</table>

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm², 1 cubic foot = 0.0283 m³.

a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.

b. [Thickness] Thicknesses shown for brick and clay tile are nominal thicknesses unless plastered, in which case thicknesses are net. Thickness shown for concrete masonry and clay masonry is equivalent thickness defined in Section [721.1-3] 722.3.1 for concrete masonry and Section [721.1-4] 722.4.1.1 for clay masonry. Where all cells are solid grouted or filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, the equivalent thickness shall be the thickness of the block or brick using specified dimensions as defined in Chapter 21. Equivalent thickness [mms] shall also include the thickness of applied plaster and lath or gypsum wallboard, where specified.

c. For units in which the net cross-sectional area of cored brick in any plane parallel to the surface containing the cores is [size] not less than 75 percent of the gross cross-sectional area measured in the same plane.

d. Shall be used for nonbearing purposes only.

e. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with a [minimum] not less than of 3/16″ inch gypsum veneer plaster.

f. The fire-resistance time period for concrete masonry units meeting the equivalent thicknesses required for a 2-hour fire-resistance rating in Item 3, and having a thickness of not less than 7⅛″ inches is 4 hours [whens] where cores [whens] that are not grouted are filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, sand or slag having a maximum particle size of 3/16″ inch.

g. The fire-resistance rating of concrete masonry units composed of a combination of aggregate types or where plaster is applied directly to the concrete masonry shall be determined in accordance with ACI 216.1/TMS 216. Lightweight aggregates shall have a maximum combined density of 65 pounds per cubic foot.

h. See also Note b. The equivalent thickness shall be permitted to include the thickness of cement plaster or 1.5 times the thickness of the gypsum plaster applied in accordance with the requirements of Chapter 25.

i. Concrete walls shall be reinforced with horizontal and vertical temperature reinforcement as required by Chapter 19.

j. Studs are welded truss wire studs with 0.18 inch (No. 7 B.W. gage) flange wire and 0.18 inch (No. 7 B.W. gage) truss wires.

k. Nailable metal studs consist of two channel studs spot welded back to back with a crimped web forming a nailing groove.

l. Wood structural panels shall be permitted to be installed between the fire protection and the wood studs on either the interior or exterior side of the wood frame assemblies in this construction, provided the length of the fasteners used to attach the fire protection is increased by an amount [amount equivalent] not less than the thickness of the wood structural panel.

m. [This] For studs with a slenderness ratio, L/d, greater than 33, the design stress [stress] shall be reduced to 75 percent of allowable F'. For studs with [the maximum] a slenderness ratio, L/d, not [greater than 33 percent] exceeding 33, the design stress shall be reduced to 75 percent of the adjusted stress F', calculated [stress] for studs having a slenderness ratio L/d of 33.

n. For properties of cooler or wallboard nails, see ASTM C 514, ASTM C 547 or ASTM F 1667.

o. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in the GA 600 shall be accepted as if herein listed.

p. NCMA TEK 5-8, shall be permitted for the design of fire walls.

q. The design stress of studs shall be equal to a maximum of 100 percent of the allowable F', calculated in accordance with Section 2306.

Table 720.1(3) 721.1(3)

MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS

[Table 720.1(3) Notes.]

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m³, 1 pound per square inch = 6.895 kPa = 1 pound per lineal foot = 1.4882 kg/m.

a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.

b. [Note] Where the slab is in an unrestrained condition, minimum reinforcement cover shall be not less than 1½ inches for 4 [house] hours (siliceous aggregate only): 1½ inches for 4 [house] and 3 ½ [house] hours; 1 inch for 2 ½ [house] hours (siliceous aggregate only); and 1½ inches for all other restrained and unrestrained conditions.

c. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with a minimum of 1½-inch gypsum veneer plaster.

d. Slab thickness over steel joists measured at the joists for metal lath form and at the top of the form for steel form units.

e. (a) The maximum allowable stress level for H-Series joists shall not exceed 22,000 psi.

(b) The allowable stress for K-Series joists shall not exceed 26,000 psi, the nominal depth of such joist shall be not less than 10 inches and the nominal joist weight shall be not less than 5 pounds per linear foot.

f. Cement plaster with 15 pounds of hydrated lime and 3 pounds of approved additives or admixtures per bag of cement.

g. Gypsum wallboard ceilings attached to steel framing shall be permitted to be suspended with 1½-inch cold-formed carrying channels spaced 48 inches on center (siliceous aggregate) that are spaced with No. 8 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire (double strand) and spaced as required for direct attachment to the framing. This alternative is applicable to those steel framing assemblies recognized under Note q.

h. Six-inch hollow clay tile with 2-inch concrete slab above.

i. Four-inch hollow clay tile with 1½-inch concrete slab above.

j. Thickness measured to bottom of steel form units.

k. Five-eighths inch of vermiculite gypsum plaster plus 1/2 inch of approved vermiculite acoustical plastic.

l. Furring channels spaced 12 inches on center.

m. Double wood floor shall be permitted to be either of the following:
(a) Subfloor of 1-inch nominal boarding, a layer of asbestos paper weighing not less than 14 pounds per 100 square feet and a layer of 1-inch nominal tongue-and-groove finished flooring; or
(b) Subfloor of 1-inch nominal tongue-and-groove boarding or 15/32-inch wood structural panels with exterior glue and a layer of 1-inch nominal tongue-and-groove finished flooring or 19/32-inch wood structural panel finish flooring or a layer of Type I GradeM-1 particleboard not less than 5/8-inch thick.

n. The ceiling shall be permitted to be omitted over unusable space, and flooring shall be permitted to be omitted where unusable space occurs above.
o. For properties of cooler or wallboard nails, see ASTM C 514, ASTM C 547 or ASTM F 1667.
p. Thickness measured on top of steel deck unit.
q. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in the GA 600 shall be accepted as if herein listed.

[720.1.1] 721.1.1 **Thickness of protective coverings.** The thickness of fire-resistant materials required for protection of structural members shall be not less than set forth in Table [720.1(1)] 721.1(1), except as modified in this section. The figures shown shall be the net thickness of the protective materials and shall not include any hollow space in back of the protection.

[720.1.2] 721.1.2 **Unit masonry protection.** Where required, metal ties shall be embedded in bed joints of unit masonry for protection of steel columns. Such ties shall be as set forth in Table [720.1(1)] 721.1(1) or be equivalent thereto.

[720.1.3] 721.1.3 **Reinforcement for cast-in-place concrete column protection.** Cast-in-place concrete protection for steel columns shall be reinforced at the edges of such members with wire ties of not less than 0.18 inch (4.6 mm) in diameter wound spirally around the columns on a pitch of not more than 8 inches ([203] 203.2 mm) or by equivalent reinforcement.

[720.1.4] 721.1.4 **Plaster application.** The finish coat is not required for plaster protective coatings where [they] such coatings comply with the design mix and thickness requirements of Tables [720.1(1)] 721.1(1), [720.1(2)] 721.1(2), and [720.1(3)] 721.1(3).

[720.1.5] 721.1.5 **Bonded prestressed concrete tendons.** For members having a single tendon or more than one tendon installed with equal concrete cover measured from the nearest surface, the cover shall be not [be] less than that set forth in Table [720.1(1)] 721.1(1). For members having multiple tendons installed with variable concrete cover, the average tendon cover shall be not [be] less than that set forth in Table [720.1(1)] 721.1(1), provided:

1. The clearance from each tendon to the nearest exposed surface is used to determine the average cover.
2. In no case can the clear cover for individual tendons be less than one-half of that set forth in Table [720.1(1)] 721.1(1). A minimum cover of 3/4 inch (19.1 mm) for slabs and 1 inch ([25] 25.4 mm) for beams is required for any aggregate concrete.
3. For the purpose of establishing a fire-resistance rating, tendons having a clear covering less than that set forth in Table [720.1(1)] 721.1(1) shall not contribute more than 50 percent of the required ultimate moment capacity for members less than 350 square inches (0.226 m²) in cross-sectional area and 65 percent for larger members. For structural design purposes, however, tendons having a reduced cover are assumed to be fully effective.

SECTION BC [724] 722
CALCULATED FIRE RESISTANCE

[724.1] 722.1 **General.** The provisions of this section contain procedures by which the fire resistance of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated
fire resistance of concrete, concrete masonry,[7] and clay masonry assemblies shall be permitted in accordance with ACI 216.1/TMS [0216.1] 216. The calculated fire resistance of steel assemblies shall be permitted in accordance with Chapter 5 of [ASCE/SEI 29] ASCE 29. The calculated fire resistance of exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of [ANSI/AF&PA] ANSI/AWC National Design Specification for Wood Construction (NDS).

[721.1.1] 722.1.1 Definitions. The following [words and] terms [shall, for the purposes of this chapter and as used elsewhere] are defined in [this code, have the meanings shown herein.] Chapter 2 of this code:

CERAMIC FIBER BLANKET. [A mineral wool insulation material made of alumina-silica fibers and weighing 4 to 10 pounds per cubic foot (pcf) (64 to 160 kg/m³).]

CONCRETE, CARBONATE AGGREGATE. [Concrete made with aggregates consisting mainly of calcium or magnesium carbonate, such as limestone or dolomite, and containing 40 percent or less quartz, chert, or flint.]

CONCRETE, CELLULAR. [A lightweight insulating concrete made by mixing a preformed foam with portland cement slurry and having a dry unit weight of approximately 30 pcf (480 kg/m³).]

CONCRETE, LIGHTWEIGHT AGGREGATE. [Concrete made with aggregates of expanded clay, shale, slag or slate or sintered fly ash or any natural lightweight aggregate meeting ASTM C 330 and possessing equivalent fire-resistance properties and weighing 85 to 115 pcf (1360 to 1840 kg/m³).]

CONCRETE, PERLITE. [A lightweight insulating concrete having a dry unit weight of approximately 30 pcf (480 kg/m³) made with perlite concrete aggregate. Perlite aggregate is produced from a volcanic rock which, when heated, expands to form a glass-like material of cellular structure.]

CONCRETE, SAND-LIGHTWEIGHT. [Concrete made with a combination of expanded clay, shale, slag, slate, sintered fly ash, or any natural lightweight aggregate meeting ASTM C 330 and possessing equivalent fire-resistance properties and natural sand. Its unit weight is generally between 105 and 120 pcf (1680 and 1920 kg/m³).]

CONCRETE, SILICEOUS AGGREGATE. [Concrete made with normal-weight aggregates consisting mainly of silica or compounds other than calcium or magnesium carbonate, which contains more than 40 percent quartz, chert, or flint.]

CONCRETE, VERMICULITE. [A lightweight insulating concrete made with vermiculite concrete aggregate which is laminated micaceous material produced by expanding the ore at high temperatures. When added to a portland cement slurry the resulting concrete has a dry unit weight of approximately 30 pcf (480 kg/m³).]

GLASS FIBERBOARD. [Fibrous glass roof insulation consisting of inorganic glass fibers formed into rigid boards using a binder. The board has a top surface faced with asphalt and kraft reinforced with glass fiber.]
MINERAL BOARD. [A rigid felted thermal insulation board consisting of either felted mineral fiber or cellular beads of expanded aggregate formed into flat rectangular units.]

[721.2] 722.2 Concrete assemblies. The provisions of this section contain procedures by which the fire-resistance ratings of concrete assemblies are established by calculations.

[721.2.1] 722.2.1 Concrete walls. Cast-in-place and precast concrete walls shall comply with Section [721.2.1.1] 722.2.1.1. Multiwythe concrete walls shall comply with Section [721.2.1.2] 722.2.1.2. Joints between precast panels shall comply with Section [721.2.1.3] 722.2.1.3. Concrete walls with gypsum wallboard or plaster finish shall comply with Section [721.2.1.4] 722.2.1.4.

[721.2.1.1] 722.2.1.1 Cast-in-place or precast walls. The minimum equivalent [thickness] thicknesses of cast-in-place or precast concrete walls for fire-resistance ratings of 1 hour to 4 hours are shown in Table [721.2.1.1] 722.2.1.1. For solid walls with flat vertical surfaces, the equivalent thickness is the same as the actual thickness. The values in Table [721.2.1.1] 722.2.1.1 apply to plain, reinforced or prestressed concrete walls.

<table>
<thead>
<tr>
<th>CONCRETE TYPE</th>
<th>MINIMUM SLAB THICKNESS (inches) FOR FIRE-RESISTANCE RATING OF</th>
</tr>
</thead>

<tr>
<td>Sand-[Lightweight] lightweight</td>
<td>2.7</td>
</tr>
<tr>
<td>Lightweight</td>
<td>2.5</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm.

[721.2.1.1.1] 722.2.1.1.1 Hollow-core precast wall panels. For hollow-core precast concrete wall panels in which the cores are of constant cross section throughout the length, calculation of the equivalent thickness by dividing the net cross-sectional area (the gross cross section minus the area of the cores) of the panel by its width shall be permitted.

[721.2.1.1.2] 722.2.1.1.2 Core spaces filled. Where all of the core spaces of hollow-core wall panels are filled with loose-fill material, such as expanded shale, clay[,] or slag, or vermiculite or perlite, the fire-resistance rating of the wall is the same as that of a solid wall of the same concrete type and of the same overall thickness.

[721.2.1.1.3] 722.2.1.1.3 Tapered cross sections. The thickness of panels with tapered cross sections shall be that determined at a distance $2t$ or 6 inches ([152] 152.4 mm), whichever is less, from the point of minimum thickness, where $t$ is the minimum thickness.

[721.2.1.1.4] 722.2.1.1.4 Ribbed or undulating surfaces. The equivalent thickness of panels with ribbed or undulating surfaces shall be determined by one of the following expressions:

733
For \( s \geq 4t \), the thickness to be used shall be \( t \)

For \( s \leq 2t \), the thickness to be used shall be \( t_e \)

For \( 4t > s > 2t \), the thickness to be used shall be

\[
t + \left( \frac{4t}{s} - 1 \right) (t_e - t)
\]

(Equation 7-3)

where:

\( s = \) Spacing of ribs or undulations.

\( t = \) Minimum thickness.

\( t_e = \) Equivalent thickness of the panel calculated as the net cross-sectional area of the panel divided by the width, in which the maximum thickness used in the calculation shall not exceed 2t.

[721.2.1.2] 722.2.1.2 Multi-wythe walls. For walls that consist of two wythes of different types of concrete, the fire-resistance ratings shall be permitted to be determined from Figure [721.2.1.2] 722.2.1.2.

\[ R = (R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59}) \times 1.7 \]

(Equation 7-4)

where:

\( R = \) The fire endurance of the assembly, minutes.

For SI: 1 inch = 25.4 mm.
$R_1, R_2, \text{ and } R_n$ are the fire endurances of the individual wythes, minutes. Values of $R_n^{0.59}$ for use in Equation 7-4 are given in Table [721.2.1.2(4)] 722.1.2(1). Calculated fire-resistance ratings are shown in Table [721.2.1.2(2)] 722.1.2(2).

| TABLE [721.2.1.2(1)] 722.2.1.2(1) VALUES OF $R_n^{0.59}$ FOR USE IN EQUATION 7-4 |

| Insulating concrete^a            |                               | 9.3            | 13.3           | 16.6           | 18.3           | 23.1           | 26.5^c         | Note c         | Note c         | Note c         | Note c         | Note c         | Note c         |
| Airspace^b                       |                               | --             | --             | --             | --             | --             | --             | --             | --             | --             | --             | --             | --             |

For SI: 1 inch = 25.4 mm, 1 pound per cubic foot = 16.02 kg/m³.

a. Dry unit weight of 35 pcf or less and consisting of cellular, perlite or vermiculite concrete.

b. The $R_n^{0.59}$ value for one $\frac{1}{2}''$ to $3\frac{1}{2}''$ airspace is 3.3. The $R_n^{0.59}$ value for two $\frac{1}{2}''$ to $3\frac{1}{2}''$ airspaces is 6.7.

c. The fire-resistance rating for this thickness exceeds 4 hours.

TABLE [721.2.1.2(2)] 722.2.1.2(2) FIRE-RESISTANCE RATINGS BASED ON $R_n^{0.59}$

<table>
<thead>
<tr>

<td>16.85</td>
</tr>
<tr>
<td>180</td>
<td>21.41</td>
</tr>
<tr>
<td>240</td>
<td>25.37</td>
</tr>
</tbody>
</table>

a. Based on Equation 7-4.

Foam plastic insulation. The fire-resistance ratings of precast concrete wall panels consisting of a layer of foam plastic insulation sandwiched between two wythes of concrete shall be permitted to be determined by use of Equation 7-4. Foam plastic insulation with a total thickness of less than 1 inch ([25] 25.4 mm) shall be disregarded. The $R_n$ value for thickness of foam plastic insulation of 1 inch ([25] 25.4 mm) or greater, for use in the calculation, is 5 minutes; therefore $R_n^{0.59} = 2.5$.

Joints between precast wall panels. Joints between precast concrete wall panels [which] that are not insulated as required by this section shall be considered as openings in walls. Uninsulated joints shall be included in determining the percentage of openings permitted by Table [704.8] 705.8. Where openings are not permitted or are required by this code to be protected, the provisions of this section shall be used to determine the amount of joint insulation required. Insulated joints shall not be considered openings for purposes of determining compliance with the allowable percentage of openings in Table [704.8] 705.8.
[721.2.1.3.1] 722.2.1.3.1 Ceramic fiber joint protection. Figure [721.2.1.3.1] 722.2.1.3.1 shows thicknesses of ceramic fiber blankets to be used to insulate joints between precast concrete wall panels for various panel thicknesses and for joint widths of \( \frac{3}{8} \) inch (9.5 mm) and 1 inch ([25] 25.4 mm) for fire-resistance ratings of 1 hour to 4 hours. For joint widths between \( \frac{3}{8} \) inch (9.5 mm) and 1 inch ([25] 25.4 mm), the thickness of ceramic fiber blanket is allowed to be determined by direct interpolation. Other tested and labeled materials are acceptable in place of ceramic fiber blankets.

For SI: 1 inch = 25.4 mm.

**FIGURE [721.2.1.3.1] 722.2.1.3.1 CERAMIC FIBER JOINT PROTECTION**

[721.2.1.4] 722.2.1.4 Walls with gypsum wallboard or plaster finishes. The fire-resistance rating of cast-in-place or precast concrete walls with finishes of gypsum wallboard or plaster applied to one or both sides shall be permitted to be calculated in accordance with the provisions of this section.

[721.2.1.4.1] 722.2.1.4.1 Nonfire-exposed side. Where the finish of gypsum wallboard or plaster is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of the finish shall first be corrected by multiplying the actual thickness of the finish by the applicable factor determined from Table [721.2.1.4(1)] 722.2.1.4(1) based on the type of aggregate in the concrete. The corrected thickness of finish shall then be added to the actual or equivalent thickness of concrete and fire-resistance rating of the concrete and finish determined from [Table 721.2.1.1, Figure 721.2.1.2 or Table 721.2.1.2(1)] Tables 722.2.1.1 and 722.2.1.2(1), and Figure 722.2.1.2.

<tr>
<td>3/8 inch</td>
<td>60</td>
</tr>
<tr>
<td>1 inch</td>
<td>80</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm.
The actual thickness of portland cement-sand plaster, provided it is \( \frac{5}{8} \) inch or less in thickness, shall be permitted to be included in determining the equivalent thickness of the masonry for use in Table [721.2.1.4.2] 722.2.1.4.2.

**722.2.1.4.2 Fire-exposed side.** Where gypsum wallboard or plaster is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table [721.2.1.4.2(2)] 722.2.1.4(2) shall be added to the fire-resistance rating determined from [Table 721.2.1.1 or Figure 721.2.1.2, or Table 721.2.1.2(1)] Tables 722.2.1.1 and 722.2.1.2(1) and Figure 722.2.1.2 for the concrete alone, or to the rating determined in Section [721.2.1.4.1] 722.2.1.4.1 for the concrete and finish on the nonfire-exposed side.

**722.2.1.4.3 Nonsymmetrical assemblies.** For a wall having no finish on one side or different types or thicknesses of finish on each side, the calculation procedures of Sections [721.2.1.4.1] 722.2.1.4.1 and [721.2.1.4.2] 722.2.1.4.2 shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values.

**Exception:** For an exterior wall with a fire separation distance greater than 5 feet (1524 mm), the fire shall be assumed to occur on the interior side only.

**722.2.1.4.4 Minimum concrete fire-resistance rating.** Where finishes applied to one or both sides of a concrete wall contribute to the fire-resistance rating, the concrete alone shall provide not less than one-half of the total required fire-resistance rating. Additionally, the contribution to the fire resistance of the finish on the nonfire-exposed side of a load-bearing wall shall not exceed one-half the contribution of the concrete alone.

**722.2.1.4.5 Concrete finishes.** Finishes on concrete walls that are assumed to contribute to the total fire-resistance rating of the wall shall comply with the installation requirements of Section [721.2.3.2.5] 722.3.2.5.

**722.2.2 Concrete floor and roof slabs.** Reinforced and prestressed floors and roofs shall comply with Section [721.2.2.1] 722.2.2.1. Multicourse floors and roofs shall comply with Sections [721.2.2.2] 722.2.2.2 and [721.2.2.3] 722.2.2.3, respectively.

**722.2.2.1 Reinforced and prestressed floors and roofs.** The minimum thicknesses of reinforced and prestressed concrete floor or roof slabs for fire-resistance ratings of 1 hour to 4 hours are shown in Table [721.2.2.4] 722.2.2.1.

**Exception:** Minimum thickness shall not be required for floors and ramps within open and enclosed parking garages constructed in accordance with Section 406.
**TABLE [721.2.2.1] 722.2.2.1**

</table>

For SI: 1 inch = 25.4 mm.

[721.2.2.1.1] **Hollow-core prestressed slabs.** For hollow-core prestressed concrete slabs in which the cores are of constant cross section throughout the length, the equivalent thickness shall be permitted to be obtained by dividing the net cross-sectional area of the slab including grout in the joints, by its width.

[721.2.2.1.2] **Slabs with sloping soffits.** The thickness of slabs with sloping soffits (see Figure [721.2.2.1.2] 722.2.2.1.2) shall be determined at a distance 2t or 6 inches ([152] 152.4 mm), whichever is less, from the point of minimum thickness, where t is the minimum thickness.

![Determination of slab thickness for sloping soffits](image)

For SI: 1 inch = 25.4 mm

**FIGURE [721.2.2.1.2] 722.2.2.1.2**

**DETERMINATION OF SLAB THICKNESS FOR SLOPING SOFFITS**

[721.2.2.1.3] **Slabs with ribbed soffits.** The thickness of slabs with ribbed or undulating soffits (see Figure [721.2.2.1.3] 722.2.2.1.3) shall be determined by one of the following expressions, whichever is applicable:

For \( s \geq 4t \), the thickness to be used shall be \( t \)

For \( s \leq 2t \), the thickness to be used shall be \( t_e \)

For \( 4t > s > 2t \), the thickness to be used shall be

\[
t + \left( \frac{4t}{s} - 1 \right) (t_e + t)
\]

(Equation 7-5)
where:

\[ s = \text{Spacing of ribs or undulations.} \]
\[ t = \text{Minimum thickness.} \]
\[ t_e = \text{Equivalent thickness of the slab calculated as the net area of the slab divided by the width, in which the maximum thickness used in the calculation shall not exceed } 2t. \]

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.1.3**

*SLABS WITH RIBBED OR UNDULATING SOFFITS*

[721.2.2.2] **722.2.2.2 Multicourse floors.** The fire-resistance ratings of floors that consist of a base slab of concrete with a topping (overlay) of a different type of concrete shall comply with Figure [721.2.2.2] 722.2.2.2.
For SI: 1 inch = 25.4 mm.

**FIGURE [721.2.2.2]** 722.2.2.2

**FIRE-RESISTANCE RATINGS FOR TWO-COURSE CONCRETE FLOORS**

[721.2.2.3] 722.2.2.3 Multicourse roofs. The fire-resistance ratings of roofs [which] that consist of a base slab of concrete with a topping (overlay) of an insulating concrete or with an insulating board and built-up roofing shall comply with Figures [721.2.2.3(1)] 722.2.2.3(1) and [721.2.2.3(2)] 722.2.2.3(2).
For SI: 1 inch = 25.4 mm.
FIGURE [721.2.2.3(4)] 722.2.2.3(1)  
FIRE-RESISTANCE RATINGS FOR CONCRETE 
ROOF ASSEMBLIES

For SI: 1 inch = 25.4 mm.

FIGURE [721.2.2.3(2)] 722.2.2.3(2)  
FIRE-RESISTANCE RATINGS FOR CONCRETE 
ROOF ASSEMBLIES

[721.2.2.3.1] 722.2.2.3.1 Heat transfer. For the transfer of heat, three-ply built-up roofing contributes 10 minutes to the fire-resistance rating. The fire-resistance rating for concrete assemblies such as those shown in Figure [721.2.2.3(4)] 722.2.2.3(1) shall be increased by 10 minutes. This increase is not applicable to those shown in Figure [721.2.2.3(2)] 722.2.2.3(2).

[721.2.2.4] 722.2.2.4 Joints in precast slabs. Joints between adjacent precast concrete slabs need not be considered in calculating the slab thickness provided that a concrete topping [at least] not less than 1 inch ([25] 25.4 mm) thick is used. Where no concrete topping is used, joints must be grouted to a depth of [at least] not less than one-third the slab thickness at the joint, but not less than 1 inch ([25] 25.4 mm), or the joints must be made fire resistant by other approved methods.
### 721.2.3 Cover over reinforcement

The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this section.

#### Table 722.2.3(1)

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of 1/4 inch is adequate for ratings of 4 hours or less.

b. For beam widths between the tabulated values, the minimum cover thickness can be determined by direct interpolation.

c. The cover for an individual reinforcing bar is the minimum thickness of concrete between the surface of the bar and the fire-exposed surface of the beam. For beams in which several bars are used, the cover for corner bars used in the calculation shall be reduced to one-half of the actual value. The cover for an individual bar must be not less than one-half of the value given in Table 722.2.3(1) nor less than 1/4 inch.

</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of 7/8 inch is adequate for 4-hour ratings or less.

b. The cross-sectional area of a stem is permitted to include a portion of the area in the flange, provided the width of the flange used in the calculation does not exceed three times the average width of the stem.

c. U-shaped or hooped stirrups spaced not to exceed the depth of the member and having a minimum cover of 1 inch shall be provided.

**[721.2.3.1] 722.2.3.1 Slab cover.** The minimum thickness of concrete cover to the positive moment reinforcement shall comply with Table [721.2.3(1)] 722.2.3(1) for reinforced concrete and Table [721.2.3(2)] 722.2.3(2) for prestressed concrete. These tables are applicable for solid or hollow-core one-way or two-way slabs with flat undersurfaces. These
tables are applicable to slabs that are either cast in place or precast. For precast prestressed concrete not covered elsewhere, the procedures contained in PCI MNL 124 shall be acceptable.

[721.2.3.2] **722.2.3.2 Reinforced beam cover.** The minimum thickness of concrete cover to the positive moment reinforcement (bottom steel) for reinforced concrete beams is shown in Table [721.2.3(3)] 722.2.3(3) for fire-resistance ratings of 1 hour to 4 hours.

[721.2.3.3] **722.2.3.3 Prestressed beam cover.** The minimum thickness of concrete cover to the positive moment prestressing tendons (bottom steel) for restrained and unrestrained prestressed concrete beams and stemmed units shall comply with the values shown in Tables [721.2.3(4)] 722.2.3(4) and [721.2.3(5)] 722.2.3(5) for fire-resistance ratings of 1 hour to 4 hours. Values in Table [721.2.3(4)] 722.2.3(4) apply to beams 8 inches ([203] 203.2 mm) or greater in width. Values in Table [721.2.3(5)] 722.2.3(5) apply to beams or stems of any width, provided the cross-section area is not less than 40 square inches ([25 806] 25 806.4 mm²). In case of differences between the values determined from Table [721.2.3(4)] 722.2.3(4) or [721.2.3(5)] 722.2.3(5), it is permitted to use the smaller value. The concrete cover shall be calculated in accordance with Section [721.2.3.3.1] 722.2.3.3.1. The minimum concrete cover for nonprestressed reinforcement in prestressed concrete beams shall comply with Section [721.2.3.2] 722.2.3.2.

[721.2.3.3.1] **722.2.3.3.1 Calculating concrete cover.** The concrete cover for an individual tendon is the minimum thickness of concrete between the surface of the tendon and the fire-exposed surface of the beam, except that for [ungrouped] ungrouted ducts, the assumed cover thickness is the minimum thickness of concrete between the surface of the duct and the fire-exposed surface of the beam. For beams in which two or more tendons are used, the cover is assumed to be the average of the minimum cover of the individual tendons. For corner tendons (tendons equal distance from the bottom and side), the minimum cover used in the calculation shall be one-half the actual value. For stemmed members with two or more prestressing tendons located along the vertical centerline of the stem, the average cover shall be the distance from the bottom of the member to the centroid of the tendons. The actual cover for any individual tendon shall be not [be] less than one-half the smaller value shown in Tables [721.2.3(4)] 722.2.3(4) and [721.2.3(5)] 722.2.3(5), or 1 inch ([25] 25.4 mm), whichever is greater.

[721.2.4] **722.2.4 Concrete columns.** Concrete columns shall comply with this section.

| **TABLE [721.2.4] 722.2.4 MINIMUM DIMENSION OF CONCRETE COLUMNS (inches)** |
|---|---|---|---|---|
| **TYPES OF CONCRETE** | **FIRE-RESISTANCE RATING (hours)** | 1 | 1/2 | 2 | 3 | 4 |
| Siliceous | 8 | 9 | 10 | 12 | 14 |
| Carbonate | 8 | 9 | 10 | 11 | 12 |
| Sand-lightweight | 8 | 8½ | 9 | 10½ | 12 |

For SI: 1 inch = 25 mm.

a. The minimum dimension is permitted to be reduced to 8 inches for rectangular columns with
two parallel sides at least 36 inches in length.
b. The minimum dimension is permitted to be reduced to 10 inches for rectangular columns with
two parallel sides at least 36 inches in length.

[721.2.4.1] 722.2.4.1 Minimum size. The minimum overall dimensions of reinforced concrete columns for fire-resistance ratings of 1 hour to 4 hours for exposure to fire on all sides shall comply with this section.

[721.2.4.1.1] 722.2.4.1.1 Concrete strength less than or equal to 12,000 psi. For columns made with concrete having a specified compressive strength, $f'_{c}$, of less than or equal to 12,000 psi (82.7 MPa), the minimum dimension shall comply with Table [721.2.4] 722.2.4.

[721.2.4.1.2] 722.2.4.1.2 Concrete strength greater than 12,000 psi. For columns made with concrete having a specified compressive strength, $f'_{c}$, greater than 12,000 psi (82.7 MPa), for fire-resistance ratings of 1 hour to 4 hours the minimum dimension shall be 24 inches (610 mm).

[721.2.4.2] 722.2.4.2 Minimum cover for R/C columns. The minimum thickness of concrete cover to the main longitudinal reinforcement in columns, regardless of the type of aggregate used in the concrete, the specified compressive strength of concrete, $f'_{c}$, shall be not be less than 1 inch (25 mm) times the number of hours of required fire resistance or 2 inches (50.8 mm), whichever is less.

[721.2.4.3] 722.2.4.3 Tie and spiral reinforcement. For concrete columns made with concrete having a specified compressive strength, $f'_{c}$, greater than 12,000 psi (82.7 MPa), tie and spiral reinforcement shall comply with the following:

1. The free ends of rectangular ties shall terminate with a 135-degree (2.4 rad) standard tie hook.
2. The free ends of circular ties shall terminate with a 90-degree (1.6 rad) standard tie hook.
3. The free ends of spirals, including at lap splices, shall terminate with a 90-degree (1.6 rad) standard tie hook.

The hook extension at the free end of ties and spirals shall be the larger of six bar diameters and the extension required by Section 7.1.3 of ACI 318. Hooks shall project into the core of the column.

[721.2.4.4] 722.2.4.4 Columns built into walls. The minimum dimensions of Table [721.2.4] 722.2.4 do not apply to a reinforced concrete column that is built into a concrete or masonry wall provided all of the following are met:

1. The fire-resistance rating for the wall is equal to or greater than the required rating of the column;
2. The main longitudinal reinforcing in the column has cover not less than that required by Section [721.2.4.2] 722.2.4.2; and
3. Openings in the wall are protected in accordance with Table [745.4] 716.5.

Where openings in the wall are not protected as required by Section [745.4] 716.5, the minimum dimension of columns required to have a fire-resistance rating of 3 hours or less shall be 8 inches (203.2 mm), and 10 inches (254 mm) for columns required to have a fire-resistance rating of 4 hours, regardless of the type of aggregate used in the concrete.

[722.2.4.5] 722.2.4.5 Precast cover units for steel columns. See Section [724.5.1.4] 722.5.1.4.

[721.3] 722.3 Concrete masonry. The provisions of this section contain procedures by which the fire-resistance ratings of concrete masonry are established by calculations.

[721.3.1] 722.3.1 Equivalent thickness. The equivalent thickness of concrete masonry construction shall be determined in accordance with the provisions of this section.

[721.3.1.1] 722.3.1.1 Concrete masonry unit plus finishes. The equivalent thickness of concrete masonry assemblies, $T_{ea}$, shall be computed as the sum of the equivalent thickness of the concrete masonry unit, $T_e$, as determined by Section [721.3.1.2] 722.3.1.2, or [721.3.1.4] 722.3.1.4, plus the equivalent thickness of finishes, $T_{ef}$, determined in accordance with Section [721.3.2] 722.3.2:

$$T_{ea} = T_e + T_{ef} \quad \text{(Equation 7-6)}$$

[721.3.1.2] 722.3.1.2 Ungrouted or partially grouted construction. $T_e$ shall be the value obtained for the concrete masonry unit determined in accordance with ASTM C 140.

[721.3.1.3] 722.3.1.3 Solid grouted construction. The equivalent thickness, $T_e$, of solid grouted concrete masonry units is the actual thickness of the unit.

[721.3.1.4] 722.3.1.4 Airspaces and cells filled with loose-fill material. The equivalent thickness of completely filled hollow concrete masonry is the actual thickness of the unit where loose-fill materials are: sand, pea gravel, crushed stone, or slag that meet ASTM C 33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders that comply with ASTM C 351; or perlite or vermiculite meeting the requirements of ASTM C 549 and ASTM C 516, respectively.

[721.3.2] 722.3.2 Concrete masonry walls. The fire-resistance rating of walls and partitions constructed of concrete masonry units shall be determined from Table [721.3.2] 722.3.2. The rating shall be based on the equivalent thickness of the masonry and type of aggregate used.

</tbody>
</table>

For SI: 1 inch = 25.4 mm.
\(\textsuperscript{a}\) Values between those shown in the table can be determined by direct interpolation.
\(\textsuperscript{b}\) Where combustible members are framed into the wall, the thickness of solid material between the end of each member and the opposite face of the wall, or between members set in from opposite sides, shall be not less than 93 percent of the thickness shown in the table.
\(\textsuperscript{c}\) Requirements of ASTM C 55, ASTM C 73, ASTM C 90 or ASTM C 744 shall apply.
\(\textsuperscript{d}\) Minimum required equivalent thickness corresponding to the hourly fire-resistance rating for units with a combination of aggregate shall be determined by linear interpolation based on the percent by volume of each aggregate used in manufacture.

\[721.3.2.1\] 722.3.2.1 Finish on nonfire-exposed side. Where plaster or gypsum wallboard is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of gypsum wallboard or plaster shall be corrected by multiplying the actual thickness of the finish by applicable factor determined from Table [721.2.1.4(1)] 722.2.1.4(1). This corrected thickness of finish shall be added to the equivalent thickness of masonry and the fire-resistance rating of the masonry and finish determined from Table [721.3.2] 722.3.2.

\[721.3.2.2\] 722.3.2.2 Finish on fire-exposed side. Where plaster or gypsum wallboard is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table [721.2.1.4(2)] 722.2.1.4(2) shall be added to the fire-resistance rating determined in Section [721.3.2] 722.3.2 for the masonry alone, or in Section [721.3.2.1] 722.3.2.1 for the masonry and finish on the nonfire-exposed side.

\[721.3.2.3\] 722.3.2.3 Nonsymmetrical assemblies. For a wall having no finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this section shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values calculated.

**Exception:** For exterior walls with a fire separation distance greater than 5 feet (1524 mm), the fire shall be assumed to occur on the interior side only.

\[721.3.2.4\] 722.3.2.4 Minimum concrete masonry fire-resistance rating. Where the finish applied to a concrete masonry wall contributes to its fire-resistance rating, the masonry alone shall provide not less than one-half the total required fire-resistance rating.

\[721.3.2.5\] 722.3.2.5 Attachment of finishes. Installation of finishes shall be as follows:

1. Gypsum wallboard and gypsum lath applied to concrete masonry or concrete walls shall be secured to wood or steel furring members spaced not more than 16 inches (\(406\) mm) on center (o.c.).
2. Gypsum wallboard shall be installed with the long dimension parallel to the furring members and shall have all joints finished.

3. Other aspects of the installation of finishes shall comply with the applicable provisions of Chapters 7 and 25.

**[721.3.3] 722.3.3 Multi-wythe masonry walls.** The fire-resistance rating of wall assemblies constructed of multiple wythes of masonry materials shall be permitted to be based on the fire-resistance rating period of each wythe and the continuous airspace between each wythe in accordance with the following formula:

\[ R_A = \left( R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59} + A_1 + A_2 + \ldots + A_n \right)^{1.7} \]  

(Equation 7-7)

where:

- \( R_A \) = Fire endurance-resistance rating of the assembly (hours).
- \( R_1, R_2, \ldots, R_n \) = Fire endurance-resistance rating of wythes for 1, 2, n (hours), respectively.
- \( A_1, A_2, \ldots, A_n = 0.30 \) factor for each continuous airspace for 1, 2, ...n, respectively, having a depth of \( \frac{1}{2} \) inch (12.7 mm) or more between wythes.

**[721.3.4] 722.3.4 Concrete masonry lintels.** Fire-resistance ratings for concrete masonry lintels shall be determined based upon the nominal thickness of the lintel and the minimum thickness of concrete masonry or concrete, or any combination thereof, covering the main reinforcing bars, as determined [according to] in accordance with Table [721.3.4] 722.3.4, or by approved alternate methods.

</tbody>
</table>

For SI: 1 inch = 25.4 mm.

[721.4.1.1] 722.4.1.1 Equivalent thickness. The fire-resistance ratings of walls or partitions constructed of solid or hollow clay masonry units shall be determined from Table [721.4.1(4)] 722.4.1(1) or [721.4.1(2)] 722.4.1(2). The equivalent thickness of the clay masonry unit shall be determined by Equation 7-8 [when] where using Table [721.4.1(4)] 722.4.1(1). The fire-resistance rating determined from Table [721.4.1(4)] 722.4.1(1) shall be permitted to be used in the calculated fire-resistance rating procedure in Section [721.4.2] 722.4.2.

$$T_e = V_n / L H$$  \hspace{2cm} (Equation 7-8)

where:

$T_e$ = The equivalent thickness of the clay masonry unit (inches).
\[ V_n = \text{The net volume of the clay masonry unit (inch}^3\text{)} \]
\[ L = \text{The specified length of the clay masonry unit (inches)} \]
\[ H = \text{The specified height of the clay masonry unit (inches)} \]

[721.4.1.1.1] 722.4.1.1.1 Hollow clay units. The equivalent thickness, \( T_e \), shall be the value obtained for hollow clay units as determined in accordance with Equation 7-8. The net volume, \( V_n \), of the units shall be determined using the gross volume and percentage of void area determined in accordance with ASTM C 67.

[721.4.1.1.2] 722.4.1.1.2 Solid grouted clay units. The equivalent thickness of solid grouted clay masonry units shall be taken as the actual thickness of the units.

[721.4.1.1.3] 722.4.1.1.3 Units with filled cores. The equivalent thickness of the hollow clay masonry units is the actual thickness of the unit when completely filled with loose-fill materials of: sand, pea gravel, crushed stone, or slag that meet ASTM C 33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders in compliance with ASTM C 331; or perlite or vermiculite meeting the requirements of ASTM C 549 and ASTM C 516, respectively.

[721.4.1.2] 722.4.1.2 Plaster finishes. Where plaster is applied to the wall, the total fire-resistance rating shall be determined by the formula:

\[
R = \left( R_n^{0.59} + pl \right)^{1.7} \quad \text{(Equation 7-9)}
\]

where:

\[ R = \text{The fire-endurance-resistance of the assembly (hours).} \]
\[ R_n = \text{The fire-endurance-resistance of the individual wall (hours).} \]
\[ pl = \text{Coefficient for thickness of plaster.} \]

Values for \( R_n^{0.59} \) for use in Equation 7-9 are given in Table 721.4.1(3). Coefficients for thickness of plaster shall be selected from Table 721.4.1(4) based on the actual thickness of plaster applied to the wall or partition and whether one or two sides of the wall are plastered.

[721.4.1.3] 722.4.1.3 Multi-wythe walls with airspace. Where a continuous airspace separates multiple wythes of the wall or partition, the total fire-resistance rating shall be determined by the formula:

\[
R = \left( R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59} + as \right)^{1.7} \quad \text{(Equation 7-10)}
\]

where:

\[ R = \text{The fire-endurance-resistance of the assembly (hours).} \]
\[ R_1, R_2 \text{ and } R_n = \text{The fire-endurance-resistance of the individual wythes (hours).} \]
\[ as = \text{Coefficient for continuous airspace.} \]
Values for $R_n^{0.59}$ for use in Equation 7-10 are given in Table [721.4.1(3)] 722.4.1(3). The coefficient for each continuous airspace of $\frac{1}{2}$ inch to $3\frac{1}{2}$ inches (12.7 to 89 mm) separating two individual wythes shall be 0.3.

[721.4.1.4] 722.4.1.4 Nonsymmetrical assemblies. For a wall having no finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this section shall be performed twice, assuming either side to be the fire-exposed side of the wall. The fire resistance of the wall shall not exceed the lower of the two values determined.

Exception: For exterior walls with a fire separation distance greater than 5 feet (1524 mm), the fire shall be assumed to occur on the interior side only.

[721.4.2] 722.4.2 Multi-wythe walls. The fire-resistance rating for walls or partitions consisting of two or more dissimilar wythes shall be permitted to be determined by the formula:

$$R = (R_1^{0.59} + R_2^{0.59} + \ldots + R_n^{0.59})^{1.7} \quad \text{(Equation 7-11)}$$

where:

$R = \text{The fire}\left[\text{endurance}\right]\text{-resistance of the assembly (hours).}$

$R_1, R_2$ and $R_n = \text{The fire}\left[\text{endurance}\right]\text{-resistance of the individual wythes (hours).}$

Values for $R_n^{0.59}$ for use in Equation 7-11 are given in Table [721.4.1(3)] 722.4.1(3).

[721.4.2.1] 722.4.2.1 Multi-wythe walls of different material. For walls that consist of two or more wythes of different materials (concrete or concrete masonry units) in combination with clay masonry units, the fire-resistance rating of the different materials shall be permitted to be determined from Table [721.2.1.1] 722.2.1.1 for concrete; Table [721.3.2] 722.3.2 for concrete masonry units or Table [721.4.1(1)] 722.4.1(1) or [721.4.1(2)] 722.4.1(2) for clay and tile masonry units.

[721.4.3] 722.4.3 Reinforced clay masonry lintels. Fire-resistance ratings for clay masonry lintels shall be determined based on the nominal width of the lintel and the minimum covering for the longitudinal reinforcement in accordance with Table [721.4.1(5)] 722.4.1(5).

[721.4.4] 722.4.4 Reinforced clay masonry columns. The fire-resistance ratings shall be determined based on the last plan dimension of the column in accordance with Table [721.4.1(6)] 722.4.1(6). The minimum cover for longitudinal reinforcement shall be 2 inches (51 mm).

[721.5] 722.5 Steel assemblies. The provisions of this section contain procedures by which the fire-resistance ratings of steel assemblies are established by calculations.

[721.5.1] 722.5.1 Structural steel columns. The fire-resistance ratings of structural steel columns shall be based on the size of the element and the type of protection provided in accordance with this section.

FIGURE 722.5.1(2) 722.5.1(2)  
[GYPSUM WALLBOARD PROTECTED] GYPSUM-PROTECTED STRUCTURAL STEEL COLUMNS WITH SHEET STEEL COLUMN COVERS

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

1. Structural steel column, either wide flange or tubular shapes.
2. Type X gypsum [wallboard] board or gypsum panel products in accordance with ASTM C 36. For single layer applications, the wallboard [shall] be applied vertically to an individual column using one of the following methods:
   1. As a single layer with no horizontal joints.
   2. As multiple [layer applications] layers with no horizontal joints [are permitted] at a minimum spacing of 8 feet, provided that the [12 inches] in any layer.
   3. As multiple layers with horizontal joints [in successive layers] are staggered at least 12 inches vertically between layers and not less than 8 feet vertically in any single layer. The total required thickness of [wallboard] gypsum board or gypsum panel products shall be determined on the basis of the specified fire resistance rating and the weight-to-heated-perimeter ratio (W/D) of the column. For fire-resistance ratings of 2 hours or less, one of the required layers of gypsum [wallboard] board or gypsum panel product may be applied to the exterior of the sheet steel column covers with 1-inch long Type S screws spaced 1 inch from the wallboard edge and 8 inches on center. For such installations, 0.0149-inch minimum thickness galvanized steel corner beads with 1 1/2-inch legs shall be attached to the wallboard with Type S screws spaced 12 inches on center.
3. For fire-resistance ratings of 3 hours or less, the column covers shall be fabricated from 0.0239-inch minimum thickness galvanized or stainless steel. For 4-hour fire-resistance ratings, the column covers shall be fabricated from 0.0239-inch minimum thickness stainless steel. The column covers shall be erected with the Snap Lock or Pittsburgh joint details. For fire-resistance ratings of 2 hours or less, column covers fabricated from 0.0269-inch minimum thickness galvanized or stainless steel shall be permitted to be erected with lap joints. The lap joints shall be permitted to be located anywhere around the perimeter of the column cover. The lap joints shall be secured with 1 1/2-inch long No.8 sheet metal screws spaced 12 inches on center.

The column covers shall be provided with a minimum expansion clearance of 1/8 inch per linear foot between the ends of the cover and any restraining construction.
1. Structural steel column, either wide flange or tubular shapes.
2. 11/32-inch deep studs fabricated from 0.0179-inch minimum thickness galvanized steel with 15/16 or 17/16-inch legs. The length of the steel studs shall be 1/2 inch less than the height of the assembly.
3. Type X gypsum board or gypsum panel products in accordance with ASTM C 177, C 1178, C 1278, C 1396 or C 1658. The total thickness of gypsum board or gypsum panel products calculated as h in Section 722.5.1.2 shall be applied vertically to an individual column using one of the following methods:
   1. As a single layer with no horizontal joints.
   2. As multiple -layer applications, layer with no horizontal joints are permitted at a minimum spacing of 8 feet, provided that this in any layer.
   3. As multiple layers with horizontal joints in successive layers are staggered at least not less than 12 inches vertically between layers and not less than 8 feet vertically in any single layer. The total required thickness of gypsum board or gypsum panel products shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (W/D) of the column.
4. Galvanized 0.0149-inch minimum thickness steel corner beads with 11/2-inch legs attached to the gypsum board or gypsum panel products with 1-inch-long Type S screws spaced 12 inches on center.
5. No. 18 SWG steel tie wires spaced 24 inches on center.
6. Sheet metal angles with 2-inch legs fabricated from 0.0221-inch minimum thickness galvanized steel.
7. Type S screws, 1 inch long, shall be used for attaching the first layer of gypsum board or gypsum panel product to the steel studs and the third layer to the sheet metal angles at 24 inches on center. Type S screws 11/2-inch long shall be used for attaching the second layer of gypsum board or gypsum panel product to the steel studs and the fourth layer to the sheet metal angles at 12 inches on center. Type S screws 21/4 inches long shall be used for attaching the third layer of gypsum board or gypsum panel product to the steel studs at 12 inches on center.
FIRE RESISTANCE OF STRUCTURAL STEEL COLUMNS PROTECTED WITH VARIOUS THICKNESSES OF TYPE X GYPSUM WALLBOARD

For SI: 1 inch = 25.4 mm, 1 pound per linear foot/inch = 0.059 kg/m/mm.

a. The W/D ratios for typical wide flange columns are listed in Table 721.5.1(1). For other column shapes, the W/D ratios shall be determined in accordance with Section 720.5.1.1.
a. When the inside perimeter of the concrete protection is not square, \( L \) shall be taken as the average of \( L_1 \) and \( L_2 \). When the thickness of concrete cover is not constant, \( h \) shall be taken as the average of \( h_1 \) and \( h_2 \).

b. Joints shall be protected with a minimum 1 inch thickness of ceramic fiber blanket but in no case less than one-half the thickness of the column cover (see Section 221.2.1.3).

For SI: 1 inch = 25.4 mm.

\[
D = 2(w+d) + 2(w-t_{web})
\]

\[
D = \pi d
\]

\[
D = 2w + 2d
\]

</tbody>
</table>

For SI: 1 inch = 25.4 mm.

a. The tabulated thicknesses are based upon the assumed properties of structural lightweight concrete given in Table [721.5.1(10)] 722.5.1(2).
722.5.1.1 General. These procedures establish a basis for determining the fire resistance of column assemblies as a function of the thickness of fire-resistant material and, the weight, \( W \), and heated perimeter, \( D \), of structural steel columns. As used in these sections, \( W \) is the average weight of a structural steel column in pounds per linear foot. The heated perimeter, \( D \), is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 721.5.1(1).

722.5.1.1.1 Nonload-bearing protection. The application of these procedures shall be limited to column assemblies in which the fire-resistant material is not designed to carry any of the load acting on the column.

722.5.1.1.2 Embedments. In the absence of substantiating fire-endurance test results, ducts, conduit, piping, and similar mechanical, electrical, and plumbing installations shall not be embedded in any required fire-resistant materials.

722.5.1.1.3 Weight-to-perimeter ratio. Table 721.5.1(1) contains weight-to-heated-perimeter ratios (\( W/D \)) for both contour and box fire-resistant profiles, for the wide flange shapes most often used as columns. For different fire-resistant protection profiles or column cross sections, the weight-to-heated-perimeter ratios (\( W/D \)) shall be determined in accordance with the definitions given in this section.

722.5.1.2 Gypsum wallboard protection. The fire resistance of structural steel columns with weight-to-heated-perimeter ratios (\( W/D \)) less than or equal to 3.65 and which are protected with Type X gypsum wallboard shall be permitted to be determined from the following expression:

\[
R = 130 \left[ \frac{h(W'/D)}{2} \right]^{0.75}
\]

(Equation 7-12)

where:

- \( R \) = Fire resistance (minutes).
- \( h \) = Total thickness of gypsum wallboard (inches).
- \( D \) = Heated perimeter of the structural steel column (inches).
- \( W' \) = Total weight of the structural steel column and gypsum wallboard protection (pounds per linear foot).
- \( W' = W + 50hD/144 \).

722.5.1.2.1 Attachment. The gypsum board or gypsum panel products shall be supported as illustrated in either Figure 721.5.1(2) for fire-resistance ratings of 4 hours or less, or Figure 721.5.1(3) for fire-resistance ratings of 3 hours or less.

722.5.1.2.2 Gypsum wallboard equivalent to concrete. The determination of the fire resistance of structural steel columns from Figure 721.5.1(4) is permitted for various thicknesses of gypsum wallboard as a function of the weight-to-heated-perimeter ratio (\( W/D \)) of the column. For structural steel columns with weight-to-heated-perimeter ratios (\( W/D \)) greater than 3.65, the thickness of gypsum wallboard...
required for specified fire-resistance ratings shall be the same as the thickness determined for a W14 x 233 wide flange shape.

[721.5.1.3] **722.5.1.3 Spray-applied fire-resistant materials.** The fire resistance of wide-flange structural steel columns protected with spray-applied fire-resistant materials, as illustrated in Figure [721.5.1(5)] 722.5.1(5), shall be permitted to be determined from the following expression:

\[ R = [C_1 (W/D) + C_2]h \] (Equation 7-13)

where:
- \( R \) = Fire resistance (minutes).
- \( h \) = Thickness of spray-applied fire-resistant material (inches).
- \( D \) = Heated perimeter of the structural steel column (inches).
- \( C_1 \) and \( C_2 \) = Material-dependent constants.
- \( W \) = Weight of structural steel column (pounds per linear foot).

**Exception:** The fire resistance of structural steel columns protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire resistance tests in accordance with Section 703.2.

[721.5.1.3.1] **722.5.1.3.1 Material-dependent constants.** The material-dependent constants, \( C_1 \) and \( C_2 \), shall be determined for specific fire-resistant materials on the basis of standard fire-resistance tests in accordance with Section 703.2. Unless evidence is submitted to the commissioner substantiating a broader application, this expression shall be limited to determining the fire resistance of structural steel columns with weight-to-heated-perimeter ratios (\( W/D \)) between the largest and smallest columns for which standard fire-resistance test results are available.

[721.5.1.3.2] **722.5.1.3.2 Identification.** Spray-applied fire-resistant materials shall be identified by density and thickness required for a given fire-resistance rating.

[721.5.1.4] **722.5.1.4 Concrete-protected columns.** The fire resistance of structural steel columns protected with concrete, as illustrated in Figure [721.5.1(6)] 722.5.1(6)(a) and (b), shall be permitted to be determined from the following expression:

\[ R = R_0 (1 + 0.03m) \] (Equation 7-14)

where:
- \( R_0 \) = 10(W/D)^0.7 + 17(h^{1.6}/k_c^{0.2}) \times (1 + 26 (h/p_c c_h (L + h))^{0.8})

As used in these expressions:
- \( R \) = Fire endurance at equilibrium moisture conditions (minutes).
- \( R_0 \) = Fire endurance at zero moisture content (minutes).
- \( m \) = Equilibrium moisture content of the concrete by volume (percent).
W = Average weight of the steel column (pounds per linear foot).
D = Heated perimeter of the steel column (inches).
h = Thickness of the concrete cover (inches).
k_c = Ambient temperature thermal conductivity of the concrete (Btu/hr ft °F).
H = Ambient temperature thermal capacity of the steel column = 0.11W (Btu/hr °F).
p_c = Concrete density (pounds per cubic foot).
c_c = Ambient temperature specific heat of concrete (Btu/lb °F).
L = Interior dimension of one side of a square concrete box protection (inches).

[721.5.1.4.1] 722.5.1.4.1 Reentrant space filled. For wide-flange structural steel columns completely encased in concrete with all reentrant spaces filled (Figure 722.5.1(6)(c)), the thermal capacity of the concrete within the reentrant spaces shall be permitted to be added to the thermal capacity of the steel column, as follows:

\[ H = 0.11W + \left( p_c c_c / 144 \right) \left( b_f d - A_s \right) \]  \hspace{1cm} \text{(Equation 7-15)}

where:
- \( b_f \) = Flange width of the steel column (inches).
- \( d \) = Depth of the steel column (inches).
- \( A_s \) = Cross-sectional area of the steel column (square inches).

[721.5.1.4.2] 722.5.1.4.2 Concrete properties unknown. If specific data on the properties of concrete are not available, the values given in Table 722.5.1(2) are permitted.

[721.5.1.4.3] 722.5.1.4.3 Minimum concrete cover. For structural steel column encased in concrete with all reentrant spaces filled, Figure 722.5.1(6)(c) and Tables 722.5.1(7) and 722.5.1(8) indicate the thickness of concrete cover required for various fire-resistance ratings for typical wide-flange sections. The thicknesses of concrete indicated in these tables also apply to structural steel columns larger than those listed.

[721.5.1.4.4] 722.5.1.4.4 Minimum precast concrete cover. For structural steel columns protected with precast concrete column covers as shown in Figure 722.5.1(6)(a) and Tables 722.5.1(9) and 722.5.1(10) indicate the thickness of the column covers required for various fire-resistance ratings for typical wide-flange shapes. The thicknesses of concrete given in these tables also apply to structural steel columns larger than those listed.

[721.5.1.4.5] 722.5.1.4.5 Masonry protection. The fire resistance of structural steel columns protected with concrete masonry units or clay masonry units as illustrated in Figure 722.5.1(7), shall be permitted to be determined from the following expression:

\[ R = 0.17(W/D)^{0.7} + 0.285(T_{e16} / K^{0.2}) [1.0 + 42.7 \left( (A_s / d_m T_e) / (0.25p + T_e) \right)^0.8] \]  \hspace{1cm} \text{(Equation 7-16)}
where:

- \( R \) = Fire-resistance rating of column assembly (hours).
- \( W \) = Average weight of steel column (pounds per foot).
- \( D \) = Heated perimeter of steel column (inches) [see Figure 722.5.1(7)].
- \( T_e \) = Equivalent thickness of concrete or clay masonry unit (inches) (see Table 722.5.1(3)).
- \( K \) = Thermal conductivity of concrete or clay masonry unit (Btu/hr ft °F) [see Table 722.5.1(3)].
- \( A_s \) = Cross-sectional area of steel column (square inches).
- \( d_m \) = Density of the concrete or clay masonry unit (pounds per cubic foot).
- \( p \) = Inner perimeter of concrete or clay masonry protection (inches) [see Figure 722.5.1(7)].

**721.5.1.4.6 Equivalent concrete masonry thickness.** For structural steel columns protected with concrete masonry, Table 722.5.1(5) gives the equivalent thickness of concrete masonry required for various fire-resistance ratings for typical column shapes. For structural steel columns protected with clay masonry, Table 722.5.1(6) gives the equivalent thickness of concrete masonry required for various fire-resistance ratings for typical column shapes.

**721.5.2 Structural steel beams and girders.** The fire-resistance ratings of structural steel beams and girders shall be based upon the size of the element and the type of protection provided in accordance with this section.

![Diagram of structural steel beams and girders](image)
721.5.2.1 Determination of fire resistance. These procedures establish a basis for determining resistance of structural steel beams and girders that differ in size from that specified in approved fire-resistance-rated assemblies as a function of the thickness of fire-resistant material and the weight \((W)\) and heated perimeter \((D)\) of the beam or girder. As used in these sections, \(W\) is the average weight of a structural steel member in pounds per linear foot (plf). The heated perimeter, \(D\), is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 721.5.2.2.

722.5.2.1.1 Weight-to-heated perimeter. The weight-to-heated-perimeter ratios \((W/D)\), for both contour and box fire-resistant protection profiles, for the wide flange shapes most often used as beams or girders are given in Table 722.5.1(4). For different shapes, the weight-to-heated-perimeter ratios \((W/D)\) shall be determined in accordance with the definitions given in this section.

722.5.2.1.2 Beam and girder substitutions. Except as provided for in Section 722.5.2.2, structural steel beams in approved fire-resistance-rated assemblies shall be considered the minimum permissible size. Other beam or girder shapes shall be permitted to be substituted provided that the weight-to-heated-perimeter ratio \((W/D)\) of the substitute beam is equal to or greater than that of the beam specified in the approved assembly.

722.5.2.2 Spray-applied fire-resistant materials. The provisions in this section apply to structural steel beams and girders protected with spray-applied fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in approved unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

\[
h_2 = \frac{[(W_1/D_1) + 0.60]}{[(W_2/D_2) + 0.60]}h_1
\]

(Equation 7-17)

where:

- \(h\) = Thickness of spray-applied fire-resistant material in inches.
- \(W\) = Weight of the structural steel beam or girder in pounds per linear foot.
- \(D\) = Heated perimeter of the structural steel beam or girder in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the approved assembly.

Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material.

Exception: The fire-resistance of structural steel beams and girders protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

722.5.2.1 Minimum thickness. The use of Equation 7-17 is subject to the following conditions:

1. The weight-to-heated-perimeter ratio for the substitute beam or girder \((W_2/D_2)\) shall be not less than 0.37.
2. The thickness of fire protection materials for the substitute beam or girder \( (T_i) \) shall be not less than \( \frac{3}{8} \) inch (9.5 mm).

3. The unrestrained or restrained beam rating shall be not less than 1 hour.

4. Where used to adjust the material thickness for a restrained beam, the use of this procedure is limited to structural steel sections classified as compact in accordance with AISC 360.

\[ 722.5.2.3 \] 722.5.2.3 Structural steel trusses. The fire resistance of structural steel trusses protected with fire-resistant materials spray applied to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section \[ 722.5.1.3 \] 722.5.1.3. The weight-to-heated-perimeter ratio \( (W/D) \) of truss elements which can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section \[ 722.5.1.1 \] 722.5.1.1. The weight-to-heated-perimeter ratio \( (W/D) \) of truss elements which directly support floor or roof assembly shall be determined on the same basis as beams and girders, as specified in Section \[ 722.5.2.1 \] 722.5.2.1.

**Exception:** The fire resistance of structural steel trusses protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

\[ 722.6 \] 722.6 Wood assemblies. The provisions of this section contain procedures by which the fire-resistance ratings of wood assemblies are established by calculations.

\[ 722.6.1 \] 722.6.1 General. This section contains procedures for calculating the fire-resistance ratings of walls, floor/ceiling and roof/ceiling assemblies based in part on the standard method of testing referenced in Section 703.2.

\[ 722.6.1.1 \] 722.6.1.1 Maximum fire-resistance rating. Fire-resistance ratings calculated for assemblies using the methods in Section \[ 722.6 \] 722.6 shall be limited to a maximum of 1 hour.

\[ 722.6.1.2 \] 722.6.1.2 Dissimilar membranes. Where dissimilar membranes are used on a wall assembly that requires consideration of fire exposure from both sides, the calculation shall be made from the least fire-resistant (weaker) side.

\[ 722.6.2 \] 722.6.2 Walls, floors and roofs. These procedures apply to both load-bearing and nonload-bearing assemblies.
### TABLE [721.6.2(1)] 722.6.2(1)

<tr>
<td>Add to the fire-resistance rating of wood stud walls if the spaces between the studs are completely filled with glass fiber mineral wool batts weighing not less than 2 pounds per cubic foot (0.6 pound per square foot of wall surface) or rockwool or slag material wool batts weighing not less than 3.3 pounds per cubic foot (1 pound per square foot of wall surface), or cellulose insulation having a nominal density not less than 2.6 pounds per cubic foot.</td>
<td>15</td>
</tr>
</tbody>
</table>

For SI: 1 pound/cubic foot = 16.0185 kg/m³.

**[721.6.2.1] 722.6.2.1 Fire-resistance rating of wood frame assemblies.** The fire-resistance rating of a wood frame assembly is equal to the sum of the time assigned to the membrane on the fire-exposed side, the time assigned to the framing members and the time assigned for additional contribution by other protective measures such as insulation. The membrane on the unexposed side shall not be included in determining the fire resistance of the assembly.
[721.6.2.2] **722.6.2.2 Time assigned to membranes.** Table [721.6.2(4)] 722.6.2(1) indicates the time assigned to membranes on the fire-exposed side.

[721.6.2.3] **722.6.2.3 Exterior walls.** For an exterior wall with a fire separation distance greater than 5 feet (1524 mm), the wall is assigned a rating dependent on the interior membrane and the framing as described in Tables [721.6.2(4)] 722.6.2(1) and [721.6.2(2)] 722.6.2(2). The membrane on the outside of the nonfire-exposed side of exterior walls with a fire separation distance greater than 5 feet (1524 mm) [may] shall consist of sheathing, sheathing paper[,] and siding as described in Table [721.6.2(3)] 722.6.2(3).

[721.6.2.4] **722.6.2.4 Floors and roofs.** In the case of a floor or roof, the standard test provides only for testing for fire exposure from below. Except as noted in Section 703.3, Item 5, floor or roof assemblies of wood framing shall have an upper membrane consisting of a subfloor and finished floor conforming to Table [721.6.2(4)] 722.6.2(4) or any other membrane that has a contribution to fire resistance of [at least] not less than 15 minutes in Table [721.6.2(4)] 722.6.2(1).

[721.6.2.5] **722.6.2.5 Additional protection.** Table [721.6.2(5)] 722.6.2(5) indicates the time increments to be added to the fire resistance where glass fiber, rock wool, slag mineral wool[,] or cellulose insulation is incorporated in the assembly.

[721.6.2.6] **722.6.2.6 Fastening.** Fastening of wood frame assemblies and the fastening of membranes to the wood framing members shall be done in accordance with Chapter 23.

---

**721.6.3 Design of fire-resistant exposed wood members.** The fire-resistance rating, in minutes, of timber beams and columns with a minimum nominal dimension of 6 inches (152 mm) is equal to:

\[
\text{Beams: } 2.54Z_b(4 - 2(b/d)) \text{ for beams which may be exposed to fire on four sides.} \\
\text{(Equation 7-18)}
\]

\[
2.54Z_b(4 - 2(b/d)) \text{ for beams which may be exposed to fire on three sides.} \\
\text{(Equation 7-19)}
\]

\[
\text{Columns: } 2.54Z_d(3 - (d/b)) \text{ for columns which may be exposed to fire on four sides.} \\
\text{(Equation 7-20)}
\]

\[
2.54Z_d(3 - (d/2b)) \text{ for columns which may be exposed to fire on three sides.} \\
\text{(Equation 7-21)}
\]

[where:]

\[
b = \text{ The breadth (width) of a beam or larger side of a column before exposure to fire (inches).} \\
\]

\[
d = \text{ The depth of a beam or smaller side of a column before exposure to fire (inches).} \\
\]

\[
Z = \text{ Load factor, based on Figure 721.6.3(1).} \\
\]
[721.6.3.1 Equation 7-21. Equation 7-21 applies only where the unexposed face represents the smaller side of the column. If a column is recessed into a wall, its full dimension shall be used for the purpose of these calculations.]

[FIGURE 721.6.3(1)]
[LOAD FIGURE]

[K_e = The effective length factor as noted in Figure 721.6.3(2).]
[l = The unsupported length of column (inches).]

[FIGURE 721.6.3(2)]
[EFFECTIVE LENGTH FACTORS]

[721.6.3.2 Allowable loads. Allowable loads on beams and columns are determined using design values given in AF&PA NDS.]

[721.6.3.3 Fastener protection. Where minimum 1-hour fire resistance is required, connectors and fasteners shall be protected from fire exposure by 1½ inches (38 mm) of wood, or other approved covering or coating for a 1-hour rating. Typical details for commonly used fasteners and connectors are shown in AITC Technical Note 7.]
[721.6.3.4 Minimum size. Wood members are limited to dimensions of 6 inches (152 mm) nominal or greater. Glued-laminated timber beams utilize standard laminating combinations except that a core lamination is removed. The tension zone is moved inward and the equivalent of an extra nominal 2-inch-thick (51 mm) outer tension lamination is added.]

[721.7 Other reference documents. Refer to Section 703.3, Item 1, and NBS BMS 71 and NBS TRBM 44 for fire-resistance ratings of materials and assemblies.]

§ 9. Chapter 8 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 8
INTERIOR FINISHES

SECTION BC 801
GENERAL

801.1 Scope. The provisions of this chapter shall govern the use of materials used as interior finishes, trim and decorative materials.

801.2 Interior wall and ceiling finish. The provisions of Section 803 shall limit the allowable fire performance and smoke development of interior wall and ceiling finish materials based on occupancy classification.

801.3 Interior floor finish. The provisions of Section 804 shall limit the allowable fire performance of interior floor finish materials based on occupancy classification.

801.4 Decorative materials and trim. Decorative materials and trim shall be restricted by combustibility and the fire performance or flame propagation performance criteria of NFPA 701, in accordance with Section 806.

801.5 Applicability in flood hazard areas. For buildings in flood hazard areas as established in Appendix G, interior finishes, trim and decorative materials below the design flood elevation shall be flood-damage-resistant materials.

801.6 Application. Combustible materials complying with the requirements of this chapter shall be permitted to be used as finish for walls, ceilings, floors and other interior surfaces of buildings.

801.7 Windows. Show windows in the exterior walls of the first story above grade plane shall be permitted to be of wood or of unprotected metal framing.

801.8 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 803.4. Foam plastics shall not be used as interior trim except as provided in Section 806.5 or 2604.2. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

782
802.1 [General] Definitions. The following [words and] terms [shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.] are defined in Chapter 2:

EXPANDED VINYL WALL COVERING. [Wall covering consisting of a woven textile backing, an expanded vinyl base coat layer and a non-expanded vinyl skin coat. The expanded base coat layer is a homogeneous vinyl layer that contains a blowing agent. During processing, the blowing agent decomposes, causing this layer to expand by forming closed cells. The total thickness of the wall covering is approximately 0.055 inch to 0.070 inch (1.4 mm to 1.8 mm).]

FLAME SPREAD. [The propagation of flame over a surface.]

FLAME SPREAD INDEX. [A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E 84.]

INTERIOR FINISH. [Interior finish includes interior wall and ceiling finish and interior floor finish.]

INTERIOR FLOOR FINISH. [The exposed floor surfaces of buildings including coverings applied over a finished floor or stair, including risers.]

INTERIOR FLOOR-WALL BASE. [Interior floor finish trim used to provide a functional and/or decorative border at the intersection of walls and floors.]

INTERIOR WALL AND CEILING FINISH. [The exposed interior surfaces of buildings including, but not limited to: fixed or movable walls and partitions; toilet room privacy partitions; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including trim.]

SITE-FABRICATED STRETCH SYSTEM. [A system, fabricated on site and intended for acoustical, tackable or aesthetic purposes, that is comprised of three elements: (a) a frame (constructed of plastic, wood, metal or other material) used to hold fabric in place, (b) a core material (infill, with the correct properties for the application), and (c) an outside layer, comprised of a textile, fabric or vinyl, that is stretched taut and held in place by tension or mechanical fasteners via the frame.]

SMOKE-DEVELOPED INDEX. [A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E 84.]

TRIM. [Picture molds, chair rails, baseboards, handrails, door and window frames and similar decorative or protective materials used in fixed applications.]
SECTION BC 803
WALL AND CEILING FINISHES

803.1 General. Interior wall and ceiling finish materials shall be accepted as compliant for fire performance and smoke development in accordance with Section 803.1.1 or Section 803.1.2, and installed in accordance with the criteria therein. [Materials tested in accordance with Section 803.1.2 shall not be required to be tested in accordance with Section 803.1.1.]

[Exceptions:]

803.1.1 Interior wall and ceiling finish materials. Interior wall and ceiling finish materials shall be tested and classified in accordance with ASTM E 84 or UL 723. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.

