document. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

**3501.2 Subsequent additions, modifications or deletions.** Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the *Administrative Code*.

**3501.3 Applicability.** The application of the referenced standards shall be as specified in Section 102.4.

§ 52. Section D102.2.5 of appendix D of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

**D102.2.5 R-1 and R-2 occupancies.** No building or space classified in occupancy group Occupancy Group R-1 or R-2 may be located on a lot containing a building classified in construction Type IIB, VA or VB.

§ 52-a. Items 9 and 12 of section D105.1 of appendix D of the New York city building code, as amended by local law number 141 for the year 2013, are amended to read as follows:

9. One- or two-family detached or semidetached dwellings of two stories or less in height and 2,500 square feet (232 m²) or less in area per story located within Zoning Districts R-2 through R-5 may be constructed or reconstructed of construction Type VA, or if damaged for any cause only the damaged portions shall be required to be reconstructed to conform to Type VA construction. In addition, one-family dwellings located within Zoning District R-1 anywhere in the city, may be constructed of Type VB construction in conformance with the area and height limits established by Tables 503 of Chapter 5 Tables 504.3, 504.4 and 506.2 of this code.

12. One- or two-family detached, zero lot line or semi-detached dwellings of three stories in height and 2,500 square feet (232 m²) or less in area per story located within Zoning Districts R-1 through R-5 within Lower Density Growth Management Areas as defined by the New York City Zoning Resolution may be constructed or reconstructed of construction Type VA where such buildings are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, or if damaged for any cause only the damaged portions shall be required to be reconstructed to conform to Type VA construction where such buildings are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. In addition, no portion of a one- or two-family detached, zero lot line or semi-detached dwellings located within Zoning Districts R-1, R-2 or R-5 within Lower Density Growth Management Areas shall exceed a maximum building height of 35 feet (10 668 mm) above the grade plane.

§ 53. Section D106 of appendix D of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

**SECTION BC D106 FIRE DISTRICT MAPS FOR THE BOROUGHS OF STATEN ISLAND (RICHMOND COUNTY) AND QUEENS**

**D106.1 Fire district maps.** Within the boroughs of Staten Island (Richmond County) and Queens, the fire districts shall comprise such areas indicated on the “fire district maps” as per Figures D106.1(1) and D106.1(2).
§ 53-a. Figure D106.1(1) of appendix D of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

Subpart 37 (Appendix E of the New York City Building Code)

§54. Appendix E of the New York city building code, as added by local law number 33 for the year 2007, sections E104.3, E105, E106.2, E107.2, and E112.4 as amended by local law number 141 for the year 2013, is amended to read as follows:
APPENDIX E
SUPPLEMENTARY ACCESSIBILITY REQUIREMENTS

SECTION BC E101
GENERAL

E101.1 Scope. The provisions of this appendix shall control the supplementary requirements for the design and construction of facilities for accessibility [to persons] for individuals with [physical] disabilities.

E101.2 Design. Technical requirements for items herein shall comply with this code and ICC A117.1.

SECTION BC E102
DEFINITIONS

E102.1 [General] Definitions. The following [words and] terms [shall, for the purposes of this appendix, have the meanings shown herein] are defined in Chapter 2:

CLOSED-CIRCUIT TELEPHONE. [A telephone with a dedicated line such as a house phone, courtesy phone or phone that must be used to gain entrance to a facility.]

MAILBOXES. [Receptacles for the receipt of documents, packages or other deliverable matter. Mailboxes include, but are not limited to, post office boxes and receptacles provided by commercial mail-receiving agencies, apartment houses and schools.]

TRANSIENT LODGING. [A building, facility or portion thereof, excluding inpatient medical care facilities and long-term care facilities, that contains one or more dwelling units or sleeping units. Examples of transient lodging include, but are not limited to, resorts, group homes, hotels, motels, dormitories, homeless shelters, halfway houses and social service lodging.]

SECTION BC E103
ACCESSIBLE ROUTE

E103.1 Raised platforms. In banquet rooms or spaces where a head table or speaker’s lectern is located on a raised platform, an accessible route shall be provided to the platform.

SECTION BC E104
SPECIAL OCCUPANCIES

E104.1 General. Transient lodging facilities shall be provided with accessible features in accordance with Sections E104.2 and E104.3. Group I-3 occupancies shall be provided with accessible features in accordance with Sections [E104.3] E104.2 and E104.4.

[E104.2 Accessible beds. In rooms or spaces having more than 25 beds, five percent of the beds shall have a clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1.]
[E104.2.1] **Sleeping areas.** A clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1 shall be provided on both sides of the accessible bed. The clear floor space shall be positioned for parallel approach to the side of the bed.

[Exception: This requirement shall not apply where a single clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1 positioned for parallel approach is provided between two beds.]

[E104.3] **E104.2 Communication features.** Accessible communication features complying with Chapter 7 of ICC A117.1 shall be provided in accordance with Sections [E104.3.1] E104.2.1 through [E104.3.4] E104.2.4 of this code.

[E104.3.1] **E104.2.1 Transient lodging.** In transient lodging facilities, sleeping units with accessible communication features shall be provided in accordance with Table [E104.3.1] E104.2.1. Units required to comply with Table [E104.3.1] E104.2.1 shall be dispersed among the various classes of units.

[E104.3.2] **E104.2.2 Group I-3.** In Group I-3 occupancies at least 2 percent, but no fewer than one of the total number of general holding cells and general housing cells equipped with audible emergency alarm systems and permanently installed telephones within the cell, shall comply with Section [E104.3.4] E104.2.4.

[E104.3.3] **E104.2.3 Dwelling units and sleeping units.** Where dwelling units and sleeping units are altered or added, the requirements of Section [E104.3] E104.2 shall apply only to the units being altered or added until the number of units with accessible communication features complies with the minimum number required for new construction.
E104.2.4 Notification devices. Visual notification devices shall be provided to alert room occupants of incoming telephone calls and a door knock or bell. Notification devices shall not be connected to visual alarm signal appliances. Permanently installed telephones shall have volume controls and an electrical outlet complying with ICC A117.1, including Section 309 (Operable Parts), located within 48 inches (1219 mm) of the telephone to facilitate the use of a TTY.

E104.3 Accessible beds. In rooms or spaces having more than 25 beds, five percent of the beds shall have a clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1.

E104.3.1 Sleeping areas. A clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1 shall be provided on both sides of the accessible bed. The clear floor space shall be positioned for parallel approach to the side of the bed.

Exception: This requirement shall not apply where a single clear floor space complying with Section 305 (Clear Floor Space) of ICC A117.1 positioned for parallel approach is provided between two beds.

E104.4 Partitions. Solid partitions or security glazing that separates visitors from detainees in Group I-3 occupancies shall provide a method to facilitate voice communication. Such methods are permitted to include, but are not limited to, grilles, slats, talk-through baffles, intercoms or telephone handset devices. The method of communication shall be accessible to individuals who use wheelchairs and individuals who have difficulty bending or stooping. Hand-operable communication devices, if provided, shall comply with Section E106.3.

SECTION BC E105
OTHER FEATURES AND FACILITIES

E105.1 Portable toilets and bathing rooms. Where multiple single-user portable toilet or bathing units are clustered at a single location, at least 5 percent, but not less than one toilet unit or bathing unit at each cluster, shall be accessible and comply with ICC A117.1, including Section 603 (Toilet and Bathing Rooms). Signs containing the [International Symbol of Accessibility] dynamic accessibility symbol and complying with Section 703 (Signs) of ICC A117.1 shall identify accessible portable toilets and bathing units.

Exception: Portable toilet units provided for use exclusively by construction personnel on a construction site.

E105.2 Laundry equipment. Where provided in spaces required to be accessible, washing machines and clothes dryers shall comply with this section. Where laundry equipment is provided within a dwelling or sleeping unit, not for public use or common use, such equipment shall comply with Section 1107.2.8.

E105.2.1 Washing machines. Where three or fewer washing machines are provided, at least one shall comply with ICC A117.1, including Section 611 (Washing Machines and Clothes Dryers), and shall be [front-loading] accessible. Where more than three washing machines are provided, at least two shall comply with ICC A117.1, including Section 611 and shall be [front-loading] accessible.
**E105.2.2 Clothes dryers.** Where three or fewer clothes dryers are provided, at least one shall comply with ICC A117.1, including Section 611 (Washing Machines and Clothes Dryers), and shall be [front-loading] accessible. Where more than three clothes dryers are provided, at least two shall comply with ICC A117.1, including Section 611, and shall be [front-loading] accessible.

**E105.3 Depositories, vending machines, change machines and similar equipment.** Where provided, at least one of each type of depository, vending machine, change machine and similar equipment shall [comply with ICC A117.1] be accessible.

**Exception:** Drive-up-only depositories are not required to comply with this section.

**E105.4 Mailboxes.** Where mailboxes are provided in facilities not subject to Section 1107.3.1, but required to be accessible pursuant to the Americans with Disabilities Act, at least five percent, but not less than one, of each type shall comply with ICC A117.1.

**E105.5 Automatic teller machines and fare machines.** Where automatic teller machines or self-service fare vending, collection or adjustment machines are provided, at least one machine of each type at each location where such machines are provided shall be accessible and comply with ICC A117.1, including Section 707 (ATMs and Fare Machines). Where bins are provided for envelopes, wastepaper or other purposes, at least one of each type shall be accessible and comply with ICC A117.1, including Section 905 (Storage Facilities).

**E105.6 Two-way communication systems.** Where two-way communication systems are provided to gain admittance to a building or facility or to restricted areas within a building or facility, the system shall be accessible and comply with ICC A117.1, including Section 708 (Two-Way Communication Systems).

**SECTION BC E106 TELEPHONES**

**E106.1 General.** Where coin-operated public pay telephones, coinless public pay telephones, public closed-circuit telephones, courtesy phones or other types of public telephones are provided, accessible public telephones shall be provided in accordance with Sections E106.2 through E106.5 for each type of public telephone provided. For purposes of this section, a bank of telephones shall be considered two or more adjacent telephones.

**E106.2 Wheelchair-accessible telephones.** Where public telephones are provided, wheelchair-accessible telephones complying with ICC A117.1, including Section 704 (Telephones), shall be provided in accordance with Table E106.2.

**Exception:** Drive-up-only public telephones are not required to be accessible.

#### E106.3 Volume controls.
All public telephones provided shall have accessible volume control complying with Section 704.3 (Volume-Control Telephones) of ICC A117.1.

#### E106.4 TTYs.
TTYs complying with ICC A117.1, including Sections 704.4 through 704.7, shall be provided in accordance with Sections E106.4.1 through E106.4.9.

##### E106.4.1 Bank requirement.
Where four or more public pay telephones are provided at a bank of telephones, at least one public TTY shall be provided at that bank.

**Exception:** TTYs are not required at banks of telephones located within 200 feet (60 960 mm) of, and on the same floor as, a bank containing a public TTY.

##### E106.4.2 Floor requirement.
Where four or more public pay telephones are provided on a floor of a privately owned building, at least one public TTY shall be provided on that floor. Where at least one public pay telephone is provided on a floor of a publicly owned building, at least one public TTY shall be provided on that floor.

##### E106.4.3 Building requirement.
Where four or more public pay telephones are provided in a privately owned building, at least one public TTY shall be provided in the building. Where at least one public pay telephone is provided in a publicly owned building, at least one public TTY shall be provided in the building.

##### E106.4.4 Site requirement.
Where four or more public pay telephones are provided on a site, at least one public TTY shall be provided on the site.

##### E106.4.5 Rest stops, emergency road stops[4] and service plazas.
Where a public pay telephone is provided at a public rest stop, emergency road stop or service plaza, at least one public TTY shall be provided.

##### E106.4.6 Hospitals.
Where a public pay telephone is provided in or adjacent to a hospital emergency room, hospital recovery room or hospital waiting room, at least one public TTY shall be provided at each such location.

##### E106.4.7 Transportation facilities.
Transportation facilities shall be provided with TTYs in accordance with Section E109.2.5 in addition to the TTYs required by Sections E106.4.1 through E106.4.4.
**E106.4.8 Detention and Correctional Facilities.** In detention and correctional facilities, where a public pay telephone is provided in a secured area used only by detainees or inmates and security personnel, then at least one TTY shall be provided in at least one secured area.

**E106.4.9 Signs.** Public TTYs shall be identified by the International Symbol of TTY complying with Section 703.6.3.2 (International Symbol of TTY) of ICC A117.1. Directional signs indicating the location of the nearest public TTY shall be provided at banks of public pay telephones not containing a public TTY. Additionally, where signs provide direction to public pay telephones, they shall also provide direction to public TTYs. Such signs shall comply with visual signage requirements in ICC A117.1, including Section 703.2 (Visual Characters), and shall include the International Symbol of TTY.

**E106.5 Shelves for Portable TTYs.** Where a bank of telephones in the interior of a building consists of three or more public pay telephones, at least one public pay telephone at the bank shall be provided with a shelf and an electrical outlet in accordance with Section 704.6 (TTY Shelf) of ICC A117.1.

**Exceptions:**
1. In secured areas of detention and correctional facilities, if shelves and outlets are prohibited for purposes of security or safety shelves and outlets for TTYs are not required to be provided.
2. The shelf and electrical outlet shall not be required at a bank of telephones with a TTY.

**SECTION BC E107 SIGNAGE**

**E107.1 Signs.** Required accessible portable toilets and bathing facilities shall be identified by the [International Symbol of Accessibility] dynamic accessibility symbol, in accordance with Figure 1111.1.

**E107.2 Designations.** Interior and exterior signs identifying permanent rooms and spaces shall have tactile visual characters, raised characters and braille complying with ICC A117.1. Where pictograms are provided as designations of interior rooms and spaces, the pictograms shall have tactile text descriptors. Signs required to provide tactile visual characters, raised characters and pictograms shall comply braille complying with Sections 703.3 and 703.2 through 703.5 of ICC A117.1.

**Exceptions:**
1. Exterior signs that are not located at the door to the space they serve are not required to comply.
2. Building directories, menus, seat and row designations in assembly areas, occupant names, building addresses and company names and logos are not required to comply.
3. Signs in parking facilities are not required to comply.
4. Temporary (seven days or less) signs are not required to comply.

5. In detention and correctional facilities, signs not located in public areas are not required to comply.

E107.3 Directional and informational signs. Signs that provide direction to, or information about, permanent interior spaces of the site and facilities shall contain visual characters complying with Section 703.2 (Visual Characters) of ICC A117.1.

Exception: Building directories, personnel names, company or occupant names and logos, menus and temporary (seven days or less) signs are not required to comply with ICC A117.1.

E107.4 Other signs. Signage indicating special accessibility provisions shall be provided at fixed facilities and stations, signage must be provided in accordance with Sections E109.2.2 through E109.2.2.3.

SECTION BC E108
RESERVED

SECTION BC E109
TRANSPORTATION FACILITIES AND STATIONS

E109.1 General. Fixed transportation facilities and stations shall comply with the applicable provisions of Section E109.2.

E109.2 New construction. New stations in rapid rail, light rail, commuter rail, intercity rail, high speed rail and other fixed guideway systems shall comply with Sections E109.2.1 through E109.2.8.

E109.2.1 Station entrances. Where different entrances to a station serve different transportation fixed routes or groups of fixed routes, all entrance serving each group or route shall comply with Section 1104 and ICC A117.1, including Section 404 (Doors and Doorways).

E109.2.2 Signs. Signage in fixed transportation facilities and stations shall comply with Sections E109.2.2.1 through E109.2.2.3.

E109.2.2.1 [Tactile] Raised character and braille signs. Where signs are provided at entrances to stations identifying the station or the entrance, or both, at least one sign at each entrance shall have raised characters and braille. A minimum of one [tactile] raised character and braille sign identifying the specific station shall be provided on each platform or boarding area. Such signs shall be placed in uniform locations at entrances and on platforms or boarding areas within the transit system to the maximum extent practicable. [Tactile] Raised character and braille signs shall comply with [Section] Sections 703.3 ([Tactile] Raised Characters) and 703.4 (Braille) of ICC A117.1.

Exceptions:
1. Where the station has no defined entrance but signs are provided, the tactile raised character and braille signs shall be placed in a central location.

2. Signs are not required to be tactile raised character and braille where audible signs are remotely transmitted to hand-held receivers, or are user or proximity actuated.

**E109.2.2 Identification signs.** Stations covered by this section shall have identification signs containing visual characters complying with Section 703.2 (Visual Characters) of ICC A117.1. Signs shall be clearly visible and within the sightlines of a standing or sitting passenger from within the train on both sides when not obstructed by another train.

**E109.2.3 Informational signs.** Lists of stations, routes and destinations served by the station which are located on boarding areas, platforms or mezzanines shall provide visual characters complying with Section 703.2 (Visual Characters) of ICC A117.1. Signs covered by this provision shall, to the maximum extent practicable, be placed in uniform locations within the transit system.

**E109.2.4 Fare machines.** Self-service fare vending, collection and adjustment machines shall comply with Section 707 (ATMs and Fare Machines) of ICC A117.1. Where self-service fare vending, collection or adjustment machines are provided for the use of the general public, at least one accessible machine of each type provided shall be provided at each accessible point of entry and exit.

**E109.2.5 TTYs.** Where a public pay telephone is provided in a transit facility (as defined by the Department of Transportation), at least one public TTY complying with Sections 704.4 through 704.7 of ICC A117.1, Sections 704.4 through 704.7, shall be provided in the station. In addition, where one or more public pay telephones serve a particular entrance to a transportation facility, at least one TTY telephone complying with ICC A117.1, [Section] Sections 704.4 through 704.7 [of ICC A117.1] shall be provided to serve that entrance.

**E109.2.6 Track crossings.** Where a circulation path serving boarding platforms crosses tracks, an accessible route complying with ICC A117.1, including Section 402 (Accessible Routes) shall be provided.

**Exception:** Openings for wheel flanges shall be permitted to be 2 1/2 inches (64 mm) maximum.

**E109.2.7 Public address systems.** Where public address systems convey audible information to the public, the same or equivalent information shall be provided in a visual format.
E109.2.8 Clocks. Where clocks are provided for use by the general public, the clock face shall be uncluttered so that its elements are clearly visible. Hands, numerals and digits shall contrast with the background either light-on-dark or dark-on-light. Where clocks are mounted overhead, numerals and digits shall comply with ICC A117.1, Section 703.2 (Visual Characters) [of ICC A117.4].

REFERENCED STANDARDS

E111.1 General. This section lists the standards that are referenced in various sections of this appendix. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

E111.2 Subsequent additions, modifications, or deletions. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the [Administrative Code] Administrative Code.

E111.3 Applicability. The application of the referenced standards shall be as specified in Section 102.4.

E111.4 Standards.

E109.2.4

ICC A117.1-09 Accessible and Usable Buildings and Facilities §55. Section F102.5 of appendix F of the New York city building code, as added by local law number 33 for the year 2007, is amended to read as follows:

F102.5 Exterior wall ventilation openings. Exterior wall ventilator openings located with any portion within 2 feet (610 mm) of outside ground level shall be covered for their height and width with perforated sheet metal plates no less than 0.070 inch (1.8 mm) thick, expanded sheet metal
plates not less than 0.047 inch (1.2 mm) thick, cast-iron cast-iron grills or grating, extruded aluminum load-bearing vents or with hardware cloth of 0.035 inch (0.89 mm) wire or heavier. The openings therein shall not exceed ¼ inch (6.4 mm).

§ 56. Appendix G of the New York city building code, as added by local law number 33 for the year 2007, sections G103.3.1 and G307.4 as added by local law number 99 for the year 2013, section G307.5 as added by local law number 100 for the year 2013, section G311 as added by local law number 108 for the year 2013, and sections G102, G104, G105, G106, G107, G201, G301, G303, G304, G308, G309, G310, G402 and G501 as amended by local law number 141 for the year 2013, are amended to read as follows:

APPENDIX G
FLOOD-RESISTANT CONSTRUCTION

[CHAPTER G1]
[GENERAL PROVISIONS]

SECTION BC G101
PURPOSE AND OBJECTIVES

G101.1 Purpose. The purpose of this appendix is to promote the public health, safety and general welfare and to minimize public and private losses due to flood conditions in specific flood hazard areas through the establishment of comprehensive regulations for management of flood hazard areas designed to:

1. Prevent unnecessary disruption of commerce, access and public service during times of flooding;
2. Manage the alteration of natural floodplains, stream channels and shorelines;
3. Manage filling, grading, dredging and other development that may increase flood damage or erosion potential;
4. Prevent or regulate the construction of flood barriers that will divert floodwaters or that can increase flood hazards;
5. Contribute to improved construction techniques in the floodplains; and
6. Comply with and exceed the minimum standards of the National Flood Insurance Program as administered by the Federal Emergency Management Agency (FEMA).

G101.2 Objectives. The objectives of this appendix are to:
1. Protect human life;
2. Minimize the expenditure of public money for flood control projects;
3. Minimize the need for rescue and relief efforts associated with flooding;
4. Minimize prolonged business interruption;
5. Minimize damage to structures located in areas of special flood hazard areas;
6. Minimize damage to public facilities and utilities such as water, electricity, telephone and sewer lines, and streets and bridges located in areas of special flood hazard areas;
7. Help maintain a stable tax base by providing for the sound use and development of flood prone areas; and
8. Ensure that potential owners and occupants are notified that property is within areas of special flood hazard areas.

G101.3 [Reserved.] Referenced standards. Where this code makes reference to the nationally recognized standard ASCE 24, such standard shall be as modified for New York City in accordance with Section G501 of this appendix.

G101.4 Reserved.

SECTIONS BC G102
APPLICABILITY

G102.1 General. This appendix, in conjunction with the New York City Construction Codes, provides minimum requirements for development located, in whole or in part, in areas of special flood hazard areas and shaded X-Zones within the jurisdiction of New York City, including:

1. Subdivisions. This appendix shall apply to the subdivision of land;
2. Utilities. This appendix shall apply to the installation of utilities;
3. Group U buildings and structures. This appendix shall apply to placement and replacement of Group U buildings as defined in Section 312;
4. Site improvements. This appendix shall apply to site improvements, including but not limited to, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations, operations and other land disturbing activities;
5. Prefabricated buildings and manufactured homes. This appendix shall apply to placement and replacement of prefabricated buildings and manufactured homes;
6. Post-FIRM construction. This appendix shall apply to post-FIRM construction;
7. **Alterations to post-FIRM construction.** This appendix shall apply to repair, alteration, reconstruction, rehabilitation[,] or additions to post-FIRM construction;

8. **Substantial improvement of pre-FIRM construction.** This appendix shall apply to substantial improvement of pre-FIRM buildings and structures, including restoration after damage, as if hereafter erected;

9. **Horizontal enlargements of pre-FIRM construction.** This appendix shall apply to horizontal enlargements of pre-FIRM buildings and structures to the extent of such horizontal enlargement, including but not limited to additions[,] (whether above or below grade), decks, carports, or similar appendages. The existing portions of the structure shall not be required to comply, unless otherwise required because the alteration is deemed a substantial improvement; and

10. **Other alterations to pre-FIRM construction.** This appendix shall apply to [alterations or repairs,] repair, alteration, reconstruction, rehabilitation, or additions to pre-FIRM buildings and structures[,] including installation of new components, materials, finishes and equipment, that increase the degree of noncompliance with this appendix. No increase in the degree of noncompliance with this appendix shall be permitted. The requirements of this Item 10 shall be deemed satisfied if the work would not increase the degree of noncompliance with this appendix.

10.1. **Work that increases the degree of noncompliance.** Work to pre-FIRM construction deemed as an increase in the degree of noncompliance includes, but is not limited to:

10.1.1. The conversion of any space below the design flood elevation from nonhabitable space into habitable space;

10.1.2. The creation of a direct communication between a dwelling unit and a space below the design flood elevation;

10.1.3. Where a dwelling unit already has space below the design flood elevation or has space with which the dwelling unit directly communicates that is below the design flood elevation, an increase in such space;

10.1.4. The conversion of any space below the design flood elevation in a non-residential building (for flood zone purposes) to accessory (as such term is defined in NYC ZR) to a group R-1, R-2, or R-3 occupancy, when such space was not previously accessory to such occupancy;

10.1.5. The installation of new components, materials, finishes, plumbing fixtures and equipment below the design flood elevation that are not permitted by this appendix to be located below the design flood elevation, where such similar items did not previously exist, except for new components, materials, finishes, and equipment as permitted by Item 10.2.2.
10.1.6. The lowering of the elevation of a floor of a basement (for floodzone purposes), or a portion thereof located below the design flood elevation, except as permitted by Item 10.2.4;

10.1.7. An alteration consisting of a change in use, occupancy or how such space is used in a building, or portion thereof, that results in a more restrictive flood design class per ASCE 24; and

10.1.8. Any condition not addressed in Items 10.1.1 through 10.1.7 as determined by the commissioner.

10.2. Work that does not increase the degree of noncompliance. The following alterations or repairs work to pre-FIRM construction, other than substantial improvements, shall not be deemed as an increase in the degree of noncompliance:

[10.1. Where the alteration or repair comprises the replacement of pre-FIRM components, materials, finishes or equipment;]

[10.2. Where the alteration or repair comprises the installation of new components, materials, finishes or equipment in a space within the structure where similar pre-FIRM components, materials, finishes or equipment already exist; and]

[10.3. Where such alteration is a change in use, occupancy or how such space is used, provided that such change would not increase the degree of noncompliance with requirements of this appendix. The conversion of any space below the design flood elevation from nonhabitable space into habitable space shall be deemed an increase in the degree of noncompliance.]

10.2.1. Plumbing fixtures:

10.2.1.1. The in-kind replacement of plumbing fixtures below the design flood elevation; and

10.2.1.2. The installation of new plumbing fixtures in a space within the structure where similar plumbing fixtures already exist, provided that the number of plumbing fixtures is not increased and provided any required backflow prevention and/or sewage ejection is provided in accordance with this appendix.

10.2.2. Components, materials, finishes, equipment, fire protection systems and equipment, and appliances, other than plumbing fixtures:

10.2.2.1. The in-kind replacement of components, materials, finishes, equipment, fire protection systems and equipment, and appliances;

10.2.2.2. The installation of new components, materials, finishes, equipment, fire protection systems and equipment, and appliances, in a space within the structure where similar pre-FIRM items already exist; and
10.2.3. Within existing nonresidential portions of a nonresidential (for flood zone purposes) building, the installation of new components, materials, finishes, equipment, fire protection systems and equipment, and appliances which serve only the space(s) being altered below the design flood elevation, provided such items, as well as any associated electrical wiring, are designed and/or isolated so as not to affect the operation of building components, systems and wiring of other parts of the building if submerged. This item shall not include increases to the number of plumbing fixtures or the installation of building systems which support other areas of the building.

10.2.3. Change in use, occupancy or how such space is used. Alteration consisting of a change in use, occupancy or how such space is used in a nonresidential building (for flood zone purposes), or portion thereof, that does not result in a more restrictive flood design class per ASCE 24, is not a conversion from nonhabitable space into habitable space, and is not otherwise required by Item 10.1.4 to comply with this appendix. Such alteration shall also comply with the provisions of Item 10.2.2; and

10.2.4. Pits. The lowering of the elevation of a floor or a portion thereof located below the design flood elevation for pits to accommodate sump pumps, house traps, valve access, cleanouts, ejector pumps and elevators.

11. Retroactive requirements. This appendix shall apply to retroactive requirements as provided for in Section \[G311\] G312.

G102.2 Establishment of areas of special flood hazard areas. The following flood hazard map and supporting data are adopted as referenced standards and declared to be a part of this appendix.

1. FEMA FIS 360497.

2. FEMA FIRMs 360497.

G102.2.1 Preliminary flood insurance study and rate maps. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than \[May 1, 2014\] April 18, 2018, the following flood hazard maps and supporting data are also adopted as a referenced standard and declared a part of this appendix.

1. FEMA PFIS 360497.

2. FEMA PFIRMs 360497.

G102.2.2 Effect of preliminary flood insurance study and rate maps. Notwithstanding any other provision in this appendix to the contrary:

1. All references in this appendix to elevations in FEMA FIS 360497 and FEMA FIRMs 360497 shall be deemed to refer to the greater of (i) the elevations identified in the
FEMA FIS 360497/FEMA FIRMs 360497 or (ii) the elevations identified in the FEMA PFIS 360497/FEMA PFIRMs 360497. In comparing elevations, the elevations identified in FEMA FIS 360497 and FEMA FIRMs 360497 that are expressed in relation to the National Geodetic Vertical Datum (NGVD) shall be converted to the North American Vertical Datum (NAVD).

2. All references in this appendix to [areas of special] flood hazard areas as delineated on FEMA FIRMs 360497 shall be deemed to refer to the [areas of special] flood hazard areas as delineated on FEMA PFIRMs 360497 except that, where a structure is located in [an area of special] a flood hazard area as delineated on FEMA PFIRMs 360497 and in a more restrictive [area of special] flood hazard area as delineated on FEMA FIRMs 360497, such structure shall be deemed to be located in the more restrictive [area of special] flood hazard area as delineated on FEMA FIRMs 360497.

G102.3 Letters of map change. Map changes to FEMA FIRMs 360497 shall be administered in compliance with Sections G102.3.1 through G102.3.3.

G102.3.1 Letters of map amendment (LOMA). Where FEMA FIRMs 360497 indicates that a structure or tax lot is within a delineated [area of] special flood hazard area, but the pre-FIRM ground elevations adjacent to the structure or throughout the tax lot are at or above the base flood elevation, the commissioner shall deem such structure or tax lot as being within the [area of] special flood hazard area and shall not approve plans except in compliance with this appendix, unless a letter of map amendment (LOMA) is issued by FEMA removing such structure or tax lot from the [area of] special flood hazard area.

G102.3.1.1 Letters of map amendment (LOMAs) during pendency of PFIRMs. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than [May 1, 2014] April 18, 2018, the commissioner shall not deem issuance of a LOMA by FEMA as removing such structure or tax lot from the [area of] special flood hazard area unless the elevations specified in the LOMA equal or exceed the applicable corresponding elevations on the FEMA PFIS 360497/FEMA PFIRMs 360497.

G102.3.2 Letter of map revision based on fill (LOMR-F). Where FEMA FIRMs 360497 indicates that a structure or tax lot is within a delineated [area of] special flood hazard area, but post-FIRM compacted fill is proposed to be added adjacent to the structure or throughout the tax lot to an elevation at or above the base flood elevation, the commissioner shall deem such structure or tax lot as being within the [area of] special flood hazard area and shall not approve plans except in compliance with this appendix, unless a conditional or final letter of map revision based on fill (LOMR-F) is issued by FEMA removing such structure or tax lot from the [area of] special flood hazard area. Buildings constructed with basements below the Base Flood Elevation on filled land shall maintain a minimum setback distance of 20 feet (6096 mm), at or above the Base Flood Elevation, from the edge of the [Special Flood Hazard Area] special flood hazard area to the nearest wall of the basement, regardless of the design approach used. The commissioner shall promulgate rules establishing procedures for processing letters of map revision based on fill (LOMR-F).
G102.3.2.1 Letters of map revision based on fill (LOMR-Fs) during pendency of PFIRMs. Until such time that the department by rule adopts revised FEMA FIS 360497 and FEMA FIRMs 360497 with a final effective date later than [May 1, 2014] April 18, 2018, the commissioner shall not deem issuance of a LOMR-F as removing such structure or tax lot from the [area of] special flood hazard area unless the elevations specified in the LOMR-F equal or exceed the applicable corresponding elevations on the FEMA PFIS 360497/FEMA PFIRMs 360497.

G102.3.3 Certificates of occupancy. Certificates of occupancy shall indicate that the structure or tax lot is subject to a letter of map amendment (LOMA) or letter of map revision based on fill (LOMR-F) as per Section G106.5.

SECTION BC G103
ADMINISTRATION

G103.1 Permit applications. The commissioner is hereby designated as the [flood plain] floodplain administrator for the City of New York and shall review permit applications to determine that:

1. Proposed development sites will be reasonably safe from flooding;

2. All site development activities, including grading, filling, utility installation and drainage modification, and all new construction and substantial improvements (including the placement of prefabricated buildings and manufactured homes) are designed and constructed with methods, practices and materials that minimize flood damage and that are in accordance with this code and ASCE 24; and

3. All other required state and federal permits have been obtained.

G103.2 Reserved.

G103.3 Determination of flood elevations. Flood elevations shall be determined in accordance with Sections G103.3.1 through G103.3.2.

G103.3.1 Determination of base flood elevations. Where the proposed development is within [an area of] a special flood hazard area but the base flood elevations are not specified in the FEMA FIRMs 360497, the commissioner shall require the applicant to request base flood elevation data from the New York State Department of Environmental Conservation (DEC); and

1. Submit to the commissioner either:

   1.1. A letter from DEC making such a determination of base flood elevation; or

   1.2. A letter from the DEC indicating that the data are not available. When such a letter from DEC indicates that the data are not available, the base flood elevation shall be equal to 3 feet (914 mm) above the highest adjacent pre-FIRM grade.
**Exception:** Large lots. Where the base flood elevation is not specified, the applicant shall submit a detailed engineering study establishing the base flood elevation, performed by an engineer in accordance with accepted hydrologic and hydraulic engineering techniques, in sufficient detail to allow review by the commissioner for any of the following conditions:

1. For a development which is located on a tax lot greater than 5 acres (2.02 hectares), or is located on property that was part of a tax lot that was greater than 5 acres (2.02 hectares) at the time of the adoption of the FIRM (October 1, 1984), or at any subsequent applicable map change thereto; or

2. For subdivisions resulting in 50 or more tax lots, including all tax lots previously subdivided from the same tax lot since the adoption of the FIRM (October 1, 1984), or since any subsequent applicable map changes thereto.

**[G103.3.1]** **G103.3.2 Determination of 500-year flood elevations.** Where 500-year flood elevations are not specified in the FEMA FIRM 360497 or FEMA FIS 360497, such elevations shall be determined by a registered design professional using modeling based on generally accepted engineering methods or a review of available data from city, state and federal agencies.

**G103.4 Reserved.**

**G103.5 Floodway encroachment.** Prior to issuing a permit for any floodway encroachment, including fill, new construction, substantial improvements and other development or land-disturbing activity, the commissioner shall require submission of a certification, prepared by a registered design professional, along with supporting technical data, demonstrating that such development will not cause any increase of the level of the base flood. [However, a floodway encroachment that increases the level of the base flood may be authorized if the applicant has:]

1. Applied for a conditional Letter of Map Revision; and]

[2. Received the approval of the Federal Emergency Management Agency (FEMA).]

**G103.5.1 Floodway revisions.** A floodway encroachment that increases the level of the base flood is authorized if the applicant has applied for a conditional Flood Insurance Rate Map (FIRM) revision and has received the approval of the Federal Emergency Management Agency (FEMA).

**G103.6 Watercourse alteration.** Prior to issuing a permit for any alteration or relocation of any watercourse within [an area of] a special flood hazard area, the commissioner shall require the applicant to:

1. Notify any affected adjacent municipalities or government jurisdictions;

2. Notify the DEC;
3. Submit evidence of such notifications to the commissioner and the Regional Director, Region II, the Federal Emergency Management Agency (FEMA);

4. Submit to the commissioner evidence of all such notifications;

5. Submit an engineering analysis demonstrating that the flood-carrying capacity of the altered or relocated portion of the watercourse will not be decreased; and

6. Submit evidence that such watercourses will be maintained in a manner which preserves the channel’s flood-carrying capacity.

G103.7 [Sand-dune alterations in V-Zones] Alterations in coastal areas. Prior to issuing a permit for any alteration of sand dunes [in a V-Zone] in coastal high-hazard areas and coastal A-zones, the commissioner shall require submission of an engineering analysis, prepared by a registered design professional, demonstrating that the proposed alteration will not increase the potential for flood damage.

G103.8 Records. The commissioner shall maintain records of the following:

1. Applications and supporting documents for development in [areas of special] flood hazard areas;

2. Permits issued in [areas of special] flood hazard areas;

3. Inspection reports;

4. Certifications required in this appendix; and

5. Certificate of occupancy where applicable.

G103.9 Violations. See Chapter 2 of Title 28 of the Administrative Code.

SECTION BC G104

PERMITS

G104.1 [Permit required] Required. Any person, owner or owner’s authorized agent who intends to conduct any development, as applicable pursuant to Section G102.1, within [an area of special] a flood hazard area, shall first [apply] make application to the commissioner and shall obtain the required permit in accordance with Section 28-105.1 of the Administrative Code, notwithstanding any exemption pursuant to Section 28-105.4 of the Administrative Code.

G104.2 [ Permit application requirements] Application for permit. The applicant shall file an application in writing on a form furnished by the commissioner. The commissioner shall not approve such application unless the applicant submits all plans, details, data and documents demonstrating that the development complies with [Section G104] Sections G104.2.1 through G104.2.3 and all other provisions of this appendix.
**G104.3 Site plan**  
**G104.2.1 Flood zone compliance plans.** The permit application shall include [site plan] flood zone compliance plans. The site plan shall include plans and drawings, shall be sealed by a registered design professional, and shall include a site plan and the following information and any other data as may be required by the department:

1. Flood design class assigned according to ASCE 24;

2. A delineation of the flood hazard areas including identification of the base (and) flood elevation(s), design flood (and) elevations and stillwater flood depth;

3. If applicable, the location of the regulatory floodway;

4. For all proposed structures, spot ground elevations at building corners and in 20-foot (6096 mm) or smaller intervals along the foundation footprint, or 1-foot (305 mm) contour elevations throughout the building site;

5. Proposed locations of water supply, sanitary sewer, and utilities;

6. Drainage patterns and facilities (and)

7. Foundation design details, including but not limited to:

   1. Proposed elevation of the lowest floor including basement (for flood zone purposes) of all structures;

   2. For crawl spaces and enclosed parking, storage, and building access that are wet floodproofed below the design flood elevation, location and total net area of foundation openings in accordance with ASCE 24;

   3. For dry floodproofed spaces in buildings or structures that are nonresidential (for flood zone purposes), the proposed elevation to which the enclosure will be dry floodproofed in accordance with ASCE 24 (and)

   4. Any proposed fill and excavation details (and)

7.5 In coastal high-hazard areas and coastal A-zones, the proposed elevation of the bottom of the lowest horizontal structural member of the lowest floor; and

8. For structures in coastal high-hazard areas or coastal A-zones, and for dry-floodproofed structures; flood loading and parameters including average velocity of water (V), debris impact load (F_i), scour depths, and wave loads (F_t or F_D).

**Exception:** Applications for subdivisions shall comply with Section G302.

**G104.4 Water course**  
**G104.2.2 Watercourse alteration.** The permit application shall include documentation required by Section G103.6 and, if applicable, a description of the extent to which any watercourse will be altered or relocated as a result of proposed development (and any documentation required by Section G103.6).
[G104.2.3] Certifications. The permit application shall include the applicable certifications in accordance with Sections [G104.5.1] G104.2.3.1 through [G104.5.3] G104.2.3.3.

[G104.5.1] G104.2.3.1 A-Zones. For construction in A-Zones, the permit application shall include the following certifications, as applicable:

1. **Wet floodproofing certification.** For applications involving wet floodproofed enclosures below the design flood elevation, [construction documents] flood zone compliance plans shall include a certification by the applicant, as applicable to the scope of work proposed, that "in accordance with ASCE 24, the use of the enclosure is limited to the parking of vehicles, building access, or storage, and that the design incorporates openings to allow for the automatic entry and exit of floodwaters for equalization of hydrostatic flood forces [in accordance with Section 2.6.2, ASCE 24] and flood damage-resistant materials and techniques that minimize damage to a structure by floodwater."

2. **Dry floodproofing certification for nonresidential buildings.** For applications involving dry floodproofed buildings and structures that are nonresidential (for flood zone purposes), [construction documents] flood zone compliance plans shall include a certification by the applicant that "the [dry floodproofing is designed] structure is designed to be dry floodproofed with walls that are substantially impermeable to the passage of water and that all walls, floors, and flood shields are designed to resist hydrostatic, hydrodynamic, and other flood-related loads, including the effects of buoyancy resulting from flooding to the elevation listed in Table 6-1 in accordance with ASCE 24."

3. **Utility certifications.** For all applications involving utility or mechanical work, including applications where such work is to be filed in a separate, related application, [construction documents] flood zone compliance plans shall include a certification by the applicant that "all heating, ventilation, air conditioning, plumbing, electrical and other services facilities and equipment within the structure or site will be located or constructed so as to prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24."

[G104.5.2 V-Zones] G104.2.3.2 Coastal high-hazard areas and coastal A-Zones. For construction in V-Zones, coastal high-hazard areas and coastal A-Zones, the permit application shall include the following certifications, as applicable:

1. **Structural design certification.** [Construction documents] Flood zone compliance plans shall include a certification by the applicant that the "entire structure is designed in accordance with ASCE 24, including that the pile or column foundation and building or structure to be attached thereto is designed to be anchored to resist flotation, collapse and lateral movement due to the effects of wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16 of the New York City Building Code."
2. **Breakaway wall certification.** Where breakaway walls are provided, [construction documents] flood zone compliance plans shall include a certification by applicant that "the breakaway walls meet the load requirements of Section 5.3.3 of ASCE 7, are designed in accordance with ASCE 24, and are of an open lattice-type construction only."

3. **Utility certifications.** For all applications involving utility or mechanical work, including applications where such work is to be filed in a separate, related application, [construction documents] flood zone compliance plans shall include a certification by the applicant that "all heating, ventilation, air conditioning, plumbing, electrical and other services, facilities and equipment within the structure or site will be located or constructed so as to prevent water from entering or accumulating within the components during conditions of flooding, in accordance with ASCE 24."

[G104.5.3] **G104.2.3.3 Floodway encroachment certification.** For any floodway encroachment, including fill, new construction, substantial improvements and other development or land-disturbing activity, the applicant shall submit a certification, along with supporting technical data, demonstrating that such development will not cause any increase of the level of the base flood in accordance with the requirements of Section G103.5.

[G104.6] **G104.3 Validity of permit.** The issuance of a permit under this appendix shall not be construed to be a permit for, or approval of, any violation of this appendix or any other provision of this code. The issuance of a permit based on submitted documents and information shall not prevent the commissioner from requiring the correction of errors. The commissioner is authorized to prevent occupancy or use of a structure or site [which] that is in violation of this appendix or other provisions of this code.

[G104.7] **G104.4 Expiration.** A permit shall become invalid if the proposed development:

1. Is not commenced within 180 days after its issuance, or
2. If the work authorized is suspended or abandoned for a period of 180 days after the work commences.

[G104.8] **G104.5 Suspension or revocation.** The commissioner is authorized to suspend or revoke a permit issued under this appendix wherever the permit is issued in error or on the basis of incorrect, inaccurate or incomplete information, or in violation of this code, in accordance with Section 28-105 of the Administrative Code.
G104.6 Reinstatement. Permit reinstatements for a permit that has expired pursuant to Section G104.4 shall be requested in writing. The commissioner is authorized to grant such reinstatement, provided that the work shall comply with all of the requirements of this appendix, including any revised FEMA FIRMs 360497 in effect at the time the application for reinstatement is made, and provided further that the applicant shall pay all reinstatement fees as required in Article 112 of Title 28 of the Administrative Code.

SECTION BC G105
VARIANCES

G105.1 General. The Board of Standards and Appeals shall hear and decide requests for variances from the requirements of this appendix. The Board of Standards and Appeals shall base its determination on technical justifications, and has the right to attach such conditions to variances as it deems necessary to further the purposes and objectives of this appendix.

Exception: In specific cases, provided that noncompliance with the requirements of the 44 CFR section 60.3 is not created, the commissioner shall be authorized to vary the standards prescribed in this appendix under and pursuant to the provisions of Section 28-103.3 of the Administrative Code and Section 645(b)(2) of the New York City Charter, including but not limited to:

1. Increases to the number of plumbing fixtures on an existing non-dry floodproofed story located below DFE including to accommodate compliance with the New York City Plumbing Code or Chapter 11 of this code for accessibility for persons with disabilities, or both; and

2. Modifications to the egress provisions of ASCE 24, Section 6.2.2.

G105.2 Records. The Board of Standards and Appeals shall:

1. Maintain a record of all variance actions, including justification for their issuance; and

G105.3 Historic structures. A variance is authorized to be issued by the Board of Standards and Appeals for the repair or rehabilitation of a historic structure upon a determination that the proposed repair or rehabilitation will not preclude the structure’s continued designation as a historic structure, and the variance is the minimum necessary to preserve the historic character and design of the structure.

G105.4 Functionally dependent facilities. The Board of Standards and Appeals is authorized to issue a variance for the construction or substantial improvement of a functionally dependent facility provided the criteria in Sections G105.3, G105.5 and G105.7 are met and the variance is the minimum necessary to allow the construction or substantial improvement, and that all due consideration has been given to methods and materials that minimize flood damages during the base flood and create no additional threats to public safety.
**G105.5 Floodway restrictions.** The Board of Standards and Appeals shall not issue a variance for any proposed development in a floodway if any increase in flood levels would result during the base flood discharge.

**G105.6 Conditions.** In reviewing applications for variances, the Board of Standards and Appeals shall consider all technical evaluations, all relevant factors, all other portions of this appendix and the following:

1. The danger that materials and debris may be swept onto other lands resulting in further injury or damage.
2. The danger to life and property due to flooding or erosion damage.
3. The susceptibility of the proposed development, including contents, to flood damage and the effect of such damage on current and future owners.
4. The importance of the services provided by the proposed development to the community.
5. The availability of alternate locations for the proposed development that are not subject to flooding or erosion.
6. The compatibility of the proposed development with existing and anticipated development.
7. The relationship of the proposed development to the comprehensive plan and floodplain management program for that area.
8. The safety of access to the property in times of flood for ordinary and emergency vehicles.
9. The expected heights, velocity, duration, rate of rise and debris and sediment transport of the floodwaters and the effects of wave action, if applicable, expected at the site.
10. The costs of providing governmental services during and after flood conditions including maintenance and repair of public utilities and facilities such as sewer, gas, electrical and water systems, streets and bridges.

**G105.7 Conditions for issuance.** Except for historic structures as provided for in Section G105.3, the Board of Standards and Appeals is authorized to issue a variance where all of the following criteria are met:

1. A technical showing of good and sufficient cause that the characteristics of the size, configuration or topography of the site renders the standards inappropriate;
2. A determination that failure to grant the variance would result in exceptional hardship to the applicant for the variance;
3. A determination that the granting of a variance will not result in increased flood heights, additional threats to public safety, extraordinary public expense, nor create nuisances,
cause fraud on or victimization of the public or conflict with existing local laws or ordinances;

4. A determination that the variance is the minimum necessary, considering the flood hazard, to afford relief;

5. Notification to the applicant in writing over the signature of the Executive Director of the Board of Standards and Appeals that the issuance of a variance to construct a structure below the base flood level will result in increased premium rates for flood insurance up to amounts as high as $25 for $100 of insurance coverage, and that such construction below the base flood level increases risks to life and property; and

6. A determination that the new construction, substantial improvement, or other proposed development is located on a tax lot that, on November 16, 1983, was no more than 1/2 acre (0.2 hectare) in size. However, where the tax lot has been determined to be larger than 1/2 acre (0.2 hectare), the technical justification required for issuing the variance increases with the lot size.

PROGRESS AND SPECIAL INSPECTION REQUIREMENTS

[G105.1 General. Progress and special inspections shall be performed in accordance with this section. All work applications, regardless of the scope of work, shall be subject to the progress and special inspection requirements of Sections G105.2 through G105.4.]

[G105.2 All work applications other than new buildings and substantial improvements. All work applications other than new buildings and substantial improvements, shall be subject to the following special inspection:]

1. **Flood zone compliance special inspection.** Prior to sign-off of work, a special inspector or special inspection agency shall inspect during the course of construction and certify that: “the structure was constructed” or “alterations were performed,” “with methods and practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the New York City Building Code and ASCE 24.”

[G105.3 New buildings and substantial improvements. All applications for new buildings or substantial improvements shall be subject to the following inspections:]

1. **Elevation progress inspection.** Upon placement of the lowest floor, including the basement (for flood zone purposes), an engineer or licensed professional surveyor shall inspect the site and verify the elevation of such lowest floor. The inspection report verifying the elevation shall be submitted to the department prior to further vertical construction. The commissioner shall be permitted to issue a stop work order if such inspection report is not submitted.

2. **Flood zone compliance special inspection.** Prior to sign-off of work, a special inspector or special inspection agency shall inspect during the course of construction and certify that: “the structure was constructed” or “alterations were performed,” “with methods and
practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the *New York City Building Code* and ASCE 24.”]

[3.--- **Final elevation required items.** Prior to the sign-off of the flood zone compliance special inspection, the special inspector or special inspection agency shall verify that the following required items have been submitted to the department, as applicable:

[3.1. **Elevation certificate.** The elevation certificate shall be made utilizing FEMA Form 086-0-33 titled, “Elevation Certificate,” and shall be signed by an engineer or surveyor.]

[3.2. **Dry floodproofing certificate.** The Dry floodproofing certificate shall be made utilizing FEMA Form 086-0-34 titled, “Floodproofing Certificate,” and shall be signed by an engineer.]

[G105.4 Flood shield inspection.** Where floodshields or other flood control devices are installed as part of a dry floodproofing system in buildings and structures that are nonresidential (for flood zone purposes), the special inspector or special inspection agency responsible for the flood zone compliance special inspection shall inspect the shields or devices in their stored positions or locations, witness their activation or transportation to their installed positions, and witness their deactivation or transportation back to their stored locations. The special inspector or special inspection agency shall also confirm the installation of signage required by ASCE 24, Section 6.2.3, Item 3.]

[G105.5 Reserved.]

[G105.6 Reserved.]

[G105.7 Reserved.]
SECTION BC G106
CERTIFICATES OF OCCUPANCY

G106.1 Applicability. This section shall apply to post-FIRM construction and substantial improvements where the work results in the issuance of a new or amended certificate of occupancy.

G106.2 Enclosed areas subject to flooding in A-Zones. The certificate of occupancy shall describe all [wet floodproofed] enclosed areas below the design flood elevation that are subject to flooding and that meet the requirements of this appendix for wet floodproofing as "wet floodproofed, subject to flooding". [Such wet floodproofed enclosed areas shall be usable solely for parking, storage, building access or crawl spaces.] The certificate of occupancy shall indicate the use of wet floodproofed spaces as either parking, storage, building access or crawl spaces. The certificate of occupancy shall be issued with the following restriction: “Levels subject to flooding shall not be used for any other use except as stated on this certificate.”

G106.3 Enclosed areas subject to flooding in [V-Zones] coastal high-hazard areas and coastal A-Zones. The certificate of occupancy shall describe all enclosed areas below the design flood elevation that are not dry floodproofed as "subject to flooding". [Such enclosed areas shall be usable solely for parking, storage and building access.] The certificate of occupancy shall indicate the use of spaces enclosed by open lattice breakaway walls below the design flood elevation as either unconditioned parking, unconditioned storage, or unconditioned building access. The certificate of occupancy shall be issued with the following restriction: "Levels subject to flooding shall not be used for any other use except as stated on this certificate."

G106.4 Dry floodproofed spaces. The certificate of occupancy shall describe any dry floodproofed spaces as "dry floodproofed." Where flood shields or other flood control devices are installed, the certificate of occupancy shall also provide notations describing these features. For evacuated buildings or evacuated portions of buildings utilizing the temporary stair or ramp provisions of Section G308.10.1, the certificate of occupancy shall note "In portions of this building planned to be evacuated during flood conditions, occupancy shall be prohibited except for maintenance or emergency personnel."

G106.4.1 Restrictive declaration. [For such] Where dry floodproofed buildings [containing] contain dwelling units, patient care areas (for flood zone purposes) or spaces intended to be used by persons for sleeping purposes, the certificate of occupancy shall also provide notations as required by Section G304.1.2, Item [2.2.5] 2.2. [Where flood shields or other flood control devices are installed, the certificate of occupancy shall also provide notations describing these features.]

G106.5 Letters of map change. Where applicable, the certificate of occupancy shall indicate that “the structure is exempted from the [area of] special flood hazard area pursuant to FEMA Letter of Map Amendment (LOMA) # (_______),” or that “the structure is exempted from the [area of] special flood hazard area pursuant to FEMA Letter of Map Revision Based on Fill (LOMR-F) # (_______),” or that “the structure is exempted from the [area of] special flood hazard area pursuant to FEMA Letter of Map Revision (LOMR) # (_______).”
[SECTION BC G107]
[VARIANCES]

[G107.1 General. The Board of Standards and Appeals shall hear and decide requests for variances from the requirements of this appendix. The Board of Standards and Appeals shall base its determination on technical justifications, and has the right to attach such conditions to variances as it deems necessary to further the purposes and objectives of this appendix.]

[G107.2 Conditions for variance.]

[G107.2.1 Historic structures. The Board of Standards and Appeals is authorized to issue a variance for the repair or rehabilitation of a historic structure provided that:]

1. The application has received approval from the Landmark Preservation Commission and/or the New York State Historical Preservation Office, as applicable;

2. The proposed repair or rehabilitation will not preclude the structure’s continued designation as a historic structure; and

3. The variance is the minimum necessary to preserve the historic character and design of the structure.

[G107.2.2 Floodway restrictions. The Board of Standards and Appeals shall not issue a variance for any proposed development in a floodway if any increase in flood levels would result during the base flood discharge.]

[G107.2.3 General conditions for variance. Except for historic structures as provided for in Section G107.2.1, the Board of Standards and Appeals is authorized to issue a variance only upon:]

1. A determination that the new construction, substantial improvement, or other proposed development is located on a tax lot that, on November 16, 1983, was no more than 1/2 acre (0.2 hectare) in size. However, where the tax lot has been determined to be larger than 1/2 acre (0.2 hectare), the technical justification required for issuing the variance increases with the lot size;

2. Showing of good and sufficient cause;

3. Determination that failure to grant the variance would result in exceptional hardship to the applicant;

4. Determination that the granting of a variance will not result in:

   a. Increased flood heights;

   b. Additional threats to public safety;

   c. Extraordinary public expense;]
[d. Nuisances;]
[e. Fraud on or victimization of the public; or]
[f. Conflict with existing local laws or ordinances; and]

[5. Determination that the variance is the minimum necessary, considering the flood hazard, to afford relief.]

[G107.2.4 Functionally dependent facilities. The Board of Standards and Appeals is authorized to issue a variance for the construction or substantial improvement of a functionally dependent facility provided that:]

[1. The criteria for Sections G107.2.1 through G107.2.3 are met; and]

[2. All methods and materials utilized minimize flood damage during the base flood and create no additional threats to public safety.]

[G107.3 Standards for variance. In reviewing applications for variances, the Board of Standards and Appeals shall consider all technical evaluations, all relevant factors, all other portions of this appendix and the following:]

[1. The danger that materials and debris may be swept onto other lands resulting in injury or damage;]

[2. The danger to life and property due to flooding or erosion damage;]

[3. The susceptibility of the proposed development, including contents, to flood damage and the effect of such damage on current and future owners;]

[4. The importance of the services provided by the proposed development to the community;]

[5. The availability of alternate locations for the proposed development that are not subject to flooding or erosion;]

[6. The relationship of the proposed development to the comprehensive plan and flood plain management program for that area;]

[7. The safety of access to the property in times of flood or ordinary and emergency vehicles;]

[8. The expected heights, velocity, duration, rate of rise and debris and sediment transport of the floodwaters and the effects of wave action, if applicable, expected at the site; and]

[9. The costs of providing governmental services during and after flood conditions including maintenance and repair of public utilities and facilities such as sewer, gas, electrical and water systems, streets and bridges.]

[G107.4 Notification of risks. Upon issuance of a variance, the Executive Director of the Boards of Standards and Appeals shall provide written notice to the owner and the applicant that:]

2112
[1. The issuance of a variance to construct a structure below the base flood level will result in increased premium rates for flood insurance up to amounts as high as twenty-five dollars for each one hundred dollars of insurance coverage; and]

[2. That such construction below the base flood level increases risks to life and property.]

[G107.5 Records. The Board of Standards and Appeals shall:]

[1. Maintain a record of all variance actions, including justification for their issuance; and]

[2. Report such variances issued in its biennial report submitted to the Federal Emergency Management Agency (FEMA).]

SECTION BC G107
PERIODIC, PROGRESS AND SPECIAL INSPECTION REQUIREMENTS

G107.1 General. Periodic, progress and special inspections shall be performed in accordance with this section. All work applications, regardless of the scope of work, shall be subject to the progress and special inspection requirements of Sections G107.2 through G107.4.

G107.2 All work applications other than new buildings, horizontal enlargements and substantial improvements. All work applications other than new buildings, horizontal enlargements and substantial improvements, shall be subject to the following special inspection:

1. Flood zone compliance special inspection. Prior to sign-off of work, a special inspector or special inspection agency shall inspect during the course of construction and certify that: "the structure was constructed" or "alterations were performed," "with methods and practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the New York City Building Code and ASCE 24."

G107.3 New buildings, horizontal enlargements and substantial improvements. All applications for new buildings, horizontal enlargements or substantial improvements shall be subject to the following inspections:

1. Elevation progress inspection. Upon placement of the lowest floor, including the basement (for flood zone purposes), an engineer or licensed professional surveyor shall inspect the site and verify the elevation of such lowest floor. The inspection report verifying the elevation shall be submitted to the department prior to further vertical construction. The commissioner shall be permitted to issue a stop work order if such inspection report is not submitted.

2. Flood zone compliance special inspection. Prior to sign-off of work, a special inspector or special inspection agency shall inspect during the course of construction and certify that: "the structure was constructed" or "alterations were performed," "with methods and practices that minimize flood damage and that are in accordance with approved plans, and with any applicable provisions of Appendix G of the New York City Building Code and ASCE 24."
3. **Final elevation required items.** Prior to the sign-off of the flood zone compliance special inspection, the special inspector or special inspection agency shall verify that the following required items have been submitted to the department, as applicable:

3.1. **Elevation certificate.** The elevation certificate shall be made utilizing FEMA Form 086-0-33 titled, “Elevation Certificate,” and shall be signed by a registered design professional or surveyor.

3.2. **Dry floodproofing certificate.** The dry floodproofing certificate shall be made utilizing FEMA Form 086-0-34 titled, “Floodproofing Certificate,” and shall be signed by a registered design professional.

**G107.4 Flood shield inspection.** Where flood shields or other flood control devices are installed as part of a dry floodproofing system in buildings and structures that are nonresidential (for flood zone purposes), the special inspector or special inspection agency responsible for the flood zone compliance special inspection shall inspect the shields or devices in their stored positions or locations, witness their activation or transportation to their installed positions, and witness their deactivation or transportation back to their stored locations. The special inspector or special inspection agency shall also confirm the installation of signage required by ASCE 24, Section 6.2.3, Item 3.

**G107.5 Periodic inspections of dry floodproofing systems.** Covered buildings, as described in Section 28-324 of the Administrative Code, shall be subject to periodic inspections for dry floodproofing systems in accordance with Sections G107.5.1 and G107.5.2.

G107.5.1 Annual inspection of dry floodproofing system. An inspection of the dry floodproofing system shall be conducted annually in accordance with Section 28-324.2 of the Administrative Code.

G107.5.2 Triennial full scale deployment inspection. A full-scale deployment inspection shall be conducted every three years in accordance with Section 28-324.3 of the Administrative Code.

[CHAPTER G2]
[DEFINITIONS]
SECTION BC G201
DEFINITIONS

G201.1 [General. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein.]

[G201.2] Definitions. This section contains terms defined elsewhere in this code, and terms with definitions that are specific to this appendix.

G201.1.1 Terms defined elsewhere in this code. The following terms are defined in Chapter 2:
500-YEAR FLOOD ELEVATION. [The elevation of the flood having a 0.2 percent chance of being equaled or exceeded in any given year, as specified on FEMA FIRM 360497 or FEMA FIS 360497.]

A-ZONE. [An area of special flood hazard without high velocity wave action. When not shown on the FIRMs, the water surface elevation may be determined from available data by the registered design professional of record in accordance with Section G103.3. See also “Area of special flood hazard.”]

[AREA OF SPECIAL FLOOD HAZARD. The land in the flood plain delineated as subject to a 1 percent or greater chance of flooding in any given year. Such areas are designated on the Flood Insurance Rate Map (FIRM) as A-Zones, Limit of Moderate Wave Action (Coastal A-Zones), or V-Zones. Such areas are also known as the base flood plain or 100-year floodplain. Areas designated as X-Zones shall not be deemed areas of special flood hazard for the purposes of this Appendix.]

BASE FLOOD. [The flood having a 1 percent chance of being equaled or exceeded in any given year.]

BASE FLOOD ELEVATION. [The elevation of the base flood, including wave height, as specified on FEMA FIRMs 360497 or as determined in accordance with Section G103.3. In areas designated as ZONE AO, the base flood elevation shall be the elevation of the highest existing grade of the building’s perimeter plus the depth number (in feet) specified on the flood hazard map.]

BASEMENT (FOR FLOOD ZONE PURPOSES). [The portion of a building having its floor subgrade (below ground level) on all sides.]

BREAKAWAY WALL. [An open lattice wall that is not part of the structural support of the building to which it is attached and that is intended through its design and construction to collapse under specified lateral loading forces without causing damage to the elevated portion of the building or the supporting foundation system.]

COASTAL A-ZONE. [An area within a special flood hazard area, shown on FEMA FIRMs 360497 as an area bounded by a “Limit of Moderate Wave Action,” landward of a V-Zone or landward of an open coast without mapped V-Zones. In a Coastal A-Zone, the principal source of flooding must be astronomical tides, storm surges, seiches, or tsunamis, and not riverine flooding. During the base flood conditions, the potential for breaking wave heights must be greater than or equal to 1 foot, 6 inches (457 mm). In no case shall an area of special flood hazard be deemed a coastal A-Zone unless and until it has been identified as such on the adopted FEMA FIRMs 360497.]

COASTAL HIGH-HAZARD AREA.

DESIGN FLOOD ELEVATION. [The applicable elevation specified in ASCE 24, Tables 2-1, 4-1, 5-1, 6-1, or 7-1, depending on the structural occupancy category designated in ASCE 24, Table 1-1.]
DEVELOPMENT. Any man-made change to improved or unimproved real estate, including but not limited to, buildings or other structures, temporary structures, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations, operations and other land disturbing activities.

EXISTING CONSTRUCTION. See “Pre-FIRM development.”

EXISTING STRUCTURE. See “Pre-FIRM development.”

FLOOD or FLOODING. A general and temporary condition of partial or complete inundation of normally dry land from:

1. The overflow of inland or tidal waters.
2. The unusual and rapid accumulation or runoff of surface waters from any source.

FLOOD-DAMAGE-RESISTANT MATERIALS. Any construction material, including finishes, capable of withstanding direct and prolonged contact with floodwaters without sustaining any damage that requires more than cosmetic repair.

FLOOD HAZARD AREA.

FLOOD INSURANCE RATE MAP (FIRM). The flood official map on which the Federal Emergency Management Agency (FEMA) has delineated areas of special flood hazard, base flood elevations, and the flood boundary and floodways.

FLOOD INSURANCE STUDY (FIS). The official report provided by the Federal Emergency Management Agency (FEMA) containing the Flood Insurance Rate Map (FIRM), the water surface elevation of the base flood and supporting technical data.

FLOODPROOFING, DRY. For buildings and structures that are nonresidential (for flood zone purposes), a combination of design modifications that results in the building’s or structure’s being water tight to the design flood elevation, including the attendant utility and sanitary facilities, with walls substantially impermeable to the passage of water and with structural components having the capacity to resist loads as identified in ASCE 7.

FLOODPROOFING, WET. A floodproofing method designed to permit parts of the structure below the design flood elevation that are used for parking, storage, building access, or crawl space to intentionally flood, by equalizing hydrostatic pressures and by relying on the use of flood damage-resistant materials and construction techniques.

FLOODWAY. The channel of the river, creek or other watercourse and the adjacent land areas that must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height. Floodways are mapped only in the Boroughs of the Bronx and Staten Island.

FUNCTIONALLY DEPENDENT FACILITY. A facility that cannot be used for its intended purpose unless it is located or carried out in close proximity to water, such as a
docking or port facility necessary for the loading or unloading of cargo or passengers, shipbuilding or ship repair. The term does not include long-term storage, manufacture, sales or service facilities.

[HISTORIC STRUCTURE. A pre-FIRM building or structure:]

[1. Designated as a landmark or located within an historic district designated by the New York City Landmarks Preservation Commission;]

[2. Listed or preliminarily determined to be eligible for listing in the National or State Register of Historic Places; or]

[3. Determined by the Secretary of the U.S. Department of the Interior or the New York State Department of Parks and Recreation as contributing to the historical significance of a registered historic district or a district preliminarily determined to qualify as an historic district.]

[LETTER OF MAP AMENDMENT (LOMA). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from areas of special flood hazard, resulting from a demonstration that the pre-FIRM ground elevations are at or above the base flood elevation.]

[LETTER OF MAP REVISION BASED ON FILL (LOMR-F). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from areas of special flood hazard, resulting from the post-FIRM placement of compacted fill, such that the new ground elevation is at or above the base flood elevation.]

[LETTER OF MAP REVISION (LOMR). An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing or adding structures or tax lots or portions of tax lots from areas of special flood hazard, which generally results from physical measures implemented that affect the hydrologic or hydraulic characteristics of a flooding source and thus result in the modification of the existing regulatory floodway, the effective base flood elevations, or the special flood hazard area.]

LOWEST FLOOR. [The lowest floor of the lowest enclosed area, including crawl spaces and basements (for flood zone purposes). The lowest floor shall not include any wet floodproofed spaces usable solely for vehicle parking, building access, storage or crawl space, provided that such enclosure is not built so as to render the structure in violation of this appendix, including that:]

[1. Such enclosure shall allow for the automatic entry and exit of floodwaters;]

[2. Such enclosure shall be constructed solely of flood-resistant materials and finishes;]

[3. Such enclosure shall have a floor elevation equal to or higher than the outside adjacent grade on at least one side; and]
[4. Such outside adjacent grade shall slope down, towards the source of flooding, providing positive drainage by gravity, thus preventing accumulations of water under or in the structure after the floodwaters recede without the use of pumps, pipes or drains.]

[MANUFACTURED HOME. A structure that is transportable in one or more sections, built on a permanent chassis, designed for use with or without a permanent foundation when attached to the required utilities, and constructed to the Federal Mobile Home Construction and Safety Standards and rules and regulations promulgated by the U.S. Department of Housing and Urban Development. The term also includes mobile homes, park trailers, travel trailers and similar transportable structures that are placed on a site for 180 consecutive days or longer.]

[MANUFACTURED HOME PARK OR SUBDIVISION. A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.]

[MARKET VALUE OF STRUCTURE. The price that a buyer is willing, but is not under any duty, to pay for a particular structure to an owner who is willing, but not obligated, to sell, exclusive of the value of the land, or of other buildings or structures on the same tax lot. The market value of a structure shall be determined in accordance with rules promulgated by the commissioner.]

NATIONAL GEODETIC VERTICAL DATUM (NGVD). [The national vertical datum standard established in 1929; used as a reference for establishing elevations within a flood plain.]

[NEW CONSTRUCTION. See “Post-FIRM development.”]

NONRESIDENTIAL (FOR FLOOD ZONE PURPOSES). [A building or structure that either:]

[1. Contains no space classified in Group I-1, R-1, R-2, or R-3, and contains no space that is accessory, as such term is defined in the New York City Zoning Resolution, to any Group I-1, R-1, R-2, or R-3 occupancy; or]

[2. Contains such space(s), but also contains space on the lowest floor that is not accessory, as such term is defined in the New York City Zoning Resolution, to a Group I-1, R-1, R-2, or R-3 occupancy.]

NORTH AMERICAN VERTICAL DATUM (NAVD). [The national vertical datum standard established in 1988, used as a reference for establishing elevations within a flood plain.]

PATIENT CARE AREA (FOR FLOOD ZONE PURPOSES). [Any space meeting the following conditions:]

[1. The space is located within a building or structure, or portion thereof, that is classified in Group I-2; and]
The space is primarily used for the provision of medical services to persons, including, but not limited to, consultation, evaluation, monitoring and treatment services.

Exceptions: The following spaces shall not be considered patient care areas (for flood zone purposes):

1. "Emergency rooms or departments" as defined in 10 NYCRR 700.2(a)(2) and

2. Spaces primarily used for the provision of medical services identified in 10 NYCRR 703.6(c)(2)(i).

[PRE-FIRM DEVELOPMENT. Any development:]

1. Completed prior to November 16, 1983;

2. Under construction on November 16, 1983 provided that the start of construction was prior to said date; or

3. Completed on or after November 16, 1983 but that:

   3.1. Was not located within an area of special flood hazard at the start of construction; and

   3.2. Is now located within an area of special flood hazard as a result of a subsequent change to the FIRM.

[PRE-FIRM STRUCTURE. See “Pre-FIRM development.”]

[POST-FIRM DEVELOPMENT. Any development that is not pre-FIRM development.]

[POST-FIRM STRUCTURE. See “Post-FIRM development.”]

[RECREATIONAL VEHICLE. A vehicle that is built on a single chassis, 400 square feet (37.16 m²) or less when measured at the largest horizontal projection, designed to be self-propelled or permanently towable by a light duty truck, and designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel or seasonal use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect type utilities and security devices and has no permanently attached additions.]

RESIDENTIAL (FOR FLOOD ZONE PURPOSES). [A building or structure containing any space that is either:

1. Classified in Group I-1, R-1, R-2, or R-3; or

2. Accessory, as such term is defined in the New York City Zoning Resolution, to any Group I-1, R-1, R-2, or R-3 occupancy.]
Exception: Such a building or structure shall be considered nonresidential (for flood zone purposes) when also containing space on the lowest floor that is not accessory, as such term is defined in the New York City Zoning Resolution, to a Group I-1, R-1, R-2, or R-3 occupancy.

SAND DUNES. [Naturally occurring accumulations of sand in ridges or mounds landward of a beach.]

SHADED X-ZONE. [The land in the floodplain delineated as subject to a 0.2 percent or greater chance of flooding, but less than one percent chance of flooding, in any given year. Such areas are designated on the Flood Insurance Rate Map (FIRM) as shaded X-Zones.]

SPECIAL FLOOD HAZARD AREA. [See “Area of special flood hazard.”]

START OF CONSTRUCTION. The date of permit issuance for: (i) post-FIRM developments; (ii) substantial improvements to pre-FIRM structures; and (iii) those pre-FIRM developments that, at the time of permit issuance, were not within an area of special flood hazard but that, prior to completion, were within an area of special flood hazard as a result of map change, provided the actual commencement of construction, repair, reconstruction, rehabilitation, addition, placement or other improvement is within 180 days after the date of permit issuance and such construction activity is not thereafter suspended or abandoned for 180 days or more. For the purposes of this definition:

1. The actual commencement of construction means the first placement of permanent construction of a building (including a manufactured home or prefabricated building) on a site, such as the pouring of a slab or footings, installation of pilings or construction of columns.

2. Permanent construction does not include land preparation (such as clearing, excavation, grading or filling), the installation of streets or walkways, excavation for abasement (for flood zone purposes), footings, piers or foundations, the erection of temporary forms or the installation of accessory buildings such as garages or sheds not occupied as dwelling units or not part of the main building.

3. For a substantial improvement, the actual commencement of construction means the first alteration of any wall, ceiling, floor or other structural part of a building, regardless of whether that alteration affects the external dimensions of the building.

SUBSTANTIAL DAMAGE. [Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure before the damage occurred.]

SUBSTANTIAL IMPROVEMENT. [Any repair, reconstruction, rehabilitation, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, any repairs are considered substantial improvement regardless of the actual repair work performed. The term does not, however, include either.]
[1. Any project for improvement of a building required to correct pre-FIRM health, sanitary or safety code violations identified by the commissioner, the Fire Commissioner, the Commissioner of Housing Preservation and Development, or the Commissioner of Health and Mental Hygiene, and that are the minimum necessary to assure safe living conditions; or]

[2. Any alteration of a historic structure provided that the alteration will not preclude the structure’s continued designation as a historic structure.]

[VARIANCE. A grant of relief from the requirements of this appendix, which permits construction in a manner otherwise prohibited by this appendix.]

V-ZONE. [An area of special flood hazard subject to high-velocity wave action.]

G201.1.2 Definitions specific to this appendix. The following words and terms shall, for the purposes of this appendix, have the meanings shown herein:

DEVELOPMENT. Any man-made change to improved or unimproved real estate, including but not limited to, buildings or other structures, temporary structures, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations or drilling operations and other land-disturbing activities.

EXISTING CONSTRUCTION. See “Pre-FIRM development.”

EXISTING STRUCTURE. See “Pre-FIRM development.”

FLOOD DESIGN CLASS. A classification of buildings and other structures for determination of flood loads and conditions, and determination of minimum elevation requirements on the basis of risk associated with unacceptable performance.

FUNCTIONALLY DEPENDENT FACILITY. A facility that cannot be used for its intended purpose unless it is located or carried out in close proximity to water. The term includes only docking facilities, port facilities that are necessary for loading and unloading of cargo or passengers and shipbuilding and ship repair facilities, but does not include long-term storage or related manufacturing, sales or service facilities.

HISTORIC STRUCTURE. Any structure that meets one of the following criteria:

1. Listed individually in the National Register of Historic Places;

2. Certified by the Secretary of the U.S. Department of the Interior as meeting the requirements for individual listing in the National Register;

3. Certified or preliminarily determined by the Secretary of the U.S. Department of the Interior to be contributing to the historical significance of a registered historic district or a district preliminarily determined by the Secretary of the U.S. Department of the Interior to qualify as a registered historic district:
4. Individually listed or preliminarily determined to be eligible for listing in the New York State Register of Historic Places; or

5. Individually listed as a landmark by the NYC Landmarks Preservation Commission. Location within a historic district does not alone qualify as being an individually listed landmark.

**LETTER OF MAP AMENDMENT (LOMA).** An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from special flood hazard areas, resulting from a demonstration that the pre-FIRM ground elevations are at or above the base flood elevation.

**LETTER OF MAP REVISION BASED ON FILL (LOMR-F).** An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing structures or tax lots or portions of tax lots from special flood hazard areas, resulting from the post-FIRM placement of compacted fill, such that the new ground elevation is at or above the base flood elevation.

**LETTER OF MAP REVISION (LOMR).** An official amendment to the FIRM, issued and approved by the Federal Emergency Management Agency (FEMA), removing or adding structures or tax lots or portions of tax lots from special flood hazard areas, which generally results from physical measures implemented that affect the hydrologic or hydraulic characteristics of a flooding source and thus result in the modification of the existing regulatory floodway, the effective base flood elevations, or the special flood hazard area.

**MANUFACTURED HOME.** A structure that is transportable in one or more sections, built on a permanent chassis, designed for use with or without a permanent foundation when attached to the required utilities, and constructed to the Federal Mobile Home Construction and Safety Standards and rules and regulations promulgated by the U.S. Department of Housing and Urban Development. The term also includes mobile homes, park trailers, travel trailers and similar transportable structures that are placed on a site for 180 consecutive days or longer.

**MANUFACTURED HOME PARK OR SUBDIVISION.** A parcel (or contiguous parcels) of land divided into two or more manufactured home lots for rent or sale.

**MARKET VALUE OF STRUCTURE.** The price that a buyer is willing, but is not under any duty, to pay for a particular structure to an owner who is willing, but not obligated, to sell, exclusive of the value of the land, or of other buildings or structures on the same tax lot. The market value of a structure shall be determined in accordance with rules promulgated by the commissioner.

**NEW CONSTRUCTION.** See “Post-FIRM development.”

**POST-FIRM DEVELOPMENT.** Any development that is not pre-FIRM development.

**POST-FIRM STRUCTURE.** See "Post-FIRM development."
**PRE-FIRM DEVELOPMENT.** Any development:

1. Completed prior to November 16, 1983;

2. Under construction on November 16, 1983, provided that the start of construction was prior to said date; or

3. Completed on or after November 16, 1983, but that:
   3.1. Was not located within a special flood hazard area at the start of construction; and
   3.2. Is now located within a special flood hazard area as a result of a subsequent change to the FIRM.

**PRE-FIRM STRUCTURE.** See "Pre-FIRM development."

**RECREATIONAL VEHICLE.** A vehicle that is built on a single chassis, 400 square feet (37.16 m²) or less when measured at the largest horizontal projection, designed to be self-propelled or permanently towable by a light-duty truck, and designed primarily not for use as a permanent dwelling but as temporary living quarters for recreational, camping, travel or seasonal use. A recreational vehicle is ready for highway use if it is on its wheels or jacking system, is attached to the site only by quick disconnect-type utilities and security devices and has no permanently attached additions.

**START OF CONSTRUCTION.** The date of permit issuance for: (i) post-FIRM developments; (ii) substantial improvements to pre-FIRM structures; and (iii) those pre-FIRM developments that, at the time of permit issuance, were not within a special flood hazard area but that, prior to completion, were within a special flood hazard area as a result of map change; provided the actual commencement of construction, repair, reconstruction, rehabilitation, addition, placement or other improvement is within 180 days after the date of permit issuance and such construction activity is not thereafter suspended or abandoned for 180 days or more.

For the purposes of this definition:

1. The actual commencement of construction means the first placement of permanent construction of a building (including a manufactured home or prefabricated building) on a site, such as the pouring of a slab or footings, installation of pilings or construction of columns.

2. Permanent construction does not include land preparation (such as clearing, excavation, grading or filling), the installation of streets or walkways, excavation for a basement (for flood zone purposes), footings, piers or foundations, the erection of temporary forms or the installation of accessory buildings such as garages or sheds not occupied as dwelling units or not part of the main building.

3. For a substantial improvement, the actual commencement of construction means the first alteration of any wall, ceiling, floor or other structural part of a building, regardless of whether that alteration affects the external dimensions of the building.
VARIANCE. A grant of relief from the requirements of this appendix, which permits construction in a manner otherwise prohibited by this appendix.

[CHAPTER G3]  
[CONSTRUCTION STANDARDS]  

SECTION BC G301  
[GENERAL] CONSTRUCTION STANDARDS  

G301.1 All developments. To the extent required by Section G102.1, all developments, including but not limited to utility installation, site improvements, placement of prefabricated buildings and manufactured homes, new building construction, alterations and repairs, shall be designed and constructed to resist the effects of flood hazards and flood loads in accordance with this appendix and ASCE 24.

G301.1.1 Multiple flood zones. For a structure that is located in more than one zone (for instance both an A-Zone and an X-Zone, or both an A-Zone and a V-Zone), the provisions associated with the most restrictive [area of special flood hazard] zone shall apply to the entire structure.