- Class A = Flame spread index 0-25; smoke developed index 0-450.
- Class B = Flame spread index 26-75; smoke developed index 0-450.
- Class C = Flame spread index 76-200; smoke developed index 0-450.

Exception: Materials tested in accordance with Section 803.1.2 need not be classified in accordance with Section 803.1.1.

803.1.2 Room corner test for interior wall or ceiling finish materials. As an alternative to Section 803.1.1, interior wall or ceiling finish materials shall be permitted to be tested in accordance with NFPA 286. Interior wall or ceiling finish materials tested in accordance with NFPA 286 shall comply with Section 803.1.2.1 of this code.

803.1.2.1 Acceptance criteria for NFPA 286. The interior finish shall comply with the following:

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. The flame shall not spread to the outer extremity of the sample on any wall or ceiling.
3. Flashover, as defined in NFPA 286, shall not occur.
4. The peak heat release rate throughout the test shall not exceed 800 kW.
5. The total smoke released throughout the test shall not exceed 10,764 square feet (1000 m²).

803.1.3 Room corner test for textile wall coverings and expanded vinyl wall coverings. Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Section 803.1.3.1 of this code when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product-mounting system, including adhesive.

803.1.3.1 Acceptance criteria for NFPA 265. The interior finish shall comply with the following:
1. During the 40 kW exposure, flames shall not spread to the ceiling.

2. The flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (2438.4 mm by 3657.6 mm) walls.

3. Flashover, as defined in NFPA 265, shall not occur.

4. The total smoke released throughout the test shall not exceed 10,764 square feet (1000 m²).

803.1.4 Flame-spread and smoke-developed tests for textile wall or ceiling coverings. Specimens shall be tested and indexed per ASTM E 84 or UL 723, and classified for flame spread per Section 803.1.4.1 of this code.

803.1.4.1 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84 or UL 723. Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index per Section 803.1.1 of this code; shall meet the smoke developed index requirements of Section 803.1.1; and shall be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of this code. Test specimen preparation and mounting shall be in accordance with ASTM E 2404.

[1.] 803.2 Thickness exemption. Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls or ceilings shall not be required to be tested.

[2.] 803.3 Heavy timber exemption. Exposed portions of structural members complying with the requirements for buildings of Type IV construction in Section 602.4 shall not be subject to interior finish requirements.

803.4 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 2603.9. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

[3.] 803.5 Textile wall coverings. Where used as interior wall finish materials, textile wall coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.2, 803.1.3 or 803.1.4.1.

[4.] 803.6 Textile ceiling coverings. Where used as interior ceiling finish materials, textile ceiling coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.2 or 803.1.4.1.

[5.] 803.7 Expanded vinyl wall coverings. Where used as interior wall finish materials, expanded vinyl wall coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.2 or 803.1.4.1.

785
system, including adhesive, and shall comply with the requirements of Section 803.1.2, 803.1.3 or 803.1.4.1.

[6.] 803.8 Expanded vinyl ceiling coverings. Where used as interior ceiling finish materials, expanded vinyl ceiling coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of Section 803.1.2 or 803.1.4.1.

[7.] 803.9 High-density polyethylene (HDPE) and polypropylene (PP). Where high-density polyethylene or polypropylene is used as an interior finish[,] it shall comply with [the requirements of] Section 803.1.2.

[8.] 803.10 Site-fabricated stretch systems. Where used as interior wall or interior ceiling finish materials, site-fabricated stretch systems containing all three components described in the definition in Chapter 2 of this code shall be tested in the manner intended for use, and shall comply with the requirements of Section 803.1.1 or 803.1.2 of this code. If the materials are tested in accordance with ASTM E 84 or UL 723, specimen preparation and mounting shall be in accordance with ASTM E 2573.

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m².

a. Class C interior finish materials shall be permitted for wainscoting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.3.1.
b. In exit enclosures of buildings less than three stories above grade plane other than Group I-3, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted.
c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.
e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
f. For churches and places of worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
g. Class B material is required where the building exceeds two stories.
h. Class C interior finish materials shall be permitted in administrative spaces.
i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
j. Class B materials shall be permitted in wainscoting extending not more than 18 inches above the finished floor in exit access corridors.
k. Finish materials as provided for in other sections of this code.
l. Applies when the exit enclosures, exit passageways, corridor, or rooms and enclosed spaces are protected by a sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

[803.1 Flame-spread and smoke-development tests. Interior wall and ceiling finish materials shall be tested and accorded indices for flame spread and smoke development in accordance with ASTM E 84 or UL 723.]

[803.1.1 Classification of flame spread indices. Such interior finish materials shall be grouped in the following flame spread classes in accordance with their flame spread index.]

[Class A: Flame spread 0–25.]

[Class B: Flame spread 26–75.]

[Class C: Flame spread 76–200.]

[803.1.1.2 Interior flame spread index requirements based on occupancy group. Interior wall and ceiling finish shall have a flame spread index not greater than that for the classification rating specified in Table 803.1 for the group and location designated.]

[803.1.1.3 Interior smoke developed index requirements based on occupancy group. Except where permitted for interior trim in Section 806.5, acceptable smoke developed indices shall range from 0–450 with the following restrictions:]

[Exits, corridors: 25 or less]

[Occupancy Group I: 50 or less]

[Rooms in which the net floor area]
[per occupant is 10 square feet or less] [100 or less]

[803.1.2 Room corner test for interior wall or ceiling finish materials (including textiles). As an alternative to Section 803.1.1, interior wall or ceiling finish materials shall be permitted to be tested in accordance with NFPA 286. Interior wall or ceiling finish materials tested in accordance with NFPA 286 shall comply with Section 803.1.2.1. Interior wall and ceiling finish materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.1.2.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 or UL 723 is required.]

[803.1.2.1 Acceptance criteria for NFPA 286. During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Items 3 and 4.]

[1. During the 40 kW exposure, flames shall not spread to the ceiling.]

[2. During the 160 kW exposure, the interior finish shall comply with the following:

[2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.]

[2.2. Flashover, as defined in NFPA 286, shall not occur.]]

[3. The peak rate of heat release throughout the NFPA 286 test shall not exceed 800 kW.]

[4. The total smoke released throughout the NFPA 286 test shall not exceed 10,764 square feet (1,000 m²).]

[803.1.3 Room corner test for textile wall coverings and expanded vinyl wall coverings. Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Section 803.1.3.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product-mounting system, including adhesive.]

[803.1.3.1 Acceptance criteria for NFPA 265. During the 40 kW exposure the interior finish shall comply with Item 1. During the 150 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Item 3.]

[1. During the 40 kW exposure, flames shall not spread to the ceiling.]

[2. During the 150 kW exposure, the interior finish shall comply with the following:

[2.1. Flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 mm by 305 mm) walls.]

[2.2. Flashover, as described in NFPA 265, shall not occur.]]

[3. The total smoke released throughout the NFPA 265 test shall not exceed 10,764 square feet (1,000 m²).]
[803.1.4 Flame spread and smoke development tests for textile wall or ceiling coverings. Specimens shall be tested and indexed per ASTM E 84 or UL 723, and classified for flame spread per Section 803.1.4.1.]

[803.1.4.1 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84 or UL 723. Textile wall and ceiling coverings and expanded vinyl wall and ceiling coverings shall have a Class A flame spread index per Section 803.1.1.1; shall meet the smoke-developed index requirements of Section 803.1.1.3; and shall be protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.]

803.11 Interior finish requirements based on group. Interior wall and ceiling finish shall have a flame spread index and smoke-developed index not greater than that specified in Table 803.11 of this code for the group and location designated. Interior wall and ceiling finish materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.1.2.1 of this code, shall be permitted to be used where a Class A classification, in accordance with ASTM E 84 or UL 723, is required.

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m$^2$.

a. Class C interior finish materials shall be permitted for wainscoting or paneling of not more than 1,000 square feet (92 m$^2$) of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.13.1.

b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscoting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

[803.2] 803.12 Stability. Interior finish materials regulated by this chapter shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 200°F ([93] 93.3°C) for not less than 30 minutes.

[803.3] 803.13 Application of interior finish materials to fire-resistance-rated [structural] or noncombustible building elements. Where interior finish materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, [they] these finish materials shall comply with the provisions of this section.

[803.3.1] 803.13.1 Direct attachment and furred construction. Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 1 3/4 inches ([44] 44.5 mm) applied directly against such surfaces. [The intervening spaces between such furring strips shall comply with one of the following:]

803.13.1.1 Furred construction. If the interior finish material is applied to furring strips, the intervening spaces between such furring strips shall comply with one of the following:

1. Be filled with material that is inorganic or noncombustible;

2. Be filled with material that meets the requirements of a Class A material in accordance with Section 803.1.1 or 803.1.2; or

3. Be [fire-blocked] fireblocked at a maximum of 8 feet ([2438] 2438.4 mm) in [any]
every direction in accordance with Section [BC-747] 718.

[803.3.2] **803.13.2 Set-out construction.** Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section [803.3.1] 803.13.1, Class A finish materials, in accordance with Section 803.1.1 or 803.1.2, shall be used [except where].

**Exceptions:**

1. Where interior finish materials are protected on both sides by an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 [or attached to noncombustible backing or furring strips installed as specified in Section 803.3.1].

2. Where interior finish materials are attached to noncombustible backing or furring strips installed as specified in Section 803.13.1.

**803.13.2.1 Hangers and assembly members.** The hangers and assembly members of such dropped ceilings that are below the main ceiling line horizontal fire-resistance-rated floor or roof assembl[ies] shall be of noncombustible materials[—except that in Types III and V construction, fire-retardant treated wood shall be permitted]. The construction of each set-out set out wall and horizontal fire-resistance-rated floor or roof assembly shall be of fire-resistance-rated construction as required elsewhere in this code.

**Exception:** In Type III and V construction, fire-retardant-treated wood shall be permitted for use as hangers and assembly members of dropped ceilings.

[803.3.3 Attachment to heavy] **803.13.3 Heavy timber construction.** Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fireblocked as specified in Section [803.3.4] 803.13.1.1.

[803.3.4] **803.13.4 Materials.** An interior wall or ceiling finish material that is not more than ¼ inch (6.4 mm) thick shall be applied directly [against a noncombustible backing] onto the wall, ceiling or building element without the use of furring strips and shall not be suspended away from the building element to which that finish material is applied.

**Exceptions:**

1. Noncombustible interior finish materials.

2. Materials that meet the requirements of Class A materials in accordance with Section 803.1.1 or 803.1.2 where the qualifying tests were made with the material [suspended or furred out from the noncombustible backing].

3. Materials that meet the requirements of Class A materials in accordance with Section 803.1.1 or 803.1.2 where the qualifying tests were made with the material suspended away from the noncombustible backing shall be permitted to be used suspended away from the building element.
803.4 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 2603.9. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

803.5 Toxicity. Interior wall or ceiling finishes, other than textiles, upon exposure to fire, shall not produce products of decomposition or combustion that are more toxic in point of concentration than those given off by wood or paper when decomposing or burning under comparable conditions as tested in accordance with NFPA 269.

SECTION BC 804

INTERIOR FLOOR FINISH

804.1 General. Interior floor finish and floor covering materials shall comply with this section.

804.2 Classification. Interior floor finish and floor covering materials required by Section 804.4.1 of this code to be of Class I or II materials shall be classified in accordance with NFPA 253 or ASTM E 648. The classification referred to herein corresponds to the classifications determined by NFPA 253 or ASTM E 648 as follows: Class I, 0.45 watts/cm² or greater; Class II, 0.22 watts/cm² or greater.

804.3 Testing and identification. Interior floor finish and floor covering materials shall be tested by an approved agency in accordance with NFPA 253 or ASTM E 648 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the interior floor finish or floor covering classification according to Section 804.2 of this code. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer’s product identification shall be furnished to the department upon request.

804.4 Interior floor finish limitations. In buildings and spaces classified in Occupancy Group H and in all exits and exit passageways of any occupancy group, floor finishes shall be of noncombustible materials.

Exception: Interior floor finish may be of combustible materials in the following spaces. Carpet-type materials must be able to withstand a minimum critical radiant flux as specified in Section 804.4.1.

1. Buildings of Type VB Construction.

2. Interior stairs in buildings of Type III, IV and V construction in Occupancy Group B, F, M or S-2, when the buildings are two stories in height or less.

3. Interior stairs in buildings of Type III, IV and V construction in Occupancy Groups R-2 and R-3 when the buildings are three stories in height or less.

4. Interior stairs in buildings of Type III, IV and V construction in Occupancy Group R-2 when occupied by three families or less.
**804.4.1 Minimum critical radiant flux.** Interior floor finishes shall not be less than Class I in Occupancy Groups I-2 and I-3 and not less than Class II in Occupancy Groups A, B, E, H, I-4, M, R-1, R-2 and S. In all other occupancy groups, the interior floor finish shall comply with the DOC FF-1 “pill test” (CPSC 16 CFR, Part 1630).

**804.5 Volatile organic compounds emissions in carpet and carpet cushion.** [On and after July 1, 2013 carpet] Carpet and carpet cushion as defined in Section 17-1401 of the Administrative Code shall comply with the limits on volatile organic compound emissions set forth in Chapter 14 of Title 17 of such code.

### SECTION BC 805
COMBUSTIBLE FLOORING MATERIALS IN TYPES I AND II CONSTRUCTION

**805.1 Application.** Combustible materials installed on or embedded in floors of buildings of Type I or II construction shall comply with Sections 805.1.1 through 805.1.4.

[Exception] **Exceptions:**

1. Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.

2. Bleachers, grandstands and folding and telescopic seating within assembly spaces constructed in accordance with Section 1029.1.1.

**805.1.1 Subfloor construction.** Floor sleepers, bucks and nailing blocks shall not be constructed of combustible materials, unless the space between the fire-resistance-rated floor assembly and the flooring is either solidly filled with noncombustible materials or fireblocked in accordance with Section [717] 718, and provided that such open spaces shall not extend under or through permanent partitions or walls.

**805.1.2 Wood finish flooring.** Wood finish flooring is permitted to be attached directly to the embedded or fireblocked wood sleepers and shall be permitted where cemented directly to the top surface of approved fire-resistance-rated floor assemblies or directly to a wood subfloor attached to sleepers as provided for in Section 805.1.1.

**805.1.3 Insulating boards.** Combustible insulating boards not more than ½-inch (12.7 mm) thick and covered with finish flooring are permitted where attached directly to a noncombustible floor assembly or to wood subfloors attached to sleepers as provided for in Section 805.1.1.

**805.1.4 Carpet-type floor coverings.** Carpet-type floor coverings are permitted where cemented directly to the top surface of approved fire-resistance-rated construction or directly to a wood subfloor attached to sleepers as provided for in Section 805.1.1.

### SECTION BC 806
DECORATIVE MATERIALS AND TRIM

**806.1 Decorations.** All decorations shall comply with the requirements of the New York City Fire Code.
806.2 Reserved.

806.3 Reserved.

806.4 Reserved.

806.5 **Foam plastic as trim.** Foam plastic used as trim shall comply with Section 2604.2 and shall not be permitted in [Group R-3] occupancies other than Group R-3, within individual dwelling units of Group R-1 and R-2 occupancies, [and where] or unless approved in accordance with [the special provisions of] Section 2603.9. [Foam plastics used as trim in any occupancy shall comply with the requirements of Section 2604.2.]

[806.4] **806.6 Pyroxylin plastic.** Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used in Group A occupancies.

[806.5] **806.7 Interior trim.** Material, other than foam plastic used as interior trim, shall have a minimum Class C flame spread index [as described in Section 803.1.1] and maximum smoke-developed index [of 450] when tested in accordance with ASTM E 84 or UL 723 as described in Section 803.1.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the specific wall or ceiling area in which it is attached.

[806.6] **806.8 Interior floor-wall base.** Interior floor-wall base that is 6 inches ([152] 152.4 mm) or less in height shall be tested in accordance with Section 804.2 and shall be not [be] less than Class II. Where a Class I floor finish is required, the floor-wall base shall be Class I.

**Exception:** Interior trim materials that comply with Section [806.5] 806.7.

SECTION BC 807

INSULATION

807.1 **Insulation.** Thermal and acoustical insulation shall comply with Section [749] 720.

SECTION BC 808

ACOUSTICAL CEILING SYSTEMS

808.1 **Acoustical ceiling systems.** The quality, design, fabrication and erection of metal suspension systems for acoustical tile and lay-in panel ceilings in buildings or structures shall conform [with] to generally accepted engineering practice, the provisions of this chapter and other applicable requirements of this code.

808.1.1 **Materials and installation.** Acoustical materials complying with the interior finish requirements of Section 803 shall be installed in accordance with the manufacturer’s recommendations and applicable provisions for applying interior finish.

808.1.1.1 **Suspended acoustical ceilings.** Acoustical ceilings that are to be suspended below floor or roof construction by means of a framing system shall consist of supporting hangers of minimum ¼-inch diameter (6.4 mm) steel rods, carrying channels of minimum 1½-inch deep ([38] 38.1 mm) cold-rolled steel weighing [0.457] 0.440 pounds per linear foot ([0.707] 0.675 kg per meter).
kg/m) (0.681 kg/m), and a supporting grid complying with Appendix R. Use of wire hangers shall not be permitted. Direct hung suspension systems shall not be permitted.

**Exception:** Acoustical ceiling systems in [Group] Groups R-2 and R-3 occupancies shall be permitted to be installed in accordance with ASTM C 635 and ASTM C 636 without modifications.

**808.1.1.2 Fire-resistance-rated construction.** Acoustical ceiling systems that are part of fire-resistance-rated construction shall be installed in the same manner used in the assembly tested and shall comply with the provisions of Chapter 7.

§ 10. Chapter 9 of the New York city building code, as amended by local law number 141 for the year 2013, the definition of “Natural Gas Alarm” and sections 28-908.7.1.1.2 and 28-908.10 as added by local law number 157 for the year 2016, sections 28-903.1.1, 28-903.2.11.9, 28-903.3.1.1.1, 28-903.3.3, 28-904.2, 28-904.2.1, 28-907.1, 28-907.1.1, 28-907.1.1.1, 28-908.10, 28-908.11 and 28-917.1.1 as amended by local law number 195 for the year 2018, section 28-903.2.2 as amended by local law number 78 for the year 2015, section 28-907.2.2 as added by local law number 51 for the year 2014, section 28-907.2.11.5 as added by local law number 113 for the year 2018, section 28-907.3.5 and item 8 of section 28-911.1.5 as added by local law number 17 for the year 2014, section 28-908.7 as amended by, and section 28-908.7.4 as renumbered by, local law number 10 for the year 2014, and section 28-908.7.3 as amended by, and section 28-908.7.3.1 as added by, local law number 191 for the year 2018, is amended to read as follows:

**CHAPTER 9**
**FIRE PROTECTION SYSTEMS**

**SECTION BC 901**
**GENERAL**

901.1 Scope. The provisions of this chapter shall specify where fire protection systems are required and shall apply to the design, installation and operation of fire protection systems.

901.1.1 Referenced standards. Where this code makes reference to the nationally recognized standards NFPA 13, NFPA 13D, NFPA 13R, NFPA 14, NFPA 20, [or] NFPA 72, or NFPA 92, such standard shall be as modified for New York City in accordance with Appendix Q of this code.
901.2 Fire protection systems. Fire protection systems shall be installed, repaired, operated and maintained in accordance with this code and the New York City Fire Code. Any fire protection system for which an exception or reduction to the provisions of this code has been granted shall be considered to be a required system.

Exception: Any fire protection system or portion thereof not required by this code shall be permitted to be installed provided that such system meets the requirements of this code.

901.2.1 Fire protection systems within a building. Fire protection systems shall be dedicated to one building only.

Exception: Upon review and approval by the commissioner and the Fire Department, multiple buildings may be served by one fire protection system.

901.3 Modifications. No person shall remove or modify any fire protection system installed or maintained under the provisions of this code or the New York City Fire Code without approval by the commissioner.

901.4 Threads. Threads provided for Fire Department connections to sprinkler systems, standpipes, yard hydrants or any other fire hose connection shall be compatible with the connections used by the Fire Department.

901.5 Acceptance tests. Fire protection systems shall be tested in accordance with the requirements of this code and the New York City Fire Code. When required by this chapter, the tests shall be conducted in the presence of the department or an approved agency. Tests required by this code, the New York City Fire Code and the standards listed in this code shall be conducted at the expense of the owner or the owner’s representative. It shall be unlawful to occupy portions of a structure until the required fire protection systems within that portion of the structure have been tested and approved.

901.6 Supervisory service. Where required, fire protection systems shall be monitored by a central supervising station in accordance with NFPA 72.

901.6.1 Automatic sprinkler systems. Automatic sprinkler systems shall be monitored by a central supervising station.

Exceptions:

1. A central supervising station is not required for automatic sprinkler systems protecting one- and two-family dwellings.

2. Limited area sprinkler systems serving fewer no more than 20 sprinkler heads.

901.6.2 Fire alarm systems. Fire alarm systems required by the provisions of Section 907.2 of this code and the New York City Fire Code shall be monitored by a central supervising station in accordance with Section 907.14.907.6.5.

Exceptions:
1. Single- and multiple-station smoke alarms and carbon monoxide alarms required by Section 907.2.11.

2. Smoke detectors in Group I-3 occupancies.

3. Supervisory service is not required for automatic sprinkler systems in one- and two-family dwellings.

901.6.3 Group H. Manual fire alarm, automatic fire-extinguishing and emergency alarm systems in Group H occupancies shall be monitored by an approved supervising station.

Exception: When approved by the Fire Department, on-site monitoring at a constantly attended location shall be permitted provided that notifications to the Fire Department will be equal to those provided by a central supervising station.

901.7 Fire areas. Where buildings, or portions thereof, are divided into fire areas so as not to exceed the limits established for requiring a fire protection system in accordance with this chapter, such fire areas shall be separated by fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both, having a fire-resistance rating of not less than that determined in accordance with Section [707.3.9] 707.3.10.

901.8 Construction documents. Construction documents shall comply with Chapter 1 of Title 28 of the Administrative Code, Section 107 and other applicable provisions of this code and its referenced standards.

901.9 Special provisions for prior code buildings. The provisions of this chapter shall apply to alterations and changes of use or occupancy to prior code buildings in accordance with Sections 901.9.1 through 901.9.6.

901.9.1 Additions, alterations or repairs. Additions, alterations, renovations or repairs to existing systems shall conform to that required for new systems without requiring the existing system to comply with all of the requirements of this code, except as otherwise required in Sections 901.9.2 through 901.9.6. Additions, alterations or repairs shall not cause an existing installation to become unsafe, hazardous or overloaded.

901.9.1.1 Minor additions, alterations, renovations and repairs. Minor additions, alterations, renovations and repairs to existing systems shall meet the provisions for new construction, unless such work is done in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

901.9.2 Additional requirements based on change of occupancy or use. Fire protection systems governed by this chapter shall be provided:

1. To the entire building as if the building were hereafter erected, where a change is made in the main use or dominant occupancy of such building.

2. Throughout a space, where a change is made in the occupancy group classification or usage of the space.
901.9.3 Additional requirements for enlargements. Fire protection systems shall be provided in enlarged portions of a building and where this chapter would require such systems in new construction for a space or building.

Exception: Section 901.9.3 shall not require sprinklers to be installed in enlarged portions of unsprinklered buildings to be occupied exclusively as one- or two-family dwellings. This exception shall not apply where sprinklers are otherwise required by the provisions of Sections 901.9.2 or 901.9.4.

901.9.4 Additional requirements based on value of alterations. Fire protection systems shall be provided to buildings and spaces in accordance with the provisions of Sections 901.9.4.1 through 901.9.4.3.

901.9.4.1 Alterations requiring fire protection systems throughout a building. If the value of alterations to the building equals or exceeds 60 percent of the value of the existing building, or, in the case of a building containing 4 or more dwelling units, 50 percent of the value of the existing building, the entire building shall be made to comply with the fire protection requirements of this chapter as if it were hereafter erected.

901.9.4.2 Alterations requiring fire protection systems in the space being altered. If the value of alterations of a space is between 30 percent and 60 percent of the value of the existing building, or, in the case of a building containing 4 or more dwelling units, if the value of alterations of a space is between 30 percent and 50 percent of the value of the existing building, those portions of the building being altered shall be made to comply with the fire protection requirements of this chapter.

901.9.4.3 Additional requirements for buildings containing 4 or more dwelling units. For buildings containing 4 or more dwelling units, if the value of alterations to an existing space classified in [occupancy group] Occupancy Group R-1 or R-2 exceeds 50 percent of the value of the space, such space shall be made to comply with the fire protection requirements of this chapter.

901.9.5 Additional provisions. In buildings or spaces not otherwise required to provide fire protection systems in accordance with this chapter, fire protection systems shall be provided for the types of alterations described in Sections 901.9.5.1 through 901.9.5.4.

901.9.5.1 Additional requirements for providing smoke and carbon monoxide alarms in dwelling units during alterations involving removal of existing interior finishes. Smoke and/or carbon monoxide alarms complying with the location, interconnection and power source requirements of this chapter shall be provided throughout a dwelling unit when alteration work results in the removal of existing and/or installation of new interior wall or ceiling finishes permitting the installation of concealed wiring for all the required alarms throughout the dwelling unit.

901.9.5.2 Additional requirements for providing standpipes in newly constructed stair shafts. Where an alteration includes the addition or replacement of an entire exit stair shaft that is a required means of egress, the entire shaft shall be equipped with a standpipe in accordance with Section 905.
901.9.5.3 Additional requirements for enlargements of buildings with existing standpipe systems. Where the alteration involves the addition of stories to a building with an existing standpipe system, and one or more stair shafts are not currently equipped with standpipes, standpipes shall be provided to all stair shafts in accordance with this chapter.

Exception: Additional standpipes are not required where:

1. The alteration involves the addition of only one story;
2. Existing standpipes in existing stair shafts are extended in accordance with this chapter;
3. Standpipe hose connections are provided in compliance with Section 905.4, Item 6; and
4. The demand on the standpipe system, including any additional demand, with respect to flow and pressure does not exceed the capacity of the existing approved system.

901.9.5.4 Additional requirements for enlargements of buildings with no existing standpipe systems. Where the alteration involves the addition of stories to a building with no existing standpipe system, standpipes shall be provided to all stair shafts in accordance with this chapter.

Exception: Standpipes are not required where:

1. the alteration involves the addition of only one story;
2. the completed building does not exceed 7 stories; and
3. the completed building does not exceed 85 feet (25.9 m) in height.

901.9.6 Seismic supports. The determination as to whether seismic requirements apply to an alteration shall be made in accordance with the 1968 Building Code and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements shall be permitted to be determined in accordance with Chapter 16 of this code or the 1968 Building Code and Reference Standard RS 9-6 of such code.

SECTION BC 902
DEFINITIONS

902.1 Definitions. The following [words and] terms [shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.] are defined in Chapter 2:

ALARM NOTIFICATION APPLIANCE. [A fire alarm system component such as a bell, horn, speaker, light or text display that provides audible, tactile or visible outputs, or any combination thereof.]
ALARM SIGNAL. [A signal indicating an emergency requiring immediate action, such as a signal indicative of fire.]

ALARM VERIFICATION FEATURE. [A feature of automatic fire detection and alarm systems to reduce unwanted alarms wherein smoke detectors report alarm conditions for a minimum period of time, or confirm alarm conditions within a given time period, after being automatically reset, in order to be accepted as a valid alarm initiation signal.]

ANIMAL SERVICE FACILITY.

ANNUNCIATOR. [A unit containing one or more indicator lamps, alphanumeric displays or other equivalent means in which each indication provides status information about a circuit, condition or location.]

AUDIBLE ALARM NOTIFICATION APPLIANCE. [A notification appliance that alerts by the sense of hearing.]

AUTOMATIC. [As applied to fire protection devices, a device or system providing an emergency function as a result of a predetermined temperature rise, rate of temperature rise or combustion products, without the necessity for human intervention.]

AUTOMATIC FIRE-EXTINGUISHING SYSTEM. [An approved system of devices and equipment that automatically detects a fire and discharges an approved fire-extinguishing agent onto or in the area of a fire.]

AUTOMATIC SMOKE DETECTION SYSTEM. [A fire alarm system that has initiation devices that utilize smoke detectors for protection of an area such as a room or space with detectors to provide early warning of fire.]

AUTOMATIC SPRINKLER SYSTEM. [An automatic sprinkler system, for fire protection purposes, is an integrated system of underground and overhead piping designed in accordance with fire protection engineering standards. The system includes a suitable water supply. The portion of the system above the ground is a network of specially sized or hydraulically designed piping installed in a structure or area, generally overhead, and to which automatic sprinklers are connected in a systematic pattern. The system is usually activated by heat from a fire and discharges water over the fire area.]

AUTOMATIC WATER MIST SYSTEM.

AVERAGE AMBIENT SOUND LEVEL. [The root mean square, A-weighted sound pressure level measured over a 24-hour period, or the time any person is present, whichever time period is less.]

CARBON DIOXIDE EXTINGUISHING SYSTEMS. [A system supplying carbon dioxide (CO₂) from a pressurized vessel through fixed pipes and nozzles. The system includes a manual— or automatic-actuating mechanism.]

CARBON MONOXIDE ALARM. [A single— or multiple—station alarm responsive to carbon monoxide.]
CARBON MONOXIDE DETECTOR. [A listed device that senses carbon monoxide.]

CARBON [MONOXIDE-PRODUCING] MONOXIDE-PRODUCING EQUIPMENT. [Any furnace, boiler, water heater, fireplace, cooking appliance, gas clothes dryer, apparatus, appliance or device that burns coal, kerosene, oil, wood, fuel gases and other petroleum products including, but not limited to, methane, natural gas, liquefied natural gas and manufactured fuel gases.]

CEILING LIMIT. [The maximum concentration of an air-borne contaminant to which one may be exposed, as published in DOL 29 CFR Part 1910.1000.]

CLEAN AGENT. [Electrically nonconducting, volatile or gaseous fire extinguishant that does not leave a residue upon evaporation.]

COMMERCIAL COOKING SYSTEM. [A system consisting of commercial cooking equipment, exhaust hood, filters, exhaust duct system, fire suppression system and other related appurtenances designed to capture grease-laden cooking vapors and exhaust them safely to the outdoors.]

COMMERCIAL MOTOR VEHICLE.

CONSTANTLY ATTENDED LOCATION. [A designated location at a facility staffed by trained personnel on a continuous basis where alarm or supervisory signals are monitored and facilities are provided for notification of the Fire Department or other emergency services.]

DELUGE SPRINKLER SYSTEM. [A sprinkler system employing open sprinklers attached to a piping system connected to a water supply through a valve that is opened by the operation of a detection system installed in the same areas as the sprinklers. When this valve opens, water flows into the piping system and discharges from all sprinklers attached thereto.]

DETECTOR, HEAT. [A fire detector that senses heat—either abnormally high temperature or rate of rise, or both.]

DRY-CHEMICAL EXTINGUISHING AGENT. [A powder composed of small particles, usually of sodium bicarbonate, potassium bicarbonate, urea potassium based bicarbonate, potassium chloride or monoammonium phosphate, with added particulate material supplemented by special treatment to provide resistance to packing, resistance to moisture absorption (caking) and the proper flow capabilities.]

ELECTRICAL CIRCUIT PROTECTIVE SYSTEM.

EMERGENCY ALARM SYSTEM. [A system to provide indication and warning of emergency situations involving hazardous materials.]

EMERGENCY VOICE/ALARM COMMUNICATIONS. [Dedicated manual or automatic facilities for originating and distributing voice instructions, as well as alert and evacuation signals pertaining to a fire emergency, to the occupants of a building.]

FIRE ALARM BOX, MANUAL. [See “Manual Fire Alarm Box.”]
FIRE ALARM CONTROL UNIT. [A system component that receives inputs from automatic and manual fire alarm devices and may be capable of supplying power to detection devices and transponder(s) or off-premises transmitter(s). The control unit may be capable of providing a transfer of power to the notification appliances and transfer of condition to relays or devices.]

FIRE ALARM SIGNAL. [A signal initiated by a fire alarm initiating device such as a manual fire alarm box, automatic fire detector, water flow switch, or other device whose activation is indicative of the presence of a fire or fire signature.]

FIRE ALARM SYSTEM. [A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals.]

FIRE AREA. [The aggregate floor area enclosed and bounded by fire walls, fire barriers, exterior walls and/or horizontal assemblies of a building. Areas of the building not provided with surrounding walls shall be included in the fire area if such areas are included within the horizontal projection of the roof or floor next above.]

FIRE COMMAND CENTER. [The principal attended or unattended location where the status of detection, alarm communications and control systems is displayed, and from which the system(s) can be manually controlled.]

FIRE DETECTOR, AUTOMATIC. [A device designed to detect the presence of a fire signature and to initiate action.]

FIRE PROTECTION SYSTEM. [Approved devices, equipment and systems or combinations of systems used to detect a fire, activate an alarm, extinguish or control a fire, control or manage smoke and products of a fire or any combination thereof.]

FIRE PUMP. [A pump used exclusively for fire protection. A pump used only to fill a tank is not a fire pump.]

Fire pump, automatic standpipe. [A fire pump located at or below street level that supplies the lower 300 feet of a standpipe system or a combined standpipe and sprinkler system.]

Fire pump, foam. [A fire pump used to boost water supply pressures in a fire protection system where such system uses firefighting foam as an additive.]

Fire pump, limited service. [A fire pump with a motor rating not exceeding 30 hp and utilizing a limited service fire pump controller.]

Fire pump, special service. [A fire pump that is located above street level and that receives its water supply from a gravity tank or suction tank.]

Fire pump, sprinkler booster pump. [A fire pump that supplies sprinkler systems only.]

Fire pump, water mist system. [A fire pump used to boost water supply pressures in a fire protection system where such system utilizes water misting technology.]
FIRE SAFETY FUNCTIONS. [Building and fire control functions that are intended to increase the level of life safety for occupants or to control the spread of harmful effects of fire.]

FOAM-EXTINGUISHING SYSTEM. [A special system discharging foam made from concentrates, either mechanically or chemically, over the area to be protected.]

HALOGENATED EXTINGUISHING SYSTEM. [A fire-extinguishing system using one or more atoms of an element from the halogen chemical series: fluorine, chlorine, bromine and iodine.]

INITIATING DEVICE. [A system component that originates transmission of a change-of-state condition, such as in a smoke detector, manual fire alarm box or supervisory switch.]

LIMITED AREA SPRINKLER SYSTEM. [An automatic sprinkler system serving fewer than 20 sprinkler heads on any single connection.]

LISTED. [See Chapter 1 of Title 28 of the Administrative Code.]

MANUAL FIRE ALARM BOX. [A manually operated device used to initiate an alarm signal.]

MULTIPLE-STATION ALARM DEVICE. [Two or more single-station alarm devices that are capable of interconnection such that actuation of one causes all integral or separate audible alarms to operate. It also can consist of one single-station alarm device having connections to other detectors or to a manual fire alarm box.]

MULTIPLE-STATION SMOKE ALARM. [Two or more single-station alarm devices that are capable of interconnection such that actuation of one causes the appropriate alarm signal to operate in all interconnected alarms.]

NOTIFICATION ZONE.

POST-FIRE SMOKE PURGE SYSTEM. [A mechanical or natural ventilation system intended to move smoke from the smoke zone to the exterior of the building. Such systems are intended for the timely restoration of operations and overhaul activities once a fire is extinguished. Post-fire smoke purge systems are not intended or designed to be life safety systems.]

PRESIGNAL SYSTEM. [An alarm system having a feature that allows initial fire alarm signals to sound in a constantly attended central location and for which a human action is subsequently required to achieve a general alarm, or a feature that allows the control equipment to delay the general alarm by more than 1 minute after the start of the alarm processing.]

RECORD DRAWINGS. [Drawings (“as-builds”) that document the location of all devices, appliances, wiring sequences, wiring methods and connections of the components of a fire alarm system as installed.]

SINGLE-STATION SMOKE ALARM. [An assembly incorporating the detector, the control equipment and the alarm-sounding device in one unit, operated from a power supply either in the unit or obtained at the point of installation.]

SMOKE ALARM. [A single- or multiple-station alarm responsive to smoke.]
SMOKE DETECTOR. [A listed device that senses visible or invisible particles of combustion.]

SMOKEPROOF ENCLOSURE. [An exit stairway designed and constructed so that the movement of the products of combustion produced by a fire occurring in any part of the building into the enclosure is limited.]

STANDPIPE SYSTEM. [Piping installed in a building or structure that serves to transfer water from a water supply to hose connections at one or more locations in a building or structure for fire-fighting purposes.]

STANDPIPE, TYPES OF. [Standpipe types are as follows:]

Automatic dry. [A dry standpipe system, normally filled with pressurized air, that is arranged through the use of a device, such as dry pipe valve, to admit water into the system piping automatically upon the opening of a hose valve. The water supply for an automatic dry standpipe system shall be capable of supplying the system demand.]

Automatic wet. [A wet standpipe system that has a water supply that is capable of supplying the system demand automatically.]

Manual dry. [A dry standpipe system that does not have a permanent water supply attached to the system. Manual dry standpipe systems require water from a Fire Department pumper to be pumped into the system through the Fire Department connection in order to meet the system demand.]

Manual wet. [A wet standpipe system connected to a water supply for the purpose of maintaining water within the system but that does not have a water supply capable of delivering the system demand attached to the system. Manual wet standpipe systems require water from a Fire Department pumper to be pumped into the system in order to meet the system demand.]

Semiautomatic dry. [A dry standpipe system that is arranged through the use of a device, such as a deluge valve, to admit water into the system piping upon activation of a remote control device located at a hose connection. A remote control activation device shall be provided at each hose connection. The water supply for a semiautomatic dry standpipe system shall be capable of supplying the system demand.]

STANDPIPE SYSTEM, CLASSES OF. [Standpipe classes are as follows:]

Class I system. [A system providing 2½ inch (64 mm) hose connections to supply water for use by the Fire Department and those trained in handling heavy fire streams.]

Class II system. [A system providing 1½-inch (38 mm) hose stations to supply water for use primarily by the building occupants or by the Fire Department during initial response.]

Class III system. [A system providing 1½-inch (38 mm) hose stations to supply water for use by building occupants and 2½-inch (64 mm) hose connections to supply a larger volume of water for use by the Fire Department and those trained in handling heavy fire streams.]
SUPERVISING STATION. [A facility that receives signals from protected premises’ fire alarm systems and at which personnel are in attendance at all times to respond to these signals.]

Supervising station, central. [A supervising station that is listed and approved by the Fire Department for central station service.]

Supervising station, proprietary. [A supervising station under the same ownership as the protected premises’ fire alarm system(s) that it supervises (monitors) and to which alarm, supervisory, or trouble signals are received and where personnel are in attendance at all times to supervise operation and investigate signals.]

Supervising station, remote. [A supervising station to which alarm, supervisory, or trouble signals or any combination of those signals emanating from protected premises’ fire alarm systems are received and where personnel are in attendance at all times to respond.]

SUPERVISORY SERVICE. [The service required to monitor performance of guard tours and the operative condition of fixed suppression systems or other systems for the protection of life and property.]

SUPERVISORY SIGNAL. [A signal indicating the need for action in connection with the supervision of guard tours, fire suppression systems or equipment, fire alarm systems, or the maintenance features of related systems.]

SUPERVISORY SIGNAL-INITIATING DEVICE. [An initiation device, such as a valve supervisory switch, water level indicator or low air pressure switch on a dry pipe sprinkler system, whose change of state signals an off normal condition and its restoration to normal of a fire protection or life safety system, or a need for action in connection with the supervision of guard tours, fire suppression systems or equipment, fire alarm systems, or the maintenance features of related systems.]

TIRES, BULK STORAGE OF. [Storage of tires where the area available for storage exceeds 20,000 cubic feet (566 m³).]

TROUBLE SIGNAL. [A signal initiated by the fire alarm system or device indicative of a fault in a monitored circuit or component.]

VALUE (OF ALTERATIONS TO DETERMINE REQUIRED FIRE PROTECTION). [The value of alterations shall be determined by adding the estimated cost of the proposed alteration, excluding minor alterations and ordinary repairs, computed as of the time of submitting the application for construction document approval, to the actual cost of any and all alterations made in the preceding 12-month period. Where the proposed alteration includes an enlargement, the value of such alteration shall include the cost of the enlargement.]

VALUE (OF EXISTING BUILDING OR SPACE). [See Section 202.]

VISIBLE ALARM NOTIFICATION APPLIANCE. [A notification appliance that alerts by the sense of sight.]
WET CHEMICAL EXTINGUISHING [SYSTEM] AGENT. [A solution of water and potassium carbonate-based chemical, potassium acetate-based chemical or a combination thereof, forming an extinguishing agent.]

WIRELESS PROTECTION SYSTEM. [A system or a part of a system that can transmit and receive signals without the aid of wire.]

ZONE. [A defined area within the protected premises. A zone can define an area from which a signal can be received, an area to which a signal can be sent or an area in which a form of control can be executed.]

ZONE, NOTIFICATION. [An area within a building or facility covered by notification appliances which are activated simultaneously.]

SECTION BC 903
AUTOMATIC SPRINKLER SYSTEMS

903.1 General. Automatic sprinkler systems shall comply with this section. Installation of automatic sprinkler systems shall comply with the special inspection requirements of Chapter 17.

903.1.1 Alternative protection. Where permitted by the New York City Fire Code, the Fire Department may approve the installation of alternative automatic fire-extinguishing systems complying with this code and the New York City Fire Code in lieu of automatic sprinkler protection.

903.1.2 Construction documents. Construction documents for automatic sprinkler systems shall contain plans that include the following data and information:

1. The location and size of water supplies and the location, number, and type of sprinkler heads to be used, with approximate location and size of all feed mains, valves and other essential features of the system. For hydraulically calculated systems, hydraulic data substantiating pipe sizes shown shall be submitted and hydraulic reference points and areas must be indicated on the plan. If any other methods are utilized to size the sprinkler system and its components, as allowed by NFPA 13, supporting documentation shall be submitted to the department.

2. A diagram showing the proposed sprinkler system in relation to principal construction features of the building, such as its size, walls, columns, and partitions; and such other information as may be necessary for the evaluation of the system.

3. The location, number, and type of any electrical or automatic devices or alarms to be used in the system.

4. In buildings where a new separate fire sprinkler system is required, the available water pressure at the top and bottom floors of each zone shall be shown on the riser diagram.

5. For street pressure-fed systems and fire pumps, a statement from the New York City Department of Environmental Protection, giving the minimum water pressure in the main serving the building.
903.2 Where required. Approved automatic sprinkler systems in new buildings and structures shall be provided in the locations described in [this section] Sections 903.2.1 through 903.2.13.

Exceptions:

1. Sprinklers shall not be required in electrical equipment rooms where all of the following conditions are met:
   1.1 The room is dedicated to electrical equipment only.
   1.2 Only dry-type electrical equipment is used.
   1.3 Equipment is installed in a 2-hour fire-rated enclosure including protection for penetrations.
   1.4 No combustible storage is permitted to be stored in the room.
2. Sprinklers shall not be permitted in elevator machine rooms and elevator machinery spaces.
3. Sprinklers shall not be required in rooms and spaces protected by an alternative fire suppression system in accordance with the New York City Fire Code and Section 904 of this code.

903.2.1 Group A. An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. For Group A-1, A-2, A-3 and A-4 occupancies, the automatic sprinkler system shall be provided throughout the story where the fire area containing the Group A-1, A-2, A-3 or A-4 occupancy is located, and throughout all stories from the Group A occupancy to, and including, the levels of exit discharge serving the Group A occupancy. For Group A-5 occupancies, the automatic sprinkler system shall be provided in the spaces indicated in Section 903.2.1.5. In all Group A occupancies providing live entertainment, dressing rooms and property rooms used in conjunction with such assembly occupancy shall be provided with an automatic sprinkler system. Stages shall comply with Section [410.6] 410.7.

903.2.1.1 Group A-1. An automatic sprinkler system shall be provided for fire areas containing Group A-1 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1114.8 m²).
2. The fire area has an occupant load of 300 or more.
3. The fire area is located on a floor other than a level of exit discharge serving such occupancies.
4. The fire area contains a multitheater complex.
903.2.1.2 Group A-2. An automatic sprinkler system shall be provided for Group A-2 occupancies where any one of the following conditions exists:

1. The fire area exceeds 5,000 square feet (464.5 m²).
2. The fire area has an occupant load of 300 or more.
3. The aggregate occupant load of all fire areas occupied by Group A, located on any given floor other than the level of exit discharge, is 300 or more.
4. The A-2 occupancy is used as a cabaret.

903.2.1.3 Group A-3. An automatic sprinkler system shall be provided for fire areas containing Group A-3 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1114.8 m²).
2. The fire area has an occupant load of 300 or more.
3. The aggregate occupant load of all fire areas occupied by Group A, located on any given floor other than the level of exit discharge, is 300 or more.

Exception: Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.

903.2.1.4 Group A-4. An automatic sprinkler system shall be provided for fire areas containing Group A-4 occupancies and intervening floors of the building where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1114.8 m²).
2. The fire area has an occupant load of 300 or more.
3. The aggregate occupant load of all fire areas occupied by Group A, located on any given floor other than the level of exit discharge, is 300 or more.

Exception: Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.

903.2.1.5 Group A-5. An automatic sprinkler system shall be provided in all enclosed areas of the structure, including but not limited to the concession concourse, concession stands, retail areas, press boxes and other accessory occupancies, in excess of 1,000 square feet (92.9 m²).

903.2.1.6 Assembly occupancies on roofs. Where an occupied roof has an assembly occupancy with an occupant load exceeding 100 for Group A-2 and 300 for other Group A occupancies, all floors between the occupied roof and the level of exit discharge shall be
equipped with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Exception: Open parking garages of Type I or Type II construction.

903.2.1.7 Multiple fire areas. An automatic sprinkler system shall be provided where multiple fire areas of Group A-1, A-2, A-3 or A-4 occupancies share exit or exit access components and the combined occupant load of these fire areas is 300 or more.

903.2.2 Group B. An automatic sprinkler system shall be installed for Group B occupancies as provided in Sections 903.2.2.1 and 903.2.2.2.

903.2.2.1 Ambulatory health care facilities. An automatic sprinkler system shall be installed throughout all fire areas containing a Group B ambulatory health care facility occupancy [when either of the following conditions exists at any time:]. In buildings where ambulatory care is provided on levels other than the level of exit discharge, an automatic sprinkler system shall be installed throughout the entire floor where such care is provided as well as all floors below, and all floors between the level of ambulatory care and the nearest level of exit discharge, including the level of exit discharge.

1. Four or more care recipients are incapable of self-preservation.
2. One or more care recipients who are incapable of self-preservation are located at other than the level of exit discharge serving such an occupancy.

903.2.2.2 Animal service facilities. An automatic sprinkler system shall be provided for animal service facilities. [This provision shall be retroactive and shall apply to all such facilities in existence on the effective date of this provision, and such facilities shall achieve compliance no later than December 31, 2016.]

Exceptions:

1. Animal service facilities [which] that provide 24 hour in-person supervision of animals sheltered therein and are equipped with smoke alarms.
2. Animal service facilities that were in operation on or before December 31, 2016, and are equipped with an automatic smoke detection system.

903.2.3 Group E. An automatic sprinkler system shall be provided for Group E occupancies as follows:

1. Throughout all Group E fire areas greater than [20,000 square feet (1858 m²)] 12,000 square feet (1114.8 m²) in area.
2. Throughout every portion of educational buildings below the level of exit discharge.

Exception: An automatic sprinkler system is not required in any fire area or area below the level of exit discharge where every classroom throughout the building has [at least] not fewer than one exterior exit door at ground level without intervening
corridors, passageways, [or exit enclosures] interior exit stairways or ramps or exit passageways.

903.2.4 Group F. An automatic sprinkler system shall be provided throughout all buildings containing a Group F occupancy where any one of the following conditions exists:

1. Where a Group F-1 fire area exceeds 12,000 square feet ([1445] 1144.8 m²);

2. Where a Group F-1 fire area is located more than three stories above grade plane; [or]

3. Where the combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet ([2230] 2229.7 m²); [or]

4. Where required by Section 280 of the New York State Labor Law for “factory buildings” defined in Section 2 of such law[; or]

5. Where a Group F-1 occupancy used for the manufacture of upholstered furniture or mattresses exceeds 2,500 square feet (232.3 m²).

903.2.4.1 Woodworking operations. An automatic sprinkler system shall be provided throughout [any] all Group F-1 occupancy fire [area] areas that [contains wood working] contain woodworking operations in excess of 2,500 square feet ([232] 232.3 m²) in area that generate finely divided combustible waste or use finely divided combustible materials.

903.2.4.2 Repair garages. An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406, as follows:

1. Buildings two or more stories in height, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m²).

2. One-story buildings with a fire area containing a repair garage exceeding 12,000 square feet ([1445] 1144.8 m²).

3. A Group F-1 fire area used for the repair of commercial trucks or buses where the fire area exceeds 5,000 square feet ([464] 464.5 m²).

903.2.4.3 Group F-1 fire areas. An automatic sprinkler system shall be provided throughout any Group F-1 occupancy fire area where any one of the following conditions exists:

1. The fire area exceeds 7,500 square feet ([697] 696.8 m²).

2. The fire area of any size is located more than three stories above grade.

903.2.5 Group H. Automatic sprinkler systems shall be provided in high-hazard occupancies as required in the New York City Fire Code and Sections 903.2.5.1 through 903.2.5.3 [and the New York City Fire Code] of this code.
903.2.5.1 **General.** An automatic sprinkler system shall be installed in Group H occupancies. An automatic sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group H.

903.2.5.2 **Group H-5 occupancies.** An automatic sprinkler system shall be installed throughout buildings containing Group H-5 occupancies. The design of the sprinkler system shall **not** be less than that required by this code for the occupancy hazard classifications in accordance with Table 903.2.5.2. Where the design area of the sprinkler system consists of a corridor protected by one row of sprinklers, the maximum number of sprinklers required to be calculated is 13.

903.2.5.3 **Pyroxylin plastics.** An automatic sprinkler system shall be provided in buildings, or portions thereof, where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 100 pounds (45.4 kg).

903.2.6 **Group I.** An automatic sprinkler system shall be provided in Group I occupancies. An automatic sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group I.

**[Exception:]** Exceptions:

1. An automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities if located in an I-1 occupancy building or a residential building, provided such building is six stories or less in height.

2. An automatic sprinkler system is not required where Group I-4 day care facilities are at the level of exit discharge and where every room where care is provided has not fewer than one exterior exit door.

3. In buildings where Group I-4 day care is provided on levels other than the level of exit discharge, an automatic sprinkler system in accordance with Section 903.3.1.1 shall be installed on the entire floor where care is provided, all floors between the level of care and the level of exit discharge, and all floors below the level of exit discharge other than areas classified as an open parking garage.
903.2.7 Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. A Group M fire area exceeds 12,000 square feet (1114.8 m²).
2. A Group M fire area is located more than three stories above grade plane.
3. The combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2229.7 m²).
4. A Group M occupancy used for the display and sale of upholstered furniture or mattresses exceeds 5,000 square feet (464.5 m²).

903.2.7.1 High-piled storage. An automatic sprinkler system shall be provided in accordance with the New York City Fire Code in all buildings of Group M where storage of merchandise is in high-piled or rack storage arrays.

903.2.7.2 Group M fire areas. An automatic sprinkler system shall be provided throughout any Group M occupancy fire area where any one of the following conditions exists:

1. The fire area exceeds 7,500 square feet (696.8 m²).
2. The fire area of any size contains an unenclosed stair or escalator connecting two or more floors.

903.2.8 Group R. An automatic sprinkler system shall be installed in Group R fire areas. An automatic sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group R.

Exception: An automatic sprinkler system shall not be required in detached one- and two-family dwellings and multiple single-family dwellings (townhouses), provided that such structures are not more than three stories above grade plane in height and have separate means of egress.

903.2.9 Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where any one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1114.8 m²).
2. The building is greater than 1,000 square feet (92.9 m²) in area and the main use or dominant occupancy is Group S-1.
3. A Group S-1 fire area is located more than three stories above grade plane.
4. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2229.7 m²).
5. A Group S-1 fire area used for the storage of commercial motor vehicles where the fire area exceeds 5,000 square feet (464.5 m²).
6. A Group S-1 occupancy used for the storage of upholstered furniture or mattresses exceeds 2,500 square feet (232.3 m²).

903.2.9.1 Group S-1 fire areas. An automatic sprinkler system shall be provided throughout any Group S-1 occupancy fire area where the fire area exceeds 500 square feet ([46 m²]) (46.5 m²).

903.2.9.2 Bulk storage of tires. Buildings and structures where the area for the storage of tires exceeds 500 square feet ([47 m²]) (46.5 m²) or 7,500 cubic feet ([212 m³]) shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

903.2.9.3 High-piled storage. An automatic sprinkler system shall be provided in accordance with the New York City Fire Code in all buildings or portions thereof in Group S-1 occupancies where the storage of merchandise is in high-piled or rack storage arrays.

903.2.10 Group S-2. An automatic sprinkler system shall be installed throughout buildings greater than 5,000 square feet ([465] 464.5 m²) in area where the main use or dominant occupancy is Group S-2.

903.2.10.1 Commercial parking garages. An automatic sprinkler system shall be provided throughout buildings used for storage of commercial trucks, buses or other commercial motor vehicles where the fire area exceeds 5,000 square feet ([465] 464.5 m²).

903.2.10.2 Group S-2 fire areas. An automatic sprinkler system shall be provided throughout any Group S-2 occupancy fire area greater than 5,000 square feet ([465] 464.5 m²).

903.2.10.3 Parking garages. An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.4 or where an open or enclosed parking garage is located beneath other occupancy groups.

   Exception: Parking garages located beneath Group R-3 occupancies.

903.2.10.4 High-piled storage. An automatic sprinkler system shall be provided in all buildings or portions thereof of Group S-2 occupancies in accordance with the New York City Fire Code.

903.2.11 Specific building areas and hazards. An automatic sprinkler system shall be installed for building design or hazards in the locations set forth in Sections 903.2.11.1 through 903.2.11.13.

903.2.11.1 Above- or below-grade stories. An automatic sprinkler system shall be installed throughout every above- or below-grade story of all buildings where the floor area exceeds 1,500 square feet (139.4 m²) and where [at least] not fewer than one of the following types of exterior wall openings is provided:

   1. Openings below grade that lead directly to ground level by an exterior stairway complying with Section [4009] 1011 or an outside ramp complying with Section
Openings shall be located in each 50 linear feet (15 240 mm), or fraction thereof, of exterior walls facing onto a street, public way or frontage space, in the story on at least one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 50 feet (15 240 mm).

2. Openings entirely above the adjoining ground level totaling at least not less than 20 square feet (1.86 m²) in each 50 linear feet (15 240 mm), or fraction thereof, of exterior walls facing onto a street, public way or frontage space, in the story on at least one side. The required openings shall be distributed such that the lineal distance between adjacent openings does not exceed 50 feet (15 240 mm). The bottom of the clear opening shall not exceed 36 inches (914.4 mm) measured from the floor.

903.2.11.1 Opening dimensions and access. Such openings shall have a minimum dimension of not less than 30 inches (762 mm). Such openings shall be accessible to the Fire Department from the exterior and shall not be obstructed in a manner that firefighting or rescue cannot be accomplished from the exterior.

903.2.11.2 Openings on one side only. Where such openings in a story are provided on only one side and the opposite wall of such story is more than 100 feet (30 480 mm) from such openings, the story shall be equipped throughout with an approved automatic sprinkler system, or openings as specified above shall be provided on not fewer than two sides of the story.

903.2.11.3 Below-grade stories. Where any portion of a below-grade story is located more than 75 feet (22 860 mm) from openings required by Section 903.2.11.1, or where walls, partitions, or other obstructions are installed that restrict the application of water from hose streams, the below-grade story shall be equipped throughout with an approved automatic sprinkler system.

903.2.11.2 Other above-grade stories. An automatic sprinkler system shall be installed throughout every above-grade story of buildings below a height of 100 feet (30 480 mm), other than the first story or ground floor, on which access is not provided directly from the outdoors by at least one window or readily identifiable access panel within each 50 feet (15 240 mm) or fraction thereof of horizontal length of every wall that fronts on a street or frontage space required pursuant to Section 501.3.1.

903.2.11.2.1 Opening dimensions and access. Such windows shall be openable from the inside or breakable from both the inside and the outside, and shall have a size when open of at least 24 inches by 36 inches ([640] 609.6 mm by [914] 914.4 mm). Such panels shall be openable from both the inside and outside and shall have a height when open of 48 inches ([1220] 1220 mm) and a width of at least 32 inches ([813] 812.8 mm). The sill of the window or panel shall not be higher than 36 inches ([914] 914.4 mm) above the inside floor. Where not all of the windows are openable or breakable, the windows intended to satisfy the requirements of this section shall be readily identifiable.

903.2.11.3 Other below-grade stories. An automatic sprinkler system shall be installed throughout every first basement or cellar story below grade of buildings on which access is not provided directly from the outdoors within each 100 feet (30 480 mm) or fraction thereof.
of horizontal length of every wall that fronts on a street or frontage space required pursuant to Section 501.3.1.

Exceptions:

1. One- and two-family dwellings need not provide direct access.

2. Any building classified in Occupancy Group R-2 not more than three stories in height and with not more than two dwelling units on any story need not provide direct access when such first basement or cellar story is used for dwelling units or for uses accessory to the residential use in the building.

3. Except as provided in Exception 2, above, for Group R-1 and R-2 occupancies, only one direct access from the outdoors to the first basement or cellar story consisting of a stair or door shall be required when such story is used for dwelling units or for uses accessory to the residential use in the building.

903.2.11.3.1 Opening dimensions and access. Such access shall be by stairs, doors, windows or other means that provide an opening 48 inches (1219 mm) high and 32 inches (812.8 mm) wide, the sill of which shall not be higher than 36 inches (914.4 mm) above the inside floor. If an areaway is used to provide below grade access, the minimum horizontal dimension shall be at least one-third the depth of the areaway or 6 feet (1828.8 mm), whichever is less.

903.2.11.4 Signs obstructing openings. Where wall signs are erected to cover doors or windows of existing buildings, access panels shall be provided as necessary to comply with the requirements of Section 903.2.11.

903.2.11.5 Compliance with the New York State Multiple Dwelling Law. Nothing in Section 903.2.11 shall be construed so as to supersede any applicable provisions of Section 54 of the New York State Multiple Dwelling Law relating to access to cellars or basements in multiple dwellings.

903.2.11.6 Rubbish and linen chutes. An automatic sprinkler system shall be installed at the top of rubbish and linen chutes, in chute access rooms, and in their terminal rooms. Chutes extending through three or more floors shall have additional sprinkler heads installed within such chutes at alternate floors and at the lowest intake. Where a rubbish chute extends through a building more than one floor below the lowest intake, or through areas with no openings, such an extension shall have sprinklers installed that are recessed from the drop area of the chute and protected from freezing in accordance with Section 903.3.1.1. Such sprinklers shall be installed at alternate floors, beginning with the second level below the last intake and ending with the floor above the discharge. All chute sprinklers shall be accessible for servicing and shall not obstruct the vertical path for rubbish or linens.

903.2.11.7 Buildings [over] 55 feet (16 764 mm) or more in height. An automatic sprinkler system shall be installed throughout buildings that have one or more stories with...
having] an occupant load of 30 or more [that is] located 55 feet (16 764 mm) or more above the lowest level of Fire Department vehicle access, measured to the finished floor.

**Exceptions:**

1. Open parking structures without any other occupancy groups, unless otherwise required.

2. Occupancies in Group F-2, unless required by the New York State Department of Labor.

**903.2.11.8 Ducts conveying hazardous exhausts.** Where required by the *New York City Mechanical Code*, automatic sprinklers shall be provided in ducts conveying hazardous exhaust[,] or flammable or combustible materials.

**Exception:** Ducts [in which] where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).

**903.2.11.9 Commercial cooking operations.** An automatic sprinkler system shall not be installed in a commercial kitchen exhaust hood and duct system. Fire-extinguishing systems shall be installed in commercial cooking systems in accordance with this code and the *New York City Fire Code*.

**903.2.11.10 Other buildings, occupancies and areas.** In addition to the requirements of Section 903.2, the provisions indicated in Table 903.2.11.10 also require the installation of a suppression system for certain buildings and areas. Suppression systems shall also be required as provided for in other sections of this code, the *New York City Fuel Gas Code*, and the *New York City Mechanical Code*.

903.2.11.11 Steel-plated and vault-like occupancies. An automatic sprinkler system shall be installed throughout all steel-plated or similarly reinforced or secured vault-like occupancies regardless of area.

903.2.11.12 Refuse collection and disposal areas. An automatic sprinkler system shall be installed throughout all areas used for the storage and sorting of refuse and recyclables.

903.2.11.13 Laundry drying areas. An automatic sprinkler system shall be installed in spaces in which two or more clothes drying machines are installed. Sprinkler heads shall be spaced to cover the areas 5 feet (1524 mm) on all sides of the drying machines.

903.2.12 During construction. Automatic sprinkler systems required during construction, alteration and demolition operations shall be provided in accordance with [Chapter 33 and] the New York City Fire Code and Chapter 33 of this code.

903.2.13 Type IV construction with cross-laminated timber (CLT) or structural composite lumber (SCL). Automatic sprinkler systems in accordance with NFPA 13 shall be required throughout buildings utilizing Type IV construction with CLT or SCL as follows:
1. In all occupancies where the building is more than three stories above grade plane.

2. In Group B occupancies, where a floor exceeds 28,500 square feet (2647.7 m²).

903.3 Installation requirements. Automatic sprinkler systems shall be designed and installed in accordance with Sections 903.3.1 through 903.3.6.

903.3.1 Standards. Sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.

903.3.1.1 NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 [as modified in Appendix Q] except as provided in Section 903.3.1.1.1 and 903.2 of this code.

903.3.1.1 Exempt locations protected by other means. When approved by the Fire Department, automatic sprinklers shall not be required in the following:

1. In rooms or areas protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion, and an alternative automatic fire-extinguishing system in accordance with this code and the New York City Fire Code. Sprinklers shall not be omitted from any room merely because it is of fire-resistance-rated construction or contains electrical equipment. This exemption shall not apply to a generator or transformer room unless, in addition to the above requirements, such room is separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours, and the generator in such room shall not use high pressure flammable gas in excess of 15 psig ([403] 103.4 kPa gauge).

2. Machine rooms, machinery spaces, control rooms and control spaces associated with occupant evacuation elevators designed in accordance with Section 3008.

903.3.1.2 NFPA 13R sprinkler systems. Where allowed in buildings of Group R, up to and including six stories in height, automatic sprinkler systems shall be installed throughout in accordance with NFPA 13R [as modified in Appendix Q].

The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 shall be measured from the horizontal assembly creating separate buildings.

903.3.1.2.1 Balconies and decks. Sprinkler protection shall be provided for exterior balconies, decks and ground-floor patios of dwelling units where the building is of Type V construction and automatic sprinkler protection is required for the Group R occupancy. Side wall sprinklers that are used to protect such areas shall be permitted to be located such that their deflectors are within 1 inch ([25] 25.4 mm) to 6 inches ([152] 152.4 mm) below the structural members, and a maximum distance of 14 inches ([356] 355.6 mm)
below the deck of the exterior balconies and decks that are constructed of open wood joist construction.

**903.3.1.2** **Open-ended corridors.** Sprinkler protection and freeze protection shall be provided in open-ended corridors and associated exterior stairways and ramps as specified in Section 1027.6, Exception 3.

**903.3.1.3** **NFPA 13D sprinkler systems.** Where allowed, automatic sprinkler systems in one- and two-family dwellings and townhouses, up to and including six stories in height, shall be installed throughout in accordance with NFPA 13D [as modified].

**903.3.2** **Quick-response and residential sprinklers.** Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in all of the following areas in accordance with Section 903.3.1 and their listings:

1. Throughout all spaces within a smoke compartment containing [patient dwelling] care recipient sleeping units in Group I-2 in accordance with this code.

2. Throughout all spaces within a smoke compartment containing treatment rooms in ambulatory care facilities.

[2.] 3. Dwelling units and sleeping units in Group [R and] I-1 and R occupancies.

**903.3.3** **Obstructed locations.** Automatic sprinklers shall be installed with due regard to obstructions that will delay activation or obstruct the water distribution pattern. Automatic sprinklers shall be installed in or under covered kiosks, displays, booths, concession stands, or equipment that exceeds 4 feet (1219 mm) in width. Not less than a 3-foot (914 mm) clearance shall be maintained between automatic sprinklers and the top of piles of combustible fibers.

Exception: Kitchen equipment under exhaust hoods protected with a fire-extinguishing system in accordance with this code and the New York City Fire Code.

**903.3.4** **Actuation.** Automatic sprinkler systems shall be automatically actuated unless [otherwise] specifically provided for in this code.

**903.3.5** **Water supplies.** Water supplies for automatic sprinkler systems shall comply with this section and the standards referenced in Section 903.3.1. The potable water supply shall be protected against back flow in accordance with the requirements of this section, the New York City Plumbing Code, and Rules of the New York City Department of Environmental Protection.

**903.3.5.1** **Domestic services.** Where the domestic service provides the water supply for the automatic sprinkler system, the supply shall be in accordance with NFPA 13, 13R and 13D.

**903.3.5.1.1** **Limited area sprinkler systems.** Limited area sprinkler systems serving fewer than 20 sprinklers on any single connection are permitted to be connected to the
domestic service where a wet automatic standpipe is not available. Limited area sprinkler systems connected to domestic water supplies shall comply with NFPA 13.]

[The domestic service shall be capable of supplying the simultaneous domestic demand and the sprinkler demand required to be hydraulically calculated by NFPA 13, NFPA 13R or NFPA 13D.]

[903.3.5.1.2] Residential combination services. A single combination water supply shall be permitted in accordance with NFPA 13R.

903.3.5.2 Secondary on-site water supply. [A secondary on-site water supply equal to the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high rise buildings in Seismic Design Category C or D as determined by this code, and in any high rise building with occupied floors located more than 300 feet (91 440 mm) above the lowest level of Fire Department vehicle access. The secondary water supply shall have a duration not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.] A secondary on-site water supply for high-rise buildings shall be provided in accordance with Section 403.3.3.

903.3.6 Hose threads. Fire hose threads and fittings used in connection with automatic sprinkler systems shall be approved and compatible with Fire Department hose threads.

903.3.7 Fire Department connections. The location of Fire Department connections for automatic sprinkler systems shall be installed in accordance with Sections 905 and 912.

903.3.8 Limited area sprinkler systems. Limited area sprinkler systems shall be in accordance with the standards listed in Section 903.3.1 except as provided in Sections 903.3.8.1 through 903.3.8.5.

903.3.8.1 Number of sprinklers. Limited area sprinkler systems shall not exceed six sprinklers in any single fire area.

903.3.8.2 Occupancy hazard classification. Only areas classified by NFPA 13 as Light Hazard or Ordinary Hazard Group 1 shall be permitted to be protected by limited area sprinkler systems.

903.3.8.3 Piping arrangement. Where a limited area sprinkler system is installed in a building with an automatic wet standpipe system, sprinklers shall be supplied by the standpipe system. Where a limited area sprinkler system is installed in a building without an automatic wet standpipe system, water shall be permitted to be supplied by the plumbing system provided that the plumbing system is capable of simultaneously supplying domestic and sprinkler demands.

903.3.8.4 Supervision. Control valves shall not be installed between the water supply and sprinklers unless the valves are of an approved indicating type that are supervised or secured in the open position.
**903.3.8.5 Calculations.** Hydraulic calculations in accordance with NFPA 13 shall be provided to demonstrate that the available water flow and pressure are adequate to supply all sprinklers installed in any single fire area with discharge densities corresponding to the hazard classification.

**903.4 Sprinkler system supervision and alarms.** [All valves] Valves controlling the water supply for automatic sprinkler systems, pumps, tanks, water levels and temperatures, critical air pressures and water-flow switches on all sprinkler systems shall be electrically supervised by the fire alarm system where [a] such fire alarm system is required by Section 907.

**Exceptions:**

1. Automatic sprinkler systems protecting one- and two-family dwellings.
2. Limited area sprinkler systems in accordance with Section 903.3.8.
3. Automatic sprinkler systems installed in accordance with NFPA 13R where a common supply main is used to supply both domestic water and the automatic sprinkler systems and a separate shutoff valve for the automatic sprinkler system is not provided.
4. Jockey pump control valves that are sealed or locked in the open position.
5. Control valves to commercial kitchen hoods, paint spray booths or dip tanks that are sealed or locked in the open position.
6. Valves controlling the fuel supply to fire pump engines that are sealed or locked in the open position.
7. Trim valves to pressure switches in dry, preaction and deluge sprinkler systems that are sealed or locked in the open position.

**903.4.1 Signals and monitoring.** Alarm, supervisory and trouble signals shall be distinctly different and shall be automatically transmitted to a central supervising station or when approved by the Fire Department, shall sound an audible signal at a constantly attended location.

**Exceptions:**

1. Underground key or hub valves in roadway boxes provided by the city or a public utility are not required to be monitored.
2. [Backflow] Backflow prevention device test valves, located in limited area sprinkler system supply piping, shall be locked in the open position. In occupancies required to be equipped with a fire alarm system, the backflow preventer valves shall be electrically supervised by a tamper switch installed in accordance with NFPA 72 and separately annunciated.

**903.4.2 Alarms.** [Approved] An approved audible device, located on the exterior of the building in an approved location, shall be connected to every automatic sprinkler system. Such sprinkler water-flow alarm devices shall be activated by water flow equivalent to the flow
of a single sprinkler of the smallest orifice size installed in the system. Alarm devices shall be provided on the exterior of the building in an approved location or in a location approved by the Fire Department, except in buildings equipped with a fire alarm system. Where a fire alarm system is installed, actuation of the automatic sprinkler system shall actuate the building fire alarm system.

903.4.3 Floor control valves. Approved supervised indicating control valves shall be provided at the point of connection to the riser on each floor in high-rise buildings.

903.5 Testing and maintenance. Sprinkler systems shall be tested and maintained in accordance with the New York City Fire Code.