G301.2 Design requirements and load combinations. Any construction [within the scope of subject to the requirements of Section G102.1] located in a special flood hazard area, shall be designed and constructed to resist the loads and load combinations specified in Chapter 16.

SECTION BC G302  
SUBDIVISIONS  

G302.1 General. Any subdivision proposal, including proposals for manufactured home parks and subdivisions, or other proposed new development within [an area of] a special flood hazard area shall [demonstrate that] be reviewed to verify all of the following:

1. All such proposals are consistent with the need to minimize flood damage[.]
2. All public utilities and facilities, such as sewer, gas, electric and water systems, are located and constructed to minimize or eliminate flood damage[.]
3. Adequate drainage is provided to reduce exposure to flood hazards.

G302.2 Subdivision requirements. The following requirements shall apply [to] in the case of any proposed subdivision, including proposals for manufactured home parks and subdivisions, any portion of which lies within [an area of] a special flood hazard area:

1. The [area of] special flood hazard area, including floodways [and V-Zones], coastal high-hazard areas and coastal A-Zones, as appropriate, shall be delineated on tentative and final subdivision plats[.]
2. Base flood elevations shall be shown on tentative and final subdivision plats[.]
3. Building lots shall be provided with adequate buildable area, in accordance with the New York City Zoning Resolution, outside the floodway.

4. The design criteria for utilities and facilities set forth in this appendix and appropriate New York City Construction Codes shall be met.

**SECTION BC G303**

**SITE IMPROVEMENT**

**G303.1 Development in floodways.** Development or land-disturbing activity shall not be authorized in the floodway unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practice, and prepared by a registered design professional, that the proposed encroachment will not result in any increase in the base flood level, in accordance with Section G103.5.

**G303.2 Coastal high-hazard areas and coastal A-Zones.** In coastal high-hazard areas and coastal A-Zones:

1. New buildings, not including substantial improvements, shall only be authorized landward of the reach of mean high tide.

2. The use of fill for structural support of buildings is prohibited.

**G303.3 Sewer facilities.** All new or replaced sanitary sewer facilities, private sewage treatment plants (including all pumping stations and collector systems) and on-site waste disposal systems shall be designed in accordance with Chapter 7, ASCE 24, to minimize or eliminate infiltration of floodwaters into the facilities and discharge from the facilities into floodwaters, or impairment of the facilities and systems.

**G303.4 Water facilities.** All new or replacement water facilities shall be designed in accordance with the provisions of Chapter 7, ASCE 24, to minimize or eliminate infiltration of floodwaters into the systems.

**G303.5 Storm drainage.** Storm drainage shall be designed to convey the flow of surface waters to minimize or eliminate damage to persons or property and shall meet the requirements of ASCE 24.

**G303.6 Streets and sidewalks.** Streets and sidewalks shall be designed to minimize potential for increasing or aggravating flood levels and shall meet the requirements of Section G303.7.

**G303.7 Retaining walls and driveways.** Retaining walls shall be designed in accordance with Section 1807. Retaining walls and driveways shall meet the requirements of Section G303.8.

**G303.8 Grading and fill.** In areas of special flood hazard areas, grading and/or fill shall not be approved:
1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of flood water and, as applicable, wave action, in accordance with ASCE 24 and Section 1804 of this code.

2. In floodways, unless it has been demonstrated through hydrologic and hydraulic analyses performed by an engineer in accordance with standard engineering practice that the proposed grading or fill, or both will not result in any increase in the flood levels during the occurrence of the design flood, in accordance with Section G103.5.

3. In coastal A-Zones and [V-Zones] coastal high-hazard areas, unless such fill is conducted and or placed to avoid diversion of water and waves towards any building or structure.

SECTION BC G304
POST-FIRM CONSTRUCTION, HORIZONTAL ENLARGEMENTS AND SUBSTANTIAL IMPROVEMENTS

G304.1 A-Zone construction standards. In addition to the requirements of ASCE 24, the following standards shall apply to post-FIRM construction, horizontal enlargements and substantial improvements located within A-Zones, other than Coastal A-Zones.

G304.1.1 Residential. For buildings or structures that are residential (for flood zone purposes), all post-FIRM new buildings, horizontal enlargements and substantial improvements shall comply with the applicable requirements [in Chapter G3] of this [code] appendix and ASCE 24, and shall be elevated as follows:

1. **Lowest floor.** The lowest floor, including the basement (for flood zone purposes), shall be elevated to [at] or above the design flood elevation specified in ASCE 24, Table 2-1;

2. **Enclosures below the design flood elevation.** Enclosed spaces below the design flood elevation specified in ASCE 24, Table 2-1, shall be useable solely for parking of vehicles, building access, storage, or crawlspace, and shall be wet floodproofed in accordance with ASCE 24. Breakaway walls are not required in A-Zones;

   2.1. A restrictive declaration noting the above restriction shall be filed with the City Register or County Clerk, and the City Register File Number (CRFN) shall be identified in the permit application and on the certificate of occupancy.

3. **Under-floor spaces.** The finished ground level of an under-floor space, such as a crawl space, shall be equal to or higher than the outside finished ground level on at least one side;

4. **Materials.** Only flood-damage-resistant materials and finishes shall be utilized below the design flood elevation specified in ASCE 24, Table 5-1;

5. **Utilities and equipment.** Utilities and attendant equipment shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, or with the exception of the items below, shall be constructed so as to prevent water from entering
or accumulating within the components during conditions of flooding in accordance with ASCE 24[1].

5.1. Fire protection systems and equipment. The following fire protection systems and equipment shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, except that where the system or equipment or portion thereof serves only spaces located below such design flood elevation, the system or equipment or portion thereof may be located below such design flood elevation:

5.1.1. Sprinkler control valves that are not outside stem and yoke valves;

5.1.2. Fire standpipe control valves that are not outside stem and yoke valves;

5.1.3. Sprinkler booster pumps and fire pumps;

5.1.4. Dry pipe valve-related electrically operated alarm appurtenances;

5.1.5. Alarm control panels for water and non-water fire extinguishing systems;

5.1.6. Alarm control panels for sprinkler systems, pre-action sprinkler systems, deluge sprinkler systems, and combined dry pipe and pre-action sprinkler systems;

5.1.7. Electrically operated waterflow detection devices serving sprinkler systems; and

5.1.8. Air compressors serving sprinkler systems and pre-action sprinkler systems.

5.2. Fire alarm systems and components. Where a zoning indicator panel is provided at the main building entrance in accordance with Section 907.6.3.1 of this code and such panel is located at or below 5 feet (1524 mm) above the design flood elevation specified in ASCE 24, Table 7-1, at least one secondary zoning indicator panel complying with the following requirements shall be provided:

5.2.1. The secondary zoning indicator panel, associated controls, power supplies and means of transferring control shall be provided at least 5 feet (1524 mm) above the design flood elevation specified in ASCE 24, Table 7-1, in a location accessible to responding Fire Department personnel and approved by the department and the Fire Department; and

5.2.2. Where the secondary zoning indicator panel or associated controls are only operable upon transfer of control from another zoning indicator panel, such transfer shall be by a means that is approved by the Fire Department.
5.3. Fuel-oil piping systems. The following requirements shall apply to fuel-oil piping systems, as defined by Section 202 of the New York City Mechanical Code:

5.3.1. Fill piping that does not terminate in a watertight terminal approved by the department shall terminate at least 3 feet (914 mm) above the design flood elevation specified in ASCE 24, Table 7-1; and

5.3.2. Normal vent piping and emergency vent piping shall terminate at least 3 feet (914 mm) above the design flood elevation specified in ASCE 24, Table 7-1.

5.4. Plumbing systems and components. The structure shall comply with the following requirements:

5.4.1. Relief vents and fresh air intakes. Relief vents and fresh air intakes serving building traps in accordance with Section 1002.6 of the New York City Plumbing Code shall be carried above grade and shall terminate in a screened outlet that is located outside of the building and at or above the design flood elevation specified in ASCE 24, Table 7-1; and

5.4.2. Reduced pressure zone backflow preventers.

5.4.2.1. Primary reduced pressure principle backflow preventers complying with the requirements of the Department of Environmental Protection shall be located at or above the design flood elevation specified in ASCE 24, Table 7.1.

5.4.2.2. Secondary reduced pressure principle backflow preventers complying with Section 608.13.2 of the New York City Plumbing Code and backflow preventers with intermediate atmospheric vents complying with Section 608.13.3 of the New York City Plumbing Code shall be located at or above the design flood elevation specified in ASCE 24, Table 7.1.

5.4.3. Relief vents for gas service, equipment, and appliance pressure regulators. Relief vents for gas service, equipment, and appliance pressure regulators complying with the New York City Fuel Gas Code shall be located at or above the design flood elevation specified in ASCE 24, Table 7.1.

6. Certifications. Applications shall contain applicable certifications in accordance with Section G104.5; and

G304.1.2 Nonresidential. For buildings or structures that are nonresidential (for flood zone purposes), all post-FIRM new buildings, horizontal enlargements and substantial
improvements shall comply with the applicable requirements [in Chapter G3 of this code] appendix and ASCE 24, and shall comply with either of the following:

1. **Elevation option.** The structure shall comply with Items 1 through [6] 7 of Section G304.1.1; or

2. **Dry floodproofing option.** The structure shall comply with the following:

   2.1. Elevation of dry floodproofing. The structure shall be dry floodproofed to [at] or above the design flood elevation specified in ASCE 24, Table 6-1;

   2.2. Dwelling units, patient care areas (for flood zone purposes) and sleeping [spaces] areas. Where dwelling units, patient care areas (for flood zone purposes) or spaces intended to be used by persons for sleeping purposes are located in a building utilizing the dry floodproofing option, the following additional requirements shall be met:

      2.2.1. All rooms and spaces within dwelling units, patient care areas (for flood zone purposes) and all spaces intended to be used by persons for sleeping purposes shall be located at or above the design flood elevation;

      2.2.2. A restrictive declaration noting the above restriction shall be filed with the City Register or County Clerk, and the City Register File Number (CRFN) shall be identified in the permit application and on the certificate of occupancy.

2.3. Utilities and equipment. Utilities and attendant equipment shall be located within the dry floodproofed enclosure, or may be located outside the dry floodproofed enclosure provided that they are located at or above the design flood elevation specified in ASCE 24, Table 7-1, or are constructed so as to prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24.

   2.3.1. Additional requirements. [The structure shall comply with] Notwithstanding the above, utilities and attendant equipment, listed in Items 5.1 through 5.4 of Section G304.1.1, shall not be located in dry floodproofed enclosures and shall be elevated in accordance with Section G304.1.1.

2.4. Fire department connections. Dry floodproofing measures including temporary shields, stairs and ramps shall be located and arranged so as to allow hose lines to be attached to the inlets of fire department connections without interference in accordance with Section 6.4.5 of NFPA 14, as modified by Appendix Q of this code.

2.5. Certifications. Applications shall contain applicable certifications in accordance with Section [G104.5] G104.2.3; and
2.5.2.6. Special inspections. Special inspections shall be as required by Section G105 and G107.

G304.2 [V–Zone] Coastal high-hazard area construction standards. In addition to the requirements of ASCE 24, the following standards shall apply to post-FIRM construction, horizontal enlargements and substantial improvements located within [V–Zones] coastal high-hazard areas.

1. **Foundation.** The lowest floor shall be elevated on adequately anchored pilings or columns and securely anchored to such piles or columns to prevent [floatation] flotation, collapse and lateral movement resulting from wind and flood loads acting simultaneously on all building components, and other load requirements of Chapter 16 and this appendix.

2. **Lowest horizontal member.** The lowest portion of the lowest horizontal structural member of the lowest floor (excluding the pilings or columns) shall be at or above the design flood elevation specified in ASCE 24, Table 4-1.

3. **Below the lowest horizontal member.** Spaces below the lowest horizontal member shall be either:

   3.1. Free of obstructions; or

   3.2. Enclosed with breakaway walls providing unconditioned space useable solely for parking of vehicles, building access, storage or crawl space. Such breakaway walls shall:

      3.2.1. Be of an open lattice type construction only;

      3.2.2. Meet the load requirements of Section 5.3.3 of ASCE 7; and

      3.2.3. Meet the additional requirements of ASCE 24.

4. **Materials.** Only flood-damage-resistant materials and finishes shall be utilized below the design flood elevation specified in ASCE 24, Table 5-1;

5. **Utilities and equipment.** Utilities and attendant equipment shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, or shall be constructed so as to both resist the wave action and prevent water from entering or accumulating within the components during conditions of flooding in accordance with ASCE 24;

   [5-4] 5.1. Additional requirements. The structure shall comply with Items 5.1 through 5.4 of Section G304.1.1.

6. **Prohibitions.** The following shall be prohibited in [V–Zones] coastal high-hazard areas:

   6.1. Development, including land-disturbing activities, seaward of the reach of mean high tide;
6.2. Use of fill for structural support of buildings; and

6.3. Man-made alterations of sand dunes that would increase potential damage to buildings.

7. **Certifications.** Applications shall contain applicable certifications in accordance with Section [G104.5] G104.2.3; and

8. **Special inspections.** Special inspections shall be as required by Section [G105] G107.

**G304.3 Coastal A-Zone construction standards.** In addition to the requirements of ASCE 24, all post-FIRM new buildings, horizontal enlargements and substantial improvements in a Coastal A-Zone shall comply with the [V-Zone] coastal high-hazard area construction standards of Section G304.2.

**Exceptions:** The following structural systems shall be permitted in a Coastal A-Zone:

1. **Wave-resisting stem wall foundation.** Stem walls supporting a floor system above, and backfilled with soil or gravel to the underside of the floor system, shall be permitted in Coastal A-Zones. The design and construction of the shallow foundation system shall comply with the following:

   1.1. The underside of such floor system shall be located at or above the design flood elevation specified in ASCE 24, Table 4-1.

   1.2. Stem walls enclosing areas below the design flood elevation shall not be permitted. Stem walls shall be designed to transfer all vertical and lateral forces to the slab above and to the foundation elements below;

   1.3. The design shall consider all forces resulting from flooding, including wave action, debris impact, erosion, and local scour;

   1.4. The design shall consider all forces resulting from soil pressure behind the walls, including the effect of hydrostatic loads, and all live and dead surcharge loads from the slab above;

   1.5. Flood openings shall not be required in stem walls constructed in accordance with this section;

   1.6. Where soils are susceptible to erosion and local scour, stem walls shall be supported by deep footings;

   1.7. Shallow foundations including spread footing, mat and raft foundations shall be designed to prevent sliding, uplift, or overturning when exposed to the combination of loads in ASCE 24, Section 1.6.2.

2. **Wave-resisting dry floodproofing wall and foundation system.** Buildings that are nonresidential (for flood zone purposes) and that are located in Coastal A-Zones shall
be permitted to be dry floodproofed in accordance with Section G304.1.2 [provided
the structure is]. Such structure shall be dry floodproofed to [at] or above the design
flood elevation specified in ASCE 24, Table 6-1. [For buildings or structures utilizing
this exception, construction documents] Flood zone compliance plans shall include
calculations demonstrating that the foundation and building, including flood shields
if provided, will resist the wave action, including the combination of loads in ASCE
24, Section 1.6, to at or above the design flood elevation [specified in ASCE 24, Table
4-1].

G304.4 Construction standards for shaded X-Zones. In shaded X-Zones, [buildings that
include I-2 occupancies that are hospitals] flood design class 4 buildings, as defined in ASCE 24,
Table 1-1, shall comply with the requirements of this [chapter] appendix and the applicable
provisions of ASCE 24 for A-Zone construction.

G304.4.1 Alterations to certain flood design class 4 buildings. Where existing emergency
vehicle garages and fire, rescue, ambulance, and police stations located within shaded
X-Zones are undergoing either a substantial improvement or an increase in the degree
of noncompliance as such term is described in Item 10 of Section G102.1, they shall
comply with this appendix to the maximum extent practicable as described in Sections
G304.4.1.1 through G304.4.1.4.

G304.4.1.1 Existing emergency vehicle garages and fire, rescue, ambulance, and
police stations to remain. Where an existing emergency vehicle garage or fire,
rescue, ambulance, or police station building is undergoing substantial improvement
or an increase in the degree of noncompliance, such existing emergency vehicle
storage area shall be permitted to be located below the design flood elevation,
provided such space is wet floodproofed in accordance with ASCE 24 and an
emergency action plan is filed with the department in accordance with ASCE 24,
Section 6.2.3. Such emergency action plan shall include actionable directives for
the relocation of such emergency vehicles in advance of a flood event.

G304.4.1.2 Equipment within existing emergency vehicle garages and fire,
rescue, ambulance, and police stations. Where an existing emergency vehicle
garage or fire, rescue, ambulance, or police station building is undergoing
substantial improvement or an increase in the degree of noncompliance, equipment
necessary to support operations of such facilities may be located below the design
flood elevation where elevation of such equipment to the design flood elevation is
physically unfeasible. Such equipment shall be elevated to the maximum extent
practicable.

G304.4.1.3 Conversion of space below the design flood elevation. Conversion of
existing nonoccupiable space to occupiable space without such space being in full
compliance with this appendix shall be prohibited.

G304.4.1.4 Subgrade spaces to remain. Where an existing emergency vehicle
garage or fire, rescue, ambulance, or police station building is undergoing
substantial improvement or an increase in the degree of noncompliance, the existing
Subgrade space shall be provided with a sump pump system, designed to be fully submerged and remain operational post-flood-event to remove flood waters after a storm surge has receded. Such pump system shall be designed with the pump controller located above the design flood elevation and all electrical wiring below the design flood elevation shall be listed and marked for use with a submersible pump. The pump system shall be connected to a standby power source, which shall be elevated above the design flood elevation.

G304.5 Additional construction standards with respect to connections for temporary external generators, boilers and chillers. In addition to the other requirements of this [chapter] appendix, connections for temporary external generators, boilers and chillers shall be provided in accordance with Sections G304.5.1 through G304.5.4.

G304.5.1 Group I-1 and adult homes, enriched housing, community residences and intermediate care facilities. An occupancy that is classified as Group I-1, or that is an adult home, enriched housing, community residence or intermediate care facility and classified as Group R pursuant to an exception to Section [308.2.1 or 308.2.2] 308.3.1 or 308.3.2, shall comply with the following requirements:

1. Connections for temporary external generators. Electrical connections shall be provided allowing for the connection of temporary external generators capable of providing power for at least 72 hours for, at a minimum, the following systems:
   1.1. Exit signs and means of egress illumination required by Chapter 10 and serving such occupancy;
   1.2. Fire alarm systems serving such occupancy;
   1.3. For buildings having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, at least one elevator that serves all floors; and
   1.4. Lighting in such occupancy, sufficient to maintain illumination in accordance with Section 1205.3, for (i) spaces primarily used for the provision of medical services to persons, including, but not limited to, consultation, evaluation, monitoring and treatment services and (ii) spaces intended to be used by persons for sleeping purposes.

Exception: Connections for temporary external generators shall not be required for buildings with emergency or standby power systems that are permanently installed above the design flood elevation specified in Table 7-1 of ASCE 24 and capable of providing power for at least 72 hours to the systems identified in Item 1 of Section G304.5.1. Natural gas shall be a permitted fuel supply.

2. Flood protection for temporary external generator connections. Electrical connections installed in accordance with Item 1 of Section G304.5.1 shall be located at or above the design flood elevation specified in Table 7-1 of ASCE 24.
3. **Emergency connection plan.** Prior to sign-off of work by the department, a plan shall be submitted to the department that identifies how the temporary external generators will be connected and capable of providing power for the occupancy in accordance with Item 1 of Section G304.5.1 within 72 hours after failure of the normal power supply.

**G304.5.2 Group I-2 hospitals.** An occupancy that is a Group I-2 hospital shall comply with the following requirements:

1. **Connections for temporary external generators.** Electrical connections shall be provided allowing for the connection of temporary external generators capable of providing power for at least 72 hours for, at a minimum, the following systems:

   1.1. All electrical services serving such occupancy for which emergency or standby power must be provided in accordance with any other applicable local, state or federal law or rule; and

   1.2. Air conditioning and cooling systems serving such occupancy, sufficient to maintain temperature and humidity in accordance with Section 1204, for (i) spaces primarily used for the provision of medical services to persons, including, but not limited to, consultation, evaluation, monitoring and treatment services and (ii) spaces intended to be used by persons for sleeping purposes.

   **Exception:** Connections for temporary external generators shall not be required for buildings that have emergency or standby power systems that are permanently installed above the design flood elevation specified in Table 7-1 of ASCE 24 and capable of providing power for at least 72 hours to the systems identified in Item 1 of Section G304.5.2. Natural gas shall be a permitted fuel supply.

2. **Connections for temporary external boilers and chillers.** Where boiler and chiller plants are located below the design flood elevation specified in Table 7-1 of ASCE 24 and serve (i) spaces primarily used for the provision of medical services to persons, including, but not limited to, consultation, evaluation, monitoring and treatment services or (ii) spaces intended to be used by persons for sleeping purposes, connections shall be provided to allow for the connection of temporary external boilers and chillers capable of maintaining temperature and humidity for such spaces in accordance with Section 1204 for at least 72 hours.

3. **Flood protection for temporary external generator, boiler and chiller connections.** Electrical connections installed in accordance with Item 1 of Section G304.5.2 and connections installed in accordance with Item 2 of Section G304.5.2 shall be located at or above the design flood elevation specified in Table 7-1 of ASCE 24.

4. **Emergency connection plan.** Prior to sign-off of work by the department, the following shall be submitted to the department:
4.1. For an occupancy required to comply with Item 1 of Section G304.5.2, a plan that identifies how the temporary external generators will be connected and capable of providing power for the occupancy in accordance with such item within 72 hours after failure of the normal power supply; and

4.2. For an occupancy required to comply with Item 2 of Section G304.5.2, a plan that identifies how the temporary external boilers and chillers will be connected and capable of maintaining temperature and humidity for specified spaces in accordance with Section 1204 within 72 hours after failure of the primary boiler and chiller plants.

G304.5.3 Group I-2 nursing homes. An occupancy that is a Group I-2 nursing home shall comply with Section G304.5.2.

Exception: Such occupancy is not required to comply with Items 1.2, 2 and 4.2 of Section G304.5.2.

G304.5.4 Group I-2 occupancies, other than hospitals and nursing homes. A Group I-2 occupancy, other than a hospital or a nursing home, shall comply with Section G304.5.1.

SECTION BC G305
MANUFACTURED HOMES

G305.1 Elevation. All new and replacement manufactured homes shall be prohibited in coastal high-hazard areas. Within A-Zones, all new, replaced or substantially improved manufactured homes shall be elevated such that the lowest floor of the manufactured home is elevated to or above the design flood elevation as specified in ASCE 24, Table 2-1.

G305.2 Foundations. Within A-Zones, all new and replacement manufactured homes, including substantial improvement of existing manufactured homes, shall be placed on a permanent, reinforced foundation that is designed in accordance with ASCE 24.

G305.3 Anchoring. Manufactured homes shall be securely anchored to a] an adequately anchored foundation system designed to resist flotation, collapse and lateral movement. Methods of anchoring are authorized to include, but are not limited to, use of over-the-top or
frame ties to ground anchors. This requirement is in addition to applicable state and local anchoring requirements for resisting wind forces.

G305.4 Protection of mechanical equipment and outside appliances. Mechanical equipment and outside appliances shall be elevated to or above the design flood elevation.

Exception: Where such equipment and appliances are designed and installed to prevent water from entering or accumulating within their components and the systems are constructed to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding up to the elevation required by ASCE 24, Table 2-1, the systems and equipment shall be permitted to be located below the elevation required by ASCE 24, Table 2-1. Electrical wiring systems shall be permitted below the design flood elevation provided they conform to the provisions of the New York City Electrical Code.

G305.5 Enclosures. Fully enclosed areas below elevated manufactured homes shall comply with the requirements of Section G304.1.1, Item 2.

SECTION BC G306
RECREATIONAL VEHICLES

G306.1 [General] Placement prohibited. The following shall apply to [all] recreational vehicles [within areas of special flood hazard] shall not be authorized in coastal high-hazard areas or in floodways.

[1. Placement in V-Zones and floodways prohibited. The placement of recreational vehicles is prohibited in V-Zones and floodways.]

[2.] G306.2 Temporary placement in A-Zones. [Within A-Zones, recreational vehicles] Recreational vehicles in A-Zones shall be fully licensed and ready for highway use, and shall be placed on a site for less than 180 consecutive days.

[3.] G306.3 Permanent placement [in A-Zones]. [Within A-Zones, recreational] Recreational vehicles in A-Zones that are not fully licensed and ready for highway use, or that are to be placed on a site for 180 or more consecutive days, shall meet the requirements of Section G305 for manufactured homes.

SECTION BC G307
TANKS

G307.1 Underground tanks. Underground tanks in [areas of] special flood hazard areas shall be designed, constructed, installed, and anchored to prevent flotation, collapse and lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of flooding to the design flood elevation, in accordance with ASCE 24.

G307.2 Above-ground tanks. Above-ground tanks in [areas of] special flood hazard areas shall be:

1. Elevated to or above the design flood elevation specified in ASCE 24, Table 7-1; or
2. Designed, constructed, installed, and anchored to prevent flotation, collapse and lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy, during conditions of flooding to the design flood elevation, in accordance with ASCE 24.

**G307.3 Tank inlets and vents.** In areas of special flood hazard areas, tank inlets, fill openings, outlets and vents shall be:

1. Installed at or above the design flood elevation specified in ASCE 24, Table 7-1, or [fitted with covers] designed to prevent the inflow of floodwater and outflow of the contents of the tanks during conditions of flooding to the design flood elevation, in accordance with ASCE 24; and

2. Anchored to prevent lateral movement resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy, during conditions of flooding to the design flood elevation, in accordance with ASCE 24.

**G307.4 Additional fuel-oil storage capacity.** Fuel-oil storage capacity in areas of special flood hazard areas and shaded X-Zones shall comply with the following:

1. In areas of special flood hazard areas, fuel oil on the lowest story having its floor above the applicable design flood elevation shall be limited to 3,000 gallons (11 356 L) and no storage tank may exceed the lesser of 1,500 gallons (5678 L) or the quantity of fuel-oil needed to operate the emergency or standby generator(s) served by such tank for 24 hours; and

2. In shaded X-Zones, fuel oil on the lowest story having its floor above the 500-year flood elevation shall be limited to 3,000 gallons (11 356 L) and no storage tank may exceed the lesser of 1,500 gallons (5678 L) or the quantity of fuel-oil needed to operate the emergency or standby generator(s) served by such tank for 24 hours.

**G307.4.1 Additional requirements.** Where fuel-oil storage capacity exceeds the quantity set forth in Section 1305.11.1.3 of the New York City Mechanical Code, the fuel-oil storage shall comply with Sections G307.4.1.1 and G307.4.1.2 in addition to Section 1305 of the New York City Mechanical Code.

**G307.4.1.1 Vault.** Each fuel-oil storage tank shall be separately enclosed in a vault complying with all of the following requirements:

1. The walls, floor, and top of such vault shall have a fire resistance rating of not less than 3 hours;

2. The walls of such vault shall be bonded to the floor of such vault;

3. The top and walls of such vault shall be independent of the building structure;

4. An exterior building wall having a fire resistance rating of not less than 3 hours shall be permitted to serve as a wall of such vault; and
5. The vault shall be located in a dedicated room or area of the building that is separated vertically and horizontally from other areas of the building by construction having a fire resistance rating of not less than 2 hours.

G307.4.1.2 Extinguishing system. Fuel-oil storage shall be protected with an alternative automatic fire-extinguishing system complying with Section 904.

G307.5 Elevation of certain tanks and containers serving critical facilities flood design class 4 buildings. The following tanks and containers shall be located at or above the design flood elevation specified in ASCE 24, Table 7-1, unless such tanks and containers serve buildings that include I-2 occupancies that are hospitals, in which case such tanks and containers shall be located at or above the greater of (i) the design flood elevation specified in ASCE 24, Table 7-1, or (ii) the 500-year flood elevation] when serving flood design class 4 buildings. Such tanks and containers must be designed to maintain service to such structure during flood conditions and shall comply with [section 9.6] Section 9.7 of ASCE 24:

1. Medical and compressed gas storage tanks, oxygen tanks, and other cryogenic system storage tanks;
2. Hazardous material storage tanks;
3. Stationary compressed gas containers;
4. Stationary cryogenic containers; and
5. Stationary flammable gas storage containers.

SECTION BC G308
OTHER BUILDING WORK

G308.1 [Detached] Garages and accessory structures. [Detached] Garages and accessory structures shall be anchored to prevent flotation, collapse and lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of flooding to the design flood elevation. Enclosed accessory structures usable solely for parking or storage shall be wet floodproofed and shall have flood openings to allow for the automatic entry and exit of flood waters designed and constructed in accordance with ASCE 24, Section 9.4.

G308.2 Fences. Fences in floodways that may block the passage of floodwaters, such as stockade fences and wire mesh fences, shall meet the requirement of Section G103.5.

G308.3 Oil derricks. Oil derricks located in [areas of] special flood hazard areas shall be designed in conformance with ASCE 24.

G308.4 Retaining walls, sidewalks and driveways. Retaining walls, sidewalks and driveways shall meet the requirements of [Section] Sections G303.6 and G303.7.

G308.5 [Prefabricated swimming pools in floodways. Prefabricated swimming pools] Swimming pools. Swimming pools shall be designed and constructed in accordance with ASCE
24. Above-ground swimming pools, on-ground swimming pools and in-ground swimming pools that involve placement of fill in floodways shall also meet the requirements of Section G103.5.

G308.6 Temporary flood shields. Temporary flood shields shall be permitted in accordance with Section 6.2.3 of ASCE 24. Decks, porches, and patios. Decks, porches and patios shall be designed and constructed in accordance with ASCE 24.

G308.7 Nonstructural concrete slabs in coastal high-hazard areas and coastal A-Zones. In coastal high-hazard areas and coastal A-Zones, nonstructural concrete slabs used as parking pads, enclosure floors, landings, decks, walkways, patios and similar nonstructural uses are permitted beneath or adjacent to buildings and structures provided that the concrete slabs shall be constructed in accordance with ASCE 24, Section 9.3.

G308.8 Roads and watercourse crossings in regulated floodways. Roads and watercourse crossings that encroach into regulated floodways, including roads, bridges, culverts, low-water crossings and similar means for vehicles or pedestrians to travel from one side of a watercourse to the other, shall meet the requirements of Section G103.5.

G308.9 Temporary flood shields. Temporary flood shields shall be permitted in accordance with Section 6.2.3 of ASCE 24. Temporary flood shields shall be located and arranged so as to allow hose lines to be attached to the inlets of fire department connections without interference in accordance with Section 6.4.5 of NFPA 14 as modified by Appendix Q. Where temporary flood shields extend beyond the property line, Section 3202 for permitted encroachments into the public right-of-way shall apply.

G308.10 Temporary stairs and ramps. Temporary stairs and ramps shall comply with the requirements of Sections G308.7.1 and G308.7.2. Temporary stairs and ramps shall be located and arranged so as to allow hose lines to be attached to the inlets of fire department connections without interference in accordance with Section 6.4.5 of NFPA 14, as modified by Appendix Q. Where temporary stairs and ramps extend beyond the property line, Section 3202 for permitted encroachments into the public right-of-way shall apply.

G308.7.1 Evacuated buildings. Temporary stairs and ramps shall be permitted to provide elevated ingress and egress in compliance with Item 3 of Section 6.2.2 of ASCE 24 for buildings or portions of buildings that are planned to be evacuated during design flood conditions, except for maintenance and emergency personnel, provided that such temporary stairs and ramps shall not be permitted to serve as a required means of egress for a dwelling unit or for any area described in Item 2.2.1 of Section G304.1.2 required to be located at or above the design flood elevation.

G308.7.2 Existing buildings. Temporary stairs and ramps for an existing building or portions thereof shall be permitted to provide elevated ingress and egress in compliance with Item 3 of Section 6.2.2 of ASCE 24, including as a required means of egress for dwelling units or for areas described in Item 2.2.1 of Section G304.1.2 required to be located at or above the design flood elevation, where such temporary stairs and ramps comply with Sections 1009 and 1010.
G308.11 Alterations to pre-FIRM buildings involving flood protective works. Where alterations to pre-FIRM buildings within the flood hazard area, other than substantial improvements or horizontal enlargements, include the installation of flood protective works, compliance with ASCE 24, Section 6.2.2 shall be required. Flood protective works shall be located and arranged so as to allow hose lines to be attached to the inlets of fire department connections without interference in accordance with Section 6.4.5 of NFPA 14, as modified by Appendix Q of this code.

SECTION BC G309
TEMPORARY STRUCTURES AND TEMPORARY STORAGE

G309.1 Temporary structures. Temporary structures shall be erected for a period of less than 180 days. Temporary structures shall be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of the base flood. Fully enclosed temporary structures shall have flood openings that are in accordance with ASCE 24 to allow for the automatic entry and exit of floodwaters.

G309.2 Temporary storage. Temporary storage includes storage of goods and materials for a period of fewer than 180 days. Stored materials shall not include hazardous materials.

G309.3 Floodway encroachment. Temporary structures and temporary storage in floodways shall meet the requirements of Section G103.5.

SECTION BC G310
UTILITY AND MISCELLANEOUS GROUP U [BUILDINGS AND OTHER SIMILAR STRUCTURES]

G310.1 Utility and miscellaneous Group U [buildings and other similar structures]. Section G310 shall govern utility and miscellaneous Group U [buildings that are accessory in character and other similar miscellaneous structures not classified in any specific occupancy in this code, including, but not limited to, agricultural buildings, aircraft hangars (accessory to a one- or two-family residence), barns, carports, fences more than 6 feet (1829 mm) high, grain silos (accessory to a residential occupancy), greenhouses, livestock shelters, private garages, retaining walls, sheds, stables, and towers.

G310.2 Flood loads. Utility and miscellaneous Group U buildings and similar structures, including substantial improvement of such buildings and structures, shall be anchored to prevent flotation, collapse or lateral movement resulting from flood loads, including the effects of buoyancy, during conditions of the design flood.

G310.3 Elevation. Utility and miscellaneous Group U buildings and similar structures, including substantial improvement of such buildings and structures, shall be elevated such that the lowest floor, including basement, is [at] or above the design flood elevation specified in ASCE 24, unless otherwise permitted to comply with requirements of Section 9.4 of ASCE 24.

G310.4 Enclosures below design flood elevation. Fully enclosed areas below the design flood elevation shall be constructed in accordance with Section G304.
G310.5 Flood-damage-resistant materials. Flood-damage-resistant materials shall be used below the design flood elevation.

G310.6 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures, shall be elevated to or above the design flood elevation.

Exception: [The following] Electrical systems, equipment and components; heating, ventilating, air conditioning and plumbing appliances; plumbing fixtures, duct systems and other service equipment shall be permitted to be located below the design flood elevation provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation in compliance with the flood-resistant construction requirements of this code:

1. Electrical systems, equipment and components;
2. Heating, ventilating, air conditioning, and plumbing appliances;
3. Plumbing fixtures;
4. Duct systems; and
5. Other service equipment.

in compliance with Section G304.1.2, Item 2.3 and other applicable flood-resistant construction requirements of this code.

Electrical wiring systems shall be permitted to be located below the design flood elevation provided they conform to the provisions of the New York City Electrical Code and Section 7.2 of ASCE 24.

SECTION BC G311
HAZARDOUS SUBSTANCES

G311.1 Hazardous substances. Portable containers located in the flood hazard area that store hazardous substances, as defined in Section 41-03 of Title 15 of the Rules of the City of New York, shall comply with Section 41-14 of Title 15 of the Rules of the City of New York.

SECTION BC [G344] G312
RETROACTIVE REQUIREMENTS

[G344.1] G312.1 General. Notwithstanding any other provision of the New York City Construction Codes, the provisions of this section shall apply retroactively to all buildings and structures specified herein.

[G344.2] G312.2 Connections for temporary external generators. The following buildings shall be provided with connections for temporary external generators in accordance with Sections
G304.5.1 through G304.5.4, as applicable, by January 1, 2033, and a report detailing compliance with such requirements shall be filed with the department in accordance with Section [G311.2.2] G312.2.2 by such date:

1. Buildings whose main use or dominant occupancy is Group I-1 and that are located in [an area of] a special flood hazard area;

2. Buildings whose main use or dominant occupancy is an adult home, enriched housing, community residence or intermediate care facility that is classified as occupancy Group R pursuant to an exception to Section [308.2.1 or 308.2.2] 308.3.1 or 308.3.2 and that are located in [an area of] a special flood hazard area;

3. Buildings whose main use or dominant occupancy is Group I-2 hospital and that are located in [an area of] a special flood hazard area or shaded X-Zone;

4. Buildings whose main use or dominant occupancy is Group I-2 nursing home and that are located in [an area of] a special flood hazard area; and

5. Buildings whose main use or dominant occupancy is Group I-2, other than hospitals and nursing homes, and that are located in [an area of] a special flood hazard area.

[G311.2.2] G312.2.1 Modification to the [area of special] flood hazard area [or shaded X-Zone]. Where the [area of] special flood hazard area or shaded X-Zone is modified on or after the effective date of this section, any building identified in Section [G311.2] G312.2 and newly identified as being within such modified [area of] special flood hazard area or shaded X-Zone shall, no later than 20 years following the adoption of such modification, comply with the retroactive requirements of Section [G311.2] G312.2. The owner of such building shall, no later than 20 years following the adoption of such modification, file with the department a report detailing compliance with such requirements in accordance with Section [G311.2.2] G312.2.2.

[G311.2.2] G312.2.2 Report of compliance. The owner of a building required to comply with the provisions of Section [G311.2] G312.2 shall file with the department, by January 1, 2033, a report prepared by a registered design professional or licensed master electrician (i) certifying that the requirements of Section [G311.2] G312.2 have been satisfied and detailing how such requirements were satisfied or (ii) certifying that the building met or was altered to meet the provisions of any applicable exception in Sections G304.5.1 or G304.5.2.

[G311.2.3] G312.2.3 Filing. The department may promulgate rules establishing filing fees for the review and examination of such reports.

[G311.3] G312.3 Connections for temporary external boilers and chillers. Buildings whose main use or dominant occupancy is Group I-2 hospital and that are located in [an area of special] a flood hazard area [or shaded X-Zone] shall be provided with connections for temporary external boilers and chillers in accordance with Section G304.5.2 by January 1, 2033, and a report detailing compliance with such requirements shall be filed with the department in accordance with Section [G311.3.2] G312.3.2 by such date.
Modification to the area of special flood hazard area or shaded X-Zone. Where the area of special flood hazard area or shaded X-Zone is modified on or after the effective date of this section, any building whose main use or dominant occupancy is Group I-2 hospital and that is newly identified as being within such modified area of special flood hazard area or shaded X-Zone shall comply with the retroactive requirements of Section G311.3 G312.3 no later than 20 years following the adoption of such modification. The owner of such building shall file with the department a report detailing compliance with such requirements in accordance with section G311.3.2 Section 312.3.2 no later than 20 years following the adoption of such modification.

Report of compliance. The owner of a building required to comply with the provisions of Section G311.3 G312.3 shall file with the department, by January 1, 2033, a report prepared by a registered design professional (i) certifying that the requirements of Section G311.3 G312.3 have been satisfied and detailing how such requirements were satisfied or (ii) certifying that any boiler and chiller plants that serve the spaces specified in Item 2 of Section G304.5.2 are located at or above the design flood elevation specified in Table 7-1 of ASCE 24.

Filing. The department may promulgate rules establishing filing fees for the review and examination of such reports.

CHAPTER G401
REFERENCED STANDARDS

SECTION BC G401
GENERAL REFERENCED STANDARDS

G401.1 General. This section lists the standards that are referenced in various sections of this appendix. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

G401.2 Subsequent additions, modifications or deletions. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the Administrative Code.

G401.3 Applicability. The application of the referenced standards shall be as specified in Section G402.4 G105.1.
SECTION BC G402

[CHAPTER G5]
[MODIFICATIONS TO REFERENCED STANDARDS]

SECTION BC G501
MODIFICATIONS TO REFERENCED STANDARDS

[The following amendments are hereby made to the referenced standards listed in Section G401-]

G501.1 Amendments to [ASCE 24-05] ASCE 24-14. The following amendments are hereby made to the applicable sections of [ASCE 24-05] ASCE 24-14. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

Section 1.1. Section 1.1 (Scope) is amended by deleting the sentence “In addition to the requirements of this section (see Fig. 1-2):” and Items 1 through 4, and by adding the following paragraph to read as follows:

[The scope] In addition to the requirements of this section, the applicability of this standard is as provided for in Section G102.1 of the New York City Building Code, Appendix G.

Section 1.2. Section 1.2 (Definitions) is amended by modifying only the following definitions to read as follows:

Breakaway wall — As defined in Section G201 of the New York City Building Code, Appendix G.

Design flood elevation — The applicable elevation specified in Table 2-1, 4-1, 5-1, 6-1, or 7-1, depending on the structural occupancy category, flood design classification designated in Table 1-1.
High-risk flood hazard area—An area designated as a coastal high-hazard area, being those areas identified on the FIRM as a V-Zone or Coastal A-Zone.

Nonresidential—[As defined] Defined as Nonresidential (for flood zone purposes) in Section G201 of the New York City Building Code, Appendix G.

Residential—[As defined] Defined as Residential (for flood zone purposes) in Section G201 of the New York City Building Code, Appendix G.

Section 1.4.3. Table 1-1 of Section 1.4.3 (Classification of Structures) is amended to read as follows:
### TABLE 1-1
CLASSIFICATION OF STRUCTURES FOR FLOOD RESISTANT DESIGN AND CONSTRUCTION

CLASSIFICATION SAME AS NEW YORK CITY BUILDING CODE TABLE 1604.5)

**FLOOD DESIGN CLASS OF BUILDINGS AND STRUCTURES**

<td>11. buildings and other structures not included in Flood Design Class 4 (including but not limited to facilities that manufacture, process, handle, store, use, or dispose of such substances as hazardous fuels, hazardous chemicals, hazardous waste, or explosives) containing toxic or explosive substances where the quantity of the material exceeds a threshold quantity established by the authority having jurisdiction and is sufficient to pose a threat to the public if released.</td>
<td>11. buildings and other structures not included in Flood Design Class 4 (including but not limited to facilities that manufacture, process, handle, store, use, or dispose of such substances as hazardous fuels, hazardous chemicals, hazardous waste, or explosives) containing toxic or explosive substances where the quantity of the material exceeds a threshold quantity established by the authority having jurisdiction and is sufficient to pose a threat to the public if released.</td>
<td>11. buildings and other structures not included in Flood Design Class 4 (including but not limited to facilities that manufacture, process, handle, store, use, or dispose of such substances as hazardous fuels, hazardous chemicals, hazardous waste, or explosives) containing toxic or explosive substances where the quantity of the material exceeds a threshold quantity established by the authority having jurisdiction and is sufficient to pose a threat to the public if released.</td>
</tr>
</tbody>
</table>

IV. Buildings and structures designated as essential facilities, including but not limited to, and services necessary for emergency response and recovery, or that pose a substantial risk to the community at large in the event of failure, disruption of function, or damage by flooding. Flood Design Class 4 includes:

1. Group I-2 occupancies having surgery or emergency treatment facilities;  
2. Fire, rescue, ambulance, and police stations and emergency vehicle garages;  
3. Designated earthquake, hurricane or other designated emergency shelters;  
4. Designated emergency preparedness, communications, and operation centers and other facilities required for emergency response;  
5. Power generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category.
Table 2-1 of Section 2.3 (Elevation Requirements) is amended to read as follows:

<table>
<thead>
<tr>
<th>STRUCTURAL OCCUPANCY/CATEGORY</th>
<th>USE OF OCCUPANCY OF BUILDINGS AND STRUCTURES</th>
<th>FLOOD DESIGN CLASS</th>
</tr>
</thead>
<tbody>
<tr>
<td>IV structures in emergencies;</td>
<td>6. [Structures] structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1(2)</td>
<td></td>
</tr>
<tr>
<td>7. [Aviation] critical aviation facilities such as control towers, air traffic control centers, and emergency aircraft hangars for aircraft used in emergency response;</td>
<td>8. ancillary structures such as communication towers, electrical substations, fuel or water storage tanks, or other structures necessary to allow continued functioning of a Flood Design Class 4 facility during and after an emergency;</td>
<td></td>
</tr>
<tr>
<td>8.-9. [Buildings] buildings and other structures having critical national defense functions; and</td>
<td>9.-10. [Water] water storage facilities and pump structures required to maintain water pressure for fire suppression.</td>
<td></td>
</tr>
</tbody>
</table>

a. [For purposes of occupant load calculation, occupancies required by Table 1004.1.1 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.] Certain agricultural structures may be exempt from some of the provisions of this standard; see Section C1.4.3.

b. Buildings and other structures containing toxic, highly toxic, or explosive substances shall be eligible for assignment to a lower Flood Design Class if it can be demonstrated to the satisfaction of the authority having jurisdiction by a hazard assessment as described in Section 1.5.3 of Minimum Design Loads for Buildings and Other Structures that a release of the substances is commensurate with the risk associated with that Flood Design Class.
### Table 2-1

**Minimum Elevation of the Top of Lowest Floor**  
*Relative to Design Flood Elevation (DFE) — A-Zones*

<table>
<thead>

<td>2&lt;sup&gt;d&lt;/sup&gt;</td>
<td>DFE=BFE+ 4 ft</td>
</tr>
<tr>
<td>[II&lt;sup&gt;c&lt;/sup&gt;]</td>
<td>3&lt;sup&gt;d&lt;/sup&gt;</td>
<td>DFE=BFE+ 4 ft</td>
</tr>
<tr>
<td>[III&lt;sup&gt;c,d&lt;/sup&gt;]</td>
<td>4&lt;sup&gt;d&lt;/sup&gt;</td>
<td>DFE=BFE+ 2 ft, or 500-year flood elevation, whichever is higher</td>
</tr>
</tbody>
</table>

**Notes:**

- a. Minimum elevations shown in Table 2-1 do not apply to [V Zones] Coastal High-Hazard Areas and Coastal A-Zones (see Table 4-1). Minimum elevations shown in Table 2-1 apply to [A-Zones] other high risk flood hazard areas unless specific elevation requirements are given in Section 3 of this standard.
- b. See Table 1-1 [or Table 1604.5 of the New York City Building Code] for [structural occupancy category] Flood Design Class descriptions.
- c. Flood Design Class 1 structures shall be allowed below the minimum elevation where the structure is permitted to be wet floodproofed in accordance with the requirements of Section 6.3.1 and is wet floodproofed in accordance with Section 6.3.2.
- d. For nonresidential buildings and nonresidential portions of mixed-use buildings, the lowest floor shall be allowed below the minimum elevation if the structure meets the floodproofing requirements of Section 6.2.
- e. Buildings that include I-2 occupancies that are hospitals shall use the greater of (i) the DFE for the applicable structural occupancy category as indicated in this table or (ii) the 500-year flood elevation.

**Section 4.4.** Table 4-1 of Section 4.4 (Elevation Requirements) is amended to read as follows:
**TABLE 4-1**

**MINIMUM ELEVATION OF BOTTOM OF LOWEST SUPPORTING HORIZONTAL STRUCTURAL MEMBER OF LOWEST FLOOR [RELATIVE TO DESIGN FLOOD ELEVATION (DFE) — V-ZONES] COASTAL HIGH-HAZARD AREAS AND COASTAL A-ZONES**

<table>

a. See Table 1-1, or Table 1604.5 of the New York City Building Code, for [structural occupancy category] Flood Design Class descriptions.

b. Orientation of lowest horizontal structural member relative to the general direction of wave approach; parallel shall mean less than or equal to +20 degrees from the direction of approach; perpendicular shall mean greater than +20 degrees from the direction of approach.

c. Buildings that include I-2 occupancies that are hospitals shall use the greater of (i) the DFE for the applicable structural occupancy category as indicated in this table or (ii) the 500-year flood elevation.

Section 5.2.6. Section 5.2.6 (Finishes) shall be amended to read as follows:

5.2.6 Finishes and other materials. Interior and exterior finishes, as well as any materials not otherwise provided for in Sections 5.2.1 through 5.2.5, shall be flood damage-resistant materials in accordance with FEMA Technical Bulletin 2/August 2008, Flood Damage-
Resistant Materials Requirement for Buildings Located in Special Flood Hazard Areas, or shall be required to be approved by the authority having jurisdiction.

Section 6.2. Table 6-1 of Section 6.2 (Dry Floodproofing) is amended to read as follows:

**TABLE 6-1**

<table>
<thead>
<tr>
<th>[STRUCTURAL OCCUPANCY CATEGORY&lt;sup&gt;a&lt;/sup&gt;] FLOOD DESIGN CLASS&lt;sup&gt;b&lt;/sup&gt;</th>

<sup>a</sup> Dry floodproofing is not allowed in Coastal High-Hazard Areas.

<sup>b</sup> See Table 1-1, or Table 1604.5 of the New York City Building Code, for structural occupancy category Flood Design Class descriptions.

<sup>c</sup> Wet or dry floodproofing shall extend to the same level.

<sup>d</sup> Dry floodproofing of residential buildings and residential portions of mixed use buildings shall not be permitted, shall not be permitted (i) in buildings that are "residential for flood zone purposes"; (ii) for certain systems and equipment as provided for in Section G304.1.2, Item 2.3.1 of the New York City Building Code; and (iii) for dwelling units and spaces directly accessed from dwelling units in buildings that are "nonresidential for flood zone purposes".

<sup>1</sup> Buildings that include 1-2 occupancies that are hospitals shall use the greater of (i) the DFE for the applicable structural occupancy category as indicated in this table or (ii) the 500-year flood elevation.

Section 6.2.1. (Dry Floodproofing Limitations) is amended to add the following exceptions:

**Exceptions:**

1. Upon special application to the commissioner, the department may authorize dry floodproofing for designs that demonstrate resistance to flood velocities exceeding 5 ft/s while meeting the other limitations of this standard.

2. Dry floodproofing shall be permitted in Coastal A-Zones, provided:

   2.1 such dry floodproofing complies with the requirements of Appendix G of the *New York City Building Code*; and
2.2 Where flood velocities adjacent to the structure exceed 5 ft/s, the commissioner has authorized the dry floodproofing in accordance with Exception 1.

Section 6.2.2 Item 1 of Section 6.2.2 (Dry Floodproofing Requirements) is amended to read as follows:

1. Be designed and constructed so that any area below the applicable elevation specified in Table 6-1, together with attendant utilities, equipment, and sanitary facilities, is flood resistant with walls that are substantially impermeable to the passage of water. Where acceptable to the commissioner, fixed flood-resistant glazing systems may be used when tested and designed to be within walls substantially impermeable to water. Walls, floors, and flood shields shall be designed and constructed to resist hydrostatic, hydrodynamic, and other flood-related loads, including the effects of buoyancy resulting from flooding to the elevation listed in Table 6-1;

Section 6.2.2 Item 3 of Section 6.2.2 (Dry Floodproofing Requirements) is amended to read as follows:

3. [Have either:] Provide egress and ingress, where a means of egress is required by Chapter 10 of the New York City Building Code, to such dry floodproofed areas of structures in accordance with Item 3.1, 3.2 or 3.3, or a combination thereof, where permitted, as follows:

   3.1 Egress and ingress not blocked by shields. [All required means] Means of egress shall be elevated to or above the applicable DFE specified in Table 6-1, capable of providing human ingress and egress during the design flood between the dry floodproofed area to the exterior, without being blocked by flood shields or flood control devices; or

   3.2 At least one elevated door located in close proximity to each required means of egress to the exterior that is to be blocked by flood shields or flood control devices, such that the Egress and ingress blocked by shields not serving dwelling units. Where a means of egress required by Chapter 10 of the New York City Building Code that does not serve a dwelling unit is to be blocked by flood shields or flood control devices, an alternate means of egress shall be provided capable of providing human ingress and egress during the design flood between the dry floodproofed area to the exterior. The alternate means of egress shall comprise of: (i) a door providing ingress and egress opening directly to the exterior at or above the DFE, and such door shall be permitted to be accessed by steps or ramps; or (ii) a means of egress leading to an exterior exit door not blocked by shields or which is constructed as a wet floodproofed enclosure where discharging below the DFE, and such means of egress shall be permitted to be accessed by stairs and ramps. In either case, such alternate means of egress shall also comply with Items 3.2.1 through 3.2.6:
3.2.1 Alternate Means of Egress Entrance. The alternate means of egress entrance door, or directional signage to such alternate means of egress entrance door shall be readily visible and identifiable within a direct line of sight to a person approaching the blocked egress door(s). The path of travel from the blocked egress door to the alternate means of egress entrance shall be unobstructed with a travel distance of not more than 40 ft as measured from the blocked means of egress. Directional signage to the alternate means of egress shall be installed on the exit door blocked by flood shields prior to flood condition and removed during non-flood conditions.

3.2.2 Travel Distance. The path of travel from the alternate means of egress entrance door leading to the exterior of the building shall not exceed 100 ft.

3.2.3 Temporary Stairs, Ramps and Platforms. For buildings or portions of buildings that are planned to be evacuated during the design flood condition and pre-FIRM buildings, temporary stairs and ramps shall be permitted to serve as an alternate means of egress if their only purpose is to provide supplemental egress and ingress during conditions of flooding subject to the limitations of Section G308.10 of the New York City Building Code.

3.2.3.1 Doors. Any door opening directly onto such temporary stairs or platforms shall be secured during non-flood conditions to prevent use when such temporary stairs and ramps are in storage.

3.2.3.2 Signage. Directional signage to an egress utilizing temporary stairs, ramps or platforms shall be removed to prevent accidental operation during non-flood conditions.

3.2.4 Visibility from outside. Permanent signage affixed to the outside of flood shields or flood control devices that block the egress door shall provide directions to first responders or other personnel seeking to locate the path into the space from the exterior.

3.2.5 Compliance with egress requirements. Such alternate means of egress shall meet all requirements of Chapter 10 of the New York City Building Code for a required means of egress, including, travel distances, hardware and signage. Where an alternate means of egress may be used as a means of egress at any time other than a flood event, temporary stairs and ramps shall not be permitted.

Exceptions for buildings or portions of buildings that are planned to be evacuated during the design flood conditions:

1. Such alternate means of egress shall not be required to comply with occupant load calculations of the New York City Building Code if its only purpose is to provide supplemental egress and ingress during conditions of flooding.
2. The alternate means of egress may serve more than one required exit provided that the travel distances to and within the alternate means of egress comply with Item 3.2.1 and Item 3.2.2 from each required means of egress that is blocked by flood shields or flood control devices.

3.2.6 Accessibility. The alternate means of egress shall not be required to comply with Chapter 11 of the New York City Building Code if its only purpose is to provide supplemental egress and ingress during conditions of flooding, unless the structure is intended for occupancy during the design flood.

3.3 Egress and ingress blocked by shields serving dwelling units. For each means of egress required by Chapter 10 of the New York City Building Code that serves a dwelling unit and is to be blocked by flood shields or flood control devices, at least one alternate means of egress shall be provided capable of providing human ingress and egress during the design flood between the dry floodproofed area to the exterior. The alternate means of egress shall comprise either an elevated door opening directly to the exterior of the building arranged in accordance with Section 3.3.1 or an enclosure that incorporates wet floodproofing and is arranged in accordance with Section 3.3.2.

3.3.1 Elevated door. Where an elevated door is provided, such door shall be capable of providing human ingress and egress during the design flood. The elevated door shall open directly to the exterior of the building and shall be located in close proximity to the required means of egress to the exterior that is to be blocked by flood shields or flood control devices as follows:

3.3.1.1 Face of door. The face of the elevated door itself, and not merely its directional signage, shall be arranged so it is clearly visible to a person approaching the blocked egress door(s).

3.3.1.2 Elevation of door. Such door(s) shall be elevated to [at] or above the applicable DFE specified in Table 6-1, capable of providing human ingress and egress during the design flood.

3.3.1.3 Compliance with egress requirements. Such door shall meet all New York City Building Code requirements for a required means of egress to the exterior of the structure including hardware and signage, but shall not be required to comply with occupant load calculations, unless the structure is intended for occupancy during the design flood.

3.3.1.4 Accessibility. Such door may be accessed by open steps and shall not be required to comply with Chapter 11 of the New York City Building Code if its only purpose is to provide supplemental egress and ingress during conditions of flooding and to provide emergency egress at other times.
3.3.2 Enclosure that incorporates wet floodproofing. Where an enclosure which is partially wet floodproofed is used to provide alternate means of egress, such means of egress shall be capable of providing human ingress and egress during the design flood and shall be located in close proximity to the required means of egress to the exterior that is to be blocked by flood shields or flood control devices as follows:

3.3.2.1 Face of door to enclosure. The face of the door to the enclosure, and not merely its directional signage, shall be arranged so it is clearly visible to a person approaching the blocked egress door(s).

3.3.2.2 Wet floodproofing within an enclosure. Wet floodproofed portions of the enclosure shall be designed to comply with Section 6.3 and resist all flood related loads while prohibiting infiltration of floodwater to dry floodproofed spaces within the building.

3.3.2.3 Travel Distance. The path of travel from the alternate means of egress entrance door to the door leading to the exterior of the building shall not exceed 25 ft.

3.3.2.4 Compliance with egress requirements. The entrance and exit door shall meet all requirements of Chapter 10 of the New York City Building Code for a required means of egress to the exterior of the structure including hardware and signage.

Section 6.2.3. Section 6.2.3 (Limits on Human Intervention) is amended to read as follows:

**Section 6.2.3 Limits on human intervention.** Dry floodproofing measures that require human intervention to activate or implement prior to or during a flood, including temporary stairs or ramps, shall be permitted only when all of the following conditions are satisfied:

1. The flood warning time (alerting potential flood victims of a pending flood situation) shall be a minimum of 12 [hours] unless the community operates a flood warning system and implements an emergency plan to ensure safe evacuation of flood hazard areas, in which case human intervention is allowed only if the community can provide a minimum flood warning time equal to or longer than the cumulative time:

   (a) [time] to notify [person(s)] persons responsible for installation of floodproofing measures,[plus]

   (b) [time] for responsible persons to travel to structure to be floodproofed,[plus]

   (c) [time] to install, activate, or implement floodproofing measures, [plus] and

   (d) [time] to evacuate all occupants from the flood hazard area [s].

2158
2. All removable shields or covers for openings such as windows, doors, and other openings in walls and temporary stairs or ramps shall be designed to resist flood loads specified in Section 1.6.

3. Where removable shields or temporary stairs or ramps are to be used, a flood emergency plan shall be approved by the authority having jurisdiction and shall specify, at a minimum, the following information: storage locations of the shields and temporary stairs and ramps; the method of installation and removal; conditions activating installation and removal; maintenance of shields and attachment devices and temporary stairs and ramps; periodic practice of installing and removing shields and temporary stairs and ramps; testing sump pumps and other drainage measures; and inspecting necessary material and equipment to activate or implement floodproofing. The flood emergency plan shall be posted permanently in at least two conspicuous locations within the structure.

4. Where removable shields or temporary stairs or ramps are to be used, they shall be stored on site within a building or within a secured, weather-resistant enclosure. Off-site storage shall be prohibited for buildings required to comply with Section G304.

5. Where removable shields or temporary stairs or ramps are proposed as per Section G304, periodic inspections, including a triennial full scale deployment, shall be conducted in accordance with Article 324 of the Administrative Code.

Section 7.1. Table 7-1 of Section 7.1 (General) is amended to read as follows (see Table 7-1 below):
TABLE 7-1
MINIMUM ELEVATION OF [UTILITIES-AND] ATTENDANT UTILITIES AND EQUIPMENT [RELATIVE TO DESIGN FLOOD ELEVATION (DFE)]

a. See Table 1-1, or Table 1604.5 of the New York City Building Code, for [structural occupancy category] Flood Design Class descriptions.
b. Locate [utilities and] attendant utilities and equipment above elevations shown unless otherwise provided in Chapter 7 of ASCE 24.
c. Orientation of lowest horizontal structural member relative to the general direction of wave approach; parallel shall mean less than or equal to +20 degrees from the direction of approach; perpendicular shall mean greater than +20 degrees from the direction of approach.
d. Buildings that include I-2 occupancies that are hospitals shall use the greater of (i) the DFE for the applicable structural occupancy category as indicated in this table or (ii) the 500-year flood elevation.

Section 7.2.4. Section 7.2.4 (Panelboards, Disconnect Switches, and Circuit Breakers) is amended to read as follows:

7.2.4 Panelboards, Disconnect [switches] Switches, and [circuit—breakers] Circuit Breakers. The panelboards, load centers, main disconnect [switch] switches, all service disconnecting means, and all circuit breakers shall be located above and be accessible from the elevation specified in Table 7-1, or within a dry floodproofed enclosure, except where prohibited by the New York City Building Code. [Switches] Panelboards, load centers, main
disconnect switches, all service disconnecting means, and circuit breakers shall be located no more than 6 feet 7 inches (2 m) above the floor, or a platform shall be installed to provide access.

Section 7.3.3. Section 7.3.3 is amended to read as follows:

7.3.3 Plumbing systems installed below minimum elevations. Plumbing systems and components, including plumbing fixtures, shall be elevated above the elevation specified in Table 7-1. Where plumbing systems and components have openings below the elevation specified in Table 7-1, the openings shall be protected with automatic backwater valves or other automatic backflow devices. Devices shall be installed in each line that extends below the DFE to prevent release of sewage into floodwaters and to prevent infiltration by floodwaters into the plumbing. Redundant devices requiring human intervention shall be permitted. Plumbing systems shall be provided with backwater valves in the building drain at its point of exit from the building and downstream of the building trap.

Section 7.3.4. Section 7.3.4 is amended to read as follows:

7.3.4 Sanitary systems. Sanitary systems shall be designed to minimize infiltration of flood waters into the systems and discharges from the systems into floodwaters. Vents and openings shall be above the elevation specified in Table 7-1. Sanitary system storage tanks shall be designed, constructed, installed, and anchored to resist at least 1.5 times the potential buoyant and other flood forces acting on an empty tank during design flood conditions. Tanks and piping shall be installed to resist local scour and erosion. Sanitary systems shall be provided with backwater valves at the point of exit from the building and downstream of the building trap. Sanitary systems that must remain operational during or immediately after the design flood or lesser floods shall be equipped with a sealed storage tank that is sized to store at least 150% of the anticipated sewage flow associated with occupancy during flood conditions and during subsequent periods of saturated soil when sewage will not percolate.

Section 7.5.1. A new section 7.5.2 is added to read as follows:

7.5.2 Elevator signage. Where there is potential for an elevator cab to descend below the elevation specified in Table 7-1 into a wet floodproofed space, the elevator shall be equipped with controls that will prevent the cab from descending into floodwaters. Permanent, durable, and washable signage shall be placed in the elevator cab and in the elevator lobby on any story subject to flooding, stating that “In the event of flooding, water sensors in the elevator shaft will prevent the elevator from descending to [description of story, e.g., ground floor, first floor, parking level, etc.] and will automatically cause the elevator to rise to [description of story, e.g., second floor, mezzanine, etc.]”

Section 8.1. Section 8.1 (General) is amended to read as follows:

8.1 General. Stairways and ramps, including stairs and ramps pursuant to Section G308.10 of the New York City Building Code, that are located below the elevations specified in Tables 2-1 and 4-1 shall be designed and constructed to:

1. Resist flood-related loads specified in Section 1.6 and minimize transfer of flood-related loads to the structure and structure foundation; or
2. Break away during design flood conditions without causing damage to the structure, including the foundation; or

3. Use materials that conform to Chapter 5 for those portions of stairways and ramps that are located below the elevations specified in Tables 2-1 and 4-1, including items such as gates and doors.

In flood hazard areas other than Coastal High-Hazard Areas and Coastal A-Zones, enclosures for stairways and ramps that extend below the elevations specified in Table 2-1 shall conform to the requirements for enclosures in Section 2.7. In Coastal High-Hazard Areas and Coastal A-Zones, enclosures for stairways and ramps that extend below the elevations specified in Table 4-1 shall conform to the requirements for enclosures in Section 4.6.

Elevators shall conform to the requirements of Section 7.5.

Section [9.3.1.] 9.4.1. The second sentence of the first paragraph of Section [9.3.1] 9.4.1 (Attached Garages, and Carports, and Accessory Storage Structures) is amended to read as follows:

Wet floodproofed garages and carports are permitted below elevations specified in Table 2-1 provided the lowest level of the garage, or carport or accessory storage structure is at or above grade on at least one side, the garage, or carport or accessory storage structure walls meet the opening requirements of Section [2.6] 2.7, and the lowest level of the garage, or carport or accessory storage structure is not classified as a “lowest floor” pursuant to Appendix G of the New York City Building Code.

[Section 9.5. Section 9.5 (Pools) is amended by adding a new paragraph to read as follows:]

[Mechanical equipment for pools such as pumps and water heaters, and associated electrical wiring, shall comply with Section 7.2 and 7.4.]

Section 9.7. The first sentence of Section 9.7 (Tanks) is amended to read as follows:

Tanks and tank inlets, fill openings, outlets, and vents shall terminate in accordance with Section G307.3 of the New York City Building Code or where located below the design flood elevation, shall be designed, constructed, installed, and anchored to resist all flood-related and other loads, including the effects of buoyancy, during flooding up to and including the design flood and without release of contents into floodwaters or infiltration of floodwaters into the tanks.

[G501.2 Reserved.]

[G501.3 Reserved.]
§ 57. Sections H 102.1 and H 108.1 of Appendix H of the New York city building code, as amended by local law number 141 for the year 2013, are amended to read as follows:

**H102.1 [General.** Unless otherwise expressly stated, the following words and terms shall, for the purposes of this appendix, have the meanings shown herein. Refer to Chapter 2 of this code for general definitions.] Definitions. The following terms are defined in Chapter 2:

**COMBINATION SIGN.** [A sign incorporating any combination of the features of pole, projecting and roof signs.]

**DISPLAY SIGN.** [The area made available by the sign structure for the purpose of displaying the sign.]

**ELECTRIC SIGN.**

**FILM SIGN[s].** [A flat section of a material that is extremely thin in comparison to its length and breadth and has a nominal maximum thickness of 0.01 inch (0.25 mm).]

**GROUND SIGN.** [A billboard or similar type of sign which is supported by one or more uprights, poles or braces in or upon the ground other than a combination sign or pole sign, as defined by this code.]

**MONOPOLE SIGN.**

**POLE SIGN.** [A sign wholly supported by a sign structure in the ground.]
PROJECTING SIGN. [A sign other than a wall sign, projects from and is supported by a wall of a building or structure.]

ROOF SIGN. [A sign erected upon or above a roof or parapet of a building or structure.]

SIGN. [Any letter, figure, character, mark, plane, point, marquee sign, design, poster, pictorial, picture, stroke, stripe, line, trademark, reading matter or illuminated service, which shall be constructed, placed, attached, painted, erected, fastened or manufactured in any manner whatsoever, so that the same shall be used for the attraction of the public to any place, subject, person, firm, corporation, public performance, article, machine or merchandise, whatsoever, which is displayed in any manner outdoors. Every sign shall be classified and conform to the requirements of that classification as set forth in this chapter.]

SIGN STRUCTURE. [Any structure which supports or is capable of supporting a sign as defined in this code. A sign structure is permitted to be a single pole and is not required to be an integral part of the building.]

TEMPORARY SIGN. [A sign, with display area 500 square feet (46.5 m$^2$) or less, erected for a period of 30 days or less.]

WALL SIGN. [Any sign attached to or erected against the wall of a building or structure, projecting no more than 15 inches (381 mm) from the face of the wall, with the exposed face of the sign in a plane parallel to the plane of said wall.]

H108.1 Fail-safe device. Signs that contain moving sections or ornaments shall have fail-safe provisions to prevent the section or ornament from releasing and falling or shifting its center of gravity more than 15 inches (381 mm). The fail-safe device shall be in addition to the mechanism and the mechanism’s housing [which] that operate the movable section or ornament. The fail-safe device shall be capable of supporting the full dead weight of the section or ornament when the moving mechanism releases.

§ 58. Sections H 114.2.3, H114.2.3.1 and H 114.2.3.2 of Appendix H of the New York city building code, as amended by local law number 141 for the year 2013, are amended to read as follows:

H114.2.3 Identification. The additional requirements set forth in sections Sections H114.2.3.1 through H114.2.3.2 shall apply:

H114.2.3.1 UL classification decal. All signs shall bear a decal bearing the UL classification mark or name of the testing entity and its listing number, on a corner of the face of the fabric. This decal shall be of color(s) contrasting with those of the background of the display, and shall be readable from street or roadway level with the aid of binoculars.

H114.2.3.2 Date of sign erection. All signs shall bear a decal identifying the date of erection of the flexible sign structure on a corner of the face of the sign fabric. This decal shall be of color(s) contrasting with those of the background of the display, and shall be readable from street or roadway level with the aid of binoculars. If the same fabric is
relocated, the existing decal shall remain, and a new decal stating the re-erection date shall be affixed.

§ 59. Section BC H117 of Appendix H of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

SECTION BC H117
REFERENCED STANDARDS

H117.1 General. This section lists the standards that are referenced in various sections of this appendix. The standards are listed herein by the promulgating agency of the standard, the standard identification, the effective date and title and the section or sections of this document that reference the standard.

H117.2 Subsequent additions, modifications or deletions. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to these standards in accordance with Section 28-103.19 of the Administrative Code.

H117.3 Applicability. The application of the referenced standards shall be as specified in Section 102.4.

H117.4 Standards.

§60. Appendix K of the New York city building code is REPEALED and a new appendix K is added to read as follows:

APPENDIX K
MODIFIED INDUSTRY STANDARDS FOR ELEVATORS AND CONVEYING SYSTEMS

CHAPTER K1
MODIFICATIONS TO ASME A17.1-2013, SAFETY CODE FOR ELEVATORS AND ESCALATORS

K101.1 General. As referenced by Chapter 30 of the New York City Building Code, the provisions of ASME A17.1-2013 shall be modified in accordance with this chapter. The section numbers correlate to those in the referenced ASME standard. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.
PART 1
GENERAL

SECTION 1.1
SCOPE

1.1.4 Effective date.
Delete Section 1.1.4 in its entirety.

SECTION 1.2
PURPOSE AND EXCEPTIONS

1.2.1 Purpose.
Delete and revise Section 1.2.1 to read as follows:

The purpose of this Code is to provide for the safety of life and limb, and to promote the public welfare. Compliance with this Code shall be achieved by:

(a) conformance with the requirements in ASME A17.1/CSA B44; or

(b) conformance with some of the requirements in ASME A17.1/CSA B44 and for systems, subsystems, components, or functions that do not conform with certain requirements in ASME A17.1/CSA B44, conform with the applicable requirements in ASME A17.7/CSA B44-07, subject to the approval of the Commissioner; or

(c) conformance with the requirements in ASME A17.7/CSA B44.7, subject to the approval of the Commissioner.

SECTION 1.3
DEFINITIONS

1.3 Add or delete and revise the following definitions to Section 1.3 as follows:

Delete and revise the definition of “Alternate level” to read as follows:

ALTERNATE LEVEL: Alternate levels shall be located in accordance with the following provisions:

(a) Where no blind hoistway exists, the alternate level shall be three (3) levels above the designated level.

(b) Where blind hoistways exist, the alternate level shall be the second level above the blind hoistway.

(c) The sky lobby alternate level shall be three (3) levels above the sky lobby designated level.
(d) Where the designated level is the top floor, the alternate level shall be one floor below the designated level.

Delete and revise the definition of “Building code” to read as follows:

Delete and revise the definition of “Control space, elevator, dumbwaiter, material lift” to read as follows:

CONTROL SPACE, ELEVATOR, DUMBWAITER, MATERIAL LIFT: A space outside the hoistway, intended to be accessed with or without full bodily entry, that contains the motor controller. The space could also contain electrical and/or mechanical equipment used directly in connection with the elevator, dumbwaiter, or material lift but not the electric driving machine or the hydraulic machine. (See Nonmandatory Appendix Q).

Add new definition of “Hospital emergency service” to read as follows:

HOSPITAL EMERGENCY SERVICE: A special operating control function that may be provided for elevators in Occupancy Group I-2 (Hospital) or other applicable medical facility used to transport a patient in a life or death situation.

Delete and revise the definition of “In-car stop switch” to read as follows:

IN-CAR STOP SWITCH: A device located in the car that, when manually operated, causes the electric power to be removed from the driving-machine motor and brake of an electric elevator or from the electrically operated valves and pump motor of a hydraulic elevator.

Add new definition of “Load, balanced” to read as follows:

LOAD, BALANCED: The amount of weight measured as a percentage of the car capacity that must be placed in the elevator such that the suspended load of the car side is equal to the suspended load of the counterweight side.

Add new definition of “Lobby, elevator” to read as follows:

LOBBY, ELEVATOR: see landing, elevator or material lift.

Delete and revise the definition of “Occupant Evacuation Operation” to read as follows:

OCCUPANT EVACUATION OPERATION (OEO): The operation of an elevator system for occupant evacuation under emergency conditions.
Add new definition of “Patient elevator” to read as follows:

PATIENT ELEVATOR: An elevator located in a building classified in Occupancy Group I-2 (Hospital) reserved for the “sole” use of vertical transportation of nonambulatory patients who are incapable of self-preservation because of age, physical or mental disability. Hospital staff or other passengers transporting a patient are permitted to ride with the patient. Such elevators must be operated by a designated attendant and shall meet the requirements of Sections 2.27.4 and 2.27.5.3.

Add new definition of “Sky lobby” to read as follows:

SKY LOBBY: The lowest landing of an elevator or a group of elevators located above the street level.

Add new definition of “Smoke hole” to read as follows:

SMOKE HOLE: An opening for venting at the top of the elevator hoistway(s).

PART 2
ELECTRIC ELEVATORS

SECTION 2.1
CONSTRUCTION OF HOISTWAYS AND HOISTWAY ENCLOSURES

2.1.2 Construction at top and bottom of the hoistway.

Delete and revise Section 2.1.2.1 to read as follows:

2.1.2.1 Construction at top of the hoistway. The top of the hoistway shall be enclosed as required by the building code. A metal or concrete roof or floor shall be provided at the top of the hoistway and shall comply with Section 2.1.3.

2.1.4 Control of smoke and hot gases.

Delete Section 2.1.4 in its entirety.

2.1.5 Windows and skylights.

Delete and revise Section 2.1.5 to read as follows:

2.1.5 Windows and skylights.

Windows in the walls of hoistway enclosures are prohibited. Windows and skylights and their frames and sashes in machine rooms and control rooms shall conform to the requirements of the building code (see Section 1.3).

2.1.6 Projections, recesses, and setbacks in hoistway enclosures.
Delete and revise Subsections (a) and (c) of Section 2.1.6.2 to read as follows:

2.1.6.2 On sides not used for loading and unloading

(a) beams, floor slabs, or other building construction making an angle less than 75 deg with
the horizontal shall not project more than 50 mm (2 in) inside the hoistway enclosure
unless the top surface of the projection is beveled at an angle not less than 75 deg with
the horizontal

(c) where recesses or setbacks exceeding 50 mm (2 in) occur in the enclosure wall, the top of
the recess or setback shall be beveled at an angle of not less than 75 deg with the horizontal

SECTION 2.2

PITS

2.2.2 Design and construction of pits.

Delete and revise Section 2.2.2.5 to read as follows:

2.2.2.5 Elevators with sprinklers in the hoistway shall be provided with a drain or sump pump.
The sump pump/drain shall have the capacity to remove a minimum of 11.4 m³/h (3,000 gal/h)
per elevator.

2.2.4 Pit access.

Add new Subsection (f) to Section 2.2.4.5 to read as follows:

2.2.4.5 Separate pit access door, when provided, shall be subject to the following requirements:

(f) Pit doors shall be labeled “DANGER, ELEVATOR PIT” with letters not less than 51 mm
(2 in.) high.

SECTION 2.5

HORIZONTAL CAR AND COUNTERWEIGHT CLEARANCES

2.5.1 Clearances between cars, counterweights, and hoistway enclosures.

Delete and revise Section 2.5.1.3 to read as follows:

2.5.1.3 Between cars in multiple hoistways. The running clearance between the cars and any
equipment attached thereto, of elevators operating in a multiple hoistway, shall be not less than
50 mm (2 in.). Where the clearance between elevators exceeds 762 mm (30 in), emergency
access doors shall be provided for each elevator and shall conform with Sections 2.11.1.1 and
2.11.1.2.
SECTION 2.7  
MACHINERY SPACES, MACHINE ROOMS, CONTROL SPACES, AND CONTROL ROOMS

2.7.2 Maintenance path and clearance.

Delete and revise Section 2.7.2.4.1 to read as follows:

2.7.2.4.1 Where a space is intended to be accessed with full bodily entry, then the requirements of Section 2.7.2.3 shall apply. When the machine space is inside the hoistway, the following shall apply:

(a) All components of driving machines, motors, brakes and governors shall be installed within 915 mm (36 inches) horizontally from the inside edge of the car top railing, or from the edge of the car top, if a car top railing is not required by Section 2.14.1.7.1.

(b) The top of all components of driving machines, motors, brakes and governors shall be located no more than a maximum of 1825 mm (72 inches) vertically above the car enclosure top working surface when components are located outside the standard railing or car top perimeter, and within 1980 mm (78 inches) vertically when the components are located within the standard railing or car top perimeter.

(c) The maximum vertical dimensions shall be measured from the car top working surface when the car has been moved as per Subsection 2.26.1.4.2(g) and the locking means required by Subsections 2.7.5.1.1 and 2.7.5.1.2(c) has been engaged.

2.7.3 Access to machinery spaces, machine rooms, control spaces, and control rooms.

Add new Subsection (d) to Section 2.7.3.1.1 to read as follows:

2.7.3.1.1 A permanent and unobstructed means of access shall be provided to:

(d) A control space for elevators must only be located where working clearances required for the control space will not impede upon the path of travel in unrestricted areas. Where the elevator control space is located in a path of travel in an unrestricted area, a clear path of travel parallel to the control space must not be less than the required working clearance plus 1219 mm (48 in) perpendicular to the control space. A permanent barricade is needed to establish the working clearances for the control space and must be accessible to elevator personnel from the control space. The barricade must be deployed whenever the doors to the control space are in the open position. (See figure Q-2.)
Add new Subsection (d) to Section 2.7.3.4.1 to read as follows:

2.7.3.4.1 Access doors shall be

(d) labeled “ELEVATOR EQUIPMENT” with letters not less than 51 mm (2 in.) high.