[903.6 Painting of dedicated sprinkler piping and valve handles. Dedicated sprinkler piping shall be painted and such painting certified in accordance with Sections 903.6.1 through 903.6.5. In addition to painting, sprinkler piping may also be identified by lettered legend in accordance with ANSI A13.1. Where the piping is required to be listed and labeled, such painting shall not obscure such labeling.

1. Attachments, gauges, valves and operable parts of sprinkler systems other than valve handles.

2. Horizontal branch lines.

3. Where different color coding may be required by Section 3406 of the New York City Fire Code for facilities storing, handling, and using flammable and combustible liquids in connection with special operations.]

903.6 Painting of dedicated sprinkler piping and valve handles. Dedicated sprinkler piping shall be painted and such painting certified in accordance with Sections 903.6.1 through 903.6.5 of this code. In addition to painting, sprinkler piping may also be identified by lettered legend in accordance with ANSI A13.1. Where the piping is required to be listed and labeled, such painting shall not obscure such labeling.

Exceptions:

1. Attachments, gauges, valves and operable parts of sprinkler systems other than valve handles.

2. Horizontal branch lines.

3. Where different color coding may be required by Section 3406 of the New York City Fire Code for facilities storing, handling, and using flammable and combustible liquids in connection with special operations.

903.6.1 New buildings. Cross connections and risers in new buildings, including buildings constructed pursuant to Section 28-101.4.2 of the Administrative Code, shall be painted red and the handles of valves serving dedicated sprinklers shall be painted green prior to the hydrostatic pressure test regardless of whether they will be enclosed at a later point in time.
Exception: Where a standpipe system is used as a combination standpipe and sprinkler system, the sprinkler risers and cross connections that are also used for the standpipe system shall be painted red and the handles of valves serving such combination system shall be painted yellow.

903.6.2 Alterations. Cross connections and risers for independent (stand-alone) existing sprinkler systems that are exposed during alterations, including alterations pursuant to Section 28-101.4.2 of the Administrative Code, shall be painted red and the handles of valves serving such existing sprinkler systems shall be painted green. Where the alteration requires a hydrostatic pressure test such painting shall be completed prior to such test.

Exception: Where a standpipe system is used as a combination standpipe and sprinkler system, the sprinkler risers and cross connections that are also used for the standpipe system shall be painted red and the handles of valves serving such combination system shall be painted yellow.

903.6.3 Retroactive requirement for completed buildings. Notwithstanding any other provision of law, all exposed risers and cross connections of completed buildings in existence on March 2, 2010, shall be painted red by June 2, 2010, and all handles of valves serving such sprinkler system shall be painted green.

Exception: Where a standpipe system is used as a combination standpipe and sprinkler system, the sprinkler risers and cross connections that are also used for the standpipe system shall be painted red and the handles of valves serving such combination system shall be painted yellow.

903.6.4 Buildings under construction on March 2, 2010. Notwithstanding any other provision of law, where construction documents were approved and permits issued for the construction of a new building or alteration of an existing building prior to March 2, 2010, and the work is not signed off by the department prior to such date, all exposed cross connections and risers in any such building shall be painted red prior to the hydrostatic pressure test, including cross connections and risers that will be enclosed at a later point in time, and handles of valves serving such sprinkler system shall be painted green.

Exceptions:

1. Where a standpipe system is used as a combination standpipe and sprinkler system, the sprinkler risers and cross connections that are also used for the standpipe system shall be painted red and the handles of valves serving such combination system shall be painted yellow.

2. Cross connections and risers enclosed prior to March 2, 2010, need not be painted.

903.6.5 Certification of completion of system painting. For all buildings where sprinkler and combination sprinkler and standpipe systems are not subject to a special inspection pursuant to Section [4704.23] 1705.2.9 of this code, a licensed master plumber, licensed master fire suppression piping contractor, registered design professional or an individual holding an appropriate certificate of fitness from the Fire Department for the operation and/or maintenance
of such system shall certify on forms provided by the department that all required painting has been completed in accordance with Section 903.6. Such certification shall be maintained on the premises and made available for inspection by the department and the Fire Department.

SECTION BC 904
ALTERNATIVE AUTOMATIC
FIRE-EXTINGUISHING SYSTEMS

904.1 General. Automatic fire-extinguishing systems, other than automatic sprinkler systems, shall be designed, installed, inspected, tested and maintained in accordance with the provisions of this section, the New York City Fire Code, and the applicable referenced standards.

904.1.1 Construction documents. Construction documents for alternative automatic fire-extinguishing systems shall be approved by the Fire Department and shall contain plans that include at least the following data and information:

1. Commercial kitchen suppression systems:

   1.1. Location of all surface, plenum and duct nozzles; surface dimensions and location of all cooking appliances; the location of automatic fuel shutoff and statement as to type (gas or electric); location and distance of the remote control or manual pull station;

   1.2. Identification of the grease filters to be used in any kitchen hood; the dimensions of all hoods and all related ducts, including termination of duct at the exterior of the building;

   1.3. Identification of the fire suppression piping system; the make and model of the system; the type of extinguishing agent and number and size of agent containers; size, length, and type of all piping that will be used; the number and location of all fusible links or detectors and the temperature setting; any surface, plenum and duct nozzles.

2. For extinguishing agent systems, the plan should also include type and concentration of the extinguishing agent, the method of providing power supply to smoke or heat detectors, fire rating of partitions, location of all audible/visible alarms within and outside the location involved and the details of construction of the room to contain the extinguishing agent. If the area is not sprinklered, the following information is required:

   2.1. The size and location of the reserve supply, and

   2.2 Information as to why it has been determined that water is not effective as an extinguishing agent for the fire hazard in such location.

3. The plans must note whether the proposed system is connected to the building’s fire alarm system.

Exception: For that portion of a fire suppression piping system within an approved preengineered system, a schematic isometric diagram shall be acceptable in lieu of full
904.2 Where required. Automatic fire-extinguishing systems installed as an alternative to the required automatic sprinkler systems of Section 903 shall be approved by the Fire Department. Automatic fire-extinguishing systems shall not be considered alternatives for the purposes of exceptions or reductions allowed by other requirements of this code.

904.2.1 Hood system suppression. Each required commercial kitchen exhaust hood and duct system required by Chapter 5 of the New York City Mechanical Code to have a Type I hood shall be protected with an automatic fire-extinguishing system installed in accordance with this code and the New York City Fire Code.

904.3 Installation. Automatic fire-extinguishing systems shall be installed in accordance with this section.

904.3.1 Electrical wiring. Electrical wiring shall be in accordance with the New York City Electrical Code.

904.3.2 Actuation. Automatic fire-extinguishing systems shall be automatically actuated and provided with a manual means of actuation in accordance with Section [904.41.1] 904.12.1. Where more than one hazard could be simultaneously involved in fire due to their proximity, all hazards shall be protected by a single system designed to protect all hazards that could become involved.

Exception: Multiple systems shall be permitted to be installed if they are designed to operate simultaneously.

904.3.3 System interlocking. Automatic equipment interlocks with fuel shutoffs, ventilation controls, door closers, window shutters, conveyor openings, smoke and heat vents and other features necessary for proper operation of the fire-extinguishing system shall be provided as required by the design and installation standard utilized for the hazard.

904.3.4 Alarms and warning signs. Where alarms are required to indicate the operation of automatic fire-extinguishing systems, distinctive audible and visible alarms and warning signs shall be provided to warn of pending agent discharge. Where exposure to automatic-extinguishing agents poses a hazard to persons and a delay is required to ensure the evacuation of occupants before agent discharge, a separate warning signal shall be provided to alert occupants once agent discharge has begun. Audible signals shall be in accordance with Section [907.5.2.4] 907.5.2.

904.3.5 Monitoring. Where a fire alarm system is installed, automatic fire-extinguishing systems shall be monitored by the fire alarm system in accordance with NFPA 72.

904.4 Inspection and testing. Automatic fire-extinguishing systems shall be inspected and tested in accordance with the provisions of this section and the New York City Fire Code prior to acceptance.

904.4.1 Inspection. Prior to conducting final acceptance tests, all of the following items shall be inspected:
1. Hazard specification for consistency with design hazard.

2. Type, location and spacing of automatic- and manual initiating devices.

3. Size, placement and position of nozzles or discharge orifices.

4. Location and identification of audible and visible alarm devices.

5. Identification of devices with proper designations.

6. Operating instructions.

904.4.2 Alarm testing. Notification appliances, connections to fire alarm systems and connections to central supervising stations shall be tested in accordance with this section and Section 907 to verify proper operation.

904.4.2.1 Audible and visible signals. The audibility and visibility of notification appliances signaling agent discharge or system operation, where required, shall be verified.

904.4.3 Monitor testing. Connections to protected premises and supervising station fire alarm systems shall be tested to verify proper identification and retransmission of alarms from automatic fire-extinguishing systems.

904.5 Wet-chemical systems. Wet-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.

904.6 Dry-chemical systems. Dry-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with New York City Fire Code. New dry-chemical extinguishing systems are not permitted for the protection of kitchen equipment.

904.7 Foam systems. Foam-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.

904.8 Carbon dioxide systems. Carbon dioxide extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.

904.9 Halon systems. Halogenated extinguishing systems shall not be permitted. However, existing systems shall be maintained, periodically inspected and tested in accordance with the New York City Fire Code.

904.10 Clean-agent systems. Clean-agent fire-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.

904.11 Automatic water mist systems. Automatic water mist systems shall be permitted in applications that are consistent with the applicable listing or approvals and shall comply with Sections 904.11.1 through 904.11.3.

904.11.1 Design and installation requirements. Automatic water mist systems shall be designed and installed in accordance with Sections 904.11.1.1 through 904.11.1.4.
904.11.1 General. Automatic water mist systems shall be designed and installed in accordance with the manufacturer’s instructions and the New York City Fire Code.

904.11.2 Actuation. Automatic water mist systems shall be automatically actuated.

904.11.3 Water supply protection. Connections to a potable water supply shall be protected against backflow in accordance with the New York City Plumbing Code.

904.11.4 Secondary water supply. Where a secondary water supply is required for an automatic sprinkler system, an automatic water mist system shall be provided with an approved secondary water supply in accordance with the New York City Fire Code.

904.11.2 Water mist system supervision and alarms. Supervision and alarms shall be provided as required for automatic sprinkler systems in accordance with Section 903.4.

904.11.2.1 Monitoring. Monitoring shall be provided as required for automatic sprinkler systems in accordance with Section 903.4.1.

904.11.2.2 Alarms. Alarms shall be provided as required for automatic sprinkler systems in accordance with Section 903.4.2.

904.11.2.3 Floor control valves. Floor control valves shall be provided as required for automatic sprinkler systems in accordance with Section 903.4.3.

904.11.3 Testing, operation and maintenance. Automatic water mist systems shall be tested, operated and maintained in accordance with the New York City Fire Code.

904.12 Commercial cooking systems. The automatic fire-extinguishing system for commercial cooking systems shall be of a type recognized for protection of commercial cooking equipment and exhaust systems of the type and arrangement protected. Pre-engineered automatic wet-chemical extinguishing systems shall be approved by the Fire Commissioner, tested in accordance with UL 300, and listed and labeled for the intended application. The protected area shall include the area under the hood and over the cooking equipment, the area above or behind the filters and the opening of the hood into the branch duct. Where a preengineered system is installed and the size of the protected area exceeds that allowed for a single preengineered system, additional preengineered systems arranged for simultaneous operation shall be provided. Other types of automatic fire-extinguishing systems shall be listed and labeled for specific use as protection for commercial cooking operations. The system shall be installed in accordance with this code, its listing and the manufacturer’s installation instructions. [Automatic] Only automatic fire-extinguishing systems of the following types shall be installed in accordance with the New York City Fire Code and the referenced standard indicated, as shown:

1. [Carbon dioxide extinguishing systems, in accordance with the New York City Fire Code.] Foam water sprinkler system or foam water spray systems.

2. Wet-chemical extinguishing systems [in accordance with the New York City Fire Code].
Automatic sprinkler systems, dry-chemical fire-extinguishing systems, and carbon dioxide fire-extinguishing systems shall not be installed to protect commercial cooking equipment and exhaust systems.

904.12.1 Manual system operation. A manual actuation device shall be located at or near a means of egress from the cooking areas, a minimum of 10 feet (3048 mm) and not more than 20 feet (6096 mm) from the kitchen exhaust system. The manual actuation device shall be installed not more than 48 inches (1200 mm) or less than 42 inches (1067 mm) above the finished floor and shall clearly identify the hazard protected. The manual actuation device shall require a maximum force of 40 pounds (178 N) and a maximum movement of 14 inches (355.6 mm) to actuate the fire suppression system.

Exception: Automatic sprinkler systems shall not be required to be equipped with manual actuation means.

904.12.2 System interconnection. The actuation of the fire suppression system shall automatically shut down the fuel or electrical power supply to the cooking equipment. The fuel and electrical supply reset shall be manual.

904.11.3 Carbon dioxide systems. When carbon dioxide systems are used, there shall be a nozzle at the top of the ventilating duct. Additional nozzles that are symmetrically arranged to give uniform distribution shall be installed within vertical ducts exceeding 20 feet (6096 mm) and horizontal ducts exceeding 50 feet (15 240 mm). Dampers shall be installed at either the top or the bottom of the duct and shall be arranged to operate automatically upon activation of the fire-extinguishing system. Where the damper is installed at the top of the duct, the top nozzle shall be immediately below the damper. Automatic carbon dioxide fire-extinguishing systems shall be sufficiently sized to protect against all hazards venting through a common duct simultaneously.

904.13 Domestic cooking systems in Group I-2. In Group I-2 occupancies where cooking facilities are installed in accordance with Section 407.2.6 of this code, the domestic cooking hood provided over the cooktop or range shall be equipped with an automatic fire-extinguishing system of a type recognized for protection of domestic cooking equipment. Preengineered automatic extinguishing systems shall be tested in accordance with UL 300A and listed and labeled for the intended application. The system shall be installed in accordance with this code, its listing and the manufacturer’s instructions.

904.13.1 Manual system operation and interconnection. Manual actuation and system interconnection for the hood suppression system shall be installed in accordance with Sections 904.12.1 and 904.12.2, respectively.
904.13.2 Portable fire extinguishers for domestic cooking equipment in Group I-2. A portable fire extinguisher complying with Section 906 shall be installed within a 30-foot (9144 mm) distance of travel from domestic cooking appliances.

SECTION BC 905
STANDPIPE SYSTEMS

905.1 General. Standpipe systems shall be provided in buildings and structures in accordance with this section. Fire hose threads used in connection with standpipe systems shall be approved by the Fire Commissioner. Standpipe systems in buildings used for high-piled combustible storage shall be in accordance with the New York City Fire Code. Installation of standpipe systems shall comply with the special inspection requirements of Chapter 17 of this code.

Any space or room that contains equipment of such nature that the use of water would be ineffective in fighting a fire therein, or would be otherwise hazardous, shall have a conspicuous sign on each door opening on such space or room stating the nature of the use and the warning: “IN CASE OF FIRE, USE NO WATER.”

905.1.1 Construction documents. Construction documents for standpipe systems shall contain plans that include, at least a minimum, the following data and information:

1. The locations and sizes of all risers, cross-connections, hose racks, valves, Department connections, sources of water supply, piping, and other essential features of the system;

2. A floor plan for each group of floors that have typical riser locations and no special features within such group of floor levels, with the indication in title block of such plan indicating clearly the floors to which the arrangement is applicable;

3. A riser diagram showing the essential features of the system, including the risers, cross-connections, valves, Fire Department connections, tanks, pumps, sources of water supply, pipe sizes, capacities, floor heights, zone pressures, and other essential data and features of the system; [and]

4. The available water pressure at the top and bottom floors of each zone, and at each floor where the [weight pipe fittings change] pressure rating of piping, fittings, couplings, and valves are required to change, shall be shown on the riser diagram; and

5. For street pressure-fed systems and fire pumps, a statement from the New York City Department of Environmental Protection, giving the minimum water pressure in the main serving the building.

905.2 Installation standards. Standpipe systems shall be installed in accordance with this section and NFPA 14[as modified in Appendix Q].
905.3 Required installations. Standpipe systems shall be installed where required by Sections 905.3.1 through 905.3.6 and in the locations indicated in Sections 905.4, 905.5 and 905.6. Standpipe systems are allowed to be combined with automatic sprinkler systems.

Exception: Standpipe systems are not required in buildings occupied entirely by Group R-3.

905.3.1 Applicability. Class III standpipe systems shall be installed throughout the following buildings:

1. In buildings two stories or more in height with floor area of 10,000 square feet (929 m²) or greater on any story;

2. In buildings three stories or more in height with floor area of 7,500 square feet (696.8 m²) or greater on any story;

3. In buildings of any area with a floor level having an occupant load of 30 or more that is located 55 feet (16 764 mm) or more above the lowest level of Fire Department vehicle access; and

4. In buildings of any area, constructed in accordance with Section 403, with occupied floors located 75 feet (22 860 mm) or more above the lowest level of Fire Department vehicle access.

Exceptions: The following exceptions are allowed as an alternative to the requirement of a Class III standpipe system:

1. Class I standpipes are allowed in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 provided that the following additional requirements are met:

   1.1. A locked noncombustible storage cabinet shall be provided on the main entrance floor. One additional locked storage cabinet shall be provided on every tenth floor above the main entrance floor, such that no occupant on any floor would have to travel more than five floors to reach a cabinet in a location within 15 feet (4572 mm) of each standpipe riser. Where one standpipe riser is installed in the building, such cabinet shall contain at least one fog nozzle, one [4 1/2-inch (38.1 mm)] spanner wrench, one [2 1/2-inch (63.5 mm)] spanner wrench, one [2 1/2-inch (64 mm)] by [1 1/2-inch (38 mm)] nonswivel reducing coupling, and 125 feet (38.1 m) of [1 1/2-inch (38.1 mm)] hose. [Where two or more standpipe risers are installed in the building, at least two of each of the above items of equipment shall be provided. However, the hose may be omitted when serving Group R–2 occupancies.]

   1.1.1. The cabinet shall be kept locked, openable by a Fire Department citywide standard key.
1.1.2. The cabinet shall be labeled, “FOR FIRE DEPARTMENT ONLY.”

1.1.3. A metal sign stating clearly where the storage cabinet is located shall be placed in each stair enclosure on the main entrance floor and on each floor where the cabinet is located.

1.2. Hose valves are capped with a hose valve cap fastened to the valve with a chain.

2. Class I manual standpipes are allowed in open parking garages where the highest floor is located not more than 150 feet (45 720 mm) above the lowest level of Fire Department vehicle access.

3. Class I manual dry standpipes are allowed in open parking garages that are subject to freezing temperatures, provided that the hose connections are located as required for Class [I][II][III] standpipes in accordance with Section [905.5] 905.6.

4. Class I standpipes are allowed in below-grade stories equipped throughout with an automatic sprinkler system.

5. Standpipe outlets may be omitted in portions of first floors or basements that are completely separated from the entrance hall or enclosed stairways leading to the upper floors, provided that portable fire extinguishers are installed, subject to the approval of the [fire commissioner] Fire Commissioner.

905.3.2 Group A. Class I automatic wet standpipes shall be provided in nonsprinklered Group A buildings having an occupant load exceeding 1,000 persons.

Exceptions:

1. Open-air-seating spaces without enclosed spaces.

2. Class I automatic dry and semiautomatic dry standpipes or manual wet standpipes are allowed in buildings where the highest floor surface used for human occupancy is not more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access. Dry standpipes are permitted only where subject to freezing temperatures.

905.3.3 Covered mall buildings. Covered mall buildings and buildings connected thereto shall be equipped throughout with a Class I automatic wet standpipe system, except as permitted by Sections 905.3.3.1 through 905.3.3.3.

905.3.3.1 Covered-mall building height. Covered-mall buildings where the highest occupied floor level is located not more than 30 feet (9144 mm) above the lowest level of the Fire Department vehicle access shall be permitted to be provided with Class I hose connections connected to the mall sprinkler system in accordance with Section 8.17.5.2 of
NFPA 13 regarding hose connections for Fire Department use and under the following conditions:

1. Any individual outlet shall be capable of delivering water flow at a rate of 250 gallons per minute ([946] 946.4 L/m) while concurrently supplying the mall sprinkler demand; and

2. Each of the two most hydraulically remote outlets shall be capable of concurrently delivering 250 gallons per minute ([946] 946.4 L/m) at a pressure of 100 pounds per square inch (689.4 kPa) with no mall sprinkler demand, based on a supply pressure at the system Fire Department connection of not more than 175 pounds per square inch ([1207] 1206.6 kPa). Adequacy of the water supply available to the Fire Department [to meet the hydraulic calculations] shall be demonstrated through hydraulic calculations provided by the registered design professional.

905.3.3.2 Location of hose connections. Hose connections shall be provided in accordance with Section 905.4 and at each of the following locations:

1. Within the mall at the entrance to each exit passageway or exit.

2. At each floor-level landing within [enclosed stairways] interior exit stairways opening directly on the mall.

3. At exterior public entrances to the mall of a covered mall building.

4. At public entrances at the perimeter line of an open mall building.

5. At other locations as necessary so that the distance to reach all portions of a tenant space does not exceed 150 feet (45 720 mm) from a hose connection.

905.3.3.3 Installation standard. Except as provided in Sections 905.3.3.1 and 905.3.3.2, the Class I hose connections and Fire Department connections shall be designed in conformance with NFPA 14.

905.3.4 Stages. Stages greater than 1,000 square feet in area ([93] 92.9 m²) or any assembly occupancy [with a stage and] having an occupant load of 1,000 or [greater] more with a stage of any size, shall be equipped with a Class III wet standpipe system with [1½ inch and 2½ inch (38 mm and 64 mm)] a hose [connections] station on each side of the stage. Such hose stations shall comply with Section 905.6 and shall have sufficient hose to provide protection for the entire stage area from either standpipe location. The exceptions allowed under Section 905.3.1 shall not apply to these hose stations.

905.3.5 Underground buildings. Underground buildings shall be equipped throughout with a Class I automatic wet or manual wet standpipe system.
905.3.6 Helistops and heliports. Buildings with a helistop or heliport that are equipped with a standpipe shall extend the standpipe to the roof level on which the helistop or heliport is located in accordance with the New York City Fire Code. All portions of the helistop and heliport area shall be within 150 feet (45 720 mm) of a 2½-inch ([64] 63.5 mm) outlet on a Class I or III standpipe, in accordance with the New York City Fire Code.

905.3.7 Marinas and boatyards. Standpipes in marine terminals, piers, wharves, marinas and boatyards shall comply with the New York City Fire Code or other requirements of the Fire Department.

905.3.8 Rooftop gardens, landscaped roofs and green roofs. Buildings with a rooftop garden, landscaped roof, green roof, or roof used for any purpose other than weather protection or maintenance that are equipped with a standpipe system shall extend the standpipe system to the roof level on which the rooftop garden, landscaped roof, green roof, or roof used for any purpose other than weather protection or maintenance is located.

905.3.9 High-piled stock or rack storage. Where exit passageways are required in accordance with Chapter 10 of this code, a standpipe system shall be provided in accordance with the New York City Fire Code in all buildings containing high-piled stock or rack storage.

905.4 Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required stairway, a hose connection shall be provided for each floor level above or below grade. Hose connections shall be readily accessible and located at the riser on each floor-level landing and on the entrance floor above the standpipe riser control valve. Nonrequired enclosed stairways that do not serve as a means of egress are not required to have hose connections. Stairways without hose connections shall have a sign on the door to the stairway stating, “No standpipe connections in stairway”.

2. On each side of the wall adjacent to the exit opening of a horizontal exit.

   Exception: Where floor areas adjacent to a horizontal exit are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the horizontal exit.

3. In every exit passageway at the entrance from the exit passageway to the other areas of a building.

   Exception: Where floor areas adjacent to an exit passageway are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30 480 mm) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.

4. In covered mall buildings, in accordance with Section 905.3.3.2.

5. Where the roof has a slope of less than four units vertical in 12 units horizontal (33.3-percent slope), each standpipe shall be provided with a hose connection located either on the roof or
at the highest landing of stairways with stair access to the roof. An additional hose connection shall be provided at the top of the most hydraulically remote standpipe for testing purposes. This additional hose connection shall not be required when a roof manifold is installed in accordance with NFPA 14.

6. Where the most remote portion of a floor or story is more than 150 feet (45 720 mm) from a hose connection, additional hose connections shall be provided in approved locations. For the purposes of this section, a penthouse with an occupant load greater than 10 shall be considered a story.

7. In any staircase where the change in elevation between floor landings is more than 25 feet (7620 mm), in addition to the hose connections required by Item 1, a hose connection shall be installed at the first intermediate stair landing below the higher floor level.

905.4.1 Protection. Risers and laterals of Class I standpipe systems not located within an enclosed stairway or pressurized enclosure shall be protected by a degree of fire resistance equal to that required for vertical enclosures in the building in which they are located. No standpipe riser shall be placed in any shaft containing a gas or fuel pipeline.

Exception: In buildings equipped throughout with an approved automatic sprinkler system, laterals that are not located within an enclosed stairway or pressurized enclosure are not required to be enclosed in fire resistance rated construction.

905.4.2 Interconnection. In buildings where more than one standpipe is provided, the standpipes shall be interconnected in accordance with NFPA 14.

905.5 Location of Class II standpipe hose connections. Class II standpipe hose connections shall be [accessible and located in accordance with Section 905.3.4] prohibited.

905.5.1 Reserved.

[905.5.2 Protection. Fire resistance rated protection of risers and laterals of Class II standpipe systems is not required.]

905.6 Location of Class III standpipe hose connections. Class III standpipe systems shall have 2½-inch (63.5 mm) hose connections located as required for Class I standpipes in Section 905.4 and shall have Class II hose connections as required in Section 905.5. At each hose connection, there shall be a hose station. The hose stations shall be equipped with a minimum of 125 feet (38 100 mm) but not more than a maximum of 150 feet (45 720 mm) of 1½-inch (38.1 mm) fire hose connected to an adjustable fog nozzle. The hose shall be attached to the 2½-inch (63.5 mm) hose connection by a 2½-inch (63.5 mm) by 1½-inch (38.1 mm) non-swivel reducing coupling. The hose shall be mounted on a rack and may be located in a cabinet, in accordance with Section 905.7. A pressure restricting device shall be installed when required by NFPA 14. Such pressure restricting device and reducing coupling shall be installed in such a manner that they are readily removable by the Fire Department.

905.6.1 Protection. Risers and laterals of Class III standpipe systems shall be protected as required for Class I systems in accordance with Section 905.4.1.
905.6.2 Interconnection. In buildings where more than one standpipe is provided, the standpipes shall be interconnected in accordance with NFPA 14.

905.7 Cabinets. Cabinets containing firefighting equipment such as standpipes, fire hoses, fire extinguishers or Fire Department valves shall not be blocked from use or obscured from view.

905.7.1 Cabinet equipment identification. Cabinets shall be identified in an approved manner by a permanently attached sign with white letters not less than 2 inches (51 mm) high and a red background color, indicating the equipment contained therein.

[Exception:] Exceptions:

1. Doors not large enough to accommodate a written sign with 2-inch lettering shall be marked with a permanently attached pictogram indicating the equipment contained therein, in addition to corresponding smaller white lettering on a red background adjacent to such pictogram.

2. Doors that have either an approved visual identification clear glass panel or a complete glass door panel are not required to be marked.

905.7.2 Locking cabinet doors. Cabinets shall be unlocked.

Exceptions:

1. Visual identification panels of glass or other approved transparent frangible material that is easily broken and allows access.

2. Approved locking arrangements.

3. Locking of cabinets shall be permitted in Group I-3.

905.8 Dry standpipes. Dry standpipes shall not be installed.

Exception: Where subject to freezing and in accordance with NFPA 14.

905.9 Valve supervision. Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the central supervising station required by Section 903.4. Where a fire alarm system is provided, a signal shall also be transmitted to the fire alarm system.

Exceptions:

1. Valves to underground key or hub valves in roadway boxes provided by the city or a public utility do not require supervision.

2. Valves locked in the normal position and inspected as provided in this code in buildings not equipped with a fire alarm system.
905.10 During construction. Standpipe systems required during construction, alteration and demolition operations shall be provided in accordance with Section 3303.8.

905.11 Painting of dedicated standpipes. Dedicated standpipes and the handles of valves serving standpipes shall be painted and such painting certified in accordance with Sections 905.11.1 through 905.11.6. In addition to painting, standpipe piping may also be identified by lettered legend in accordance with ANSI A13.1. Where the piping is required to be listed and labeled such painting shall not obscure such labeling.

Exceptions:

1. Attachments, gauges, valves and operable parts of standpipes other than valve handles.

2. Where different color coding may be required by Section 3406 of the New York City Fire Code for facilities storing, handling, and using flammable and combustible liquids in connection with special operations.

905.11.1 New buildings. All portions of a standpipe system and the handles of valves serving the standpipe system in new buildings, including buildings constructed pursuant to Section 28-101.4.2 of the Administrative Code, shall be painted red prior to the hydrostatic pressure test whether or not they are intended to be enclosed at the end of construction.

905.11.2 Alterations. Existing handles of valves serving existing standpipe systems and existing unpainted standpipe risers that are exposed during alterations, including alterations pursuant to Section 28-101.4.2 of the Administrative Code shall be painted red. Where the alteration requires a hydrostatic pressure test such painting shall be completed prior to such test.

905.11.3 Retroactive requirement for completed buildings. Notwithstanding any other provision of law, all portions of exposed standpipe systems and handles of valves serving the standpipe system of completed buildings in existence March 2, 2010 shall be painted red by June 2, 2010.

905.11.4 Buildings under construction on March 2, 2010. Notwithstanding any other provision of law, where construction documents were approved and permits issued for the construction of a new building or alteration of an existing building prior to March 2, 2010, and the work is not signed off by the department prior to such date, all exposed portions of the standpipe system and handles of valves serving the standpipe system shall be painted red prior to the hydrostatic pressure test, including portions that will be enclosed at a later point in time.

Exception: Portions of the standpipe system enclosed prior to March 2, 2010 need not be painted.

905.11.5 Combination standpipe and sprinkler systems. Where a standpipe system that is used as a combination standpipe and sprinkler system is required to be painted pursuant to Section 905.11.1, 905.11.2, 905.11.3 or 905.11.4, the sprinkler risers and cross connections that are also used for the standpipe system shall be painted red, and the handles of valves serving such combination standpipe and sprinkler system shall be painted yellow.
905.11.6 Certification of completion of system painting. For all buildings where standpipe and combination sprinkler and standpipe systems are not subject to a special inspection pursuant to Section [1704.24] 1705.30 of this code, a licensed master plumber, licensed master fire suppression piping contractor, registered design professional or an individual holding an appropriate certificate of fitness from the Fire Department for the operation and/or maintenance of such system shall certify on forms provided by the department that all required painting has been completed in accordance with Section 905.11. Such certification shall be maintained on the premises and made available for inspection by the department and the Fire Department.

SECTION BC 906
PORTABLE FIRE EXTINGUISHERS

906.1 General. Portable fire extinguishers shall be provided in occupancies and locations as required by the New York City Fire Code.

SECTION BC 907
FIRE ALARM AND DETECTION SYSTEMS

907.1 General. This section covers the application, installation, performance and maintenance of fire alarm systems and their components. Systems shall be designed and installed in accordance with NFPA 72 [as modified in Appendix Q] and the New York City Electrical Code. Systems shall be tested and maintained in accordance with this code and the New York City Fire Code.

907.1.1 Construction documents. Construction documents for fire alarm systems shall be submitted for review and approval to the Fire Department prior to system installation. Construction documents shall include, but not be limited to, all of the following:

1. A floor plan that indicates the use of all rooms.
2. Locations of alarm-initiating devices.
3. Locations of alarm notification appliances, including candela ratings for visible alarm notification appliances.
4. Location of fire command center, fire alarm control units, transponders and notification power supplies.
5. Location of remote annunciators.
6. Location of all primary, secondary and local sources of power.
7. Fire alarm riser diagram showing all fire alarm devices indicated on the floor plans. Quantities of devices on the floor plans shall match the quantities indicated on the riser diagram. Riser diagram shall include class and style of circuits and levels of survivability. The riser diagram shall show the interface of fire safety control functions.
8. Copies of any variances granted by the department or the Fire Department.
9. Legend of all fire alarm symbols and abbreviations used.
10. Design criteria for fire alarm audibility in various occupancies indicated on plans.

11. Fire alarm sequence of operation for the fire alarm system in a matrix format.

12. Classification of the central supervising station.

**907.1.1 Amended construction documents.** Amendments to approved construction documents shall be submitted and approved by the Fire Department before the final inspection of the work or equipment is completed, and such amendments when approved shall be deemed part of the original construction documents. The Fire Department may allow minor revisions of construction documents to be made and submitted to the Fire Department after the completion of work but prior to sign-off of the work in accordance with rules promulgated by the Fire Department regarding such amendments.

**907.1.2 Equipment.** Systems and their components shall be listed for the purpose for which they are installed. The fire alarm control unit shall meet the requirements of the Fire Department.

**907.2 Where required.** An approved fire alarm system installed in accordance with the provisions of this code and NFPA 72 [as modified by Appendix Q] shall be provided in accordance with Sections 907.2.1 through 907.2.22 and provide occupant notification in accordance with Section 907.5, unless other requirements are provided by another section of this code.

A minimum of one manual fire alarm box shall be provided in an approved location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other sections of this code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

**Exceptions:**

1. The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.

2. The manual fire alarm box is not required for Group R-2 occupancies unless required by the Fire Department to provide a means for fire watch personnel to initiate an alarm during a sprinkler system impairment event. Where provided, the manual fire alarm box shall not be located in an area that is accessible to the public.

In all occupancies where an automatic fire alarm system is required by this section, selective coverage smoke detectors shall be located as follows, unless partial or total coverage automatic detection is specified.

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms, and in elevator lobbies.

2. In air distribution systems in accordance with Section 606 of the *New York City Mechanical Code*.

**907.2.1 Group A.** A manual and automatic fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group A occupancies
having an occupant load of due to the assembly occupancy is 300 or more. Group A occupancies not separated from one another in accordance with Section 707.3.10 shall be considered as a single occupancy for the purposes of applying this section. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.

Exceptions:

1. Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system and the notification appliances will activate upon sprinkler water flow. This exception shall not apply to Group A-2 occupancies used as a cabaret.

2. A Group A-2 occupancy used as a cabaret with an occupant load of 75 or more, including associated stages, dressing rooms, and property rooms, shall be equipped with a manual fire alarm system. Such a Group A-2 occupancy with an occupant load of 300 or more shall also be equipped with an automatic fire alarm system.

3. Group A occupancies with a stage in accordance with Section 410, and having an occupant load of 75 or more, shall be provided with a voice/alarm communication system as required by Sections [410.8] 410.9 and 907.2.1.1.

907.2.1.1 System initiation in Group A occupancies. Activation of the fire alarm in Group A-1 occupancies with an occupant load of 300 or more, and in all other Group A occupancies with an occupant load of 1,000 or more, shall initiate a presignal system in accordance with NFPA 72 [as amended by Appendix Q] at a constantly attended location from which the Fire Department shall be notified and live voice evacuation instructions shall be initiated using an emergency voice/alarm communications system in accordance with Section 907.5.2.2.

907.2.1.2 Emergency voice/alarm communication captions. Stadiums, arenas and grandstands required to caption audible public announcements shall be in accordance with Section 907.5.2.4.

907.2.2 Group B. A manual and automatic fire alarm system shall be installed in Group B occupancies that are protected by an automatic sprinkler system where one of the following conditions exists:

1. The combined Group B occupant load of all floors is 500 or more.

2. The Group B occupant load is more than 100 persons above or below the lowest level of exit discharge.

3. The Group B fire area contains a Group B ambulatory [health] care facility, which shall comply with Section 907.2.2.1.

Where such Group B occupancies meeting any one of the above conditions are not protected by an automatic sprinkler system, a partial coverage automatic smoke detection system shall be installed in accordance with NFPA 72.
907.2.2.1 [Group B ambulatory health] Ambulatory care facilities. Fire areas containing [Group B] ambulatory [health] care facilities shall be provided with an electronically supervised automatic partial-coverage smoke detection system installed within the ambulatory [health] care facility and in public use areas outside of tenant spaces and along the path of egress, including public corridors and elevator lobbies.

Exception: Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, provided the occupant notification appliances will activate throughout the notification zones upon sprinkler workflow.

907.2.2.2 Large-area buildings. Group B occupancies having a total gross area exceeding 100,000 square feet ([9290] 9290.3 m²) located in buildings where the highest occupied floor is [less than] 75 feet (22 860 mm) or less above the lowest level of Fire Department vehicle access shall be provided with automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1 and emergency voice/alarm communication system in accordance with Section 907.5.2.2 that initiates a total evacuation signal.

907.2.3 Group E. A manual and automatic fire alarm system shall be installed in Group E occupancies. An emergency voice/alarm communication system meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall be installed in Group E occupancies. When automatic] Automatic sprinkler systems [or], smoke detectors [are installed], and/or other initiating devices, shall be installed in accordance with other sections of this code. When such systems, initiating devices, and/or detectors are installed, they shall be connected to the building fire alarm system.

Exception: Emergency voice/alarm communication systems meeting the requirements of Section 907.5.2.2 and installed in accordance with Section 907.6 shall not be required in Group E occupancies with occupant loads of 100 or less, provided that activation of the manual and automatic fire alarm system initiates an approved occupant notification signal in accordance with Section 907.5.

907.2.4 Group F. A manual and automatic fire alarm system shall be installed in Group F occupancies that are two or more stories in height and have an occupant load of 100 or more, or when 25 persons or more are above or below the lowest level of exit discharge.

907.2.5 Group H. A manual and automatic fire alarm system shall be installed in Group H-5 occupancies and in occupancies used for the manufacture of organic coatings. In addition to the automatic fire alarm system requirements of Section 907.2, an automatic smoke detection system shall be installed for highly toxic gases, organic peroxides and oxidizers in accordance with the New York City Fire Code [and shall be connected to a central supervising station].

Exceptions: A smoke detection system shall not be required in detached storage buildings equipped throughout with an approved automatic fire extinguishing system and used only to store the following:

1. Organic peroxides.
2. Liquid or solid oxidizers.
Exception: Where exempt under the New York City Fire Code.

907.2.6 Group I. A manual and automatic fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group I occupancies. An automatic smoke detection system that activates the occupant notification system shall be provided in accordance with Sections 907.2.6.1, 907.2.6.2 and 907.2.6.3.3.

907.2.6.1 Group I-1. An automatic smoke detection system shall be installed in corridors, waiting areas open to corridors and habitable spaces other than sleeping units and kitchens. The system shall be activated in accordance with Section 907.5.

Exception: Smoke detection is not required for exterior balconies.

907.2.6.1.1 Smoke detectors within dwelling and sleeping units. Smoke detectors and notification appliances shall be installed in dwelling units and such notification appliances shall activate only in the unit in which the alarm originates. Such detectors and appliances shall be annunciated by dwelling unit at a constantly attended location from which the fire alarm system is capable of being manually activated. Smoke detectors are required in the following areas:

1. Sleeping areas;
2. Every room in the path of the means of egress from the sleeping area to the door leading from the dwelling unit; and
3. Each story within the unit, including below-grade stories. For dwelling units with split levels and without an intervening door between the adjacent levels, a smoke detector installed on the upper level shall suffice for the adjacent lower level.

907.2.6.2 Group I-2. An automatic smoke detection system shall be installed in corridors in nursing homes (both intermediate-care and skilled nursing facilities), corridors in detoxification facilities and spaces permitted to be open to the corridors by Section 407.2. The system shall be activated in accordance with Section 907.5. Hospitals shall be equipped with smoke detection as required in Section 407. A one-way voice communication system activated in accordance with Section 907.5.2.2 shall be provided at the fire command center for use by Fire Department personnel. A two-way voice communication system in accordance with Section 907.2.13.3 shall be provided for Group I-2 buildings.

[907.2.6.2.1 Group I-2 hospital buildings. Group I-2 hospital buildings where the highest occupied floor is less than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access shall be provided with partial coverage automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.]

907.2.6.3 Group I-3. Group I-3 occupancies shall be equipped with a manual and automatic fire alarm system and automatic smoke detection system installed for alerting staff.
907.2.6.3.1 System initiation. Actuation of an automatic fire-extinguishing system, automatic sprinkler system, a manual fire alarm box, a fire detector, or a smoke detector shall initiate an approved alarm signal that automatically notifies staff.

907.2.6.3.2 Manual fire alarm boxes. Manual fire alarm boxes are not required to be located in accordance with Section 907.4.2 where the fire alarm boxes are provided at staff-attended locations having direct supervision over areas where manual fire alarm boxes have been omitted.

907.2.6.3.2.1 Manual fire alarm boxes in detainee areas. Manual fire alarm boxes are allowed to be locked in areas occupied by detainees, provided that staff members are present within the subject area and have keys readily available to operate the manual fire alarm boxes.

907.2.6.3.3 Automatic smoke detection system. An automatic smoke detection system shall be installed throughout resident housing units, including sleeping areas, units and contiguous day rooms, group activity spaces and other common spaces normally accessible to residents.

Exceptions:

1. Other approved smoke detection arrangements providing equivalent protection, including, but not limited to, placing detectors in exhaust ducts from cells or behind protective guards listed for the purpose, are allowed when necessary to prevent damage or tampering.

2. Sleeping units in Use Conditions 2 and 3 as described in Section 308.

3. Smoke detectors are not required in sleeping units with four or fewer occupants in smoke compartments that are equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1.

907.2.7 Group M. A manual and automatic fire alarm system shall be installed in Group M occupancies where any one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1114.8 m²);

2. Where a Group M fire area is located more than three stories above grade;

3. Where the combined area of all Group M fire areas on all floors, including mezzanines, exceeds 24,000 square feet (2229.7 m²); or

4. Where a Group M fire area in a below-grade story exceeds 1,500 square feet (139.4 m²).

Where such occupancies are not protected by an automatic sprinkler system, a manual fire alarm and partial coverage automatic smoke detection or automatic heat detection system shall be installed in accordance with NFPA 72.
907.2.7.1 Large-area buildings. Group M occupancies having a total gross area exceeding 100,000 square feet (9,290,3 m²) located in buildings where the highest occupied floor is [less than] 75 feet (22,860 mm) or less above the lowest level of Fire Department vehicle access and covered mall buildings having a total gross area exceeding 50,000 square feet (4,645.2 m²) shall be provided with automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2 initiating a total evacuation signal.

907.2.8 Group R-1. Fire alarm systems shall be installed in Group R-1 occupancies as required in Sections 907.2.8.1 through [907.2.8.4] 907.2.8.5.

907.2.8.1 Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.5 shall be installed in Group R-1 occupancies.

Exception: A manual fire alarm system is not required in buildings not over two stories in height where all individual [dwelling] sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each individual dwelling unit has an exit directly to a public way, exit court or yard.

907.2.8.2 Automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.5 shall be installed in all public corridors serving [dwelling] sleeping units and sleeping units in accordance with Section 907.2.8.3.

Exception: An automatic fire detection system is not required in buildings that do not have public corridors serving [dwelling] sleeping units and each [dwelling] sleeping unit has a means of egress door opening directly to an exterior exit access that leads directly to an exit.

907.2.8.3 Smoke detectors within dwelling units and sleeping units. Smoke detectors and audible notification appliances shall be installed in dwelling units and sleeping units and shall be annunciated by dwelling unit and sleeping unit at a constantly attended location from which the fire alarm system is capable of being manually activated. Smoke detectors are required in the following areas:

1. In sleeping areas.

2. In every room in the path of the means of egress from the sleeping area to the door leading from the dwelling unit and sleeping unit.

3. In each story within the unit, including below-grade stories. For dwelling units and sleeping units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level.
907.2.8.4 Group R-1 student dormitories. A manual and automatic smoke detection system shall be installed in occupancies for student or school staff dormitory housing in all of the following locations:

1. Common spaces outside of sleeping units.
2. Laundry rooms, mechanical equipment rooms and storage rooms.
3. Interior corridors serving sleeping units.

**Exception:** An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units or dwelling units and where each sleeping unit or dwelling unit either has a means of egress door opening directly to an exterior exit access that leads directly to an exit or a means of egress door opening directly to an exit.

Required smoke alarms for student or staff dormitory housing shall be interconnected with the fire alarm system in accordance with NFPA 72.

[907.2.8.4] 907.2.8.5 Large Group R-1 occupancies. Group R-1 occupancies with a total of more than 50 sleeping rooms above street level located in buildings where the highest occupied floor is less than 75 feet (22 860 mm) or less above the lowest level of Fire Department vehicle access, or communal sleeping facilities above street level occupied or designed to be occupied by more than 50 lodgers, shall be provided with automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2 that initiates a total evacuation signal.

907.2.9 Group R-2. A fire alarm system without alarm notification appliances and smoke alarms shall be installed in accordance with this section in Group R-2 occupancies, other than student apartments, where such occupancy satisfies any one of the following conditions:

1. Any dwelling unit is located three or more stories above the lowest level of exit discharge, including dwelling units in penthouses of any area;
2. Any dwelling unit is located more than one story below the highest level of exit discharge of exits serving the dwelling unit; or
3. The building contains more than 16 dwelling units.

Actuation of smoke detectors shall not initiate a signal to alarm notification appliances. The activation of any detector required by this section shall initiate a signal at a central station or a constantly attended location. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room greater than 75 square feet (6.96 m²) in area.
2. In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.
3. In elevator machine rooms and in elevator lobbies.

907.2.9.1 Group R-2 student apartments. Where the main use or dominant occupancy of a building is classified as R-2 student apartments, as defined in Section 310.2, fire alarm systems shall be installed in accordance with Section 907.2.8. Where the main use or dominant occupancy of a building is not classified as R-2 student apartments and the building is occupied partially by Group R-2 student apartments, fire alarm systems shall be installed in accordance with Sections 907.2.9.1.1 through 907.2.9.2.

907.2.9.1.1 Manual fire alarm system. A manual fire alarm system shall be installed throughout all public corridors serving student apartments and student-related uses. Student-related uses shall include common spaces such as recreation rooms, lounges, dining rooms, laundry rooms and storage rooms.

Exceptions:

1. A manual fire alarm system is not required in buildings not over two stories in height where all individual dwelling units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each individual dwelling unit has an exit directly to a public way, exit court or yard.

2. A manual fire alarm system is not required in buildings containing fewer than 15 student apartments.

907.2.9.1.2 Automatic fire alarm system. An automatic fire alarm system without alarm notification appliances shall be installed in accordance with this section in Group R-2 student apartments and student-related uses. The activation of any smoke detector required by this section shall initiate a signal at a central station or a constantly attended location. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms, and in elevator lobbies.

2. In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.

3. Throughout all public corridors serving student apartments and student-related uses. Student-related uses shall include common spaces such as recreation rooms, lounges, dining rooms, laundry rooms and storage rooms. However, smoke detectors shall not be required in such public corridors in buildings containing fewer than 15 student apartments.

Exception: An automatic fire alarm system is not required in buildings not over two stories in height where all individual dwelling units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire barriers and each individual dwelling unit has an exit directly to a public way, exit court or yard.
907.2.9.2 Smoke alarms. Single- and multiple-station smoke alarms shall be installed in accordance with Section 907.2.11.

907.2.10 [Reserved.] Group S. A manual and automatic fire alarm system shall be installed in Group S occupancies where any one of the following conditions exists:

1. Group S fire area has an occupant load of 300 occupants or more;
2. The combined occupant load of all Group S fire areas on all floors, including mezzanines, is 300 or more.

907.2.10.1 Large-area buildings. Group S occupancies having a total gross area exceeding 500,000 square feet (46451.5 m²) located in buildings, where the highest occupied floor is 75 feet (22 860) or less above the lowest level of Fire Department vehicle access, shall be provided with automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2 that initiates a total evacuation signal.

907.2.11 Single- and multiple-station smoke alarms. Listed single- and multiple-station smoke alarms complying with UL 217 shall be installed in accordance with Sections 907.2.11.1 through Section 907.2.11.7 and NFPA 72.

907.2.11.1 Smoke alarms in Groups R-2[,] and R-3 [,] and I-1. Single- or multiple-station smoke alarms shall be installed and maintained in Groups R-2[,] and R-3 [,] and I-1, regardless of occupant load at all of the following locations within all dwelling units:

1. On the ceiling or wall outside of each room used for sleeping purposes within 15 feet (4572 mm) from the door to such room.
2. In each room used for sleeping purposes.

[Exception: Single- or multiple-station smoke alarms in Group I-1 shall not be required where smoke detectors are provided in the sleeping rooms as part of an automatic smoke detection system.]

3. In each story within a dwelling unit, including below-grade stories and penthouses of any area, but not including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

907.2.11.1.1 Group R-2 occupancy. Smoke alarms shall be provided with the capability to support visible alarm notification appliances in accordance with ICC/ANSI A117.1.

907.2.11.2 Power source. Required smoke alarms shall receive their primary power from a dedicated branch circuit or the unswitched portion of a branch circuit also used for power or lighting, or both, and shall be equipped with a battery backup. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for over-current protection.

849
**Exception:** Smoke alarms with integral strobes shall not require battery backup provided that the smoke alarms are connected to an emergency or standby power electrical source.

**907.2.11.3 Installation near cooking appliances.** Smoke alarms shall not be installed in the following locations unless this would prevent placement of a smoke alarm in a location required by Section 907.2.11.1:

1. Ionization smoke alarms shall not be installed less than 20 feet (6096 mm) horizontally from a permanently installed cooking appliance.

2. Ionization smoke alarms with an alarm-silencing switch shall not be installed less than 10 feet (3048 mm) horizontally from a permanently installed cooking appliance.

3. Photoelectric smoke alarms shall not be installed less than 6 feet (1828.8 mm) horizontally from a permanently installed cooking appliance.

**907.2.11.4 Installation near bathrooms.** Smoke alarms shall be installed not less than 3 feet (914.4 mm) horizontally from the door or opening of a bathroom that contains a bathtub or shower unless this would prevent placement of a smoke alarm required by Section 907.2.11.1.

**[907.2.11.3] 907.2.11.5 Interconnection.** Where more than one smoke alarm [or detector] is required to be installed within an individual dwelling unit or sleeping unit in Group I-1, R-2[,] and R-3 occupancies, [or within an individual dwelling unit or sleeping unit in Group R-1,] the smoke alarms [or detectors] shall be interconnected in such a manner that the activation of one alarm [or detector] will activate all of the alarms [or detectors] in the individual unit. Physical interconnection of smoke alarms shall not be required where listed wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm [or detector] shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

**[907.2.11.4 Group R-2 occupancy.** Smoke alarms shall be provided with the capability to support visible alarm notification appliances in accordance with ICC/ANSI A117.1.]

**[907.2.11.5] 907.2.11.6 Smoke alarms and smoke detectors in group R occupancies.** On and after January 1, 2021, smoke alarms and smoke detectors shall not be installed or replaced in an individual dwelling or sleeping unit, including dwellings or units in prior code buildings, within an area of exclusion determined by a 20 foot (6.0 m) (6096 mm) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed in accordance with the 8th edition of UL 217 for smoke alarms or the 7th edition of UL 268 for smoke detectors.

**907.2.11.7 Smoke detection system.** Smoke detectors listed in accordance with UL 268 and provided as part of the building fire alarm system shall be an acceptable alternative to single and multiple station smoke alarms and shall comply with the following:

1. The fire alarm system shall comply with all applicable requirements in Section 907 of this code.
2. Activation of a smoke detector in a dwelling unit or sleeping unit shall initiate alarm notification in the dwelling unit or sleeping unit in accordance with Section 907.5.2 of this code.

3. Activation of a smoke detector in a dwelling unit or sleeping unit shall not activate alarm notification appliances outside of the dwelling unit or sleeping unit, provided that a supervisory signal is generated and monitored in accordance with Section 907.6.5 of this code.

907.2.12 Special amusement buildings. An automatic smoke detection system shall be provided in special amusement buildings in accordance with Sections 907.2.12.1 through 907.2.12.3.

Exception: In areas where ambient conditions will cause a smoke detection system to alarm, an approved alternative type of automatic detector shall be installed.

907.2.12.1 Alarm. [Activation] Actuation of [any] a single smoke detector, [the] automatic sprinkler system or [any] other automatic fire detection [device] system shall [immediately sound an alarm at the building] initiate a pre-signal system in accordance with NFPA 72 at a constantly attended location from which [emergency action can be initiated, including the capability of manual initiation of requirements in Section 907.2.12.2] the Fire Department shall be notified and live voice evacuation instructions shall be initiated using an emergency voice/alarm communications system in accordance with Section 907.5.2.2.

907.2.12.2 System response. The following minimum system actuations and responses shall be required upon approval by the department and the Fire Department. The activation of two or more smoke detectors, a single smoke detector equipped with an alarm verification feature, the automatic sprinkler system or other approved fire detection device shall automatically do all of the following:

1. Cause illumination of the means of egress with light of not less than 1 [foot-candle] footcandle (11 lux) at the walking surface level[;]

2. Stop any conflicting or confusing sounds and visual distractions[; and]

3. Activate an approved directional exit marking that will become apparent in an emergency[; and]

[4. Activate a prerecorded message, clearly audible throughout the special amusement building, instructing patrons to proceed to the nearest exit. Alarm signals used in conjunction with the prerecorded message shall produce a sound that is distinctive from other sounds used during normal operation.]

907.2.12.3 Emergency voice/alarm communication system. An emergency voice/alarm communication system, which is also allowed to serve as a public address system, shall be installed in accordance with Section 907.5.2.2[;] and be audible throughout the entire special amusement building.
907.2.13 High-rise buildings. In addition to the requirements of Sections 907.2.1 through 907.2.12, buildings constructed in accordance with Section 403 and having floors used for human occupancy located more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access shall be provided with an automatic smoke detection connected to an automatic fire alarm system in accordance with Section 907.2.13.1, a Fire Department communication system in accordance with Section 907.2.13.2, a two-way communication system in accordance with Section 907.2.13.3, and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.

Exceptions:

1. Open parking garages in accordance with Section [406.3] 406.5.
3. Special Low-hazard special occupancies in accordance with Section 503.1.1.
4. Buildings with an occupancy in Group H-1, H-2 or H-3 in accordance with Section 415.

907.2.13.1 Automatic smoke detection. In addition to smoke detection otherwise required by this code, automatic smoke detection in high-rise buildings shall be in accordance with Sections 907.2.13.1.1 and 907.2.13.1.2.

Exception for Group R-2 occupancies: In R-2 occupancies, the activation of smoke detectors shall initiate a signal at a central supervising station or a constantly attended location and shall not initiate a signal to [an] alarm notification appliances.

907.2.13.1.1 Automatic smoke detection. Automatic smoke detectors shall be provided in accordance with this section. Smoke detectors shall be connected to an automatic fire alarm system. The activation of any detector required by this section shall activate the emergency voice/alarm communication system. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room.
2. In each elevator machine room and in elevator lobbies.

907.2.13.1.2 Duct smoke detection. Duct smoke detectors complying with Section 907.3.1 shall be located in air distribution systems in accordance with Section 606 of the New York City Mechanical Code.

907.2.13.2 Fire Department communication system. [A] The Fire Department Auxiliary Radio Communication System (ARCS)[, which shall be in accordance with Section [917], shall be required in all high-rise buildings] 916.

[Exception: Where it is determined by the Fire Department that a radio communication system is not required.]
907.2.13.3 Two-Way Communication System. A two-way voice communication system (warden) phone that complies with the requirements of NFPA 72 shall be provided in the following locations and shall comply with the following requirements. Such phones shall communicate with the fire command center.

1. In Group B high-rise office buildings and large area office buildings, there shall be a minimum of two phones located on every floor accessible to all occupants, with each phone located within 5 feet (1524 mm) of a different exit stair.

2. Where elevator lobbies are permitted to be locked, the phones provided are permitted to be connected to the fire alarm system.

3. If phones are provided in areas of rescue assistance and refuge areas, the phones are permitted to be connected to the fire alarm system.

4. Where phones are provided to meet the requirements for stairway communication systems in Section 403.5.3.1, the phones are permitted to be connected to the fire alarm system.

5. In all Group I-2 buildings, there shall be a phone located at staff attended locations, such as nurses’ stations or similar locations accessible to all staff members, on every patient floor per fire/smoke zone. Phones shall also be located in areas of the building where the fire alarm does not sound.

   **Exception:** Group R-2 occupancies.

907.2.14 Atriums connecting more than two stories. A fire alarm system shall be installed in occupancies with an atrium that connects more than two stories, with smoke detection installed throughout in locations as required by a rational analysis in Section 909.4 and in accordance with the atrium system operation requirements in Section 909.17. The system shall be activated in accordance with Section 907.5. Such occupancies in Group A, E or M shall be provided with an emergency voice/alarm communication system complying with the requirements of Section 907.5.2.2.

907.2.15 High-piled combustible storage areas. An automatic fire detection system shall be installed throughout high-piled combustible storage areas where required by the New York City Fire Code.

907.2.16 Aerosol storage uses. Aerosol storage rooms and general-purpose warehouses containing aerosols shall be provided with an approved manual fire alarm system where required by the New York City Fire Code.

907.2.17 Lumber, wood structural panel and veneer mills. Lumber, wood structural panel and veneer mills shall be provided with a manual fire alarm system.

907.2.18 Underground buildings with compartment smoke control system. Where a compartment smoke control system is installed in an underground building as required by Section 405, automatic fire smoke detectors shall be provided in accordance with Section 907.2.18.1.
907.2.18.1 **Smoke detectors.** [A minimum of] Not fewer than one smoke detector listed for the intended purpose shall be installed in all of the following areas:

1. Mechanical equipment, electrical, transformer, telephone equipment, elevator machine or similar rooms.
2. Elevator lobbies.
3. The main supply and main return, and exhaust air plenum of each air-conditioning system serving more than one story and located in a serviceable area downstream from filters on supply ducts and in return/exhaust ducts downstream of the last duct inlet.
4. Each connection to a vertical duct or riser serving two or more floors from return air ducts or plenums of heating, ventilating and air-conditioning systems, except that in Group R occupancies, a listed smoke detector is allowed to be used in each return air riser carrying not more than 5,000 cfm (2.4 m³/s) and serving not more than 10 air inlet openings.

907.2.18.2 **Alarm required.** Activation of the smoke exhaust system shall activate an audible alarm at a constantly attended location.

907.2.19 **Underground buildings.** In underground buildings complying with Section 405 where the lowest level of a structure is more than 30 feet (9144 mm) below the lowest level of exit discharge, the structure shall be equipped throughout with a manual and automatic fire alarm system, including an emergency voice/alarm communication system installed in accordance with Section 907.5.2.2.

907.2.20 **Covered and open mall buildings.** [Covered mall buildings exceeding] Where the total floor area exceeds 50,000 square feet (4645.2 m²) within either a covered mall building or within the perimeter line of an open mall building, an emergency voice/alarm communication system shall be provided. [An emergency] Emergency voice/alarm communication [system] systems serving a mall, required or otherwise, shall be accessible to the Fire Department. The system shall be provided in accordance with Section 907.5.2.2.

907.2.21 **Battery rooms.** An approved automatic smoke detection system shall be installed in areas containing stationary storage battery systems having a liquid capacity of more than 50 gallons (189.3 L). Where the battery room is located in a building or space that is provided with a fire alarm system or subsystem, the smoke detectors shall be connected to such building fire alarm system or subsystem. The detection system shall be supervised by a central supervising station, or a local alarm that will sound an audible signal at a constantly attended location. [Reserved.]

907.2.22 **Airport traffic control towers.** An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.5 shall be provided in airport control towers in [all occupiable and equipment spaces] accordance with Sections 907.2.22.1 and 907.2.22.2.
Exception: Audible appliances shall not be installed within the control tower cab.

907.2.22.1 Airport traffic control towers with multiple exits and automatic sprinklers. Airport traffic control towers with multiple exits and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall be provided with smoke detectors in all of the following locations:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Outside each opening into interior exit stairways.
5. Along the single means of egress permitted from observation levels.
6. Outside each opening into the single means of egress permitted from observation levels.

907.2.22.2 Other airport traffic control towers. Airport traffic control towers with a single exit or where sprinklers are not installed throughout shall be provided with smoke detectors in all of the following locations:

1. Airport traffic control cab.
2. Electrical and mechanical equipment rooms.
3. Airport terminal radar and electronics rooms.
4. Office spaces incidental to the tower operation.
5. Lounges for employees, including sanitary facilities.
7. Accessible utility shafts.

907.2.23 Battery rooms. An approved automatic smoke detection system shall be installed in areas containing any battery systems. Where the battery room is located in a building or space that is provided with a fire alarm system or subsystem, the smoke detectors shall be connected to such building fire alarm system or subsystem. The detection system shall be supervised by a central supervising station, or a local alarm that will sound an audible signal at a constantly attended location. Battery rooms shall also comply with the requirements of the New York City Fire Code.

907.3 Fire safety functions. Automatic fire detectors utilized for the purpose of performing fire safety functions shall be connected to the building’s fire alarm control unit where a fire alarm system is required by Section 907.2. Detectors shall, upon actuation, perform the intended function and
activate the alarm notification appliances or activate a visible and audible supervisory signal at a constantly attended location.

**Exception:** In buildings not equipped with a fire alarm system, the automatic fire detector shall be powered by normal electrical service and, upon actuation, perform the intended function. The detectors shall be located in accordance with NFPA 72.

**907.3.1 Duct smoke detectors.** Smoke detectors installed in ducts shall be listed for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building’s fire alarm control unit when a fire alarm system is required by Section 907.2. Activation of a duct smoke detector shall initiate a visible and audible [supervisory] alarm signal at a constantly attended location and shall perform the intended fire safety function in accordance with this code and the *New York City Mechanical Code*. Duct smoke detectors shall not be used as a substitute for required open area detection.

**Exceptions:**

1. The [supervisory] alarm signal at a constantly attended location is not required where duct smoke detectors activate the [building] building’s alarm notification appliances.

2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

**907.3.2 Delayed egress locks.** Where delayed egress locks are installed on means of egress doors in accordance with Section [1008.1.9.7] 1010.1.9.7, an automatic smoke or heat detection system shall be installed as required by that section.

**907.3.3 Elevator emergency operation.** Automatic fire detectors installed for elevator emergency operation shall be installed in accordance with the provisions of Chapter 30 of this code, ASME A17.1 and NFPA 72.

**907.3.4 Wiring.** The wiring to the auxiliary devices and equipment used to accomplish [the above] fire safety functions shall be monitored for integrity in accordance with NFPA 72 and the *New York City Electrical Code*.

**907.3.5 Monitoring of hold-open devices and closers.** All hold-open devices used in automatic-closing doors pursuant to the exception to Section [708.7] 713.7 shall be electrically supervised to monitor the integrity of the wiring connections among the fire alarm system, the smoke detection system, and the hold-open devices.

**907.4 Initiating devices.** Where manual or automatic alarm initiation is required as part of a fire alarm system, the initiating devices shall be installed in accordance with Sections 907.4.1 through [907.4.3] 907.4.4.
907.4.1 Protection of fire alarm control unit. In areas that are not continuously occupied, a single smoke detector shall be provided at the location of each fire alarm control unit, notification appliance circuit power extenders, and supervising station transmitting equipment.

Exceptions:

1. Where ambient conditions prohibit installation of a smoke detector, a heat detector shall be permitted.

2. In prior code buildings, where a fire alarm control unit is installed in an [exit enclosure] interior exit stairway or ramp or exit passageway, a smoke detector is not required at the location of such fire alarm control unit.

907.4.2 Manual fire alarm boxes. Where a manual fire alarm system is required by another section of this code, it shall be activated by fire alarm boxes installed in accordance with Sections 907.4.2.1 through [907.4.2.5] 907.4.2.6.

907.4.2.1 Location. Manual fire alarm boxes shall be located not more than 5 feet (1524 mm) from the entrance to each exit. Additional manual fire alarm boxes shall be located so that travel distance to the nearest box does not exceed 200 feet (60 960 mm).

907.4.2.2 Height. The height of the manual fire alarm boxes shall be [a minimum of] not less than 42 inches ([1062 mm]) and [a maximum of] not more than 48 inches ([1219 mm]) measured vertically, from the floor level to the activating handle or lever of the box.

907.4.2.3 Color. Manual fire alarm boxes shall be red in color.

907.4.2.4 Signs. Where fire alarm systems are not required to be monitored by a supervising station, an approved permanent sign that reads: WHEN ALARM SOUNDS—CALL 911 shall be installed adjacent to each manual fire alarm box.

Exception: Where the manufacturer has permanently provided this information on the manual fire alarm box.

907.4.2.5 Protective covers. The Fire Department is authorized to require the installation of listed manual fire alarm box protective covers to prevent malicious false alarms or provide the manual fire alarm box with protection from physical damage. The protective cover shall be transparent or red in color with a transparent face to permit visibility of the manual fire alarm box. Each cover shall include proper operating instructions. A protective cover that emits a local alarm signal shall not be installed unless approved. Protective covers shall not project more than that permitted by Section 1003.3.3.

907.4.2.6 Unobstructed and unobscured. Manual fire alarm boxes shall be readily accessible, unobstructed, unobscured and visible at all times.

907.4.3 Automatic smoke detection. Where an automatic smoke detection system is required, it shall utilize smoke detectors unless ambient conditions prohibit such an installation. In spaces
where smoke detectors cannot be utilized due to ambient conditions, approved automatic heat detectors shall be permitted.

907.4.3.1 Automatic sprinkler system. For conditions other than specific fire safety functions noted in Section 907.3, in areas where ambient conditions prohibit the installation of smoke detectors, an automatic sprinkler system installed in such areas in accordance with Section 903.3.1.1 or 903.3.1.2 and that is connected to the fire alarm system shall be approved as automatic heat detection.

907.4.4 Fire-extinguishing systems. Where a fire alarm system is required by another section of this code or is otherwise installed, automatic fire-extinguishing systems installed in accordance with Section 904 shall be monitored by the fire alarm system.

907.5 Occupant notification systems. A fire alarm system shall annunciate at the fire alarm control unit and shall initiate occupant notification upon activation, in accordance with Sections 907.5.1 through 907.5.2.3.2. Where a fire alarm system is required by another section of this code, it shall be activated by:

1. Automatic fire detectors.
4. Automatic fire-extinguishing systems.

Exception: Where notification systems are allowed elsewhere in Section 907 to annunciate at a constantly attended location or to a central supervising station.

907.5.1 Presignal feature. A presignal feature shall not be installed unless approved by the Fire Department. Where a presignal feature is provided, a signal shall be annunciated at a constantly attended location approved by the Fire Department, in order that occupant notification can be activated in the event of fire or other emergency.

907.5.2 Alarm notification appliances. Alarm notification appliances shall be provided and shall be listed for their purpose.

907.5.2.1 Audible alarms. Audible alarm notification appliances shall be provided and emit a distinctive sound that is not to be used for any purpose other than that of a fire alarm.

[Exception:] Exceptions:

1. Visible alarm notification appliances shall be allowed in lieu of audible alarm notification appliances in critical care areas of Group I-2 occupancies.

2. Where provided, audible notification appliances located in each occupant evacuation elevator lobby in accordance with Section 3008.10.1 shall be connected to a separate notification zone for manual paging only.
907.5.2.1.1 **Average sound pressure.** The audible alarm notification appliances shall provide a sound pressure level of 15 decibels (dBA) above the average ambient sound level or 5 dBA above the maximum sound level having a duration of [at least] not less than 60 seconds, whichever is greater, in every occupiable space within the building. The minimum sound pressure levels shall be: 75 dBA in occupancies in Groups R and I-1; 90 dBA in mechanical equipment rooms and 60 dBA in other occupancies. For one-way voice communication system in Group R-2 occupancies, the minimum sound pressure level of the alert tone shall be 75 dBA throughout the dwelling unit.

907.5.2.1.2 **Maximum sound pressure.** The maximum sound pressure level for audible alarm notification appliances shall be 110 dBA at the minimum hearing distance from the audible appliance. Where the average ambient noise is greater than 95 dBA, visible alarm notification appliances shall be provided in accordance with NFPA 72 and audible alarm notification appliances shall not be required.

907.5.2.2 **Emergency voice/alarm communication systems.** Emergency voice/alarm communication systems required by this code shall be designed and installed in accordance with NFPA 72. The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation in accordance with the building’s fire safety and evacuation plans required by the *New York City Fire Code*. In high-rise buildings, the system shall operate on [a minimum of] at least the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. At a minimum, paging zones shall be provided as follows:

1. Each exit stairway.
2. Each floor.
3. Refuge areas as defined in [Section 1002.4] Chapter 2 of this code.

Exceptions:

1. **Group I-1 and I-2 occupancies.** In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.

2. **Group R-2 occupancies 125 feet or less in height.** Emergency voice/alarm communication systems shall not be required in Group R-2 occupancies in buildings 125 feet (33 100 mm) or less in height.

3. **Group R-2 occupancies greater than 125 feet 75 feet (22 860 mm) in height.** In Group R-2 occupied buildings greater than [125 feet (33 100 mm)] 75 feet (22 860 mm) in height above the lowest level of Fire Department vehicle access, activation of any smoke detector or sprinkler water flow device shall initiate a signal at a central supervising station or constantly attended location and shall not initiate a signal to an alarm notification appliance. An emergency voice/alarm communication system shall not be required. However, a one-way
voice communication shall be provided between the fire command center for use by Fire Department personnel and the following terminal areas:

[3-1-] 2.1. Within dwelling units. An intercom system may be utilized when provided with an override feature for use by Fire Department personnel. Such intercom system shall comply with rules promulgated by the commissioner establishing installation requirements.

[3-2-] 2.2. Within required exit stairs. Annunciation devices shall be located at least on every other story units. Such annunciation devices shall comply with rules promulgated by the commissioner establishing installation requirements.

907.5.2.2.1 Manual override. A manual override for emergency voice communication shall be provided on a selective and all-call basis for all paging zones.

907.5.2.2.2 Live voice messages. The emergency voice/alarm communication system shall have multi-channel capability to broadcast live voice messages by paging zones on a selective and all-call basis without automatic interruption of the alarm tones on the floor of incidence, floor above or floor below.

907.5.2.2.3 Alternate uses. When approved by the [fire commissioner] Fire Commissioner, the emergency voice/alarm communication system may be allowed to be used for other announcements.

907.5.2.2.4 Emergency voice/alarm communication captions. Where stadiums, arenas and grandstands provide audible public announcements, the emergency/voice alarm communication system shall be captioned. Emergency captions shall be approved by the Fire Department.