Delete and revise Section 2.7.3.4.2 to read as follows:

2.7.3.4.2 Access doors to machine rooms, control rooms and control spaces shall be provided. They shall be of a minimum width of 750 mm (29.5 in.) and a minimum height of 2 030 mm (80 in.). Keys to unlock the access doors shall be Group 2 Security (see 8.1).

Add new Subsection (d) to Section 2.7.3.4.7 to read as follows:

2.7.3.4.7 Access openings in elevator hoistway enclosures where full bodily entry is not necessary for maintenance and inspection of components shall be

(d) labeled “DANGER: ELEVATOR HOISTWAY” with letters not less than 51 mm (2 in.) high and have an electrical safety switch that will remove power from the hoist machine and brake if the door is opened.

2.7.6 Location of machinery spaces, machine rooms, control spaces, control rooms, and equipment.
Delete and revise Section 2.7.6.3.1 to read as follows:

2.7.6.3.1 The electric driving machine shall be located in a machinery space or machine room. When the driving machine is located inside the hoistway

(a) an access door conforming to the requirements of Sections 2.7.3.3 and 2.7.3.4 shall be provided for visual observation of the driving machine motor and brake(s).

(b) landing inspection operation in accordance with Section 2.26.1.4.4 shall be provided at the access door and shall be permitted to be within the frame of the door. The machine and brake must be visible to the operator.

Delete and revise Section 2.7.6.3.2 to read as follows:

2.7.6.3.2 The motor controller shall be located in a machine room, control space, or control room.

NOTE: For electrical clearance requirements, see NFPA 70 or CSA-C22.1, whichever is applicable (see Part 9).

Delete and revise Section 2.7.6.3.4 to read as follows:

2.7.6.3.4 Where a governor is located inside the hoistway, means of access conforming to the requirements of Sections 2.7.3.3 and 2.7.3.4 for inspection and servicing the governor shall be provided from outside the hoistway. This access door is permitted to be the same as the door required by Section 2.7.6.3.1, provided that visual observation of the governor is possible.

Delete and revise Section 2.7.6.4 to read as follows:

2.7.6.4 Means necessary for tests. Where an elevator driving-machine brake or an emergency brake is located in the hoistway or pit, means necessary for tests that require movement of the car or release of the driving-machine brake or emergency brake shall be provided in the machine room, control room, or control space and arranged so that they can be operated from outside the hoistway and shall conform to Sections 2.7.6.4.1 through 2.7.6.4.3. These means are also permitted to be used by elevator personnel for passenger rescue.

Delete and revise the first sentence of Section 2.7.6.4.3 to read as follows:

2.7.6.4.3 A means to move the car from outside the hoistway shall be provided in the control room, control space, or machine room and it shall conform to the following:

2.7.8 Remote machine rooms and control rooms.

Delete and revise Section 2.7.8.4 to read as follows:

2.7.8.4 A permanent means of communication shall be provided between the elevator car, remote machine room and/or control room/control space, and the lobby fire command station (where required or provided).
SECTION 2.8
EQUIPMENT IN HOISTWAYS, MACHINERY SPACES, MACHINE ROOMS,
CONTROL SPACES, AND CONTROL ROOMS

2.8.3 Pipes, ducts, tanks, and sprinklers.

Delete and revise Section 2.8.3.3 to read as follows:

2.8.3.3 Sprinkler systems conforming to NFPA 13 shall be permitted to be installed in the hoistway, subject to Sections 2.8.3.3.1 through 2.8.3.3.4.

Delete and revise Section 2.8.3.3.2 to read as follows:

2.8.3.3.2 Where elevator equipment is located or its enclosure is configured such that application of water from sprinklers could cause unsafe elevator operation, means shall be provided to automatically disconnect the main line power supply to the affected elevator and any other power supplies used to move the elevator upon or prior to the application of water.

(a) This means shall be independent of the elevator control and shall not be self-resetting.

(b) Heat detectors and sprinkler flow switches used to initiate main line elevator power shutdown shall comply with the requirements of NFPA 72.

(c) The activation of sprinklers outside of such locations shall not disconnect the main line elevator power supply. See also Section 2.27.3.3.6.

Delete and revise the first sentence of Section 2.8.3.3.4 to read as follows:

2.8.3.3.4 When sprinklers are installed not more than 600 mm (24 in.) above the pit floor, Subsections 2.8.3.3.4(a) and (b) apply to elevator electrical equipment and wiring in the hoistway located less than 1 200 mm (48 in.) above the pit floor, except earthquake protective devices conforming to Subsection 8.4.10.1.2(d); and on the exterior of the car at the point where the car platform sill and the lowest landing hoistway door sill are in vertical alignment.

SECTION 2.11
PROTECTION OF HOISTWAY OPENINGS

2.11.1 Entrances and emergency doors required.

Delete and revise Section 2.11.1.1 to read as follows:

2.11.1.1 Hoistway landing entrances. All elevator hoistway landing openings shall be provided with entrances that shall guard the full height and width of the openings. Entrances shall be at least 2 030 mm (80 in.) in height and 915 mm (36 in.) in width.

Delete and revise Subsection (a) of Section 2.11.1.2 to read as follows:
2.11.1.2 Emergency doors in blind hoistways. Where an elevator is installed in a single blind hoistway, there shall be installed in the blind portion of the hoistway an emergency door at every third floor, but not more than 11 m (36 ft) from sill to sill, conforming to the following:

(a) The clear opening shall be at least 915 mm (36 in.) wide and 2030 mm (80 in.) high.

2.11.2 Types of entrances.

Delete and revise Section 2.11.2.1 to read as follows:

2.11.2.1 Passenger elevators. For passenger elevators, entrances shall be one of the following types:

(a) horizontally sliding

(b) horizontally swinging, single-section

(c) hand- or power-operated vertically sliding that slide up to open

2.11.7 Glass in hoistway doors.

Delete and revise Sections 2.11.7.1 and 2.11.7.1.1 to read as follows:

2.11.7.1 Vision panels. For elevators with automatic or continuous-pressure operation, manually operated or self-closing hoistway doors of the vertically or horizontally sliding type must be provided with a vision panel. In multisection doors, the vision panel is required in one section only, but is permitted to be placed in all sections. All horizontally swinging elevator doors must be provided with vision panels. Vision panels are permitted for any type of hoistway door. Vision panels are not required at the landing of automatic operation elevators equipped with horizontally sliding car and hoistway doors. Where required or used, vision panels must conform to Sections 2.11.7.1.1 through 2.11.7.1.7.

2.11.7.1.1 The area of any single vision panel must not be less than 0.008 m² (12 in²), and the total area of one or more panels in any hoistway door must not be more than .026 m² (40 in²).

2.11.11 Entrances, horizontal slide type.

Delete and revise Subsection (a) of Section 2.11.11.6 to read as follows:

2.11.11.6 Bottom guides. Bottom guides shall conform to the following:

(a) The bottom of each panel shall be guided by two or more members.

2.11.14 Fire tests.

Delete and revise Section 2.11.14.1 to read as follows:

2.11.14.1 Reserved.
Delete and revise Section 2.11.14.2 to read as follows:

2.11.14.2 Sections 2.11.15 through 2.11.18, and 2.11.14.2.1 through 2.11.14.2.3 apply where fire-resistive construction is required by 2.1.1.1.3.

2.11.15 Marking.

Delete and revise Section 2.11.15.1 to read as follows:

2.11.15.1 Labeling of tested entrance assembly. A single label listing covered components included per Section 2.11.15.1.1, or separate labels on all individual components per Section 2.11.15.1.2 shall be provided. Where required by the New York City Building Code, the entire entrance assembly must be of an approved type.

Delete and revise Section 2.11.15.2 to read as follows:

2.11.15.2 Other entrance assemblies. Other entrance assemblies of the three basic types (see Section 2.11.14) shall qualify for labeling or listing/certification:

(a) when composed of panel(s), frame, and hardware of the same type as tested and not exceeding the overall height and width of any panel and frame of the largest size tested; or

(b) when such panel(s), frame, and hardware are modified, and test or technical data demonstrates that the modifications will meet the performance requirements of the test procedure in Section 8.3.3.

All other elements of the assembly shall conform to all other applicable requirements of this Code.

Delete and revise Section 2.11.15.3 to read as follows:

2.11.15.3 Entrances larger than tested assemblies. When the entrance is too large for the regularly available test facilities, the certifying organization shall be permitted to issue oversize certificates or oversize labels, or such entrances shall be permitted to be used subject to approval by the commissioner.

2.11.16 Factory inspections.

Delete and revise Section 2.11.16 to read as follows:

2.11.16 Factory inspections.

The manufacturing facilities for the production of entrances or components thereof shall be inspected by the certifying organization at random at least quarterly, or if they are not manufactured on a continuous basis, at the time they are being produced, to assure that production methods are such that entrances or components thereof similar to those tested are being produced.

2.11.17 Transoms and fixed side panels.
Delete and revise the opening paragraph of Section 2.11.17 to read as follows:

2.11.17 Transoms and fixed side panels.

Transoms and fixed side panels shall be permitted to close openings above and beside the horizontally sliding or horizontally swinging type entrances, provided that

2.11.18 Installation instructions.

Delete and revise Section 2.11.18 to read as follows:

2.11.18 Installation instructions.

(a) Instructions detailing the application and installation of door listed/certified panels and entrance hardware shall be provided.

(b) Where frames are used, instructions detailing the listed/certified frame-to-wall interface shall be provided.

2.11.19 Gasketing of hoistway entrances.

Delete and revise the first sentence of Section 2.11.19.4 to read as follows:

2.11.19.4 Labeled gasketing material shall conform to Section 2.11.16.

SECTION 2.12 HOISTWAY DOOR LOCKING DEVICES AND ELECTRIC CONTACTS, AND HOISTWAY ACCESS SWITCHES

2.12.3 Hoistway door combination mechanical locks and electric contacts.

Delete Section 2.12.3 in its entirety.

2.12.4 Listing/certification door locking devices and door or gate electric contacts.

Delete and revise Section 2.12.4.1 to read as follows:

2.12.4.1 Type tests. Each type and make of hoistway-door interlock, electric contact, and door or gate electric contact must be of an approved type. Hoistway-door combination mechanical locks and electrical contacts are not permitted.

2.12.7 Hoistway access switches.

Delete and revise Subsection (b) of Section 2.12.7.3.3 to read as follows:

2.12.7.3.3 The operation of a hoistway access switch at the landing shall permit movement of the car with the hoistway door located adjacent to the switch at the landing unlocked or not in the closed position, and with only the car door or gate associated with this hoistway door unlocked or not in the closed position, subject to the following requirements:
(b) The car shall not be operated at a speed greater than 0.35 m/s (75 ft/min). For elevators with static control, a means independent from the normal means to control the speed shall be provided to limit the speed of the car on hoistway access operation to a maximum of 0.35 m/s (75 ft/min), should the normal means to control this speed (mechanical, electrical, or solid-state devices) fail to do so.

The car speed-sensing device used for the means to limit the speed of the car while operating in response to an access switch shall be permitted to be either a separate car speed-sensing device from that of the normal speed control system or the same car speed-sensing device, provided that a separate means is used to continuously verify the proper operation of this speed-sensing device. Where the same car speed-sensing device is used, the detection of a failure of this car speed-sensing device while operating in response to an access switch shall cause the power to be removed from the driving machine motor and brake.

The car speed-sensing device(s) and, where required, the verification means described above, shall conform to the following:

1. a common actuating means (e.g., a driving-machine shaft, brake drum, etc.) shall be permitted provided that it is not dependent on the following connection types, unless the connection is continuously monitored:

   a) traction (excluding the traction between the drive sheave and suspension means and the traction between the governor and governor rope)

   b) friction (except for interference fits), or

   c) a flexible coupling where positive engagement is not assured between coupling halves.

   Where monitoring is required, the monitoring shall detect a failure that prevents conformance with this requirement while operating in response to an access switch and shall cause the electric power to be removed from the elevator driving-machine motor and brake.

2. a common member (e.g., tape, target, wire, etc.) that is sensed by both speed-sensing devices shall be permitted, provided that

   a) the member is monitored such that when its presence is not detected while operating in response to an access switch, this shall cause the electric power to be removed from the elevator driving-machine motor and brake

   b) the common member is securely mounted in such a manner that horizontal movement of the car shall not affect the operation of the sensors

3. a common mounting means shall be permitted
SECTION 2.13
POWER OPERATION OF HOISTWAY DOORS AND CAR DOORS

2.13.2 Power opening.
Delete and revise Section 2.13.2.1 to read as follows:

2.13.2.1.2 Collapsible car gates shall not be power opened.

SECTION 2.14
CAR ENCLOSURES, CAR DOORS AND GATES, AND CAR ILLUMINATION

2.14.1 Passenger and freight enclosures, general.
Delete and revise Section 2.14.1.5.1 to read as follows:

2.14.1.5.1 Top emergency exits shall conform to the following requirements:

(a) The top emergency exit opening shall have an area of not less than 0.26 m$^2$ (400 in.$^2$) and shall measure not less than 508 mm (20 in.) on any side.

(b) Where the distance between the platform and the top of car escape hatch is 2 743 mm (9 ft.) or greater, the emergency exit opening shall measure not less than 0.37 m$^2$ (576 in.$^2$) and shall measure not less than 600 mm (24 in) on any side.

(c) During an alteration involving installation of a new car enclosure, the top emergency exit opening shall have an area of not less than 0.26 m$^2$ (400 in.$^2$) and shall measure not less than 400 mm (16 in.) on any one side where prevailing conditions prevent any increase in opening size.

(d) The top emergency exit and suspended ceiling opening, if any, shall be so located as to provide a clear passageway, unobstructed by fixed equipment located in or on top of the car. Equipment is permitted directly above the exit opening, provided that

(1) it is not less than 1 070 mm (42 in.) above the top of the car; or

(2) the exit is located to allow unobstructed passage of a parallelepiped volume measuring 300 mm by 500 mm by 1 500 mm (12 in. by 20 in. by 59 in.) at an angle not less than 60 deg from the horizontal (see Nonmandatory Appendix C).

(e) The top emergency exit cover shall open outward. It shall be securely attached with a chain when in both the open and closed positions. Hinges are not permitted. The chain shall be not more than 300 mm (12 in.) in length and have a factor of safety of not less than 5. The exit cover shall only be openable from the top of the car, where it shall be openable without the use of special tools. The exit cover of the lower compartment of a multideck elevator shall be openable from both compartments. On elevators with two compartments, if the emergency exit of the lower compartment does not open directly
into the upper compartment, a guarded passageway shall be provided between the lower compartment roof and the upper compartment floor.

(f) The movable portion (exit panel) of the suspended ceiling that is below the top exit opening shall be restrained from falling. It shall not be permitted to be hinged and shall provide a clear opening with the top exit opening.

1. The movable portion of the suspended ceiling shall measure no less than 600 mm (24 in.) by 600 mm (24 in).

2. Where the distance between the platform and the top of car exit is greater than 2,743 mm (9 ft.), the movable portion of the suspended ceiling shall measure no less than 710 mm (28 in.) by 710 mm (28 in.).

3. The movable portion and the fixed portion of a suspended ceiling shall not contain lamps that could be shattered by the rescue operation using the top emergency exit. The movable portion of the suspended ceiling shall be permitted to contain light fixtures connected to the stationary portion of the suspended ceiling wiring by means of a plug and socket or by flexible armored wiring. Flexible wiring shall not be used to support or restrain the exit opening in the suspended ceiling in the open position.

(g) Where elevators installed in enclosed hoistways are provided with special car top treatments such as domed or shrouded canopies, the exit shall be made accessible, including the car top refuge space as specified in 2.4.12.

(h) Immediately adjacent to the top emergency exit there shall be a space available for standing when the emergency exit cover is open. This space shall be permitted to include a portion of the refuge area (see Section 2.4.12). All exit covers shall be provided with a car top emergency exit electrical device (see Section 2.26.2.18) that will prevent operation of the elevator car if the exit cover is open more than 50 mm (2 in.), and the device shall be so designed that it

1. is positively opened

2. cannot be closed accidentally when the cover is removed

3. must be manually reset from the top of the car and only after the cover is within 50 mm (2 in.) of the fully closed position

4. shall be protected against mechanical damage

2.14.2 Passenger-car enclosures.

Delete and revise Section 2.14.2.1.1 to read as follows:

2.14.2.1.1
(a) materials in their end-use configuration, other than those covered by Subsections 2.14.2.1.1(b) and (c), 2.14.2.1.3, and 2.14.2.1.4, shall conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E84, ANSI/UL 723, NFPA 255, or CAN/ULC-S102:

(1) flame spread rating of 0 to 50

(2) smoke development of 0 to 100

(b) napped, tufted, woven, looped, and similar materials in their end-use configuration on car enclosure walls shall conform to Section 8.3.7. The enclosure walls to which this material is attached shall conform to Subsection 2.14.2.1.1(a).

(c) floor covering, underlayment, and its adhesive shall have a critical radiant flux of not less than 0.45 W/cm², as measured by ASTM E648.

Delete and revise Section 2.14.2.1.2 to read as follows:

2.14.2.1.2 Reserved.

Delete and revise Section 2.14.2.5 to read as follows:

2.14.2.5 Vision panels. Vision panels are not required, but where used, shall meet the following requirements:

(a) Be of a total area of not more than 0.047 m² (72 in²) and contain no single glass panel having a width exceeding 101 mm (4 in.);

(b) Hoistway door vision panels must be protected by protective grills made of number sixteen (16) gauge stainless or galvanized steel in accordance with the following specifications:

(1) Grills shall be sized to fit within or over the vision panel frame and completely cover the vision panel opening in the elevator, car doors and hoistway doors.

(2) Grills and vision panel frames shall be secured by means of non-reversible screws or other tamper proof fasteners.

(3) Grills shall contain openings that shall not be larger than 19 mm (0.75 in.) in diameter.

(4) All cut edges shall be deburred.

(5) Requirements for such grills may be waived if certification is submitted that such elevator is operated manually or twenty-four (24) hour doorman service is provided. A security guard shall not be considered doorman service.

(6) For the purpose of this subsection (b), a vandal resistant 6 mm (0.25 in.) polycarbonate sheet, such as Lexan, in two (2) layers, one (1) on each side of the required wire glass, may be used in lieu of the metal protective.
2.14.4 Passenger and freight car doors and gates, general requirements.

Delete and revise Section 2.14.4.11 to read as follows:

2.14.4.11 Closed position of car doors or gates. Car doors or gates shall be considered to be in the closed position under the following conditions:

(a) for horizontally sliding doors or gates, when the clear open space between the leading edge of the door or gate and the nearest face of the jamb does not exceed 25 mm (1 in.) except where car doors are provided with a car door interlock(s), 10 mm (0.375 in.)

(b) for vertically sliding counterweighted doors or gates, when the clear open space between the leading edge of the door or gate and the car platform sill does not exceed 25 mm (1 in.)

(c) for horizontally sliding center-opening doors, or vertically sliding biparting counterbalanced doors, when the door panels are within 25 mm (1 in.) of contact with each other, except where horizontally sliding center-opening car doors are provided with a car door interlock(s), 10 mm (0.375 in.)

2.14.5.10 Folding Car Doors

Section 2.14.5.10 is renumbered Section 2.14.6.4.

2.14.7 Illumination of cars and lighting fixtures.

Delete and revise Section 2.14.7.1.4 to read as follows:

2.14.7.1.4 Each elevator shall be provided with lighting and a duplex receptacle fixture on the car top and under the car platform. The lighting shall be permanently connected, fixed, or portable, or a combination thereof, to provide an illumination level of not less than 100 lx (10 fc) measured at the point of any elevator part or equipment, where maintenance or inspection is to be performed from the car top or under the car platform. All lighting shall be equipped with guards. The light switch shall be accessible from the landing when accessing the car top or under the car platform.

SECTION 2.15
CAR FRAMES AND PLATFORMS

2.15.8 Protection of platforms against fire.

Delete and revise Section 2.15.8 to read as follows:

2.15.8 Protection of platforms against fire.

Exposed wood shall not be used on Fire Service Access Elevators and Occupant Evacuation Elevators. All platform materials exposed to the hoistway shall be either of the following:

(a) metal
(b) other materials that, in their end-use configuration, conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E84, UL 723, NFPA 255, or CAN/ULC-S102.2, whichever is applicable (see Part 9):

1. flame spread rating of 0 to 50
2. smoke development of 0 to 100

SECTION 2.16
CAPACITY AND LOADING

2.16.1 Minimum rated load for passenger elevators.

Delete and revise Section 2.16.1.3 to read as follows:

2.16.1.3 Carrying of freight on passenger elevators. When freight is to be carried on a passenger elevator, the requirements of Sections 2.16.1.3.1, 2.16.1.3.2 and 2.16.1.3.3 shall be conformed to.

2.16.1.3.1 The minimum rated load shall conform to Sections 2.16.1 or 2.16.2, whichever is greater.

2.16.1.3.2 The elevator shall be designed for applicable class of freight elevator loading.

2.16.1.3.3 Nonpermanent freight-handling equipment (Section 2.14.1.9.1), and freight materials, shall be removed when the elevator is used for passenger service.

2.16.3 Capacity and data plates.

Delete and revise Section 2.16.3.2.1 to read as follows:

2.16.3.2.1 Capacity plates must indicate the rated load of the elevator in pounds or kilograms and pounds (see Appendix D). In addition, this plate or a separate plate shall indicate

(a) the capacity lifting one-piece loads where the elevator conforms to Section 2.16.7

(b) for freight elevators designed for Class C2 loading, the maximum load the elevator is designed to support while being loaded or unloaded (see Subsection 2.16.2.2.4(c)), and

(c) calculated per Appendix D, the number of persons on passenger elevators and freight elevators permitted by Section 2.16.4 to carry passengers.

Add new Subsection (f) to Section 2.16.3.2.2 to read as follows:

2.16.3.2.2 Data plates shall indicate

(f) the weight required for balanced load.

Add new Section 2.16.10 to read as follows:
2.16.10 Detection of overload on passenger elevators and freight elevators permitted by Section 2.16.4 to carry passengers.

Passenger elevators and freight elevators permitted by Section 2.16.4 to carry passengers must be designed with the means to detect if the load exceeds the rated capacity of the elevator. If an overload is detected, the elevator doors must reopen and remain open and a voice notification and visual signal must indicate that the car is overloaded.

SECTION 2.18
SPEED GOVERNORS

2.18.1 Speed governors required and location.

Delete and revise Section 2.18.4.1.3 to read as follows:

2.18.4.1.3 The switches required in Section 2.18.4.1.1 shall remain in the open position until manually reset. Manual reset is defined here as personal intervention by elevator personnel at the governor and can include means such as a finger, hand or cable-actuated lever, or some form of electromechanical actuation from the access door specified in Section 2.7.6.3.4.

Add new Subsection (c) and Note to Section 2.18.4.2.5 to read as follows:

2.18.4.2.5 The speed-governor overspeed switch shall be permitted to open in the down direction of the elevator at not more than 100% of the speed at which the governor is set to trip in the down direction, subject to the following requirements:

(c) An access door is required when the governor is installed at the top of the hoistway for access to reset switches by elevator personnel. The access door must comply with Section 2.7.3.4.6.

NOTE: Manual reset is defined here as personal intervention by elevator personnel at the governor.

SECTION 2.20
SUSPENSION MEANS AND THEIR CONNECTIONS

2.20.1 Suspension means.

Delete and revise Section 2.20.1 to read as follows:

2.20.1 Suspension means.

Elevator cars and counterweights shall be suspended by steel wire ropes, or noncircular elastomeric-coated steel suspension members attached to the car frame or passing around sheaves attached to the car frame specified in Section 2.15.1. Suspension means that have previously been installed and used on another installation shall not be reused. All suspension members in a set of suspension means shall be the same material, grade, construction, and
dimensions. A suitable means shall be provided to protect the suspension means during the installation process.

Only the following shall be permitted:

(a) steel wire ropes constructed in accordance with ASME A17.6, Part 1

(b) noncircular elastomeric-coated steel suspension members constructed in accordance with ASME A17.6, Part 3

2.20.2 Suspension-means data.

Delete and revise Subsection (a) of Section 2.20.2.2 to read as follows:

2.20.2.2 The following data shall be provided:

(a) type of suspension (steel wire rope or noncircular elastomeric-coated steel suspension member)

2.20.4 Minimum number and diameter of suspension means.

Delete Section 2.20.4.2 in its entirety.

Section 2.20.4.3 is renumbered to Section 2.20.4.2.

2.20.9 Suspension-member fastening.

Delete and revise Section 2.20.9.5 to read as follows:

2.20.9.5 Wedge rope sockets. The use of wedge rope socket assemblies shall be permitted only for steel wire ropes. When used, the wedge rope socket assemblies shall be of a design as shown in Fig. 2.20.9.5 and shall conform to Sections 2.20.9.2, 2.20.9.3, and 2.20.9.5.1 through 2.20.9.5.7. Socket and wedge surfaces that contact the rope shall be free of burrs or sharp edges that could damage the rope. Wedge rope sockets are not permitted on counterweighted winding drum machines.

Delete Section 2.20.9.5.5 in its entirety.

Section 2.20.9.5.6 is renumbered to Section 20.9.5.5.

Section 2.20.9.5.7 is renumbered to Section 20.9.5.6.

SECTION 2.21
COUNTERWEIGHTS

2.21.1 General requirements.

Add new Section 2.21.1.2.1 to read as follows:
2.21.1.2.1 Weight section material. Weight section material shall be steel, iron or lead only and shall have a minimum melting temperature of 620°F (327°C).

SECTION 2.22
BUFFERS AND BUMPERS

2.22.4 Oil buffers.

Delete and revise Section 2.22.4 to read as follows:

2.22.4 Oil buffers.

Delete and revise Section 2.22.4 to read as follows:

2.22.4.6 Means for determining oil level. Oil buffers shall be provided with means for determining that the oil level is within the maximum and minimum allowable limits. Transparent sight gauges shall be permitted to be used provided they meet the requirements for the purpose in accordance with good engineering practice. They shall resist shock loading on the buffer or pressure rise as a result of impact, and not be stained by the presence of buffer oil or a means shall be provided to ensure that any staining does not affect the reading of the oil level.

(a) A fixed inclined ladder shall be provided where the top of the buffer cylinder is over 524 mm (5 ft.) in height above the pit floor.

(b) A fixed vertical or inclined ladder fitted with an inspection and maintenance platform with guard rails shall be provided where the top of the car buffer cylinder is over 2 134 mm (7 ft.) from the pit floor.

SECTION 2.24
DRIVING MACHINES AND SHEAVES

2.24.2 Sheaves and drums.

Delete and revise Section 2.24.2.1 to read as follows:

2.24.2.1 Sheaves. Driving-machine sheaves shall be integral with or directly attached to driving machine shafts. Sheaves shall be provided with steel shafts and metal bearings. Non-metallic sheaves are not permitted.

Delete Section 2.24.2.3.2 in its entirety.

Section 2.24.2.3.3 is renumbered to 2.24.2.3.2.

Section 2.24.2.3.4 is renumbered to 2.24.2.3.3.

2.24.10 Means for inspection of gears.

Delete and revise Section 2.24.10 to read as follows:

2.24.10 Means for inspection of gears.

Each gear case of geared machines shall have access to permit inspection of the contact surfaces of the gears.
SECTION 2.25
TERMINAL STOPPING DEVICES

2.25.3 Final terminal stopping devices.

Add new Subsection (d) to Section 2.25.3.1 to read as follows:

2.25.3.1 General requirements. Final terminal stopping devices shall conform to Section 2.25.1 and the following:

(d) Final limit switches and bracket shall be permanently secured and pinned.

Delete and revise Section 2.25.3.3.1 to read as follows:

2.25.3.3.1 Traction machine elevators shall have final terminal-stopping switches located in the hoistway and operated by cams attached to the car.

SECTION 2.26
OPERATING DEVICES AND CONTROL EQUIPMENT

2.26.1 Operation and operating devices.

Add new Items 3 and 4 to Subsection (c) of Section 2.26.1.4.1 to read as follows:

2.26.1.4.1 General requirements.

(c) Inspection operating devices shall

(3) be provided with a separate device of the continuous-pressure type labeled “ENABLE”, adjacent to the inspection operating devices; and

(4) become effective only when the “ENABLE” device is activated.

Add new Item 3 to Subsection (e) of Section 2.26.1.4.2 to read as follows:

2.26.1.4.2 Top-of-car inspection operation. Top-of-car inspection operation shall conform to Section 2.26.1.4.1 and the following:

(e) The inspection operating devices (see Subsection 2.26.1.4.1(c)) shall be permitted to be of the portable type, provided that

(3) when the machine is located in the hoistway, inspection operating devices shall be of the portable type.

Delete and revise Subsection (g) of Section 2.26.1.4.2 to read as follows:

(g) When in top-of-car inspection operation, a separate additional device shall be permitted to render ineffective the top final terminal stopping device, and the buffer switch for gas spring-return counterweight oil buffers, in conformance with the requirements of Subsections
2.26.4.3, 2.26.9.3.1(a), 2.26.9.3.2, and 2.26.9.4, and it shall allow the car to be moved to a position in conformance with the requirements of Subsections 2.7.4.5 and 2.7.5.1.3(c). When operating in the up direction with these devices rendered ineffective, the elevator shall stop when it reaches its maximum upward movement and shall be able to travel in the down direction without the need for any devices to be manually reset.

2.26.2 Electrical protective devices.

Delete and revise Section 2.26.2.5 to read as follows:

**2.26.2.5 Emergency stop switch.** On all elevators, an emergency stop switch must be provided in the car, and located in or adjacent to each car operating panel. When open (“STOP” position), this switch must cause the electric power to be removed from the elevator driving-machine motor and brake. Emergency stop switches must:

(a) Be of the manually opened and closed type;

(b) Have red operating handles or buttons;

(c) Be conspicuously and permanently marked “STOP” and must indicate the “STOP” and “RUN” positions; and

(d) While opened, cause the audible device to sound (see Section 2.27.1.2).

Delete and revise Section 2.26.2.21 to read as follows:

**2.26.2.21 Reserved.**

Delete Section 2.26.2.33 in its entirety.

2.26.5 System to monitor and prevent automatic operation of the elevator with faulty door contact circuits.

Add new Exception to Section 2.26.5 to read as follows:

**EXCEPTION:** When operating on Firefighters’ Service Phase II, item (b)(2) shall not be permitted.

2.26.6 Phase protection of motors.

Delete and revise Section 2.26.6 to read as follows:

**2.26.6 Phase protection of motors.**

Elevators having a polyphase AC power supply shall be provided with means to prevent the operation of the elevator drive motor or door motor if a reversal of phase rotation, or phase failure of the incoming polyphase AC power, will cause the elevator car or elevator door(s) to operate in the wrong direction.
SECTION 2.27
EMERGENCY OPERATION AND SIGNALING DEVICES

Add new Note to the header of Section 2.27 to read as follows:

NOTE: Additional requirements, including those for firefighters’ communications systems, Fire Service Access Elevators (see Section 2.27.10) and Occupant Evacuation Operation (see Section 2.27.11), may be found in the building code.

2.27.1 Car emergency signaling devices.

Delete and revise Section 2.27.1.1 to read as follows:

2.27.1.1 Emergency communications. The two-way communications shall conform to 2.27.1.1.1 through 2.27.1.1.6.

2.27.1.1.1 A communications means between the car and a location staffed by authorized personnel who can take appropriate action shall be provided.

2.27.1.1.2

(a) Two-way voice communication shall be provided between the elevator car and elevator machine room, and/or control room.

(b) If the call is not acknowledged [Subsection 2.27.1.1.3(c)] within 45 s, the call shall be automatically directed to an alternate on- or off-site location.

2.27.1.1.3 The permanent two-way communication means within the car shall comply with the following requirements:

(a) ICC/ANSI A117.1.

(b) A push button to actuate the two-way communication means shall be provided in or adjacent to a car operating panel. The push button shall be visible and permanently identified with the “PHONE” symbol (see Section 2.26.12.1). The identification shall be on or adjacent to the “PHONE” push button. The communications means shall be initiated when the push button is actuated.

(c) On the same panel as the “PHONE” push button, a message shall be displayed that is activated by authorized personnel to acknowledge that communications are established. The message shall be permitted to be extinguished where necessary to display a new message [see Subsections 2.27.1.1.3(d) and 2.27.1.1.3(e)] or when the communications are terminated.

(d) On the same panel as the “PHONE” push button, messages shall be displayed which permit authorized personnel to communicate with and obtain responses from a trapped passenger(s) including a passenger(s) who cannot verbally communicate or cannot hear.
(e) On the same panel as the “PHONE” push button, a message shall be displayed that is activated by authorized personnel to indicate when help is on the way. The message shall continue to be displayed until a new message is displayed [see Subsection 2.27.1.1.4(c)] or the communication is terminated.

(f) The communications means shall provide on demand to authorized personnel, information that identifies the building location and elevator number.

(g) The communications, once established, shall be disconnected only when authorized personnel terminate the call or a timed termination occurs. A timed termination by the communications means in the elevator, with the ability to extend the call by authorized personnel, is permitted if voice notification is sent by the communications means to authorized personnel a minimum of 3 min after communication has been established. Upon notification, authorized personnel shall have the ability to extend the call; automatic disconnection shall be permitted if the means to extend are not enacted within 20 s of the voice notification.

(h) The communications means shall not use a handset in the car.

(i) The communications shall not be transmitted to an automated answering system. The call shall be answered by authorized personnel.

(j) Operating instructions shall be incorporated with or adjacent to the “PHONE” push button.

(k) A means to display video to observe passengers at any location on the car floor, to authorized personnel for entrapment assessment, shall be provided.

2.27.1.1.4 Where the elevator rise is 18 m (60 ft) or more, a permanent two-way voice communication means within the building accessible to emergency personnel shall be provided at the designated level, and shall comply with the following requirements:

(a) The means shall enable emergency personnel within the building to establish communications to each car individually. The communications shall be established without any intentional delay and shall not require intervention by a person within the car. The means shall override voice communications to outside of the building.

(b) The communications, once established, shall be disconnected only when emergency personnel outside the car terminates the call or a timed termination occurs. A timed termination by the communications means in the elevator, with the ability to extend the call by emergency personnel, is permitted if voice notification is sent by the communications means to emergency personnel a minimum of 3 min after communication has been established. Upon notification, emergency personnel shall have the ability to extend the call; automatic disconnection shall be permitted if the means to extend are not enacted within 20 s of the voice notification.

(c) Once the communications have been established, a message shall be displayed on the same panel as the “PHONE” push button, that is activated by emergency personnel.
personnel, to indicate that help is on site. The message shall be permitted to be extinguished where necessary to display a new message [see Subsection 2.27.1.1.4(e)] or when the communications are terminated.

(d) Operating instructions shall be incorporated with or adjacent to the communications outside the car. Instructions shall conform to Section 2.27.7.3.

(e) On the same panel as the “PHONE” push button, messages shall be displayed that permit emergency personnel to communicate with and obtain responses from a trapped passenger including a passenger who cannot verbally communicate or cannot hear. If the means of communication is behind a locked panel, it shall be accessible with the New York City Fire Department standard and New York City standard keys.

(f) A means to display video to observe passengers at any location on the car floor to emergency personnel for entrapment assessment shall be provided. The communications system shall be located within the fire command center where one is provided.

2.27.1.1.5 If the two-way communications means is normally connected to the building power supply, it shall automatically transfer to a source of standby or emergency power as required by the applicable building code or, where applicable, Standard for Health Care Facilities (ANSI/NFPA-99), after the normal power supply fails. The power source(s) shall be capable of providing for the means of communications [see Sections 2.27.1.1.3 and 2.27.1.1.4] for at least 4 h; and the audible signaling device (see Section 2.27.1.2) for at least 1 h.

2.27.1.1.6

(a) The voice communications means within the car shall include a means to verify operability of the telephone line, where

(1) verification of the telephone line operability shall be automatically performed

(2) verification may be continuous or periodic

(3) periodic verification shall be at least on a daily basis

(4) verification shall not require activation of the communications link(s). If means other than a telephone line (e.g., VOIP, network, intercom, etc.) is used for the communications, similar verification of this equivalent means shall be performed.

(b) If the verification means in 2.27.1.1.6(a) determines that the telephone line or equivalent means is not functional, an audible and illuminated visual signal shall be activated. A minimum of one visual and one audible signal shall be provided for each group of elevators controlled by a “FIRE RECALL” switch.

(1) The visual signal shall
(a) be located at the designated level in the vicinity of the “FIRE RECALL” switch and visible to elevator user(s)

(b) be labeled “ELEVATOR COMMUNICATIONS FAILURE” in red letters a minimum of 5 mm (0.25 in.) high

(c) illuminate intermittently

(d) continue illuminating intermittently until the telephone line or equivalent means is functional

(2) The audible signal shall

(a) be 10 dBA minimum above ambient, but shall not exceed 80 dBA measured at the designated landing “FIRE RECALL” switch

(b) sound at least once every 30 s with a minimum duration of half a second

(c) continue to sound until silenced by authorized personnel or the telephone line or equivalent means is functional

(3) A means to silence the audible signal shall be provided and shall be accessible only to authorized personnel. The signal when silenced shall remain silent for a period of no less than 12 hr or until activated by the next failed periodic verification [see 2.27.1.1.6(a)(3)].

(4) The verification means in 2.27.1.1.6(a) shall continue to monitor the operability of the telephone line or equivalent means while the telephone line or equivalent means is not functional on a continuous basis or periodically with intervals of not more than 5 min.

When the verification determines that the operability of the telephone line or equivalent means has been restored after being nonfunctional, the audible signal shall be silenced unless the signal has already been silenced in accordance with 2.27.1.1.6(b)(3) and the illuminated visual signal shall be extinguished.

2.27.2 Emergency or standby power system.
Delete and revise Section 2.27.2.4.1 to read as follows:

**2.27.2.4.1** A selector switch(es) marked “ELEVATOR EMERGENCY POWER” in red lettering a minimum of 5 mm (0.25 in.) in height, that is key operated or under a locked cover (see Section 2.27.8), shall be provided to permit the selection of the elevator(s) to operate on the emergency or standby power system. The key shall be Group 3 Security (see Section 8.1). (NYC Fire Department and NYC standard keys.)

Delete and revise Section 2.27.2.4.3 to read as follows:

**2.27.2.4.3** Means shall be provided adjacent to the selector switch(es) to indicate that the elevator is at the designated level with the doors in the normally open position.

Delete and revise the Note to Section 2.27.3 to read as follows:

**2.27.3 Firefighters’ Emergency Operation: Automatic elevators.**

Delete and revise Section 2.27.3.1 to read as follows:

**2.27.3.1 Phase I Emergency Recall Operation.**

**2.27.3.1.1** A two-position key-operated switch that will not change position without a deliberate action by the user, shall be

(a) provided at the designated or sky lobby level for each single elevator or for each group of elevators.

(b) labeled “FIRE RECALL” and its positions marked “NORMAL” and “FIREMAN SERVICE” (in that order). The “FIRE RECALL” letters shall be a minimum of 5 mm (0.25 in.) high. Text shall be either red on a background that contrasts with red, or a color that contrasts with red on a red background.

(c) located in the lobby or sky lobby within sight of the elevator or all elevators in that group and shall be readily accessible.

Delete and revise Section 2.27.3.1.2 to read as follows:

**2.27.3.1.2** An additional key-operated “FIRE RECALL” switch, with two positions that will not change position without a deliberate action by the user, marked “NORMAL” and “FIREMAN
SERVICE” (in that order), shall be permitted only at the fire command center and the secondary fire command center where provided.

Delete and revise Section 2.27.3.1.3 to read as follows:

2.27.3.1.3 The switch(es) shall be rotated clockwise to go from the “NORMAL” to “FIREMAN SERVICE” positions. Keys shall be removable in the “NORMAL” and “FIREMAN SERVICE” positions.

Delete and revise Section 2.27.3.1.5 to read as follows:

2.27.3.1.5 All “FIRE RECALL” switches shall be provided with an illuminated visual signal (see Fig. 2.27.3.1.6(h)) to indicate when Phase I Emergency Recall Operation is in effect.

Delete and revise Section 2.27.3.1.6 to read as follows:

2.27.3.1.6 When a “FIRE RECALL” switch is in the “FIREMAN SERVICE” position, all cars controlled by the switch shall operate as follows:

(a) A car traveling towards the designated or sky lobby level shall continue nonstop to the designated or sky lobby level and power operated doors shall open and remain open. On cars with more than one entrance, if the doors for another entrance can be opened at the designated or sky lobby level, only the doors serving the lobby where the “FIRE RECALL” switch is activated shall automatically open and remain open. Once at the designated or sky lobby level, all in-car door open button(s) shall be operative. Once the doors at an entrance other than the entrance serving the lobby where the “FIRE RECALL” switch is activated, are opened by means of an in-car door open button, they shall initiate reclosing within 15 s of reaching the normal open position.

(b) A car traveling away from the designated or sky lobby level shall reverse at or before the next available landing without opening its doors and proceed to designated or sky lobby level.

(c) A stopped car shall have the in-car stop switch (see Section 2.26.2.21) and the emergency stop switch in the car (see Section 2.26.2.5) when provided, rendered inoperative as soon as the car moves away from the landing. A moving car shall have the in-car stop switch and the emergency stop switch in the car when provided, rendered inoperative without delay. Once the emergency stop switch in the car and the in-car stop switch have been rendered inoperative, they shall remain inoperative while the car is on Phase I Emergency Recall Operation. All other stop switches required by Section 2.26.2 shall remain operative.

(d) A car standing at a landing other than the designated or sky lobby level, with the doors open and the in-car stop switch and the emergency stop switch in the car when provided, in the run position, shall conform to the following:

(1) Elevators having automatic power-operated horizontally sliding doors shall close the doors without delay and proceed to the designated level.
(2) Elevators having power-operated vertically sliding doors provided with automatic or momentary pressure closing operation shall have the closing sequence initiated without delay in accordance with Section 2.13.3.4, and the car shall proceed to the designated level.

(3) Elevators having power-operated doors provided with continuous pressure closing operation (see Section 2.13.3.2), or elevators having manual doors, shall be provided with a visual and audible signal system [see Subsection 2.27.3.1.6(h)] to alert an operator to close the doors and shall, when the doors are closed, proceed to the designated level. Sequence operation, if provided, shall remain effective.

(e) Door reopening devices for power-operated doors that are sensitive to smoke or flame shall be rendered inoperative without delay. Door reopening devices not sensitive to smoke or flame (e.g., mechanically actuated devices) are permitted to remain operative.

(1) Door closing for power-operated horizontally sliding doors shall conform to Section 2.13.5.

(2) Door closing for power-operated vertically sliding doors shall conform to Section 2.13.6.1.2 and shall have an average closing car door or gate speed not to exceed 0.20 m/s (0.67 ft/s).

(f) Floor selection means, lanterns, and indicators

(1) in the car

(a) floor selection means shall be rendered inoperative

(b) car call-registered lights and car lanterns, where provided, shall be extinguished and remain inoperative

(c) position indicators and car-direction indicators, where provided, shall remain operative

(2) at the fire command center and secondary fire command center where provided

(a) position indicators and car-direction indicators shall remain operative

(3) at the designated or sky lobby level

(a) hall call-registered lights and hall lanterns, where provided, shall be extinguished and remain inoperative

(b) position indicators and car-direction indicators, where provided, shall remain operative
(4) at all landings, except at the designated or sky lobby level

(a) hall call-registered lights and hall lanterns, where provided, shall be extinguished and remain inoperative

(b) position indicators and car-direction indicators, where provided, shall be extinguished and remain inoperative

(g) Where provided on elevators with vertically sliding doors, corridor door open and door close buttons shall remain operative.

(h) An illuminated visual and audible signal system shall be activated. The visual signal shall be one of the symbols shown in Fig. 2.27.3.1.6(h) and located on the car-operating panel. The entire circular or square area or the outline of the hat, or the outline of the area shown in Fig. 2.27.3.1.6(h) shall be illuminated. The visual signal shall remain activated until the car is restored to automatic operation. When the door is open, the audible signal shall remain active until the door is closed. When the door is closed, the audible signal shall remain active for a minimum of 5 s. The audible signal shall not be active when the car is at the recall level.

(i) A car stopped at a landing shall have the in-car door open button(s) rendered inoperative as soon as the car moves away from the landing. The in-car door open button(s) shall remain inoperative when a car stops to reverse direction. Once the in-car door open button(s) has been rendered inoperative, it shall remain inoperative until the car has returned to the designated level.

(j) Where additional “FIRE RECALL” switches are provided, any “FIRE RECALL” switches shall be in the “FIREMAN SERVICE” position to recall the elevator to the designated level if the elevator was recalled to the alternate level (see 2.27.3.2.4).

(k) To remove the elevator(s) from Phase I Emergency Recall Operation, the “FIRE RECALL” switch shall be rotated to the “NORMAL” position, provided that

(1) the additional two-position “FIRE RECALL” switch, where provided, is in the “NORMAL” position

(2) no fire alarm initiating device is activated (see Section 2.27.3.2)

(l) Means used to remove elevators from normal operation shall not prevent Phase I Emergency Recall Operation, except

(1) as specified in this Code

(2) as controlled by elevator personnel

(m) No device that measures load shall prevent operation of the elevator.
(n) If the normal power supply, emergency power supply, and standby power supply are not available and the elevator is equipped with an alternate source of power that can move the car to a floor, but is insufficient to move the car to the recall level, the following requirements shall apply:

(1) The visual signal [2.27.3.1.6(h)] shall extinguish.

(2) A car that is not at a landing shall move to the closest landing it is capable of reaching.

(3) A car that has automatic power-operated horizontally sliding doors or power-operated vertically sliding doors provided with automatic closing operation and is stopped at a landing, shall open the doors, and then within 15 s, initiate reclosing.

(4) A car that is stopped at a landing shall have its door open button operative.

(5) A car stopped at a landing shall not move until normal power, emergency power, or standby power becomes available.

2.27.3.2 Phase I Emergency Recall Operation by fire alarm initiating devices.

Delete and revise Section 2.27.3.2.1 to read as follows:

2.27.3.2.1 Smoke detectors or other automatic fire detectors in environments not suitable for smoke detectors (fire alarm initiating devices) used to initiate Phase I Emergency Recall Operation shall be installed in conformance with the requirements of NFPA 72, and shall be located

(a) at each elevator lobby served by the elevator

(b) in the associated elevator machine room, machinery space containing a motor controller or driving machine, control space, or control room

(c) in the elevator hoistway, when sprinklers are located in those hoistways
Delete and revise Section 2.27.3.2.2 to read as follows:

2.27.3.2.2 Sprinkler Waterflow Alarm. In a building equipped throughout with an automatic sprinkler system, the activation of the waterflow alarm shall cause Phase I emergency recall operation to be initiated.

Delete and revise Subsections (c) and (e) of Section 2.27.3.2.3 to read as follows:

2.27.3.2.3 Phase I Emergency Recall Operation to the designated level shall conform to the following:

(c) The activation of a fire alarm initiating device specified in Subsection 2.27.3.2.1(c) shall cause all elevators having any equipment in that hoistway, and any associated elevators of a group automatic operation, to be returned nonstop to the designated level, except that initiating device(s) installed at or below the designated landing shall cause the car to be sent to the alternate level.

(d) The Phase I Emergency Recall Operation to the designated level shall conform to Subsections 2.27.3.1.6(a) through (n).

Delete and revise Section 2.27.3.2.5 to read as follows:

2.27.3.2.5 The recall level shall be determined by the first activated fire alarm initiating device for that bank (see Section 2.27.3.2.1 or 2.27.3.2.2). If the car(s) is recalled to the designated level by the “FIRE RECALL” switch(es) [see also 2.27.3.1.6(j)], the recall level shall remain the designated level.

Delete and revise Section 2.27.3.2.7 to read as follows:

2.27.3.2.7 Listed relay(s) or other listed appliance(s) as specified and defined in NFPA 72 for connection to the fire alarm system shall be provided, and shall be

(a) installed in conformance with the requirements of NFPA 72

(b) used to initiate Phase I Emergency Recall Operation

(c) located outside of any room or space requiring Group I Security (see 8.1)

Delete and revise Section 2.27.3.3 to read as follows:

2.27.3.3 Phase II Emergency In-Car Operation. A three-position (“NORMAL”, “HOLD,” and “FIREMAN SERVICE”, in that order) key-operated switch that will not change position without a deliberate action by the user, shall be labeled “FIRE OPERATION,” provided in an operating panel in each car, and shall be readily accessible. The label “FIRE OPERATION” lettering shall be a minimum of 5 mm (0.25 in.) high. Text shall be either red on a background that contrasts with red, or a color that contrasts with red on a red background. It shall become
effective only when Phase I Emergency Recall Operation is in effect and the car has been returned to the recall level.

The switch shall be rotated clockwise to go from “NORMAL” to “HOLD” to “FIREMAN SERVICE”. The key shall only be removable in the “NORMAL” and “HOLD” position. For elevators with power-operated doors, the “NORMAL”, “HOLD,” and “FIREMAN SERVICE” positions shall not change the mode of operation within Phase II Emergency In-Car Operation until the car is at a landing with the doors in the normal open position, except as required by Sections 2.27.3.3.4 and 2.27.3.4. The three modes of operation within Phase II In-Car Operation, “NORMAL”, “HOLD,” and “FIREMAN SERVICE”, are specified by Sections 2.27.3.3.1 through 2.27.3.3.4.

For elevators with manual doors, after the car and hoistway doors have been opened at least once at the recall level, the “NORMAL”, “HOLD,” and “FIREMAN SERVICE” positions shall then change the mode of operation in accordance with Sections 2.27.3.3.1 through 2.27.3.3.4.

Delete and revise Section 2.27.3.3.1 to read as follows:

2.27.3.3.1 When the “FIRE OPERATION” switch is in the “FIREMAN SERVICE” position, the elevator shall be on Phase II Emergency In-Car Operation, for use by emergency personnel only, and the elevator shall operate as follows:

(a) The elevator shall be operable only by a person in the car.

(b) Floor selection means, lanterns, and indicators

(1) in the car

(a) floor selection means shall function as required in Subsection 2.27.3.3.1(i)

(b) car call-registered lights, where provided, shall remain operative

(c) car lanterns, where provided, shall remain inoperative

(d) position indicators and car-direction indicators, where provided, shall remain operative

(2) at the fire command center

(a) position indicators and car-direction indicators, where provided, shall remain operative

(3) at the designated level

(a) the car shall not respond to hall calls
(b) hall call-registered lights, where provided, shall remain inoperative, except where associated cars of a group have been returned to group automatic operation

(c) position indicators and car-direction indicators, where provided, shall remain operative

(4) at all landings, except at the designated level

(a) the car shall not respond to hall calls

(b) hall call-registered lights, where provided, shall remain inoperative, except where associated cars of a group have been returned to group automatic operation

(c) position indicators, car-direction indicators, and hall lanterns, where provided, shall remain inoperative

(c) Door open and close buttons shall be provided for power-operated doors only and located as required by Section 2.27.3.3.7. Buttons shall be a minimum of 19 mm (0.75 in.) in the smallest dimension. The door open and door close buttons shall be labeled “OPEN” and “CLOSE” and when applicable “REAR OPEN” and “REAR CLOSE” or “SIDE OPEN” and “SIDE CLOSE” in lettering a minimum of 5 mm (0.25 in.) in height with a contrasting background. The labeling shall be on or adjacent to the buttons. The door open and close buttons shall be operative when the elevator is stopped within an unlocking zone.

(d) The opening of power-operated doors shall be controlled only by a continuous-pressure door open button. If the button is released prior to the doors reaching the normal open position, the doors shall automatically reclose. Requirements 2.13.3.3, 2.13.3.4, 2.13.4.2.1(b)(2), and 2.13.4.2.1(c) do not apply. All door open button(s) in the car shall be operational.

(e) Open power-operated doors shall be closed only by momentary pressure on the door close button. Where provided, additional door close button(s) in the car shall be operational.

(f) Opening and closing of power-operated car doors or gates that are opposite manual swing or manual slide hoistway doors shall conform to 2.27.3.3.1(d) and (e).

(g) All door reopening devices, except the door open button(s), shall be rendered inoperative. Full-speed closing shall be permitted. Landing door opening and closing buttons, where provided, shall be rendered inoperative.

(h) Every car shall be provided with a button labeled “CALL CANCEL” that shall be effective during Phase II Emergency In-Car Operation. When activated, all registered calls shall be canceled and a traveling car shall stop at or before the next available landing. The button shall be a minimum of 19 mm (0.75 in.) in the smallest dimension. Button labeling
shall be in lettering a minimum of 5 mm (0.25 in.) in height with a contrasting background. The labeling shall be on or adjacent to the button.

(i) Floor selection means shall be provided in the car to permit travel to all landings served by the car, and shall be operative at all times, except as in Sections 2.27.3.3.2 and 8.12.1. Means to prevent the operation of the floor selection means or door-operating buttons shall be rendered inoperative. Floor selection means that provide access to all landings served by the elevator shall be located below the firefighters’ operating devices. The floor selection means shall be operable without the use of keys, cards, tools, or special knowledge. Where buttons not accessible to the public are provided, they shall be a minimum of 19 mm (0.75 in.) in the smallest dimension.

(j) A traveling car shall stop at the next available landing for which a car call was registered. When a car stops at a landing, all registered car calls shall be canceled.

(k) Means used to remove elevators from normal operation shall not prevent Phase II Emergency In-Car Operation, except

(1) as specified in this Code

(2) as controlled by elevator personnel

(l) No device that measures load shall prevent operation of the elevator at or below the capacity and loading required in Section 2.16.

(m) If the normal power supply, emergency power supply, and standby power supply are not available and the elevator is equipped with an alternate source of power that can move the car to a floor, but is insufficient to move the car to all landings, the following requirements shall apply:

(1) The visual signal [2.27.3.1.6(h)] shall illuminate intermittently.

(2) A car that is not at a landing shall not start until a car call is entered. After a car call is entered, the car shall move to the closest landing it is capable of reaching.

(3) A car stopped at a landing shall not move until normal power, emergency power, or standby power becomes available.

Delete and revise Sections 2.27.3.3.3, 2.27.3.3.4, and 2.27.3.3.5 to read as follows:

2.27.3.3.3 When the car is at a landing other than the recall level, with the doors in the normal open position, and the “FIRE OPERATION” switch is in the “NORMAL” position, power-operated doors shall operate as follows:

(a) Horizontal sliding doors shall close automatically. All door reopening devices shall remain inoperative. Door open buttons in the car shall remain operative. Full-speed closing is permitted. If the “FIRE OPERATION” switch is turned to the “FIREMAN SERVICE” or “HOLD” position prior to the completion of door closing, the doors shall reopen.
(b) Elevators having vertically sliding doors shall have corridor “DOOR OPEN” and “DOOR CLOSE” buttons rendered operative. All door reopening devices shall remain inoperative. Door closing shall be in accordance with Subsection 2.27.3.3.1(e). Full-speed closing is permitted. If the “FIRE OPERATION” switch is turned to the “FIREMAN SERVICE” or “HOLD” position prior to the completion of door closing, the doors shall reopen.

2.27.3.3.4 When the doors are in the closed position and the “FIRE OPERATION” switch is placed in the “NORMAL” position, the car shall return to the recall level in conformance with Subsections 2.27.3.1.6(a) through (n) and 2.27.3.2.5. If the normal power supply, emergency power supply, and standby power supply are not available and the elevator is equipped with an alternate source of power that can move the car to a floor, and the “FIRE OPERATION” switch in the car is in the “NORMAL” position, the following requirements shall apply:

(a) The visual signal [2.27.3.1.6(h)] shall illuminate intermittently.

(b) The requirements of 2.27.3.1.6(n)(2) through (5) shall apply.

2.27.3.3.5 Elevators shall be removed from Phase II Emergency In-Car Operation only when the “FIRE OPERATION” switch is in the “NORMAL” position and the car is at the designated level and the doors are in the normal open position.

Delete and revise Section 2.27.3.3.7 to read as follows:

2.27.3.3.7 The “FIRE OPERATION” switch (2.27.3.3), the “CALL CANCEL” button (2.27.3.3.1(h)), and the additional visual signal (2.27.3.3.8), shall be grouped together as shown in Fig. 2.27.3.3.7, exposed and accessible, on the cover of the main car operating panel and shall be located more than 1 220 mm (48 in.) and less than 1 830 mm (72 in.) above the floor as measured to the centerline of the “CALL CANCEL” button, “FIRE OPERATION” switch and visual signal.
Delete Section 2.27.3.3.8 in its entirety.

Delete and revise Subsections (b) and (d) of Section 2.27.3.4 to read as follows:

2.27.3.4 Interruption of power. The failure and subsequent restoration of electrical power (normal, emergency, or standby) shall not cause any elevator to be removed from Phase I Emergency Operation or Phase II Emergency In-Car Operation.

(b) Elevators on Phase II Emergency In-Car Operation with the key in the “NORMAL” position shall be permitted to move only to the next floor in the direction of the recall level to reestablish absolute car position prior to conforming to Sections 2.27.3.3.3 and 2.27.3.3.4. If the key is moved to the “FIREMAN SERVICE” or “HOLD” position before the doors are fully closed, Subsections 2.27.3.4(c) or (d) shall apply, and automatic power-operated doors shall open if in a leveling zone.

(d) Elevators on Phase II Emergency In-Car Operation with the key in the “FIREMAN SERVICE” position shall not move, except for leveling within a leveling zone, until a car call is entered. Automatic power-operated doors shall not move until a door open or close button is pressed; after which they shall conform to Subsections 2.27.3.3.1(d) and (e). After a car call is entered, the car shall be permitted to move only to the next floor in the direction of the recall level to reestablish absolute car position prior to answering car calls.

Delete and revise Section 2.27.3.5 to read as follows:
2.27.3.5 *Multicompartment elevators.* Multicompartment elevators shall also conform to Sections 2.27.3.5.1 through 2.27.3.5.10 and shall be designed to have a usable hoistway entrance for the lower compartment when the upper compartment is at the designated or alternate level.

When the upper compartment has been recalled to the designated or alternate level and Phase I Emergency Recall Operation is in effect, the car and hoistway doors for both compartments shall open.

Delete and revise Sections 2.27.3.5.1, 2.27.3.5.2, 2.27.3.5.3, 2.27.3.5.4 and add new Sections 2.27.3.5.5 through 2.27.3.5.10 to read as follows:

2.27.3.5.1 The “FIRE RECALL” switch (see Section 2.27.3.1) shall be located at the designated level served by the upper compartment. Where a sky lobby exists, a “FIRE RECALL” switch shall also be located at the floor served by the upper compartment that is immediately above the sky lobby level. This level above the sky lobby level shall be the sky lobby designated level.

2.27.3.5.2 The Phase II Emergency In-Car Operation switch (see Section 2.27.3.3) shall be located in the upper compartment.

2.27.3.5.3 A visual and audible signal (see Subsection 2.27.3.1.6(h)) shall be provided in the main car operating panel of both the upper and lower compartments.

2.27.3.5.4 A minimum 3” diagonal video display shall be installed in the car operating panel of the upper compartment so that the entire floor area in the lower compartment is visible. The display shall show the lower compartment when the upper deck is on Phase I Emergency Recall Operation and is at the designated level with the car doors open and shall remain on during Phase II Emergency In-Car Operation.

2.27.3.5.5 Moving the Phase II Emergency In-Car Operation key switch to the “FIREMAN SERVICE” position shall result in locking out the lower compartment.

(a) When placed in the “FIREMAN SERVICE” position, the control system shall:

(1) disable all door reopening devices in the lower compartment; and

(2) initiate closing of the lower compartment doors in accordance with Subsection 2.13.4.2.1(c).

(b) When the upper compartment is stopped at the designated level, the Phase II Emergency In-Car Operation key switch is in the “NORMAL” position and Phase I Emergency Recall Operation is in effect; the lower compartment doors shall be opened.

2.27.3.5.6 Two-way hands-free voice communication shall be established between the upper and lower compartments when the elevator is on Phase I Emergency Recall Operation, the upper compartment is at the designated or alternate level, and the car and hoistway doors are open. Voice communication between the two compartments shall be maintained until such time as the elevator is returned to normal service.
2.27.3.5.7 A switch labeled “LOWER COMPARTMENT RECOVERY” with two positions marked “OFF” and “ON” shall be located adjacent to the elevator at the designated level. The key shall only be removable when the switch is in the “OFF” position.

(a) When the switch is in the “ON” position, the doors of the upper and lower compartments shall close in accordance with Subsection 2.13.4.2.1(c), and the lower compartment shall move to the designated level.

(b) When the lower compartment arrives at the designated level, the doors of the lower compartment shall open and remain open until the switch is turned to the “OFF” position. The doors of the upper compartment shall remain closed.

(c) When the switch is turned to the “OFF” position, the doors of the lower compartment shall close and the upper compartment shall arrive at the designated level and open the doors.

1. The doors of the upper compartment shall remain open until:

   (i) the elevator is placed on Phase II Emergency In-Car Operation; or

   (ii) the elevator is returned to normal operation.

2. The doors of the lower compartment shall remain closed until such time as:

   (i) the elevator is returned to normal operation;

   (ii) the “LOWER COMPARTMENT RECOVERY” switch is operated and the lower compartment has returned to the designated level; or

   (iii) the elevator is on “FIREMAN SERVICE” Phase I Emergency Recall Operation.

2.27.3.5.8 Activation of a fire alarm initiating device at either the designated level or the level below the designated level shall cause the elevator(s) to travel to the alternate level.

2.27.3.5.9 Activation of a fire alarm initiating device at the sky lobby or the level above the sky lobby (which is the sky lobby designated level) shall cause the elevator(s) to travel to the sky lobby alternate level.

2.27.3.5.10 Alternate levels shall be located in accordance with the following provisions:

(a) Where no blind hoistway exists, the alternate level shall be three (3) levels above the designated level.

(b) Where blind hoistways exist, the alternate level shall be the second level above the blind hoistway.

(c) The sky lobby alternate level shall be three (3) levels above the sky lobby designated level.

Delete and revise Section 2.27.4 to read as follows:
2.27.4 Firefighters’ Emergency Operation: Nonautomatic elevators.

(a) Firefighters’ Emergency Operation shall apply to all nonautomatic elevators except where the hoistway or a portion thereof is not required to be fire-resistive construction (see Section 2.1.1.1), the rise does not exceed 2 000 mm (80 in.), and the hoistway does not penetrate a floor.

(b) Where Firefighters’ Emergency Operation is provided voluntarily, the requirements of Section 2.27.4 shall also apply.

(c) The following signage shall be provided:

(1) A sign stating “Manual Elevator” shall be provided on the inside of the entrance frame of all nonautomatic operated elevators at the designated landing.

(2) Single nonautomatic elevators, or a group of non-automatic elevators, shall be provided with signage indicating “Manual Elevator” on or adjacent to the Phase I Firemens’ Emergency Operation key switch located at the designated landing.

(3) Lettering shall be in accordance with Subsection 2.27.3.1.1(b).

Delete and revise Section 2.27.4.1 to read as follows:

2.27.4.1 Phase I Emergency Recall Operation. A two-position key-operated switch shall be provided at the designated level for each single elevator or for each group of elevators. The two-position switch shall be labeled “FIRE RECALL” and its positions marked “NORMAL” and “FIREMAN SERVICE” (in that order), with the “NORMAL” position as the center position. The “FIRE RECALL” letters shall be a minimum of 5 mm (0.25 in.) high in red or a color contrasting with a red background. The two-position switch shall be located in the lobby within sight of the elevator or all elevators in that group and shall be readily accessible.

An additional “FIRE RECALL” switch with two positions, “NORMAL” and “FIREMAN SERVICE” (in that order), shall be permitted only at the fire command center.

The switch(es) shall be rotated clockwise to go from the “NORMAL” to the “FIREMAN SERVICE” positions. All keys shall be removable only in the “NORMAL” and “FIREMAN SERVICE” positions.

Only the “FIRE RECALL” switch(es) or fire alarm initiating devices located at floors that are served by the elevator, in the hoistway, or in an elevator machine room, a control space, or a control room (see Section 2.27.3.2) shall initiate Phase I Emergency Recall Operation.

All “FIRE RECALL” switches shall be provided with an illuminated visual signal to indicate when Phase I Emergency Recall Operation is in effect.

When all switches are in the “NORMAL” position, normal elevator service shall be in effect and the fire alarm initiating devices required by Section 2.27.4.2 shall be operative.
When a “FIRE RECALL” switch is in the “FIREMAN SERVICE” position, a visual and audible signal shall be provided to alert the attendant to return nonstop to the designated or alternate level. The visual signal shall read “FIRE RECALL — RETURN TO _____” [insert level to which the car should be returned (the designated or alternate level)]. The signal system shall be activated when Phase I Emergency Recall Operation is in effect.

Where an additional “FIRE RECALL” switch is provided, any “FIRE RECALL” switch must be in the “FIREMAN SERVICE” position to recall the elevator to the designated level if the elevator was recalled to the alternate level.

Any “FIRE RECALL” switch shall not affect the visual signal if the designated level fire alarm initiating device (see Section 2.27.3.2.4) has been activated.

To extinguish the audible and visual signals, the “FIRE RECALL” switch shall be rotated to the “NORMAL” position, provided that:

(a) the additional two-position “FIRE RECALL” switch, where provided, is in the “NORMAL” position

(b) no fire alarm initiating device is activated (see also Section 2.27.3.2.4)

No device, that measures load, shall prevent operation of the elevator at or below the capacity and loading required in Section 2.16.

Delete and revise Section 2.27.4.2 to read as follows:

2.27.4.2 Phase I Emergency Recall Operation by fire alarm initiating devices.

(a) Fire alarm initiating devices shall be installed, in the locations listed in Subsections 2.27.4.2(a)(1) through (3), in compliance with the requirements in NFPA 72 as follows:

(1) at each elevator lobby served by the elevator

(2) in the associated elevator machine room, machinery space containing a motor controller or driving machine, control space, or control room

(3) in the elevator hoistway, when sprinklers are located in those hoistways

(b) Phase I Emergency Recall Operation, conforming to Section 2.27.4.1, shall be initiated when any Phase I Emergency Recall Operation fire alarm initiating device specified in Subsection 2.27.4.2(a) is activated.

(c) Phase I Emergency Recall Operation, when initiated by a Phase I Emergency Recall Operation fire alarm initiating device, shall be maintained until canceled by moving the “FIRE RECALL” switch to the “NORMAL” position.

(d) When a fire alarm initiating device in a location specified by Subsections 2.27.4.2(a)(2) or (3) initiates Phase I Emergency Recall Operation as required by Sections 2.27.3.2.3
or 2.27.3.2.4, the visual signal [see 2.27.3.1.6(h) and Fig. 2.27.3.1.6(h)] shall illuminate intermittently only in a car(s) with equipment in that location.

2.27.5 Firefighters’ Emergency Operation: automatic elevators with designated-attendant operation.

Delete and revise Section 2.27.5.2 to read as follows:

2.27.5.2 When operated by a designated attendant in the car,

(a) elevators parked at the recall level shall conform to Section 2.27.3 and when Occupant Evacuation Operation is provided shall also conform to Section 2.27.11.6 without delay; elevators parked at a floor other than the recall level shall conform to Subsection 2.27.3.1.6(h). At the completion of a time delay of not less than 10 seconds and not more than 30 seconds, elevators parked at a floor away from the recall level shall conform to Section 2.27.3 and when Occupant Evacuation Operation is provided shall also conform to Section 2.27.11.6.

(b) a moving car shall conform to Section 2.27.3 and when Occupant Evacuation Operation is provided shall also conform to Section 2.27.11.6.

Exception. The provisions of Section 2.27.5.2 do not apply to hospital service.

Delete and revise Section 2.27.5.3 to read as follows:

2.27.5.3 When an elevator that is provided with Firefighters’ Emergency Operation or Occupant Evacuation Operation is on hospital service, a visual signal as shown in Fig. 2.27.3.1.6(h) shall illuminate and a continuous audible signal, audible within the car, shall sound when a “FIRE RECALL” switch (see Sections 2.27.3.1 and 2.27.11.1.2) is in the “FIREMEN SERVICE” position, or when a fire alarm initiating device (see Section 2.27.3.2) is activated to alert the operator of an emergency. There may be a means located in the car for manually silencing the audible signal, after the signal has been active for at least 5 seconds.

The signal shall be automatically reactivated when the doors open. The car shall remain under control of the operator until removed from hospital service. An elevator on Firefighters’ Emergency Operation or Occupant Evacuation Operation shall not be placed on hospital service.

Add new Sections 2.27.5.3.1 through 2.27.5.3.3 to read as follows:

2.27.5.3.1 Hospital Emergency Service Recall Operation (when provided). A two-position key-operated corridor call (Hospital Emergency Service) switch shall be provided at one or more landings to activate the special control function by authorized or designated personnel. The two-position switch shall be marked “NORMAL” and “HOSPITAL EMERGENCY SERVICE”. Keys shall be removed only in the “NORMAL” position.

When the switch is in the “HOSPITAL EMERGENCY SERVICE” position:
(a) All patient elevator cars equipped with the special control function shall override normal automatic operating modes for immediate recall of the patient elevator(s) to the landing at which the call is registered.

(b) On patient elevator cars with two entrances, if both entrances can be opened at the designated level, the doors serving the corridor where the two-position Hospital Emergency Service switch is located shall open and remain open.

(c) A patient elevator car traveling away from the designated level shall reverse at or before the next available landing without opening its doors.

(d) A patient elevator car stopped at a landing other than the designated level, with the doors open and in-car emergency stop switch in the run position, shall close the doors without delay and proceed to the designated level.

(e) A visual and audible signal shall be activated within the patient elevator car to alert the passengers and/or attendant operator that the “Hospital Emergency Service” function has been activated.

(f) Upon arrival at the registered call landing, power operated doors shall open automatically and remain in the open position for a predetermined adjustable time period to allow the authorized personnel sufficient time to activate the “In-Car” special operation function.

(g) If the Phase I (Section 2.27.3.1) recall mode is initiated while the elevator is under “Hospital Emergency Service” recall mode and “In-Car” hospital emergency service is not activated, the elevator shall revert to Phase I (Section 2.27.3.1) operation.

(h) Hospital emergency service corridor recall shall not override fire emergency Phase I (Section 2.27.3.1) or Phase II (Section 2.27.3.3) operation in effect.

2.27.5.3.2 Hospital Emergency Service In-Car Operation: A two-position “NORMAL” and “HOSPITAL EMERGENCY SERVICE” key-operated switch shall be provided in an operating panel inside the patient elevator(s) to activate the “Hospital Emergency Service”, a special independent operating mode. The switch shall be rotated clockwise to go from the “NORMAL” to “HOSPITAL EMERGENCY SERVICE” position. It shall become effective only when the designated level corridor call “Hospital Emergency Service” switch is in the “HOSPITAL EMERGENCY SERVICE” position and the car has returned to the designated level by “Hospital Emergency Service” recall operation.

When the “In-Car” switch is in the “HOSPITAL EMERGENCY SERVICE” position, the patient elevator shall be on Hospital Emergency Service operation, and the patient elevator shall operate as follows:

(a) The patient elevator shall be operable only by a designated person in the car.

(b) Activation of the “In-Car” operating mode shall remove the patient elevator from normal automatic and/or attendant service.
(c) The patient elevator(s) shall not be recalled under Phase I (Section 2.27.3.1) operation after the activation of “In-Car” operation mode.

(d) Doors shall remain open until the authorized person registers the car call and initiates the door closing function.

(e) The patient elevator shall travel directly to the selected landing, overriding normal corridor call demand or Phase I (Section 2.27.3.1) recall and shall automatically open the doors upon the arrival at the selected landing, except when the smoke detector(s) are activated on the selected landing or the workflow alarm is activated on that floor. In such case, before the patient elevator has reached the selected landing, the patient elevator shall stop at a floor two stories below the selected landing or in the absence of a stop at that floor, at the nearest landing below the selected landing.

(f) When the patient elevator reaches the selected floor and the smoke detector(s) are activated on that landing or the workflow alarm is activated on that floor before the doors are open, the patient elevator, without opening the doors, shall travel to a floor two stories below the selected landing or in the absence of a stop at that floor, to the nearest landing below the selected landing.

(g) Doors shall remain open with the audible and visual signal functioning until the “in-Car” switch is turned to the “NORMAL” position or for a predetermined adjustable time period to allow the removal of patients from the car and the patient elevator is placed into automatic, attendant or Phase I (Section 2.27.3.1) if in effect, operating mode.

(h) Upon transfer from “HOSPITAL EMERGENCY SERVICE” back to normal operation during a fire emergency and Phase I (Section 2.27.3.1) is in effect, the patient elevator shall be automatically recalled to the designated level.

2.27.5.3.3 Hospital Emergency Service switches color. The color of the Hospital Emergency Service switches located in the corridor at the designated level and inside the patient elevator(s) operating panel shall be “BLUE”.

2.27.6 Firefighters’ Emergency Operation, Occupant Evacuation Operation: Inspection Operation.

Delete and revise Section 2.27.6 to read as follows:

2.27.6 Firefighters’ Emergency Operation, Occupant Evacuation Operation: Inspection Operation.

When an elevator that is provided with Firefighters’ Emergency Operation or Occupant Evacuation Operation is on inspection operation (see Sections 2.26.1.4 and 2.26.1.5) or when a hoistway access switch has been enabled (see Subsection 2.12.7.3.3(a)), a continuous audible signal, audible at the location where the inspection operation is activated, shall sound when a “FIRE RECALL” switch (see Sections 2.27.3.1 and 2.27.11.1.2) is in the “FIREMAN SERVICE” position or when the fire alarm initiating device (see Sections 2.27.3.2 and 2.27.11.5) is activated to alert the operator of an emergency. The car shall remain under the
control of the operator until removed from inspection operation or hoistway access operation. Inspection operation or hoistway access operation shall take precedence over Phase I Emergency Recall Operation, Phase II Emergency In-Car Operation, and Occupant Evacuation Operation.

2.27.7 Firefighters’ Emergency Operation: Operating procedures.

Delete Section 2.27.7 in its entirety.

2.27.8 Switch keys.

Delete and revise Section 2.27.8 to read as follows:

2.27.8 Switch keys.

The switches required by Section 2.27.2 through Section 2.27.5 for all elevators in a building shall be operable both by a citywide standard (2642) key and the New York City Fire Department standard (1620) key.

The citywide standard key and Fire Department standard key shall be designed in accordance with the requirements of the Fire Department. The Fire Department standard key (1620) shall be obtained only through Fire Department authorization.

Citywide standard keys shall be kept on the premises by a person responsible for the maintenance and operation of the elevators in a location readily accessible to authorized persons in an emergency, but not where they are available to the public.

2.27.11 Occupant Evacuation Operation.

Delete and revise the Note to Section 2.27.11 to read as follows:

2.27.11 Occupant Evacuation Operation.

Where elevators are provided for occupant evacuation, Occupant Evacuation Operation (OEO) shall be provided to function prior to Firefighter’s Emergency Operation and shall conform to 2.27.11.1 through 2.27.11.6.

NOTE: See also Nonmandatory Appendix V for additional information.

Delete and revise Sections 2.27.11.1, 2.27.11.2, and 2.27.11.3 to read as follows:

2.27.11.1 The requirements of Section 2.27.3.1 are modified as follows.

2.27.11.1.1 The two-position switch in the lobby (Section 2.27.3.1.1) and two-position switch in the fire command center (Section 2.27.3.1.2) shall be labeled “BANK FIRE RECALL” and indicate the elevator bank that they control.

2.27.11.1.2 An additional two-position key operated individual “CAR FIRE RECALL” switch per elevator, that will not change position without a deliberate action by the user, shall be
located in the lobby at the designated level adjacent to the elevator it controls. Each switch shall be labeled “CAR FIRE RECALL” (with the car identification, as specified in Section 2.29.1, inserted), and its positions marked “NORMAL” and “FIREMEN SERVICE” (in that order) in letters a minimum of 5 mm (0.25 in.) high. Text shall be black on a yellow background. Each switch shall control the associated elevator in conformance with Section 2.27.3.1.6, but shall not control the other elevators controlled by the “BANK FIRE RECALL” switch (see Section 2.27.11.1).

2.27.11.1.3 Each individual “CAR FIRE RECALL” switch shall terminate Occupant Evacuation Operation for the elevator it controls when placed in the “FIREMEN SERVICE” position. Each “BANK FIRE RECALL” switch shall terminate Occupant Evacuation Operation for the elevators it controls when placed in the “FIREMEN SERVICE” position.

2.27.11.1.4 Each individual “CAR FIRE RECALL” switch shall be provided with an illuminated visual signal to indicate when Phase I Emergency Recall Operation is in effect for that car (see Section 2.27.3.1.5).

2.27.11.1.5 To remove an individual elevator from Phase I Emergency Recall Operation, the individual “CAR FIRE RECALL” switch shall be rotated to the “NORMAL” position, provided that

(a) the “BANK FIRE RECALL SWITCH” and the additional two-position “GROUP FIRE RECALL” “BANK FIRE RECALL” switch, where provided, are in the “NORMAL” position; and

(b) no fire alarm initiating device is activated (see Section 2.27.3.2).

2.27.11.1.6 A car with its individual “CAR FIRE RECALL” switch in the “FIREMEN SERVICE” position shall not be removed from Phase I Emergency Recall Operation when the “BANK FIRE RECALL” switch is rotated to the “NORMAL” position.

2.27.11.1.7 At the elevator designated level, only the door(s) serving the lobby where the “BANK FIRE RECALL” switch is located shall open.

2.27.11.2 The sign required by Section 2.27.9 shall not be installed. A variable message sign, as defined in ANSI/ICC A117.1, shall be installed for each elevator bank on each landing served. It shall be located not less than 2 130 mm (84 in.) and not more than 3 000 mm (120 in.) above the floor and in a central visible location within the elevator lobby. Message text shall be a minimum of 50 mm (2 in.) high and conform to ANSI/ICC A117.1. The variable message signs shall be powered by the same power supply as the elevator, including emergency or standby power.

When the elevators are not on Occupant Evacuation Operation or Firefighters’ Emergency Operation, the variable message signs shall not display other elevator system status messages.

2.27.11.3 Where hoistway pressurization is provided, a car on Phase I Emergency Recall, after completing the requirements of Section 2.27.3.1.6, shall conform to the following:
(a) A car shall close its doors after 15 seconds.

(b) Door reopening devices, door force limiting devices, kinetic energy limiting devices, and the door open button shall remain active.