907.5.2.2.5 Emergency power. Emergency voice/alarm communications systems shall be provided with an approved emergency power source in accordance with Section 2702 of this code and the New York City Electrical Code.

907.5.2.3 Visible alarms. Visible alarm notification appliances shall be provided in accordance with Sections 907.5.2.3.1 through [907.5.2.3.2] 907.5.2.3.2.

Exceptions:

1. Visible alarm notification appliances shall not be required in exits as defined in Chapter 2.

2. Visible alarm notification appliances shall not be required in elevator cars.

907.5.2.3.1 Public and common areas. Visible alarm notification appliances shall be provided in public use areas and common use areas, as defined in Chapter 2.

[907.5.2.3.2 Employee work areas.] Exception: Where employee work areas have audible alarm coverage, the notification appliance circuits serving the employee work
areas shall be initially designed with [a minimum of] not less than 20-percent spare capacity to account for the potential of adding visible notification appliances in the future to accommodate hearing impaired employee(s).

**[907.5.2.3.3] 907.5.2.3.2 Groups I-1 and R-1.** Group I-1 and R-1 dwelling units or sleeping units in accordance with Table [907.5.2.3.3] 907.5.2.3.2 shall be provided with a visible alarm notification appliance, activated by both the in-room smoke detector and the building fire alarm system.

**907.6 Installation and monitoring.** A fire alarm system shall be installed and monitored in accordance with this section Sections 907.6.1 through 907.6.5.2 of this code and NFPA 72 [as modified by Appendix Q].

**907.6.1 Wiring.** Wiring shall comply with the requirements of the New York City Electrical Code and NFPA 72 [as modified by Appendix Q]. Wireless protection systems utilizing radio-frequency transmitting devices shall comply with the special requirements for supervision of low-power wireless systems in NFPA 72 [as modified by Appendix Q].

**907.6.2 Power supply.** The primary and secondary power supply for the fire alarm system shall be provided in accordance with the New York City Electrical Code.
Exception: Secondary power for single-station and multiple-station smoke alarms as required in Section [907.2.11.2] 907.2.11.2.

907.6.3 Zones. Each floor shall be zoned separately. For non-addressable systems, each floor shall be zoned separately and a zone shall not exceed 22,500 square feet ([2090] 2090.3 m²). The length of any zone shall not exceed 300 feet (91 440 mm) in any direction.

Exception: Automatic sprinkler system zones shall not exceed the area permitted by NFPA 13.

907.6.3.1 Zoning indicator panel. A zoning indicator panel and the associated controls shall be provided at the main building entrance accessible to responding Fire Department personnel and in other locations approved by the [department] commissioner and the Fire Department. The visual zone indication shall lock in until the system is reset and shall not be canceled by the operation of an audible-alarm silencing switch.

907.6.3.2 High-rise buildings. In high-rise buildings constructed in accordance with Section 403, a separate zone by floor shall be provided for each of the following types of alarm-initiating devices where provided:

1. Smoke detectors.
2. Sprinkler waterflow devices.
4. Other approved types of automatic fire detection devices or suppression systems.

907.6.4 Access. Access shall be provided to each fire alarm device and notification appliance for periodic inspection, maintenance and testing.

907.6.5 Monitoring. Fire alarm systems required by this chapter or by the New York City Fire Code shall be monitored by a central supervising station in accordance with NFPA 72 and approved by the [fire commissioner] Fire Commissioner.

Exception: Monitoring by a central supervising station is not required for:

1. Single- and multiple-station smoke alarms required by Section 907.2.11.
2. Smoke detectors in Group I-3 occupancies.
3. Automatic sprinkler systems in one- and two-family dwellings.

907.6.5.1 Automatic telephone-dialing devices. Automatic telephone-dialing devices used to transmit an emergency alarm shall not be connected to any Fire Department telephone number unless approved by the Fire Commissioner.

907.6.5.2 Termination of monitoring service. Termination of fire alarm monitoring services shall be in accordance with the New York City Fire Code.
907.7 Acceptance tests and completion. Upon completion of the installation, the fire alarm system and all fire alarm components shall be tested in accordance with NFPA 72.

907.7.1 Single- and multiple-station alarm devices. When the installation of the alarm devices is complete, each device and interconnecting wiring for multiple-station alarm devices shall be tested in accordance with the smoke alarm provisions of NFPA 72.

907.7.2 Record of completion. A record of completion in accordance with NFPA 72 verifying that the system has been installed and tested in accordance with the approved construction documents and specifications shall be provided.

907.7.3 Instructions. Operating, testing and maintenance instructions, and record drawings (“as built”) and equipment specifications shall be provided at an approved location.

907.8 Inspection, testing and maintenance. The maintenance and testing schedules and procedures for fire alarm and fire detection systems shall be in accordance with the New York City Fire Code.

SECTION BC 908
EMERGENCY ALARM SYSTEMS

908.1 Group H occupancies. Emergency alarms for the detection and notification of an emergency condition in Group H occupancies shall be provided in accordance with Section [414.7] 415.5 of this code and the New York City Fire Code.

908.2 Group H-5 occupancy. Emergency alarms for notification of an emergency condition in a Hazardous Production Material (HPM) facility shall be provided as required in Section [415.8.4.6] 415.11.3.5. A continuous gas detection system shall be provided for HPM gases in accordance with Section [415.8.7] 415.11.7 of this code and the New York City Fire Code.

908.3 Highly toxic and toxic materials. A gas detection system shall be provided to detect the presence of highly toxic or toxic gas at or below the permissible exposure limit (PEL) or ceiling limit of the gas for which detection is provided. The system shall be capable of monitoring the discharge from the treatment system at or below one-half the immediately dangerous to life and health (IDLH) limit and shall comply with the New York City Fire Code.

Exception: A gas detection system is not required for toxic gases when the physiological warning threshold level for the gas is at a level below the accepted PEL for the gas.

908.3.1 Alarms. The gas detection system shall initiate a local alarm and transmit a signal to a constantly attended control station when a short-term hazard condition is detected. The alarm shall be both visible and audible and shall provide warning both inside and outside the area where gas is detected. The audible alarm shall be distinct from all other alarms.

Exception: Signal transmission to a constantly attended control station is not required when not more than one cylinder of highly toxic or toxic gas is stored.

908.3.2 Shutoff of gas supply. The gas detection system shall automatically close the shutoff valve at the source on gas supply piping and tubing related to the system being monitored for whichever gas is detected.
Exception: Automatic shutdown is not required for reactors utilized for the production of highly toxic or toxic compressed gases where such reactors are:

1. Operated at pressures less than 15 pounds per square inch gauge (psig) (103.4 kPa); and
2. Provided with readily accessible emergency shutoff valves.

908.3.3 Valve closure. The automatic closure of shutoff valves shall be in accordance with the following:

1. When the gas-detection sampling point initiating the gas detection system alarm is within a gas cabinet or exhausted enclosure, the shutoff valve in the gas cabinet or exhausted enclosure for the specific gas detected shall automatically close.
2. Where the gas-detection sampling point initiating the gas detection system alarm is within a gas room and compressed gas containers are not in gas cabinets or exhausted enclosures, the shutoff valves on all gas lines for the specific gas detected shall automatically close.
3. Where the gas-detection sampling point initiating the gas detection system alarm is within a piping distribution manifold enclosure, the shutoff valve for the compressed container of specific gas detected supplying the manifold shall automatically close.

Exception: When the gas-detection sampling point initiating the gas detection system alarm is at a use location or within a gas valve enclosure of a branch line downstream of a piping distribution manifold, the shutoff valve in the gas valve enclosure for the branch line located in the piping distribution manifold enclosure shall automatically close.

908.4 Ozone gas-generator rooms. Ozone gas-generator rooms shall be equipped with a continuous gas-detection system that will shut off the generator and sound a local alarm when concentrations above the PEL occur and shall comply with the New York City Fire Code.

908.5 Repair garages. A flammable-gas detection system shall be provided in repair garages for vehicles fueled by enumerated gases in accordance with Section 406.6.6 of this code and the New York City Fire Code.

908.6 Refrigerant detectors. Machinery rooms shall contain refrigerant detectors with audible and visual alarm alarms. The detectors, or sampling tubes that draw air to the each detector, shall be located in all areas where refrigerant from a leak will concentrate. The alarm shall be actuated at a value not greater than the corresponding TLV-TWA values for the refrigerant classification indicated in the New York City Mechanical Code. Detectors and alarms shall be placed in approved locations. Refrigerant detectors shall initiate all functions as required by the New York City Mechanical Code and New York City Fire Code.

[908.7 Carbon monoxide alarms and detectors. Carbon monoxide alarms and detectors shall be provided and installed in accordance with Sections 908.7.1 through 908.7.4.]
[908.7.1 Group I-1 and R-occupancies. Listed carbon monoxide alarms or detectors shall be installed as follows:]

[1. Group R-1 and Group R-2 where the main use or dominant occupancy of a building is classified as Group R-2 student apartments. Carbon monoxide detectors and audible notification appliances shall be installed in affected dwelling units as per Section 908.7.1.1 and shall be annunciated by dwelling unit at a constantly attended location from which the fire alarm system is capable of being manually activated.]

[2. Groups I-1, R-2 (other than occupancies covered by Item 1) and R-3. Carbon monoxide alarms shall be installed in affected dwelling units as per Section 908.7.1.1.]

[908.7.1.1 Affected dwelling units. Carbon monoxide alarms or detectors shall be required within the following dwelling units:]

[1. Units on the same story where carbon monoxide-producing equipment or enclosed parking is located.]

[2. Units on the stories immediately above and below the floor where carbon monoxide-producing equipment or enclosed parking is located.]

[3. Units in a building containing a carbon monoxide-producing furnace, boiler, or water heater as part of a central system.]

[4. Units in a building served by a carbon monoxide-producing furnace, boiler, or water heater as part of a central system that is located in an adjoining or attached building.]

[908.7.1.1.1 Required locations within dwelling units. Carbon monoxide alarms or detectors shall be located within dwelling units as follows:]

[1. Outside of any room used for sleeping purposes, within 15 feet (4572 mm) of the entrance to such room.]

[2. In any room used for sleeping purposes.]

[3. On any story within a dwelling unit, including below-grade stories and penthouses of any area, but not including crawl spaces and uninhabitable attics.]

[908.7.1.1.2 Installation requirements. Carbon monoxide alarms or detectors shall comply with the power source, interconnection, and acceptance testing requirements as required for smoke alarms in accordance with Sections 907.2.11.2 through 907.2.11.3.]

[908.7.1.1.3 Exhaust of Carbon Monoxide in Group R-3 Occupancy (One- and Two-Family dwellings and townhouses). Means of exhausting carbon monoxide from garages shall be provided when a carbon monoxide alarm or detector is activated in a Group R-3 occupancy, provided such garage is attached within the Group R-3 occupancy. Such exhaust system shall be arranged to operate automatically upon detection of a concentration of carbon monoxide of 35 parts per million (ppm) or greater by approved automatic detection device. The system shall be capable of producing an exhaust rate of]
1.5 cfm per square foot of floor area of the garage. Removal of sensor, interruption of power or cut wires shall cause the relay circuit to open and start fan. The relay contact shall close and the fan may shut off when the carbon monoxide level is below 35 ppm. Carbon monoxide exhausting means shall be connected to a separate circuit and provided with a lock and identified at the power source. Such circuit shall not be connected to a power source through an arc fault or Ground Fault Circuit Interrupter (GFCI) devices. Additionally, when the carbon monoxide exhausting means is connected to the plug-in-type overcurrent protection device, such device shall be secured in place by an additional fastener.

[908.7.2 Group E, I-2 and I-4 occupancies. Listed carbon monoxide detectors with built-in sounder bases shall be transmit a signal to a central supervising station and shall be permitted to initiate an audible and visual supervisory alarm at a constantly attended location.]

[1. Carbon monoxide detectors with built-in sounder bases shall be installed within any room containing carbon monoxide-producing equipment.]

Exception: Kitchens or laboratories.

[2. Carbon monoxide detectors with built-in sounder bases shall be installed in corridors on the story where carbon monoxide-producing equipment unit is located, as well as one story above and one story below.]

[3. Carbon monoxide detectors with built-in sounder bases shall be installed in all corridors on the story where enclosed parking is located, as well as one story above and one story below.]

[908.7.3 Buildings that are equipped with a fire alarm system and that contain Group A-1, A-2, A-3, Group B or Group M occupancies. Listed carbon monoxide detectors shall be installed in buildings that are equipped with a fire alarm system and that contain Group A-1, A-2 or A-3, Group B or Group M occupancies. Such carbon monoxide detectors installed pursuant to this section shall have built-in sounder bases, shall transmit a signal to a central supervising station and shall be permitted to initiate an audible and visual supervisory alarm at a constantly attended location. The department shall adopt rules and/or reference standards (i) governing the installation and location of carbon monoxide detectors provided such detectors shall be required within rooms containing carbon monoxide-producing equipment and (ii) addressing the installation of such detectors or any alternative means of compliance in existing buildings.]

Exception: Carbon monoxide detectors shall not be required in kitchens.

[908.7.3.1 Retroactive provisions for existing buildings. Notwithstanding any other provision of law, listed carbon monoxide detectors shall be installed in existing buildings that are equipped with a fire alarm system and that contain group A-1, A-2, A-3, Group B or Group M occupancies in accordance with Section 908.7.3 by January 1, 2021.]

[908.7.4 Installation. Carbon monoxide alarms and detectors shall be listed in accordance with UL 2034 and UL 2075.]
908.7 Carbon dioxide (CO₂) systems. The emergency alarm system for a carbon dioxide system, including detection, pre-discharge and discharge alarms, shall be provided in accordance with the New York City Fire Code.

908.8 Gas detection systems. Gas detection systems shall be provided in accordance with Section 918.

[908.8] 908.9 Medical gas. Medical gas pressure monitoring and alarm systems shall be provided in accordance with NFPA 99 and NFPA 99C.

[908.9] 908.10 Flammable gas. Rooms and spaces containing flammable gas distribution piping operating at levels above 15 pounds per square inch gauge (psig) (103.4 kPa) shall be provided with an approved flammable gas detection-alarm system and shall comply with the New York City Fire Code.

[908.10] 908.11 Construction documents. Construction documents for emergency alarm systems shall be submitted for review and approval to the Fire Department prior to system installation.

[908.11] 908.12 Acceptance testing and maintenance. Acceptance testing and maintenance of emergency alarm systems shall be performed in accordance with the New York City Fire Code.

SECTION BC 909
SMOKE CONTROL SYSTEMS

909.1 Scope and purpose. This section applies to mechanical or passive smoke control systems when they are required by other provisions of this code. A smoke control system is a life safety system, and, where required, facilitates the evacuation of the occupants. The purpose of this section is to establish minimum requirements for the design, installation and acceptance testing of smoke control systems that are intended to provide a tenable environment for the evacuation or relocation of occupants. These provisions are not intended for the preservation of contents, the timely restoration of operations or for assistance in fire suppression or post-fire smoke purge. Smoke control systems regulated by this section serve a different purpose than the smoke- and heat-venting provisions found in Section 910. Mechanical smoke control systems shall not be considered exhaust systems under Chapter 5 of the New York City Mechanical Code.

909.1.1 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meaning shown herein: ELEVATOR LANDING.

PRESSURIZATION. [Creation and maintenance of pressure levels in zones of a building, including elevator shafts and stairwells, that are higher than the pressure level at the smoke source, such pressure levels being produced by positive pressures of a supply of uncontaminated air; by exhausting air and smoke at the smoke source; or by a combination of these methods.]
SMOKE. [Air-borne solid and liquid particulates and gases evolved when a material undergoes pyrolysis or combustion, including the quality of air that is entrained or otherwise mixed into the mass.]

SMOKE BARRIER. [See Section 702.1.]

SMOKE CONTROL MODE. [A predefined operational configuration of a system or device for the purpose of smoke control.]

SMOKE CONTROL SYSTEM, MECHANICAL. [An engineered system that uses mechanical fans to produce pressure differences across smoke barriers or that establishes airflows to limit and direct smoke movement.]

SMOKE CONTROL SYSTEM, PASSIVE. [A system of smoke barriers arranged to limit the migration of smoke.]

SMOKE CONTROL ZONE. [A space within a building enclosed by smoke barriers.]

SMOKE DAMPER. [See Section 702.1.]

STACK EFFECT. [Vertical airflow within buildings caused by temperature differences.]

TENABLE ENVIRONMENT. [An environment in which the concentration and location of smoke is limited or otherwise restricted to allow for ready evacuation through the space.]

909.2 General design requirements. Buildings, structures or parts thereof required by this code to have a smoke control system or systems shall have such systems designed in accordance with the applicable requirements of Section 909 and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information and detail to adequately describe the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied by sufficient information and analysis to demonstrate compliance with these provisions.

909.3 Special inspection and test requirements. In addition to the ordinary inspection and test requirements that buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Section 909 shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the construction documents shall clearly detail procedures and methods to be used and the devices, flow measurement, and other items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this section shall be conducted under the same terms in Section 1704. [A record] Records of the special inspection, including device locations, duct air leakage, pressure differentials, air/smoke flow measurements, smoke detection and control verification shall be maintained on the premises as a baseline against which future tests can be compared.
909.3.1 Periodic testing. Smoke control systems shall be verified weekly through the automatic control system in accordance with Section 909.12 and shall be tested annually to ensure proper operation of detection devices, dampers, fans and controls in accordance with the requirements of Sections 909.18.1, 909.18.3, 909.18.5 and 909.18.7. Full testing of smoke control systems in accordance with Sections 909.18 through 909.18.7 shall be conducted at 5-year intervals by an inspector qualified in accordance with Section 909.18.8.2. Test reports shall include all information required by Section 909.18.8.3 and shall be compared against the baseline special inspection report. Causes for any significant deviations from the baseline report shall be identified and corrected. A record of each inspection and test shall be maintained on the premises by the owner or lessee, and the records for at least the last 5 years of operation shall be made available for inspection by the department and the [fire commissioner] Fire Commissioner.

909.4 Analysis. A rational analysis supporting the types of smoke control systems to be employed, their methods of operation, the systems supporting them and the methods of construction to be utilized shall accompany the submitted construction documents and shall include, but not be limited to, the items indicated in Sections 909.4.1 through 909.4.7. The basis of design and design analysis of the smoke control system shall be submitted to the department and the Fire Department.

909.4.1 Stack effect. The system shall be designed such that the maximum probable normal or reverse stack effect will not adversely interfere with the system’s capabilities. In determining the maximum probable stack effect, altitude, elevation, weather history and interior temperatures shall be used.

909.4.2 Temperature effect of fire. Buoyancy and expansion caused by the design fire in accordance with Section 909.9 shall be analyzed. The system shall be designed such that these effects do not adversely interfere with the system’s capabilities.

909.4.3 Wind effect. The design shall consider the adverse effects of wind. Such consideration shall be consistent with the wind-loading provisions of Chapter 16.

909.4.4 HVAC systems. The design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis shall include all permutations of systems’ status. The design shall consider the effects of the fire on the HVAC systems.

909.4.5 Climate. The design shall consider the effects of low temperatures on systems, property and occupants. Air inlets and exhausts shall be located so as to prevent snow or ice blockage.

909.4.6 Duration of operation. All portions of active or passive smoke control systems shall be capable of continued operation after detection of the fire event for a period of not less than either 20 minutes or 1.5 times the [calculated] required safe egress time, whichever is [more] greater.

909.4.7 Smoke control system interaction. The design shall consider the interaction effects of the operation of multiple smoke control systems for all design scenarios.

909.5 Smoke barrier construction. Smoke barriers required for passive smoke control and a smoke control system using the pressurization method shall comply with Section [710, and] 709. Smoke barriers shall be constructed and sealed to limit leakage areas exclusive of protected openings. The
maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls: \( \frac{A}{A_w} = 0.00100 \)

2. [Exit enclosures] Interior exit stairways and ramps and exit passageways:
   \( \frac{A}{A_w} = 0.00035 \)

3. [All] Enclosed exit access stairways and ramps and all other shafts:
   \( \frac{A}{A_w} = 0.00150 \)

4. Floors and roofs: \( \frac{A}{A_F} = 0.00050 \)

where:

\( A = [\text{Total}] \) Maximum allowable leakage area, square feet (m²).

\( A_F = \) Unit floor or roof area of barrier, square feet (m²).

\( A_w = \) Unit wall area of barrier, square feet (m²).

The leakage area ratios shown do not include openings due to gaps around doors and operable windows. The total leakage area of the smoke barrier shall be determined in accordance with Section 909.5.1 and tested in accordance with Section 909.5.2.

909.5.1 [Leakage] **Total leakage area.** The total leakage area of the barrier is the product of the smoke barrier gross area multiplied by the allowable leakage area ratio, plus the area of other openings such as gaps around doors and operable windows. Compliance shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems. Passive smoke control systems tested using other approved means such as door fan testing shall be approved by the department and the fire commissioner.

909.5.2 [Opening protection:] **Testing of leakage area.** Compliance with the maximum allowable leakage area shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems utilizing the pressurization method. Compliance with the maximum allowable leakage area of passive smoke control systems shall be verified through methods such as door fan testing or other methods, as approved by the commissioner and the Fire Commissioner.

909.5.3 **Opening protection.** Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by fire door assemblies complying with Section 716.5.3.

**Exceptions:**
1. Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with Section 907.3.

2. Fixed openings between smoke zones that are protected utilizing the airflow method.

3. In Group I-1, Group I-2, and Group B ambulatory care facilities, where [such doors are installed across corridors,] a pair of opposite-swinging doors [without a center mullion shall be installed having vision panels with approved fire protection rated glazing materials in approved fire protection rated frames] are installed across a corridor in accordance with Section 909.5.3.1, the [area of which] doors shall not [exceed that tested] be required to be protected in accordance with Section 716. The doors shall be [close-fitting close-fitting within operational tolerances and shall not have a center mullion, louvers, grilles, or door undercuts, louvers or grilles] in excess of ¾ inch (19.1 mm). The doors shall have head and jamb stops[,] and astragals or rabbits at meeting edges [, and shall be automatic closing by smoke detection in accordance with Section 715.4.8.3. Positive-latching devices are not required]. If allowed by the door manufacturer’s listing, positive-latching devices are not required.

4. In Group I-1, Group I-2 and Group B ambulatory care facilities, where such doors are special-purpose horizontal sliding, accordion or folding door assemblies installed in accordance with Section 1010.1.4.3 and are automatic closing by smoke detection in accordance with Section 716.5.9.3.

[4:] 5. Group I-3.

[5:] 6. Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank-down capacity of greater than 20 minutes as determined by the design fire size.

909.5.3.1 Group I-2 and Group B ambulatory care facilities. In Group I-2 and Group B ambulatory care facilities, where doors are installed across a corridor, the doors shall be automatic closing by smoke detection in accordance with Section 716.5.9.3 and shall have a vision panel with fire protection-rated glazing materials in fire protection-rated frames, the area of which shall not exceed that tested.

[909.5.2.4] 909.5.3.2 Ducts and air transfer openings. Ducts and air transfer openings are required to be protected with a minimum Class II, 250°F (121.1°C) smoke damper complying with Section [746] 717.

909.6 Pressurization method. The primary mechanical means of controlling smoke shall be by pressure differences across smoke barriers. Maintenance of a tenable environment is not required in the smoke control zone of fire origin.

909.6.1 Minimum pressure difference. The minimum pressure difference across a smoke barrier shall be 0.05-inch water [gage] gage (0.0124 kPa) in fully sprinklered buildings. In buildings permitted to be other than fully sprinklered, the smoke control system shall be designed to achieve pressure differences [at least] not less than two times the maximum calculated pressure difference produced by the design fire [but in no case less than the values indicated in Table 909.6.1].
### TABLE 909.6.1
[MINIMUM PRESSURE DIFFERENCES] [ACROSS SMOKE BARRIERS]

<table>
<thead>
<tr>
<th>CEILING HEIGHT</th>
<th>MINIMUM DESIGN PRESSURE DIFFERENCE</th>

<tbody>
<tr>
<td>[Less than 15 feet (4572 mm)]</td>
<td>[0.10-inch water gage (0.0259 kPa)]</td>
</tr>
<tr>
<td>[Equal to or greater than 15 feet (4572 mm), but less than 21 feet (6401 mm)]</td>
<td>[0.14-inch water gage (0.0349 kPa)]</td>
</tr>
<tr>
<td>[Equal to or greater than 21 feet (6401 mm)]</td>
<td>[0.18-inch water gage (0.0448 kPa)]</td>
</tr>
</tbody>
</table>

#### 909.6.2 Maximum pressure difference. The maximum air pressure difference across a smoke barrier shall be determined by required door-opening or closing forces. The actual force required to open exit doors when the system is in the smoke control mode shall be in accordance with Section [1008.1.3] 1010.1.3. Opening and closing forces for other doors shall be determined by standard engineering methods for the resolution of forces and reactions. The calculated force to set a side-hinged, swinging door in motion shall be determined by:

\[
F = F_{dc} + K(WAΔP)/2(W − d)
\]

(Equation 9-1)

where:

- \( A \) = Door area, square feet (m²).
- \( d \) = Distance from door handle to latch edge of door, feet (m).
- \( F \) = Total door opening force, pounds (N).
- \( F_{dc} \) = Force required to overcome closing device, pounds (N).
- \( K \) = Coefficient 5.2 (1.0).
- \( W \) = Door width, feet (m).
- \( ΔP \) = Design pressure difference, inches of water (Pa).

#### 909.6.3 Pressurized stairways and elevator hoistways. Where stairways or elevator hoistways are pressurized, such pressurization systems shall comply with Section 909 of this code as smoke control systems, in addition to the requirements of Sections 909.20 and 909.21 of this code and the New York City Fire Code.

#### 909.7 Air flow design method. [When] Where approved by the [department] commissioner, smoke migration through openings fixed in a permanently open position, which are located between smoke control zones by the use of the airflow method, shall be permitted. The design air flow shall be in accordance with this section. Air flow shall be directed to limit smoke migration from the fire zone.
The geometry of openings shall be considered to prevent flow reversal from turbulent effects. Smoke control systems using the airflow method shall be designed in accordance with NFPA 92.

909.7.1 [Velocity. The minimum average velocity through a fixed opening shall not be less than:]

\[ v = 217.2 \left[ \frac{h(T_f - T_o)}{(T_f + 460)} \right]^{1/2} \]  
(Equation 9.2)

[For SI: \( v = 119.9 \left[ \frac{h(T_f - T_o)}{T_f} \right]^{1/2} \)]

[where:]

\[ h = \text{Height of opening, feet (m).} \]
\[ T_f = \text{Temperature of smoke, °F (°K).} \]
\[ T_o = \text{Temperature of ambient air, °F (°K).} \]
\[ v = \text{Air velocity, feet per minute (m/minute).} \]

909.7.2 [Prohibited conditions. This method shall not be employed where either the quantity of air or the velocity of the airflow will adversely affect other portions of the smoke control system, unduly intensify the fire, disrupt plume dynamics or interfere with exiting. In no case shall airflow toward the fire exceed 200 feet per minute (1.02 m/s). Where the [formula in Section 909.7.1 requires] calculated airflow [to exceed] exceeds this limit, the airflow method shall not be used.]

909.8 Exhaust method. [When] Where approved by the [department] commissioner, mechanical smoke control for large enclosed volumes, such as in atriums or malls, shall be permitted to utilize the exhaust method. [The design] Smoke control systems using the exhaust [volumes] method shall be designed in accordance with NFPA [92B] 92.

909.8.1 Smoke layer. The height of the lowest horizontal surface of the accumulating smoke layer shall be maintained [at least] not less than 6 feet ([1829] 1828.8 mm) above any walking surface that forms a portion of a required egress system within the smoke zone.

909.9 Design fire. The design fire shall be based on a [Q of not less than 5,000 Btu/s (5275 kW) unless a] rational analysis performed by the registered design professional and approved by the [department] commissioner. The design fire shall be based on the analysis in accordance with Section 909.4 and this section.

909.9.1 Factors considered. The engineering analysis shall include the characteristics of the fuel, fuel load, effects included by the fire and whether the fire is likely to be steady or unsteady.

909.9.2 [Separation distance.] Design fire fuel. Determination of the design fire shall include consideration of the type of fuel, fuel spacing and configuration.

909.9.3 Heat-release assumptions. The analysis shall make use of best available data from approved sources and shall not be based on excessively stringent limitations of combustible material.

909.9.4 Sprinkler effectiveness assumptions. A documented engineering analysis shall be provided for conditions that assume fire growth is halted at the time of sprinkler activation.
909.10 Equipment. Equipment including, but not limited to, fans, ducts, automatic dampers and balance dampers, shall be suitable for its intended use, suitable for the probable exposure temperatures that the rational analysis indicates and as approved by the department commissioner.

909.10.1 Exhaust fans. Components of exhaust fans shall be rated and certified by the manufacturer for the probable temperature rise to which the components will be exposed. This temperature rise shall be computed in accordance with NFPA 92.

[Exception: Reduced Tₚ as calculated based on the assurance of adequate dilution air.]

\[ T_s = \left( \frac{Q_c}{mc} \right) + (T_a) \]  
\[ \text{[Equation 9-3]} \]

[where:]

\[ c = \text{Specific heat of smoke at smoke layer temperature, Btu/lb°F (kJ/kg \cdot K)} \]
\[ m = \text{Exhaust rate, pounds per second (kg/s)} \]
\[ Q_c = \text{Convective heat output of fire, Btu/s (kW)} \]
\[ T_a = \text{Ambient temperature, °F (°K)} \]
\[ T_s = \text{Smoke temperature, °F (°K)} \]

909.10.2 Ducts. Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 909.10.1. Ducts shall be constructed and supported in accordance with the New York City Mechanical Code. Ducts shall be leak tested to 1.5 times the maximum design pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.

Exception: Flexible connections for the purpose of vibration isolation, complying with the New York City Mechanical Code and that are constructed of approved fire-resistance-rated materials.

909.10.3 Equipment, inlets and outlets. Equipment shall be located so as not to expose uninvolved portions of the building to an additional fire hazard. Outside air inlets shall be located so as to minimize the potential for introducing smoke or flame into the building. Exhaust outlets shall be located so as to minimize reintroduction of smoke into the building and to limit exposure of the building or adjacent buildings to an additional fire hazard.

909.10.4 Automatic dampers. Automatic dampers, regardless of the purpose for which they are installed within the smoke control system, shall comply with Section 717.3.1.

909.10.5 Fans. In addition to other requirements, belt-driven fans shall have 1.5 times the number of belts required for the design duty, but not less than, with the minimum number of belts being
two. Fans shall be selected for stable performance based on normal temperature and, where applicable, elevated temperature. Calculations and manufacturer’s fan curves shall be part of the documentation procedures. Fans shall be supported and restrained by noncombustible devices in accordance with the requirements of Chapter 16. Motors driving fans shall not be operated beyond their nameplate horsepower (kilowatts), as determined from measurement of actual current draw, and shall have a minimum service factor of 1.15.

909.10.6 Seismic Requirements. Smoke control systems covered by Section 909 are life safety systems and are required to function after an earthquake. Such smoke control systems shall be seismically designed in accordance with Section 1613 of this code and ASCE 7-10. The component importance factor, \( I_p \), shall be taken as 1.5 in accordance with ASCE 7-10, Section 13.1.3. The smoke control system includes all components required for its operation, including but not limited to fans, ducts, electrical power, switchboards, motor control centers, starters, and controls.

Exception: Smoke control systems in structures classified in Seismic Design Categories A or B shall have a component importance factor, \( I_p \), of 1.0.

909.11 [Power systems] Standby power. The smoke control system shall be supplied with two sources of power. [Primary power] The primary power supply shall be from the normal building power systems, while the secondary power source shall be from a standby power system complying with Section 2702.1-2702.

909.11.1 Equipment room. The standby power source shall be located in a room separate from the normal power transformers and switch gears, and ventilated directly to and from the exterior. The room shall be enclosed with not less than 2-hour fire barriers constructed in accordance with Section 707, or with not less than 2-hour fire-resistance-rated horizontal assemblies constructed in accordance with Section 711, or both.

909.11.2 Power sources and power surges. Elements of the smoke control system relying on electronic volatile memories or similar systems shall be supplied with uninterruptable power sources of sufficient duration to span a 15-minute primary power interruption. Elements of the smoke control system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

909.12 Detection and control systems. Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Section 907. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

909.12.1 Verification. Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, and the presence of power downstream of all disconnects. A preprogrammed weekly test sequence shall report, abnormal conditions audibly, visually and by printed report. The preprogrammed weekly test shall operate all devices, equipment and components used for smoke control.
Exception: Where verification of individual components tested through the preprogrammed weekly testing sequence will interfere with, and produce unwanted effects to, normal building operation, such individual components are permitted to be bypassed from the preprogrammed weekly testing, where approved by the Fire Department and in accordance with both of the following:

1. Where the operation of components is bypassed from the preprogrammed weekly test, presence of power downstream of all disconnects shall be verified weekly by a listed control unit.

2. Testing of all components bypassed from the preprogrammed weekly test shall be tested semi-annually, and be tested under standby power conditions in accordance with Section 909 of the New York City Fire Code.

[909.12.1] 909.12.2 Wiring. In addition to meeting requirements of the New York City Electrical Code, all wiring, regardless of voltage, shall be fully enclosed within continuous raceways.

[909.12.2] 909.12.3 Activation. Smoke control systems shall be activated in accordance with this section.

[909.12.2.1] 909.12.3.1 Pressurization, airflow or exhaust method. Mechanical smoke control systems using the pressurization, airflow or exhaust method shall have completely automatic control.

[909.12.2.2] 909.12.3.2 Passive method. Passive smoke control systems actuated by spot-type detectors listed for releasing service shall be permitted.

[909.12.3] 909.12.4 Automatic control. Where completely automatic control is required or used, the automatic-control sequences shall be initiated from an appropriately zoned automatic sprinkler system complying with Section 903.3.1.1, manual controls that are readily accessible to the Fire Department and any smoke detectors required by engineering analysis. See Section 909.16 for manual control requirements.

[909.12.3.1] 909.12.4.1 Building Management System. Automatic and manual operation of the smoke control system may alternately be done through a Building Management System (BMS) that is approved by the Fire Department and meets the following requirements:

1. The BMS system shall be listed for UL 864 UUKL Smoke Control.

2. The BMS Control Center shall be staffed 24 hours a day by operators trained in the building’s smoke control systems and their operation. In buildings where Fire Safety Directors are required, they shall operate the The smoke control system shall be operated by a certificate of fitness holder where required by the New York City Fire Code.

3. The control room shall be 2-hour fire-resistance-rated construction.
4. BMS annunciation and additional control station locations shall be located in the fire command center in accordance with Section 909.16.

**909.13 Control air tubing.** Control air tubing shall be of sufficient size to meet the required response times. Tubing shall be flushed clean and dry prior to final connections and shall be adequately supported and protected from damage. Tubing passing through concrete or masonry shall be sleeved and protected from abrasion and electrolytic action.

**909.13.1 Materials.** Control air tubing shall be hard drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type, in accordance with ASME B 16.18 or ASME B16.22. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP-5 brazing alloy with solidus above 1,100°F (593.3°C) and liquids below 1,500°F (816.6°C). Brazing flux shall be used on copper-to-brass joints only.

**Exception:** Nonmetallic tubing used within control panels and at the final connection to devices [provided] provided all of the following conditions are met:

1. Tubing shall [be listed by an approved agency for flame and smoke characteristics] comply with the optical density, flame spread, and the listing & labeling requirements of Section 602.2.1.3 of the *New York City Mechanical Code*.

2. Tubing and connected devices shall be completely enclosed within a galvanized or paint-grade steel enclosure having a minimum thickness of 0.0296 inch (0.7534 mm) (No. 22 gage). Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or Teflon or by suitable brass compression to male-barbed adapter.

3. Tubing shall be identified by appropriately documented coding.

4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.

**909.13.2 Isolation from other functions.** Control tubing serving other than smoke control functions shall be isolated by automatic isolation valves or shall be an independent system.

**909.13.3 Testing.** Control air tubing shall be tested at three times the operating pressure for not less than 30 minutes without any noticeable loss in gauge pressure prior to final connection to devices.

**909.14 Marking and identification.** The detection and control systems shall be clearly marked at all junctions, accesses and terminations.

**909.15 Control diagrams.** Identical control diagrams showing all devices in the system and identifying their location and function shall be maintained current and kept on file with the
department, the Fire Department and in the fire command center in a format and manner approved by the Fire Commissioner.

909.16 [Fire-fighter’s] Firefighter’s smoke control panel. A [fire-fighter’s] firefighter’s smoke control panel for Fire Department emergency response purposes only shall be provided and shall include manual control or override of automatic control for mechanical smoke control systems. The panel shall be located in a fire command center complying with Section 911 in high-rise buildings or buildings with smoke-protected assembly seating. In all other buildings, the [fire-fighter’s] firefighter’s smoke control panel shall be installed in the ground floor lobby of the building, adjacent to the fire alarm control panel or remote annunciator, or in another approved location. The firefighter’s smoke control panel shall either be a separate panel or can be integrated with a UUKL listed fire alarm control panel. The [fire-fighter’s] firefighter’s smoke control panel shall comply with Sections 909.16.1 through 909.16.3 [and NFPA 72 Annex E, Fire Service Annunciator and Interface]. Where required in Section [916] 917, the post-fire smoke purge system shall be manually activated from the [fire-fighter’s] firefighter’s control panel or an adjacent panel.

909.16.1 Panel indicators. Fans within the building shall be shown on the [fire-fighter’s] firefighter’s control panel. A clear indication of the direction of airflow and the relationship of components shall be displayed. Status indicators shall be provided for all smoke control equipment, annunciated by fan and zone, and by pilot-lamp-type indicators as follows:

1. Fans, dampers and other operating equipment in their normal status—WHITE.

2. Fans, dampers and other operating equipment in their [off] on or [closed] open status—[RED] GREEN.

3. Fans, dampers and other operating equipment in [their on or open] a fault status—[GREEN] YELLOW/AMBER.

4. Fans, dampers and other operating equipment in [a fault] their off or closed status—[YELLOW/AMBER] RED.

The indicators shall be provided in the following order: WHITE, GREEN, YELLOW/AMBER then RED.

909.16.2 Panel controls. The [fire-fighter’s] firefighter’s control panel shall provide control capability over the complete [smoke-control] smoke control system equipment within the building as follows:

1. ON-AUTO-OFF control over each individual piece of operating smoke control equipment that can also be controlled from other sources within the building. This includes stairway pressurization fans; smoke exhaust fans; supply, return and exhaust fans; elevator shaft fans and other operating equipment used or intended for smoke control purposes.

2. OPEN-AUTO-CLOSE control over [individual] dampers relating to smoke control and that are also controlled from other sources within the building. Dampers are permitted to be controlled by individual damper or grouped by smoke zone.
3. ON-OFF or OPEN-CLOSE control over smoke control and other critical equipment associated with a fire or smoke emergency and that can only be controlled from the [fire-fighter’s] firefighter’s control panel. The [fire-fighter’s] firefighter’s control panel shall be configured as described in Section 911.

Exceptions:

1. [Complex systems] Systems, where approved by the commissioner and the Fire Department, where the controls and indicators are combined to control and indicate all elements of a single smoke zone as a unit.

2. [Complex systems] Systems, where approved by the commissioner and the Fire Department, where the control is accomplished by computer interface using approved, plain English commands.

909.16.3 Control action and priorities. The [fire-fighter’s] firefighter’s control panel actions shall be as follows:

1. ON-OFF[,] and OPEN-CLOSE control actions shall have the highest priority of any control point within the building. Once issued from the [fire-fighter’s] firefighter’s control panel, [no] automatic or manual control from any other control point within the building shall not contradict the control action. Where automatic means are provided to interrupt normal, nonemergency equipment operation or produce a specific result to safeguard the building or equipment [i.e., including, but not limited to, duct freezestats, duct smoke detectors, high-temperature cutouts, temperature-actuated linkage and similar devices], such means shall be capable of being overridden by the [fire-fighter’s] firefighter’s control panel. The last control action as indicated by each [fire-fighter’s] firefighter’s control panel switch position shall prevail. [In no case shall control] Control actions shall not require the smoke control system to assume more than one configuration at any one time.

   Exception: Power disconnects required by the New York City Electrical Code.

2. Only the AUTO position of each three-position [fire-fighter’s] firefighter’s control panel switch shall allow automatic or manual control action from other control points within the building. The AUTO position shall be the NORMAL, nonemergency, building control position. Where a [fire-fighter’s] firefighter’s control panel is in the AUTO position, the actual status of the device (on, off, open, closed) shall continue to be indicated by the status indicator described [above. When] in Section 909.16.1. Where directed by an automatic signal to assume an emergency condition, the NORMAL position shall become the emergency condition for that device or group of devices within the zone. [In no case shall control] Control actions shall not require the smoke control system to assume more than one configuration at any one time.

909.17 System response time. Smoke-control system activation shall be initiated immediately after receipt of an appropriate automatic or manual activation command. Smoke control systems shall activate individual components (such as dampers and fans) in the sequence necessary to prevent physical damage to the fans, dampers, ducts and other equipment. For purposes of smoke control, the [fire-fighter’s] firefighter’s control panel response time shall be the same for automatic or manual
smoke control action initiated from any other building control point. The total response time, including that necessary for detection, shutdown of operating equipment and smoke control system startup, shall allow for full operational mode to be achieved before the conditions in the space exceed the design smoke condition. The system response time for each component and their sequential relationships shall be detailed in the required rational analysis and verification of their installed condition reported in the required final report.

909.18 Acceptance testing. Devices, equipment, components and sequences shall be individually tested. These tests, in addition to those required by other provisions of this code, shall consist of determination of function, sequence and, where applicable, capacity of their installed condition.

909.18.1 Detection devices. Smoke or fire detectors that are a part of a smoke control system shall be tested in accordance with Chapter 9 in their installed condition. When applicable, this testing shall include verification of airflow in both minimum and maximum conditions.

909.18.2 Ducts. Ducts that are part of a smoke control system shall be traversed using generally accepted practices to determine actual air quantities.

909.18.3 Dampers. Dampers shall be tested for function in their installed condition.

909.18.4 Inlets and outlets. Inlets and outlets shall be read using generally accepted practices to determine air quantities.

909.18.5 Fans. Fans shall be examined for correct rotation. Measurements of voltage, amperage, revolutions per minute (rpm) and belt tension shall be made.

909.18.6 Smoke barriers. Measurements using inclined manometers or other approved calibrated measuring devices shall be made of the pressure differences across smoke barriers. Such measurements shall be conducted for each possible smoke control condition.

909.18.7 Controls. Each smoke zone[1] equipped with an automatic-initiation device[2] shall be put into operation by the actuation of one such device. Each additional device within the zone shall be verified to cause the same sequence without requiring the operation of fan motors in order to prevent damage. Control sequences shall be verified throughout the system, including verification of override from the [fire-fighter’s] firefighter’s control panel and simulation of standby power conditions.

909.18.8 Special inspections for smoke control. Smoke control systems shall be tested by a special inspector in accordance with Chapter 17.

909.18.8.1 Scope of testing. Special inspections shall be conducted in accordance with the following:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.

2. Prior to occupancy and after sufficient completion for the purposes of pressure-difference testing, flow measurements, and detection and control verification.
909.18.8.2 Qualifications. Special inspectors for smoke control shall have a certification as air balancers and expertise in fire protection engineering or mechanical engineering.

909.18.8.3 Reports. A complete report of testing shall be prepared by the special inspector or approved agency. The report shall include identification of all devices by manufacturer, nameplate data, design values, measured values and identification tag or mark. The report shall be reviewed by the responsible engineer and, when satisfied that the design intent has been achieved, the engineer shall seal, sign and date the report.

909.18.8.3.1 Report filing. A copy of the final report and each inspection report shall be filed with the department and Fire Commissioner, and an identical copy shall be maintained in an approved location at the building.

909.18.9 Identification and documentation. Charts, drawings and other documents identifying and locating each component of the smoke control system, and describing its proper function and maintenance requirements, shall be maintained on file at the building as an attachment to the report required by Section 909.18.8.3. Devices shall have an approved identifying tag or mark on them consistent with the other required documentation and shall be dated indicating the last time they were successfully tested and by whom.

909.18.10 Reacceptance testing. The smoke control system shall require a reacceptance test after any modifications to the system or physical changes to the building that may affect system performance. Reacceptance testing shall be a retest of the entire system in accordance with Sections 909.18.1 through 909.18.9.

909.19 System acceptance. Buildings, or portions thereof, required by this code to comply with this section shall not be issued a certificate of occupancy until such time that the department determines that the provisions of this section have been fully satisfied and a written maintenance program is approved by the New York City Fire Department.

Exception: In buildings of phased construction, the department may issue a temporary certificate of occupancy provided that those portions of the building to be occupied meet the requirements of this section and that the remainder does not pose a significant hazard to the safety of the proposed occupants or adjacent buildings.

909.20 Smokeproof enclosures. Where required by Section [4022.9] 1023.11, a smoke proof enclosure shall be constructed in accordance with this section. Where access to the roof is required by the New York City Fire Code, such access shall be from the smoke proof enclosure where a smoke proof enclosure is required. Smokeproof enclosures shall consist of one of the following systems:

1. An enclosed interior exit stairway constructed in accordance with Section [4022.4] 1023 and accessed through an open exterior balcony.

2. An enclosed interior exit stairway constructed in accordance with Section [4022.4] 1023 and accessed through a naturally ventilated vestibule.

3. An enclosed interior exit stairway constructed in accordance with Section [4022.4] 1023 and accessed through a mechanically ventilated vestibule.
4. A pressurized interior exit stairway constructed in accordance with Section 1022.4

909.20.1 Access. Access to the interior exit stairway or ramp shall be by way of a vestibule or an open exterior balcony, unless such stairway is pressurized in accordance with Section 909.20.5. The minimum dimension of the vestibule or open exterior balcony shall not be less than the required width of the corridor leading to the vestibule or open exterior balcony but shall not have a width of less than 44 inches (1118 mm) and shall not have a length of less than 72 inches (1829 mm) in the direction of egress travel.

909.20.2 Construction. The smoke proof enclosure shall be separated from the remainder of the building by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both. Openings are not permitted other than the required means of egress doors. The vestibule shall be separated from the stairway or ramp by not less than a 2-hour fire-resistance-rated fire barrier. The open exterior balcony shall be constructed in accordance with the fire-resistance-rating requirements for floor construction.

909.20.2.1 Door closers. Doors in a smoke proof enclosure shall be self- or automatic-closing by actuation of a smoke detector in accordance with Section 715.4, and shall be installed at the floor-side entrance to the smoke proof enclosure in accordance with Section 715.4.8. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smoke proof enclosure at all levels. Smoke detectors shall be installed in accordance with Section 907.3.

909.20.3 Natural ventilation alternative. The provisions of Sections 909.20.3.1 through 909.20.3.3 shall apply to ventilation of smoke proof enclosures by natural means.

909.20.3.1 Balcony doors. Where access to the stairway or ramp is by way of an open exterior balcony, the door assembly into the enclosure shall be a fire door assembly in accordance with Section 715.4, and shall be installed at the floor-side entrance to the smoke proof enclosure in accordance with Section 715.4.8. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smoke proof enclosure at all levels. Smoke detectors shall be installed in accordance with Section 907.3.

909.20.3.2 Vestibule doors. Where access to the stairway or ramp is by way of a vestibule, the door assembly into the vestibule shall be a fire door assembly complying with Section 716.5. The door assembly from the vestibule to the stairway shall have not less than a 90-minute fire protection rating complying with Section 716.5.

909.20.3.3 Vestibule ventilation. Each vestibule shall have a minimum net area of 16 square feet (1.5 m²) of opening in a wall facing an outer court, yard or public way that is not less than 20 feet (6096 mm) in width.

909.20.4 Mechanical ventilation alternative. The provisions of Sections 909.20.4.1 through 909.20.4.5 shall apply to ventilation of smoke proof enclosures by mechanical means.

909.20.4.1 Vestibule doors. The door assembly from the building into the vestibule shall be a fire door assembly complying with Section 715.4, and shall be installed at the floor-side entrance to the smoke proof enclosure in accordance with Section 715.4.8. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smoke proof enclosure at all levels. Smoke detectors shall be installed in accordance with Section 907.3.
rating and shall meet the requirements for a smoke door assembly in accordance with Section [715.4.3] 716.5.3. The door shall be installed in accordance with NFPA 105.

909.20.4.2 Vestibule ventilation. The vestibule shall be supplied with not less than one air change per minute and the exhaust shall not be less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 6 inches ([152] 152.4 mm) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 6 inches ([152] 152.4 mm) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling dampers are permitted where necessary to meet the design requirements, but dampers are not otherwise required.

909.20.4.2.1 Engineered ventilation system. Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor-side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Section 907.3.

909.20.4.3 Smoke trap. The vestibule ceiling shall [be at least] not be less than 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward-moving air column. The height shall not be decreased unless approved and justified by design and test.

909.20.4.4 [Stair] Stairway or ramp shaft air movement system. The [stair] stairway or ramp shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 0.10 inch of water ([25] 24.9 Pa) in the shaft relative to the vestibule with all doors closed. The system shall maintain a maximum of 0.35 inch of water ([87] 87.2 Pa) in the shaft relative to the building measured with all stairway doors closed under maximum anticipated stack pressures.

909.20.4.5 Door opening force. Door opening force shall not exceed limits in Section [1008.1.3] 1010.1.3.

909.20.5 [Stair] Stairway and ramp pressurization alternative. Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the vestibule is not required, provided that each interior exit stairway or ramp is pressurized to a minimum of not less than 0.10 inches [inch] inch of water ([25] 24.9 Pa) and a maximum of not more than 0.35 inches of water ([87] 87.2 Pa) in the shaft relative to the building measured with all interior exit stairway and ramp doors closed under maximum anticipated conditions of stack effect and wind effect.

909.20.6 Ventilating equipment. The activation of ventilating equipment required by the alternatives in Sections 909.20.4 and 909.20.5 shall be by smoke detectors installed at each floor level at an approved location at the entrance to the smokeproof enclosure. When the closing device for the [stair] stairway and ramp shaft and vestibule doors is activated by smoke detection or
power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.3.

909.20.6.1 Ventilation systems. Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both.

2. Equipment, control wiring, power wiring and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both.

3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section [742] 711, or both.

Exceptions:

1. Control wiring and power wiring utilizing a 2-hour rated cable or cable system in accordance with UL 2196.

2. Where encased with not less than 2 inches (50.8 mm) of concrete.

3. Control wiring and power wiring protected by a listed electrical circuit protective system with a fire-resistance rating of not less than 2 hours.

909.20.6.2 Standby power. Mechanical vestibule and stairway and ramp shaft ventilation systems and automatic fire detection systems shall be powered with standby power system conforming to Section 403.4.8 and Chapter 2702.

909.20.6.3 Acceptance and testing. Before the mechanical equipment is approved, the system shall be tested in the presence of the department or approved agency to confirm that the system is operating in compliance with these requirements.

909.21 Elevator hoistway pressurization alternative. Where elevator hoistway pressurization is provided in lieu of required enclosed elevator lobbies, the pressurization system shall comply with Sections 909.21.1 through 909.21.11.
909.21.1 Pressurization requirements. Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.10 inch of water (24.9 Pa) and a maximum positive pressure of 0.25 inch of water (62.2 Pa) with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The pressure differentials shall be measured between the hoistway and the adjacent elevator landing. The opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Exceptions:

1. On floors containing only Group R occupancies, the pressure differential is permitted to be measured between the hoistway and a dwelling unit or sleeping unit.

2. Where an elevator opens into a lobby enclosed in accordance with Section 3007.6 or 3008.7, the pressure differential is permitted to be measured between the hoistway and the floor space immediately outside of the door(s) to the enclosed lobby.

3. The pressure differential is permitted to be measured relative to the outdoor atmosphere on floors other than the following:
   3.1. The fire floor.
   3.2. The two floors immediately below the fire floor.
   3.3. The floor immediately above the fire floor.

4. The minimum positive pressure of 0.10 inch of water (24.9 Pa) and a maximum positive pressure of 0.25 inch of water (62.2 Pa) with respect to occupied floors are not required at the floors of recall with the doors open.

909.21.1.1 Use of ventilation systems. Ventilation systems, other than hoistway supply air systems, are permitted to be used to exhaust air from adjacent spaces on the fire floor, two floors immediately below and one floor immediately above the fire floor to the building’s exterior where necessary to maintain positive pressure relationships as required in Section 909.21.1 during operation of the elevator shaft pressurization system.

Where ventilation systems are being used as a component of the elevator hoistway pressurization system, they shall comply with Section 909.21.

909.21.2 Rational analysis. A rational analysis complying with Section 909.4 shall be submitted with the construction documents.

909.21.3 Ducts for system. Any duct system that is part of the pressurization system shall be protected with the same fire-resistance rating as required for the elevator shaft enclosure.

909.21.4 Fan system. The fan system provided for the pressurization system shall be as required by Sections 909.21.4.1 through 909.21.4.4.
909.21.4.1 **Fire resistance.** Where located within the building, the fan system that provides the pressurization shall be protected with the same fire-resistance rating required for the elevator shaft enclosure.

909.21.4.2 **Smoke detection.** The supply fan system shall be equipped with a smoke detector that will automatically shut down the supply fan system when smoke is detected within the system.

909.21.4.3 **Separate systems.** A separate fan system shall be used for each elevator hoistway.

909.21.4.4 **Fan capacity.** The supply fan capacity shall be specified by a registered design professional to meet the requirements of a designed pressurization system in accordance with the rational analysis required by Section 909.21.2.

909.21.5 **Standby power.** The pressurization system, including ventilation systems used per Section 909.21.1.1, shall be provided with standby power in accordance with Section 2702.

909.21.6 **Activation of pressurization system.** The elevator pressurization system shall be activated upon activation of either the building fire alarm system or the elevator landing smoke detectors. Where both a building fire alarm system and elevator landing smoke detectors are present, each shall be independently capable of activating the pressurization system.

909.21.7 **Testing and special inspections.** Special inspections for performance shall be required in accordance with Section 909.18.8. System acceptance testing shall be in accordance with Section 909.19.

909.21.8 **Marking and identification.** Detection and control systems shall be marked in accordance with Section 909.14.

909.21.9 **Control diagrams.** Control diagrams shall be provided in accordance with Section 909.15.

909.21.10 **Firefighter’s smoke control panel.** A control panel complying with Section 909.16 shall be provided.

909.21.11 **System response time.** Hoistway pressurization systems shall comply with the requirements for smoke control system response time in Section 909.17.

**SECTION BC 910**

**SMOKE AND HEAT [VENTS] REMOVAL**

910.1 **General.** Where required by this code [or otherwise installed], smoke and heat vents or mechanical smoke [exhaust] removal systems [and draft curtains] shall conform to the requirements of this section.

910.2 **Where required.** Smoke and heat vents or a mechanical smoke removal system shall be installed as required by Sections 910.2.1 and 910.2.2.

Exceptions:
1. Frozen-food warehouses used solely for storage of Class I and II commodities where protected by an automatic sprinkler system in accordance with Section 903.3.1.1.

2. Smoke and heat removal shall not be required in areas of buildings equipped with early suppression fast-response (ESFR) sprinklers or automatic smoke and heat vents shall not be required within these areas.

3. Smoke and heat removal shall not be required in areas of buildings equipped with control mode special application sprinklers with a response time index of 50 \( (m \cdot s)^{1/2} \) or less that are listed to control a fire in stored commodities with 12 or fewer sprinklers.

[910.2 Where required. Smoke and heat vents shall be installed in the roofs of buildings or portions thereof occupied for the uses set forth in Sections 910.2.1 and 910.2.2. Vents shall be installed at the top of a closed shaft in accordance with Section 708.12.1-]

910.2.1 Group F-1 or S-1. Buildings Smoke and heat vents installed in accordance with Section 910.3 or a mechanical smoke removal system installed in accordance with Section 910.4 shall be installed in buildings and portions thereof used as a Group F-1 or S-1 occupancy having more than 50,000 square feet \([4645.2 m^2]\) of undivided area. In occupied portions of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the upper surface of the story is not a roof assembly, a mechanical smoke removal system in accordance with Section 910.4 shall be installed.

Exception: Group S-1 aircraft repair hangars.

910.2.2 High-piled combustible storage. Buildings Smoke and heat removal for buildings and portions thereof containing high-piled combustible [stock or rack] storage in any occupancy group shall be installed in accordance with Section 413 of this code and the New York City Fire Code and Section 413 of this code. Installation shall also be in conformance with Section 910.3 in unsprinklered buildings and portions thereof.

In buildings and portions thereof containing high-piled combustible storage equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a smoke and heat removal system shall be installed in accordance with Section 910.3 or 910.4. In occupied portions of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the upper surface of the story is not a roof assembly, a mechanical smoke removal system in accordance with Section 910.4 shall be installed.

910.3 [Design and installation] Smoke and heat vents. The design and installation of smoke and heat vents [and draft curtains] shall be [as specified] in accordance with Sections 910.3.1 [and Table 910.3] through 910.3.3.

[TABLE 910.3]
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS*]
### Design Listing and Labeling

Smoke and heat vents shall be listed and labeled to indicate compliance with UL 793 or FM 4430.

### Vent Operation

Smoke and heat vents shall be capable of being operated by approved automatic and manual means. Automatic operation of smoke and heat vents shall conform to the provisions of Sections 910.3.2.1 through 910.3.2.3.

### Gravity-operated Drop-out Vents

Automatic smoke and heat vents containing heat-sensitive glazing designed to shrink and drop out of the vent opening when exposed to

[For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².]

1. Requirements for rack storage heights in excess of those indicated shall be in accordance with the New York City Fire Code. For solid-piled storage heights in excess of those indicated, an approved engineered design shall be used.

2. Vents adjacent to walls or draft curtains shall be located within a horizontal distance not greater than the maximum distance specified in this column as measured perpendicular to the wall or draft curtain that forms the perimeter of the draft curtained area.

3. Where draft curtains are not required, the vent area to floor area ratio shall be calculated based on a minimum draft curtain depth of 6 feet (Option 1).

4. H is the height of the vent, in feet, above the floor.
fire shall fully open within 5 minutes after the vent cavity is exposed to a simulated fire, represented by a time-temperature gradient that reaches an air temperature of 500°F (260°C) within 5 minutes.

[910.3.2.2 Sprinklered buildings. Where installed in buildings provided with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke and heat vents shall be designed to operate automatically.]

[910.3.2.3 Nonsprinklered buildings. Where installed in buildings not provided with an automatic sprinkler system, smoke and heat vents shall operate automatically by actuation of a heat-responsive device rated at between 100°F (38°C) and 220°F (104°C) above ambient.]

[Exception: Gravity-operated drop-out vents complying with Section 910.3.2.1.]

[910.3.3 Vent dimensions. The effective venting area shall not be less than 16 square feet (1.5 m²) with no dimension less than 4 feet (1219 mm), excluding ribs or gutters having a total width not exceeding 6 inches (152 mm).]

[910.3.4 Vent locations. 910.3.2 Smoke and heat vent locations. Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barriers. Vents shall be uniformly located within the roof in the areas of the building where the vents are required to be installed by Section 910.2, with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.]
\[ V = \text{Volume (ft}^3\text{) of the area that requires smoke removal.} \]

For unsprinklered buildings:

\[ A_{VR} = \frac{A_{FA}}{50} \quad \text{(Equation 9-3)} \]

where:

\[ A_{VR} = \text{The required aggregate vent area (ft}^2\text{).} \]

\[ A_{FA} = \text{The area of the floor in the area that requires smoke removal.} \]

910.4 Mechanical smoke [exhaust] removal systems. [Where approved by the department, engineered mechanical smoke exhaust shall be an acceptable alternate to smoke and heat vents. Mechanical smoke removal systems shall be designed and installed in accordance with Sections 910.4.1 through 910.4.7.]

[910.4.1 Location. Exhaust fans shall be uniformly spaced within each draft-curtained area and the maximum distance between fans shall not be greater than 100 feet (30 480mm).]

910.4.1 Automatic sprinklers required. The building shall be equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

[910.4.2 Size. Fans shall have a maximum individual capacity of 30,000 cfm (14.2 m\(^3\)/s). The aggregate capacity of smoke exhaust fans shall be determined by the equation:]

\[ C = A \times 300 \quad \text{(Equation 9-4)} \]

where:

\[ C = \text{Capacity of mechanical ventilation required, in cubic feet per minute (m}^3\text{/s).} \]

\[ A = \text{Area of roof vents provided in square feet (m}^2\text{) in accordance with Table 910.3.} \]

910.4.2 Exhaust fan construction. Exhaust fans that are part of a mechanical smoke removal system shall be rated for operation at 221°F (105°C). Exhaust fan motors shall be located outside of the exhaust fan air stream.

910.4.3 [Operation. Mechanical smoke exhaust fans shall be automatically activated by the automatic sprinkler system or by heat detectors having operating characteristics equivalent to those described in Section 910.3.2. Individual manual controls of each fan unit shall also be provided.] System design criteria. The mechanical smoke removal system shall be sized to exhaust the building at a minimum rate of two air changes per hour based upon the volume of the building or portion thereof without contents. The capacity of each exhaust fan shall not exceed 30,000 cubic feet per minute (14.2 m\(^3\)/sec).

910.4.3.1 Makeup air. No portion of the makeup air openings shall be higher than 6 feet (1828.8 mm) above the floor level. Operation of makeup air openings shall be manual or, if properly coordinated with the smoke removal system, automatic. The minimum gross area of makeup air inlets shall be 8 square feet per 1,000 cubic feet per minute (0.74 m\(^2\) per 0.4719 m\(^3\)/s) of smoke exhaust.
910.4.4 **Activation.** The mechanical smoke removal system shall be started by manual controls.

910.4.4 **Wiring and control.** Wiring for operation and control of smoke exhaust fans shall be connected ahead of the main disconnect and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes. Controls

910.4.5 **Manual control location.** Manual controls shall be located so as to be immediately accessible to the Fire Department from the exterior door of the building and protected against interior fire exposure by not less than 1-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both. The location of manual controls is subject to the approval of the Fire Commissioner.

910.4.5 **Supply air.** Supply air for exhaust fans shall be provided at or near the floor level and shall be sized to provide a minimum of 50 percent of required exhaust. Openings for supply air shall be uniformly distributed around the periphery of the area served.

910.4.6 **Interlocks.** In combination comfort air-handling/smoke removal systems or independent comfort air-handling systems, fans shall be controlled to shut down in accordance with the approved smoke control sequence. Control wiring. Wiring for operation and control of mechanical smoke removal systems shall be connected ahead of the main disconnect in accordance with the New York City Electrical Code and be protected against interior fire exposure to temperatures in excess of 1,000°F (537.8°C) for a period of not less than 15 minutes.

910.4.7 **Controls.** Where building air-handling and mechanical smoke removal systems are combined or where independent building air-handling systems are provided, fans shall automatically shut down in accordance with the New York City Mechanical Code. The manual controls provided for the smoke removal system shall have the capability to override the automatic shutdown of fans that are part of the smoke removal system.

910.5 **Maintenance.** Smoke and heat vents and mechanical smoke removal systems shall be maintained in accordance with the New York City Fire Code.

SECTION BC 911
FIRE COMMAND CENTER

911.1 **General.** Where required by other sections of this code and in all buildings classified as high-rise buildings by this code, a fire command center for Fire Department operations shall be provided and shall comply with Sections 911.1.1 through 911.1.6.

911.1.1 **Location and access.** The fire command center location shall be in the lobby of the building on the main entrance floor near the Fire Department designated response point.

911.1.2 Reserved.

911.1.3 Reserved.

911.1.4 Reserved.
911.1.5 Storage. Storage unrelated to operation of the fire command center shall be prohibited.

911.1.6 Required features. The fire command center shall comply with the New York City Fire Code and NFPA 72 and shall include the following features as applicable in their respective control units or panels:

1. Fire alarm control unit:
   1.1. The emergency voice/alarm communication system control unit.
   1.2. The two-way communications system.
   1.3 Fire detection and alarm system annunciator.
   1.4 Controls for unlocking stairway doors and locked elevator vestibule doors simultaneously.
   1.5 Sprinkler valve and water-flow detector display panels.
   1.6 Emergency and standby power status indicators (generator running, generator failure to start).
   1.7 Fire pump status indicators.
   1.8 Elevator fire recall switch in accordance with ASME A17.1.

3. Elevator control panel:
   3.1 Annunciator visually indicating the location of the elevators and whether they are operational.
   3.2 Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

4. The [fire-fighter’s] firefighter’s control panel required by Section 909.16 for smoke control systems installed in the building.

5. Monitoring/Control for Post-Fire Smoke Purge:
   5.1 Status indicators and controls for air distribution systems.
   5.2 Manual controls of post-fire smoke purge system in accordance with Section [916.2.3] 917.2.3.

6. A telephone for Fire Department use with controlled access to the public telephone system.

7. Public address system, where specifically required by other sections of this code.
8. Manual controls for the release of doors that are automatic-closing by the actuation of smoke detectors or activation of the fire alarm in accordance with the exception to Section [708.7] 713.7.

**911.2 Secondary fire command center.** Where required in locations described in Appendix G of this code, a secondary fire command center shall be provided subject to the approval of the Fire Department. Design and installation requirements shall be in accordance with NFPA 72.

**SECTION BC 912**
**FIRE DEPARTMENT CONNECTIONS**

**912.1 Installation.** Fire Department connections shall be installed in accordance with the NFPA standard applicable to the system design and shall comply with Sections 912.2 through 912.6.

**912.2 Location.** With respect to hydrants, driveways, buildings and landscaping, Fire Department connections shall be so located that fire apparatus and hose connected to supply the system will not obstruct access to the buildings for other fire apparatus.

**912.2.1 Fire Department connections.** The location of Fire Department connections shall be as follows:

- **912.2.1.1** One Fire Department connection shall be provided for each 300 feet (91 140 mm) of exterior building wall or fraction thereof facing upon each street or public space.

- **912.2.1.2** Where buildings face upon two parallel streets or public spaces without an intersecting street or public space, one connection shall be provided for each 300 feet (91 140 mm) of exterior building wall or fraction thereof facing upon each such parallel street or public space.

- **912.2.1.3** Where a building faces upon two intersecting streets or public spaces and the total length of the exterior building walls facing upon such streets or public spaces does not exceed 300 feet (91 140 mm), only one Fire Department connection need be installed provided the Fire Department connection is located within 15 feet (4572 mm) of the corner and on the street with the longest building frontage.

- **912.2.1.4** Where a building faces on three streets or public spaces, one Fire Department connection shall be provided for each 300 feet (91 140 mm) of building wall or fraction thereof facing upon such streets or public spaces provided that at least one Fire Department connection is installed on each of the parallel streets or public spaces, and further provided that the Fire Department connections shall be located so that the distance between them does not exceed 300 feet (91 140 mm).

- **912.2.1.5** Where a building faces upon four streets or public spaces, at least one Fire Department connection shall be provided on each street front or public space; however, only one Fire Department connection need be provided at the corner of two intersecting streets or public spaces if the Fire Department connection is located within 15 feet (4572 mm) of the corner and on the street with the longest building frontage or public space, and if the distances between Fire Department connections, in all cases, do not exceed 300 feet (91 140 mm).
912.2.1.6 In any case where the exterior building walls of a building facing a street or public space are obstructed in part by another building, one Fire Department connection shall be provided for each clear 300 feet (91.140 mm) of exterior building wall or fraction thereof facing upon such street or public space.

912.2.2 Existing buildings. On existing buildings, wherever the Fire Department connection is not visible to approaching fire apparatus, the Fire Department connection shall be indicated by an approved sign mounted on the street front or on the side of the building. Such sign shall have the letters “FDC” [at least] not less than 6 inches (152.4 mm) high and words in letters [at least] not less than 2 inches (50.8 mm) high or an arrow to indicate the location. Such signs shall be subject to the approval of the Fire Department.

912.3 Fire hose threads. Fire hose threads used in connection with standpipe, sprinkler and combination standpipe-sprinkler systems shall be approved and shall be compatible with New York City Fire Department hose threads.

912.4 Access. Immediate access to Fire Department connections shall be maintained at all times and without obstruction by fences, bushes, trees, walls or any other object. A working space of not less than 36 inches (914 mm) in width, 36 inches (914 mm) in depth and 78 inches (1981 mm) in height shall be provided and maintained in front of and to the sides of wall-mounted Fire Department connections and around the circumference of free-standing Fire Department connections, except as otherwise required or approved.

Exception: Fences, where provided with an access gate and a means of emergency operation that shall be maintained operational at all times in accordance with the New York City Fire Code.

912.4.1 Locking Fire Department connection caps. The Fire Department may require locking caps on Fire Department connections in accordance with the New York City Fire Code.

912.4.2 Clear space around connections. A working space of not less than 36 inches (914.4 mm) in width, 36 inches (914.4 mm) in depth and 78 inches (1981.2 mm) in height shall be provided and maintained in front of and to the sides of wall-mounted Fire Department connections and around the circumference of free-standing Fire Department connections, except as otherwise required or approved by the Fire Commissioner.

912.4.3 Physical protection. Where Fire Department connections are subject to impact by a motor vehicle, vehicle impact protection shall be provided in accordance with the New York City Fire Code.

912.5 Signs. Fire Department connections shall be provided with signage in accordance with Section 912 of the New York City Fire Code.

912.6 Backflow protection. The potable water supply to automatic sprinkler and standpipe systems shall be protected against backflow as required by the New York City Plumbing Code.
SECTION BC 913
FIRE PUMPS

913.1 General. Where provided or required, fire pumps shall be installed in accordance with this section, NFPA 20[Appendix Q] and other applicable sections of this code.

913.2 Protection against interruption of service. The fire pump, driver and controller shall be protected in accordance with NFPA 20 against possible interruption of service.

913.2.1 Protection of fire pump rooms. Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Section 707 or 2-hour horizontal assemblies constructed in accordance with Section [712] 711, or both.