(c) At least one operating device normally used to call a car to the landing (e.g., hall call button, keypad) shall be located in the elevator lobby at the elevator designated level. Actuating this device shall cause all recalled cars to open their doors for 30 seconds to 45 seconds, then reclose.

2.27.11.5 Fire alarm system interface.

Delete and revise Sections 2.27.11.5.1 and 2.27.11.5.2 to read as follows:

2.27.11.5.1 Upon activation of an automatic fire alarm initiating device in the building in any area that does not initiate Phase I recall in this bank, the fire alarm system shall provide signals to the elevator system in conformance with NFPA 72, as modified by Appendix Q of the New York City Building Code and any applicable rules, indicating the floors to be evacuated. The floors to be evacuated shall be a contiguous block of floors, consisting of at least the floor with an active alarm, one floor above and one floor below. The elevator system shall initiate Occupant Evacuation Operation in accordance with Section 2.27.11.6 for the indicated floors. If activation of an automatic fire alarm initiating device which does not initiate Phase I recall in this bank occurs on any additional floor at any time while Occupant Evacuation Operation in accordance with Section 2.27.11.6 is in effect, the evacuation zone shall be expanded to include all floors with an active alarm, all floors between the highest and lowest floor with an active alarm plus one floor above the highest floor with an active alarm and one floor below the lowest floor with an active alarm. If the active alarm is on the elevator designated level, automatic initiation of Occupant Evacuation Operation in accordance with Section 2.27.11.6 shall not be permitted. Initiation by authorized or emergency personnel shall be provided through manual operation of the fire alarm system.

For the purposes of this section, an active alarm refers to the condition caused by the activation of an automatic fire alarm initiating device.

2.27.11.5.2 A means to initiate total building evacuation, labeled “ELEVATOR TOTAL BUILDING EVACUATION,” shall be provided at the fire command center location and installed in accordance with NFPA 72, as modified by Appendix Q of the New York City Building Code and any applicable rules. When this means is actuated, the fire alarm system shall provide a signal to the elevator system indicating that all floors are to be evacuated. The means to initiate total building evacuation shall be keyed as New York City standard #2642 and FDNY standard key.

Delete and revise Sections 2.27.11.6.1, 2.27.11.6.2, and 2.27.11.6.3 to read as follows:

2.27.11.6.1 The variable message signs required by Section 2.27.11.2 shall indicate one of the following messages:
(a) On all floors being evacuated, they shall indicate that the elevators are available for evacuation and the estimated time duration in minutes for the next elevator to arrive.

Text shall read: “Elevators and stairs available for evacuation. Next car in about “X” minutes.”

(b) On all floors not being evacuated, they shall indicate that elevator service is not available.

Text shall read: “Elevators temporarily dedicated to other floors.”

(c) On the elevator designated level, they shall indicate that the cars are in evacuation mode and that passengers should not use elevators.

Text shall read: “Elevators dedicated to evacuation. Do not enter elevator.”

(d) If no elevators are available for Occupant Evacuation Operation (fire service, inspection, shut off, etc.), they shall indicate that elevator service is not available.

On all floors being evacuated, they shall also indicate that occupants should use the stairs.

Text for floors being evacuated: “Elevators out of service. Use stairs to evacuate.”

Text for other floors: “Elevators out of service.”

2.27.11.6.2 Automatic visual signal or variable message sign, and voice notification in each car shall indicate that the car is being used to evacuate the building.

In the event that the car stops to pick up passengers at a floor other than the elevator designated level, the signals shall instruct the passengers to remain in the car.

Upon or prior to arrival at the elevator designated level, passengers shall be notified that they have arrived at the exit floor and to exit quickly. Message text shall be a minimum of 25 mm (1 in.) high and conform to ANSI/ICC A117.1. Voice notification shall be at least 10 dBA above ambient but not more than 80 dBA measured 1.525 mm (60 in.) above the floor, at the center of the car.

2.27.11.6.3 All landing calls outside of the contiguous block of floors being evacuated shall be canceled and disabled. Building security systems that limit service to these floors shall be overridden. Any landing call within the contiguous block of floors shall call an elevator or elevators to that landing. Landing calls entered at the floor with an active alarm shall be given higher priority than the calls at the floors above and below it. If a subsequent active alarm is received from a different floor, the evacuation priority shall be assigned in the sequence received. Once passengers have entered an elevator, it shall proceed only towards the elevator designated level. When total building evacuation is in effect and no calls are entered at an affected floor, priority shall be based on distance from the elevator designated level, with the farthest floor served getting highest priority.

Delete and revise Section 2.27.11.6.6 to read as follows:
2.27.11.6.6 Cars that are occupied when Occupant Evacuation Operation is actuated shall proceed without delay to the elevator designated level. Any reversal of travel direction that is needed shall be done at or before the next available floor without opening the doors. After opening and closing the doors at the elevator designated level, the cars shall proceed without delay to a floor that is being evacuated and park with their doors closed until a landing call is registered.

Delete and revise Section 2.27.11.6.9 to read as follows:

2.27.11.6.9 Once the block of floors being evacuated has been evacuated, as indicated by a 60 second period in which no landing calls are registered, one car shall park with its doors closed at the lowest floor of the block of floors ready to answer subsequent landing calls within the block of floors; the rest shall park with doors closed at the elevator designated level. A car parked at the elevator designated level shall replace the car at the lowest floor of the block that has answered a landing call.

SECTION 2.28
LAYOUT DRAWINGS

2.28.1 Information required on layout drawings.

Add new Subsection (k) to Section 2.28.1 to read as follows:

Elevator layout drawings shall, in addition to other data, indicate the following:

(k) any special operation of the elevator including, but not limited to, Occupancy Evacuation Operation (OEO) or Fire Service Access Elevator (FSAE)

SECTION 2.29
IDENTIFICATION

2.29.1 Identification of equipment.

Delete and revise Section 2.29.1 to read as follows:

2.29.1 Identification of Equipment

2.29.1.1 Each elevator shall be assigned a unique alpha-numeric or numerical identification, a minimum of 50 mm (2 in.) in height. The identification number shall be applied to the following locations:

(a) The driving machine;

(b) MG and/or Transformers set;

(c) Controller;

(d) Selector;
(e) Governor;

(f) Main line disconnect switch;

(g) The crosshead, or where there is no crosshead, the car frame, such that it is visible from the top of the car;

(h) The car operating panel, minimum of 13 mm (0.5 in.) in height;

(i) Adjacent to or on every elevator entrance at the designated level, minimum of 75 mm (3 in.) height; and

(j) Each bank of elevators shall be identified by an alphabetic letter.

Where an alpha-numeric designation is used for an elevator, the alpha portion shall represent the bank designation in which the elevator is located.

2.29.1.2 New York City Identification Number.

Each elevator shall be assigned a unique numerical identification, a minimum of 6 mm (¼ in.) in height. The City identification number shall be applied to the following locations:

(a) The driving machine;

(b) MG and/or Transformers set;

(c) Controller;

(d) Main line disconnect switch;

(e) The crosshead, or where there is no crosshead, the car frame, such that it is visible from the top of the car;

(f) The car operating panel (main panel only).

2.29.1.3 Where any of the following devices for more than one elevator are located in the same enclosure, such devices or a grouping of devices for one elevator with demarcation to establish that all devices within the demarcation belong to that identified elevator shall be identified with the unique alphabetical or numerical identification letter(s) or number(s) of its associated elevator as assigned in Section 2.29.1.1:

(a) means to trip the governor and/or means to reset the governor from outside the hoistway as permitted by Section 2.7.6.3.4

(b) display devices or their equivalent as required by Section 2.7.6.4.1

(c) means to move the car from outside the hoistway as required by Section 2.7.6.4.3

(d) stop switches as required by Section 2.7.6.5.2
(e) landing inspection operation transfer switches and operating devices as required by Section 2.7.6.5.2 (see also Section 2.26.1.4.4)

(f) “CAR DOOR BYPASS” and “HOISTWAY DOOR BYPASS” switches as required by Section 2.26.1.5

(g) means to manually reset the ascending car overspeed detection means as required by Section 2.19.1.2(a)(4)

(h) means to manually reset the unintended motion detection means as required by Section 2.19.2.2(a)(4)

(i) the earthquake reset button or switch as required by Section 8.4.10.1.1(a)(2)(b)

PART 3
HYDRAULIC ELEVATORS

SECTION 3.7
MACHINERY SPACES, MACHINE ROOMS, CONTROL SPACES, AND CONTROL ROOMS

Delete and revise the opening paragraph of Section 3.7.1 to read as follows:

3.7.1 Machinery spaces, machine rooms, control spaces, and control rooms shall conform to the requirements of Sections 2.7.1 through 2.7.7 and 2.7.9. Hydraulic machines and controllers are not permitted in the hoistway or pit.

SECTION 3.16
CAPACITY AND LOADING

Add new Section 3.16.10 to read as follows:

3.16.10 Detection of overload on passenger and freight elevators permitted to carry passengers.

Requirements of 2.16.10 shall not apply to direct acting hydraulic elevators.

SECTION 3.26
OPERATING DEVICES AND CONTROL EQUIPMENT

3.26.3 Anticreep and leveling operation.

Delete and revise Section 3.26.3.1.2 to read as follows:

3.26.3.1.2 The anticreep device shall maintain the car within 13 mm (1/2 in.) of the landing, irrespective of the position of the hoistway door.

PART 4
ELEVATORS WITH OTHER TYPES OF DRIVING MACHINES
SECTION 4.3
HAND ELEVATORS

Delete and revise Section 4.3 to read as follows:

RESERVED

PART 5
SPECIAL APPLICATION ELEVATORS

SECTION 5.2
LIMITED-USE/LIMITED-APPLICATION ELEVATORS

5.2.1 Electric limited-use/limited-application elevators.

Delete and revise Section 5.2.1.13 to read as follows:

5.2.1.13 Power operation of hoistway doors and car doors. When provided, power operation, power opening, and power closing of hoistway doors and car doors shall conform to Section 2.13, except as modified by Section 5.2.1.13.

(a) Requirement Section 2.13.1 does not apply. Both car and hoistway doors shall be of the horizontally sliding type with a power-operated horizontally sliding car door. Power operation of accordion or bifold type car doors shall be permitted.

(b) Vertically sliding doors and power operated swing doors shall not be permitted.

Delete and revise Section 5.2.1.16.1 to read as follows:

5.2.1.16.1 Rated load and platform area. The minimum rated load shall conform to Section 2.16.1, except as follows:

(a) The maximum rated load shall not exceed 635 kg (1,400 lb).

(b) The inside net platform area shall not exceed 1.67 m² (18 ft²) and shall comply with A117.1 Section 408.4.

(c) Requirements of Sections 2.16.1.2 and 2.16.1.3 do not apply.

SECTION 5.3
PRIVATE RESIDENCE ELEVATORS

5.3.1 Private residence electric elevators.

Delete and revise Section 5.3.1.6.1 to read as follows:

5.3.1.6.1 Suspension means passing through floors or stairs. Ropes passing through a floor or stairway outside the hoistway enclosure shall be enclosed with a solid or openwork enclosure. If of openwork, the enclosure shall reject a ball 13 mm (0.5 in.) in diameter. Means for inspection
shall be provided. The floor openings shall not be larger than is necessary to clear the suspension means.

5.3.1.7 Protection of hoistway openings.

Delete and revise Sections 5.3.1.7.1 through 5.3.1.7.5 to read as follows:

5.3.1.7.1 Where required. Where a hoistway enclosure is required, landing openings shall be protected by swinging or horizontally sliding doors. Landing openings in solid hoistway enclosures shall be protected the full height by solid swinging or horizontally sliding doors. Their fire-protection rating shall be not less than required by the building code (see Section 1.3). The doors shall be designed to withstand a force of 670 N (150 lbf) applied horizontally over an area 100 mm x 100 mm (4 in. x 4 in.) in the center of the doors without permanent displacement or deformation. Gates shall not be permitted.

5.3.1.7.2 Clearance between hoistway doors and landing sills and car doors and gates. The clearance between the hoistway doors and the hoistway edge of the landing sill shall not exceed 19 mm (0.75 in.) for swinging doors and 57 mm (2.25 in) for sliding doors. The distance between the hoistway face of the landing door and the car door gate shall not exceed 100 mm (4 in.).

5.3.1.7.3 Projection of hoistway doors into the hoistway. The hoistway face of the hoistway door shall not project into the hoistway beyond the line of the landing sill. No hardware, except that required for door-locking and door-operating or signaling devices, shall project into the hoistway beyond the line of the landing sill.

5.3.1.7.4 Locking devices for hoistway doors. Hoistway doors shall be provided with locking devices. The locking device shall be an interlock and conform to the requirements of Sections 2.12.2 and 2.12.4.

5.3.1.7.5 Opening of hoistway doors. Hoistway doors shall be so arranged that it will not be necessary to reach behind any panel, jamb, or sash to operate them.

Delete and revise Sections 5.3.1.7.7 and 5.3.1.7.8 to read as follows:

5.3.1.7.7 Access to the hoistway for emergency purposes. Hoistway door unlocking devices shall be provided for all hoistway doors, conforming to Section 2.12.6.

5.3.1.7.8 Power operation of hoistway doors. Power opening shall be permitted for hoistway doors and shall conform to Sections 2.13.2.2.1 and 2.13.2.2.2. Power closing shall be permitted for hoistway doors and shall conform to Sections 2.13.3.2 through 2.13.4, and 2.13.6.

Delete and revise Section 5.3.1.8.2 to read as follows:

5.3.1.8.2 Car doors and gates. A car door or gate that, when closed, will guard the opening to a height of at least 1 675 mm (66 in.) shall be provided at each entrance to the car. Car doors shall be permitted to be of solid or openwork construction that will reject a ball 75 mm (3 in.) in diameter.
Collapsible car gates shall be of a design that, when fully closed (extended position), will reject a ball 75 mm (3 in.) in diameter.

(a) **Power Operation of Car Doors and Gates.** Power opening shall be permitted for car doors and shall conform to Sections 2.13.2.1 and 2.13.6. Power closing shall be permitted for car doors and shall conform to Sections 2.13.3 through 2.13.6. Power operation of gates is not permitted.

(b) **Car Door or Gate Locking Devices.** Where the hoistway enclosure is not continuous for the full travel of the car, the car door or gate shall be provided with a mechanical lock that will lock the car door or gate if the car is more than 150 mm (6 in.) away from a landing.

(c) **Car Door or Gate Electric Contacts.** Every car door or gate shall be provided with an electric contact conforming to Sections 2.14.4.2.3 and 2.14.4.2.5.

(d) **Strength and Deflection of Doors, Gates, and Their Guides, Guide Shoes, Track, and Hangers.**

1. Horizontal sliding car doors and gates shall be designed and installed to withstand a force of 335 N (75 lbf) applied horizontally on an area 100 mm by 100 mm (4 in. by 4 in.) at right angles to and at any location on the car door without permanent deformation. The deflection shall not exceed 19 mm (0.75 in.) and shall not displace the door from its guides or tracks. The force shall be applied while the door is in the fully closed position.

2. Folding car doors shall be designed and installed to withstand a force of 335 N (75 lbf) applied horizontally using a 100 mm (4 in.) diameter sphere at any location within the folds on the car door without permanent deformation. The deflection shall not exceed 19 mm (0.75 in.) and shall not displace the door from its guides or tracks. The force shall be applied while the door is in the fully closed position.

The design of the car door or gate electric contacts shall be such that for a sliding door or gate, the car cannot move unless the door or gate is within 50 mm (2 in.) of the closed position. If the door or gate swings outward to open, the car door or gate must be closed and locked before the car can move.

Delete and revise Section 5.3.1.10.3 to read as follows:

5.3.1.10.3 Rise. The rise shall not exceed 18 m (60 ft).

Delete and revise Section 5.3.1.11.2 to read as follows:

5.3.1.11.2 Operation of safeties. The safety shall be of the inertia, rack and pinion, or other type operated by the action of a speed governor. If of the speed-governor type, the governor shall operate the safety at a maximum tripping speed of 0.38 m/s (75 ft/min).

Delete and revise Subsection (a) of Section 5.3.1.12.1 to read as follows:

5.3.1.12.1 Types permitted.
(a) Suspension means shall be not less than two wire ropes.

Delete and revise Section 5.3.1.12.4 to read as follows:

5.3.1.12.4 Arc of contact of suspension means on sheaves and sprockets. The arc of contact of a wire rope on a traction sheave shall be sufficient to produce traction under all load conditions up to rated load.

Delete and revise Subsection (b) of Section 5.3.1.16.1 to read as follows:

5.3.1.16.1 Overhead machinery beams and supports.

(b) Overhead Beams and Their Supports. Overhead beams and their supports shall be designed for not less than the sum of the following:

(1) the load resting on the beams and their supports, which shall include the complete weight of the machine, sheaves, controller, and any other equipment supported thereon

(2) the sum of the tension on all suspension ropes times 2

Delete and revise Subsection (a) of Section 5.3.1.16.2 to read as follows:

5.3.1.16.2 Driving machines: General requirements.

(a) Types of Driving Means. The driving means shall be one of the following types:

(1) traction

(2) winding drum (see Section 5.3.1.16.3)

(3) direct plunger hydraulic (see Section 5.3.2)

(4) roped-hydraulic (see Section 5.3.2)

(5) screw machine (see Section 5.3.1.16.4)

(6) rack-and-pinion, in jurisdictions enforcing NBCC

Delete and revise Section 5.3.1.16.4 to read as follows:

5.3.1.16.4 Screw machines. Screw machines, where used, shall conform to Sections 4.2.15 and 4.2.20, except that the rated speed shall not exceed 0.20 m/s (40 ft/min) and shall be provided with an overspeed governor.

Delete and revise Subsection (c) of Section 5.3.1.17.1 to read as follows:

5.3.1.17.1 Stopping devices required.

(c) If the driving machine is of the winding drum type
(1) a final terminal stopping device operated by the driving machine shall also be provided.

(2) driving-machine-operated final terminal stopping devices are not required when a lower final terminal stopping device is used in addition to the slack rope switch, and two independent upper final terminal stopping devices are provided. A separate device shall be used to operate the lower final terminal and one upper final terminal stopping devices. All final terminal stopping and slack-rope devices shall operate independently of one another. The power feed lines to the driving machine and brake shall be opened by one or both of the upper final terminal stopping devices and either the slack-rope switch or the lower terminal stopping device, or both.

(3) indirect connections between the final terminal stopping device and the driving machine shall be designed to prevent slippage.

Delete and revise Section 5.3.1.18.2.2 to read as follows:

5.3.1.18.2.2 Monitoring of the car door or gate switch electric contacts. The elevator controls shall be designed in such a manner that when the car stops at a floor and the landing door and its related electric contact are opened and closed and the car door or gate switch electric contact(s) fails to open, the car shall not be permitted to respond to a call. The car shall be permitted to answer a call only after the car door or gate switch electric contacts have cycled at least once.

Delete and revise Section 5.3.1.18.8 to read as follows:

5.3.1.18.8 Slack-rope devices for winding drum driving machines. Winding drum machines with rope suspension shall be provided with a slack-rope device of the manually reset type that will remove power from the motor and brake if the car is obstructed in its descent and the hoisting ropes slacken.

5.3.2 Private residence hydraulic elevators.

Delete and revise Section 5.3.2.2.1 to read as follows:

5.3.2.2.1 Direct-plunger and roped-hydraulic private residence elevator driving machines, sheaves, valves, supply piping, fittings, and tanks shall conform to Sections 3.18, 3.19, and 3.24, except as modified by 5.3.1.16.2 and 5.3.2.

Delete and revise Section 5.3.2.3 to read as follows:

5.3.2.3 Terminal stopping devices. Direct-plunger and roped-hydraulic private residence elevator terminal stopping devices shall conform to Section 3.25, except as modified in 3.25.2.

SECTION 5.4
PRIVATE RESIDENCE INCLINED ELEVATORS

5.4.2 Landing enclosures and gates (where required).
Delete and revise the header of 5.4.2 to read as follows:

5.4.2 Landing enclosures and doors (where required).

Delete and revise Sections 5.4.2.2, 5.4.2.3, and 5.4.2.4 to read as follows:

5.4.2.2 Landing doors. Landing doors shall comply with Section 5.3.1.7.

5.4.2.3 Construction of landing enclosures and doors. The landing enclosure shall either be of solid construction or of openwork rejecting a 25 mm (1 in.) ball. A force of 670 N (150 lbf) applied at any area 100 mm x 100 mm (4 in. X 4 in.) on the walls of the enclosure shall not reduce the running clearance below 19 mm (0.75 in.) nor cause a deflection exceeding 25 mm (1 in.).

5.4.2.4 Clearance between landing doors and landing sills and car doors. Clearances shall conform to Section 5.3.1.7.2.

SECTION 5.5
POWER SIDEWALK ELEVATORS

5.5.1 Electric sidewalk elevators.

Delete and revise Section 5.5.1.17 to read as follows:

5.5.1.17 Car and counterweight safeties. Safeties shall conform to Section 2.17.

SECTION 5.12
OUTSIDE EMERGENCY ELEVATORS

Delete Section 5.12 in its entirety.

PART 6
ESCALATORS AND MOVINGS WALKS

SECTION 6.1
ESCALATORS

6.1.3 Construction requirements.

Delete and revise Section 6.1.3.3.5 to read as follows:

6.1.3.3.5 Skirt and step clearance.

6.1.3.3.5.1 Loaded gap between skirt and step. The clearance (loaded gap) between the step tread and the adjacent skirt panel shall be not more than 5 mm (0.2 in.) when 110 N (25 lbf) is laterally applied from the step to the adjacent skirt panel. The applied load shall not deviate from 110 N (25 lbf) by more than ±11 N (2.5 lbf). The load shall be distributed over an area not less than 1 940 mm² (3 in.²) and not more than 3 870 mm² (6 in.²).
6.1.3.3.5.2 Clearance between skirt and step. The clearance on either side of the steps between the step and the adjacent skirt panel shall not be more than 4 mm (0.16 in.), and the sum of the clearances on both sides shall be not more than 7 mm (0.28 in.).

Delete and revise Subsection (c) of Section 6.1.3.3.6 to read as follows:

6.1.3.3.6 Skirt panels.

(c) The exposed surfaces of the skirt panels adjacent to the steps shall be smooth and made from a low friction material, or permanently treated with a friction-reducing material. Untreated surfaces, such as porcelain, enameled steel, bronze or stainless steel, are not acceptable.

Delete and revise the first paragraph of Section 6.1.3.3.10 to read as follows:

6.1.3.3.10 Skirt deflector devices. Deflector devices shall be required and shall extend from skirt panels parallel to the escalator path of travel. Means to secure such deflector devices are permitted to be on the exposed surface of the skirt. Any exposed fastener heads shall be of the tamper-resistant type and flush to within 1 mm (0.04 in.).
Add new Subsection 6.1.3.6.6 to read as follows:

6.1.3.6.6 Floor opening protection adjacent to escalator wellway. Floor openings adjacent to the entire length of the escalator wellway shall be provided with protection in accordance with the New York City Building Code (see Part 9).

6.1.6 Operating and safety devices.

Delete and revise Section 6.1.6.2 to read as follows:

6.1.6.2 Starting devices.

In every new and existing escalator, starting devices shall be provided with the combination of a starting switch and a starting button. The escalator shall be started only after the activation of both the switch and the button.

(a) Starting Switch. The starting switch shall be of continuous pressure spring return type and shall be operated by a cylinder type lock having five-pin, five-disc or five-tumbler combination. The starting switch shall be of three-position type and shall be clearly marked as follows:

NORMAL. A central position for the key entry and spring return position.

START-UP. A right side position for starting the escalator in the upward direction.

START-DOWN. A left side position for starting the escalator in the downward direction.

(b) Starting Button. The starting button shall be of the constant pressure type and located within six (6) inches from the starting switch. It shall be clearly marked “Start”.

(c) Cover Plate. The starting devices shall be protected by a locked, transparent cover plate that can be opened by the starting key and clearly marked “For Start Only.”

(d) Location of starting devices. Starting devices shall be located at top and bottom of the escalator on the right side-facing newel.

NOTE: The starting key shall be kept on the premises at all times and may only be accessible to persons authorized to start escalators. It shall also be made available to the Commissioner or his or her representative.

(e) The key shall be of Group 2 Security (see Section 8.1).

Delete and revise Subsection (a) of Section 6.1.6.3.1 to read as follows:

6.1.6.3.1 Emergency stop buttons.

(a) Location - A red stop button shall be visibly located at the top and bottom landings on the right side facing the escalator. Remote stop buttons are prohibited except that any
escalator connected to an automatic fire alarm system shall gradually stop the escalator at a rate not greater than 3 ft per sec² (0.91 m/s ²) upon the activation of such system.

(1) On high deck balustrades, they shall be located on the curved newel deck in the upper quadrant, with the centerline of the button at a 45 deg angle from the horizontal.

(2) On low deck balustrades, they shall be located below the handrail height. The centerline of the button shall be located on a radial line 45 deg above the horizontal, such that no part of the button assembly is within 38 mm (1.5 in.) of the bottom of the handrail and the button is no more than 90 mm (3.5 in.) from the bottom of the handrail.

Delete and revise Section 6.1.6.3.6 to read as follows:

6.1.6.3.6 Skirt obstruction device. Means shall be provided to cause the electric power to be removed from the escalator driving machine motor and brake if an object becomes caught between the step and the skirt as the step approaches the upper combplate, intermediate device, or lower combplate. On units having a run of 6 096 mm (20 ft.) or more, intermediate devices shall be provided on both sides of the escalator with devices located at intervals of 3 048 mm (10 ft.) or less. The activation of an intermediate device shall gradually stop the escalator at a rate not greater than 3 ft per sec² (0.91 m/s ²) in the direction of travel. The skirt obstruction devices shall be located so that the escalator will stop before that object reaches the combplate. The escalator shall stop before that object reaches the combplate with any load up to full brake rated load with escalator running. The device shall be of the manually reset type.

Delete and revise Section 6.1.6.3.9 to read as follows:

6.1.6.3.9 Step upthrust device. Means shall be provided in the passenger-carrying line of the track system to detect a step forced upward in the lower transition curve at or prior to the point of tangency of the horizontal and curved track. The means shall actuate when the riser end of the step is displaced upward more than 5 mm (0.20 in.) at the lower landing. Actuation of the means shall cause power to be removed from the driving-machine motor and brake. The escalator shall stop, before the detected step reaches the combplate with any load up to brake rated load with escalator running [see Subsections 6.1.3.9.3(a)(2) and (b)(2)]. The device shall be of the manual reset type.

Delete and revise Section 6.1.6.3.12 to read as follows:

6.1.6.3.12 Handrail entry device. A handrail entry device shall be provided at each newel. It shall be operative in the newels in which the handrail enters the balustrade. It shall cause the escalator to stop by removing power from the driving-machine motor and brake. It shall operate in either of two ways:

(a) if an object becomes caught between the handrail and the handrail guard.

(b) if an object approaches the area between the handrail and the handrail guard.
For those units that rely on an opening of the balustrade to prevent entrapment, all handrail entry devices shall be operative whenever the handrails are operating. The device shall be of the manual reset type.

**Delete and revise Subsection (b) of Section 6.1.6.3.13 to read as follows:**

**6.1.6.3.13 Combplate impact devices.** Devices shall be provided that will cause the opening of the power circuit to the escalator driving-machine motor and brake if either

(b) a resultant vertical force not greater than 268 N (60 lbf) in the upward direction is applied at the center of the front of the combplate.

These devices shall be of the manual-reset type.

**Add new Sections 6.1.6.3.17 and 6.1.6.3.18 to read as follows:**

**6.1.6.3.17 Service ports.** Service ports used for diagnostic purposes or for resetting faults shall be placed in a location accessible only to elevator personnel.

**6.1.6.3.18 Phase protection of motors.** Escalators having a polyphase AC power supply shall be provided with means to prevent the operation of the escalator drive motor if a reversal of phase rotation, or phase failure of the incoming polyphase AC power, will cause the escalator to operate in the wrong direction.

**Delete and revise Section 6.1.6.4 to read as follows:**

**6.1.6.4 Handrail speed monitoring device.** A handrail speed monitoring device shall be provided that will cause the activation of the alarm required by Subsection 6.1.6.3.1(b) without any intentional delay, whenever the speed of either handrail deviates from the step speed by 15% or more. The device shall also cause electric power to be removed from the driving-machine motor and brake when the speed deviation of 15% or more is continuous within a 2 s to 6 s range. The device shall be of the manual reset type.

**Delete and revise Section 6.1.6.7 to read as follows:**

**6.1.6.7 Step demarcation lights.** Green step demarcation lights shall be located below the step at both landings in an area not to exceed 400 mm (16 in.) from the combplate. The lamps shall be LED type and activated whenever the escalator is in operation.

**Delete and revise Section 6.1.6.9.3 to read as follows:**

**6.1.6.9.3 Additional signs, video displays or graphics.** Signs, video displays or graphics other than those specified in Sections 6.1.6.9.1 and 6.1.6.9.2 shall not be permitted adjacent to the escalator in such a manner that obstructs boarding passenger view of the signs required in Section 6.1.6.9.1, obstructs or reduces passenger access to the handrails, within the safety zone (see Section 6.1.3.6.4), nor on the escalator, except for signs, graphics, or markings required by this Code, manufacturer’s identification, and owner’s identification that are permitted on the
escalator. They shall not be distracting, create passenger flow hazards, or impair function of safety devices. Step, step riser, handrail and balustrade signs or graphics are not permitted.

6.1.7 Lighting, access, and electrical work.

Delete and revise Section 6.1.7.3.2 to read as follows:

6.1.7.3.2 Access plates at the top and bottom landings shall be securely fastened by a mechanical means. Access plate(s) shall be provided with electrical switches that will remove power to the driving machine and brake should the access plate be displaced or removed.

Add new Sections 6.1.9 and 6.1.10 to read as follows:

6.1.9 New York City identification number.

Each escalator shall be assigned a unique numerical identification a minimum of 6 mm (0.25 in) in height. The city identification number shall be applied on the right hand side, facing the newel, at the top and bottom of the escalator as well as the following locations:

(a) The driving machine;
(b) Controller;
(c) Main line disconnect switch.

6.1.10 Building identification number.

Each escalator shall be assigned a unique alpha-numeric or numerical identification, a minimum of 6 mm (0.25 in) in height. The building identification number shall be applied on the exterior, clearly visible, at the top or bottom of the escalator.

SECTION 6.2
MOVING WALKS

6.2.6 Operating and safety devices.

Delete and revise Section 6.2.6.2 to read as follows:

6.2.6.2 Starting and inspection control switches.

In every new and existing moving walk, starting devices shall be provided with the combination of a starting switch and a starting button. The moving walk shall be started only after the activation of both the switch and the button.

(a) Starting Switch. The starting switch shall be of continuous pressure spring return type and shall be operated by a cylinder type lock having a five-pin, five-disc or five-tumbler combination. The starting switch shall be of three-position type and shall be clearly marked as follows:
TOWARDS. A left side position for starting the moving walk in the towards direction.

RUN (NORMAL). A central position for the key entry and spring return position.

AWAY. A right side position for starting the moving walk in the away direction.

(b) Starting Button. The starting button shall be of the constant pressure type and located within six (6) inches from the starting switch. It shall be clearly marked “Start”.

(c) Cover Plate. The starting devices shall be protected by a locked, transparent cover plate that can be opened by the starting key and clearly marked “For Start Only.”

(d) Location of starting devices. Starting devices shall be located at top and bottom of the moving walk on the right side-facing newel.

NOTE: The starting key shall be kept on the premises at all times and may only be accessible to persons authorized to start escalators. It shall also be made available to the Commissioner or his or her representative.

Delete and revise 6.2.6.3.10 to read as follows:

6.2.6.3.10 Handrail entry device. A handrail entry device shall be provided at each newel. It shall be operative in the newels in which the handrail enters the balustrade. It shall cause the moving walk to stop by removing power from the driving-machine motor and brake. It shall operate in either of the following two ways:

(a) if an object becomes caught between the handrail and the handrail guard

(b) if an object approaches the area between the handrail and handrail guard

For those units that rely on an opening of the balustrade to prevent entrapment, all handrail entry devices shall be operative whenever the handrails are operating. The device shall be of the manual reset type.

Delete and revise Subsection (b) of 6.2.6.3.11 to read as follows:

6.2.6.3.11 Combplate impact devices. Devices shall be provided that will cause the opening of the power circuit to the moving walk driving-machine motor and brake if either

(b) a resultant vertical force not greater than 268 N (60 lbf) in the upward direction is applied at the center of the front of the combplate.

Add new Subsections 6.2.6.3.13 and 6.2.6.3.14 to read as follows:

6.2.6.3.13 Service ports. Service ports used for diagnostic purposes or for resetting faults shall be placed in a location accessible only to elevator personnel.
6.2.6.3.14 Phase protection of motors. A moving walk having a polyphase AC power supply shall be provided with means to prevent the operation of the moving walk drive motor if a reversal of phase rotation, or phase failure of the incoming polyphase AC power, will cause the moving walk to operate in the wrong direction.

Delete and revise Section 6.2.6.4 to read as follows:

6.2.6.4 Handrail speed monitoring device. A handrail speed monitoring device shall be provided that will cause the activation of the alarm required by Subsection 6.2.6.3.1(b) without any intentional delay whenever the speed of either handrail deviates from the treadway speed by 15% or more. The device shall also cause electric power to be removed from the driving-machine motor and brake when the speed deviation of 15% or more is continuous within a 2 s to 6 s range. The device shall be of the manual reset type.

Delete and revise Section 6.2.6.8.3 to read as follows:

6.2.6.8.3 Additional signs, video displays or graphics. Signs, video displays or graphics other than those specified in Sections 6.2.6.8.1 and 6.2.6.8.2 shall not be permitted adjacent to the walk in such a manner that obstructs boarding passenger view of the signs required in Section 6.2.6.9.1, obstructs or reduces passenger access to the handrails, within the safety zone, nor on the moving walk, except for signs, graphics, or markings required by this Code, manufacturer’s identification, and owner’s identification that are permitted on the moving walk. They shall not be distracting, create passenger flow hazards, or impair function of safety devices. Pallet, handrail and balustrade signs or graphics are not permitted.

6.2.7 Lighting, access, and electrical work.

Delete and revise Section 6.2.7.3.2 to read as follows:

6.2.7.3.2 Access plates at the top and bottom landings shall be securely fastened by a mechanical means. Access plate(s) shall be provided with electrical switches that will remove power to the driving machine and brake should the access plate be displaced or removed.

Add new Sections 6.2.9 and 6.2.10 to read as follows:

6.2.9 New York City identification number.

Each moving walk shall be assigned a unique numerical identification a minimum of 6 mm (0.25 in) in height. The city identification number shall be applied on the right hand side, facing the newel, at the entrance and exit of the moving walk as well as the following locations:

(a) The driving machine;

(b) Controller;

(c) Main line disconnect switch.

6.2.10 Building identification number.
Each moving walk shall be assigned a unique alpha-numeric or numerical identification, a minimum of 6 mm (0.25 in) in height. The building identification number shall be applied on the exterior, clearly visible, at the entrance and exit of the moving walk.

PART 7
DUMBWAITERS AND MATERIAL LIFTS

SECTION 7.1
POWER AND HAND DUMBWAITERS WITHOUT AUTOMATIC TRANSFER DEVICES

7.1.4 Vertical car clearances and runbys for car and counterweights.
Delete and revise Section 7.1.4.3.1 to read as follows:

7.1.4.3.1 Horizontal unobstructed area on the car top of not less than 0.370 m\(^2\) (570 in.\(^2\)) and measured not less than 500 mm (20 in.) on one side.

SECTION 7.4
MATERIAL LIFTS WITHOUT AUTOMATIC TRANSFER DEVICES

7.4.2 Classification.
Delete and revise Sections 7.4.2.1 and 7.4.2.2 to read as follows:

7.4.2.1 Type A Material Lifts shall conform to ASME B20.1.

7.4.2.2 Type B Material Lifts are not permitted.

7.4.3 Construction of Hoistways and hoistway enclosures.
Delete Section 7.4.3 in its entirety.

7.4.4 Pits.
Delete Section 7.4.4 in its entirety.

7.4.5 Location and guarding of counterweights.
Delete Section 7.4.5 in its entirety.

7.4.6 Vertical clearances and runbys for cars and counterweights.
Delete Section 7.4.6 in its entirety.

7.4.7 Horizontal car and counterweight clearances.
Delete Section 7.4.7 in its entirety.
7.4.8 Protection of spaces below hoistways.
Delete Section 7.4.8 in its entirety.

7.4.9 Machinery spaces, machine rooms, control spaces, and control rooms.
Delete Section 7.4.9 in its entirety.

7.4.10 Equipment in hoistways and machine rooms.
Delete Section 7.4.10 in its entirety.

7.4.11 Machinery and sheave beams, supports, and foundations.
Delete Section 7.4.11 in its entirety.

7.4.12 Guarding of equipment and standard railing.
Delete Section 7.4.12 in its entirety.

7.4.13 Protection of hoistway landing openings.
Delete Section 7.4.13 in its entirety.

7.4.14 Hoistway door locking devices and electric contracts, and hoistway access switches.
Delete Section 7.4.14 in its entirety.

7.4.15 Power operation of hoistway doors and car doors and gates.
Delete Section 7.4.15 in its entirety.

7.4.16 Identification of equipment.
Delete Section 7.4.16 in its entirety.

SECTION 7.5
ELECTRIC MATERIAL LIFTS WITHOUT AUTOMATIC TRANSFER DEVICES
Delete Section 7.5 in its entirety.

SECTION 7.6
HYDRAULIC MATERIAL LIFTS WITHOUT AUTOMATIC TRANSFER DEVICES
Delete Section 7.6 in its entirety.
SECTION 7.7
AUTOMATIC TRANSFER DEVICES

Delete Section 7.7 in its entirety.

SECTION 7.9
ELECTRIC MATERIAL LIFTS WITH AUTOMATIC TRANSFER DEVICES

Delete Section 7.9 in its entirety.

SECTION 7.10
HYDRAULIC MATERIAL LIFTS WITH AUTOMATIC TRANSFER DEVICES

Delete Section 7.10 in its entirety.

SECTION 7.11
MATERIAL LIFTS WITH OBSCURED TRANSFER DEVICES

Delete Section 7.11 in its entirety.

PART 8
GENERAL REQUIREMENTS

SECTION 8.1
SECURITY

Add new subsection (e) to the Note of Section 8.1.4 to read as follows:

NOTE: See the following:

(e) Firefighters Emergency Operation Phase I and Phase II and Occupant Evacuation Operation shall be by New York City standard key 2642 and FDNY standard key 1620.

SECTION 8.5
ESCALATOR AND MOVING WALK SAFETY REQUIREMENT FOR SEISMIC RISK ZONE 2 OR GREATER

Delete and revise the title of Section 8.5 to read as follows:

SECTION 8.5
ESCALATOR AND MOVING WALK SEISMIC REQUIREMENTS

Delete and revise the first paragraph of Section 8.5 to read as follows:

(a) Section 8.5 applies to all escalators and moving walks where such equipment is installed in buildings assigned to one of the following:
(1) Seismic Design Category C with Component Importance Factor, $I_p$, equal to 1.5 as defined by the *New York City Building Code*

(2) Seismic Design Category D or greater as defined by the *New York City Building Code*

(3) Design Spectral Response Acceleration for a 0.2 s time period [$S_a(0.2)$] greater than 0.12 and building designated as *post-disaster building*

(4) Seismic Performance Category C with Seismic Hazard Exposure Group II or higher as defined by earlier model building codes (see Note)

(5) Seismic Risk Zone 2 or greater as defined by earlier building codes (see Note)

NOTE [8.5(a)(4) and (a)(5)]: For example, SBC 1982, SBC 1994, etc.