Exceptions:

1. In other than high-rise buildings, separation by 1-hour fire barriers constructed in accordance with Section 707 or 1-hour horizontal assemblies constructed in accordance with Section [712] 711, or both, shall be permitted in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

2. Separation is not required for fire pumps physically separated in accordance with NFPA 20.

3. Separation is not required for a fire pump, other than an automatic standpipe fire pump, where such fire pump is located in a mechanical equipment room, as defined by the New York City Mechanical Code, enclosed by 2-hour fire barriers constructed in accordance with Section 707 or 2-hour horizontal assemblies constructed in accordance with Section [712] 711, or both. Refrigerants, gas piping, gas consumption devices, gas meters or any other gas equipment and fuel storage or fuel consuming appliances shall not be installed in any space housing a fire pump.

913.2.2 Circuits supplying fire pumps. Cables used for survivability of circuits supplying fire pumps shall be in accordance with the New York City Electrical Code. Electrical circuit protective systems shall be installed in accordance with their listing requirements, and the New York City Electrical Code.

913.3 Temperature of pump room. Suitable means shall be provided for maintaining the temperature of a pump room or pump house, where required, above 40°F (5°C).

913.3.1 Engine manufacturer’s recommendation. Temperature of the pump room, pump house or area where engines are installed shall never be less than the minimum recommended by the engine manufacturer. The engine manufacturer’s recommendations for oil heaters shall be followed.

913.4 Valve supervision. Where provided, the fire pump suction, discharge and bypass valves, and isolation valves on the backflow prevention device or assembly shall be supervised open as required by Section 907.
913.4.1 Test outlet control valve supervision. Fire pump test outlet control valves shall be supervised in the closed position. Individual hose valves on the test header are not required to be monitored.

913.5 Acceptance test. Acceptance testing shall be done in accordance with the requirements of Section 1705.30 of this code, the New York City Fire Code and NFPA 20. Refurbished or repaired fire pumps shall be tested in accordance with Section 1705.30 of this code, the New York City Fire Code and NFPA 20. All such tests shall be scheduled to include a department representative as a witness, if required.

SECTION BC 914
EMERGENCY RESPONDER SAFETY FEATURES

914.1 Shaftway markings. Vertical shafts shall be identified as required by the New York City Fire Code and Sections 914.1.1 and 914.1.2 of this code.

914.1.1 Exterior access to shaftways. Outside openings accessible to the Fire Department and that open directly on a hoistway or shaftway communicating between two or more floors in a building shall be plainly marked with the word “SHAFTWAY” in red letters [at least] not less than 6 inches (∓ 152.4 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible from the outside of the building.

914.1.2 Interior access to shaftways. Door or window openings to a hoistway or shaftway from the interior of the building shall be plainly marked with the word “SHAFTWAY” in red letters [at least] not less than 6 inches (∓ 152.4 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible.

Exception: Markings shall not be required on shaftway openings that are readily discernible as openings onto a shaftway by the construction or arrangement.

914.2 Equipment room identification. Fire protection equipment shall be identified in an approved manner. Rooms containing controls for air-conditioning systems, sprinkler risers and valves or other fire detection, suppression or control elements shall be identified for the use of the Fire Department. Approved signs required to identify fire protection equipment and equipment location shall be constructed of durable materials, permanently installed and readily visible.

SECTION BC 915
[RESERVED]
CARBON MONOXIDE DETECTION

915.1 Carbon monoxide alarms and detectors. Carbon monoxide alarms and detectors shall be provided and installed in accordance with Sections 915.1.1 through 915.7.

915.1.1 Group I-1 and R occupancies. Listed carbon monoxide alarms or detectors shall be installed as follows:

1. Group I-1, Group R-1, and Group R-2 where the main use or dominant occupancy of a building is classified as Group R-2 student apartments. Carbon monoxide detectors and
audible notification appliances shall be installed in affected dwelling units in accordance with Section 915.1.1.1 and shall be annunciated by dwelling unit at a constantly attended location from which the fire alarm system is capable of being manually activated.

2. Groups R-2 (other than occupancies covered by Item 1) and R-3. Carbon monoxide alarms shall be installed in affected dwelling units in accordance with Section 915.1.1.1.

915.1.1.1 Affected dwelling units. Carbon monoxide alarms or detectors shall be required within the following dwelling units:

1. Units on the same story where carbon monoxide-producing equipment or enclosed parking is located.

2. Units on the stories immediately above and below the floor where carbon monoxide-producing equipment or enclosed parking is located.

3. Units in a building containing a carbon monoxide-producing furnace, boiler, or water heater as part of a central system.

4. Units in a building served by a carbon monoxide-producing furnace, boiler, or water heater as part of a central system that is located in an adjoining or attached building.

915.1.1.1.1 Required locations within dwelling units. Carbon monoxide alarms or detectors shall be located within dwelling units as follows:

1. Outside of any room used for sleeping purposes, within 15 feet (4572 mm) of the entrance to such room.

2. In any room used for sleeping purposes.

3. On any story within a dwelling unit, including below-grade stories and penthouses of any area, but not including crawl spaces and uninhabitable attics.

915.1.1.2 Exhaust of Carbon Monoxide in Group R-3 Occupancy (One- and Two-Family dwellings and townhouses). Means of exhausting carbon monoxide from garages shall be provided when a carbon monoxide alarm or detector is activated in a Group R-3 occupancy, provided such garage is attached within the Group R-3 occupancy. Such exhaust system shall be arranged to operate automatically upon detection of a concentration of carbon monoxide of 35 parts per million (ppm) or greater by approved automatic detection device. The system shall be capable of producing an exhaust rate of 1.5 cfm per square foot of floor area of the garage. Removal of sensor, interruption of power or cut wires shall cause the relay circuit to open and start fan. The relay contact shall close and the fan may shut off when the carbon monoxide level is below 35 ppm. Carbon monoxide exhausting means shall be connected to a separate circuit and provided with a lock and identified at the power source. Such circuit shall not be connected to a power source through an arc-fault or Ground Fault Circuit Interrupter (GFCI) devices. Additionally, when the carbon monoxide exhausting means is connected to the plug-in-
type overcurrent protection device, such device shall be secured in place by an additional fastener.

915.1.2 Buildings that are equipped with a fire alarm system and that contain Group A-1, A-2, A-3, Group B or Group M occupancies. Listed carbon monoxide detectors shall be installed in buildings that are equipped with a fire alarm system and that contain Group A-1, A-2 or A-3, Group B or Group M occupancies. Such carbon monoxide detectors installed pursuant to this section shall have built-in sounder bases, shall transmit a carbon monoxide alarm signal to a central supervising station and shall be permitted to initiate an audible and visual supervisory signal at a constantly attended location. The department shall adopt rules and/or reference standards governing the installation and location of carbon monoxide detectors provided such detectors shall be required within rooms containing carbon monoxide-producing equipment and addressing the installation of such detectors or any alternative means of compliance in existing buildings.

915.1.2.1 Retroactive provisions for existing buildings. Notwithstanding any other provision of law, listed carbon monoxide detectors shall be installed in existing buildings that are equipped with a fire alarm system and that contain group A-1, A-2, A-3, Group B or Group M occupancies in accordance with Section 915.1.2 by July 1, 2021.

915.2 Group E, I-2 and I-4 occupancies. Listed carbon monoxide detectors with built-in sounder bases shall transmit a carbon monoxide alarm signal to a central supervising station and shall be permitted to initiate an audible and visual supervisory signal at a constantly attended location.

1. Carbon monoxide detectors with built-in sounder bases shall be installed within any room containing carbon monoxide-producing equipment.

2. Carbon monoxide detectors with built-in sounder bases shall be installed in corridors on the story where carbon monoxide-producing equipment unit is located, as well as one story above and one story below.

3. Carbon monoxide detectors with built-in sounder bases shall be installed in all corridors on the story where enclosed parking or a loading dock is located, as well as one story above and one story below.

915.3 Installation requirement for all occupancies. Where a fire alarm system is required or provided, carbon monoxide detectors with sounder bases shall be installed within any room containing carbon monoxide-producing equipment.

915.3.1 Equipment shutdown. Activation of a carbon monoxide detector located at the source of carbon monoxide-producing equipment shall shut down that source.

Exception: This provision does not apply where the source is a generator.

915.4 Detection equipment. Carbon monoxide detection required by Sections 915.1 through 915.2 shall be provided by carbon monoxide alarms complying with Section 915.5 or carbon monoxide detection systems complying with Section 915.6, unless otherwise specified in this code.
915.5 **Carbon monoxide alarms.** Carbon monoxide alarms shall comply with Sections 915.5.1 through 915.5.4.

915.5.1 **Power source.** Carbon monoxide alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source, and when primary power is interrupted, shall receive power from a battery. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection.

**Exception:** Where installed in buildings without commercial power, battery-powered carbon monoxide alarms shall be an acceptable alternative.

915.5.2 **Listings.** Carbon monoxide alarms shall be listed in accordance with UL 2034.

915.5.3 **Combination alarms.** Combination carbon monoxide/smoke alarms shall be an acceptable alternative to carbon monoxide alarms. Combination carbon monoxide/smoke alarms shall be listed in accordance with UL 2034 and UL 217.

915.5.4 **Interconnection of alarms.** When two or more alarms are installed, they shall be interconnected in accordance with NFPA 720.

915.6 **Carbon monoxide detection systems.** Carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide alarms and shall comply with Sections 915.6.1 through 915.6.4.

915.6.1 **General.** Carbon monoxide detection systems shall comply with NFPA 720. Carbon monoxide detectors shall be listed in accordance with UL 2075.

915.6.2 **Locations.** Carbon monoxide detectors shall be installed in the locations specified in Section 915.2. These locations supersede the locations specified in NFPA 720.

915.6.3 **Combination detectors.** Combination carbon monoxide/smoke detectors installed in carbon monoxide detection systems shall be an acceptable alternative to carbon monoxide detectors, provided they are listed in accordance with UL 2075 and UL 268.

915.6.4 **Wiring and power supply.** Wiring and power supply for carbon monoxide detectors shall comply with Sections 907.6.1 and 907.6.2, respectively.

915.7 **Inspection, testing and maintenance.** Carbon monoxide alarms and carbon monoxide detection systems shall be inspected, tested and maintained in accordance with NFPA 720 and the *New York City Fire Code*.

**SECTION BC 916**

**FIRE DEPARTMENT IN-BUILDING AUXILIARY RADIO COMMUNICATION SYSTEM (ARCS)**

916.1 **General.** This section covers the design, installation and performance criteria of Fire Department In-Building Auxiliary Radio Communication System (ARCS). Such systems shall be designed and installed by the *New York City Fire Code*, Sections 403 and 907 of this code, or where
installed voluntarily, such systems shall be designed and installed in accordance with this section, NFPA 72, the *New York City Electrical Code* and in accordance with Fire Department requirements.

**916.1.1 Construction documents.** Construction documents for ARCS shall be submitted for approval to the Fire Department prior to system installation. Construction documents shall include, but need not be limited to, all of the following:

1. Type of radio equipment and antenna.
2. Riser diagram and floor plans showing location of elements of the ARCS, including but not limited to building fire command center or fire alarm control panel, dedicated radio console, base station and all other critical system components such as antennas, amplifiers, cables as applicable.
3. Legend of all ARCS symbols and abbreviations used.
4. Location of primary and secondary power source.
5. Specification and listing details for all equipment, devices and cables.

**916.1.2 Acceptance testing, maintenance and operational testing.** Acceptance testing, maintenance and operational testing of the ARCS shall be performed in accordance with the *New York City Fire Code* and rules promulgated by the Fire Department.

**916.2 Instructions.** Operating, testing and maintenance instructions and record drawings (“as-builts”) and detailed specifications of all the components shall be provided at an approved location.

**916.3 Where required.** ARCS, which shall be in accordance with this section, shall be required in the following:

1. High-rise buildings constructed in accordance with Section 403.
2. Underground buildings constructed in accordance with Section 405.
3. Buildings having a total gross area exceeding 250,000 square feet (23 225.8 m²).

**Exceptions:**

1. Group R-2 buildings that meet all of the following requirements:
   a. The highest occupied floor is less than 125 feet (38 100 mm) above the lowest level of Fire Department vehicle access;
   b. The building has no more than 1 story below grade; and
   c. The floor area of the building does not exceed 250,000 square feet (23 225.8 m²).
2. Where it is determined by the Fire Department that a radio communication system is not required.
SECTION BC 917
POST-FIRE SMOKE PURGE SYSTEMS

[916.1] 917.1 Scope and purpose. The purpose of this section is to establish minimum requirements for the design and installation of post-fire smoke purge systems, which are intended for the timely restoration of operations and overhaul activities once a fire is extinguished. Post-fire smoke purge systems are not intended or designed as life safety systems and are not required to meet the provisions of Section 909. Post-fire smoke purge systems shall be required in:

1. High-rise buildings subject to Section 403.

2. Buildings with any story exceeding 50,000 square feet ([4645] 4645.2 m²) in floor area.

3. Building with spaces exceeding 100 feet (30 480 mm) from natural ventilation openings. Natural ventilation openings shall consist of operable windows and doors of at least 5 percent of the floor area or roof vents per Section 910.

4. High-piled stock or rack storage in accordance with the New York City Fire Code.

Exceptions: A post-fire smoke purge system is not required in Group R-2 occupancies where either of the following conditions exists:

1. Openable windows. A [postfire] post-fire smoke purge system is not required where every habitable room located in dwelling units is provided with windows complying with Chapter 12 and all of the following:

   1.1. Minimum window area. Each required window shall provide at least 12 square feet (1.1 m²) of glazed area. The total area of all such windows shall not be less than 10 percent of the floor area of the room or space served.

   1.2. Minimum openable area. Each required window shall provide a minimum of 6 square feet (0.56 m²) of openable area. The total area of all such openings shall not be less than 5 percent of the floor area of the room or space served. In addition, each required openable area shall be:

      1.2.1. Located wholly at least 30 inches (762 mm) above the finished floor; and

      1.2.2. Fully openable to the minimum 6 square feet (0.56 m²), at all times and without limiting stops or devices. Such openings may be achieved through the use of double-hung, sliding, or similar types of windows. However, in the event of the use of casement-, hopper-, pivot-, or awning-type windows, such windows shall satisfy the requirements of this section only when they open to at least 75 degrees (1.22 rad).

1.3 Window guards. This exception shall not apply where the type of window guards installed in compliance with Section 27-2043.1 of the Administrative Code and Section 131.15 of the New York City Health Code requires the installation of limiting devices or stops.
2. **Smokeproof enclosures.** A post-fire smoke purge system is not required where all exits are constructed as smokeproof enclosures in accordance with Section 1022.9 1023.11.

[916.2] **917.2** Post-fire smoke purge systems in occupancy groups other than R-2.

[916.2.1] **917.2.1 General design requirements.** Post-fire smoke purge systems are permitted to use dedicated equipment, the normal building HVAC system or other openings and shall have the capability to exhaust smoke from occupied spaces. Smoke removal may be by either mechanical or natural ventilation, but shall be capable of removing cold smoke. Smoke removed from a space must be discharged to a safe location outside the building and shall not be recirculated into the building in accordance with the *New York City Mechanical Code*.

[916.2.2] **917.2.2 Exhaust capability.** The system shall have an air supply and smoke exhaust capability that will provide a minimum of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft²) \[
\left(0.00508 \text{ m}^3/\text{s} \cdot \text{m}^2\right)\] (0.00508 m³/s·m²), whichever is greater. The system need not exhaust from all areas at the same time, but is permitted to be zoned based on the largest fire area served. For the purpose of calculating system size, the height of a compartment shall be considered to run from slab to slab and include the volume above suspended ceilings. Provisions shall be made for sufficient make-up air. The provisions may include operable windows, doors, building leakage, or mechanical systems. In buildings having occupied floors located less than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access, breakable windows may be utilized.

[916.2.3] **917.2.3 Operation.** The post-fire smoke purge system shall be operated by manual controls that are part of the fire command center, in accordance with Section 911, or fire alarm control unit when a fire command center is not required. Such control center or panel shall display a graphic indicating the portions of the building served by each post-fire smoke purge system. When a system is zoned into areas of operation less than the entire building, each zone shall have an individual control. Fire Department manual controls of post-fire smoke purge systems shall not override the manual or automatic operation of the smoke control system. Such Fire Department manual controls shall override the fire shutdown signal from the fire alarm system.

**917.2.4 Interior exit stairways or ramps or exit passageways in occupancies other than Group R-2.** Interior exit stairways or ramps or exit passageways shall not be used as a portion of the post-fire smoke purge system in occupancies other than Group R-2. Doors in interior exit stairways or ramps or exit passageways shall not be permitted to be used as a portion of the post-fire smoke purge system. Air transfer and duct openings associated with the post-fire smoke purge system shall not be permitted in the interior exit stairway or ramp or exit passageway.

[916.3] **917.3** Post-fire smoke purge systems in occupancy Group R-2. Post-fire smoke purge systems in Group R-2 occupancies shall comply with either Section 916.3.1 or 916.3.2 917.3.1 or 917.3.2. Smoke removed must be discharged to a safe location outside the building and shall not be recirculated into the building in accordance with the *New York City Mechanical Code*.

[916.3.1] **917.3.1 Stair ventilation.** The top of all enclosed exit stairs shall be provided with a reversible fan system capable of introducing fresh air or exhausting air at a rate of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft²) \[
\left(0.00508 \text{ m}^3/\text{s} \cdot \text{m}^2\right)\] (0.00508 m³/s·m²).
m$^{3}$/s $\cdot$ m$^{2}$), whichever is greater, based on the area of the largest floor. Such system shall be operated by manual controls that are part of the fire command center, as per Section 911, or fire alarm panel when a fire command center is not required. Such control center or panel shall display a graphic indicating the portions of the building served by each post-fire smoke purge system. The operation of such system shall be controlled by Fire Department personnel by manually opening stair doors at the appropriate story.

[916.3.2] 917.3.2 Corridor ventilation. The ducts and fans that provide fresh air supply to the public corridors in accordance with the New York City Mechanical Code shall be provided with reversible fans and duct sizes capable of introducing fresh air to or exhausting air from the corridor at a rate of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft$^2$) [(0.00508 m$^3$/s $\cdot$ m$^{2}$)] (0.00508 m$^3$/s $\cdot$ m$^{2}$), whichever is greater, based on the area of the largest apartment plus the area of the public corridor. Such system shall be operated by manual controls that are part of the fire command center, as per Section 911 of this code, or fire alarm panel when a fire command center is not required. Each floor to be ventilated shall be by individual controls. Such control center or panel shall display a graphic indicating the portions of the building served by each postfire smoke purge system.

[916.4] 917.4 Maintenance. The building owner shall maintain [postfire] post-fire smoke exhaust systems in good operational condition. Records of testing shall be maintained on the premises for inspection by the department and Fire Department personnel.

[SECTION BC 917]
[FIRE DEPARTMENT IN BUILDING AUXILIARY RADIO COMMUNICATION SYSTEM (ARCS)]

[917.1 General. This section covers the design, installation and performance criteria of Fire Department In Building Auxiliary Radio Communication System (ARCS). Where required to be installed by Section 403, Section 907, or the New York City Fire Code or where installed voluntarily, such systems shall be designed and installed in accordance with this section, NFPA 72 as modified in Appendix Q, the New York City Electrical Code and as per requirements set forth by the Fire Department.]

[917.1.1 Construction documents. Construction documents for ARCS shall be submitted for review and approval to the Fire Department prior to system installation. Construction documents shall include, but need not be limited to, all of the following:]

[1. Type of radio equipment and antenna.]

[2. Riser diagram and floor plans showing location of elements of the ARCS, including but not limited to building fire command center or fire alarm control panel, dedicated radio console, base station/s and all other critical system components such as antennas, amplifiers, cables as applicable.]

[3. Legend of all ARCS symbols and abbreviations used.]

[4. Location of primary and secondary power source.]
SECTION BC 918
GAS DETECTION SYSTEMS

918.1 Gas detection systems. Gas detection systems, including systems designed to detect flammable, toxic, asphyxiants and other gases, required by the New York City Construction Codes or the New York City Fire Code, shall comply with Sections 918.2 through 918.10 of this code.

918.2 Design and installation. Gas detection systems shall be designed and installed in accordance with this code, the New York City Electrical Code, and manufacturer’s instructions. Such systems shall be inspected, tested and maintained in accordance with the New York City Fire Code.

918.2.1 Construction documents. Construction documents for gas detection systems shall be submitted for review and approval to the Fire Department prior to system installation. Construction documents shall include, but not be limited to, the following:

1. Gas detection system devices and equipment.

2. Engineering evaluation.

3. Items required by Section 907.1.1, as applicable.

918.3 Equipment. Gas detection system devices and equipment shall be designed for use with the particular gas being detected.

918.4 Reserved.

918.5 Emergency power. Gas detection systems shall be provided with emergency power in accordance with the New York City Fire Code and Chapter 27 of this code.

918.6 Sensor locations. Where leaking gases are expected to accumulate, sensors shall be installed in approved locations in accordance with the New York City Fire Code and NFPA 72.

918.7 Gas sampling. Gas detection systems shall perform continuous gas sampling. Sample analysis shall be processed immediately after sampling, except as follows:

1. For HPM gases, sample analysis shall be performed at intervals not exceeding 30 minutes.

2. For toxic gases, sample analysis shall be performed at intervals not exceeding 5 minutes in accordance with the Section 6004 of the New York City Fire Code.
3. Where a less frequent or delayed sampling interval is approved by the Fire Commissioner.

918.8 System activation. Gas detection systems shall activate and initiate an alarm system in compliance with the requirements of Sections 918.8.1 and 918.8.2.

918.8.1 Activation thresholds. A gas detection system alarm shall be initiated when a sensor detects a concentration of gas exceeding the following thresholds unless otherwise specified in this code or the New York City Fire Code:

1. For flammable gases, a gas concentration exceeding 25 percent of the lower flammability limit (LFL).

2. For nonflammable gases, a gas concentration exceeding one-half of the immediately dangerous to life and health (IDLH) concentration.

918.8.2 Alarm signals. The gas detection system shall initiate a local alarm and transmit a signal to a constantly attended control station when a short-term hazard condition is detected. The alarm shall be both visible and audible and shall provide warning both inside and outside the area where gas is detected. The audible alarm shall be distinct from all other alarms.

918.8.3 Shutoff of gas supply. The gas detection system shall automatically close the shutoff valve at the source of gas supply piping and tubing related to the system being monitored for whichever gas is detected.

Exception: Automatic shutdown is not required for reactors utilized for the production of highly toxic or toxic compressed gases where such reactors comply with all of the following:

1. Operated at pressures less than 15 pounds per square inch gauge (psig) (103.4 kPa).

2. Constantly attended.

3. Provided with readily accessible emergency shutoff valves.

918.8.4 Valve closure. The automatic closure of shutoff valves shall be in accordance with the following:

1. When the gas-detection sampling point initiating the gas detection system alarm is within a gas cabinet or exhausted enclosure, the shutoff valve in the gas cabinet or exhausted enclosure for the specific gas detected shall automatically close.

2. Where the gas-detection sampling point initiating the gas detection system alarm is within a gas room and compressed gas containers are not in gas cabinets or exhausted enclosures, the shutoff valves on all gas lines for the specific gas detected shall automatically close.

3. Where the gas-detection sampling point initiating the gas detection system alarm is within a piping distribution manifold enclosure, the shutoff valve for the compressed container of specific gas detected supplying the manifold shall automatically close.
**Exception:** When the gas-detection sampling point initiating the gas detection system alarm is at a use location or within a gas valve enclosure of a branch line downstream of a piping distribution manifold, the shutoff valve in the gas valve enclosure for the branch line located in the piping distribution manifold enclosure shall automatically close.

918.9 Reserved.

918.10 Fire alarm system connections. Gas detection systems shall be connected to and monitored at the Fire Command Center or fire alarm control unit where required or provided. Where a Fire Command Center or fire alarm control unit is not required or provided, an approved gas detection system control panel or annunciator shall be installed at the building main front entrance. A gas detection system shall be monitored by a central supervising station. Gas detection supervisory and alarm signals shall be transmitted as separate and distinct signals to the central supervising station.

§11 Chapter 10 of the New York city building code, as amended by, sections BC 1012, BC 1017, BC 1019 and BC 1024 as added by, and sections BC 1013, BC 1014, BC 1015, BC 1016, BC 1018, BC 1020, BC 1021, BC 1022, BC 1023, BC 1025, BC 1026, BC 1027, BC 1028, BC 1029 and BC 1030 as renumbered and amended by local law number 141 for the year 2013, sections 28-1022.1 and 28-1022.8 as amended by and section 28-1022.8.5 as added by local law number 17 for the year 2014, and section 28-1009.4.2 as amended by local law number 51 for the year 2014, is amended to read as follows:

**CHAPTER 10**
**MEANS OF EGRESS**

**SECTION BC 1001**
**ADMINISTRATION**

1001.1 General. Buildings or portions thereof shall be provided with a means of egress system as required by this chapter. The provisions of this chapter shall control the design, construction and arrangement of means of egress components required to provide an approved means of egress from structures and portions thereof.

1001.2 Minimum requirements. It shall be unlawful to alter a building or structure in a manner that will reduce the number of exits or the minimum width or required capacity of the means of egress to less than required by this code.

1001.3 Maintenance. Means of egress shall be maintained in accordance with the *New York City Fire Code*.

1001.3.1 Workplace exits. Except as specifically provided for in this chapter, no employer or agent of such employer shall lock the doors of or otherwise prohibit exit from any workplace,
when by so doing the health or safety of any employee, independent contractor or other individual working in such workplace may become endangered by fire or other hazardous condition. Refer to Article 307 of Title 28 of the *Administrative Code*.

**1001.4 Fire protection and emergency preparedness plans.** Fire protection plans shall be provided for occupancies and buildings where required by Article 109 of the *Administrative Code*. Such fire protection plans shall comply with the applicable provisions of Section 28-109.3 of the *Administrative Code*. Emergency preparedness plans shall be provided for occupancies and buildings where required by the *New York City Fire Code*. Such emergency preparedness plans shall comply with the applicable provisions of Chapter 4 of the *New York City Fire Code*.

**SECTION BC 1002 DEFINITIONS**

1002.1 Definitions. [The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.] This section contains terms defined elsewhere in the code, and terms with definitions that are specific to this section.

1002.1.1 Terms defined elsewhere in this code. The following terms are defined in Chapter 2:

ACCESSIBLE MEANS OF EGRESS. [A continuous and unobstructed way of egress travel from any accessible point in a building or facility to a public way. Such way of egress travel may include an assisted rescue path.]

AISLE. [An unenclosed exit access component that defines and provides a path of egress travel.]

AISLE ACCESSWAY. [That portion of an exit access that leads to an aisle.]

ALTERNATING TREAD DEVICE. [A device that has a series of steps between 50 and 70 degrees (0.87 and 1.22 rad) from horizontal, usually attached to a center support rail in an alternating manner so that the user does not have both feet on the same level at the same time.]

AREA OF RESCUE ASSISTANCE. [An area where persons unable to use stairways can remain temporarily to await instructions or assistance during emergency evacuation.]

ASSEMBLY SPACE.

ASSISTED RESCUE PATH. [A portion of the accessible means of egress which begins at the area of rescue assistance and terminates at the public way.]

BLEACHERS. [Tiered seating supported on a dedicated structural system and two or more rows high and is not a building element (see “Grandstand”).]

BREAKOUT.
COLLECTING SAFE AREA. A safe area that receives occupants from the assembly space it serves, as well as from other safe areas.

COMMON PATH OF EGRESS TRAVEL. That portion of exit access which the occupants are required to traverse before two separate and distinct paths of egress travel to two exits are available. Paths that merge are common paths of travel. Common paths of egress travel shall be included within the permitted travel distance.

CORRIDOR. An enclosed exit access component that defines and provides a path of egress travel to an exit. Corridors shall be either interior or public.

CORRIDOR, INTERIOR. A corridor that serves only one tenant. In Group E occupancies, corridors serving only one institution shall be deemed as serving a single tenant.

CORRIDOR, PUBLIC. A corridor that serves more than one tenant.

CROSS AISLE. An unenclosed exit access component in a place of assembly usually parallel to rows of seats, connecting aisles or connecting an aisle and an exit. For the purposes of this chapter, a cross aisle is not an aisle.

DEAD END. A portion of a corridor in which the travel to an exit is in one direction only.

DOOR, BALANCED. A door equipped with double-pivoted hardware so designed as to cause a semicounterbalanced swing action when opening.

EGRESS COURT. A court or yard which provides access to a public way for one or more exits.

EMERGENCY ESCAPE AND RESCUE OPENING. An operable window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.

EXIT. That portion of a means of egress system, which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives as required to provide a protected path of egress travel between the exit access and the exit discharge. Exits include exterior exit doors at the level of exit discharge, vertical exit enclosures, exit passageways, exterior exit stairways, exterior exit ramps and horizontal exits, but do not include access stairs, aisles, exit access doors opening to corridors, or corridors.

EXIT ACCESS. That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit.

EXIT ACCESS DOORWAY. A door or access point along the path of egress travel from an occupied room, area or space where the path of egress enters an intervening room, corridor, unenclosed exit access stair or unenclosed exit access ramp.

EXIT ACCESS RAMP.

EXIT ACCESS STAIRWAY.
EXIT DISCHARGE. [That portion of a means of egress system between the termination of an exit and a public way.]

EXIT DISCHARGE, LEVEL OF. [The story at the point at which an exit terminates and an exit discharge begins.]

EXIT ENCLOSURE. An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.

EXIT, HORIZONTAL. [An exit that provides a path of egress travel from one building to an area in another building on approximately the same level, or a path of egress travel through or around a wall or partition to an area on approximately the same level in the same building, or a bridge or tunnel between two buildings, which affords safety from fire and smoke from the area of incidence and areas communicating therewith.]

EXIT PASSAGEWAY. [An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protectives, and provides for a protected path of egress travel in a horizontal direction to the exit discharge or the public way.]

EXTERIOR EXIT RAMP.

EXTERIOR EXIT STAIRWAY.

FIRE EXIT HARDWARE. [Panic hardware that is listed for use on fire door assemblies.]

FIXED SEATING.

FLIGHT. [A continuous run of rectangular treads, winders or combination thereof from one landing to another.]

FLOOR AREA, GROSS. [The floor area within the inside perimeter of the exterior walls of the building under consideration, exclusive of courts, without deduction for corridors, stairways, closets, the thickness of interior walls, columns or other features. The floor area of a building, or portion thereof, not provided with surrounding exterior walls shall be the usable area under the horizontal projection of the roof or floor above. The gross floor area shall not include interior courts.]

FLOOR AREA, NET. [The actual occupied area not including the thickness of walls, partitions, columns, furred-in spaces, fixed cabinets, equipment, and unoccupied accessory areas such as corridors, stairways, toilet rooms, mechanical rooms and closets.]

FOLDING AND TELESCOPIC SEATING. [Tiered seating having an overall shape and size that is capable of being reduced for purposes of moving or storing and is not a building element.]

GRANDSTAND. [Tiered seating supported on a dedicated structural system and two or more rows high and is not a building element (see “Bleachers”).]
GUARD. [A building component or a system of building components located at or near the open sides of elevated walking surfaces that minimizes the possibility of a fall from the walking surface to a lower level.]

HANDRAIL. [A horizontal or sloping rail intended for grasping by the hand for guidance or support.]

INTERIOR EXIT RAMP.

INTERIOR EXIT STAIRWAY.

LOW ENERGY POWER-OPERATED DOOR.

MEANS OF EGRESS. [A continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way. A means of egress consists of three separate and distinct parts: the exit access, the exit, and the exit discharge.]

MERCHANDISE PAD. [A merchandise pad is an area for display of merchandise surrounded by aisles, permanent fixtures or walls. Merchandise pads contain elements such as nonfixed and moveable fixtures, cases, racks, counters and partitions from which customers browse or shop.]

NOSING. [The leading edge of treads of stairs and of landings at the top of stairway flights.]

OCCUPANT LOAD. [The number of persons for which the means of egress of a building or portion thereof is designed.]

OCCUPANT SENSOR.

OPEN-ENDED CORRIDOR.

OPEN EXTERIOR SPACE. [A street or other public space; or a yard, court, or plaza open on one or more sides and unroofed or open on all sides, which provides egress to a street or public space.]

PANIC HARDWARE. [A door-latching assembly incorporating a device that releases the latch upon the application of a force in the direction of egress travel.] [Having the property of emitting light that continues for a length of time after excitation by visible or invisible light has been removed.]

PHOTOSENSOR.

POWER-ASSISTED DOOR.

POWER-OPERATED DOOR.

PUBLIC WAY. [A street, alley or other parcel of land open to the outside air leading to a street, that has been deeded, dedicated or otherwise permanently appropriated to the public for public use and which has a clear width and height of not less than 10 feet (3048 mm).]
RAMP. [A walking surface that has a running slope steeper than one unit vertical in 20 units horizontal (5-percent slope).]

REFUGE AREA. [A floor area to which egress is made through a horizontal exit.]

SAFE AREA. An interior or exterior space that serves as a means of egress by providing a transitional area from, and that also serves as a normal means of entry to, an assembly space.

SCISSOR [STAIR] STAIRWAY. [Two interlocking stairways providing two separate paths of egress located within one stairwell enclosure.]

SEATING SECTION. An area of seating bounded on all sides by aisles, cross aisles, walls or partitions.

SELF-LUMINOUS. [Illuminated by a self contained power source, other than batteries, and operated independently of external power sources.]

SMOKE-PROTECTED ASSEMBLY SEATING. [Seating served by means of egress that is not subject to smoke accumulation within or under a structure.]

STAIR. [A change in elevation, consisting of two or more risers.]

STAIRWAY. [One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.]

STAIRWAY, EXTERIOR. A stairway that is open on at least one side, except for required structural columns, beams, handrails and guards. The adjoining open areas shall be either yards, courts or public ways. The other sides of the exterior stairway need not be open.

STAIRWAY, INTERIOR. A stairway not meeting the definition of an exterior stairway.

STAIRWAY, SPIRAL. A stairway having a closed circular form in its plan view with uniform section-shaped treads attached to and radiating from a minimum diameter supporting column.

STAIRWAY, SPIRAL.

SUITE. A group of patient treatment rooms or patient sleeping rooms within Group I-2 occupancies where staff are in attendance within the suite, for supervision of all patients within the suite and the suite is in compliance with the requirements of Sections 1014.2.2 through 1014.2.7.

WINDER. [A stair tread with nonparallel edges.]

1002.1.2 Definitions specific to this chapter. The following terms shall, for the purposes of this chapter, have the meanings shown herein:

COLLECTING SAFE AREA. A safe area that receives occupants from the assembly
space it serves, as well as from other safe areas.

**OPEN EXTERIOR SPACE.** A street or other public space; or a yard, court, or plaza open on one or more sides and unroofed or open on all sides, which provides egress to a street or public space.

**SAFE AREA.** An interior or exterior space that serves as a means of egress by providing a transitional area from, and that also serves as a normal means of entry to, an assembly space.

**SEATING SECTION.** An area of seating bounded on all sides by aisles, cross aisles, walls or partitions.

### SECTION BC 1003
**GENERAL MEANS OF EGRESS**

**1003.1 Applicability.** The general requirements specified in Sections 1003 through 1015 shall apply to all three elements of the means of egress system, in addition to those specific requirements for the exit access, the exit and the exit discharge detailed elsewhere in this chapter.

**1003.2 Ceiling height.** The means of egress shall have a ceiling height of not less than 7 feet, 6 inches (2286 mm).

**Exceptions:**

1. Ceilings that are permitted to be less than 7 feet, 6 inches (2286 mm) in accordance with Section 1208.2.

2. Ceilings of dwelling units and sleeping units within residential occupancies in accordance with Section 1208.2.

3. Allowable projections in accordance with Section 1003.3.

4. Stair headroom in accordance with Section [1009.2] 1011.3.

5. Door height in accordance with Section [1008.1] 1010.1.3.

6. Ramp headroom in accordance with Section [1010.5] 1012.5.2.

7. The clear height of floor levels in vehicular and pedestrian traffic areas [in] of public and private parking garages in accordance with Section [406.2] 406.4.1.

8. Areas above and below mezzanine floors in accordance with Section [505.1] 505.2.

**1003.3 Protruding objects.** Protruding objects on circulation paths shall comply with the requirements of Sections 1003.3.1 through 1003.3.4.

1. **Headroom.** Protruding objects are permitted to extend below the minimum ceiling height required by Section 1003.2 provided where a minimum headroom of 84 inches (2134 mm)
shall be provided over any walking surface, including walks, corridors, aisles and passageways. Not more than 50 percent of the ceiling area of a means of egress shall be reduced in height by protruding objects.

**Exception:** Door closers and stops shall not reduce headroom to less than 78 inches ([4984] 1981.2 mm).

A barrier shall be provided where the vertical clearance is less than 80 inches (2032 mm) high. The leading edge of such a barrier shall be located 27 inches ([686] 685 mm) maximum above the floor.

**1003.3.2 Post-mounted objects.** A free-standing object mounted on a post or pylon shall not overhang that post or pylon more than 4 inches ([402] 101.6 mm) where the lowest point of the leading edge is more than 27 inches ([686] 685 mm) and less than 80 inches (2032 mm) above the walking surface. Where a sign or other obstruction is mounted between posts or pylons and the clear distance between the posts or pylons is greater than 12 inches ([305] 304.8 mm), the lowest edge of such sign or obstruction shall be 27 inches ([686] 685 mm) maximum or 80 inches (2032 mm) minimum above the finished floor or ground.

**Exception:** These requirements shall not apply to sloping portions of handrails between the top and bottom riser of stairs and above the ramp run.

**1003.3.3 Horizontal projections.** Objects with leading edges more than 4 inches (102 mm) over any walking surface between the heights of 27 inches ([686] 685 mm) and not more than 80 inches (2032 mm) above the finished floor shall not project horizontally more than 4 inches (101.6 mm) into the circulation path.

**Exception:** Handrails are permitted to protrude 4½ inches ([114] 114.3 mm) from the wall.

**1003.3.4 Clear width.** Protruding objects shall not reduce the minimum clear width of accessible routes.

**1003.4 Floor surface.** Walking surfaces of the means of egress shall have a slip-resistant surface and be securely attached.

**1003.5 Elevation change.** Where changes in elevation of less than 12 inches ([305] 304.8 mm) exist in the means of egress, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), ramps complying with Section [4049] 1012 shall be used. Where the difference in elevation is 6 inches ([152] 152.4 mm) or less, the ramp shall be equipped with handrails or floor finish materials that contrast with adjacent floor finish materials.

**Exceptions:** At locations that are not required to be accessible by Chapter 11:

1. A single step with a maximum riser height of 7 inches ([178] 177.8 mm) is permitted for buildings with occupancies in Groups F, H, R-2, R-3, S and U at exterior doors.
2. A step with a single riser or a stair with two risers and a tread is permitted [provided that] where the risers and treads comply with Section [4010.4] 1011.5, the minimum depth of the tread is 13 inches (330 mm) and [at least] not less than one handrail complying with Section [4042] 1014 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the step or stair.

3. A step is permitted in aisles serving seating that has a difference in elevation less than 12 inches (305 304.8 mm) provided that the risers and treads comply with Section [4128] 1029.13 and the aisle is provided with a handrail complying with Section [4128.13] 1029.15.

Throughout a story in a Group I-2 occupancy, any change in elevation in portions of the [exit access] means of egress that serve nonambulatory persons shall be by means of a ramp or sloped walkway.

**1003.6 Means of egress continuity.** The path of egress travel along a means of egress shall not be interrupted by [any] a building element other than a means of egress component as specified in this chapter. Obstructions shall not be placed in the minimum width or required [width] capacity of a means of egress component except projections permitted by this chapter. The minimum width or required capacity of a means of egress system shall not be diminished along the path of egress travel.

**1003.7 Elevators, escalators and moving walks.** Elevators, escalators and moving walks shall not be used as a component of a required means of egress from any other part of the building.

**Exceptions:**

1. Elevators used as a component of an accessible means of egress in accordance with Section [4007.4] 1009.4.

2. Elevators permitted to be used for occupant self-evacuation pursuant to Sections 403.5.2 and 403.6.2.

**SECTION BC 1004 OCCUPANT LOAD**

**1004.1 Design occupant load.** In determining means of egress requirements, the number of occupants for whom means of egress facilities shall be provided shall be established by the largest number computed in accordance with Section [41004.1.1] 1004.1.3, unless otherwise permitted by Section [41004.1.2] 1004.1.3.1, [1004.1.3] 1004.1.3.2 or 1004.2.[Where occupants from accessory areas egress through a primary space, the calculated occupant load for the primary space shall include the total occupant load of the primary space plus the number of occupants egressing through it from the accessory area.]

**1004.1.1 Cumulative occupant loads.** Cumulative occupant loads shall be determined in accordance with Sections 1004.1.1.1 and 1004.1.1.2.
1004.1.1.1 Cumulative occupant loads for interconnected spaces. Where the path of egress travel includes intervening rooms, areas or spaces, cumulative occupant loads shall be determined in accordance with this section.

1004.1.1.1.1 Intervening spaces or accessory areas. Where occupants egress from one or more rooms, areas or spaces through others, the design occupant load shall be the combined occupant load of interconnected accessory or intervening spaces. Design of egress path capacity shall be based on the cumulative portion of occupant loads of all rooms, areas or spaces to that point along the path of egress travel.

1004.1.1.2 Adjacent levels for mezzanines. That portion of the occupant load of a mezzanine with required egress through a room, area or space on an adjacent level shall be added to the occupant load of that room, area or space.

1004.1.1.3 Adjacent stories. Other than for the egress components designed for convergence in accordance with Section 1005.6, the occupant load from separate stories shall not be added.

1004.1.1.2 Cumulative occupant loads in Group R-2 occupancies. Rooms, areas or spaces that are accessory to a Group R-2 occupancy and that comply with the conditions below may have occupant loads calculated individually per room, area, or space, and be classified as Occupancy Group R-2.

1004.1.1.2.1 Maximum occupant load per room. The occupant load in each individual room, area and space, including those subject to Section 1004.1.1.1.1 where applicable, shall not exceed 74 persons.

1004.1.1.2.2 Separated rooms. Each individual room, area and space shall be separated from others by minimum 1-hour fire-resistance-rated fire barriers constructed in accordance with Section 707. Opening protectives in accordance with Exception 3 of Section 707.6 shall not be permitted.

1004.1.1.2.3 Group R-2 accessory spaces as primary function on a story. Where the aggregate Group R-2 occupancy accessory area of all rooms, areas or spaces, including outdoor spaces that are not provided with independent means of egress and that do not converge into interior means of egress, exceed 50 percent of the building area of the story in which they are located, and the total number of occupants on such story exceeds 150 persons, the following conditions shall apply:

1. The interior corridors or portions thereof serving such accessory spaces shall be constructed as public corridors in accordance with Table 1020.1.2 with 1-hour fire-resistance-rated fire barriers, and 2-hour fire-resistance-rated fire barriers where a dead-end corridor exceeds 40 feet (12 192 mm) in length;

2. Access to the corridors shall be limited to those necessary for exit access through the corridor from normally occupied spaces. Direct openings from the mechanical, electrical and other storage spaces shall not be permitted, except that access to the corridor may be provided through a vestibule constructed with fire barriers, with a
minimum fire-resistance rating consistent with the required hourly rating for the corridor;

3. Corridors or portions thereof serving such accessory spaces shall be sufficient to accommodate a total occupant load on the basis of 3 square feet (0.28 m²) per person;

4. The minimum dimension of such corridors shall be sufficient to accommodate the total occupant load discharging into such corridors, but shall in no case be less than 5 feet (1524 mm) in minimum dimension; and

5. In addition to Conditions 1 through 4 above, one of the following conditions shall be met:

5.1. Each of the interior exit stairways and ramps serving such story shall be protected by a smokeproof enclosure in accordance with Section 909.20;

5.2. The corridor or portions of the corridor serving the rooms, areas or spaces that are accessory to the Group R-2 occupancy shall be pressurized in accordance with requirements that are applicable to interior exit stairways. Connecting interior exit stairways need not be pressurized unless otherwise required by this code;

5.3. All passenger elevators serving the rooms, areas, or spaces that are accessory to the Group R-2 occupancy shall comply with occupant self-evacuation elevator requirements in Section 3008.1 through 3008.11; or

5.4. One additional exit stairway meeting the requirements of Sections 1009 and 1023 shall be provided in addition to the minimum number of exits required by Section 1006. The total width of any combination of remaining exit stairways with one exit stairway removed shall not be less than the total width required by Section 1005.3.

Rooms, areas or spaces that do not comply with the conditions in Sections 1004.1.1.2.1 and 1004.1.1.2.2, or Section 1004.1.1.2.3 where applicable, shall have occupant loads calculated cumulatively per story and be classified as Occupancy Group A.

1004.1.2 Multiple function occupant load. Where an area under consideration contains multiple functions having different occupant load factors, the design occupant load for such area shall be based on the floor area of each function calculated independently.

1004.1.3 Areas without fixed seating. The number of occupants shall be computed at the rate of one occupant per unit of area as prescribed in Table 1004.1.1.3. For areas without fixed seating, the occupant load shall be not [be] less than that number determined by dividing the floor area under consideration by the occupant load factor assigned to the function of the space as set forth in Table 1004.1.1.3.

1004.1.3.1 Modifications. Where the actual number of occupants of any space
will be significantly lower than listed in Table [1004.1.1] 1004.1.3, the commissioner may establish a lower basis for the determination of the number of occupants.

[1004.1.3] 1004.1.3.2 Unlisted functions. Where data regarding the square feet area per person for a function is not listed in Table [1004.1.1] 1004.1.3, the occupant load shall be established by a registered design professional, subject to the approval of the commissioner.

</table>

C* = capacity of all passenger vehicles that can be unloaded simultaneously.
For SI: 1 square foot = 0.0929 m², 1 foot = 304.8 mm.
a. Floor area in square feet per occupant.
b. For the purposes of occupant load calculation, permanent fixtures and amenities such as shrubs, decorative pools, non-walkable paving surfaces, etc. may be deducted from the total floor area.
c. A rooftop or terrace in Group R-2 or R-3 occupancies that is provided for the incidental, recreational use by the residential tenants residing in the same residential building.
d. Where the maximum occupant load of the rooftop or terrace exceeds 74 persons based on occupant load calculations, a Place of Assembly Certificate of Operation is required pursuant to Section 28.117.1 of the Administrative Code and Item 1 of Section 303.7 of this code.
e. To be used only when the occupant load for the function of the space is not listed elsewhere in Table 1004.1.3.

1004.2 Increased occupant load. The occupant load permitted in any building, or portion thereof, is permitted to be increased from that number established for the functions in Table [1004.1.1] 1004.1.3, provided that all other requirements of the code are also met based on such modified number and the occupant load shall not exceed one occupant per 5 square feet ([0.47] 0.46 m²) of occupiable floor space, except for safe areas as specified in Section 1029.19.3 and standee areas as specified in Section 1029.18. Where required by the commissioner, an approved aisle, seating or fixed equipment diagram substantiating any increase in occupant load shall be submitted. Where required by the commissioner, such diagram shall be posted. Capacity signs indicating the increased, stated occupant load in accordance with Sections 1029.1.3 and 1029.1.4 shall be posted where required by the commissioner.

[1004.3 Posting of occupant load. Every room or space that is an assembly occupancy shall have the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or authorized agent. Such sign shall also comply with Section 1028.1.2.]

[1004.4 Exiting from multiple levels. Where exits serve more than one floor, only the occupant load of each floor considered individually shall be used in computing the required capacity of the exits at that floor, provided that the exit capacity shall not decrease in the direction of egress travel.]
[1004.5 Egress convergence. Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.]

[1004.6 Mezzanine levels. The occupant load of a mezzanine level with egress onto a room or area below shall be added to that room or area’s occupant load, and the capacity of the exits shall be designed for the total occupant load thus established.]

[1004.7 1004.3 Fixed seating. For areas having fixed seats and aisles, the occupant load shall be determined by the number of fixed seats installed therein. The occupant load for areas in which fixed seating is not installed, such as waiting spaces [and wheelchair spaces], shall be determined in accordance with Section [1004.1.1] 1004.1.3 and added to the number of fixed seats.

The occupant load of wheelchair spaces and the associated companion seat shall be based on one occupant for each wheelchair space and one occupant for the associated companion seat provided in accordance with Section 1108.2.3.

For areas having fixed seating without dividing arms, the occupant load shall be not the number of seats based on one person for each 18 inches (457 mm) of seating length.

The occupant load of seating booths shall be based on one person for each 24 inches (609.6 mm) of booth seat length measured at the backrest of the seating booth.

[1004.8] 1004.4 Outdoor areas. Yards, patios, courts and similar outdoor areas accessible to and usable by the building occupants shall be provided with means of egress as required by this chapter. The occupant load of such outdoor areas shall be determined by the design professional subject to the approval of the commissioner. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the path of egress travel from the outdoor areas passes through the building, means of egress requirements for the building shall be based on the sum of the occupant loads of the building plus the outdoor areas.

Exceptions:

1. Outdoor areas used exclusively for service of the building need only have one means of egress.

2. Both outdoor areas associated with Group R-3 and individual dwelling units of Group R-2.

[1004.9] 1004.5 Multiple occupancies. Where a building contains two or more occupancies, the means of egress requirements shall apply to each portion of the building based on the occupancy of that space. Where two or more occupancies utilize portions of the same means of egress system, those egress components shall meet the more stringent requirements of all occupancies that are served.

SECTION BC 1005
MEANS OF EGRESS [WIDTH] SIZING

1005.1 General. All portions of the means of egress system shall be sized in accordance with this section.
Exception: Aisles and aisle accessways in rooms or spaces used for assembly purposes complying with Section 1029.

1005.2 Minimum [required egress] width based on component. The minimum width, in inches (mm), of any means of egress components shall be not less than that specified for such component elsewhere in this code. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by 0.3 inches (7.62 mm) per occupant for stairways and by 0.2 inches (5.08 mm) per occupant for other egress components. The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.]

[Exception: Means of egress complying with Section 1028.]

1005.3 Required capacity based on occupant load. The required capacity, in inches (mm), of the means of egress for any room, area, space or story shall be not less than that determined in accordance with Sections 1005.3.1 and 1005.3.2.

1005.3.1 Stairways. The capacity, in inches, of means of egress stairways shall be calculated by multiplying the occupant load served by such stairways by a means of egress capacity factor of 0.3 inch (7.6 mm) per occupant. Where stairways serve more than one story, only the occupant load of each story considered individually shall be used in calculating the required capacity of the stairways serving that story.

Exceptions:

1. Facilities with smoke-protected assembly seating shall be permitted to use the capacity factors in Table 1029.6.2 indicated for stepped aisles for exit access or exit stairways where the entire path for means of egress from the seating to the exit discharge is provided with a smoke control system complying with Section 909.

2. Facilities with outdoor smoke-protected assembly seating shall be permitted to the capacity factors in Section 1029.6.3 indicated for stepped aisles for exit access or exit stairways where the entire path for means of egress from the seating to the exit discharge is open to the outdoors.

1005.3.2 Other egress components. The capacity, in inches, of means of egress components other than stairways shall be calculated by multiplying the occupant load served by such component by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant.

Exceptions:

1. Facilities with smoke-protected assembly seating shall be permitted to use the capacity factors in Table 1029.6.2 indicated for level or ramped aisles for means of egress components other than stairways where the entire path for means of egress from the seating to the exit discharge is provided with a smoke control system complying with Section 909.
2. Facilities with outdoor smoke-protected assembly seating shall be permitted to the capacity factors in Section 1029.6.3 indicated for level or ramped aisles for means of egress components other than stairways where the entire path for means of egress from the seating to the exit discharge is open to the outdoors.

1005.4 Continuity. The minimum width or required capacity of the means of egress required from any story of a building shall not be reduced along the path of egress travel until arrival at the public way.

1005.5 Distribution of minimum width and required capacity. Where more than one exit, or access to more than one exit, is required, the means of egress shall be configured such that the loss of any one exit, or access to one exit, shall not reduce the available capacity or width to less than 50 percent of the required capacity or width.

1005.6 Egress convergence. Where the means of egress from stories above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall be not less than the largest minimum width or the sum of the required capacities for the stairways or ramps serving the two adjacent stories, whichever is larger.

1005.7 Encroachment. Encroachments into the required means of egress width shall be in accordance with the provisions of this section.

[1005.2 Door encroachment] 1005.7.1 Doors. Doors, when fully opened, shall not reduce the required means of egress width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half.

Exceptions:

1. Surface-mounted latch release hardware shall be exempt from inclusion in the 7-inch (177.8 mm) maximum encroachment where both of the following conditions exist:

   1.1. The hardware is mounted to the side of the door facing away from the adjacent wall where the door is in the open position.

   1.2. The hardware is mounted not less than 34 inches (865 mm) nor more than 48 inches (1220 mm) above the finished floor.

2. The restrictions on door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 occupancies and within individual dwelling units of Group R-3 occupancies.

1005.7.2 Other projections. Handrail projections shall be in accordance with the provisions of Section 1014.8. Other nonstructural projections such as trim and similar decorative features shall be permitted to project into the required width not more than 1½ inches (38 mm) on each side.

Exception: Projections are permitted in corridors within Group I-2 in accordance with Section 407.4.3.
[1005.3 Door hardware encroachment. Surface mounted latch-release hardware shall be exempt from inclusion in the 7-inch (178 mm) maximum projection requirement of Section 1005.2 when:]

[1. The hardware is mounted to the side of the door facing the corridor width when the door is in the open position; and]

[2. The hardware is mounted not less than 34 inches (865 mm) or more than 48 inches (1220 mm) above the finished floor.]

1005.7.3 Protruding objects. Protruding objects shall comply with the applicable requirements of Section 1003.3.

SECTION BC 1006
NUMBER OF EXITS AND EXIT ACCESS DOORWAYS

1006.1 General. The number of exits or exit access doorways required within the means of egress system shall comply with the provisions of Section 1006.2 for spaces, including mezzanines, and Section 1006.3 for stories.

1006.2 Egress from spaces. Rooms, areas or spaces, including mezzanines, within a story or basement shall be provided with the number of exits or access to exits in accordance with this section.

1006.2.1 Egress based on occupant load and common path of egress travel distance. Two exits or exit access doorways from any space shall be provided where the design occupant load or the common path of egress travel distance exceeds the values listed in Table 1006.2.1.

**Exception:** Care suites in Group I-2 occupancies complying with Section 407.4.

**TABLE 1006.2.1**

For SI: 1 foot = 304.8 mm.
NP = Not Permitted.
a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.2.
b. Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.2.5.
c. For a room or space used for assembly purposes having fixed seating, see Section 1029.8.
d. For the travel distance limitations in Group I-2, see Section 407.4.
e. The length of common path of egress travel distance in a Group S-2 open parking garage shall be not more than 100 feet (30,480 mm).

f. Day care maximum occupant load is 10.

g. Rooms, areas, or spaces that are accessory to a Group R-2 occupancy may have a maximum occupant load of 49.

1006.2.1.1 **Three or more exits or exit access doorways.** Three exits or exit access doorways shall be provided from any space with an occupant load of 501 to 1,000. Four exits or exit access doorways shall be provided from any space with an occupant load greater than 1,000.

1006.2.2 **Egress based on use.** The numbers of exits or access to exits shall be provided in the uses described in Sections 1006.2.2.1 through 1006.2.2.5.

1006.2.2.1 **Boiler, incinerator and furnace rooms.** Two exit access doorways are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46.5 m²) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422,000 KJ) input capacity. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

1006.2.2.2 **Refrigeration machinery rooms.** Machinery rooms larger than 1,000 square feet (92.9 m²) with refrigeration units or systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 refrigerant, or more than 30 pounds (13.6 kg) of any other group refrigerant, as classified in Section 1103.1 of the New York City Mechanical Code, shall have not less than two exits or exit access doors. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45,720 mm) of an exit or exit access doorway. An increase in exit access travel distance is permitted in accordance with Section 1017.1.

Doors shall swing in the direction of egress travel and shall be equipped with panic hardware, regardless of the occupant load served. Doors shall be tight fitting and self-closing.

1006.2.2.3 **Refrigerated rooms or spaces.** Rooms or spaces having a floor area larger than 1,000 square feet (92.9 m²) containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two exits or exit access doorways.

Exit access travel distance shall be determined as specified in Section 1017.1, but all portions of a refrigerated room or space shall be within 150 feet (45,720 mm) of an exit or exit access doorway where such rooms are not protected by an approved automatic sprinkler system. Egress is allowed through adjoining refrigerated rooms or spaces.

**Exception:** Where using refrigerants in quantities limited to the amounts based on the volume set forth in the New York City Mechanical Code.
1006.2.2.4 Day care means of egress. Day care facilities, rooms or spaces that are classified under Occupancy Group E providing care for more than 10 children shall have access to not less than two exits or exit access doorways.

1006.2.2.5 Vehicular ramps. Vehicular ramps shall not be considered as an exit access ramp unless provided with pedestrian facilities along the ramp in accordance with Section 1012.1.

1006.3 Egress from stories or occupied roofs. The means of egress system serving any story, or occupied roof designed for human occupancy or use, shall be provided with the number of exits or access to exits based on the aggregate occupant load served in accordance with this section. The path of egress travel to an exit shall not pass through more than one adjacent story.

Each story or occupied roof designed for human occupancy or use above the second story of a building shall have not less than one interior or exterior exit stairway, or interior or exterior exit ramp. Where three or more exits or access to exits are required, not less than 50 percent of the required exits shall be interior or exterior exit stairways or ramps.

Exceptions:

1. Interior exit stairways and interior exit ramps are not required in open parking garages where the means of egress serves only the open parking garage.

2. Interior exit stairways and interior exit ramps are not required in outdoor facilities where all portions of the means of egress are essentially open to the outside.

1006.3.1 Egress based on occupant load. Each story or occupied roof designed for human occupancy or use shall have the minimum number of exits, or access to exits, as specified in Table 1006.3.1. A single exit or access to a single exit shall be permitted in accordance with Section 1006.3.2. The required number of exits, or exit access stairways or ramps providing access to exits, from any such story or occupied roof shall be maintained until arrival at the exit discharge or a public way.

1006.3.2 Single exits. A single exit or access to a single exit shall be permitted from any story or occupied roof designed for human occupancy or use where one of the following conditions exists:

1. The occupant load, number of dwelling units and exit access travel distance do not exceed the values in Table 1006.3.2.
2. Rooms, areas and spaces complying with Section 1006.2.1 with exits that discharge directly to the exterior at the level of exit discharge are permitted to have one exit or access to a single exit.

3. Open or enclosed parking garages where vehicles are mechanically parked shall be permitted to have one exit provided such exit shall not be a vehicle ramp.

4. Group R-3 occupancies shall be permitted to have one exit or access to a single exit.

5. Individual single-story or multistory dwelling units shall be permitted to have a single exit or access to a single exit from the dwelling unit provided that both of the following criteria are met:

5.1. The dwelling unit complies with Section 1006.2.1 as a space with one means of egress.

5.2. Either the exit from the dwelling unit discharges directly to the exterior at the level of exit discharge, or the exit access outside the dwelling unit’s entrance door provides access to not less than two approved independent exits.

6. Buildings of Occupancy Group R-2 where all of the following conditions are met:

6.1. The building does not exceed four stories;

6.2. The building contains not more than three dwelling units per story;

6.3. The building is of construction Type I or II;

6.4. The building does not exceed 2,500 square feet (232.3 m²) per story;

6.5. Each dwelling unit has at least one window facing the street, or facing a lawful yard with open, unobstructed, and direct access to the street. Such yard or direct access shall be a minimum width equal to 25 percent of the vertical distance from the windowsill of the highest operable window, facing such yard or direct access, to the grade of such yard or direct access directly below such window, but shall in no case be less than 36 inches (914.4 mm) wide;

6.6. The stairway extends to the roof surface through a stairway bulkhead complying with Section 1509.2, provided the roof has a slope not steeper than 20 degrees (0.35 rad), or the stairway is constructed against the street wall, with one window facing the street at each landing and access to the roof is provided via a scuttle with a stationary, noncombustible access ladder;

6.7. The stairway is enclosed in 2-hour fire-rated walls with all exit doors leading into the stairway having at least 1½-hour fire rating; and

6.8. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2.
7. Buildings of Occupancy Group R-2 of construction Type I or II not exceeding six stories and not exceeding 2,000 square feet (185.8 m²) per story.

For SI: 1 foot = 304.8 mm.
NP = Not Permitted.
NA = Not Applicable.

1. In each story of a mixed occupancy building, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.2 for each occupancy does not exceed one. Where dwelling units are located on a story with other occupancies, the actual number of dwelling units divided by four plus the ratio from the other occupancy does not exceed one.

**1006.3.2 Mixed occupancies.** Where one exit, or exit access stairway or ramp providing access to exits at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single exits provided each individual occupancy complies with the applicable requirements of Table 1006.3.2 for that occupancy. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1. In each story of a mixed occupancy building, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.2 for each occupancy does not exceed one. Where dwelling units are located on a story with other occupancies, the actual number of dwelling units divided by four plus the ratio from the other occupancy does not exceed one.

**1006.4 Open or enclosed parking garages.** Open or enclosed parking garages shall not have less than two exits from each parking tier. An unenclosed vehicle ramp constructed in accordance with Section 1012.1 may serve as one of the required exits when provided with pedestrian facilities along the ramp. Such ramps serving as part of a nonaccessible means of egress in open or enclosed parking garages three stories or less in height and serving not more than one level below grade is permitted to comply with Section 1012.2, Exception 2.

**Exception:** One exit shall be permitted in parking garages complying with Item 3 of Section 1006.3.2.
SECTION BC 1007
EXIT AND EXIT ACCESS DOORWAY CONFIGURATION

1007.1 General. Exits, exit access doorways, and exit access stairways and ramps serving spaces, including individual building stories, shall be separated in accordance with the provisions of this section.

1007.1.1 Two exits or exit access doorways. Where two exits, exit access doorways, exit access stairways or ramps, or any combination thereof, are required from any portion of the exit access, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between them. Stairs sharing any common wall, floor, ceiling, scissor stair assembly, or other enclosure shall be counted as one exit stairway.

Exceptions:

1. Corridor measurements. Where interior exit stairways or ramps are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1020, the required exit separation shall be measured along the shortest direct line of travel within the corridor.

2. Remote location in sprinklered buildings. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.

3. Group R-2 occupancies. In Group R-2 occupancies, where stairs are enclosed in walls having at least a 2-hour fire resistance rating and constructed of masonry or masonry equivalent in accordance with department rules:

   3.1. The exit doors to such stairs shall be placed a distance apart equal to no less than 15 feet (4572 mm); and

   3.2. Such stairs shall be permitted to share common walls, floors, ceilings or scissor stair assemblies or other enclosures provided that the construction separating the stairs is also of at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules.

4. Group B occupancies. In Group B occupancies of construction Type I or II not exceeding 60 feet (18 288 mm) in height, not exceeding 2,000 square feet (185.8 m²) on any story and not exceeding a travel distance of 50 feet (15 240 mm) on any story, where stairs are enclosed in walls having at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules:

   4.1. The exit doors to such stairs shall be placed a distance apart equal to no less than 15 feet (4572 mm); and
4.2. Such stairs shall be permitted to share common walls, floors, ceilings or scissor stairs assemblies.

1007.1.1 Measurement point. The separation distance required in Section 1007.1.1 shall be measured in accordance with the following:

1. The separation distance to exit or exit access doorways shall be measured to the center point of the required doorway.

2. The separation distance to exit access stairways shall be measured to the center point of the closest riser.

3. The separation distance to exit access ramps shall be measured to the center point of the start of the ramp run.

1007.1.2 Three or more exits or exit access doorways. Where access to three or more exits is required, not less than two exit or exit access doorways shall be arranged in accordance with the provisions of Section 1007.1.1. Additional required exit or exit access doorways shall be arranged a reasonable distance apart so that if one becomes blocked, the others will be available.

1007.1.3 Remoteness of exit access stairways or ramps. Where two exit access stairways or ramps provide the required means of egress to exits at another story, the required separation distance shall be maintained for all portions of such exit access stairways or ramps.

1007.1.3.1 Three or more exit access stairways or ramps. Where more than two exit access stairways or ramps provide the required means of egress, not less than two shall be arranged in accordance with Section 1007.1.3.

SECTION BC [4006] 1008 MEANS OF EGRESS ILLUMINATION

[4006.1] 1008.1 Means of egress illumination. Illumination shall be provided in the means of egress in accordance with Section 1008.2. Under emergency power, means of egress illumination shall comply with Section 1008.3.

1008.2 Illumination required. Exits, exit discharges and public corridors shall be illuminated at all times by either daylight or electric lighting fixtures. Exit access components shall be illuminated by either daylight or electric lighting fixtures at all times that the space served by the exit access component is occupied.

Exceptions:

1. Occupancies in Group U.

2. Aisle accessways in Group A.

3. Dwelling units and sleeping units in Groups I-1, R-1, R-2 and R-3.

4. Sleeping units of Group I occupancies.
5. Areas beyond safe dispersal area where such areas are provided, and designed in accordance with Section [1027.6] 1028.5. Exceptions 1 through 5.

**1008.2.1 Illumination level under normal power.** The means of egress illumination level shall be not [be] less than 1 [foot-candle] footcandle (11 lux) at the walking surface.

Exceptions:

1. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the externally illuminated walking surface is permitted to be reduced during performances to not less than 0.5 [foot-candle] footcandle (5.38 lux) for aisles and cross aisles, and 0.2 [foot-candle] footcandle (2.15 lux) for other portions of the space, provided that the required illumination is automatically restored upon activation of a premise’s fire alarm system where such system is provided. [Step lights shall be provided in accordance with Section 1028.11.4.]

2. Safe areas in assembly occupancies shall be illuminated in accordance with Section [1028.17.3.2] 1029.19.3.2.

3. Open exterior spaces used to receive occupants as Class 1 or 2 exits in assembly occupancies shall be illuminated in accordance with Section [1028.17.4] 1029.19.4.

4. In exits in buildings that contain existing photoluminescent exit path markings tested in laboratory conditions with 2 [foot-candles] footcandles (22 lux) of activating illumination, the illumination level shall not be less than 2 [foot-candles] footcandles (22 lux).

**1008.2.2 Exit discharge.** In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.1.6, means of egress illumination levels for the exit discharge shall be provided such that failure of any single lighting unit shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

**1008.2.3 Sensors and controls.** Automatic, occupant sensor or photosensor lighting controls shall be permitted within means of egress, provided that the illumination level is not reduced to a level below the minimum requirements of Section [1006.2] 1008.2.1, and the switch controllers are equipped for fail-safe operation ensuring that if the sensor or control fails, the lighting levels will be at the levels required by Section [1006.2] 1008.2.1.

**1006.3 Illumination emergency power** 1008.3 Emergency power for illumination. The power supply for means of egress illumination shall normally be provided by the premise’s electrical supply.

**1008.3.1 Rooms and spaces that require two or more means of egress.** In the event of power supply failure in rooms and spaces that require two or more means of egress, an emergency electrical system shall automatically illuminate all of the following areas:

1. Aisles.

2. Corridors.
3. Exit access stairways and ramps.

4. Safe areas in assembly occupancies where required by Section 1029.19.3.2.

1008.3.2 Buildings that require two or more means of egress. In the event of power supply failure in buildings that require two or more means of egress, an emergency electrical system shall automatically illuminate all of the following areas:

1. [Aisles and unenclosed egress] Interior exit access stairways [in rooms and spaces that require two or more means of egress] and ramps.

2. [Corridors, exit enclosures and exit passageways.] Interior and exterior exit stairways and ramps.

3. [Exterior egress components at other than their levels of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.] Exit passageways.

4. [Interior exit] Vestibules and areas on the level of discharge [elements, as permitted in Section 1027.1, in buildings required to have two or more exits] used for exit discharge in accordance with Section 1028.1.

5. Exterior landings as required by Section 1008.1.6 for exit doorways in buildings required to have two or more exits.

1008.3.3 Specific rooms and spaces. In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Electrical equipment rooms containing electrical point of entry or building service disconnect.

2. Fire command centers.

3. Fire pump rooms.

4. Generator rooms.

5. Public restrooms with an area greater than 300 square feet (27.8 m²).

[1006.3.1 Emergency power source.] 1008.3.4 Duration. The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with [Chapter 27] Section 2702.

[1006.3.2] 1008.3.5 [Performance of system] Illumination level under emergency power. Emergency lighting facilities shall be arranged to provide initial illumination that is [at least] not less than an average of 1 [foot-candle] footcandle (11 lux) and a minimum at any point of 0.1 [foot-candle] footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 [foot-candle] footcandle (6.46 lux) (6 lux) average and a minimum at any point of 0.06 [foot-candle] footcandle (0.646 lux) (0.6 lux) at the end of
the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In buildings that contain existing photoluminescent exit path markings tested in laboratory conditions with greater than 1 [foot-candle] footcandle (11 lux) of activating, the initial illumination shall not be less than that required for activating the approved photoluminescent illumination. In Group I-2 occupancies, failure of any single lighting unit shall not reduce the illumination level to less than 0.2 footcandle (2.2 lux).

[1006.4 Reserved.]

SECTION BC 1009
ACCESSIBLE MEANS OF EGRESS

1007.1 1009.1 Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress are required by Section 1006.2 or 1006.3 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to prior code buildings where the level of alterations does not trigger full compliance of accessibility pursuant to Section 28-101.4 of the Administrative Code.

2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4, or 1007.5.

3. In assembly areas with sloped ramped aisles or stepped aisles, one accessible means of egress is permitted where the common path of travel is accessible and meets the requirements in Section 1028.8.

1007.2 1009.2 Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Interior accessible routes complying with Section 1104.

2. Area of rescue assistance complying with Section 1007.6.

3. Interior exit stairways complying with Sections 1007.3 and 1022.1.

4. Exit access stairways complying with Sections 1009.3 and 1019.3 or 1019.4.

5. Exterior exit stairways complying with Sections 1007.3 and 1026 and serving levels other than the level of exit discharge.

6. Elevators complying with Section 1007.4.

7. Platform lifts complying with Section 1007.5.
Horizontal exits complying with Section [1025] 1026.

Ramps complying with Section [4040] 1012.

Exit discharges complying with Section [1027] 1028.

Exterior accessible routes complying with Section 1104.

Exterior areas for assisted rescue complying with Section [1007.7] 1009.7 serving exits at the level of exit discharge.

Unenclosed vertical exits serving safe areas in assembly occupancies permitted by Section 1029.19.3.1.

High-rise buildings. In high-rise buildings subject to Section 403, at least one required accessible means of egress shall be an elevator complying with Section [1007.4] 1009.4.