(b) The appropriate Escalator Seismic Force Level is determined by the applicable building code.

(1) Where the applicable building code references Seismic Design Categories or Design Spectral Response Acceleration [$S_a(0.2)$], force levels as referenced by Section 8.4.14 shall be used (see the *New York City Building Code*).

(2) Where the applicable building code makes reference to ground motion parameters (such as $A_v$ or $Z_v$), Section 8.4.13 shall be used.

(3) Where the applicable building code makes reference to Seismic Risk Zones or to Seismic Risk Zones and component force level equations, force levels for the appropriate zone, as listed throughout Section 8.5, or the calculated component force level, whichever is greater, shall be used.

(c) The escalator and moving walk safety requirements contained in Section 8.5 shall be used considering the requirements in the other parts of the code. These requirements are to be applied as well as those in Sections 6.1 and 6.2 but are not additive. Where multiple requirements are applicable to the same component, the most stringent requirement shall control.

**8.5.1 Balustrade Construction.**

**Delete and revise Section 8.5.1 to read as follows:**

8.5.1 Balustrades shall be designed to withstand the vertical inertial force due to the weight of the balustrade and the horizontal seismic forces as follows:

(a) The component operating weight, $W_p$, is the sum of the balustrade dead load, decking weight if supported by the balustrade, and 70% of the machinery rated load (see Section 6.1.3.9.2) and the seismic force computed as defined in Sections 8.4.13 and 8.4.14.
(b) The seismic forces resulting from the machinery rated load shall be distributed along the exposed length of the handrail from entry newel tangent to exit newel tangent as depicted in Fig. 8.5.1.

**Figure 8.5.1 Balustrade Handrail Force.**

Add Figure 8.5.1 to read as follows:

![Fig. 8.5.1 Balustrade Handrail Force](image)

**8.5.2 Truss Members.**

Delete and revise Section 8.5.2 to read as follows:

8.5.2 Structural items not covered in Table 8.5.5 shall be capable of withstanding the inertia effect of the applicable masses without permanent deformation.

(a) For jurisdictions enforcing seismic zones or an equivalent ground motion parameter (see 8.4.13), the horizontal (see Section 8.5.2.1) and vertical (see Section 8.5.2.2) seismic forces shall be applied separately (not simultaneously).

(b) Earthquake forces shall be applied simultaneously as defined by Section 8.4.14, except \( W_p = W_t + W_r \) where

\[ W_r = 25\% \text{ of the structural rated load calculated per Section 6.1.3.9.1} \]

\[ W_t = \text{total dead load of the escalator, including all components supported by the truss.} \]
Delete and revise Section 8.5.2.1 to read as follows:

8.5.2.1 For jurisdictions enforcing seismic zones or an equivalent ground motion parameter, horizontal seismic forces shall be based on the total dead load of the escalator, including all components supported by the truss, plus 25% of the structural rated load in accordance with Section 6.1.3.9.1. The horizontal seismic force shall be computed as follows:

\[ F_p = ZIC_p (W_t + W_r) \]

where

\( C_p \) = horizontal seismic force factor

\( F_p \) = total horizontal seismic force

\( I \) = importance factor

\( Z \) = seismic zone factor

\( = 0.25 \) for seismic zone 2

\( = 0.5 \) for seismic zone 3 or greater

Where the applicable building code does not make reference to seismic risk zones, the ground motion parameters shown in Section 8.4.13 shall be used.

Revise the first sentence of section Section 8.5.2.1.2 to read as follows:

The escalator or moving walk is not considered a structural component of the building.

Revise the NOTE following Section 8.5.2.1.3 to read as follows:

NOTE: When any portion of the escalator is more than six stories above grade, other values of \( C_p \) may apply and should be determined based upon the fundamental period of the building.

Delete and revise Section 8.5.2.2 to read as follows:

8.5.2.2 For jurisdictions enforcing seismic zones or an equivalent ground motion parameter, vertical forces shall be structurally allocated among all the supports. The total vertical force shall be defined by the following table:

<table>
<thead>
<tr>
<th>Zone</th>
<th>Total Vertical Force, ( F_v )</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>((1 \pm 0.25)(W_t + W_r))</td>
</tr>
<tr>
<td>3 or greater</td>
<td>((1 \pm 0.50)(W_t + W_r))</td>
</tr>
</tbody>
</table>
8.5.3 Supporting Connections Between the Truss and the Building.

Delete and revise Section 8.5.3.1 to read as follows:

8.5.3.1 The truss end supports shall provide motion restraint in the principle horizontal directions capable of withstanding the seismic forces acting upon the escalator or moving walk. The clearance in the transverse direction between the escalator truss and the seismic restraint shall not exceed 6.5 mm (0.25 in.) on each side. Motion restraint in the longitudinal direction at either or both end supports shall accommodate the design story drift (see Section 8.5.3.2.2). Vertical restraint is required when the resultant vertical seismic force exceeds \( W_t + W_r \) (see Section 8.5.2.2). Where one end of the truss uses an unfastened restraint, forces resulting from movement of building structure members are not considered as being applied to the truss.

Delete and revise Section 8.5.3.2 to read as follows:

8.5.3.2 Truss end supports shall accommodate the design story drift (see Section 8.5.3.2.2) in the longitudinal direction such that

(a) clearance between the truss and the building is sufficient to prevent truss compression damage.

(b) seat depth (the longitudinal overlap and bearing surface between the building support and the truss support) is sufficient to prevent disengagement of the truss end with the building support.

Delete and revise Section 8.5.3.2.1 to read as follows:

8.5.3.2.1 When one end of the escalator truss is not designed to accommodate story drift, the design shall account for the forces developed by building movement in a manner that restricts transfer of these forces to the truss. The other truss end support shall be free to slide in the longitudinal direction to accommodate the design story drift. When both ends are designed to accommodate story drift

(a) means shall be provided to prevent any truss end from disengaging from its building support seat.

(b) the end supports shall be permitted to be free to slide in the longitudinal direction such that the sum of the motions accommodates the total design story drift.

Delete and revise Section 8.5.3.2.2 to read as follows:

8.5.3.2.2 At the sliding end(s), the depth of the beam seat shall be capable of accommodating the design story drift. The design story drift shall have a minimum value of 1.5 times the building story drift, as obtained from either of the following:

(a) the structural engineer or record.

(b) the maximum story drift value as per ASCE/SEI-7, Table 12.2-1.
NOTE [8.5.3.2.2(b)]: ASCE/SEI-7, Table 12.2-1 specifies a maximum story drift of 0.025 $h_{sx}$ where $h_{sx}$ is the building story height.

Add new Section 8.5.3.3 to read as follows:

8.5.3.3 Intermediate support(s) for escalators and moving walks, when used, shall be of sufficient size to accommodate design story drift movement in both the longitudinal and transverse directions. Any motion restraint provided shall not reduce the story drift capacity of the support.

8.5.4 Earthquake Protective Devices.

Delete and revise Section 8.5.4 to read as follows:

8.5.4 Earthquake protective devices shall be of the failsafe type. A minimum of one seismic detection device shall be provided in each escalator (nontandem operation or non-side-by-side arrangement) or moving walk. For escalators or moving walks in a tandem operation (see Section 6.1.6.6) or side-by-side arrangement, a minimum of one seismic detection device is required. The seismic detection device shall be mounted in the machine space or adjacent to the escalator or moving walk. Where possible, a seismic detection device shall be mounted adjacent to a vertical load-bearing building structural member when installed at an elevation above ground level, or any structural member if mounted at or below ground level, or any other location approved by the structural engineer of record.

(a) The seismic detection device shall conform to Sections 8.4.10.1.2(a) and (b).

(b) Actuation of the seismic detection device shall cause removal of power from the escalator and moving walk driving-machine motor(s) and brake(s) on all units controlled by the seismic detection device.

(c) Where a seismic detection device is used exclusively to control the escalator or moving walk, it shall be located in a machine room or machinery space and, where possible, shall be mounted adjacent to a vertical load-bearing member. Should no vertical load-bearing member be in close proximity, it shall be permitted to locate the seismic detection device at the nearest accessible vertical load-bearing member at approximately the same horizontal level as the upper machinery space or machine room.

Add new Section 8.5.5 to read as follows:

8.5.5 Allowable Stresses Applicable to Seismic Design. The allowable stress limits to be used in the design of all escalator and moving walk components are listed in Table 8.5.5. An escalator or moving walk subjected to seismic loading shall be capable of withstanding the specified seismic forces in combination with the dynamic or static loads occurring during normal operation.
Add Table 8.5.5 to read as follows:

<table>
<thead>
<tr>
<th>Component</th>
<th>Allowable Design Parameter</th>
<th>Building Code</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Seismic Zones Criteria</td>
<td>IBC, ASCE/SEI-7</td>
</tr>
<tr>
<td>Structural, steel</td>
<td>0.88$F_y$</td>
<td>0.6$F_y$</td>
</tr>
<tr>
<td>Structural, other materials</td>
<td>Follow allowable limits as recommended by design specifications for material of use</td>
<td>Follow allowable limits as recommended by design specifications for material of use</td>
</tr>
<tr>
<td>Balustrades</td>
<td>$&lt; F_y$</td>
<td>0.6$F_y$</td>
</tr>
<tr>
<td>Structural glass in balustrades</td>
<td>Minimum factor of safety = 2 based on the modulus of rupture</td>
<td>Minimum factor of safety = 2 based on the modulus of rupture</td>
</tr>
<tr>
<td>Structural fastenings and/or connections</td>
<td>See 8.4.2.3.3</td>
<td>Per 8.4.2.3</td>
</tr>
</tbody>
</table>

GENERAL NOTE: $F_y$ = yield strength.

NOTE:
(1) See Section 8.5.2(a).

SECTION 8.6
MAINTENANCE, REPAIR, REPLACEMENT, AND TESTING

8.6.1 General requirements.

Delete and revise Subsection (d) of Section 8.6.1.4.1 to read as follows:

8.6.1.4.1 On-site maintenance records.

(d) Permanent Record. A permanent record of the results of all acceptance tests as required by Sections 8.10.1.1.4 and 8.10.1.1.5 shall be kept with the on-site records. Test tags, complying with Section 2.16.3.3 for marking plates permanently attached to or adjacent to the controller, shall meet this requirement.

NOTE: This requirement does not apply to equipment installed under ASME A17.1-2010 and earlier editions.

Add new Note to Section 8.6.1.7.2 to read as follows:

8.6.1.7.2 Periodic test record.
NOTE: See Section 8.11.1.6 for test tag requirements.

8.6.3 Replacements.

Delete Section 8.6.3.2.2 in its entirety.

8.6.4 Maintenance and testing of electric elevators.

Delete and revise section 8.6.4.1.3 to read as follows:

**8.6.4.1.3** Equal tension shall be maintained between individual suspension members in each set. Suspension members are considered to be equally tensioned when the smallest tension measured is within 10 percent of the highest tension measured. When suspension member tension is checked or adjusted, an anti-rotation device conforming to the requirements of Section 2.20.9.8 shall be required.

Delete and revise Section 8.6.4.6 to read as follows:

**8.6.4.6.1** The driving-machine brake and emergency brake, where provided, shall be maintained annually to ensure proper operations, including, but not limited to the following:

(a) residual pads (antimagnetic pads)

(b) lining and running

(c) springs

(d) sleeves and guide bushings

(e) discs and drums

(f) brake coil and plunger

(g) brake monitoring device, where provided

**8.6.4.6.1.1** Brake maintenance shall be entered into the maintenance records.

**8.6.4.6.1.2** A metal tag indicating the elevator maintenance company and date of service shall be attached to the elevator controller.

**8.6.4.6.2** If any part of the driving-machine brake is changed or adjusted that can affect the holding capacity or decelerating capacity of the brake when required (see Section 2.24.8.3), it shall be adjusted and checked by means that will verify its proper function and holding capacity. A test complying with Section 8.6.4.20.4 shall be performed. When springs or brake pads are replaced, a brake load test shall be performed per Subsection 8.10.2.2.2(v).

**8.6.4.6.3** If any part of the emergency brake is changed or adjusted that can affect the holding capacity or decelerating capacity of the emergency brake when required (see Section 2.19.3), it
shall be adjusted and checked by means that will verify its proper function and holding capacity. When springs or brake pads are replaced, a brake load test shall be performed.

Delete and revise Section 8.6.4.8.3 to read as follows:

8.6.4.8.3 Flammable and combustible liquids shall not be stored in machine rooms and spaces unless they are in compliance with NFPA 13, as modified by New York City Fire Code and New York City Building Code.

Delete and revise Section 8.6.4.10.1 to read as follows:

8.6.4.10.1 General.

(1) The hoisting ropes of elevators having winding-drum driving-machines with 1:1 roping, if of the babbitted rope socket type, shall be resocketed at intervals no longer than:

(a) 1 year, for machines located over the hoistway;

(b) 2 years, for machines located below or at the side of the hoistway;

(c) 4 years, for all counterweight cable ends of drum machines;

(2) In addition to the foregoing requirements, rope fastenings shall be resocketed when an inspection reveals any evidence of failure at the shackle regardless of the period of time since last re-shackling.

(3) Where auxiliary rope-fasting devices conforming to the requirements of Section 2.20.10 or where car hoist ropes with additional approved type emergency clamping devices are installed, refastening at the period specified is not required provided that, where such devices are installed, all hoisting ropes shall be refastened on the failure or indication of failure of any rope fastening. Wedge clamp shackles shall not be used on drum machines.

(4) Where the elevator is equipped with a drum counterweight, the fastenings shall be examined for fatigue or damage at the socket. Where fatigue or damage is detected, the ropes shall be refastened in conformance with Section 8.6.4.10.2.

Delete and revise Section 8.6.4.10.3 to read as follows:

8.6.4.10.3 Tags. A legible metal tag shall be securely attached through one of the tapered rope sockets during each resocketing (as shown in the diagram below), and shall bear the following information:

(a) The name of the person or firm who performed the resocketing; and

(b) The date on which the rope was resocketed.

The material and marking of the tags shall conform to Section 2.16.3.3, except that the height of the letters and figures shall be not less than 1.5 mm (0.0625 in.).
Delete and revise Section 8.6.4.19.6 to read as follows:

8.6.4.19.6 Firefighters’ Emergency Operation. Firefighters’ Emergency Operation (Phase I and II) shall be tested to determine conformance with the applicable requirements. Phase I recall shall be tested by individually activating fire alarm initiating device inputs to the elevator control, the key switch at the designated landing and, where provided, the switch at the building fire control station (Part 6).

Delete and revise Section 8.6.4.19.14 to read as follows:

Delete and revise Section 8.6.4.20.1 to read as follows:

8.6.4.20.1 Car and counterweight safeties. Types A, B, and C car and counterweight safeties shall be tested in accordance with Subsection 8.6.4.20.1(a)

(a) Rated Load and Rated Speed Test. Car safeties, except those operating on wood guide rails, and their governors, shall be tested with rated load in the car. Counterweight safety tests shall be made with no load in the car. Tests shall be made by tripping the governor by hand at the rated speed. The following operational conditions shall be checked (Item 2.29.2):

(1) Type B safeties shall stop the car with the rated load within the required range of stopping distances for which the governor is tripped (Item 2.29.2) and the level of the platform checked for conformance to Section 2.17.9.2.

(2) For Type A safeties and Type A safety parts of Type C safeties, there shall be sufficient travel of the safety rollers or dogs remaining after the test to bring the car and its rated load to rest on safety application at governor tripping speed. The level of the platform shall be checked for conformance to Section 2.17.9.2.

Delete and revise Section 8.6.4.20.3 to read as follows:

8.6.4.20.3 Oil buffers.

(a) Car oil buffers shall be tested to determine conformance with the applicable requirements by running the car onto the buffer with rated load at rated speed.

(b) For reduced stroke buffers, this test shall be made at the reduced striking speed permitted (Item 5.9.2.1).

(c) This test is not required where a Type C safety is used (see Section 8.6.4.20.1).

(d) In making these tests, the normal and emergency terminal stopping devices shall be made temporarily inoperative. The final terminal stopping devices shall remain operative and be temporarily relocated, if necessary, to permit compression of the buffer during the test.
(e) After completion of the test, a metal tag, indicating the date of the test, together with the name of the person or firm who performed the test, shall be attached to the buffer [Item 5.3.2(b)].

(f) Counterweight oil buffers shall be tested by running the counterweight onto its buffer at rated speed with no load in the car, except as specified in Subsections 8.6.4.20.3(b) and (c) (Item 5.9.2.1), or at reduced speed if the requirements of Section 8.6.11.10 are met.

(g) A test tag as required in Section 8.6.1.7.2 shall be provided.

Delete Subsection (b) of Section 8.6.4.20.4 in its entirety.

Delete Subsection (b) of Section 8.6.4.20.10 in its entirety.

8.6.8 Maintenance and testing of escalators and moving walks.

Delete and revise Section 8.6.8.2 to read as follows:

8.6.8.2 Step-to-skirt clearance. Clearances shall be maintained in compliance with the applicable codes, and the clearance on either side of the steps and between the steps and the adjacent skirt guard shall not exceed 4 mm (0.16 in.), and the sum of the clearances on both sides shall not exceed 7 mm (0.28 in.).

Delete Section 8.6.8.3 in its entirety.

Delete Section 8.6.8.15.19 in its entirety.

8.6.11 Special provisions.

Delete Section 8.6.11.10 in its entirety.

Delete and revise Section 8.6.11.13 to read as follows:

8.6.11.13 Occupant Evacuation Operation. All elevators provided with Occupant Evacuation Operation shall be subjected, by authorized personnel, to a check of the operation in conjunction with the fire alarm system testing in accordance with the requirements of NFPA 72, as modified by Appendix Q of the New York City Building Code and any applicable rules. Deficiencies shall be corrected. A record of findings shall be available to elevator personnel and the commissioner. These tests and inspections are not part of the Category 1 or Category 5 tests or inspections.

8.7.2 Alterations to electric elevators.

Add new Section 8.7.2.10.6 to read as follows:

8.7.2.10.6 Intermediate hoistway entrances placed out of service. Where permitted by the New York City Building Code, an intermediate hoistway entrance placed out of service shall comply with the following:
(a) Interlocks shall remain in the safety circuit with door panel(s) separately secured in closed position on the hoistway side.

(b) Eliminate the capability of automatic elevators from opening the car doors at the floor placed out of service.

(c) Egress, Accessibility and Firefighters’ Emergency Operation.

(d) Associated labeling and signaling shall be removed.

Delete and revise Subsection (c) of Section 8.7.2.13 to read as follows:

8.7.2.13 Door reopening device. Where a reopening device for power-operated car doors or gates is added or is part of an alteration to the door system, the following requirements shall apply:

(c) when firefighters’ emergency operation is provided, door reopening devices and door closing on Phase I and Phase II shall comply with the requirements of Subsection 2.27.3.1.6(e).

Delete and revise Section 8.7.2.14.1 to read as follows:

8.7.2.14.1 Where an alteration consists of the installation of a new car, the installation shall conform to Sections 2.12.6, 2.14, 2.15, and 2.17 (see also 8.7.2.15.1).

Delete and revise Subsection (e) of Section 8.7.2.14.2 to read as follows:

8.7.2.14.2 The following requirements shall be conformed to where alterations are made to existing cars:

(e) All side emergency exits shall be permanently fixed in the closed position. The corresponding side emergency exit on an adjacent car shall also be fixed in the closed position. The installation shall comply with Section 2.12.6.

Delete and revise Subsection (b) of Section 8.7.2.14.3 to read as follows:

8.7.2.14.3 Where any alteration is made to the car enclosure, other than as specified in 8.7.2.14.2, the installation shall conform to the following:

(b) Where an existing enclosure other than as specified in Subsection 8.7.2.14.3(a) is retained and new material is installed, the new material and adhesive shall conform to the following requirements, based on the tests conducted in accordance with the requirements of ASTM E84, ANSI/UL 723, or CAN/ULC-S102:

(1) flame spread rating of 0 to 50

(2) smoke development of 0 to 100

If the material or combination of materials installed exceeds 6.4 mm (0.25 in.) in thickness, the car enclosure shall conform to Section 2.14.2.1.1.
Add new Section 8.7.2.15.2.1 to read as follows:

8.7.2.15.2.1 When weight is added or removed from a counterweighted elevator, the counterbalance prior to the alteration shall be maintained.

Add new Items (4) and (5) to Subsection (c) of Section 8.7.2.17.1 to read as follows:

8.7.2.17.1 Increase or decrease in rise. Where an alteration involves an increase or decrease in the rise, the following requirements shall be conformed to:

(c) The bottom and top clearances and runbys for cars and counterweights shall conform to Section 2.4, except as follows:

(4) Where the only hoistway alteration is the decrease in travel at the upper end of the travel, the installation shall be modified as follows:

(i) Terminal stopping devices shall be provided based on the new top terminal landing location and the final limit switch shall be of the manual reset type.

(ii) A key controlled switch shall be provided in accordance with Section 8.1.5 (i.e. Group 4) requirements to by-pass the new top terminal stopping devices, when the elevator transfer switch is placed in the Top-of-Car Inspection Operation position, for access to the hoistway above the terminal landing.

The switch shall be manually operated, be labeled “Terminal By-Pass”, and shall have two positions; By-Pass and Normal.

The switch shall be located in the hoistway in the vicinity of the terminal limits and shall be accessible to a person standing on the car top. The car transfer switch shall not be removed from the Top-of-Car Inspection Operation position until the terminal limit By-Pass switch is placed in the Normal position.

(iii) Existing terminal stopping devices shall remain functional. The hoistway door electro-mechanical safety interlocks shall remain in the safety circuit and locked with door panel(s) separately secured in closed position on the hoistway side.

(iv) Associated floor labeling and signaling shall be removed.

(5) For manually operated elevators, as an exception to Item 4, the hoist ropes shall be extended and the upper limit switches shall be lowered to the new top terminal landing. Access for maintenance and inspection of the equipment at the top of the hoistway shall be provided.
Add new Subsections (b)(5) and (c)(10) to Section 8.7.2.27.4 to read as follows:

8.7.2.27.4 Controllers.

(b) Where an operation controller is installed, and the type of operation control, if automatic remains automatic, or, if nonautomatic remains continuous pressure, car switch, or other type of operation where the movement or stopping of the car is under the manual control of the operator (non-automatic), and the existing motion control equipment is retained, the installation shall conform to the following:

(5) Requirement 2.22

(c) Where both a motion controller and an operation controller are installed without any change in the type of motion control as described in 8.7.2.27.4(a) and without any change in the type of operation control as described in 8.7.2.27.4(b), the installation shall conform to the following:

(10) Requirement 2.22

Delete and revise Subsection (j) of Section 8.7.2.27.5 to read as follows:

8.7.2.27.5 Change in type of motion control. Where there is a change in the type of motion control (the method of controlling acceleration, speed, retardation, and stopping), the installation shall conform to the following:

(j) Car overspeed protection and unintended movement protection shall conform to Section 2.19 to the extent that the existing installation is approved by a design professional.

Delete and revise Subsection (l) of Section 8.7.2.27.6 to read as follows:

8.7.2.27.6 Change in type of operation control.

(l) Ascending car overspeed and unintended car movement protection shall conform to Section 2.19 to the extent the existing installation permits.

Delete Section 8.7.2.27.7 in its entirety.

Delete and revise Section 8.7.2.27.9 to read as follows:

8.7.2.27.9 Door monitoring system. Where there is an alteration to or addition of a system to monitor and prevent automatic operation of the elevator with faulty door contact circuits while the car is in the landing zone, the alteration shall conform to the requirements in Section 2.26.5.

8.7.3 Alterations to hydraulic elevators.
Add new Subsection (f) to 8.7.3.22.1 to read as follows:

**8.7.3.22.1 Increase or decrease in rise.** Where an alteration involves an increase or decrease in the rise without any change in the location of the driving machine, it shall conform to the following:

(f) Where the decrease is at the upper end of the rise, the installation shall conform to Section 8.7.2.17.1(4).

Delete and revise Section 8.7.3.31.10 to read as follows:

**8.7.3.31.10 In-car stop switch.** On passenger and freight elevators, a stop switch shall be provided in accordance with Section 2.26.2.5.

### SECTION 8.8 WELDING

**8.8.1 Qualification of welders.**

Delete and revise Section 8.8.1 to read as follows:

**8.8.1 Qualification of welders.**

Where required elsewhere in the New York City Building Code, welding of parts, except for tack welds later incorporated into finished welds, shall be undertaken

(a) by welders qualified in accordance with the requirements of Section 4 of ANSI/AWS D1.1, whereby the welders shall be qualified by the manufacturer or contractor; a registered design professional; or a recognized testing laboratory; or

(b) as per department rules.

### SECTION 8.10 ACCEPTANCE INSPECTIONS AND TESTS

Delete and revise the header of Section 8.10 to read as follows:

**Requirement 8.10 covers acceptance inspections and tests of new or altered installations.**

**NOTE:**

(1) Compliance with certain requirements is verifiable through review of design documents, engineering, or type tests.

**8.10.1 General requirements for acceptance inspections and tests.**

Delete and revise section 8.10.1.1.3 to read as follows:

**8.10.1.1.3 RESERVED.**
Delete and revise Section 8.10.1.4 to read as follows:

8.10.1.4 Acceptance test tags. A metal tag with the date (month and year) the acceptance test was satisfactorily performed, and the name of the applicant of record, shall be installed to be readily visible and shall be permanently attached to the controller of each unit.

Delete Section 8.10.1.5 in its entirety.

Delete Section 8.10.1.2 in its entirety.

8.10.2 Acceptance inspection and tests of electric elevators

Add new Subsection (y) to Section 8.10.2.2.1 to read as follows:

8.10.2.2.1 Inside car.

(y) Elevator mirrors. (3001.6)

Delete and revise Section 8.10.2.2.9 to read as follows:

8.10.2.2.9 Occupant Evacuation Operation. Verify conformance with Section 2.27.11. Tests shall be performed jointly by the fire alarm installer and the elevator system installer in conjunction with NFPA 72, as modified by Appendix Q of the New York City Building Code and any applicable rules.

SECTION 8.11
PERIODIC INSPECTIONS AND WITNESSING OF TESTS

8.11.1 General requirements for periodic inspections and witnessing of tests.

Delete and revise Section 8.11.1.1 to read as follows:

8.11.1.1 Persons authorized to make periodic inspections and witness tests. Refer to Article 304 of the Administrative Code.

Delete and revise Sections 8.11.1.3 and 8.11.1.4 to read as follows:

8.11.1.3 Periodic inspection and test frequency. See Chapter 3 of Title 28 of the Administrative Code.

NOTE: Required intervals for periodic inspections and tests can be found in Table N1 as modified by this appendix.

8.11.1.4 Installation placed out of service. An installation placed out of service permanently or temporarily so that it cannot be operated for a definite period shall comply with the following requirements:

8.11.1.4.1 Elevators not in use but available for service. Elevators not in use but available for service are those elevators whose power feed line has been disconnected by opening the
main line switch. All required tests shall be regularly performed and a periodic inspection shall be made, and fees shall be paid pursuant to the New York City Building Code. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.

8.11.1.4.1.1 Elevators placed out of service (dismantled). Elevators that are dismantled shall have power feed lines disconnected from the main line disconnect switch and shall meet the requirements of subsections (a) or (b), below:

(a) An electric elevator, dumbwaiter, sidewalk elevator or material lift whose suspension ropes have been removed, whose car and counterweight rest at the bottom of the hoistway, and whose hoistway doors have been permanently barricaded or sealed in the closed position on the hoistway side; or

(b) A hydraulic elevator, dumbwaiter, sidewalk elevator or material lift whose car rests at the bottom of the hoistway; whose pressure piping has been disassembled and removed from the premises; whose hoistway doors have been permanently barricaded or sealed in the closed position.

In addition, an application to dismantle the elevator shall be filed with the department and an inspection fee charged. Thereafter, one (1) additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is put back in service, an application to restore service shall be filed with the department. For access to the bottom of the hoistway, the requirements of Section 8.11.1.4.1.2(b)(4) shall apply.

8.11.1.4.1.2 Elevators removed and permanently discontinued – One elevator shaftway. When a single elevator with one elevator shaftway is removed and permanently discontinued, an application shall be filed with the department and inspection fees charged. Such process shall meet the following requirements:

(a) If it is proposed to extend the floor at every story of the building, the new construction shall be the same or of similar construction as the existing adjacent floor and of equivalent or better fire resistive rating. All hoistway equipment shall be completely removed; rails may remain.

(b) If the hoistway shaft is to remain open:

(1) All hoistway equipment shall be completely removed; rails may remain. Except as provided in item 4, all door and window assemblies opening onto masonry shaftway and masonry enclosed associated machine rooms shall be completely removed and the open space so created shall be filled with the same or similar material of equal thickness and of equivalent or better fire resistive rating as the adjacent masonry.

(2) Except as provided in item 3, all door and window assemblies opening onto the hoistway shaft that were originally enclosed with an open wire screen and subsequently enclosed with other than masonry units (i.e. metal lath and plaster or
transit boards) shall remain. Such door and window assemblies shall be fastened in a closed position and shall be adequately welded or bolted shut. The assembly shall be enclosed in material of equal or similar thickness of equivalent or better fire resistive rating as the adjacent enclosure.

(3) The sidewalk elevator door at the street level shall be fastened in a closed position and shall be adequately welded shut. The underside of such door shall be properly reinforced and supported by steel beams and columns to support the same loading as the sidewalk.

(4) Firefighter access to the bottom of the hoistway (elevator pit) shall be provided through the door assembly of the pit door and shall meet the following requirements:

(i) If the machine room is located at or near the level of the bottom of the shaftway and is so located that access to the bottom of the shaftway is readily available through the machine room, the door to the machine room shall be kept closed with a heavy-duty dead bolt locking device.

(ii) If the machine room is located other than at or near the level of the bottom of the shaftway or the bottom of the shaftway is not otherwise readily accessible through the machine room, the lowermost door opening onto the shaftway shall be kept closed with a heavy-duty dead bolt locking device. A conspicuous sign of 25 mm (1 in.) block letters with contrasting background shall be permanently affixed to the door and shall read “HOISTWAY.”

(iii) The key to the locking device required in items (i) and (ii) above shall be kept by the building superintendent and shall be readily available to the commissioner or the commissioner’s representative and to firefighters.

(c) The ventilation opening (smoke hole) in the flooring provided at the top of the hoistway immediately below the sheaves or at the level of the top of the machine room floor beams and the ventilation opening at the exterior portion of the machine room shall be maintained.

(d) All electric service to the elevator hoistway and machine room shall be disconnected outside the confines of the elevator hoistway and machine room.

8.11.1.4.1.3 Elevators removed and permanently discontinued – Multi-elevator shaftway.
When a single elevator in a multi-elevator shaftway is removed and permanently discontinued, an application shall be filed with the department and inspection fees charged. Such process shall meet the following requirements:

(a) If it is proposed to extend the floor at every story of the building, the new construction shall be the same or of similar construction as the existing adjacent floor and of equivalent or better fire resistive rating. All hoistway equipment for the discontinued elevator shall be completely removed; rails may remain. The shaft enclosure shall be rearranged so that the remaining operating elevators are properly enclosed to maintain the integrity of the shaftway.
(b) If the hoistway shaft is to remain open:

(1) All hoistway equipment for the discontinued elevator shall be completely removed; rails may remain. All door assemblies serving the discontinued elevator, openings onto the masonry shaftway shall be completely removed and the open space so created shall be filled with the same or similar material of equal thickness of equivalent or better fire resistive rating as the adjacent masonry.

(2) All door assemblies serving the discontinued elevator, opening onto the hoistway shaft that were originally enclosed with an open wire screen and subsequently enclosed with other than masonry units (i.e. metal lath and plaster or transite boards), shall remain. Such door assemblies shall be fastened in a closed position and shall be adequately welded shut. The assembly shall be enclosed in material of equivalent or better fire resistive rating as the adjacent enclosure.

8.11.1.4.2 Escalator installation placed out of service.

8.11.1.4.2.1 Escalators not in use but available for service. Escalators not in use but available for service are those escalators whose power feed lines have been disconnected from the main line disconnect switch and whose entrances have been barricaded. All required tests shall be regularly performed and a periodic inspection shall be made, and fees shall be paid pursuant to the New York City Building Code. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.

8.11.1.4.2.2 Escalators discontinued or placed out of service. Escalators discontinued or placed out of service shall comply with Section 8.11.1.4.2.1. An application shall be filed with the department and inspection fees charged. Thereafter, one (1) additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is put back in service, it shall be subject to all of the routine and periodic inspections and tests required by the New York City Building Code.

8.11.1.4.2.3 Escalators removed and permanently discontinued. An application shall be filed with the department and inspection fees charged. The escalator steps, newels, rails, all wire cables, and other equipment and machinery shall be completely removed. An opening created by the removal of the escalator shall be filled with new construction of the same or similar construction as the existing adjacent floor and of equivalent or better fire resistive rating.

8.11.1.4.3 Moving walk installation placed out of service.

8.11.1.4.3.1 Moving walks not in use but available for service. Moving walks not in use but available for service are those moving walks whose power feed lines have been disconnected from the main line disconnect switch and whose entrances have been barricaded. All required tests shall be regularly performed and a periodic inspection shall be made and fees charged. An elevator inspector shall verify that these tests and inspections are being performed, and that the power was interrupted.
8.11.4.3.2 Moving walk discontinued or placed out of service. Moving walks discontinued or placed out of service shall meet the requirements of Section 8.11.1.4.3.1 except for periodic inspection. An application shall be filed with the department and inspection fees charged. Thereafter, one (1) additional inspection per year shall be made to verify that the status is unchanged and fees shall be paid for such inspection. Before the installation is placed back in service, it shall be subject to all of the routine and periodic inspections and tests required by the New York City Building Code.

8.11.4.3.3 Moving walk removed and permanently discontinued. An application shall be filed with the department and inspection fees charged. The moving walk treadways, newels, rails, all wire cables, and other equipment and machinery shall be completely removed. The truss may remain. An opening created by the removal of the moving walk shall be covered by new construction of the same or similar construction as the existing adjacent floor and of equivalent or better fire resistive rating.

Add new Section 8.11.1.6 to read as follows:

8.11.6 Test and maintenance data tags. A tag conforming to the requirements of Section 2.16.3.3 for data plates with the test date, the category number of the test, and the name of the agency performing the test shall be installed at the following locations:

(a) Category 1 on the controller for elevators, escalators and moving walks and also on the lower starting station of escalators and moving walks.

(b) Category 5 on the elevator controller, governor(s), release carrier(s) and oil buffer(s).

(c) Brake maintenance tag on the controller for elevators, escalators and moving walks and also on the lower starting station of escalators and moving walks.

8.11.2 Periodic inspection of electric elevators.

Delete and revise the Note to Section 8.11.2.1 to read as follows:

8.11.2.1 Periodic inspection requirements. Inspectors shall include the following when identifying components or systems, or both, that shall be inspected.

NOTES:

(1) For inspection frequency, see Section 8.11.1.3.

(2) Refer to Article 304 of the Administrative Code.

8.11.3 Periodic inspection of hydraulic elevators.
Delete and revise the Note to Section 8.11.3.1 to read as follows:

8.11.3.1 Periodic inspection requirements. Inspectors shall include the following when identifying components or systems, or both, that shall be inspected.

NOTES:

(1) For inspection frequency, see Section 8.11.1.3.

(2) Refer to Article 304 of the Administrative Code.

8.11.4 Periodic inspection of escalators and moving walks.

Delete and revise the Note to Section 8.11.4.1 to read as follows:

8.11.4.1 Periodic inspection and test requirements. Inspectors shall include the following when identifying components or systems, or both, that shall be inspected:

NOTES:

(1) For inspection frequency, see Section 8.11.1.3.

(2) Refer to Article 304 of the Administrative Code.

### Notes:

1. See Article 304.6 of the Administrative Code.
2. Periodic inspections, in accordance with Section 28-304.6.1 of the Administrative Code, do not require the presence of a witnessing agency.
3. Water-hydraulic elevators shall be tested in accordance with section 8.6.5.15.
4. Where filing with the Department is not required, the owner shall perform category testing and maintain a log of each test performed as required by the New York City Building Code. Such log shall be made available to the Department upon request.
5. Dismantled devices do not require Category 1 or 5 tests but do require periodic inspections.
6. For private residence elevators, periodic inspection and category testing may be performed on the same date.
CHAPTER K2
MODIFICATIONS TO ASME B20.1/2015,
SAFETY STANDARD FOR CONVEYORS AND RELATED EQUIPMENT

K201.1 General. As referenced in Section 3001.2 of this code, the provisions of ASME B20.1-2015 shall be modified in accordance with this appendix. The section numbers correlate to those in the referenced ASME standard. Refer to the rules of the department for any subsequent additions, modifications or deletions that may have been made to this standard in accordance with Section 28-103.19 of the Administrative Code.

4 DEFINITIONS
Delete and revise the definition “Conveyor, vertical reciprocating” in Section 4 to read as follows:

CONVEYOR, VERTICAL RECIPROCATING. A permanent reciprocating power or gravity-actuated unit (not designed to carry passengers or an operator) that receives objects on a carrier and transmits these objects vertically between two or more levels.

6 SPECIFIC SAFETY STANDARDS
SECTION 6.1
BELT CONVEYORS: FIXED IN PLACE
Delete Section 6.1 in its entirety.

SECTION 6.2
GUARDING OF BUCKET CONVEYORS
Delete Section 6.2 in its entirety.

SECTION 6.3
SAFETY CONSIDERATIONS FOR CHAIN CONVEYORS
Delete Section 6.3 in its entirety.

SECTION 6.4
EN MASSE CONVEYORS
Delete Section 6.4 in its entirety.

SECTION 6.5
FLIGHT AND APRON CONVEYORS: BULK MATERIAL
Delete Section 6.5 in its entirety.
SECTION 6.6
INCLINED RECIPROCATING CONVEYORS
Delete Section 6.6 in its entirety.

SECTION 6.7
LIVE ROLLER CONVEYORS: BELT OR CHAIN DRIVEN
Delete Section 6.7 in its entirety.

SECTION 6.8
MOBILE CONVEYORS
Delete Section 6.8 in its entirety.

SECTION 6.9
SAFETY CONSIDERATIONS FOR PORTABLE CONVEYORS, EXTENDABLE BELT CONVEYORS, AND CAR UNLOADERS
Delete Section 6.9 in its entirety.

SECTION 6.10
SAFETY CONSIDERATIONS FOR PUSHER BAR CONVEYORS
Delete Section 6.10 in its entirety.

SECTION 6.11
6.11 ROLLER AND WHEEL CONVEYORS
Delete Section 6.11 in its entirety.

SECTION 6.12
6.12 SAFETY CONSIDERATIONS FOR SCREW CONVEYORS
Delete Section 6.12 in its entirety.

SECTION 6.13
SAFETY CONSIDERATIONS FOR SHUTTLE CONVEYERS, BELT TRIPPERS, AND TRANSFER CARS
Delete Section 6.13 in its entirety.

SECTION 6.14
SKIP HOISTS: BULK MATERIAL