Exceptions:

1. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a horizontal exit and located at or above the level of exit discharge.

2. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a ramp conforming to the provisions of Section [1010] 1012.

3. In buildings of [occupancy] Occupancy Group R-2 not subject to the requirements of emergency power in Section 403 of this code.

Exit discharge. Where an exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section [1007.7] 1009.7. An exterior area for assisted rescue shall not be required where an exit discharge is on an assisted rescue path from a stairway or an elevator.

Exterior exit stairway. Where an exit stairway is open to the exterior, the accessible means of egress shall include either an area of rescue assistance in accordance with Section [1007.6] 1009.6 or an exterior area for assisted rescue in accordance with Section [1007.7] 1009.7.

Stairways. To be considered part of an accessible means of egress, a stairway [as permitted by Section 1016.1 or exit stairway] between stories shall have a clear width of 48 inches [(1219 mm)](1220 mm) minimum between handrails and shall either incorporate an area of rescue assistance within an enlarged floor-level landing or shall be accessed from an area of rescue assistance complying with Section [1007.6] or a horizontal exit] 1009.6. Exit access stairways that connect levels in the same story are not permitted as part of an accessible means of egress.
[Unenclosed exit stairways as permitted by Section 1022.1 are permitted to be considered part of an accessible means of egress.]

**Exceptions:** The following exceptions apply to the requirements of clear width and area of rescue assistance, and do not supersede the other requirements of the accessible means of egress:

1. [The area of rescue assistance is not required for open exit access or exit stairways as permitted by Sections 1016.1 and 1022.1 in buildings that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2] Exit access stairways providing means of egress from mezzanines are permitted as part of an accessible means of egress.

2. The clear width of 48 inches ([1219] 1220 mm) between handrails and the area of rescue assistance is not required at exit access stairways as permitted by Section 1016.1 or exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

3. [Areas of rescue assistance are not required at exit stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.]

4. The clear width of 48 inches ([1219] 1220 mm) between handrails is not required for enclosed interior exit stairways accessed from a refuge area in conjunction with a horizontal exit.

4. Areas of rescue assistance are not required at exit access stairways where two-way communication is provided at the elevator landing in accordance with Section 1009.8.

5. Areas of rescue assistance are not required at stairways in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

5. Areas of rescue assistance are not required at stairways serving open parking garages.

6. Areas of rescue assistance are not required for smoke-protected smoke-protected assembly seating areas complying with Section [1028.6.2] 1029.6.2.

7. Areas of rescue assistance are not required in Group R-2 occupancies.

9. Areas of rescue assistance are not required for stairways accessed from a refuge area in conjunction with a horizontal exit.

**1009.4 Elevators.** To be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1 as modified by Appendix K, and Section [1109.6] 1109.7 of this code. Standby power shall be provided in accordance with Chapter 27 and Section 3003. The elevator shall be accessed from either an area of rescue assistance complying with Section 1007.6 or a horizontal exit complying with Section 1025] 1009.6.
Exceptions:

1. [Elevators] Areas of rescue assistance are not required to be accessed from an area of rescue assistance or horizontal exit at the elevator in open parking garages.

2. [Elevators] Areas of rescue assistance are not required to be accessed from an area of rescue assistance or horizontal exit in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

3. [Elevators] Areas of rescue assistance are not required at elevators not required to be located in a shaft in accordance with Section 708.2 are not required to be accessed from an area of rescue assistance or horizontal exit.

4. [Elevators] Areas of rescue assistance are not required to be accessed from an area of rescue assistance or horizontal exit for smoke at elevators serving smoke-protected assembly seating areas complying with Section 1028.6.2.

5. Areas of rescue assistance are not required for elevators accessed from a refuge area in conjunction with a horizontal exit.

[1007.5] 1009.5 Platform lifts. Platform (wheelchair) lifts shall not be permitted to serve as part of an accessible means of egress except where allowed as part of a required accessible route in Section 1109.7, except for Item 10. Platform lifts shall be installed in accordance with ASME A18.1. Standby power for the platform lift shall be provided in accordance with Chapter 27 for platform lifts permitted to serve as part of an accessible means of egress.

[1007.5.1] 1009.5.1 Openness. Platform lifts on an accessible means of egress shall not be installed in a fully enclosed hoistway.

[1007.6] 1009.6 Areas of rescue assistance. Every required area of rescue assistance shall be accessible from the space it serves by one or more accessible means of egress components as listed in Section 1007.2.

1009.6.1 Travel distance. The maximum travel distance from any accessible space to an area of rescue assistance shall not exceed the exit access travel distance permitted for the occupancy in accordance with Section 1016.1.

1009.6.2 Stairway or elevator access. Every required area of rescue assistance shall have direct access to a stairway within an exit enclosure complying with Sections 1007.3 and 10022 or an elevator complying with Section 1007.4.

1009.6.2.1 Elevator lobby. Where an elevator lobby serves as an area of rescue assistance, the shaft and lobby shall comply with Section 4022.9 for smokeproof enclosures except where the elevators are in an area of rescue assistance, such lobby shall be part of a horizontal exit or protected by a smoke barrier.

[Exceptions:]
[1. A stairway serving an area of rescue assistance is not required to be enclosed where permitted in Sections 1016.1 and 1022.1.]

[2. Smokeproof enclosure is not required for an elevator lobby used as an area of rescue assistance where the elevator is not required to be enclosed.]

[1007.6.1] **1009.6.3 Size.** Each area of rescue assistance shall be sized to accommodate one wheelchair space of 30 inches by 48 inches (762 mm by [4249] 1220 mm) for each 200 occupants or portion thereof, based on the occupant load of the area of rescue assistance and areas served by the area of rescue assistance. Such wheelchair spaces shall not reduce the required means of egress minimum width or required capacity. Access to any of the required wheelchair spaces in an area of rescue assistance shall not be obstructed by more than one adjoining wheelchair space.

[1007.6.2] **1009.6.4 Separation.** Each area of rescue assistance shall be separated from the remainder of the story by a smoke barrier complying with Section [240] 709 or a horizontal exit complying with Section [1025] 1026. Each area of rescue assistance shall be designed to minimize the intrusion of smoke.

**Exception:** Exceptions:

1. Areas of rescue assistance located within an [exit] enclosure for interior exit stairways complying with Section 1023.

2. Areas of rescue assistance in outdoor facilities where exit access is essentially open to the outside.

[1007.6.3] **1009.6.5 Two-way communication.** Areas of rescue assistance shall be provided with a two-way communication system complying with Sections [1007.8.4] 1009.8.1 and [1007.8.2] 1009.8.2.

[1007.7] **1009.7 Exterior [area] areas for assisted rescue.** [The exterior area] Exterior areas for assisted rescue must be open to the outside air and meet the requirements of Section 1007.6.1. Separation walls shall comply with the requirements of Section 705 for exterior walls shall be accessed by an accessible route from the area served.

Where walls or openings are between the area for assisted rescue and the interior of the building, the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. The exit discharge does not include an accessible route from an exit located on the level of exit discharge to a public way, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Sections 1009.7.1 through 1009.7.4.

**1009.7.1 Size.** Each exterior area for assisted rescue shall be sized to accommodate wheelchair spaces in accordance with Section 1009.6.3.
1009.7.2 Separation. Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum fire-resistance rating of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally 10 feet (3048 mm) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall 4 feet (1220 mm) minimum on the side of the landing. The fire-resistance-rated construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such fire-resistance-rated exterior walls shall be protected in accordance with Section 716.

[1007.4] 1009.7.3 Openness. The exterior area for assisted rescue shall be at least open to the outside air. The sides other than the separation walls shall be not less than 50 percent open, and the open area above the guards shall be so distributed so as to minimize the accumulation of smoke or toxic gases.

[1007.2] 1009.7.4 Stairways. Stairways that are part of the accessible means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) (1220 mm) between handrails.

Exception: The clear width of 48 inches (1220 mm) between handrails is not required at stairways serving buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

1007.8 Two-way communication. A two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator landing or bank of elevators on each accessible floor that is one or more stories above or below the story level of exit discharge complying with Sections 1007.8.1 and 1007.8.2.

Exceptions:

1. Two-way communication systems are not required at the landing serving each elevator landing or bank of elevators where the two-way communication system is provided within areas of rescue assistance in accordance with Section 1007.6.3 1009.6.5.

2. Two-way communication systems are not required on floors provided with exit ramps conforming to the provisions of Section 1010 1012.

3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible means of egress or serve as part of the required accessible route into a facility.

4. Two-way communication systems are not required at the landings serving only freight elevators that are not designated as part of the accessible means of egress or serve as part of the required accessible route into a facility.

5. Two-way communication systems are not required at the landing serving a private residence elevator.
[1007.8.1] **System requirements.** Two-way communication systems shall provide communication between each required location and the fire command center or a central control point location approved by the Fire Department. Where the central control point is not a constantly attended location, a two-way communication system shall have a timed automatic telephone dial-out capability to a monitoring location or 911. The two-way communication system shall include both audible and visible signals.

[1007.8.2] **Directions.** Directions for the use of the two-way communication system, instructions for summoning assistance via the two-way communication system and written identification of the location shall be posted adjacent to the two-way communication system. Signage shall comply with the ICC A117.1 requirements for visual characters.

[1007.9] **Signage.** Signage indicating special accessibility provisions shall be provided as shown:

1. Each door providing access to an area of rescue assistance from an adjacent floor area shall be identified by a sign stating: AREA OF RESCUE ASSISTANCE.

2. Each door providing access to an exterior area for assisted rescue shall be identified by a sign stating: EXTERIOR AREA FOR ASSISTED RESCUE.

Signage shall comply with the ICC A117.1 requirements for visual characters and include the International Symbol of Accessibility. Where exit sign illumination is required by Section [1011.2] 1013.3, the signs shall be illuminated. Additionally, tactile visual character, raised character and braille signage complying with ICC A117.1 shall be located at each door to an area of rescue assistance and exterior area for assisted rescue in accordance with Section [1011.3] 1013.4 of this code.

[1007.10] **Directional signage.** Directional signage indicating the location of [the] all other means of egress and which of those are accessible means of egress shall be provided at the following:

1. At exits serving a required accessible space but not providing an approved accessible means of egress.

2. At elevator landings.

3. Within areas of rescue assistance.

[1007.11] **Instructions.** In areas of rescue assistance and exterior areas for assisted rescue, instructions on the use of the area under emergency conditions shall be posted. Signage shall comply with the ICC A117.1 requirements for visual characters. The instructions shall include all of the following:

1. Persons able to use the exit stairway do so as soon as possible, unless they are assisting others.

2. Information on planned availability of assistance in the use of stairs or supervised operation of elevators and how to summon such assistance.
3. Directions for use of the two-way communication system where provided.

SECTION BC [1008] 1010
DOORS, GATES AND TURNSTILES

[1008.1] 1010.1 Doors. Means of egress doors shall meet the requirements of this section. Doors serving a means of egress system shall meet the requirements of this section and Section [1020.2] 1022.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.

Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of egress doors. Means of egress doors shall not be concealed by curtains, drapes, decorations or similar materials.

[1008.1.1] 1010.1.1 Size of doors. The minimum width and height of each door opening shall be in accordance with this section.

[1008.1.1.1] 1010.1.1.1 Door width. The required capacity [minimum width] of each door opening shall be sufficient for the occupant load thereof and shall provide a minimum clear width of [not less than] 32 inches (812.2 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width of 32 inches (812.8 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (812.8 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. Means of egress doors in a Group I-2 occupancy used for the movement of beds shall provide a clear width not less than 41½ inches (1054 mm).

Exceptions:

1. The minimum and maximum width shall not apply to door openings that are not part of the required means of egress in Group R-2 and R-3 occupancies.

2. Door openings to resident sleeping units in Group I-3 occupancies shall have a clear width of not less than 28 inches (711.2 mm).

3. Door openings to storage closets less than 10 square feet (0.93 m²) in area shall not be limited by the minimum width.

4. Width of door leaves in revolving doors that comply with Section [1008.1.4.1] 1010.1.4.1 shall not be limited.

5. [Except for] In other than Group R-1 occupancies, the minimum widths shall not apply to interior egress doors within a dwelling unit or sleeping unit that is not required to be an Accessible unit, Type B+NYC or Type B unit.

6. Doors to walk-in freezers and coolers less than 1,000 square feet (92.9 m²) in area shall have a maximum width of 60 inches (1524 mm).
7. In Group R-1 dwelling units or sleeping units not required to be Accessible units, the minimum width shall not apply to doors for showers or saunas.

[1008.1.1.2] 1010.1.1.2 Projections into clear width. There shall not be projections into the required clear width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

Exception: Door closers and door stops shall be permitted to be 78 inches (1980 mm) minimum above the floor.

[1008.1.1.3] 1010.1.1.3 Height. The height of doors shall be not less than 80 inches (2032 mm).

Exceptions:

1. Door openings within a dwelling unit or sleeping unit shall be not less than 78 inches (1981 mm) in height.

2. Exterior door openings in dwelling units and sleeping units, other than the required exit door, shall be not less than 76 inches (1930 mm) in height.

[1008.1.2] 1010.1.2 Door swing. Egress doors shall be installed in accordance with this section.

[1008.1.2.1] 1010.1.2.1 Mounting. Egress doors shall be of the pivoted or side-hinged swinging type.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.

2. Group I-3 occupancies used as a place of detention.

3. Critical or intensive care patient rooms within suites of health care facilities.

4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.

5. In other than Group H occupancies, revolving doors complying with Section [1008.1.4.1] 1010.1.4.1.

6. In other than Group H occupancies, special purpose horizontal sliding doors, accordion or folding door assemblies complying with Section [1008.1.4.3] 1010.1.4.3 are permitted in a means of egress.

7. Power-operated doors in accordance with Section [1008.1.4.2] 1010.1.4.2.

8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

[1008.1.2.2] 1010.1.2.2 Direction of swing. Doors shall swing in the direction of egress travel where serving:

1. Group F or H occupancies.
2. Rooms or spaces with an occupant load of 50 or more persons.
3. Rooms or spaces requiring more than one exit door.
4. Automatic teller machines in accordance with Section 10-160 of the Administrative Code.

Exception: Doors need not swing in the direction of egress travel for exterior street floor exit doors from lobbies serving only Group R-2 or R-3 occupancies.

[1008.1.3] 1010.1.3 Door opening force. The force for pushing or pulling open interior swinging egress doors, other than fire doors, shall not exceed 5-pound (22.2 N). These forces do not apply to the force required to retract latch bolts or disengage other devices that hold the door in a closed position. For other swinging doors, as well as sliding and folding doors, the door latch shall release when subjected to a 15-pound (66.7 N) force. The door shall be set in motion when subjected to a 30-pound (133.4 N) force. The door shall swing to a full-open position when subjected to a 15-pound (66.7 N) force.

1010.1.3.1 Location of applied forces. Forces shall be applied to the latch side of the door.

[1008.1.4] 1010.1.4 Special doors. Special doors and security grilles shall comply with the requirements of Sections [1008.1.4.1] 1010.1.4.1 through [1008.1.4.5] 1010.1.4.4.

[1008.1.4.1] 1010.1.4.1 Revolving doors. Revolving doors shall comply with the following:

1. Revolving doors shall comply with BHMA A156.27 and shall be installed in accordance with the manufacturer’s instructions.

2. Each revolving door shall be capable of collapsing into a book fold position with parallel egress paths providing breakout in accordance with BHMA A156.27 and shall provide an aggregate width of not less than 36 inches (914 mm).

3. A revolving door shall not be located within 10 feet (3048 mm) of the foot or top of [stairs] stairways or escalators. A dispersal area shall be provided between the [stairs] stairways or escalators and the revolving doors.

4. The revolutions per minute (rpm) for a revolving door shall not exceed those shown in the maximum rpm as specified in BHMA A156.27. Manual revolving doors shall comply with Table [1008.1.4.1] 1010.1.4.1(1). Automatic or power-operated revolving doors shall comply with Table 1010.1.4.1(2).
5. An emergency stop switch shall be provided near each entry point of power or automatic operated revolving doors within 48 inches (1220 mm) of the door and between 24 inches (609.6 mm) and 48 inches (1220 mm) above the floor. The activation area of the emergency stop switch button shall be not less than 1 inch (25.4 mm) in diameter and shall be red.

6. Each revolving door shall have a side-hinged swinging door [which] that complies with Section [1008.1] 1010.1 in the same wall and within 10 feet (3048 mm) of the revolving door.

7. Revolving doors shall not be part of an accessible route required by Section [1007] 1009 and Chapter 11.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

[1008.1.4.1.1] 1010.1.4.1.1 Egress component. A revolving door used as a component of a means of egress shall comply with Section [1008.1.4.1] 1010.1.4.1 and the following three conditions:

1. Revolving doors shall not be given credit for more than 50 percent of the minimum width or required egress capacity.

2. Each revolving door shall be credited with no capacity based on not more than a 50-person occupant load.

3. Each revolving door shall be capable of being collapsed when a breakout force of not more than 130 pounds ([578] 578.3 N) [is applied within 3 inches (76 mm) of the outer edge of a wing].

[1008.1.4.1.2] 1010.1.4.1.2 Other than egress component. A revolving door used as other than a component of a means of egress shall comply with Section [1008.1.4.1] 1010.1.4.1. The collapsing breakout force of a revolving door not used as a component of a means of egress shall not be more than 180 pounds ([801] 800.7 N).

Exception: A collapsing breakout force in excess of 180 pounds ([801] 800.7 N) is permitted if the collapsing force is reduced to not more than 130 pounds ([578] 578.3 N) when at least not less than one of the following conditions is satisfied:
1. There is a power failure or power is removed to the device holding the door wings in position.

2. There is an actuation of the automatic sprinkler system where such system is provided.

3. There is an actuation of a smoke detection system [which] that is installed in accordance with Section 907 to provide coverage in areas within the building [which] that are within 75 feet (22 860 mm) of the revolving doors.

4. There is an actuation of a manual control switch, in an approved location and clearly [defined, which] identified, that reduces the [holding] breakout force to [below the] not more than 130 pounds (578.3 N).[force level].

**1008.1.4.2 Power-operated doors.** Where means of egress doors are operated or assisted by power, [such as doors with a photoelectric actuated mechanism to open the door upon the approach of a person, or doors with power assisted manual operation,] the design shall be such that in the event of power failure, the door is capable of being opened manually to permit means of egress travel or closed where necessary to safeguard means of egress. The forces required to open these doors manually shall not exceed those specified in Section [1008.1.3] 1010.1.3, except that the force to set the door in motion shall not exceed 50 pounds (222.4 N). The door shall be capable of swinging open from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which egress is made. [Full-] Power-operated swinging doors, power-operated sliding doors and power-operated folding doors shall comply with BHMA A156.10. Power-assisted swinging doors and low-energy power-operated swinging doors shall comply with BHMA A156.19.

**Exceptions:**

1. Occupancies in Group I-3.

2. Horizontal sliding doors complying with Section [1008.1.4.3] 1010.1.4.3.

3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 32-inch (812.8 mm) single-leaf requirement of Section [1008.1.1] 1010.1.1, provided a minimum 32-inch (812.8 mm) clear opening is provided when the two biparting leaves meeting in the center are broken out.

**1008.1.4.3 [Horizontal] Special purpose horizontal sliding, accordion or folding doors.** In other than Group H occupancies, special purpose horizontal sliding [doors], accordion or folding door assemblies permitted to be a component of a means of egress in accordance with Exception 6 to Section [1008.1.2.1] 1010.1.2.1 shall comply with all of the following criteria:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method from both sides without special knowledge or effort.

3. The force required to operate the door shall not exceed 30 pounds (133.4 N) to set the door in motion and 15 pounds (66.7 N) to close the door or open it to the minimum required width.

4. The door shall be openable with a force not to exceed 15 pounds (66.7 N) when a force of 250 pounds (1112 N) is applied perpendicular to the door adjacent to the operating device.

5. The door assembly shall comply with the applicable fire protection rating and, where rated, shall be self-closing or automatic closing by smoke detection in accordance with Section 715.5.3, shall be installed in accordance with NFPA 80 and shall comply with Section 715.7.16 of this code.

6. The door assembly shall have an integrated standby power supply.

7. The door assembly power supply shall be electrically supervised.

8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.

9. The door shall not be provided with a latch or lock other than panic hardware or fire exit hardware complying with Section 1010.1.10.

[1008.1.4.4 Access-controlled entrance doors. The exterior building entrance doors serving occupancies in Group A, B, E, M, R-1 or R-2 and entrance doors to tenant spaces in occupancies in Groups A, B, E, M, R-1 and R-2 are permitted to be equipped with an approved entrance and egress access control system which shall be installed in accordance with all of the following criteria:]
4. Activation of the building fire alarm system, if provided, shall automatically unlock the doors, and the doors shall remain unlocked until the fire alarm system has been reset.

5. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically unlock the doors. The doors shall remain unlocked until the fire alarm system has been reset.

6. Entrance doors in buildings with an occupancy in Group A, B, E or M shall not be secured from the egress side during periods that the building is open to the general public.

1008.1.4.4 Security grilles. In Groups B, M and S, horizontal sliding or vertical security grilles are permitted at the main entrance where the opening of such grilles are essential to the operation of the establishments. Such grilles shall be installed in accordance with the following criteria:

1. Security grilles shall be openable from the inside without the use of a key or special knowledge or effort during periods that the space is occupied.

2. The security grilles shall remain secured in the full-open position during the period of occupancy by the general public.

3. Except as to buildings or structures classified in occupancy Group S, buildings or structures that have been designated as a landmark by the landmarks preservation commission or located in a historic district designated by such commission, on or after July 1, 2011, no security grille may be installed or replaced, nor shall the owner of a structure classified as a Group B or M occupancy or the operator of the business occupying such structure allow to be installed or replaced, a security grille to secure such property where the grille abuts the sidewalk, unless the grille, when closed, permits visibility from the sidewalk of at least 70 percent of the area covered by such grille.

4. No later than July 1, 2026, all security grilles installed on buildings or structures classified in occupancy Groups B or M shall comply with the provisions of paragraph Item 3 of this section.

5. Where two or more means of egress are required, not more than one-half of the exits or exit access doorways shall be equipped with horizontal sliding or vertical security grilles.

1008.1.5 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope).
Exceptions:

1. Doors serving individual dwelling units in Groups R-2 and R-3 where the following apply:
   1.1. A door is permitted to open at the top step of an interior flight of stairs within the dwelling unit, provided the door does not swing over the top step.
   1.2. Screen doors and storm doors are permitted to swing over stairs or landings.

2. Exterior doors as provided for in Section 1003.5, Exception 1, and Section 1022.2, which are not on an accessible route.

3. In Group R-3 occupancies not required to be Accessible units, Type B+NYC units or Type B units, the landing at an exterior doorway shall not be more than 7¾ inches (197 mm) below the top of the threshold, provided the door, other than an exterior storm or screen door, does not swing over the landing.

4. Variations in elevation due to differences in finish materials, but not more than 0.5 inch (12.7 mm).

5. Exterior spaces of Type B+NYC units and Type B units where permitted pursuant to the exception to Section 1107.4.

6. Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 and serving an occupant load of five or less shall be permitted to have a landing on one side to be not more than 7 inches (177.8 mm) above or below the landing on the egress side of the door.

7. Doors serving individual dwelling units in Groups R-2 and R-3 where the following apply:
   1.1. A door is permitted to open at the top step of an interior flight of stairs within the dwelling unit, provided the door does not swing over the top step.
   1.2. Screen doors and storm doors are permitted to swing over stairs or landings.

8. Exterior doors as provided for in Section 1003.5, Exception 1, and Section 1022.2, which are not on an accessible route.

9. In Group R-3 occupancies not required to be Accessible units, Type B+NYC units or Type B units, the landing at an exterior doorway shall be not more than 7¾ inches (197 mm) below the top of the threshold, provided the door, other than an exterior storm or screen door, does not swing over the landing.

10. Variations in elevation due to differences in finish materials, but not more than 0.5 inch (12.7 mm).

11. Exterior spaces of Type B+NYC units and Type B units where permitted pursuant to the exception to Section 1107.4.

12. Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 and serving an occupant load of five or less shall be permitted to have a landing on one side to be not more than 7 inches (177.8 mm) above or below the landing on the egress side of the door.

[1008.1.6] 1010.1.6 Landings at doors. Landings shall have a width not less than the width of the stairway or the door, whichever is greater. Doors in the fully open position shall not reduce a required dimension by more than 7 inches (178 mm). At any stairway landing, or when a door landing serves an occupant load of 50 or more, doors in any position shall not reduce the landing to less than 75 percent of its required width. Landings shall have a length measured in the direction of travel of not less than 44 inches (1118 mm).

Exceptions:

1. Landing length in the direction of travel in Groups R-3 and U and within individual units of Group R-2 need not exceed 36 inches (914 mm).

2. In Group R-2 occupancies, where 36 inches wide stairways are permitted pursuant to Section 1009.1 and serving an occupant load of five or less shall be permitted to be not less than 36 inches (914 mm) or the width of the stairway, whichever is greater. Doors opening onto such stairway landings shall not reduce the landing width.

[1008.1.7] 1010.1.7 Thresholds. Thresholds at doorways shall not exceed 0.75 inch (19.1 mm) in height above the finished floor or landing for sliding doors serving dwelling units or 0.5 inch (12.7 mm)
½ inch (12.7 mm) above the finished floor or landing for other doors. Raised thresholds and floor level changes greater than [0.25] ¼ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

[Exception:] Exceptions:

1. [The threshold height shall be limited to 7.75 inches (197 mm) where the] In occupancy [is] Group R-2 or R-3[; the door is an], threshold heights for sliding and side-hinged exterior [door that is not a component] doors shall be permitted to be up to 7¾ inches (196.9 mm) in height if all of the following apply:

   1.1. The door is not part of the required means of egress[; the door, other than an exterior storm or screen door, does].

   1.2. The door is not [swing over the landing or step; and the doorway is not on] part of an accessible route as required by Chapter 11 [and].

   1.3. The door is not part of an Accessible unit, Type B+NYC unit or Type B unit.

   1.4. The exterior door, other than a storm or screen door, does not swing over the landing or step.

2. In Type B+NYC units and Type B units, where permitted pursuant to the exception to Section 1107.4, the threshold height on the exterior side of the door shall not exceed 4¼ inches (120.7 mm) in height above the exterior deck, patio or balcony for sliding doors or 4½ inches (114.3 mm) above the exterior deck, patio or balcony for other doors.

[1008.1.8] 1010.1.8 Door arrangement. Space between two doors in a series shall be 48 inches ([1219] 1220 mm) minimum plus the width of a door swinging into the space. Doors in series shall swing either in the same direction or away from the space between the doors.

Exceptions:

1. The minimum distance between horizontal sliding power-operated doors in a series shall be 48 inches ([1219] 1220 mm).

2. Storm and screen doors serving individual dwelling units in Groups R-2 and R-3 need not be spaced 48 inches ([1219] 1220 mm) from the other door.

3. Doors within individual dwelling units in Group R-3.

4. Doors within individual dwelling units in Group R-2 that are not required to comply with Section 1107.

5. Exterior doors in vestibules in Group R-2 occupancies shall not be required to swing either in the same direction or away from the space between doors provided that the 48-inch ([1219] 1220 mm) minimum space between door swings is maintained.
[1008.1.9] 1010.1.9 Door operations. Except as specifically permitted by this section, egress doors shall be readily openable from the egress side without the use of a key or special knowledge or effort.

[1008.1.9.1] 1010.1.9.1 Hardware. Door handles, pulls, latches, locks and other operating devices on doors required to be accessible by Chapter 11 shall not require tight grasping, tight pinching or twisting of the wrist to operate.

[1008.1.9.2] 1010.1.9.2 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches ([864] 863.4 mm) minimum and 48 inches ([1219] 1220 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.

Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts in compliance with Section 3109.4.2 or 3109.5.1.7, as applicable.

[1008.1.9.3] 1010.1.9.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following [exists] exist:

1. Places of detention or restraint.

2. Places where extra safeguards are required such as banks, museums, and jewelry stores subject to the approval of the commissioner and provided the locks are equipped with electrical release devices for remote control in case of emergencies. However, museums shall be subject to further special review by the commissioner and Fire Commissioner.

3. Main entrances in Occupancy Groups B, M, and S as permitted by Section [1008.1.3.5] 1010.1.4.4.

4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.

5. Doors serving Group R-2 occupancies as required by Section [1008.4] 1010.4.

6. In educational occupancies classified in Occupancy Group B or E, and college or student dormitories in Group R-1, [Stairways] stairways leading from the top floor to a roof may be provided with locked wire mesh gates openable by key [in Occupancy Group E].

7. On roofs that are not intended to be accessed by occupants other than building maintenance personnel, the [The] use of a hook and eye closing device or other similar non-self-locking devices on the [inside] stairway side of all doors openable without the use of a key or special knowledge to roofs shall be permitted.
Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

**Bolt locks.** Manually operated flush bolts or surface bolts are not permitted.

**Exceptions:**

1. On doors not required for egress in individual dwelling units or sleeping units.

2. Where a pair of doors serves a storage or equipment room, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf.

3. Where a pair of doors serves an occupant load of less than 75 persons in a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf. The inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

4. Where a pair of doors serves a Group B, F or S occupancy, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf provided such inactive leaf is not needed to meet egress capacity requirements and the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

5. Where a pair of doors serves patient care rooms in Group I-2 occupancies, self-latching edge- or surface-mounted bolts are permitted on the inactive leaf provided that the inactive leaf is not needed to meet egress capacity requirements and the inactive leaf shall not contain doorknobs, panic bars or similar operating hardware.

**Unlatching.** The unlatching of any door or leaf shall not require more than one operation.

**Exception:** More than one operation is permitted for unlatching doors in the following locations:

1. Places of detention or restraint.

2. Where manually operated bolt locks are permitted by Section 1010.1.9.4.

3. Doors from individual dwelling units and sleeping units of Group R occupancies as permitted by Section 1010.1.9.3, Items 4 and 5.

**Closet and bathroom doors in certain Group R occupancies.** In community residences or intermediate-care facilities classified as Group R-1, R-2 or R-3 occupancies pursuant to Section 308.3.2. Exception 1, 2 or 3, within such facilities, closet doors that latch in the closed position shall be openable from
inside the closet, and bathroom doors that latch in the closed position shall be capable of being unlocked from the ingress side.

[1008.1.9.6 Special locking arrangements in Group I-2. Subject to special review and approval by the commissioner, approved, listed, delayed approved, listed, delayed egress locks may be permitted on doors serving spaces in a Group I-2 occupancy where the clinical needs of persons receiving care require such locking.]

1010.1.9.6 Controlled egress doors in Groups I-1 and I-2. Electric locking systems, including electro-mechanical locking systems and electromagnetic locking systems, shall be permitted to be locked in the means of egress in Group I-1 or I-2 occupancies where the clinical needs of persons receiving care require their containment. [Delayed] Controlled egress locks may be permitted on doors serving spaces in a Group I-2 occupancy where the building is equipped throughout with an [automatic] automatic sprinkler system in accordance with Section 903.3.1.1 or an approved automatic smoke or heat [detection] detection system installed in accordance with Section 907, provided that the doors [unlock] are installed and operate in accordance with [Items 1 through 6 below. A building occupant shall not be required to pass through more than one door equipped with a delayed egress lock before entering an exit.] all of the following:

1. The [doors] door locks shall unlock [upon] on actuation of the automatic sprinkler system or automatic fire detection system.

2. The [doors] door locks shall unlock [upon] on loss of power controlling the lock or lock mechanism.

3. The door [locks] locking system shall be installed to have the capability of being unlocked by a [signal from] switch located at the fire command center, a nursing station or other approved location. The switch shall directly break power to the lock.

4. A building occupant shall not be required to pass through more than one door equipped with a controlled egress locking system before entering an exit.

5. The procedures for [the operation(s) of the unlocking system] unlocking the doors shall be described and approved as part of the emergency planning and preparedness required by [Chapter 4 of] the New York City Fire Code.

[5.] 6. All clinical staff shall have the keys, codes or other means necessary to operate the locking [devices] systems.

[6.] 7. Emergency lighting shall be provided at the door.

8. The door locking system units shall be listed in accordance with UL 294.

[Exception:] Exceptions:

1. Items 1 through [3] 4 shall not apply to doors to areas [where] occupied by persons who, because of clinical needs, require restraint or containment as part of the function of a [mental hospital] psychiatric treatment area.
2. Items 1 through 4 shall not apply to doors to areas where a listed egress control system is utilized to reduce the risk of child abduction from nursery and obstetric areas of a Group I-2 hospital.

[1008.1.9.7] 1010.1.9.7 Delayed egress [locks] locking systems. Subject to special review and approval by the commissioner, approved, listed, delayed egress [locks] locking systems may be permitted on doors serving spaces where extra safeguards are required in buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Section 907, provided that the doors unlock in accordance with Items 1 through [6] below.[A building occupant shall not be required to pass through more than one door equipped with a delayed egress lock before entering an exit.]

1. The [doors unlock] delay electronics of the delayed egress locking system shall deactivate upon actuation of the automatic sprinkler system or automatic fire detection system, allowing immediate, free egress.

2. The [doors unlock] delay electronics of the delayed egress locking system shall deactivate upon loss of power controlling the lock or lock mechanism, allowing immediate free egress.

3. The [door locks] delayed egress locking system shall have the capability of being unlocked by a signal from deactivated at the fire command center and other approved locations.

4. [The initiation of] An attempt to egress shall initiate an irreversible process [which will release the latch] that shall allow such egress in not more than 15 seconds when a [force of] physical effort of 15 pounds (66.7 N) is applied to the egress side door hardware for not more than 3 seconds [15 pounds (67 N) is applied for 1 second to the release device]. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the [door lock has] delay electronics have been [released by] deactivated, rearming the [application of force to the releasing device, relocking] delay electronics shall be by manual means only. Except [that] where approved by the department, a delay [in releasing the latch] of not more than 30 seconds is permitted on a delayed egress door.

5. The egress path from any point shall not pass through more than one delayed egress locking system. Except where approved by the department, in Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds.

6. A sign shall be provided on the door and shall be located above and within 12 inches ([305] 304.8 mm) of the [release device reading] door exit hardware. [Except where approved by the department, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.}
6.1. For doors that swing in the direction of egress, the sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 SECONDS. Except where a delay in releasing the latch of a delayed egress door is approved by the department, such sign shall read: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 30 SECONDS.

6.2. For doors that swing in the opposite direction of egress, the sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 SECONDS. Except where not more than 30 seconds is permitted on a delayed egress door is approved by the department, such sign shall read: PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 30 SECONDS.

6.3. The sign shall comply with the visual character requirements in ICC A117.1.

7. Emergency lighting shall be provided on the egress side of the door.

8. The delayed egress locking system units shall be listed in accordance with UL 294.

Exceptions:

1. Delayed egress locking systems shall not be permitted in buildings or spaces in Group A, E, F and H occupancies. However, in museums, delayed egress locks may be installed on exit doors subject to special review by the commissioner and Fire Commissioner.

2. Places of detention or restraints in Group I-3 are permitted to install delayed egress locking systems without the special review by the commissioner, provided that the installation complies with all of the other requirements of this section.

1010.1.9.8 Sensor release of electrically locked egress doors. The electric locks on sensor released doors located in a means of egress in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and entrance doors to tenant spaces in occupancies in Group A, B, E, M, R-1 or R-2 are permitted where installed and operated in accordance with all of the following criteria:

1. The sensor shall be installed on the egress side, arranged to detect an occupant approaching the doors. The doors shall be arranged to unlock by a signal from or loss of power to the sensor.

2. Loss of power to the lock or locking system shall automatically unlock the doors.

3. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1220 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads “PUSH TO EXIT.” When operated, the manual unlocking device shall result in direct
interruption of power to the lock—indispensable of other electronics—and the doors shall remain unlocked for not less than 30 seconds.

4. Activation of the building fire alarm system, where provided, shall automatically unlock the doors, and the doors shall remain unlocked until the fire alarm system has been reset.

5. Activation of the building automatic sprinkler system or fire detection system, where provided, shall automatically unlock the doors. The doors shall remain unlocked until the fire alarm system has been reset.

6. The door locking system units shall be listed in accordance with UL 294.

[1008.1.9.8] 1010.1.9.9 Electromagnetically locked egress doors. Doors in the means of egress that are not otherwise required to have panic hardware in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked with an electromagnetic locking system where equipped with hardware that incorporates a built-in switch and meet the requirements below where installed and operated in accordance with all of the following:

1. The hardware that is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.

2. The hardware is capable of being operated with one hand.

3. Operation of the hardware releases directly interrupts the power to the electromagnetic lock and unlocks the door immediately.

4. Loss of power to the electromagnetic locking system automatically unlocks the door to permit egress.

5. Where panic or fire exit hardware is required by Section 1010.1.10, operation of the panic or fire exit hardware also releases the electromagnetic lock.

6. The locking system units shall be listed in accordance with UL 294.

[1008.1.9.9] 1010.1.9.10 Locking arrangements in correctional facilities. In occupancies in Groups A-2, A-3, A-4, B, E, F, I-2, I-3, M and S within correctional and detention facilities, doors in means of egress serving rooms or spaces occupied by persons whose movements are controlled for security reasons shall be permitted to be locked when equipped with egress control devices that shall unlock manually and by at least one of the following means:

1. Activation of an automatic sprinkler system installed in accordance with Section 903.3.1.1[3];

2. Activation of an approved manual fire alarm box;

3. A signal from a constantly attended location.
[1008.1.9.10] 1010.1.9.11 Stairway doors. Interior stairway means of egress doors shall be openable from both sides without the use of a key or special knowledge or effort.

Exceptions:

1. Stairway discharge doors shall be openable from the egress side and shall only be locked from the opposite side.

2. This section shall not apply to doors arranged in accordance with Section 403.5.3.

3. In stairways serving not more than four stories, doors are permitted to be locked from the side opposite the egress side, provided they are openable from the egress side and capable of being unlocked simultaneously without unlatching upon a signal from the fire command center, if present, or a signal by emergency personnel from a single location inside the main entrance to the building.

4. This section shall not apply to buildings permitted to be served by one exit in accordance with Item 4 or 5 or 6 of Section 1021.2, 1006.3.2.

5. In schools classified as Group E occupancies that require lockdown drills as per New York State Education Law 807, stairway egress doors from occupied spaces are permitted to be locked from the side opposite the egress side for the duration of the lockdown drill, provided that they are openable from the occupied side for egress and are unlocked upon directions from the school administrative personnel following the completion of the lockdown drill.

[1008.1.10] 1010.1.10 Panic and fire exit hardware. Doors serving Group H occupancies and doors serving rooms or spaces with an occupant load of 50 or more in a Group A or E occupancy the following shall not be provided with a latch or lock unless it is other than panic hardware or fire exit hardware:

1. Group H occupancies;

2. A room or space with an occupant load of 75 or more in a Group A or E occupancy;

3. A building or nonaccessory tenant space used for assembly purposes that is permitted to be classified as a Group B occupancy pursuant to Section 303.1.2; and

4. An accessory room or space used for assembly purposes where permitted to be classified as a Group B occupancy or as part of the occupancy it is accessory to, pursuant to Section 303.1.3.

[Exceptions] Exceptions:

1. A main exit of a Group A occupancy shall be permitted to be locking in compliance with Section 1008.1.9.3, 1010.1.9.3, Item 2.

2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.
Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide that contain overcurrent devices, switching devices or control devices with exit or exit access doors shall be equipped with panic hardware or fire exit hardware. The doors shall swing in the direction of egress travel.

1010.1.10.1 Rooms with electrical equipment. Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular data centers shall be equipped with panic hardware or fire exit hardware. Where rooms contain electrical rooms with equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices and where the exit or exit access door is less than 25 feet (7629 mm) from the equipment working space, shall be equipped with panic hardware or fire exit hardware. The doors shall swing in the direction of egress travel.

1010.1.10.2 Refrigeration machinery room. Swinging doors in refrigeration machinery rooms, where required by Section 1006.2.2.3, shall not be provided with a latch or lock other than panic hardware or fire exit hardware.

1008.1.10.1 1010.1.10.3 Installation. Where panic or fire exit hardware is installed, it shall comply with the following:

1. Panic hardware shall be listed in accordance with UL 305[

2. Fire exit hardware shall be listed in accordance with UL 10C and UL 305[

3. The actuating portion of the releasing device shall extend [at least] not less than one-half of the door leaf width[

4. The maximum unlatching force shall not exceed 15 pounds (67 66.7 N).

1008.1.10.2 1010.1.10.4 Balanced doors. If balanced doors are used and panic hardware is required, the panic hardware shall be the push-pad type and the pad shall not extend more than one-half the width of the door measured from the latch side.

1008.2 1010.2 Gates. Gates serving the means of egress system shall comply with the requirements of this section. Gates used as a component in a means of egress shall conform to the applicable requirements for doors.

Exception: Horizontal sliding or swinging gates exceeding the 4-foot (1219 mm) maximum leaf width limitation are permitted in fences and walls surrounding a stadium.

1008.2.1 1010.2.1 Stadiums. Panic hardware is not required on gates surrounding stadiums where such gates are under constant immediate supervision while the public is present, and where safe dispersal areas based on 3 square feet (0.28 m²) per occupant are located between the fence and enclosed space. Such required safe dispersal areas shall not be located less than 50 feet (15 240 mm) from the enclosed space. See Section 1027.6 1028.5 for means of egress from safe dispersal areas.
1003.3 Turnstiles. Turnstiles or similar devices that restrict travel to one direction shall not be placed so as to obstruct any required means of egress. Where portable turnstiles are installed for ticketing purposes, such turnstiles shall be moved from the egress path for proper exiting.

Exceptions:

1. Manually-operated turnstiles. Manually-operated turnstiles that consist of revolving devices that turn freely in the direction of exit travel may be used in any occupancy where revolving doors are permitted. Each manually-operated turnstile or similar device shall be credited with no more than a 50-person capacity where all of the following provisions are met:

   1.1. Each device shall turn freely in the direction of egress travel when primary power is lost, and upon the manual release by an employee in the area.

   1.2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.

   1.3. Each device is not more than 39 inches (991 mm) high.

   1.4. Each device has [at least 16.5] not less than 16½ inches (419.1 mm) clear width at and below a height of 39 inches (991 mm) and [at least] not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

   1.5 Where located as part of an accessible route, turnstiles shall have [at least] not less than 36 inches (914 mm) clear at and below a height of 34 inches (864 mm), [at least] not less than 32 inches (813 mm) clear width between 34 inches (864 mm) and 80 inches (2032 mm) and shall consist of a mechanism other than a revolving device.

2. Automatic turnstiles. Automatic turnstiles that consist of mechanisms other than revolving devices, and are operated by power, such as turnstiles with a photoelectric-actuated mechanism to open the turnstile upon the approach of a person, may be used in any occupancy where revolving doors are permitted. Automatic turnstiles may serve a means of egress system where all of the following provisions are met:

   2.1. Each automatic turnstile shall have minimum widths sufficient for the occupant load served and shall provide at least 32 inches (812.8 mm) of clear width at and below a height of 80 inches (2032 mm).

   2.2. The design shall be such that in the event of power failure, each automatic turnstile is capable of breaking away manually to permit means of egress travel. The force required to break away these turnstiles manually shall not exceed 13 pounds (57.8 N). The turnstile shall be capable of swinging from any position to the full, clear opening width of the turnstile when a force is applied to the turnstile on the side from which egress is made.
2.3. Each automatic turnstile shall be operable from the egress side without special knowledge or effort.

2.4. Each automatic turnstile shall be connected to the building fire alarm system. Activation of the building fire alarm system shall automatically release each such turnstile to its full, clear opening width, and each such turnstile shall remain in its open position until the fire alarm system has been reset.

2.5. Each automatic turnstile shall, upon actuation of a manual release device, automatically open to its full, clear opening width, and shall remain in its open position until the automatic turnstile’s access control system is reset. The manual release device shall be clearly identified with ready access that results in direct interruption of power to each turnstile. The manual release device shall be positioned at the fire command center or, if a fire command center is not required, at an approved location near the building entrance where the automatic turnstiles are located.

2.6. Each automatic turnstile shall have an integrated emergency power supply.

2.7. Each automatic turnstile power supply shall be electrically supervised.

2.8. Turnstiles provided for egress purposes in numbers greater than the egress capacity required by this code shall meet the requirements of this section.

2.9. Where located as part of an accessible route, such turnstiles shall have at least 36 inches (914 mm) clear width at and below a height of 34 inches (864 mm), at least 32 inches (813 mm) clear width between 34 inches (864 mm) and 80 inches (2032 mm).

1010.4 Security requirements for doors and windows. The provisions of Sections 1010.4.1 through 1010.4.4 shall apply to Group R-2 occupancies.

1010.4.1 Entrance doors. Building entrance doors and other exterior exit doors shall be equipped with heavy duty lock sets with auxiliary latch bolts to prevent the latch from being manipulated by means other than a key. Latch sets shall have stop-work in the inside cylinder controlled by a master key only. Outside cylinders of main entrance door locks shall be operated by the tenants’ key, which shall not be keyed to also open the tenants’ apartment door. A light or lights shall be provided at or near the outside of the front entranceway of the building providing not less than 5-foot candles (5.38 lux) intensity measured at the floor level for the full width of the entranceway.
[1008.4.2] 1010.4.2 Doors to dwelling units. Doors to dwelling units shall be equipped with a heavy duty latch set and a heavy duty dead bolt operable by a key from the outside and a thumb-turn from the inside. Those doors shall also be equipped with a chain guard so as to permit partial opening of the door. Dwelling unit entrance doors shall also be equipped with a viewing device located so as to enable a person on the inside of the entrance door to view a person immediately outside.

[1008.4.3] 1010.4.3 Windows. All openable windows shall be equipped with sash locks designed to be openable from the inside only. Grilles lockable from the inside only may be placed on the inside or outside of windows that are accessible from grade but that do not serve to provide access to exits.

[1008.4.4] 1010.4.4 Intercommunication system. Buildings containing eight or more dwelling units shall be provided with an intercommunication system located at the door giving access to the main entrance lobby, consisting of a device or devices for voice communication between the occupant of each dwelling unit and a person outside the door to the main entrance lobby, and permitting such dwelling unit occupant to release the locking mechanism of said door from the dwelling unit. In buildings provided with a full-time lobby attendant, the intercommunication system may be between each dwelling unit and the attendant’s station.

SECTION BC [1009] 1011
STAIRWAYS

1011.1 General. Stairways serving occupied portions of a building shall comply with the requirements of Sections 1011.2 through 1011.13. Alternating tread devices shall comply with Section 1011.14. Ships ladders shall comply with Section 1011.15. Ladders shall comply with Section 1011.16.

Exception: Within rooms or spaces used for assembly purposes, stepped aisles shall comply with Section 1029.

[1009.1 Stairway width] 1011.2 Width and capacity. The required capacity of stairways shall be determined as specified in Section [1005.1] 1005, but the minimum width shall be not less than 44 inches (1118 mm). See Section [1007.3] 1009.3 for accessible means of egress stairways.

Exceptions:

1. A width of not less than 36 inches (914 mm) shall be permitted in:
   1.1. A stairway that serves an occupant load of 50 or less cumulative for all stories; or
   1.2. A stairway that provides egress to the exit discharge solely for the use of Group R-2 occupancies, provided the building it serves is 125 feet (38 100 mm) or less in height, and provided such a stairway serves not more than 30 occupants per floor.

2. Spiral stairways as provided for in Section [1009.9] 1011.10.

3. [Aisle stairs complying with Section 1028.]
Where an inclined platform lift or a stairway chairlift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2, a clear passage width not less than 20 inches (508 mm) shall be provided. Where the seat and platform can be folded when not in use, the distance shall be measured from the folded seat and platform.

1011.3 Headroom. Stairways shall have a minimum headroom clearance of not less than 84 inches (2133.6 mm) measured vertically from a line connecting the edge of the nosings. Such headroom shall be continuous above the stairway to the point where the line intersects the landing below, one tread depth beyond the bottom riser. The minimum clearance shall be maintained the full width of the stairway and landing. Projections into the required width shall not be limited above the minimum headroom height.

Exceptions:

1. In Group R-2 and R-3 occupancies stairways shall have a minimum headroom clearance of not less than 80 inches (2032 mm).

2. Spiral stairways complying with Section 1009.9 are permitted a 78-inch (1981 mm) headroom clearance.

3. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; where the nosings of treads at the side of a flight extend under the edge of a floor opening through which the stair passes, the floor opening shall be allowed to project horizontally into the required headroom a maximum of not more than 4¾ inches (120.7 mm).

1011.4 Walkline. The walkline across winder treads shall be concentric to the direction of travel through the turn and located 12 inches (305 mm) from the side where the winders are narrower. The 12-inch (305 mm) dimension shall be measured from the widest point of the clear stair width at the walking surface of the winder. Where winders are adjacent within the flight, the point of the widest clear stair width of the adjacent winders shall be used.

1011.5 Stair treads and risers. Stair treads and risers shall comply with Sections 1009.4.1 through 1009.4.5.

1009.3 1011.5.1 Dimension reference surfaces. For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.

1009.4 1011.5.2 Riser height and tread depth. Stair riser heights shall be 7 inches (178 mm) maximum and 4 inches (101.6 mm) minimum. The riser height shall be measured vertically between the nosings of adjacent treads. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread’s nosing. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than ⅜ inch (9.5 mm). Winder treads shall have a minimum tread depth of 11 inches (279 mm) measured between the vertical planes of the foremost projection of adjacent treads at
the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair.

Exceptions:

[1. Alternating tread devices in accordance with Section 1009.10.]

[2. Ship ladders in accordance with Section 1009.11.]  

[3.] 1. Spiral stairways in accordance with Section [4009.9] 1011.10.

[4.] 2. Aisle stairs in assembly seating areas where the stair pitch or slope is set, for sightline reasons, by the slope of the adjacent seating area in accordance with Section 1028.11-2: Stairways connecting stepped aisles to cross aisles or concourses shall be permitted to use the riser/tread dimension in Section 1029.13.2.

[5.] 3. In Group R-2 occupancies:

[5.1.] 3.1. Sum of treads and risers. The sum of two risers plus one tread exclusive of nosing shall be not less than 24 inches ([640] 609.6 mm) nor more than 25½ inches ([648] 647.7 mm).

[5.2.] 3.2. Dimensions of treads and risers. The maximum riser height shall be 7¾ inches ([197] 196.85 mm) and the minimum tread depth shall be 9½ inches ([241] 241.3 mm) plus nosing. Treads may be undercut a distance equal to the nosing. A nosing not less than ¾ inch (19 mm) but not more than 1¼ inches ([32] 31.8 mm) shall be provided on stairways with solid risers where the tread depth is less than 11 inches ([279] 279.4 mm).

[5.3.] 3.3. Tolerances. The greatest riser height, tread depth, and nosing projection, within any flight of stairs shall not exceed the smallest by more than ⅜ inch (9.5 mm).

[6.] 4. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies not subject to accessibility provisions in Section 1107.2.5, Exception 2; and in Group U occupancies that are accessory to Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies:

[6.1.] 4.1. Sum of treads and risers. The sum of two risers plus one tread exclusive of nosing shall be not less than 24 inches ([640] 609.6 mm) nor more than 25½ inches ([648] 647.7 mm).

[6.2.] 4.2. Dimensions of treads and risers. The maximum riser height shall be 8¼ inches ([240] 209.6 mm) and the minimum tread depth shall be 9 inches ([229] 228.6 mm) plus nosing. Treads may be undercut a distance equal to the nosing. A 1¼-inch ([32] 31.75 mm) nosing shall be provided on stairways with solid risers where the tread depth is less than 11 inches ([279] 279.4 mm).
Tolerances. The greatest riser height, tread depth, and nosing projection, within any flight of stairs shall not exceed the smallest by more than \( \frac{3}{8} \) inch (9.5 mm).

In Group R-3 occupancies; and within dwelling units in Group R-2 occupancies; winders shall have a minimum tread depth of 10 inches (254 mm) measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread’s leading edge, when measured at a point 12 inches (305 mm) from the side where the treads are narrower. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point. Within any flight of stairs, the greatest winder tread depth at the 12-inch (305 mm) walk line shall not exceed the smallest by more than \( \frac{3}{8} \) inch (9.5 mm).

In Group I-3 facilities, stairways providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23.2 m²) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (228.6 mm).

**Winder treads.** Winder treads are not permitted in means of egress stairways except within a dwelling unit.

**Exceptions:**

1. Curved stairways in accordance with Section [1009.8] 1011.9.

2. Spiral stairways in accordance with Section [1009.9] 1011.10.

**Dimensional uniformity.** Stair treads and risers shall be of uniform size and shape. The tolerance between the largest and smallest riser height or between the largest and smallest tread depth shall not exceed \( \frac{3}{8} \) inch (9.5 mm) in any flight of stairs. The greatest winder tread depth at the walkline within any flight of stairs shall not exceed the smallest by more than \( \frac{3}{8} \) inch (9.5 mm).

**Exceptions:**

1. Stairways connecting stepped aisles to cross aisles or concourses shall be permitted to comply with the dimensional nonuniformity in Section 1029.13.2.

2. Consistently shaped winders, complying with Section [1009.4.2] 1011.5, differing from rectangular treads in the same flight of stairs.

3. Where the bottom or top riser adjoins a sloping public way, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (101.6 mm) in height with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of stairway stair width. The nosings or leading edges of treads at such nonuniform height risers shall have a distinctive
marking stripe, different from any other nosing marking provided on the stair flight. The distinctive marking stripe shall be visible in descent of the stair and shall have a slip-resistant surface. Marking stripes shall have a width of [at least] not less than 1 inch ([25] 25.4 mm) but not more than 2 inches ([51] 50.8 mm).

[1009.4.5 Profile] 1011.5.5 Nosing and riser profile. [The radius of curvature at the leading edge of the tread shall be not greater than \( \frac{9}{16} \) inch (14.3 mm). Beveling of nosings shall not exceed \( \frac{9}{16} \) inch (14.3 mm).] Nosings shall have a curvature or bevel of not less than \( \frac{1}{16} \) inch (1.6 mm) but not more than \( \frac{9}{16} \) inch (14.3 mm) from the foremost projection of the tread. Risers shall be solid and vertical or sloped under the tread above from the underside of the nosing above at an angle not more than 30 degrees (0.52 rad) from the vertical.

1011.5.5.1 Nosing projection size. The leading edge (nosings) of treads shall project not more than 1¼ inches ([32] 31.75 mm) beyond the tread below and all.

1011.5.5.2 Nosing projection uniformity. Nosing projections of the leading edges shall be of uniform size, including the projections of the nosing's leading edge of the floor at the top of a flight.

1011.5.5.3 Solid risers. Risers shall be solid. Perforated risers with openings not exceeding ¼ inch (6.4 mm) shall be considered solid risers.

Exceptions:

1. Solid risers are not required for stairways that are not serving as exits or that are not required to comply with Section [1007.3] 1009.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches ([102] 101.6 mm).

2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas accessible to the public. There are no restrictions on the size of the opening in the riser.

3. In Group R-3 occupancies, the following shall apply:

   3.1. The radius of curvature at the leading edge of the tread shall be no greater than \( \frac{9}{16} \) inch (14.3 mm).

   3.2. Solid risers are not required provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches ([102] 101.6 mm). However, the opening between treads is not limited on stairways with a total rise of 30 inches (762 mm) or less.

4. Solid risers are not required for spiral stairways constructed in accordance with Section [1009.9] 1011.10.

5. Solid risers are not required for alternating tread devices constructed in accordance with Section [1009.10] 1011.14.
[1009.5] **1011.6 Stairway landings.** There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall be not less than the width of stairways they serve. Every landing shall have a minimum width measured perpendicular to the direction of travel equal to the width of the stairway. Where the stairway has a straight run, the depth need not exceed 48 inches (1219 mm). Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (177.8 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. Where doors open onto a stairway landing, such landing shall also comply with Section 1008.1.6.

**Exception:** [Aisle stairs complying with Section 1028] Where stairways connect stepped aisles to cross aisles or concourses, stairway landings are not required at the transition between stairways and stepped aisles constructed in accordance with Section 1029.

[1009.6] **1011.7 Stairway construction.** All stairways shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction.

[1009.6.1] **1011.7.1 Stairway walking surface.** The walking surface of treads and landings of a stairway shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Stairway treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

**Exceptions:**

1. Openings in stair walking surfaces shall be a size that does not permit the passage of ½-inch (12.7 mm) diameter sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.

2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of 1⅛ inches (28.6 mm) cannot pass through the opening.

[1009.6.2] **1011.7.2 Outdoor conditions.** Outdoor stairways and outdoor approaches to stairways shall be designed so that water will not accumulate on walking surfaces. In other than Group R-3 and Group U occupancies in Group U that are accessory to an occupancy in Group R-3, tread, platforms and landings that are part of exterior stairways in climates subject to snow or ice shall be protected to prevent the accumulation of same.

[1009.6.3] **1011.7.3 Enclosures under interior stairways.** The walls and soffits within enclosed usable spaces under enclosed and unenclosed stairways shall be protected by 1-hour fire-resistance-rated construction or the fire-resistance rating of the stairway enclosure, whichever is greater. Access to the enclosed space shall not be directly from within the stairway enclosure.
**Exception:** Spaces under stairways serving and contained within a single residential dwelling unit in Group R-2 or R-3 shall be permitted to be protected on the enclosed side with ½-inch (12.7 mm) gypsum board.

**1011.7.4 Enclosures under exterior stairways.** There shall not be enclosed usable space under exterior exit stairways unless the space is completely enclosed in 1-hour fire-resistance-rated construction. The open space under exterior stairways shall not be used for any purpose.

**1009.7 [sic] 1011.8 Vertical rise.** A flight of stairs shall not have a vertical rise greater than 12 feet (3658 mm) between floor levels or landings.

**Exceptions:**

1. Aisle stairs complying with Section 1029.
2. Alternating tread devices used as means of egress shall not have a rise greater than 20 feet (6096 mm) between floor levels or landings complying with Section 1011.14.
3. Spiral stairways used as a means of egress from technical production areas.

**1009.8 1011.9 Curved stairways.** Curved stairways with winder treads shall have treads and risers in accordance with Section 1009.4 and the smallest radius shall be not less than twice the minimum width or required capacity of the stairway, whichever is greater.

**Exception:** The radius restriction shall not apply to curved stairways for occupancies in Group R-3 and within individual dwelling units in Group R-2.

**1009.9 1011.10 Spiral stairways.** Spiral stairways are permitted to be used as a component in the means of egress only within dwelling units or from a space not more than 250 square feet (23 m²) in area and serving not more than five occupants, or from technical production areas in accordance with Section 1015.6.

A spiral stairway shall have a 7½-inch (190.5 mm) minimum clear tread depth at a point 12 inches (305 mm) from the narrow edge. The risers shall be sufficient to provide a headroom of 72 inches (1879 mm) minimum, but riser height shall not be more than 9¼ inches (237.3 mm). The minimum stairway clear width at and below the handrail shall be 26 inches (660 mm).

**1011.11 Handrails.** Stairways shall have handrails on each side and shall comply with Section 1014. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

**Exceptions:**

1. Stairways within dwelling units and spiral stairways are permitted to have a handrail on one side only.
2. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
3. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.

4. Changes in room elevations of only one riser within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.

5. One handrail shall be allowed in enclosed interior exit stairways less than 44 inches (1117.6 mm) wide that do not serve as an accessible means of egress.

6. Handrails for ramped aisles and stepped aisles shall comply with Section 1029.15.

1011.12 Stairway to roof and roof access. In buildings four or more stories or more than 40 feet (12192 mm) in height above grade, one stairway shall extend to the roof surface through a stairway bulkhead complying with Section 1510.2, unless the roof has a slope steeper than 20 degrees (0.35 rad). Access to setback roof areas may be through a door or window opening to the roof. Stairways terminating at the level of a setback shall provide access to the setback roof areas, except where the setback is less than 4 feet (1220 mm) in width and 10 feet (3048 mm) in length, measured from the inside of the parapet wall.

1011.12.1 Occupancy Groups I-1, R-1 and R-2. In buildings in Occupancy Groups I-1, R-1 and R-2 two stories or more in height, with roofs having a slope of 15 degrees (0.26 rad) or less, all interior exit stairways, except those terminating at the level of a setback roof, shall extend to the roof surface.

Exceptions:

1. In buildings in Occupancy Groups R-1 and R-2 that are two stories in height and in Occupancy Group R-2 that are three stories in height with not more than one dwelling unit per story, access to the roof shall be permitted to be a noncombustible roof hatch or trap door not less than 21 inches (533.4 mm) in width and 28 inches (711.2 mm) in length. Such hatches shall be located within the interior exit stairway enclosure and be provided with a stationary, noncombustible access ladder or alternating tread device.

2. In buildings in Occupancy Group R-2 complying with Item 6 of Section 1006.3.2, roof access shall be governed by Item 6.6 of such section.

1011.12.2 Stairway to elevator equipment. Roofs and penthouses containing elevator equipment that must be accessed for maintenance are required to be accessed by a stairway.

1011.13 Guards. Guards shall be provided along stairways and landings where required by Section 1015 and shall be constructed in accordance with Section 1015. Where the roof hatch opening providing the required access is located within 10 feet (3049 mm) of the roof edge, such roof access or roof edge shall be protected by guards installed in accordance with Section 1015.

1009.10 1011.14 Alternating tread devices. Alternating tread devices are limited to an element of a means of egress in buildings of Groups F, H and S from a mezzanine not more than 250 square feet (23 m²) in area and which serves not more than five occupants; in buildings of Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m²)
m²) in area and for access to unoccupied roofs. Alternating tread devices used as a means of egress shall not have a rise greater than 20 feet (6096 mm) between floor levels or landings.

[1009.10.1] 1011.14.1 Handrails of alternating tread devices. Handrails shall be provided on both sides of alternating tread devices and shall comply with Section [1012] 1014.

[1009.10.2] 1011.14.2 Treads of alternating tread devices. Alternating tread devices shall have a minimum [projected] tread depth of 5 inches (127 mm), a minimum projected tread depth of [8.5] 8½ inches ([216] 215.9 mm), a minimum tread width of 7 inches ([178] 177.8 mm) and a maximum riser height of [9.5] 9½ inches ([241] 241.3 mm). The [projected] tread depth shall be measured horizontally between the vertical planes of the foremost projections of adjacent treads. The riser height shall be measured vertically between the leading edges of adjacent treads. The [combination of] riser height and [projected] tread depth provided shall result in an [alternating tread device] angle [that complies with Section 1002] of ascent from the horizontal of between 50 and 70 degrees (0.87 and 1.22 rad). The initial tread of the device shall begin at the same elevation as the platform, landing or floor surface.

Exception: Alternating tread devices used as an element of a means of egress in buildings from a mezzanine area not more than 250 square feet ([23] 23.2 m²) in an area [which] that serves not more than five occupants shall have a minimum tread depth of 3 inches (76.2 mm) with a minimum projected tread [of 8.5 inches (216 mm)] with a minimum tread depth of [10.5] 10½ inches (267 mm). The rise to the next alternating tread surface [should] shall not [be more than] exceed 8 inches ([203] 203.2 mm).

[1009.11] 1011.15 Ships ladders. [Ship] Ships ladders are permitted to be used in Group I-3 as a component of a means of egress to and from control rooms or elevated facility observation stations not more than 250 square feet ([23] 23.2 m²) with not more than three occupants and for access to unoccupied roofs. The minimum clear width at and below the handrails shall be 20 inches (508 mm).

1011.15.1 Handrails of ships ladders. Handrails shall be provided on both sides of ships ladders.

1011.15.2 Treads of ships ladders. [Ship] Ships ladders shall have a minimum tread depth of 5 inches (127 mm). The tread shall be projected such that the total of the tread depth plus the nosing projection is [not] not less than 8½ inches ([216] 215.9 mm). The maximum riser height shall be 9½ inches ([241] 241.3 mm).

[Handrails shall be provided on both sides of ship ladders. The minimum clear width at and below the handrails shall be 20 inches (508 mm).]

1011.16 Ladders. Permanent ladders shall not serve as a part of the means of egress from occupied spaces within a building. Permanent ladders constructed in accordance with Section 306.5 of the New York City Mechanical Code shall be permitted to provide access to the following areas:

1. Spaces frequented only by personnel for maintenance, repair or monitoring of equipment.

2. Nonoccupiable spaces accessed only by catwalks, crawl spaces, freight elevators or very narrow passageways.
3. Raised areas used primarily for purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands.

4. Elevated levels in Group U not open to the general public.

5. Roofs that are permitted to have noncombustible access ladders in accordance with Section 1011.12.1.

6. Technical production areas in assembly occupancies.

[1009.12 Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.]

1. Handrails for aisle stairs are not required where permitted by Section 1028.13.

2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.

3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.

4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.

5. Changes in room elevations of only one riser within dwelling units and sleeping units in Group R-2 and R-3 occupancies do not require handrails.

6. One handrail shall not be allowed in enclosed exit stairs less than 44 inches (1118 mm) wide that do not serve as an accessible means of egress.

[1009.13 Stairway to roof and roof access. In buildings four or more stories or more than 40 feet (12 192 mm) in height above grade, one stairway shall extend to the roof surface through a stairway bulkhead complying with Section 1509.2, unless the roof has a slope steeper than 20 degrees (0.35 rad). Access to setback roof areas may be through a door or window opening to the roof. Stairs terminating at the level of a setback shall provide access to the setback roof areas, except where the setback is less than 4 feet (1219 mm) in width and 10 feet (3048 mm) in length, measured from the inside of the parapet wall.]

1. In buildings in Occupancy Groups I-1, R-1 and R-2 two stories or more in height, with roofs having a slope of 15 degrees (0.26 rad) or less, all interior stairs, except those terminating at the level of a setback roof, shall extend to the roof surface.
located within the stair enclosure and be provided with a stationary, noncombustible access ladder or alternating tread device.]

[2. In buildings in Occupancy Group R-2 complying with Item 4 of Section 1021.2, roof access shall be governed by Item 4.6 of such section.]

1009.13.2 Protection at roof hatch openings. Where the roof hatch opening providing the required access is located within 10 feet (3049 mm) of the roof edge, such roof access or roof edge shall be protected by guards installed in accordance with the provisions of Section 1013.]

1009.14 Stairway to elevator equipment. Roofs and penthouses containing elevator equipment that must be accessed for maintenance are required to be accessed by a stairway.]

SECTION BC [1010] 1012
RAMES

1010.1 1012.1 Scope. The provisions of this section shall apply to ramps used as a component of a means of egress.

Exceptions:

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2 through 1108.2.4 and 1108.2.6, ramped aisles within assembly rooms or spaces shall [conform] comply with the provisions in Section [1028.11] 1029.

2. Curb ramps shall comply with ICC A117.1.

3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections [1010.3] 1012.3 through [1010.9 when] 1012.10 where they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of egress.

1010.2 1012.2 Slope. Ramps used as part of a means of egress or part of an accessible route shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

Exceptions:

2. In garages three stories or less in height and serving not more than one level below grade, ramps with a maximum slope of one unit vertical in seven units horizontal (14-percent slope) may serve as part of a nonaccessible means of egress.

1010.3 1012.3 Cross slope. The slope measured perpendicular to the direction of travel of a ramp shall not be steeper than one unit vertical in 48 units horizontal (2-percent slope).
[1010.4] **1012.4 Vertical rise.** The rise for any ramp run shall be 30 inches (762 mm) maximum.

[1010.5] **1012.5 Minimum dimensions.** The minimum dimensions of means of egress ramps shall comply with Sections [1010.5.4] 1012.5.1 through [1010.5.3] 1012.5.3.

[1010.5.4] **1012.5.1 Width and capacity.** The minimum width and required capacity of a means of egress ramp shall be not less than that required for corridors by Section [1018.2] 1020.2. The clear width of a ramp between handrails, if provided, or other permissible projections shall be 36 inches ([914] 914.4 mm) minimum.

[1010.5.2] **1012.5.2 Headroom.** The minimum headroom in all parts of the means of egress ramp shall be not less than 84 inches ([2134] 2133.6 mm).

[1010.5.3] **1012.5.3 Restrictions.** Means of egress ramps shall not reduce in width in the direction of egress travel. Projections into the required ramp and landing width are prohibited. Doors opening onto a landing shall not reduce the clear width to less than 42 inches ([1066] 1066.8 mm).

[1010.6] **1012.6 Landings.** Ramps shall have landings at the bottom and top of each ramp, points of turning, entrance, exits and at doors. Landings shall comply with Sections [1010.6.1] 1012.6.1 through [1010.6.5] 1012.6.5.

[1010.6.1] **1012.6.1 Slope.** Landings shall have a slope not steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Changes in level are not permitted.

[1010.6.2] **1012.6.2 Width.** The landing width shall be not less than the width of the widest ramp run adjoining the landing.

[1010.6.3] **1012.6.3 Length.** The landing length shall be 60 inches (1525 mm) minimum.

**Exceptions:**

1. In Group R-2 and R-3 individual dwelling and sleeping units that are not required to be Accessible units, Type B+NYC units or Type B units in accordance with Section 1107, landings are permitted to be 36 inches ([914] 914.4 mm) minimum.

2. Where the ramp is not a part of an accessible route, the length of the landing shall not be required to be more than 48 inches (1220 mm) in the direction of travel.

[1010.6.4] **1012.6.4 Change in direction.** Where changes in direction of travel occur at landings provided between ramp runs, the landing shall be 60 inches by 60 inches (1524 mm by 1524 mm) minimum.

**Exception:** In Group R-2 and R-3 individual dwelling or sleeping units that are not required to be Accessible units, Type B+NYC units or Type B units in accordance with Section 1107, landings are permitted to be 36 inches by 36 inches ([914] 914.4 mm by [914] 914.4 mm) minimum.
[1010.6.5] 1012.6.5 Doorways. Where doorways are located adjacent to a ramp landing, maneuvering clearances required by ICC A117.1 are permitted to overlap the required landing area.

[1010.7] 1012.7 Ramp construction. [All ramps] Ramps shall be built of materials consistent with the types permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction. [Ramps used as an exit shall conform to the applicable requirements of Sections 1022.1 and 1022.3 through 1022.5 for vertical exit enclosures.]

[1010.7.1] 1012.7.1 Ramp surface. The surface of ramps shall be of slip-resistant materials that are securely attached.

[1010.7.2] 1012.7.2 Outdoor conditions. Outdoor ramps and outdoor approaches to ramps shall be designed so that water will not accumulate on walking surfaces. In other than occupancies in Group R-3, and occupancies in Group U that are accessory to an occupancy in Group R-3, surfaces and landings which are part of exterior exit ramps in climates subject to snow or ice shall be designed to minimize the accumulation of same.

[1010.8] 1012.8 Handrails. Ramps with a rise greater than 6 inches (152.4 mm) shall have handrails on both sides. Handrails shall comply with Section 1012.14.

Exception: Handrails for ramped aisles are not required where permitted by Section 1028.13 1029.15.

1012.9 Guards. Guards shall be provided where required by Section 1015 and shall be constructed in accordance with Section 1015. Such guards may be used to satisfy the requirement of edge protection of Section 1012.10.

[1010.9] 1012.10 Edge protection. Edge protection complying with Section [1010.9.1] 1012.10.1 shall be provided on each side of ramp runs and at each side of ramp landings not adjoining another ramp run or stairway.

Exceptions:

1. Edge protection is not required on ramps that are not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.

2. Edge protection is not required on the sides of ramp landings having a vertical dropoff of not more than [0.5] ½ inch [(43 mm)] (12.7 mm) within 10 inches (254 mm) horizontally of the required landing area.

3. Edge protection is not required where the floor or ground surface of the ramp run or landing extends 12 inches (305 mm) minimum beyond the inside face of handrail complying with Section 1012.10.14.

[1010.9.1] 1012.10.1 Curb, rail, wall or barrier. A curb, rail, wall or barrier serving as edge protection shall be provided as follows:
1. Solid barriers. Solid barriers shall extend at least 4 inches ([102] 101.6 mm) from the floor or ground surface.

2. Other types of barriers. Other types of barriers shall prevent the passage of a 4-inch-diameter ([102] 101.6 mm) diameter sphere, where any portion of the sphere is within 4 inches ([102] 101.6 mm) of the floor or ground surface.

[1010.10 Guards. Guards shall be provided where required by Section 1013 and shall be constructed in accordance with Section 1013. Such guards may be used to satisfy the requirement of edge protection of Section 1010.9.]

SECTION BC [1011] 1013
EXIT SIGNS

[1011.1] 1013.1 Where required. Exits and exit access doors shall be marked by an approved exit sign readily visible from any direction of egress travel. The path of egress travel to exits and within exits shall be marked by readily visible exit signs to clearly indicate the direction of egress travel in cases where the exit or the path of egress travel is not immediately visible to the occupants. Intervening means of egress doors within exits shall be marked by exit signs. Exit sign placement shall be such that no point in an exit access corridor or exit passageway is more than 100 feet (30 480 mm) or the listed viewing distance for the sign, whichever is less, from the nearest visible exit sign.

Exceptions:

1. Exit signs are not required in rooms or areas that require only one exit or exit access.

2. Exit signs are not required in occupancies in Group U and individual sleeping units or dwelling units in Group I-1 or R. However, in a congregate living unit where the occupancy of such unit exceeds four people, exit signs shall be provided.

3. Exit signs are not required in dayrooms, sleeping rooms or dormitories in occupancies in Group I-3.

4. In occupancies in Groups A-4 and A-5, exit signs are not required on the seating side of vomitories or openings into seating areas where exit signs are provided in the concourse that are readily apparent from the vomitories. Such vomitories shall be provided with emergency egress lighting to identify each vomitory or opening within the seating area.

[1011.1.1] 1013.1.1 Signs within exits in high-rise buildings. In high-rise buildings subject to Section 403, exit signs shall be placed within exits at horizontal extensions to indicate the transition from vertical to horizontal direction at turns along the horizontal path.

1013.2 Floor-level exit signs in Group R-1. Where exit signs are required in Group R-1 occupancies by Section 1013.1, additional low-level exit signs shall be provided in all areas serving guest rooms in Group R-1 occupancies and shall comply with Section 1013.5.

The bottom of the sign shall be not less than 10 inches (254 mm) nor more than 12 inches (304.8 mm) above the floor level. The sign shall be flush mounted to the door or wall. Where mounted on the wall, the edge of the sign shall be within 4 inches (101.6 mm) of the door frame on the latch side.
Section 1013.3 Illumination. Exit signs shall be internally or externally illuminated.

Exception: Tactile signs required by Section 1013.4 need not be provided with illumination.

Section 1013.4 Raised character and braille exit signs. A tactile sign stating “EXIT” in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided adjacent to each door to an area of rescue assistance, an exterior area for assisted rescue, an exit stairway, an exit stairway or ramp, an exit passageway, a horizontal exit and the exit discharge.

Section 1013.5 Internally illuminated exit signs. Electrically powered exit signs shall be listed and labeled in accordance with UL 924, except that letters of exit signs shall be red. Exit signs shall be installed in accordance with the manufacturer’s instructions and Chapter 27 of this code. Exit signs shall be illuminated at all times. The letters of exit signs shall be red.

Section 1013.5.1 Graphics. The height of letters shall be not less than 6 inches (152 mm), except that in Group A and Group R-1 occupancies letters shall be not less than 8 inches (203 mm) high. Graphics shall have letter widths, strokes and spacing in proportion to their height.

Section 1013.6 Externally illuminated exit signs. Externally illuminated exit signs shall comply with Sections 1013.4.1 through 1013.6.3.

Section 1013.6.1 Graphics. Every exit sign and directional exit sign shall have plainly legible letters not less than 6 inches (152.4 mm) high with the principal strokes of the letters not less than 0.75 inch (19.1 mm) wide. The word “EXIT” shall have letters having a width not less than 2 inches (50.8 mm) wide, except the letter “l,” and the minimum spacing between letters shall be not less than 0.375 inch (9.5 mm). In Group A and R-1 occupancies letters shall be not less than 8 inches (203 mm) high. Signs larger than the minimum established in this section shall have letter widths, strokes and spacing in proportion to their height.

The word “EXIT” shall be in high contrast with the background and shall be clearly discernible when the means of exit sign illumination is or is not energized. The letters of exit signs shall be red. If a chevron directional indicator is provided as part of the exit sign, the construction shall be such that the direction of the chevron directional indicator cannot be readily changed.

Section 1013.6.2 Exit sign illumination. The face of an exit sign illuminated from an external source shall have an intensity of not less than 25 foot-candles (269.1 lux).

Section 1013.6.3 Power source. Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.
SECTION BC [1012] 1014
HANDRAILS

[1012.1] 1014.1 Where required. Handrails [for stairways and ramps] serving stairways, ramps, stepped aisles and ramped aisles shall be adequate in strength and attachment in accordance with Section [1607.7] 1607.8. Handrails required for stairways by Section [1009.4] 1011.11 shall comply with Sections [1012.2] 1014.2 through [1012.9] 1014.9. Handrails required for ramps by Section [1010.8] 1012.8 shall comply with Sections [1012.2] 1014.2 through [1012.8] 1014.8. Handrails for stepped aisles and ramped aisles required by Section 1029.15 shall comply with Sections 1014.2 through 1014.8.

[1012.2] 1014.2 Height. Handrail height, measured above stair tread nosings, or finish surface of ramp slope, shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965.2 mm). Handrail height of alternating tread devices and ships ladders, measured above tread nosings, shall be uniform, not less than 30 inches (762 mm) and not more than 34 inches (864 mm).

Exceptions:

1. Where handrail fittings or bendings are used to provide continuous transition between flights, the fittings or bendings shall be permitted to exceed the maximum height.

2. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are associated with a Group R-3 occupancy or associated with individual dwelling units in Group R-2 occupancies; where handrail fittings or bendings are used to provide continuous transition between flights, transition at winder treads, transition from handrail to guard, or where used at the start of a flight, the handrail height at the fittings or bendings shall be permitted to exceed the maximum height.

3. Top surface of a guard where permitted to be used as a handrail along stepped aisles and ramped aisles in accordance with Section 1029.15.

[1012.3] 1014.3 Handrail graspability. [All required] Required handrails shall comply with Section [1012.3.1] 1014.3.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I in accordance with Section [1012.3.1] 1014.3.1, Type II in accordance with Section [1012.3.2] 1014.3.2, or shall provide equivalent graspability.

[1012.3.1] 1014.3.1 Type I. Handrails with a circular cross section shall have an outside diameter of [at least] not less than 1¼ inches (32 31.75 mm) and not greater than 2 inches (54 50.8 mm). [H] Where the handrail is not circular, it shall have a perimeter dimension of [at least] not less than 4 inches (102 101.6 mm) and not greater than 6¼ inches (160 158.75 mm) with a maximum cross-sectional dimension of 2¼ inches (57 57.15 mm) and minimum cross-sectional dimension of 1 inch (25.4 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).
[1012.3.2] 1014.3.2 Type II. Handrails with a perimeter greater than 6¼ inches ([160] 158.75 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of ¾ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of [at least] not less than $5/16$ inch ([8] 7.9 mm) within ⅛ inch (22 mm) below the widest portion of the profile. This required depth shall continue for [at least] not less than ¾ inch ([158.75] 9.6 mm) to a level that is not less than 1¾ inches ([44.5] 69.9 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[1012.4] 1014.4 Continuity. Handrail gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

Exceptions:

1. Handrails within dwelling units are permitted to be interrupted by a newel post at a turn or landing.

2. Within a dwelling unit, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.

3. Handrail brackets or balusters attached to the bottom surface of the handrail that do not project horizontally beyond the sides of the handrail within 1½ inches ([38] 38.1 mm) of the bottom of the handrail shall not be considered obstructions. For each ½ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches ([102] 101.6 mm), the vertical clearance dimension of 1½ inches ([38] 38.1 mm) shall be permitted to be reduced by ⅛ inch ([3] 3.2 mm).

4. Where handrails are provided along walking surfaces with slopes not steeper than 1:20 (5-percent slope), the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper guards.

5. Handrails serving stepped aisles or ramped aisles are permitted to be discontinuous in accordance with Section 1029.15.1.

[1012.5] 1014.5 Fittings. Handrails shall not rotate within their fittings.

[1012.6] 1014.6 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent flight of stairs or ramp run. Where handrails are not continuous between flights, the handrails shall extend horizontally [at least] not less than 12 inches ([304.8] 304.8 mm) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser. At ramps where handrails are not continuous between runs, the handrails shall extend horizontally above the landing 12 inches ([304.8] 304.8 mm) minimum beyond the top and bottom of ramp runs. The extensions of handrails shall be in the same direction of the flight of stairs at stairways and the ramp runs at ramps.

Exceptions:
1. Handrails within a dwelling unit that is not an Accessible unit, Type B+NYC unit, or Type B unit need extend only from the top riser to the bottom riser.

2. Handrails within a Type B+NYC multistory dwelling unit that complies with Section 1107.2.5, Items 1 through 3, need extend only from the top riser to the bottom riser.

3. Handrails within a Type B+NYC multistory dwelling unit that complies with Section 1107.2.5, Items 1 through 3, need extend only from the top riser to the bottom riser.

4. Handrails for alternating tread devices and ships ladders are permitted to terminate at a location vertically above the top and bottom risers. Handrails for alternating tread devices and ships ladders are not required to be continuous between flights or to extend beyond the top or bottom risers.

5. Clearance. Clear space between a handrail and a wall or other surface shall be not less than 1½ inches (38.1 mm). A handrail and a wall or other surface adjacent to the handrail shall be free of any sharp or abrasive elements.

6. On ramps and on ramped aisles that are part of an accessible route, the clear width between handrails shall be 36 inches (914 mm) minimum. Projections into the required width of aisles, stairways and ramps at each handrail side shall not exceed 4½ inches (114 mm) at or below the handrail height. Projections into the required width shall not be limited above the minimum headroom height required in Section 1009.2.1. Projections due to intermediate handrails shall not constitute a reduction in the egress width.

Exception: The available egress width shall be reduced by the distance between the closest edges of a pair of intermediate handrails where:

1. Such pair of intermediate handrails are provided within the stairway width without a walking surface between the pair; and

2. The distance between the closest edges of such pair of intermediate handrails is greater than 6 inches (152.4 mm).

7. Intermediate handrails. Stairways shall have intermediate handrails located in such a manner that all portions of the stairway minimum width or required egress capacity are within 30 inches (762 mm) of a handrail. On monumental stairs, handrails shall be located along the most direct path of egress travel.

SECTION BC 1015 GUARDS

1015.1 General. Guards shall comply with the provisions of Sections 1015.2 through 1015.7. Operable windows with sills located more than 72 inches (1828.8 mm) above finished grade or other surface below shall comply with Section 1015.8.

1015.2 Where required. Guards adequate in strength and attachment in accordance with Section 1607.8 shall be located along open-sided walking surfaces that are more than 30 inches (762...
mm) measured vertically to the floor or grade below at any point within 36 inches (914.4 mm) horizontally to the edge of the open side. Such open-sided walking surfaces shall[.]include, but not be limited to, the following:

1. Roofs and setback roofs such as terraces accessible by a stairway, including those required by Section 1011.12;

2. Where protective guards are required on building roofs pursuant to Section 1510.8;

3. [Mezzanines] Mezzanines;

4. Balconies;

5. [equipment] Equipment platforms[.];

6. Aisles;

7. [stairs] Stairs;

8. [ramps] Ramps; and

9. [landings that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side. Guards shall be adequate in strength and attachment in accordance with Section 1607.7] Landings.

Exception: Guards are not required for the following locations:

1. On the loading side of loading docks or piers.

2. On the audience side of stages and raised platforms, including [steps] stairs and ramps leading up to the stage and raised platforms.

3. On raised stage and platform floor areas such as runways, ramps and side stages used for entertainment or presentations.

4. At vertical openings in the performance area of stages and platforms.

5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.

6. Along vehicle service pits not accessible to the public.

7. In assembly seating [where guards areas at cross aisles in accordance with Section 1028.14 are permitted and provided] 1029.16.2.

[4013.1.1] 1015.2.1 Glazing. Where glass is used to provide a guard or as a portion of the guard system, the guard shall [also] comply with Section 2407. Where the glazing provided does not
meet the strength and attachment requirements of Section [1607.7] 1607.8, complying guards shall also be located along glazed sides of open-sided walking surfaces.

[1013.2] 1015.3 Height. Required guards shall be not less than 42 inches ([1067] 1066.8 mm) high, measured vertically [above the adjacent walking surfaces, adjacent fixed seating or the line connecting the leading edges of the treads] as follows:

1. From the adjacent walking surfaces.

2. Where any portion of fixed seating, fixed planters or similar fixed elements are located within 21 inches (533.4 mm) horizontally of the guards, from the upper most surface of such portion of the fixed seating or fixed element.

3. On stairways and stepped aisles, from the line connecting the leading edges of the tread nosings.

4. On ramps and ramped aisles, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards on the open sides of stairs shall have a height not less than 34 inches ([864] 863.4 mm) measured vertically from a line connecting the leading edges of the treads.

2. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard also serves as a handrail on the open sides of stairs, the top of the guard shall be not less than 34 inches ([864] 863.4 mm) and not more than 38 inches ([965] 965.2 mm) measured vertically from a line connecting the leading edges of the treads.

3. The guard height in assembly seating areas shall comply with Section [1028.14] 1029.16 as applicable.

4. Along alternating tread devices and ship ladders, guards whose top rail also serves as a handrail[1] shall have height not less than 30 inches (762 mm) and not more than 34 inches ([864] 863.4 mm), measured vertically from the leading edge of the device tread nosing.

[1013.3] 1015.4 Opening limitations. Required guards shall not have openings that allow passage of a sphere 4 inches ([102] 101.6 mm) in diameter from the walking surface to the required guard height.

Exceptions:

1. From a height of 36 inches ([914] 914.4 mm) to 42 inches ([1067] 1066.8 mm), guards shall not have openings that allow passage of a sphere 4⅜ inches ([111] 111.1 mm) in diameter.
2. The triangular openings at the open sides of a stair, formed by the riser, tread and bottom rail, shall not allow passage of a sphere 6 inches ([452] 152.4 mm) in diameter.

3. At elevated walking surfaces that are not open to the public for access to and use of electrical, mechanical or plumbing systems or equipment, guards shall not have openings [which] that allow passage of a sphere 21 inches ([533] 533.4 mm) in diameter.

4. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for alternating tread devices and [ship] ships ladders, guards shall not have openings [which] that allow passage of a sphere 21 inches ([533] 533.4 mm) in diameter.

5. In assembly seating areas, guards required at the end of aisles [where they terminate at a fascia of boxes, balconies and galleries] in accordance with Section 1029.16.4 shall not have openings [which] that allow passage of a sphere 21 inches ([533] 533.4 mm) in diameter.

6. Within individual dwelling units and sleeping units in Group R-2 and R-3 occupancies, guards on the open sides of stairs shall not have openings [which] that allow passage of a sphere 4 inches ([101] 101.6 mm) inches in diameter.

[1013.4] 1015.5 Screen porches. Porches and decks [which] that are enclosed with insect screening shall be provided with guards where the walking surface is located more than 30 inches (762 mm) above the floor or grade below.

[1013.5] 1015.6 Mechanical equipment, systems and devices. Guards shall be provided where [appliances, equipment, fans, roof hatch openings or other] various components that require service are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall extend not less than 30 inches (762 mm) beyond each end of such components. The guard shall be constructed so as to prevent the passage of a sphere 21 inches ([533] 533.4 mm) in diameter.

[1013.6] 1015.7 Roof access. Guards shall be provided where the roof hatch opening is located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall be constructed so as to prevent the passage of a sphere 21 inches ([533] 533.4 mm) in diameter.

1015.8 Window sills in Group R-3 occupancies. In one- and two-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1828.8 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 36 inches (914.4 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 36 inches (914.4 mm) shall be fixed or have openings through which a 4-inch (101.6 mm) diameter sphere cannot pass.
Exception: Openings that are provided with window guards that comply with ASTM F 2090.

1015.9 Windows and openings in Group R-2 occupancies. Windows and openings that do not allow passageway onto grade, balcony, terrace, setback, roof or other walking surfaces in Group R-2 occupancies shall be subject to the applicable requirements of the New York City Department of Health and Mental Hygiene with regard to window guards.

SECTION BC [4014] 1016
EXIT ACCESS

[4014.1] 1016.1 General. The exit access shall comply with the applicable provisions of Sections 1003 through [4013] 1015. Exit access arrangement shall comply with Sections [4014] 1016 through [4019] 1021.

[4014.2] 1016.2 Egress through intervening spaces. Egress through intervening spaces shall comply with this section.

1. Exit access through an enclosed elevator lobby is permitted. Access to not less than one of the required exits shall be provided without travel through the enclosed elevator lobbies required by Section 3006. Where the path of exit access travel passes through an enclosed elevator lobby, the level of protection required for the enclosed elevator lobby is not required to be extended to the exit unless direct access to an exit is required by other sections of this code.

2. Egress from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas and the area served are accessory to; one or the other, are not a Group H occupancy and provide a discernible path of egress travel to an exit.

Exception: Means of egress are not prohibited through adjoining or intervening rooms or spaces in a Group H, S or F occupancy when the adjoining or intervening rooms or spaces are the same or a lesser hazard occupancy group.

[2-] 3. An exit access shall not pass through a room that can be locked to prevent egress.

[3-] 4. Means of egress from dwelling units or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.

[4-] 5. Egress shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes.

Exceptions:

1. Means of egress are not prohibited through a kitchen area serving adjoining rooms constituting part of the same dwelling unit or sleeping unit.

2. Means of egress are not prohibited through stockrooms in Group M when all of the following are met:

   2.1. The stock is of the same hazard classification as that found in the main retail area.
2.2. Not more than 50 percent of the exit access is through the stockroom.

2.3. The stockroom is not subject to locking from the egress side.

2.4. There is a demarcated, minimum 44-inch wide (1118 mm) wide aisle defined by full- or partial-height fixed walls or similar construction that will maintain the required width and lead directly from the retail area to the exit without obstructions.

[1014.2.1] Multiple tenants. Where more than one tenant occupies any one floor of a building or structure, each tenant space, dwelling unit and sleeping unit shall be provided with access to the required exits without passing through adjacent tenant spaces, dwelling units and sleeping units.

**Exception:** The means of egress from a smaller tenant space shall not be prohibited from passing through a larger adjoining tenant space where the following conditions are met:

1. Such rooms or spaces of the smaller tenant occupy less than 10 percent of the area of the larger tenant space through which they pass;

2. The larger tenant is a Group M occupancy and the smaller tenant space is of the same or similar occupancy group;

3. A discernible path of egress travel is provided from the smaller tenant space to an exit;

4. The means of egress into the adjoining space is not subject to locking from the egress side of the smaller tenant space; and

5. The smaller tenant space serves the same occupants, customers, or patrons as the larger tenant space.

[1014.2.2 Group I-2. Habitable rooms or suites in Group I-2 occupancies shall have an exit access door leading directly to a corridor.]

**Exception:** Rooms with exit doors opening directly to the outside at ground level to a public way.

[1014.2.3 Suites in patient sleeping areas. Patient sleeping areas in Group I-2 occupancies shall be permitted to be divided into suites with one intervening room if one of the following conditions is met:]

1. The intervening room within the suite is not used as an exit access for more than eight patient beds.

2. The arrangement of the suite allows for direct and constant visual supervision by nursing personnel.

[1014.2.3.1 Area. Suites of sleeping rooms shall not exceed 5,000 square feet (465 m²).]
1014.2.3.2 Exit access. Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93 m²) shall have at least two exit access doors remotely located from each other.

1014.2.3.3 Travel distance. The travel distance between any point in a suite of sleeping rooms and an exit access door of that suite shall not exceed 100 feet (30 480 mm).

1014.2.4 Suites in areas other than patient sleeping areas. Areas other than patient sleeping areas in Group I-2 occupancies shall be permitted to be divided into suites.

1014.2.4.1 Area. Suites of rooms, other than patient sleeping rooms, shall not exceed 10,000 square feet (929 m²).

1014.2.4.2 Exit access. Any room or suite of rooms, other than patient sleeping rooms, of more than 2,500 square feet (232 m²) shall have at least two exit access doors remotely located from each other.

1014.2.4.3 One intervening room. For rooms other than patient sleeping rooms, suites of rooms are permitted to have one intervening room if the travel distance within the suite to the exit access door is not greater than 100 feet (30 480 mm).

1014.2.4.4 Two intervening rooms. For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through two intervening rooms where the travel distance to the exit access door is not greater than 50 feet (15 240 mm).

1014.2.5 Exit access through suites. Exit access from all other portions of a building not classified as a suite in a Group I-2 occupancy shall not pass through a suite.

1014.2.6 Travel distance. The travel distance between any point in a Group I-2 occupancy patient sleeping room and an exit access door in that room shall not exceed 50 feet (15 240 mm).

1014.2.7 Separation. Suites in Group I-2 occupancies shall be separated from other portions of the building by a smoke partition complying with Section 711.

1014.3 Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies having fixed seating, see Section 1028.8.

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30,480 mm).

4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38,100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

5. The length of a common path of egress travel in Group I-2 occupancies between any point in a suite of sleeping rooms and an exit access door of that suite shall not be more than 100 feet (30,480 mm) in accordance with Section 1014.2.3.3.

[1014.4] 1016.3 Intervening public hall in Group R-2 occupancies. Buildings in Occupancy Group R-2 shall comply with the intervening public hall requirements in accordance with Sections [1014.4.1] 1016.3.1 and [1014.4.2] 1016.3.2.

[1014.4.1] 1016.3.1 Group R-2 nonhigh-rise occupancies. In buildings in Occupancy Group R-2 not subject to Section 403, a door from a dwelling unit shall open into an intervening public hall. Such public hall shall be constructed as a public corridor in accordance with Section [1018] 1020. Opening protectives in accordance with Exception 3 of Section 707.6 shall not be permitted.

Exceptions:

1. No intervening public hall shall be required for any of the following:

   1.1. A building that is both three stories or less in height, and contains two or fewer dwelling units per story; or

2. No intervening public hall shall be required where the doors opening to the apartments are smoke and draft controlled doors complying with UL 1784 without artificial bottom seals, in accordance with [Section] Sections [715.3] 716.5 and [715.3.5.3] 716.5.7.3 of this code, and the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1 of this code. This exception shall not apply to any building that complies with Item [5] 7 of Section [1021.2] 1006.3.2 of this code where there is more than one apartment per story.

[1014.4.2] 1016.3.2 Group R-2 high-rise occupancies. In high-rise buildings in Occupancy Group R-2, all doors from a dwelling unit shall open into an intervening public hall. Such public hall shall be constructed as a public corridor in accordance with Section [1018] 1020. Opening protectives in accordance with Exception 3 of Section 707.6 shall not be permitted. Such public hall shall provide access to at least two exits.

Exception: Where the only dwelling units on a story of a building are the upper stories of multi-story (duplex) dwelling units;

1. Any public halls shall be permitted to provide access to only one exit; or

2. No such public hall shall be required where smoke and draft controlled doors
complying with UL 1784 without artificial bottom seals, in accordance with Sections
[715.4] 716.5 and [715.4.6.3] 716.5.7.3 of this code, are provided. This exception shall
not be construed to effect, alter, or change any requirement of this code to provide two
means of egress from each apartment on each story.

[SECTION BC 1015
EXIT AND EXIT ACCESS DOORWAYS]

[1015.1 Exits or exit access doorways from spaces. Two exits or exit access doorways from any
space shall be provided where one of the following conditions exists:]

[1. The occupant load of the space exceeds one of the values in Table 1015.1.]

[2. The common path of egress travel exceeds one of the limitations of Section 1014.3.]

[3. Where required by Section 1015.3, 1015.4, 1015.5, 1015.6 or 1015.6.1.
Exception: Group I-2 occupancies shall comply with Sections 1014.2.2 through 1014.2.7.]}

[Where a building contains mixed occupancies, each individual occupancy shall comply with
the applicable requirements for that occupancy. Where applicable, cumulative occupant loads
from adjacent occupancies shall be considered in accordance with the provisions of Section
1004.1.]

</table>

[a. Day care maximum occupant load is 10.]

[1015.1.1 Three or more exits or exit access doorways. Three exits or exit access doorways
shall be provided from any space with an occupant load of 501 to 1,000. Four exits or exit access
doorways shall be provided from any space with an occupant load greater than 1,000.]

[1015.2 Exit or exit access doorway arrangement. Required exits shall be located in a manner that
makes their availability obvious. Exits shall be unobstructed at all times. Exit and exit access
doorways shall be arranged in accordance with Sections 1015.2.1 and 1015.2.2.]
1015.2.1 Two exits or exit access doorways. Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Stairs sharing any common wall, floors, ceilings, scissor stair assemblies, or other enclosures shall be counted as one exit stairway.

Exceptions:

1. Corridor measurements. Where exit enclosures are provided as a portion of the required exit and are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1018, the required exit separation shall be measured along the shortest direct line of travel within the corridor.

2. Remote location in sprinklered buildings. Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.

3. R-2 occupancies. In Group R-2 occupancies, where stairs are enclosed in walls having at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules.

3.1. The exit doors to such stairs shall be placed a distance apart equal to not less than 15 feet (4572 mm); and

3.2. Such stairs shall be permitted to share common walls, floors, ceilings or scissor stair assemblies or other enclosures provided that the construction separating the stairs is also of at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules.

4. B occupancies. In Group B occupancies of construction Type I or II not exceeding 60 feet (18 288 mm) in height, not exceeding 2,000 square feet (186 m²) on any story and not exceeding a travel distance of 50 feet (15 240 mm) on any story, where stairs are enclosed in walls having at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules.

4.1. The exit doors to such stairs shall be placed a distance apart equal to not less than 15 feet (4572 mm); and

4.2. Such stairs shall be permitted to share common walls, floors, ceilings or scissor stair assemblies.

1015.2.2 Three or more exits or exit access doorways. Where access to three or more exits is required, at least two exit doors or exit access doorways shall be arranged in accordance with the provisions of Section 1015.2.1.
[1015.3 Boiler, incinerator and furnace rooms. Two exit access doorways are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m²) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422,000 KJ) input capacity. Where two exit access doorways are required, one is permitted to be a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one half the length of the maximum overall diagonal dimension of the room.]

[1015.4 Refrigeration machinery rooms. Machinery rooms larger than 1,000 square feet (93 m²) with refrigeration units or systems having a refrigerant circuit containing more than 220 pounds (100 kg) of Group A1 refrigerant or 30 pounds (14 kg) of any other group refrigerant, as classified in Section 1103.1 of the New York City Mechanical Code, shall have not less than two exits or exit access doors. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one half the maximum horizontal dimension of room.]

[All portions of machinery rooms shall be within 150 feet (45.720 mm) of an exit or exit access doorway. An increase in travel distance is permitted in accordance with Section 1016.1.]

[Doors shall swing in the direction of egress travel, regardless of the occupant load served. Doors shall be tight fitting and self-closing.]

[1015.5 Refrigerated rooms or spaces. Rooms or spaces having a floor area larger than 1,000 square feet (93 m²), containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two exits or exit access doors.]

[Travel distance shall be determined as specified in Section 1016.1, but all portions of a refrigerated room or space shall be within 150 feet (45.720 mm) of an exit or exit access door where such rooms are not protected by an approved automatic sprinkler system. Egress is allowed through adjoining refrigerated rooms or spaces.]

[Exception: Where using refrigerants in quantities limited to the amounts based on the volume set forth in the New York City Mechanical Code.]

[1015.6 Stage means of egress. Where a minimum of two means of egress are required pursuant to Section 410.5.3, one means of egress shall be provided on each side of the stage.]

[1015.6.1 Gallery, gridiron and catwalk means of egress. The means of egress from lighting and access catwalks, galleries and gridirons shall meet the requirements for occupancies in Group E-2.]

[Exceptions:]

[1. A minimum width of 22 inches (559 mm) is permitted for lighting and access catwalks.]

[2. Stairways required by this subsection need not be enclosed.]

[3. Stairways with a minimum width of 22 inches (559 mm), ladders or spiral stairs are permitted in the means of egress.]
SECTION BC [1016] 1017
EXIT ACCESS TRAVEL DISTANCE

[1016.1] Travel distance limitations. Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story along the natural and unobstructed path of egress travel to an exterior exit door at the level of exit discharge, an entrance to a vertical exit enclosure, an exit passageway, a horizontal exit, an exterior exit stairway or an exterior exit ramp, shall not exceed the distances given in Table 1016.1.

1017.1 General. Travel distance within the exit access portion of the means of egress system shall be in accordance with this section.

[Exceptions:]

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open exit stairways.

2. In outdoor facilities with open exit access components and open exterior exit stairways or exit ramps, travel distance is permitted to be measured to the closest riser of an exit stairway or the closest slope of the exit ramp.

3. In all occupancies other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps when connecting a maximum of two stories. Each such interconnected story shall have access to the minimum number of approved independent exits as required by Section 1021.1, but in no case shall there be less than two means of egress. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located in accordance with Section 1015.2.

4. In all occupancies other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit using unenclosed exit access stairways or ramps in the first and second stories above grade plane in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories above grade plane shall have access to the minimum number of approved independent exits as required by Section 1021.1, but in no case shall there be less than two means of egress. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located in accordance with Section 1015.2.

[Where applicable, travel distance on unenclosed exit access stairways or ramps and on connecting stories shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.]
1017.2 Limitations. Exit access travel distance shall not exceed the values given in Table 1017.2.

For SI: 1 foot = 304.8 mm.

a. See the following sections for modifications to exit access travel distance requirements:
   - Section [1014.2.2 through 1014.2.7] 407.4: For the distance limitation in malls.
   - Section 404.9: For the distance limitation through an atrium space.
   - Section 407.4: For the distance limitation in Group I-2.
   - Sections 408.6.1 and 1008.8.1: For the distance limitations in Group I-3.
   - Section 411.4: For the distance limitation in special amusement buildings.
   - Section 412.7: For the distance limitations in aircraft manufacturing facilities.
   - [Sections 1014.2.2 through 1014.2.7] 407.4.2: For the distance limitation in Group I-2 hospital suites.
   - Section [1015.4] 1006.2.2: For the distance limitation in refrigeration machinery rooms.
   - Section [1015.5] 1006.2.2: For the distance limitation in refrigerated rooms and spaces.
   - Section [1023.1] 1006.3.2: For buildings with one exit.
   - Section [1028.7] 1029.7: For increased limitation in assembly seating.
   - [Section 1028.7] For increased limitation for assembly open-air seating.
   - Section 3103.4: For temporary structures.
   - Section 3104.9: For pedestrian walkways.

b. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where sprinkler systems [according to] are permitted in accordance with Section 903.3.1.2<sup>[are permitted]</sup>.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

d. Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.2.5.1.

[1016.2] 1017.2.1 Exterior egress balcony increase. Exit access travel distances specified in [Section 1014.1] Table 1017.2 shall be increased up to an additional 100 feet (30 480 mm) provided the last portion of the exit access leading to the exit occurs on an exterior egress balcony constructed in accordance with Section [1049] 1021. The length of such balcony shall be not [be] less than the amount of the increase taken.

1017.3 Measurement. Exit access travel distance shall be measured from the most remote point within a story along the natural and unobstructed path of horizontal and vertical egress travel to the entrance to an exit.

**Exceptions:**

1. In open parking garages, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.
2. In buildings of Group A-5 with open-air seating served by exit access stairways and ramps, exit access travel distance is permitted to be measured to the closest riser of an exit access stairway or the closest slope of an exit access ramp.

3. Exit access travel distance in assembly occupancies shall be measured in accordance with Section 1029.

1017.3.1 Exit access stairways and ramps. Travel distance on exit access stairways or ramps shall be included in the exit access travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stair and landings. The measurement along ramps shall be made on the walking surface in the center of the ramp and landings.

SECTION BC [1017] 1018 AISLES

1018.1 General. Aisles and aisle accessways serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles or aisle accessways shall be provided from all occupied portions of the exit access [which] contain seats, tables, furnishings, displays and similar fixtures or equipment. [Aisles serving assembly areas shall comply with Section 1028. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1028.] The minimum width or required [width] capacity of aisles shall be unobstructed.

Exception: [Doors] Encroachments complying with Section [1005.2] 1005.7.

1018.2 Aisles in assembly spaces. Aisles and aisle accessways serving a room or space used for assembly purposes shall comply with Section 1029.

1018.3 Aisles in Groups B and M. In Group B and M occupancies, the minimum clear aisle width shall be determined by Section [1005.4] 1005 for the occupant load served, but shall be not less than 36 inches (914 mm).

Exception: Nonpublic aisles serving less than 50 people and not required to be accessible by Chapter 11 need not exceed 28 inches (711 mm) in width.

1018.4 Aisle accessways in Group M. An aisle accessway shall be provided on [at least] not less than one side of each element within the merchandise pad. The minimum clear width for an aisle accessway not required to be accessible shall be 30 inches (762 mm). The required clear width of the aisle accessway shall be measured perpendicular to the elements and merchandise within the merchandise pad. The 30-inch (762 mm) minimum clear width shall be maintained to provide a path to an adjacent aisle or aisle accessway. The common path of egress travel shall not exceed 30 feet (914 mm) from any point in the merchandise pad.

Exception: For areas serving not more than 50 occupants, the common path of egress travel shall not exceed 75 feet (22 860 mm).

1018.5 Seating at tables. Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of required clear width of the aisle or aisle accessway shall be made
to a line 19 inches (483 mm) away from and parallel to the edge of the table or counter. The 19-inch (483 mm) distance shall be measured perpendicular to the side of the table or counter. In the case of other side boundaries for aisle or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges, except that handrail projections are permitted.

[Exception: Where tables or counters are served by fixed seats, the width of the aisle accessway shall be measured from the back of the seat.]

[1017.4.1 Aisle accessway for tables and seating. Aisle accessways serving arrangements of seating at tables or counters shall have sufficient clear width to conform to the capacity requirements of Section 1005.1 but shall not have less than the appropriate minimum clear width specified in Section 1017.4.2.]

[1017.4.2 Table and seating accessway width. Aisle accessways shall provide a minimum of 12 inches (305 mm) of width plus ½ inch (12.7 mm) of width for each additional 1 foot (305 mm), or fraction thereof, beyond 12 feet (3658 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.]

[Exception: Portions of an aisle accessway having a length not exceeding 6 feet (1829 mm) and used by a total of not more than four persons.]

[1017.4.3 Table and seating aisle accessway length. The length of travel along the aisle accessway shall not exceed 30 feet (9144 mm) from any seat to the point where a person has a choice of two or more paths of egress travel to separate exits.]

SECTION BC 1019
EXIT ACCESS STAIRWAYS AND RAMPS

1019.1 General. Exit access stairways and ramps serving as an exit access component in a means of egress system shall comply with the requirements of this section. The number of stories connected by exit access stairways and ramps shall include basements, but not mezzanines.

1019.2 All occupancies. Exit access stairways and ramps that serve floor levels within a single story are not required to be enclosed.

1019.3 Occupancies other than Groups H, I-2 and I-3. In other than Group H, I-2 and I-3 occupancies, exit access stairways or ramps shall be enclosed with a shaft enclosure constructed in accordance with Section 713.

Exception: In other than Group H, I-2 and I-3 occupancies, exit access stairways or ramps that comply with one of the following conditions need not be enclosed:

1. A maximum of 50 percent of the exit access stairways and ramps that serve only two consecutive stories need not be enclosed, provided each such interconnected story has access to the minimum number of approved independent exits as required by Section 1006, and in no case be less than two means of egress. Such interconnected stories shall not be open to other stories. Unenclosed exit access stairways and ramps shall be remotely located in accordance with Section 1007.
2. In buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, exit access stairways and ramps that serve between only the first and second stories above grade, provided the first and second stories have access to the minimum number of approved independent exits as required by Section 1006, and in no case be less than two means of egress. Such interconnected stories shall not be open to other stories. Unenclosed exit access stairways and ramps shall be remotely located in accordance with Section 1007.

3. In Group R-1, R-2 or R-3 occupancies that are fully sprinklered in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, exit access stairways and ramps connecting four stories or less and contained within an individual residential dwelling unit.

4. Exit access stairways and ramps in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the stairway or ramp and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13 as modified by Appendix Q. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.

5. Exit access stairways and ramps within an atrium complying with the provisions of Section 404.

6. Exit access stairways and ramps in open parking garages that serve only the parking garage.

7. Exit access stairways and ramps serving open-air seating in buildings of Group A-5, where all portions of the means of egress are essentially open to the outside.

8. Exit access stairways and ramps serving the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

1019.4 Group I-2 and I-3 occupancies. In Group I-2 and I-3 occupancies, floor openings between stories containing exit access stairways or ramps are required to be enclosed with a shaft enclosure constructed in accordance with Section 713.

**Exception:** In Group I-3 occupancies, exit access stairways or ramps constructed in accordance with Section 408 are not required to be enclosed.

**SECTION BC [404] 1020 CORRIDORS**

[404.1] 1020.1 Construction. Corridors shall be constructed in accordance with this section. Interior corridor walls required to be fire-resistance rated shall comply with Section [709] 708 for fire partitions. Public corridor walls shall comply with Section 707 for fire barriers.
**Interior corridors.** Interior corridors shall be fire-resistance rated in accordance with Table [1018.1.1] 1020.1.1.

**Exceptions:**

1. A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has [at least] not less than one door opening directly to the exterior and rooms for assembly purposes have [at least] not less than one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.

2. A fire-resistance rating is not required for corridors contained within a dwelling unit or sleeping unit in an occupancy in Group R.

3. A fire-resistance rating is not required for corridors in open parking garages.

4. A fire-resistance rating is not required for corridors in an occupancy in Group B that is a space requiring only a single means of egress complying with Section [1015.1] 1006.2.

5. Corridors adjacent to the exterior walls of buildings shall be permitted to have unprotected openings on unrated exterior walls where unrated walls are permitted by Table 602 and unprotected openings are permitted by Table 705.8.

- **a.** Public corridors need not be fire rated in high-rise buildings in Occupancy Group B equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where such building is provided with smokeproof enclosures in stairways in accordance with Section 403.5.4.
- **b.** Public corridors in buildings not exceeding two stories in height, or that are three stories in height and occupied by not more than one family on each story, may be constructed with 1-hour fire-resistance rating.
- **c.** Corridors serving accessory rooms or spaces in Group R-2 occupancies pursuant to Section 1004.1.1.2.3 shall be constructed with fire barriers with 1-hour fire-resistance rating, and 2-hour fire-resistance rating where the dead-end distance exceeds 40 feet (12 192 mm) in length.

#### 1018.2 Corridor width

**1020.2 Width and capacity.** The [minimum corridor width] required capacity of corridors shall be [as] determined as specified in Section [1005.1] 1005, but the minimum width shall be not less than [44 inches (1118 mm)] that specified in Table 1020.2.

**[Exceptions:]**

1. Twenty-four inches (610 mm) — For access to and utilization of electrical, mechanical or plumbing systems or equipment.
2. Thirty-six inches (914 mm) — With a required occupant capacity of 50 or less, except as otherwise required by Chapter 11.
3. Thirty-six inches (914 mm) — Within a dwelling unit in Occupancy Groups I-1 and R-1, except as otherwise required by Section 1107.
4. Thirty inches (762 mm) — Within a dwelling unit in Occupancy Groups R-2 and R-3, except as otherwise required by Section 1107.
5. Sixty-six inches (1676 mm) — In Group E serving classrooms.
6. Seventy-two inches (1829 mm) — In corridors and areas serving gurney traffic in occupancies where patients receive outpatient medical care, which causes the patient to be not capable of self-preservation.
7. Ninety-six inches (2438 mm) — In Group I-2 in areas where required for bed movement.
**Exception:** In Group I-2 occupancies, corridors are not required to have a clear width of 96 inches (2438.4 mm) in areas where there will not be stretcher or bed movement for access to care or as part of the defend-in-place strategy.

</table>

For SI: 1 inch = 25.4 mm.

**1018.3 Corridor obstruction**  **1020.3 Obstruction.** The [required] minimum width or required capacity of corridors shall be unobstructed.

**Exception:** [Doors] Encroachments complying with Section [1005.2] 1005.7.

**1018.4 1020.4 Dead ends.** Where more than one exit or exit access doorway is required, the exit access shall be arranged such that there are no dead ends in corridors more than 20 feet (6096 mm) in length.

**Exceptions:**

1. In occupancies in Group I-3 of [Occupancy] Condition 2, 3 or 4 [(see Section 308.4)], the dead end in a corridor shall not exceed 50 feet (15 240 mm).

2. In occupancies in Groups B, E, F, I-1, M, R-1, S and U, where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the length of the dead-end corridors shall not exceed 50 feet (15 240 mm).

3. Dead-end length not exceeding 2.5 times the least width of the dead-end corridor.

4. In occupancies in Group R-2, the dead end in a corridor shall not exceed 40 feet (12 192 mm). However, where the corridors are completely enclosed in construction having a 2-hour fire-resistance rating with all doors opening into the corridor being self-closing and having a fire-resistance rating of ½ hours, the length of dead-end corridor shall not exceed 80 feet (24 384 mm).
[1018.5] 1020.5 Air movement in corridors. Use of corridors as part of direct supply, return, or exhaust air system shall be subject to the limitations of the New York City Mechanical Code.

[1018.5.1] 1020.5.1 Corridor ceiling. Use of the space between the corridor ceiling and the floor or roof structure above as a return air plenum shall be in accordance with the New York City Mechanical Code.

[1018.6] 1020.6 Corridor continuity. Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms. Where the path of egress travel within a fire-resistance-rated corridor to the exit includes travel along unenclosed exit access stairways or ramps, the fire-resistance rating shall be continuous for the length of the stairway or ramp and for the length of the connecting corridor on the adjacent floor leading to the exit.

[Exception:] Exceptions:

1. Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.

2. Enclosed elevator lobbies as permitted by Item 1 of Section 1016.2 shall not be construed as intervening rooms.

SECTION BC [1019] 1021
EGRESS BALCONIES

[1019.1] 1021.1 General. Balconies used for egress purposes shall conform to the same requirements as corridors for minimum width, required capacity, headroom, dead ends and projections.

[1019.2] 1021.2 Wall separation. Exterior egress balconies shall be separated from the interior of the building by walls and opening protectives as required for corridors.

Exception: Separation is not required where the exterior egress balcony is served by [at least] not less than two [stairs] stairways and a dead-end travel condition does not require travel past an unprotected opening to reach a [stair] stairway.

[1019.3] 1021.3 Openness. The long side of an egress balcony shall be at least 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.

1021.4 Location. Exterior egress balconies shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the egress balcony to the following:

1. Adjacent lot lines.

2. Other portions of the building.

3. Other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.
For the purposes of this section, other portions of the building shall be treated as separate buildings.

[1019.4] 1021.5 Outdoor conditions. Exterior egress balconies shall be designed to minimize accumulation of snow and ice that impedes the means of egress.

SECTION BC 1022 EXITS

[1020.1] 1022.1 General. Exits shall comply with Sections [1020] 1022 through [1026] 1027 and the applicable requirements of Sections 1003 through [1013] 1015. An exit shall not be used for any purpose that interferes with its function as a means of egress. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge. Exits shall be continuous from the point of entry into the exit to the exit discharge.

Exception: Interior exit stairways with doors that are automatic-closing by smoke detection pursuant to the exception set forth in Section 713.7 may be used for travel between floors and this use shall not be deemed to interfere with function as a means of egress.

[1020.2] 1022.2 Exterior exit doors. Buildings or structures used for human occupancy shall have [at least] not less than one exterior door that meets the requirements of Section [1008.1.1] 1010.1.1.

[1020.2.1] 1022.2.1 Detailed requirements. Exterior exit doors shall comply with the applicable requirements of Section [1008.1] 1010.1.

[1020.2.2] 1022.2.2 Arrangement. Exterior exit doors shall lead directly to the exit discharge or the public way.

[SECTION BC 1024
NUMBER OF EXITS AND CONTINUITY]

[1021.1] Exits from stories. All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1021.1 based on the occupant load of such story. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories.

[Exceptions:]

[1. As modified by Section 403.5.2.]

[2. As modified by Section 1021.2.]

[3. Exit access stairways and ramps that comply with Exception 3 or 4 of Section 1016.1 shall be permitted to provide the minimum number of approved independent exits required by Table 1021.1 on each story.]

[4. Unless otherwise required by other provisions of this chapter, the number of exits from rooms and spaces within a story discharging directly to the exterior at the level of exit discharge shall be determined in accordance with Table 1015.1.]
### TABLE 1021.1
MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD

<table>
<thead>
<tr>
<th>OCCUPANT LOAD (persons per story)</th>
<th>MINIMUM NUMBER OF EXITS (per story)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-500</td>
<td>2</td>

<tr>
<td>501-1,000</td>
<td>3</td>
</tr>
<tr>
<td>More than 1,000</td>
<td>4</td>
</tr>
</tbody>
</table>

[1021.1.1 Exits maintained. The required number of exits from any story shall be maintained until arrival at grade or the public way.]

[1021.1.2 Open or enclosed parking garages. Open or enclosed parking garages shall not have less than two exits from each parking tier. An unenclosed vehicle ramp constructed in accordance with Section 1010.2 may serve as one of the required exits when provided with pedestrian facilities along the ramp. Such ramps serving open or enclosed parking garages three stories or less in height and serving not more than one level below grade shall further comply with Section 1010.2, Exception 2.]

[Exception: Where vehicles are mechanically parked, only one exit is required but such exit shall not be a vehicle ramp.]

[1021.2 Single exits. Only one exit shall be required in buildings or from stories of buildings as described below:]

1. Stories in buildings as described in Table 1021.2.
2. Buildings of Group R-3 occupancy.
3. Single-level buildings with the occupied space at the level of exit discharge provided that the story or space complies with Section 1015.1 as a space with one means of egress.
4. Buildings of Group R-2 occupancy where all of the following conditions are met:
   4.1. The building does not exceed four stories;
   4.2. The building contains not more than three dwelling units per story;
   4.3. The building is of construction Type I or II;
   4.4. The building does not exceed 2,500 square feet (232 m²) per story;
   4.5. Each dwelling unit has at least one window facing the street, or facing a lawful yard with open, unobstructed, and direct access to the street;
   4.6. The stairway extends to the roof surface through a stairway bulkhead complying with Section 1509.2 provided the roof has a slope not steeper than 20 degrees (0.35 rad). In lieu of the stairway bulkhead, the stair may be constructed against the street wall with one window facing the street at every landing and access to the roof is provided via a...
scuttle with a stationary, noncombustible access ladder;]

[4.7. The stairway is enclosed in 2-hour fire-rated walls with all exit doors leading into the stairway having at least 1½-hour fire rating; and]

[4.8. The building shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2;]

[5. Buildings of Group R-2 occupancy of construction Type I or II not exceeding six stories and not exceeding 2,000 square feet (186 m²) per story.]

</table>

For SI: 1 foot = 304.8 mm.

a. For the required number of exits for open or enclosed parking garages, see Section 1021.1.2.

b. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1029.

c. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.

d. Day care occupancies shall have a maximum occupant load of 10.

e. Mixed occupancies shall be permitted to be served by single exit, provided each individual occupancy comply with the applicable requirements of Table 1021.2 for that occupancy.

f. Where applicable, cumulative occupant loads from adjacent occupancies shall be considered in accordance with the provisions of Section 1004.1.

g. Basements with a single exit shall not be located more than one story below grade plane.]

[1021.3 Exit continuity. Exits shall be continuous from the point of entry into the exit to the exit discharge.]

[1021.4 Exit door arrangement. Exit door arrangement shall meet the requirements of Sections 1015.2 through 1015.2.2.]

SECTION BC [1022] 1023
[EXIT ENCLOSURES] INTERIOR EXIT STAIRWAYS AND RAMPS

[1022.1 Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with] 1023.1 General. Interior exit stairways and ramps serving as an exit component in a means of egress system shall comply with the requirements of this section. Interior exit stairways and ramps shall be enclosed and lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1024, except as permitted in Section 1028.1. An interior exit stairway or ramp shall not be used for any purpose other than as a means of egress and a circulation path.

1023.2 Construction. Enclosures for interior exit stairways and ramps shall be constructed as fire barriers [constructed] in accordance with Section 707 or horizontal assemblies constructed in
accordance with Section [742] 711, or both. [Exit enclosures] Interior exit stairway and ramp enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the interior exit [enclosure] stairways or ramps shall include any basements, but not any mezzanines. [Exit enclosures] Interior exit stairways and ramps shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. In Group R-1 and R-2 occupancies, where interior exit [enclosures] stairways and ramps are required to have a fire-resistance rating of 2 hours, such enclosures shall be constructed of masonry or masonry equivalent. Wall assemblies constituting masonry equivalent shall be constructed in accordance with department rules. [Exit enclosures shall lead directly to the exterior of the building or shall be extended to the exterior of the building with an exit passageway conforming to the requirements of Section 1023, except as permitted in Section 1027.1. An exit enclosure shall not be used for any purpose other than means of egress.]

Exceptions:

1. [In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.] Interior exit stairways and ramps in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.

   [1.1 The stairway is open to not more than one story above its level of exit discharge; or]

   [1.2 The stairway is open to not more than one story below its level of exit discharge.]

2. [Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.] Interior exit stairways within an atrium enclosed in accordance with Section 404.6.

3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.

4. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.

5. Stairways in Group I-3 occupancies as provided for in Section 408.3.8 are not required to be enclosed.

6. Means of egress stairways as required by Sections 410.5.3 and 1015.6.1 are not required to be enclosed.

7. Means of egress stairways from balconies, galleries or press boxes as provided for in Section 1028.5.1 are not required to be enclosed.

8. Vertical exit enclosures with doors that are automatic-closing by smoke detection pursuant to the exception set forth in Section 708.7 may be used for travel between floors and this
**[1022.2]** 1023.3 Termination. [Exit enclosures] Interior exit stairways and ramps shall terminate at an exit discharge or a public way.

**Exception:** [An] A combination of interior exit [enclosure] stairways, interior exit ramps and exit passageways, constructed in accordance with Sections 1023.2, 1023.3.1 and 1024, respectively, and forming a continuous protected enclosure, shall be permitted to [terminate at] extend an [exit passageway complying with Section 1023, provided the exit passageway terminates at an] interior exit stairway or ramp to the exit discharge or a public way.

**[1022.2.1]** 1023.3.1 Extension. Where [an] interior exit [enclosure is] stairways and ramps are extended to an exit discharge or a public way by an exit passageway, the interior exit [enclosure] stairway and ramp shall be separated from the exit passageway by a fire barrier constructed in accordance with Section 707 or a horizontal assembly constructed in accordance with Section [712.11.1], or both. The fire-resistance rating shall be [at least equal to] not less than that required for the interior exit [enclosure] stairway and ramp. A fire door assembly complying with Section [715.4] shall be installed in the fire barrier to provide a means of egress from the interior exit [enclosure] stairway and ramp to the exit passageway. Openings in the fire barrier other than the fire door assembly are prohibited. Penetrations of the fire barrier are prohibited.

**[Exception:]** Exceptions:

1. Penetrations of the fire barrier in accordance with Section [1022.4] 1023.5 shall be permitted.

2. Separation between an interior exit stairway or ramp and the exit passageway extension shall not be required where there are no openings into the exit passageway extension.

**[1022.3]** 1023.4 Openings. Interior exit stairway and [penetrations. Exit enclosure] ramp opening protectives shall be in accordance with the requirements of Section [715] 716.

Openings in interior exit [enclosures] stairways and ramps other than unprotected exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure.

Elevators shall not open into [an] interior exit [enclosure] stairways and ramps.

**[1022.4]** 1023.5 Penetrations. Penetrations into [and openings] or through [an] interior exit [enclosure] stairways and ramps are prohibited except for [required exit doors.] equipment and ductwork necessary for independent ventilation or pressurization, hydronic piping and related heating equipment limited to serving the interior exit [enclosure] stairway or ramp in which such piping and equipment is located, sprinkler piping, standpipes, electrical raceway for Fire Department communication systems and electrical raceway serving the interior exit [enclosure] stairway and ramp and terminating at a steel box not exceeding 16 square inches (0.010 m²). Such penetrations shall be protected in accordance with Section [713] 714. There shall not be [no] penetrations or
communication openings, whether protected or not, between adjacent interior exit [enclosures] stairways and ramps.

**Exception:** Membrane penetrations shall be permitted on the outside of the interior exit stairway and ramp. Such penetrations shall be protected in accordance with Section 714.3.2.

[1022.5] **1023.6 Ventilation.** Equipment and ductwork for interior exit [enclosure] stairway and ramp ventilation [necessary for independent ventilation or pressurization] as permitted by Section [1022.4] 1023.5 shall comply with one of the following items:

1. Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the interior exit [enclosure] stairway and ramp by ductwork enclosed in construction as required for shafts.

2. Where such equipment and ductwork is located within the interior exit [enclosure] stairway and ramp, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required for shafts.

3. Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Section [715] 716 for shaft enclosures. [Exit enclosure ventilation systems shall be independent of other building ventilation systems].

The interior exit stairway and ramp ventilation systems shall be independent of other building ventilation systems.

[1022.6 Exit enclosure] **1023.7 Interior exit stairway and ramp exterior walls.** Exterior walls of [an] the interior exit [enclosure] stairway or ramp shall comply with the requirements of Section 705 for exterior walls. Where nonrated walls or unprotected openings enclose the exterior of the stairway or ramps and the walls or openings are exposed [to] by other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall have a fire-resistance rating of not less than 1 hour. Openings within such exterior walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or ramp, or to the roof line, whichever is lower.

[1022.7] **1023.8 Discharge identification.** [A] An interior exit stairway [in an exit enclosure] and ramp shall not continue below its level of exit discharge unless an approved barrier is provided at the level of exit discharge to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Section [4011] 1013. An approved barrier shall consist of partitions, doors, or gates separating the portion of the [vertical exit] interior exit stairway above grade from the portion below grade. Where doors or gates are provided as approved
barriers, such doors or gates shall be self-closing [and], opening in the direction of exit travel from the floors below grade, and provided with landings in accordance with Sections 1010.1.5 and 1010.1.6.

Exceptions:

1. Such barrier separating the above-grade portion of the [vertical exit] interior exit stairways and ramps from the portion below grade shall not be required in Group E and R-3 occupancies.

2. Such barrier separating the above-grade portion of the [vertical exit] interior exit stairways and ramps from the portion below grade shall not be required where the stairway or ramp design is intended to continue the path of egress through a below grade level.

[1022.8] 1023.9 Stairway identification and floor level signs. Signs identifying stairways shall comply with Section 1023.9.1. Signs identifying [and] floor levels shall comply with Sections [1022.8.1] 1023.9.2 through [1022.8.5] 1023.9.5.

[1022.8.1] 1023.9.1 Stairway identification signs. A stairway identification sign indicating each stair by alphabetic letter shall be posted on both sides of each stair door. The alphabetic letters designating the identification of the interior exit stairway and ramp shall be not less than 3 inches (76.2 mm) in height. Such sign shall comply with Items 2, 5 and 6 of Section 1023.9.4.

[1022.8.2] 1023.9.2 Floor identification signs. A floor identification sign shall be provided at each floor landing [within] in an interior exit [enclosures] stairway and ramp connecting more than three stories. Such sign shall designate:

1. The floor level;
2. The terminus of the top and bottom of the interior exit [enclosure] stairway and ramp;
3. The identification of the [stair or] interior exit stairway and ramp;
4. The story of the exit discharge; and
5. The availability of roof access from the [enclosure] interior exit stairway and ramp for the Fire Department.

[The signs shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions.]

[1022.8.3 Tactile] 1023.9.3 Accessible floor level identification signs. Floor level identification signs in [tactile] visual characters, raised characters and braille complying with ICC A117.1 shall be located at each floor level landing adjacent to the door on the stair side.

[1022.8.4] 1023.9.4 Signage requirements. [Stairway and floor] Floor identification signs required by [Sections 1022.8.1 and 1022.8.2] Section 1023.9.2 shall comply with all of the following requirements:
1. The signs shall be a minimum size of 18 inches (457.2 mm) by 12 inches (305.2 mm).

2. The alphabetic letters designating the identification of the stair enclosure shall be a minimum of 1½ inches (38 mm) in height. The top of the signs shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions.

3. The number designating the floor level shall be a minimum of not less than 5 inches (127 mm) in height and located in the center of the sign.

4. Other lettering and numbers shall be a minimum of not less than 1 inch (25 mm) in height.

5. Characters and their background shall have a non-glare finish. Characters shall contrast with their background, with either light characters on a dark background or dark characters on a light background.

6. Where signs required by Section 1022.8.5 are installed in the interior exit enclosures stairways and ramps of buildings subject to Section 1024.1025, the signs shall be made of the same luminous materials as required by Section 1024.4.1025.4.

**1022.8.5 Directions to openable doors.** Where doors serving vertical interior exit enclosures stairways are locked on the stair side, signage shall be posted in compliance with Sections 1030.4.1, 1030.4.2 and 1031.4.3.

**1022.9 Elevator lobby identification signs.** At landings in interior exit stairways where two or more doors lead to the floor level, any door with direct access to an enclosed elevator lobby shall be identified by signage located on the door or directly adjacent to the door stating “Elevator Lobby.” Signage shall be in accordance with Section 1023.9.4, Items 4, 5 and 6.

**1023.10 Elevator lobby identification signs.** At landings in interior exit stairways where two or more doors lead to the floor level, any door with direct access to an enclosed elevator lobby shall be identified by signage located on the door or directly adjacent to the door stating “Elevator Lobby.” Signage shall be in accordance with Section 1023.9.4, Items 4, 5 and 6.

**1023.11 Smokeproof enclosures and [pressurized stairways] pressurization alternative.** In buildings required to comply with Section 403 or 405, each of the [exit enclosures] interior exit stairways and ramps serving a story with a floor surface located more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access or more than 30 feet (9144 mm) below the finished floor of a level of exit discharge serving such stories shall be protected by a smokeproof enclosure or [pressurized stairway] pressurization alternative in accordance with Section 909.20.

**1022.9.1 Termination and extension.** A smokeproof enclosure or [pressurized stairway] pressurization alternative shall terminate at an exit discharge or a public way. The smokeproof enclosure or [pressurized stairway] pressurization alternative shall be permitted to be extended by an exit passageway in accordance with Section 1022.2.1023.3. The exit passageway shall be without openings other than the fire door assembly required by Section 1022.2.1023.3.1 and those necessary for egress from the exit passageway. The exit passageway shall be separated from the remainder of the building by 2-hour fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both.
Exceptions:

1. Openings in the exit passageway serving a smokeproof enclosure are permitted where the exit passageway is protected and pressurized in the same manner as the smokeproof enclosure, and openings are protected as required for access from other floors.

2. Openings in the exit passageway serving a pressurized stairway pressurization alternative are permitted where the exit passageway is protected and pressurized in the same manner as the pressurized stairway pressurization alternative.

3. The fire barrier separating the smokeproof enclosure or pressurized stairway pressurization alternative from the exit passageway is not required, provided the exit passageway is protected and pressurized in the same manner as the smokeproof enclosure or pressurized stairway pressurization alternative.

4. A smokeproof enclosure or pressurized stairway pressurization alternative shall be permitted to egress through areas on the level of exit discharge or vestibules as permitted by Section 1027.1028.

1022.9.2 1023.11.2 Enclosure access. Access to the stairway or ramp within a smokeproof enclosure shall be by way of a vestibule or an open exterior balcony.

Exception: Access is not required by way of a vestibule or exterior balcony for stairways and ramps using the pressurization alternative complying with Section 909.20.5.

SECTION BC 1023 1024
EXIT PASSAGEWAYS

1023.1 1024.1 Exit passageways. Exit passageways serving as an exit component in a means of egress system shall comply with the requirements of this section. An exit passageway shall not be used for any purpose other than as a means of egress and a circulation path.

1023.2 1024.2 Width. The required capacity of exit passageways shall be determined as specified in Section 1005.1 1005 but the minimum width shall be not less than 44 inches (1118 mm), except that exit passageways serving an occupant load of less than 50 shall be not less than 36 inches (914 mm) in width. The minimum width or required capacity of exit passageways shall be unobstructed.

[The required width of exit passageways shall be unobstructed.]

Exception: [Doors] Encroachments complying with Section 1005.2 1005.7.

1023.3 1024.3 Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than a 1-hour fire-resistance rating, and not less than that required for any connecting interior exit enclosure, stairway or ramp. Exit passageways shall be constructed as fire barriers in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 712 711, or both.
[1023.4] **1024.4 Termination.** Exit passageways on the level of exit discharge shall terminate at an exit discharge [or a public way]. Exit passageways on other levels shall terminate at an exit component.

[1023.5] **1024.5 Openings [and penetrations].** Exit passageway opening protectives shall be in accordance with the requirements of Section [716] 716.

Except as permitted in Section [402.4.6] 402.8.7, openings in exit passageways other than unprotected exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for egress from the exit passageway.

Where an interior exit [enclosure] stairway or ramp is extended to an exit discharge or a public way by an exit passageway, the exit passageway shall [also] comply with Section [1022.2.4] 1023.3.1.

Elevators shall not open into an exit passageway.

[1023.6] **1024.6 Penetrations.** Penetrations into [and openings] or through an exit passageway are prohibited except for [required exit doors] equipment and ductwork necessary for independent pressurization, hydronic piping and related heating equipment limited to serving the exit passageway in which such piping and equipment is located, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit passageway and terminating at a steel box not exceeding 16 square inches (0.010 m²). Such penetrations shall be protected in accordance with Section [714] 714. There shall not be [no] penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

**Exception:** Membrane penetrations shall be permitted on the outside of the exit passageway. Such penetrations shall be protected in accordance with Section 714.3.2.

**1024.7 Ventilation.** Equipment and ductwork for exit passageway ventilation as permitted by Section 1024.6 shall comply with one of the following:

1. The equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit passageway by ductwork enclosed in construction as required for shafts.

2. Where the equipment and ductwork is located within the exit passageway, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or the air shall be conveyed through ducts enclosed in construction as required for shafts.

3. Where located within the building, the equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts.

In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by opening protectives in accordance with Section 716 for shaft enclosures.

Exit passageway ventilation systems shall be independent of other building ventilation systems.
SECTION BC [1024] 1025
LUMINOUS EGRESS PATH MARKINGS

[1024.1] 1025.1 General. Approved luminous egress path markings delineating the exit path shall be provided in all high-rise buildings subject to Section 403.5 having occupied floors located more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access in accordance with Sections [1024.1] 1025.1 through [1024.9] 1025.9.

Exceptions:

1. Luminous egress path markings shall not be required on the level of exit discharge in lobbies that serve as part of the exit path in accordance with Section [1027.1] 1028.1, Exception 1.

2. Luminous egress path markings shall not be required in [areas of open exit stairways serving only the open parking garage, and areas of open parking garages that serve as such part of the exit path in accordance with Section 1027.1, Exception 3].

3. Luminous egress path markings shall not be required on egress paths serving Group R-2.

[1024.2] 1025.2 Required [Markings] markings. Egress path markings shall be provided in interior exit enclosures, including vertical stairways, interior exit enclosures, horizontal exits, ramps and exit passageways, in accordance with Sections [1024.2.1] 1025.2.1 through [1024.2.9] 1025.2.9. Entrances to interior exit enclosures, stairways, interior exit ramps and exit passageways shall be provided with exit signs in compliance with Section [1024.2.6.1] 1025.2.6.1.

[1024.2.1] 1025.2.1 Steps. A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Outlining stripes shall have a minimum horizontal width of 1 inch (25.4 mm) and a maximum width of 2 inches (50.8 mm). The leading edge of the stripe shall be placed at a maximum of not more than ½ inch (13 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by more than ½ inch (13 mm) down the vertical face of the step. Outlining stripes on steps shall comply with Figure S101.1(2) in Appendix S.

Exception: The minimum width of 1 inch (25.4 mm) shall not apply to outlining stripes listed in accordance with UL 1994.

[1024.2.2] 1025.2.2 Landings. The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps. Stripes on landings shall comply with Figure S101.1(3) in Appendix S.

[1024.2.3] 1025.2.3 Handrails. Handrails and handrail extensions shall be marked with a solid and continuous stripe having a minimum width of 1 inch (25.4 mm). The stripe shall be placed on the top surface of the handrail for the entire length of the handrail, including extensions and newel post caps. Where handrails or handrail extensions bend or turn corners, the stripe shall not have a gap of more than 4 inches (101.6 mm). Stripes on handrails shall comply with Figure S101.1(4) in Appendix S.
Exception: The minimum width of 1 inch (25.4 mm) shall not apply to outlining stripes listed in accordance with UL 1994.

1024.2.4 1025.2.4 Perimeter demarcation lines. Stair landings and other floor areas within interior exit [enclosures] stairways, interior exit ramps and exit passageways, with the exception of the sides of steps, shall be provided with solid and continuous demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 to 2 inches (25.4 mm to 50.8 mm) wide with interruptions not exceeding 4 inches (101.6 mm).

Exception: The minimum width of 1 inch (25.4 mm) shall not apply to outlining stripes listed in accordance with UL 1994.

1024.2.4.1 1025.2.4.1 Floor-mounted demarcation lines. Perimeter demarcation lines shall be placed within 4 inches (101.6 mm) of the wall and shall extend to within 2 inches (50.8 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors. Perimeter demarcation lines shall comply with Figure S101.1(5) in Appendix S.

Exceptions:

1. Demarcation lines shall not extend in front of exit discharge doors that lead out of an exit [enclosure] and through which occupants must travel to complete the exit path.

2. Demarcation lines shall be continuous but need not extend into an area such as a dead end or an obstruction that is selected not to be outlined because it is not part of the egress path.

1024.2.4.2 1025.2.4.2 Wall-mounted demarcation lines. Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe not more than 4 inches (101.6 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (50.8 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the door or transition to the floor and extend across the floor in front of such door. Wall-mounted demarcation lines shall comply with Figure S101.1(8) in Appendix S.

Exceptions:

1. Demarcation lines shall not extend in front of exit discharge doors that lead out of an exit [enclosure] and through which occupants must travel to complete the exit path.

2. Perimeter demarcation lines are not required on the sides of steps.

3. Perimeter demarcation lines are not required where an area such as a dead end or an obstruction is selected not to be outlined because it is not part of the egress path,
the demarcation lines shall not be required in such area provided that a demarcation line is continuous across the floor.

[1024.2.4.3] 1025.2.4.3 Transition. Where a wall-mounted demarcation line transitions to a floor-mounted demarcation line, or vice versa, the wall-mounted demarcation line shall drop vertically to the floor to meet a complementary extension of the floor-mounted demarcation line, thus forming a continuous marking. Transitioning demarcation lines shall comply with Figure S101.1(7) [of] in Appendix S.

[1024.2.5] 1025.2.5 Obstacles. Obstacles at or below 6 feet 6 inches ([1981] 1981.2 mm) in height and projecting more than 4 inches ([102] 101.6 mm) into the egress path shall be outlined with markings [no] not less than 1 inch ([25] 25.4 mm) in width comprised of a pattern of alternating equal bands, of luminescent luminous material and black, with the alternating bands [no] not more than 2 inches ([51] 50.8 mm) thick and angled at 45 degrees (0.79 rad). Obstacles shall include, but are not limited to, standpipes, hose cabinets, wall projections and restricted height areas. However, such markings shall not conceal any required information or indicators including[,] but not limited to[,] instructions to occupants for the use of standpipes. Markings on obstacles shall comply with Figure S101.1(6) [of] in Appendix S.

[1024.2.6] 1025.2.6 Doors [from] within the exit [enclosures] path. Doors through which occupants [within an exit enclosure] must pass in order to complete the exit path, and doors serving horizontal exits, shall be provided with markings complying with Sections [1024.2.6.1] 1025.2.6.1 through [1024.2.6.3] 1025.2.6.3 of this chapter and Figures S101.1(11) and S101.1(12) [of] in Appendix S. Exit discharge doors shall further comply with Section [1024.2.6.1.1] 1025.2.6.1.1.

[1024.2.6.1] 1025.2.6.1 Emergency exit symbol. The doors shall be identified by a low-location luminous emergency exit symbol complying with Section [1024.6.1] 1025.6.1. The exit symbol shall be [a minimum of] not less than 4 inches ([102] 101.6 mm) in height and shall be mounted on the door itself in accordance with Section [1024.2.6.1.1] 1025.2.6.1.1. Such signs shall be no higher than 18 inches ([457] 457.2 mm) above the finished floor.

[1024.2.6.1.1] 1025.2.6.1.1 Mounting location. The vertical centerline of the sign shall be centered with the door, or shall be in that half of the door, either the right or left, that contains the latch. In case of double-doors, both doors shall be marked and the signs shall be centered with the doors. Arrows may be omitted on door-mounted signs. Door-mounted signs shall comply with Figure S101.1(1) in Appendix S.

[1024.2.6.1.2] 1025.2.6.1.2 Exit discharge doors. At doors serving as exit discharge, a sign in compliance with Section [1024.2.6.1.1] 1025.2.6.1.1 shall contain supplemental directional text such as “FINAL EXIT,” “EXIT THROUGH LOBBY,” or “EXIT TO STREET” in sans serif letters one-half as high as the word EXIT. Exit discharge door sign shall comply with Figure S101.1(13) in Appendix S.

[1024.2.6.2] 1025.2.6.2 Door hardware markings. Door hardware shall be marked with [no] not less than 16 square inches ([406 mm²]) (0.01 m²) of luminous material. This marking shall be located behind, immediately adjacent to, or on the door handle [and] or escutcheon. Where a panic bar is installed, such material shall [no] be [no] less than 1 inch ([25] 25.4 mm) wide.
for the entire length of the actuating bar or touchpad. Additional hardware markings may include ANSI Z 535.1 safety green graphics such as arrows indicating door handle turning directions, or emergency egress symbols as per NFPA 170, the word “EXIT,” the word “PUSH,” and similar egress-related symbols, provided the minimum 16 square inches \((406 \text{ mm}^2)\) \((0.01 \text{ m}^2)\) of luminous materials is maintained.

\[1024.2.6.3\] **1025.2.6.3 Door frame markings.** The top and sides of the door frame shall be marked with a solid and continuous [1 inch] 1- to [2 inch] 2-inch \((25 \text{ mm} \text{ to } 50.8 \text{ mm})\) wide stripe. Where the door molding does not provide sufficient flat surface on which to locate the stripe, the stripe shall be permitted to be located on the wall surrounding the frame.

\[1024.2.7\] **1025.2.7 Directional signage upon entering an interior exit [enclosures] stairway or ramp.** Luminous directional signs designed in compliance with Section [1024.6.1] 1025.6.1 shall be placed in the interior exit [enclosure] stairway or ramp at every entrance thereto such that they are readily visible when the doors are in the open and closed positions. Such directional sign shall include an arrow indicating the direction of travel. The word “EXIT” shall not be required. The signs shall be located such that their top edge is within 18 inches \((457.2 \text{ mm})\) above the finished floor. Directional signs shall comply with Figure S101.1(9) in Appendix S.

\[1024.2.8\] **1025.2.8 Directional signage at transfer levels and where egress direction is not clear.** Luminous directional signs designed in compliance with Section [1024.6.1] 1025.6.1 and installed at heights indicated in Section [1024.2.7] 1025.2.7 shall be placed on the wall at transfer levels and wherever egress direction is not clear; including at turns along horizontal extensions, at transitions from vertical to horizontal direction and at a “T” intersection. These directional signs shall include arrows indicating the direction of travel. The word “EXIT” shall not be required. Directional signs at transfer levels shall comply with Figure S101.1(9) in Appendix S.

\[1024.2.9\] **1025.2.9 “No Exit” sign.** Luminous signs shall be placed on doors along the egress path that lead to dead ends (mechanical rooms, storage closets, etc.). Such signs shall contain sans serif lettering at least 1 inch \((25 \text{ mm})\) high reading “NO EXIT,” with the “NO” centered above the “EXIT.” The “NO” may be a larger size than the “EXIT” for clarity. The nonluminous portion of such signs shall not be green. No-exit signs shall comply with Figure S101.1(10) in Appendix S.

\[1024.3\] **1025.3 Uniformity.** Placement and dimensions of markings shall be consistent and uniform throughout the same [exit] enclosure.

\[1024.3.1\] **1025.3.1 Solid and continuous.** For the purposes of this section, solid and continuous means without gaps or interruption, except as required for the control of expansion and contraction. A series of dashes, chevrons, dots, or other similar patterns is not solid and continuous. Luminous materials shall be considered solid and continuous if they occasionally contain the following safety green (ANSI Z 535.1) symbols or text:

1. The word “EXIT”;

2. Egress symbol as per NFPA 170;
3. Direction arrows as per NFPA 170; or

4. Other text or symbols as approved by the commissioner.

[1024.4] 1025.4 Self-luminous and photoluminescent. Luminous egress path markings shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but are not limited to, self-luminous materials and photoluminescent materials. Materials shall comply with either of the following standards:

1. UL 1994[±or].

2. ASTM E 2072, except that the charging source shall be 1 foot-candle (11 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 30 millicandelas per square meter at 10 minutes and 5 millicandelas per square meter after 90 minutes.

[1024.4.1] 1025.4.1 Labeling. All approved materials shall be labeled and identified with the manufacturer’s name, model number and the name of the approved agency in a minimum of 6 point type with at least one such identification on each piece of material installed. However, labeling is not required for pieces of material less than 1 foot (304.8 mm) in length that are placed in immediate proximity of an identical model that is labeled. Materials may include supplemental identifying information such as the trade name or “NYC.”

[1024.5] 1025.5 Reserved.

[1024.6] 1025.6 General standards. Luminous materials shall comply with the design standards of Sections [1024.6.1] 1025.6.1 and [1024.6.2] 1025.6.2.

[1024.6.1] 1025.6.1 Design of door and directional signs. Unless otherwise specified, all photoluminescent door signs and directional signs:

1. May be either positive or negative image;

2. Shall be made with the non-photoluminescent portions of the signs in safety green as per ANSI Z535.1; and

3. Shall include three components:

   3.1. The word “EXIT” printed in sans serif letters at least 4 inches high (101.6 mm) with strokes no less than ½ inch (12.7 mm);

   3.2. An emergency exit symbol at least 4 inches high (101.6 mm), complying with NFPA 170; and

   3.3. An arrow at least 2¾ inches (69.9 mm) high, complying with NFPA 170.

Design of door and directional sign shall comply with Figures S101.1(9), S101.1(13), S101.1(14) and S101.1(15) in Appendix S.
Additional text for sign subject to this section. Additional descriptive text is permitted, provided such words are in sans serif letters and, where the word “EXIT” or the emergency symbol is required on such sign, such a descriptive text is no more than one-half as high as the word “EXIT” or the emergency exit symbol.

Figures. The figures in Appendix S are intended only for illustration, and where there is a conflict between the figures and this section, this section shall govern.

Voluntary installation. Where luminous egress path markings are not required but are voluntarily installed in the exit path, such markings shall comply with Section 1025.

Special inspection. Luminous exit path markings shall be subject to special inspection in accordance with Sections 1025.8.1 through 1025.8.3.

Inspection. A registered design professional shall verify by visual inspection that all components have been installed in accordance with Section 1025, both with the normal lighting turned on and with the normal and emergency lighting turned off.

Product identification. A registered design professional shall review the manufacturer product literature and information from the testing agency and verify that the products installed are labeled as meeting the standards in Section 1025.4. The registered design professional shall verify which particular products were installed in which parts of the building.

Paints. Where in situ painting was utilized, a registered design professional shall field-verify that the specified paint was utilized in accordance with the manufacturer recommended methods of application.

Maintenance program. Owners shall keep the required luminous egress path markings in good repair. At a minimum, owners shall, every 12 months, perform a visual inspection of the markings with the normal lighting turned on. Markings that are missing, damaged, loose, or that show signs of wear or missing labels shall be noted and promptly repaired. The log of such inspections, including the results and any corrective measures taken, shall be kept and maintained on the premises for inspection by the department and the Fire Department. The log shall contain the date of inspection and the printed name and signature of the person performing the inspection.

Horizontal exits. Horizontal exits serving as an exit in a means of egress system shall comply with the requirements of this section. A horizontal exit shall not serve as the only exit from a portion of a building, and where two or more exits are required, not more than one-half of the total number of exits or total exit minimum width or required capacity shall be horizontal exits.

Exceptions:

1. Horizontal exits are permitted to comprise two-thirds of the required exits from any building or floor area for occupancies in Group I-2.
2. Horizontal exits are permitted to comprise 100 percent of the exits required for occupancies in Group I-3. Not less than 6 square feet (0.6 m²) of accessible space per occupant shall be provided on each side of the horizontal exit for the total number of people in adjoining compartments.

3. Horizontal exits are permitted to serve as the only exits from a portion of a building serving as an intermediate refuge area in accordance with Section 1026.4.2, Exception.

[1025.2] 1026.2 Separation. The separation between buildings or refuge areas connected by a horizontal exit shall be provided by a fire wall complying with Section 706; or [it shall be provided] by a fire barrier complying with Section 707 or a horizontal assembly complying with Section [712] 711, or both. The minimum fire-resistance rating of the separation shall be 2 hours. Opening protectives in horizontal exits shall also comply with Section [745] 716. Duct and air transfer openings in a fire wall or fire barrier that serves as a horizontal exit shall also comply with Section [746] 717. The horizontal exit separation shall extend vertically through all levels of the building unless floor assemblies have a fire-resistance rating of not less than 2 hours with no unprotected openings.

Exception: A fire-resistance rating is not required at horizontal exits between a building area and an above-grade pedestrian walkway constructed in accordance with Section 3104, provided that the distance between connected buildings is more than 20 feet (6096 mm).

Horizontal exits constructed as fire barriers shall be continuous from exterior wall to exterior wall so as to divide completely the floor served by the horizontal exit.

[1025.3] 1026.3 Opening protectives. Fire doors in horizontal exits shall be self-closing or automatic-closing when activated by a smoke detector in accordance with Section [715.4.8.3] 716.5.9.3. Doors, where located in a cross-corridor condition, shall be automatic-closing by activation of a smoke detector installed in accordance with Section [715.4.8.3] 716.5.9.3.

[1025.4 Capacity of refuge area] 1026.4 Refuge area. The refuge area of a horizontal exit shall be a space occupied by the same tenant or a public area and each such refuge area shall be adequate to accommodate the original occupant load of the refuge area plus the occupant load anticipated from the adjoining compartment. The anticipated occupant load from the adjoining compartment shall be based on the capacity of the horizontal exit doors entering the refuge area.

1026.4.1 Capacity. The capacity of the refuge area shall be computed based on a net floor area allowance of 3 square feet (0.2787 m²) for each occupant to be accommodated therein.

Exception: The net floor area allowable per occupant shall be as follows for the indicated occupancies:

1. Six square feet (0.6 m²) per occupant for occupancies in Group I-3.
2. Fifteen square feet (1.4 m²) per occupant for ambulatory occupancies in Group I-2.
3. Thirty square feet (2.8 m²) per occupant for nonambulatory occupancies in Group I-2.
1026.4.2 Number of exits. The refuge area into which a horizontal exit leads shall be provided with exits adequate to meet the occupant requirements of this chapter, but not including the added occupant load imposed by persons entering [it] the refuge area through horizontal exits from [other areas] the adjoining compartment. [At least] Not less than one refuge area exit shall lead directly to the exterior or to an interior exit [enclosure] stairway or ramp. In addition to such refuge area exit, in buildings more than 420 feet (128 m) in height that are subject to Section 403.5.2, at least one other exit from each refuge area shall lead directly to the additional exit stairway required by Section 403.5.2, or shall provide access to occupant self-evacuation elevators where such elevators are permitted by Exception 1 or 2 of Section 403.5.2 in lieu of an additional exit stairway.

Exception: [The] A single intermediate refuge area between the adjoining compartment from which egress originates and the final refuge area shall not be required to have a stairway or door leading directly outside, provided the final refuge area into which a horizontal exit leads has stairways or doors leading directly outside and are so arranged that egress shall not require the occupants to return through the intermediate refuge area and the adjoining compartment from which egress originates.

SECTION BC [1026] 1027
EXTerior EXIT [Ramps and] StAIRWAYS AND RAMPs

1026.1 1027.1 Exterior exit [ramps and] stairways and ramps. Exterior exit [ramps and] stairways and ramps serving as an element of a required means of egress shall comply with this section.

[Exception: Exterior exit ramps and stairways for outdoor stadiums complying with Section 1022.1, Exception 2.]

1026.2 1027.2 Use in a means of egress. Exterior exit stairways shall not be used as an element of a required means of egress for Group I-2 occupancies. For all occupancies other than Group I-2, exterior exit [ramps and] stairways and ramps shall be permitted as an element of a required means of egress for buildings not exceeding six stories above grade plane or [having occupied floors more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access] that are not high-rise buildings.

1026.3 1027.3 Open side. Exterior exit [ramps and] stairways and ramps serving as an element of a required means of egress shall be open on [at least] not less than one side[es], except for required structural columns, beams, handrails and guards. An open side shall have [a minimum of] not less than 35 square feet (3.3 m²) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches ([1067] 1066.8 mm) above the adjacent floor or landing level.

1026.4 1027.4 Adjoining open areas. The open areas adjoining exterior exit [ramps or] stairways or ramps shall be either yards, courts or public ways; the remaining sides are permitted to be enclosed by the exterior walls of the building.
1026.5 1027.5 Location. Exterior exit ramps and stairways shall be located in accordance with Section 1027.3, and ramps shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the stairway or ramps, including landings, to:

1. Adjacent lot lines.
2. Other portions of the building.
3. Other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

For the purposes of this section, other portions of the building shall be treated as separate buildings.

Exception: Noncombustible stoops and ramps not exceeding one story above grade plane located at the street wall and terminating at the street are permitted to be located within 10 feet (3048 mm) of adjacent lot lines or buildings on the same lot when serving:

1. Group R-2 occupancies in buildings of noncombustible construction not exceeding four stories in height and a total of four dwelling units.
2. Group R-3 occupancies.

1026.6 1027.6 Exterior ramps and exit stairway and ramp protection. Exterior exit ramps and stairways shall be separated from the interior of the building as required in Section 1022.1. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an exterior exit stairway or ramp and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the exterior wall shall be rated in accordance with Section 1023.7.

Exceptions:

1. In all occupancies other than Group R-1 or R-2, separation from the interior of the building is not required in buildings that are not more than two stories above grade plane where a level of exit discharge serving such occupancies is the first story above grade plane.
2. Separation from the interior of the building is not required where the exterior exit stairway or ramp is served by an exterior exit ramp or balcony that connects two remote exterior exit stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior open-ended corridor of the building is not required for an exterior ramp or stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1022.4, exterior exit stairways or ramps, provided that Items 3.1 through 3.5 are met.
Separation from the interior of the building is not required for exterior ramps or stairways connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:

4.1. The building, including open-ended corridors, and stairways and ramps, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

4.2. The open-ended corridors comply with Section 1026.7.1020.

4.3. The open-ended corridors are connected on each end to an exterior exit stairway or ramp complying with Section 1026.7.1027.

4.4. The exterior walls and openings adjacent to the exterior exit stairway or ramp comply with Section 1023.7.

3.5. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m²) or an exterior stairway or ramp shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

Fire towers. Fire towers may be used as exits in lieu of interior stairs provided they comply with all of the requirements for stairways as per Section 1009.1011, except as modified below.

Enclosure. The enclosing walls of fire towers shall be of noncombustible materials or assemblies having a fire-resistance rating of at least 4 hours. Such walls shall be without openings, except for doors serving as means of egress.

Access. At each story served by a fire tower, access to the stairways of such fire tower shall be provided through outside balconies or fireproof vestibules. Such balconies or vestibules shall be at least 44 inches (1118 mm) in width and shall have unpierced floors of noncombustible materials and shall be provided with substantial guard railings at least 4 feet (1220 mm) high, without any openings greater than 5 inches (127 mm) in width.

Balconies and vestibules. Such balconies or vestibules of fire towers shall be level with the floors of the structure and the platforms of the stairs connected by such balconies. Such balconies or vestibules shall be separated from the structure and the stairs by self-closing swinging doors with a one and ½-hour fire protection rating, capable of being opened from both sides without the use of a key or other unlocking device.

Balconies or vestibules of fire towers shall open on a street or yard, or on a court open vertically to the sky for its full height, having a minimum net area of 105 square feet (9.7 m²) and a minimum dimension of 7 feet (2133.6 mm). The opening from the vestibule to the street, yard or court shall have a minimum area of 18 square feet (1.7 m²) and a minimum dimension of 30 inches (762 mm). It shall be unlawful to leave openings in the court walls surrounding an interior fire tower, other than the openings from the vestibules, within 15 feet (4572 mm) of the balcony, except that self-closing windows with a ¾-hour fire protection rating
may be used if such windows are at least 10 feet (3048 mm) from the balcony, provided that the area of the court is at least 12 feet by 24 feet (3657.6 mm by 7315.2 mm).

[1026.7.4] 1027.7.4 Termination. Fire towers shall terminate at grade level and shall exit directly to the street independently of corridors serving other stairways, except when the fire tower terminates in the ground floor corridor outside of the inner vestibule and within 10 feet (3048 mm) of the building line.

SECTION BC [1027] 1028
EXIT DISCHARGE

[1027.1] 1028.1 General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide a direct path of egress travel to grade. The exit discharge shall not reenter a building. The combined use of Exceptions 1 and 2 below shall not exceed 50 percent of the number and minimum width or required capacity of the required exits.

Exceptions:

1. [A maximum of] Not more than 50 percent of the number and minimum width or required capacity of the interior exit enclosures stairways and ramps is permitted to egress through protected areas on the level of discharge provided all of the following conditions are met:

   1.1. Such protected area shall [provide] be provided with a free and unobstructed path of travel to an exterior exit door and such exit is readily visible and identifiable within 40 feet from the point of termination of the exit enclosure.

   1.2. The protected area [shall be] of the level of exit discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.

   1.3. The protected area shall be provided with an approved automatic sprinkler system. Portions of the level of exit discharge with access to the egress path shall be either protected equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of exits interior exit stairways or ramps.

   1.4. Where a required interior exit stairway or ramp and an exit access stairway or ramp serve the same floor level and terminate at the same level of exit discharge, the termination of the exit access stairway or ramp and the exit discharge door of the interior exit stairway or ramp shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the interior exit stairway or ramp and the last tread of the exit access stairway or termination of slope of the exit access ramp.
1.5. The capacity of the protected area shall not be less than required by Section [1027.2] 1028.2 in addition to the occupant load of all exits serving communication spaces.

2. [A maximum of] Not more than 50 percent of the number and minimum width or required capacity of the interior exit [enclosures] stairways and ramps is permitted to egress through a vestibule provided all of the following conditions are met:

2.1. The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating [for] of the interior exit [enclosure] stairway or ramp enclosure.

2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).

2.3. The area is separated from the remainder of the level of exit discharge by [construction providing protection at least the equivalent of approved wired glass in steel frames] a fire partition constructed in accordance with Section 708.

Exception: The maximum transmitted temperature rise is not required.

2.4. The area is used only for means of egress and exits directly to the outside.

3. [Stairways in open parking garages complying with Section 1022.1, Exception 4, are permitted to egress through the open parking garage at their levels of exit discharge.]

[4—] In buildings in occupancy Group R-2, up to 100 percent of the number and minimum width and required capacity of the interior exit [enclosures] stairways and ramps are permitted to egress through a protected area on the level of discharge, if all of the following conditions are met:

[4—.] 3.1. Egress is provided in two different directions from the discharge points of all interior exit [enclosures] stairways and ramps to the exterior of the building that are remote from each other.

[4—.] 3.2. The exit discharges are arranged and constructed so as to minimize the possibility that all exit discharges would be compromised by smoke, fire or other emergency conditions.

[4—.] 3.3. Such protected areas shall comply with all requirements of Exception 1 above.

[5—] 4. Horizontal exits complying with Section [1025] 1026 shall not be required to discharge directly to the exterior of the building.

1028.1.1 Fire Department access. Where Exception 1 or 2 to Section 1028.1 is not applied, not less than one exit that discharges directly to the exterior shall be accessible to the Fire Department:

1. Through an exit access door directly from the protected area or vestibule, as applicable. Such exit access door shall only be used by the Fire Department and shall not be used as
an exit. Signage indicating “No Exit. FDNY Access Only” shall be posted on both sides of the exit access door; or

2. Within a maximum of 100 feet (30,480 mm) from the exit of the protected area or vestibule, as applicable. Such distance shall be measured along a natural and unobstructed path between the nearest points of the exit doors.

1027.2 1028.2 Exit discharge width or capacity. The minimum width or required capacity of the exit discharge shall be not less than the minimum width or required discharge capacity of the exits being served.

1027.3 Exit discharge location. Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 705 based on fire separation distance.

[Exception: Nonecombustible stoops and ramps not exceeding one story above grade plane located at the street wall and terminating at the street are permitted to be located within 10 feet (3048 mm) of adjacent lot lines or buildings on the same lot when serving:]

1. Group R-2 occupancies in buildings of noncombustible construction not exceeding four stories in height and a total of four dwelling units.

2. Group R-3 occupancies.

1027.4 1028.3 Exit discharge components. Exit discharge components shall be sufficiently open to the exterior so as to minimize the accumulation of smoke and toxic gases.

1027.5 1028.4 Egress courts. Egress courts serving as a portion of the exit discharge in the means of egress system shall comply with the requirements of [Section 1027] Sections 1028.4.1 and 1028.4.2.

1027.5.1 1028.4.1 Width or capacity. The required capacity of egress courts shall be determined as specified in Section [1005.1] 1005, but such the minimum width shall be not less than 44 inches (1118 mm), except as specified herein. Egress courts serving Group R-3 and U occupancies shall be not less than 36 inches (914 mm) in width. The required capacity and width of egress courts shall be unobstructed to a height of 7 feet 6 inches (2286 mm).

Exception: [Doors] Encroachments complying with Section [1005.2] 1005.7.

Where an egress court exceeds the minimum required width and the width of such egress court is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the egress court along the path of egress travel. [In no case shall the] The width of the egress court shall not be less than the required capacity.

1027.5.1.1 Projections. Doors, when fully opened, and handrails shall not reduce the
required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1½ inches (38 mm) from each side.]

[1028.5.2] 1028.4.2 Construction and openings. Where an egress court serving a building or portion thereof is less than 10 feet (3048 mm) in width, the egress court walls shall have not less than 1-hour fire-resistance-rated construction for a distance of 10 feet (3048 mm) above the floor of the egress court. Openings within such walls shall be protected by opening protectives having a fire protection rating of not less than ¾ hour.

Exception: Protection of exterior walls shall not be required where:

1. Egress courts serving an occupant load of less than 10.
2. Egress courts serving Group R-3.

[1028.6] 1028.5 Access to a public way. The exit discharge shall provide a direct and unobstructed access to a public way.

Exception: Where access to a public way cannot be provided, a safe dispersal area shall be provided where all of the following are met:

1. The area shall be of a size to accommodate [at least] not less than 5 square feet (0.46 m²) for each person.
2. The area shall be located on the same lot [at least] not less than 50 feet (15 240 mm) away from the building requiring egress.
3. The area shall be permanently maintained and identified as a safe dispersal area.
4. The area shall be provided with a safe and unobstructed path of travel from the building.
5. The area shall be illuminated in accordance with Section [1006.4] 1008.

SECTION BC [1028] 1029
ASSEMBLY

[1028.1] 1029.1 General. [Occupancies in Group] A room or space used for assembly purposes that contains seats, tables, displays, equipment or other material shall comply with this section.

1029.1.1 Bleachers. Bleachers, grandstands and folding and telescopic seating, that are not building elements, shall comply with ICC 300. Bleachers, folding and telescopic seating, and grandstands shall be permitted to be constructed of combustible or noncombustible materials in accordance with Section 302 of ICC 300 and the following:

1. Where the number of seats or seating positions of the bleachers, grandstands, and folding and telescopic seating within an assembly space exceeds 300, the dedicated structural
system supporting the bleachers, folding and telescopic seating, or grandstands shall be constructed of noncombustible materials.

2. Where the space beneath the bleachers, grandstands, or folding and telescopic seating is used for placement of portable equipment, including but not limited to those for audio, video, data, lighting, motion control, and associated wiring, the decking on such bleachers, grandstands, or folding and telescopic seating shall be constructed of fire-retardant-treated wood complying with Section 2303.2 or other Class A materials.

3. Where the number of seats or seating positions of the bleachers, grandstands, and folding and telescopic seating within an assembly space exceeds 1,500, the dedicated structural system supporting the bleachers, grandstands, or folding and telescopic seating, and the decking on such bleachers, grandstands, or folding and telescopic seating, shall be constructed of noncombustible materials.

[No place of assembly shall be located within 250 feet (76 200 mm) of any occupancy containing explosive contents.]

1029.1.1.1 Spaces under grandstands and bleachers. Where spaces under grandstands or bleachers are used for purposes other than means of egress, ticket booths less than 100 square feet (9.29 m²) and toilet rooms, such spaces shall be separated by fire barriers complying with Section 707 and horizontal assemblies complying with Section 711, with not less than 1-hour fire-resistance-rated construction. An automatic smoke detection system shall be installed in such separated spaces. The system shall be activated in accordance with Section 907.5.

[1028.1.1] 1029.1.2 Place of assembly Certificate of Operation. A Certificate of Operation shall be required for a place of assembly in accordance with Section [303.2] 303.7. It shall be unlawful to occupy any building or space as a place of assembly unless and until a Certificate of Operation therefore has been issued by the department pursuant to the provisions of Chapter 1 of Title 28 of the Administrative Code.

[1028.1.2] 1029.1.3 Posted capacity sign. Signs shall be posted in all assembly spaces, indicating the number of persons who may legally occupy the space. Every room or space in such places of assembly shall have the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space. Posted signs shall be of an approved legible permanent design in accordance with Section 1029.1.4, and shall be maintained by the owner or the owner’s authorized agent.

Exception: Signs shall not be required where seating is fixed in place in accordance with an approved plan and no provision is made for standee spaces.

[Such] Posted capacity signs, where required, shall read as follows:
**[1028.1.2.1] 1029.1.3.1 Multiple-occupant load sign.** When a space is occupied for multiple purposes involving different occupant loads the sign shall read as follows:

```
OCCUPANCY BY MORE THAN
  (number) . . . . . PERSONS AS (type of occupancy) . . .
  OR BY
  (number) . . . . . PERSONS AS (type of occupancy) . . .
  OR BY
  (number) . . . . . PERSONS AS (type of occupancy) . . .
IS DANGEROUS AND UNLAWFUL
Certificate of Operation No . . . . . .
```

Commissioner, Dept. of Buildings, City of New York

**[1028.1.2.2] 1029.1.4 Design of capacity signs.** Signs shall be at least 12 inches ([305] 304.8 mm) wide and 16 inches ([406] 406.4 mm) high. The lettering shall be red on a white background. The letters shall be at least 1 inch ([25] 25.4 mm) high and the numerals at least 1¼ inches ([32] 31.75 mm) high. Signs shall be framed under a transparent protective cover, and permanently mounted in a location that is conspicuously visible to a person entering the space. Signs shall be lighted by artificial illumination at all times during occupancy to maintain at least 5 [foot-candles] footcandles (54 lux) on the surface of the sign.

**[1028.1.3] 1029.1.5 Approved plans.** In every place of assembly providing seating or other moveable furnishings, copies of approved plans and approved alternate plans shall be kept on the premises. The plans shall be readily available for inspection, and shall provide the following information:

1. For assembly spaces:
   1.1. The location of each seat of each tier of seating, along with the number of occupants of each seating section.
   1.2. The location and number of standees for each standee area.
   1.3. The total number of occupants of each tier and of the assembly space.
1.4. The location and classification of all exits.

2. For safe areas:
   2.1. The furniture and equipment arrangement and location.
   2.2. The number of occupants to be accommodated.

3. For stage areas:
   3.1. The maximum number of occupants, including audience seating on the stage.
   3.2. Any conditions limiting the use of the stage area.
   3.3. The location of all exits.

These plans shall not be smaller in size than required for ⅛-inch (3.2 mm) scale plans.

[1028.2] 1029.2 Assembly with occupant load greater than 300. [Buildings or spaces occupied by Group A that have] A building, room or space used for assembly purposes that has an occupant load of greater than 300 [shall be] and is provided with a main exit[Such], that main exit shall be of sufficient [width] capacity to accommodate not less than one-half of the occupant load, but such [width] capacity shall be not [be] less than the total required [width] capacity of all means of egress leading to the exit. Where the main use or dominant occupancy of the building is classified as a Group A occupancy, the main exit shall front on [at least] not less than one street or an unoccupied space of not less than 10 feet (3048 mm) in width that adjoins a street or public way. Other additional exits shall provide an egress capacity for at least one-half of the total occupant load served by that level and comply with Section [1015.2] 1007.1.

   Exception: In a building, room or space used for assembly [occupancies] purposes where there is [no] not a well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total [width] capacity of egress is not less than 100 percent of the required [width] capacity.

[1028.3] 1029.3 Reserved.

[1028.4] 1029.4 Foyers and lobbies. In Group A-1 occupancies, where persons are admitted to the building at times when seats are not available, such persons shall be allowed to wait in a lobby or similar space, provided such lobby or similar space shall not encroach upon the minimum width or required [clear width] capacity of the means of egress. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.

[1028.5] 1029.5 Interior balcony and gallery means of egress. For balconies, galleries or press boxes having a seating capacity of 50 or more located in [Group A occupancies, at least] a building, room or space used for assembly purposes, not less than two means of egress shall be provided, with one from each side of every balcony, gallery[,] or press box[and at least one leading directly to an exit].
1028.5.1 Enclosure of openings. Interior stairways and other vertical openings shall be enclosed in an exit enclosure as provided in Section 1022.1, except that stairways are permitted to be open between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

1029.5.1 Accessible means of egress. At least one accessible means of egress is required from a balcony, gallery or press box level containing accessible seating locations in accordance with Section [1007.3] 1009.3 or [1007.4] 1009.4.

1028.6.1 1029.6.1 Without smoke protection. The required capacity in inches (mm) of the aisles and other means of egress shall be not less than the occupant load served by the egress elements in accordance with the following, as applicable:

1. [At least] Not less than 0.3 inch (7.6 mm) of aisle capacity for each occupant served shall be provided on stairs stepped aisles having riser heights 7 inches (178 mm) or less and tread depths 11 inches (279 mm) or greater, measured horizontally between tread nosings.

2. [At least] Not less than 0.005 inch (0.127 mm) of additional aisle capacity for each occupant served shall be provided for each 0.10 inch (2.5 mm) of riser height above 7 inches (177.8 mm).

3. Where egress requires stair stepped aisle descent, [at least] not less than 0.075 inch (1.9 mm) of additional aisle capacity for each occupant served shall be provided on those portions of aisle having no handrail within a horizontal distance of 30 inches (762 mm).

4. Ramped means of egress aisles, where slopes are steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have [at least] not less than 0.22 inch (5.6 mm) of clear aisle capacity for each occupant served. Level or ramped means of egress aisles, where slopes are not steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have [at least] not less than 0.20 inch (5.1 mm) of clear aisle capacity for each occupant served.

1028.6.2 1029.6.2 Smoke-protected assembly seating. The required capacity in inches (mm) of aisles and other means of egress shall be not less than the occupant load served by the egress element multiplied by the appropriate factor in Table [1028.6.2] 1029.6.2 of this code. The total number of seats specified shall be those within the space and exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. A life safety evaluation, complying
with NFPA 101, shall be done for a facility utilizing the reduced width requirements of Table 1028.6.2 of this code for smoke-protected assembly seating subject to the approval by the commissioner.

Exception: For an outdoor smoke-protected assembly seating with an occupant load not greater than 18,000, the clear width required capacity in inches (mm) shall be determined using the factors in Section 1028.6.3.

For SI: 1 inch = 25.4 mm.

**[1028.6.2.1 1029.6.2.1 Smoke control. [Means of egress]]** Aisles and aisle accessways serving a smoke-protected assembly seating area shall be provided with a smoke control system complying with Section 909 or natural ventilation designed to maintain the smoke level at least not less than 6 feet (1829 mm) above the floor of the means of egress.

**[1028.6.2.2 1029.6.2.2 Roof height.** A smoke-protected assembly seating area with a roof shall have the lowest portion of the roof deck not less than 15 feet (4572 mm) above the highest aisle or aisle accessway.

Exception: A roof canopy in an outdoor stadium shall be permitted to be less than 15 feet (4572 mm) above the highest aisle or aisle accessway provided that there are no objects less than 80 inches (2032 mm) above the highest aisle or aisle accessway.

**[1028.6.2.3 1029.6.2.3 Automatic sprinklers.** Enclosed areas with walls and ceilings in buildings or structures containing smoke-protected assembly seating shall be protected with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

Exceptions:

1. The floor area used for contests, performances or entertainment, provided the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet ([93] 92.9 m²) in area.

3. Outdoor seating facilities where seating and the means of egress in the seating area are essentially open to the outside.

1029.6.3 Width of means of egress for outdoor smoke-protected assembly seating. The clear width required capacity in inches (mm) of aisles and other means of egress shall be not less than the total occupant load served by the egress element multiplied by 0.08 (2.0 mm) where egress is by aisles and stairs, stepped aisle and multiplied by 0.06 (1.52 mm) where egress is by ramps, corridors, tunnels, or vomitories, level aisles or ramped aisles.

Exception: The clear width required capacity in inches (mm) of aisles and other means of egress shall be permitted to comply with Section 1028.6.2 for the number of seats in the outdoor smoke-protected assembly seating where Section 1028.6.2 permits less width capacity.

1029.7 Travel distance. Exits and aisles shall be so located such that the travel distance to an exit door shall be provided in accordance with Table 1029.7. At least one exit door shall be available from every attached seat or standee space in an assembly space, or from the most remote point in the space when movable seats are provided or, when no seats are provided, within the primary travel distance limitation listed in Table 1029.7. In addition, an alternate exit door shall be available from every attached seat or standee space, or from the most remote point when attached seats are not provided within the secondary travel distance limitation listed in Table 1029.7. Such alternate exit doors may serve to satisfy the requirements for primary travel distance for other seats or locations. Exit doors satisfying the primary and secondary travel distance requirements for any one seat or location shall be separated from each other by a distance of at least 25 feet (7620 mm) in accordance with Section 1007.1. Where aisles are provided for seating, the distance shall be measured along the aisles and aisle accessway without travel over or on the seats.

Exception: For the purposes of this section, travel distances may be measured in accordance with the following exceptions:

1. Smoke-protected assembly seating: The primary travel distance shall be permitted to be measured from each seat or standee space to the nearest entrance to a vomitory or concourse, and shall not exceed 200 feet (60 960 mm). The secondary travel distance shall be permitted to be measured from each such seat or standee space to an alternate entrance to the vomitory or concourse, and shall not exceed 300 feet (91 440 mm). The travel distance from any such entrances to the vomitory or concourse to a [stair] stairway, ramp or walk on the exterior of the building shall not exceed 200 feet (60 960 mm).

2. Open-air seating served by exit access stairways and ramps: The primary travel distance shall be permitted to be measured from each seat or standee space to the closest riser of an exit access stairway or the closest slope of an exit access ramp that are outside the assembly space. The secondary travel distance shall be permitted to be measured to the closest riser of an alternate exit access stairway or the closest slope of an alternate exit.
access ramp that are outside the assembly space.

3. Assembly with safe areas: Where an assembly space is provided with an exit access doorway that opens directly to a safe area in accordance with Section 1029.19, the primary travel distance shall be permitted to be measured to such an exit access doorway. The secondary travel distances shall also be permitted to be measured to an alternate exit access doorway that opens directly to a safe area. The travel distance within safe areas shall be in accordance with Section 1017 based on the occupancy classification of the main occupancy of the building or portion thereof to which the assembly space is ancillary. Where a safe area contains other occupancies, travel distances within such safe area shall comply with Section 1017.

4. Assembly with open exterior spaces: Where an assembly space is provided with an exit that opens directly to an open exterior space in accordance with Section 1029.19, the primary and secondary travel distances shall be measured to such an exit.

[1028.8] 1029.8 Common path of egress travel. The common path of egress travel shall not exceed 30 feet (9144 mm) from any seat to a point where an occupant has a choice of two paths of egress travel to two exits.

Exceptions:

1. For areas, such as box seats, galleries or balconies, serving not more than 75 occupants, the common path of egress travel shall not exceed 75 feet (22 860 mm).

2. For smoke-protected assembly seating, the common path of egress travel shall not exceed 50 feet (15 240 mm).

1029.8.1 Path through adjacent row. Where one of the two paths of travel is across the aisle through a row of seats to another aisle, there shall be not more than 24 seats between the two aisles, and the minimum clear width between rows for the row between the two aisles shall be 12 inches (304.8 mm) plus 0.6 inch (15.2 mm) for each additional seat above seven in the row between aisles.

Exception: For smoke-protected assembly seating there shall be not more than 40 seats between the two aisles and the minimum clear width shall be 12 inches (304.8 mm) plus 0.3 inch (7.6 mm) for each additional seat.
[1028.9] **Assembly aisles are required.** Every occupied portion of any [occupancy in Group A] building, room or space used for assembly purposes that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this section. [Aisle accessways for tables and seating shall comply with Section 1017.4-]  

[1028.9.1] **Minimum aisle width.** The minimum clear width [of] for aisles shall [be as shown] comply with one of the following:

1. Forty-eight inches ([1220] 1220 mm) for [aisle stairs] stepped aisles having seating on each side.  
   **Exception:** Thirty-six inches ([914.4] 914.4 mm) where the [aisle does not] stepped aisles serve [more] less than [50] 51 seats.

2. Thirty-six inches ([914] 914.4 mm) for [aisle stairs] stepped aisles having seating on only one side.  
   **Exception:** Twenty-three inches (584 mm) between a stepped aisle handrail and seating where a stepped aisle does not serve more than five rows on one side.

3. Twenty-three inches (584 mm) between an aisle stair handrail or guard and seating where the stepped aisle is subdivided by a mid-aisle handrail.

4. Forty-two inches ([1066.8] 1066.8 mm) for level or ramped aisles having seating on both sides.  
   **Exception:** Thirty-six inches ([914] 914.4 mm) where the aisle [does not serve more] serves less than [50] 51 seats.

5. Thirty-six inches ([914.4] 914.4 mm) for level or ramped aisles having seating on only one side.

6. Thirty-six inches (914.4 mm) for aisles other than those listed above and cross-aisles serving less than 51 persons.

[1028.9.2] **Aisle width catchment area.** The aisle [width] shall provide sufficient [egress] capacity for the number of persons accommodated by the catchment area served by the aisle. The catchment area served by an aisle is that portion of the total space [that is] served by that section of the aisle. In establishing catchment areas, the assumption shall be made that there is a balanced use of all means of egress, with the number of persons in proportion to egress capacity.

[1028.9.3] **Converging aisles.** Where aisles converge to form a single path of egress travel, the required [egress] capacity of that path shall be not [be] less than the combined required capacity of the converging aisles.

1026
1029.9.4 **Uniform width and capacity.** Those portions of aisles, where egress is possible in either of two directions, shall be uniform minimum width or [in] required width capacity.

1029.9.5 **[Assembly aisle termination] Dead end aisles.** Each end of an aisle shall [terminate at] be continuous to a cross aisle, foyer, doorway, vomitory [or] concourse or stairway in accordance with Section 1029.9.7 having access to an exit. Travel through dead-end aisles shall be subject to Section 1029.8. Dead-end aisles shall be not greater than 20 feet (6096 mm) in length.

Exceptions:

1. [Dead-end aisles shall not be greater than 20 feet (6096 mm) in length.]

2. For smoke-protected assembly seating, the dead-end aisle length of vertical aisles shall not exceed a distance of 50 feet (15 240 mm) A dead-end aisle of up to 16 rows shall be permitted to exceed 20 feet (6096 mm) in length where seats served by the dead-end aisle are not more than 24 seats from another aisle, measured along a row of seats having a clear width of not less than 12 inches (304.8 mm) plus 0.6 inches (15.2 mm) for each additional seat over a total of 7 in the row.

2. For smoke-protected assembly seating, dead end aisles of up to 21 rows may be permitted to exceed 20 feet (6096 mm) in length provided seats served by the dead-end aisle are not more than 40 seats from another aisle, measured along a row of seats having a clear width of not less than 12 inches (304.8 mm) plus 0.3 inches (7.6 mm) for each additional seat over a total of 7 in the row.

1029.9.6 **Aisle measurement.** The clear width for aisles shall be measured to walls, edges of seating and tread edges except for permitted projections.

**Exception:** The clear width of aisles adjacent to seating at tables shall be permitted to be measured in accordance with Section 1029.12.1.

1029.9.6.1 **Assembly aisle obstructions.** There shall not be [no] obstructions in the minimum width or required [width of aisles except for handrails as provided in Section 1028.13] capacity of aisles.

**Exception:** Handrails are permitted to project into the required width of stepped aisles and ramped aisles in accordance with Section 1014.8.

1029.7 **Stairways connecting to stepped aisles and vomitories.** A stairway that connects a stepped aisle or a vomitory to a cross aisle, concourse, or to another aisle shall be permitted to comply with the assembly aisle walking surface requirements of Section 1029.13. Transitions between stairways and stepped aisles shall comply with Section 1029.10.

1029.10 **Transitions.** Transitions between stairways and stepped aisles shall comply with either Section 1029.10.1 or 1029.10.2.
1029.10.1 Transitions and stairways that maintain stepped aisle riser and tread dimensions. Stepped aisles, transitions and stairways that maintain riser and tread dimensions shall comply with Section 1029.13 as one exit access component.

1029.10.2 Transitions to stairways that do not maintain stepped aisle riser and tread dimensions. Transitions to stairways from stepped aisles with riser and tread dimensions that differ from the stairways shall comply with Sections 1029.10.2.1 through 1029.10.3.

1029.10.2.1 Stairways and stepped aisles in a straight run. Transitions where the stairway is a straight run from the stepped aisle shall have a minimum depth of 22 inches (558.8 mm) where the treads on the descending side of the transition have greater depth and 30 inches (762 mm) where the treads on the descending side of the transition have lesser depth.

1029.10.2.2 Stairways and stepped aisles that change direction. Transitions where the stairway changes direction from the stepped aisle shall have a minimum depth of 11 inches (279.4 mm) or the stepped aisle tread depth, whichever is greater, between the stepped aisle and stairway.

1029.10.3 Transition marking. A distinctive marking stripe shall be provided at each nosing or leading edge adjacent to the transition. Such stripe shall be not less than 1 inch (25.4 mm), and not more than 2 inches (50.8 mm), wide. The edge marking stripe shall be distinctively different from the stepped aisle contrasting marking stripe.

1029.11 Construction. Aisles, stepped aisles and ramped aisles shall be built of materials consistent with the types permitted for the type of construction of the building.

Exception: Wood handrails shall be permitted for all types of construction. Bleachers, grandstands and folding and telescopic seating shall be built of materials permitted by Section 1029.1.1.

1029.11.1 Walking surface. The surface of aisles, stepped aisles and ramped aisles shall be of slip-resistant materials that are securely attached. The surface for stepped aisles shall comply with Section 1011.7.1.

1029.11.2 Outdoor conditions. Outdoor aisles, stepped aisles and ramped aisles and outdoor approaches to aisles, stepped aisles and ramped aisles shall be designed so that water will not accumulate on the walking surface.

1029.12 Aisle accessways. Aisle accessways for seating at tables shall comply with Section 1029.12.1. Aisle accessways for seating in rows shall comply with Section 1029.12.2.

1029.12.1 Seating at tables. Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of required clear width of the aisle or aisle accessway shall be made to a line 19 inches (482.6 mm) away from and parallel to the edge of the table or counter. The 19-inch (482.6 mm) distance shall be measured perpendicular to the side of the table or counter. In the case of other side boundaries for aisles or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges.
**Exception:** Where tables or counters are served by fixed seats, the width of the aisle or aisle accessway shall be measured from the back of the seat.

**1029.12.1.1 Aisle accessway capacity and width for seating at tables.** Aisle accessways serving arrangements of seating at tables or counters shall comply with the capacity requirements of Section 1005 but shall not have less than 12 inches (304.8 mm) of width plus 1/2 inch (12.7 mm) of width for each additional 1 foot (304.8 mm), or fraction thereof, beyond 12 feet (3657.6 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.

**Exception:** Portions of an aisle accessway having a length not exceeding 6 feet (1828.8 mm) and used by a total of not more than four persons.

**1029.12.1.2 Seating at table aisle accessway length.** The length of travel along the aisle accessway shall not exceed 30 feet (9144 mm) from any seat to the point where a person has a choice of two or more paths of egress travel to separate exits.

**[1028.10] 1029.12.2 Clear width of aisle accessways serving seating in rows.** Where seating rows have 14 or fewer seats, the minimum clear aisle accessway width shall be not less than 12 inches (305 mm) measured as the clear horizontal distance from the back of the row ahead and the nearest projection of the row behind. Where chairs have automatic or self-rising seats, the measurement shall be made with seats in the raised position. Where any chair in the row does not have an automatic or self-rising seat, the measurements shall be made with the seat in the down position. For seats with folding tablet arms, row spacing shall be determined with the tablet arm in the used position.

**Exception:** For seats with folding tablet arms, row spacing is permitted to be determined with the tablet arm in the stored position where the tablet arm when raised manually to vertical position in one motion automatically returns to the stored position by force of gravity.

**[1028.10.1] 1029.12.2.1 Dual access.** For rows of seating served by aisles or doorways at both ends, there shall not be more than 100 seats per row. The minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.3 inch (7.6 mm) for every additional seat beyond 14 seats, where seats have backrests or beyond 21 where seats are without backrests. The minimum clear width is not required to exceed 22 inches (559 mm).

**Exception:** For smoke-protected assembly seating, the row length limits for a 12-inch-wide (305 mm) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table [1028.10.1] 1029.12.2.1.
TABLE [1028.10.1] 1029.12.2.1
SMOKE-PROTECTED
ASSEMBLY AISLE ACCESSWAYS

| TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED ASSEMBLY OCCUPANCY SEATING | MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH Aisle or doorway at both ends of row |
|---|---|---|
| Seats with backrests | Seats without backrests |
| Less than 4,000 | 14 | 21 |
| 4,000 | 15 | 22 |
| 7,000 | 16 | 23 |
| 10,000 | 17 | 24 |
| 13,000 | 18 | 25 |
| 16,000 | 19 | 26 |
| 19,000 | 20 | 27 |
| 22,000 and greater | 21 | 28 |

For SI: 1 inch = 25.4 mm.

[1028.10.2] 1029.12.2.2 Single access. For rows of seating served by an aisle or doorway at only one end of the row, the minimum clear width of 12 inches ([305] 304.8 mm) between rows shall be provided. Not more than eight chairs shall be provided in such row of seating.

1029.13.1 Ramped aisles. Aisles [with a slope not exceeding] that are sloped more than one unit vertical in [eight] 20 units horizontal ([12.5] 5-percent slope) shall [consist] be considered a ramped aisle. Ramped aisles that serve as part of [a ramp having] an accessible route in accordance with Sections 1009 and 1108.2 shall have a [slip-resistant walking surface] maximum slope of one unit vertical in 12 units horizontal (8-percent slope). The slope of other ramped aisles shall not exceed one unit vertical in 8 units horizontal (12.5-percent slope).

1029.13.1.1 Cross slope. The slope measured perpendicular to the direction of travel of a ramped aisle shall not be steeper than one unit vertical in 48 units horizontal (2-percent slope).

1029.13.1.2 Landings. Ramped aisles shall have landings in accordance with Sections 1012.6 through 1012.6.5. Landings for ramped aisles shall be permitted to overlap required aisles or cross aisles.

1029.13.1.3 Edge protection. Ramped aisles shall have edge protection in accordance with Section 1012.10 and 1012.10.1.

Exception: In assembly spaces with fixed seating, edge protection is not required on the sides of ramped aisles where the ramped aisles provide access to the adjacent seating and aisle accessways.
1029.13.2 Stepped aisles. Aisles with a slope exceeding one unit vertical in eight units horizontal (12.5-percent slope) shall consist of a series of risers and treads that extends across the full width of aisles and complies with Sections [1028.11.4] 1029.13.2.1 through [1028.11.4] 1029.13.2.4.

[1028.11.4] 1029.13.2.1 Treads. Tread depths shall be [a minimum of] not less than 11 inches ([279] 279.4 mm) and shall have dimensional uniformity.

Exception: The tolerance between adjacent treads shall not exceed [0.188] \( \frac{3}{16} \) inch (4.8 mm).

[1028.11.2] 1029.13.2.2 Risers. Where the gradient of [aisle stairs] stepped aisles is to be the same as the gradient of adjoining seating areas, the riser height shall be not [be] less than 4 inches ([102] 101.6 mm) nor more than 8 inches ([203] 203.2 mm) and shall be uniform within each flight.

Exception: Riser height nonuniformity shall be limited to the extent necessitated by changes in the gradient of the adjoining seating area to maintain adequate sightlines. Where nonuniformities exceed [0.188] \( \frac{3}{16} \) inch (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated with a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers. Such stripe shall be [a minimum of] not less than 1 inch ([25] 25.4 mm), and [a maximum of] not more than 2 inches ([54] 50.8 mm), wide. The edge marking stripe shall be distinctively different from the contrasting marking stripe.

1029.13.2.2.1 Construction tolerances. The tolerance between adjacent risers on a stepped aisle that were designed to be equal height shall not exceed \( \frac{3}{16} \) inch (4.8 mm). Where the stepped aisle is designed in accordance with the Exception of Section 1029.13.2.2, the stepped aisle shall be constructed so that each riser of unequal height, determined in the direction of descent, is not more than \( \frac{3}{8} \) inch (9.5 mm) in height different from adjacent risers where stepped aisle treads are less than 22 inches (560 mm) in depth and \( \frac{3}{4} \) inch (19.1 mm) in height different from adjacent risers where stepped aisle treads are 22 inches (558.8 mm) or greater in depth.

[1028.11.3] 1029.13.2.3 Tread contrasting marking stripe. A contrasting marking stripe shall be provided on each tread at the nosing or leading edge such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be [a minimum of] not less than 1 inch ([25] 25.4 mm), and [a maximum of] not more than 2 inches ([54] 50.8 mm), wide.

Exception: The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

1029.13.2.4 Nosing and profile. Nosing and riser profile shall comply with Sections 1011.5.5 through 1011.5.5.3.

[1028.11.4] Step lighting. Each step shall have a steplight.
Aisle illumination. Aisles, cross aisles and stepped aisles shall be illuminated in accordance with Section [1006.2] 1008.2.1.

Seat stability. In a building, room or space used for assembly purposes, the seats shall be securely fastened to the floor.

Exceptions:

1. In a building, room or space used for assembly purposes or portions thereof for seating and with 200 or fewer seats, the seats shall not be required to be fastened to the floor, provided that the seating area has a minimum net floor area of 12 square feet (1.11 m²) per person or all seats in a row shall be fastened together with a maximum of 12 seats between aisles where 12 square feet (1.11 m²) per person is not provided.

2. In a building, room or space used for assembly purposes or portions thereof with seating at tables and without ramped or tiered floors for seating, the seats shall not be required to be fastened to the floor.

3. In a building, room or space used for assembly purposes or portions thereof with seating at tables on ramped or tiered floors, the seats shall not be required to be fastened to the floor provided that the seating area has a minimum net floor area of 12 square feet (1.11 m²) per person.

4. In a building, room or space used for assembly purposes or portions thereof for seating and with greater than 200 seats, the seats shall be securely fastened to the floor, or all seats in a row shall be fastened together with a maximum of 12 seats between aisles.

5. In a building, room or space used for assembly purposes where flexibility of the seating arrangement is an integral part of the design and function of the space and seating is on tiered levels, a maximum seating area of up to 200 seats shall not be required to be fastened to the floor, provided that the seating area has a minimum net floor area of 12 square feet (1.11 m²) per person or all seats in a row in such seating area shall be fastened together with a maximum of 12 seats between aisles where 12 square feet (1.11 m²) per person is not provided.

6. Groups of seats within a place of building, room or space used for assembly purposes separated from other seating by railings, guards, partial height walls or similar barriers with level floors and having not more than 14 seats per group shall not be required to be fastened to the floor.

7. Seats intended for musicians or other performers and separated by railings, guards, partial height walls or similar barriers shall not be required to be fastened to the floor.

Where a building, room or space used for assembly purposes includes mixed seating arrangements and conditions, the seat stability requirements and allowances shall be applied respectively to each portion of the space containing such seating.
[1028.13] 1029.15 Handrails. Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and [stepped aisles] shall be provided with handrails in compliance with Section 1014 located either at one or both sides of the [side] aisle or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles [having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and] with seating on both sides.

2. Handrails are not required [if] where, at the side of the aisle, there is a guard with a top surface that complies with the graspability requirements of handrails in accordance with Section 1014.3.

3. Handrail extensions are not required at the top and bottom of [stepped aisles] and [ramped aisles] to permit crossovers within the aisles.

[1028.13.1] 1029.15.1 Discontinuous handrails. Where there is seating on both sides of the aisle, the mid-aisle handrails shall be discontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to permit crossing from one side of the aisle to the other. These gaps or breaks shall have a clear width of [at least] not less than 22 inches (559 mm) and not greater than 36 inches (914.4 mm), measured horizontally, and the mid-aisle handrail shall have rounded terminations or bends.

1029.15.2 Handrail termination. Handrails located on the side of stepped aisles shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stepped aisle flight.

1029.15.3 Mid-aisle termination. Mid-aisle handrails shall not extend beyond the lowest riser and shall terminate within 18 inches (457.2 mm), measured horizontally, from the lowest riser. Handrail extensions are not required.

Exception: Mid-aisle handrails shall be permitted to extend beyond the lowest riser where the handrail extensions do not obstruct the width of the cross aisle.

[1028.13.2 Intermediate handrails.] 1029.15.4 Rails. Where mid-aisle handrails are provided in [the middle of aisle stairs] stepped aisles, there shall be an additional [intermediate handrail] rail located approximately 12 inches (305 mm) below the [main] handrail. The rail shall be adequate in strength and attachment in accordance with Section 1607.8.1.2.

[1028.14] 1029.16 Assembly guards. [Assembly guards shall comply with Sections 1028.14.1 through 1028.14.4.] Guards adjacent to seating in a building, room or space used for assembly purposes shall be provided where required by Section 1015 of this code and shall be constructed in accordance with Section 1015 except where provided in accordance with Sections 1029.16.1 through 1029.16.5 of this code. At bleachers, grandstands and folding and telescopic seating, guards must be provided where required by ICC 300 and Section 1029.16.1 of this code.
1029.16.1 Perimeter guards. Perimeter guards shall be provided where the footboards or walking surface of seating facilities are more than 30 inches (762 mm) above the floor or grade below. Where the seatboards are adjacent to the perimeter, guard height shall be 42 inches (1066.8 mm) high minimum, measured from the seatboard. Where the seats are self-rising, guard height shall be 42 inches (1066.8 mm) high minimum, measured from the floor surface. Where there is an aisle between the seating and the perimeter, the guard height shall be measured in accordance with Section 1015.2.

Exceptions:

1. Guards that impact sightlines shall be permitted to comply with Section 1029.16.3.

2. Bleachers, grandstands and folding and telescopic seating shall not be required to have perimeter guards where the seating is located adjacent to a wall and the space between the wall and the seating is less than 4 inches (101.6 mm).

1028.14.1 1029.16.2 Cross aisles. Cross aisles located more than 30 inches (762 mm) above the floor or grade below shall have guards in accordance with Section [4043] 1015.

Where an elevation change of 30 inches (762 mm) or less occurs between a cross aisle and the adjacent floor or grade below, guards not less than 26 inches ([660] 660.4 mm) above the aisle floor shall be provided.

Exception: Where the backs of seats on the front of the cross aisle project 24 inches ([640] 609.6 mm) or more above the adjacent floor of the aisle, a guard need not be provided.

1028.14.3 1029.16.3 Sightline-constrained guard heights. Unless subject to the requirements of Section [4043] 1029.16.4, a fascia or railing system in accordance with the guard requirements of Section [4043] 1015 and having a minimum height of 26 inches ([660] 660.4 mm) shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. [At bleachers, a guard must be provided where required by ICC 300.]

1028.14.4 1029.16.4 Guards at the end of aisles. A fascia or railing system complying with the guard requirements of Section [4043] 1015 shall be provided for the full width of the aisle where the foot of the aisle is more than 30 inches (762 mm) above the floor or grade below. The fascia or railing shall be a minimum of 36 inches ([914] 914.4 mm) high and shall provide a minimum 42 inches ([1067] 1066.8 mm) measured diagonally between the top of the rail and the nosing of the nearest tread.

1028.14.5 1029.16.5 Toe guard at balconies. An unperforated curb or toe guard at least 12 inches ([305] 304.8 mm) high above the level of the floor shall be provided at the fascia of all balconies.

1028.15 1029.17 Bench seating. Where bench seating is used, the number of persons shall be based on one person for each 18 inches ([457] 457.2 mm) of length of the bench.
Standing spaces may be permitted within assembly spaces provided each standee has a minimum of 5 square feet (0.47 m²) of occupiable floor space with a width of 22 inches (559 mm) and a minimum depth of 21 inches (533 mm). Standing spaces shall not encroach on the required exit facilities and shall be separated from the space to be left clear for passage by tape, ribbon or other easily broken material, supported by lightweight posts fixed in stationary sockets.

Places of assembly with an occupant load of less than 12 square feet per person. Places of assembly in which the net floor area, exclusive of stage area, is less than 12 square feet (1.11 m²) per person shall have special egress provisions in accordance with this section.

Classification of exit access doorways and exits. For the purposes of Section 1028.17, exit access doorways and exits shall be classified as follows:

1. Class 1—Exit access doorways and exits that are used for normal entry to the assembly space, and that open directly to a safe area or to an open exterior space.

2. Class 2—Exit access doorways and exits that are not used for normal entry to the assembly space, and that open directly to a safe area or to an open exterior space.

3. Class 3—Exit access doorways and exits that open from the assembly space into corridors, exit passageways or vertical exits.

Distribution of classes. The required exit capacity from assembly spaces in which the net floor area, exclusive of stage area, is less than 12 square feet (1.11 m²) per person shall be distributed so that exit access doorways and exits of each class are provided to comply with the following requirements:

1. For assembly spaces in which the mean floor level is not more than 15 feet (4572 mm) above or below the adjoining grade elevation, the exit capacity shall be distributed as follows:
   1.1. Class 1—not less than 40 percent.
   1.2. Class 2—not more than 60 percent.
   1.3. Class 3—not more than 40 percent.

2. For assembly spaces in which the mean floor level is more than 15 feet (4572 mm) above or below the adjoining grade elevation, the exit capacity shall be distributed as follows:
   2.1. Class 1—not less than 60 percent.
   2.2. Class 3—not more than 40 percent.

Safe areas. The capacity of exits from safe areas shall be provided for all occupants of the safe area. Safe areas shall comply with the following requirements:
1. When provided to serve Class 1 or 2 exit [openings] access doorways, safe areas shall be separated from assembly spaces by fire barriers constructed in accordance with Section 707 or horizontal assemblies constructed in accordance with Section 711, or both, each having a 2-hour fire-resistance rating. Such safe areas shall serve as transition areas in the line and direction of exit travel. They shall serve for normal entry to the assembly space and may be used as corridors, lobbies or lounges.

2. No room or space classified in Occupancy Group H, S-1, F-1 or F-2 shall open upon a safe area.

3. Safe areas shall be at a level not more than 6 feet ([1829] 1828.8 mm) above or below the level at which egress is made from the assembly space.

4. Ventilating systems for safe areas shall not be connected to systems serving any other spaces, unless separated from such systems by fire/smoke dampers actuated by smoke detectors.

5. Collecting safe areas. Places of assembly having more than one assembly space may have a collecting safe area that receives the occupant load discharged into it by other safe areas. Collecting safe areas shall be located within 6 feet ([1829] 1828.8 mm) above or below the assembly space nearest to grade.

6. Occupant load. The occupant load of a safe area shall be the aggregate occupant load of all exit [openings] access doorways discharging directly into it. The occupant load of a collecting safe area shall be the aggregate occupant load of all exit [openings] access doorways discharging directly into it, plus 50 percent of the occupant load of other safe areas discharging into it.

7. Dimensions. The clear unobstructed floor area of each safe area shall be sufficient to accommodate the total occupant load of the safe area on the basis of 3 square feet (0.28 m²) per person, not including space occupied by furniture or equipment. The minimum dimension of such unobstructed space shall be 8 feet ([2438] 2438.4 mm). The width of the unobstructed space shall be measured at right angles to the direction of travel to an exit and shall not be less than required for the occupant load. The height of safe areas shall be at least 8 feet ([2438] 2438.4 mm) at all points.

8. Safe areas near grade. When a safe area provides egress to an open exterior space, either directly or through a vestibule, the safe area need not provide the floor area required by this section when the level of discharge from the safe area to the open exterior space is not more than 4 feet ([1220] 1220 mm) above or below the grade of the open exterior space.

[1028.17.3.1] 1029.19.3.1 Unenclosed [vertical exits] exit access stairways and ramps. [Vertical exits] Where permitted by Section 1019, exit access stairways or ramps leading directly from one safe area to another, or leading from a safe area directly to an open exterior space, need not be enclosed. Travel distance on such unenclosed exit access stairway or ramp shall be in accordance with the primary travel distance in Table 1029.7, and shall be measured in accordance with Section 1017.3.1.
[1028.17.3.2] **1029.19.3.2 Safe area lighting.** In addition to requirements of Section [1006] 1008, safe areas shall be artificially lighted by electrical means at all times during occupancy of a place of assembly so as to provide illumination of at least 5 [foot-candles] footcandles (54 lux) at the level of the floor and on the surface of all stairs, steps, ramps, and escalators within the safe area.

[1028.17.4] **1029.19.4 Open exterior space.** The following provisions shall apply when an open exterior space is used as an exit discharge:

1. **Capacity.** Open exterior spaces shall be adequate in width and area to accommodate the accumulated occupant load of all exits discharging into them on the basis of 2 square feet (0.19 m²) per person.

2. **Minimum dimensions.** The minimum dimension of open exterior spaces shall be 20 feet (6096 mm), except that when the principal entrance to the place of assembly is from an open exterior space, the minimum dimension of this space shall be 30 feet (9144 mm). No open exterior space shall have less than 400 square feet (37.2 m²) of floor area, and floor area shall be measured exclusive of the following:

   2.1. The area immediately outside any exit door from the place of assembly for a distance perpendicular to the exit doors of 10 feet (3048 mm) for the full width of the exit opening.

   2.2. The area of steps, platforms, stairs, or ramps within or leading to or from the space.

   2.3. The area of obstructions such as shrubs, trees, fixed furniture, signs, sculptures, pools, and similar obstructions to occupancy or exit travel.

3. **Above or below grade.** When an open exterior space is more than 15 feet (4572 mm) above or below the grade of the street or public space to which it discharges, its required area shall be increased by one-third.

4. **Egress from open exterior spaces.** Exterior exit passageways, ramps, or steps leading from open exterior spaces shall be not less in width than required for the occupant load of all exits discharging into the open exterior space. The width of such exit passageways shall be based on the capacities listed in Section [1006.4] 1005.1, but in no case less than 10 feet (3048 mm).

5. **Open exterior spaces.** Yards or courts [which] that serve as open exterior spaces shall be artificially lighted by electrical means at all times between sunset and sunrise during occupancy of a place of assembly so as to provide illumination of at least 5 [foot-candles] footcandles (54 lux) at the level of the floor over at least the required area.

**SECTION BC [1029] 1030 EMERGENCY ESCAPE AND RESCUE**

[1029.1] **1030.1 General.** In addition to the means of egress required by this chapter, provisions shall be made for emergency escape and rescue openings in Group [R and Group 1-1] R-2 occupancies that
are subject to Table 1006.3.2, and Group R-3 occupancies. Sleeping rooms below the fourth story above grade plane and below-grade stories shall have at least one exterior emergency escape and rescue opening in accordance with this section. Where below-grade stories contain one or more sleeping rooms, emergency escape and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of such below-grade story. Such openings shall open directly into a public way or to a yard or court that opens to a public way.

Exceptions:

1. Buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1 or 903.3.1.2.

2. Sleeping rooms provided with a door to a fire-resistance-rated corridor having access to two remote exits in opposite directions.

3. The emergency escape and rescue opening is permitted to open onto a balcony within an atrium in accordance with the requirements of Section 404, provided the balcony provides access to an exit and the dwelling unit or sleeping unit has a means of egress that is not open to the atrium.

4. High-rise buildings in accordance with Section 403.

5. Emergency escape and rescue openings are not required from below-grade stories or sleeping rooms that have an exit door or exit access door that opens directly into a public way or to a yard, court or exterior exit balcony that opens to a public way.

6. Below-grade stories without habitable spaces and having no more than 200 square feet (18.6 m²) in floor area shall not be required to have emergency escape openings.

[1029.2] 1030.2 Minimum size. Emergency escape and rescue openings shall have a minimum net clear opening of 6 square feet (0.56 m²).

Exception: The minimum net clear opening for grade-floor emergency escape and rescue openings shall be 5 square feet (0.46 m²) unless such opening is required for natural ventilation in accordance with Chapter 12.

[1029.2.1] 1030.2.1 Minimum dimensions. The minimum net clear opening height dimension shall be 30 inches (762 mm). The net clear opening width dimension shall not be less than 24 inches (610.6 mm). The final dimensions shall result in a net clear opening area as required above. The net clear opening dimensions shall be the result of normal operation of the opening.

[1029.3] 1030.3 Maximum height from floor. Emergency escape and rescue openings shall have the bottom of the clear opening not greater than 36 inches (914.4 mm) measured from the floor.

[1029.4] 1030.4 Operational constraints. Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools in accordance with the provisions of Chapter 10 of the New York City Fire Code.
**1030.5 Window wells.** An emergency escape and rescue opening with a finished sill height below the adjacent ground level shall be provided with a window well in accordance with Sections 1029.5.1 1030.5.1 and 1029.5.2 1030.5.2.

**1029.5.4 1030.5.1 Minimum size.** The minimum horizontal area of the window well shall be 9 square feet (0.84 m²), with a minimum dimension of 36 inches (914.4 mm). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.

**1029.5.2 1030.5.2 Ladders or steps.** Window wells with a vertical depth of more than 44 inches (1117.6 mm) shall be equipped with an approved permanently affixed ladder or steps. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76.2 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the window well. The ladder or steps shall not encroach into the required dimensions of the window well by more than 6 inches (152.4 mm). The ladder or steps shall not be obstructed by the emergency escape and rescue opening. Ladders or steps required by this section are exempt from the stairway requirements of Section 1009.1011.

**SECTION BC 1030 1031 SIGNAGE**

**1031.1 Signage.** Signage shall be provided in accordance with this section and the rules of the department.

**1031.2 Exit signs.** Exits signs shall be provided in accordance with Section 1011.1013.

**1031.3 Stairway and elevator identification signs.** Stairway floor number and stairway identification signs shall be provided in accordance with Section 1022.8 1023.9. Elevator identification and emergency signs shall be provided in accordance with Section 3002.3.

**1031.4 Door signs.** For the following buildings, signs shall be posted and maintained on exit stair doors in accordance with this section:

1. Buildings or portions thereof occupied by Group B or arranged to be occupied by more than 100 persons above or below the street level or more than 500 persons in the entire building.

2. High-rise buildings subject to Section 403.

3. Buildings where any stair side door is locked pursuant to Section 1008.1.9.10 1010.1.9.11.

**Exception:** Signs shall not be required on exit stair doors opening directly to dwelling or sleeping units in occupancy Group R where permitted by Section 1014.4 1016.3.

**1031.4.1 Occupied side.** Where reentry is not provided from a stair to every floor, a sign that reads, “NO REENTRY FROM THIS STAIR” shall be posted on the occupied side of the stair door at every floor.

**1031.4.2 Stair side.** On the stair side, signs shall be posted and maintained at all stair doors at every floor. Such signs shall be either:
1. **Reentry.** Where reentry is provided, a sign shall read, "REENTRY ON THIS FLOOR."

2. **No Reentry.** Where reentry is not provided on that floor, the sign shall read:

   2.1. “NO REENTRY”; where reentry is not provided on any floor;

   2.2. “NO REENTRY, NEAREST REENTRY ON THE AND FLOORS”; where reentry is provided on other floors; and

   2.3. “NO REENTRY. REENTRY IS PROVIDED ONLY DURING FIRE EMERGENCIES. NEAREST TELEPHONE ON THE AND FLOORS”; where stair side doors are locked in accordance with Section 403.5.3.

[1030.4.3] **1031.4.3 Graphics.** The lettering and numerals of the signs shall be at least 1/2 inch (12.7 mm) high of bold type. The lettering and background shall be contrasting colors and the signs shall be securely attached approximately 5 feet (1524 mm) above the floor. The signs may be either independent or combined with floor and stairway identification signs.

[1030.5] **1031.5 Wall signs, stair side.** In high-rise buildings subject to Section 403, signs shall be posted and maintained on the wall as follows:

   1. **Reentry.** Where a reentry door is recessed, a supplementary sign complying with Section [1030.4.3] 1031.4.3, except that the lettering and numerals shall be at least 1 inch (25.4 mm) high, shall be securely attached on the wall of the landing and shall be readily visible to the evacuee on the stairs indicating the location of such recessed reentry door.

   2. **No reentry.** Where there is no reentry from the stair, an additional sign complying with [Subdivision 2 of Sections 1030.4.2] Item 2 of Section 1031.4.2, and [1030.4.3] Section 1031.4.3, except that the lettering and numerals shall be at least 1 inch (25.4 mm) high, shall be securely attached at the beginning of the descent into such portion of the stair on the wall of the landing and shall be readily visible to the evacuee on the stairs.

[1030.6] **1031.6 Accessible means of egress signs.** Accessible means of egress shall be provided with signs in accordance with Section [1007.9] 1009.9.

[1030.7] **1031.7 Capacity sign.** Occupant load signs shall be provided in accordance with Section [1004.3] 1029.1.3.

[1030.8] **1031.8 Access-controlled doors.** Access-controlled doors shall be provided with signs in accordance with Section [1008.1.4.4] 1010.1.9.8.

[1030.9] **1031.9 Delayed egress locks.** Doors equipped with delayed egress shall be provided with signs in accordance with [Sections] Section [1008.1.9.7] 1010.1.9.7.

[1030.10] **1031.10 Signs in sleeping rooms.** A sign shall be posted on the inside of every door opening onto a corridor giving access to a sleeping room in all Group R-1 occupancies. The sign shall contain a diagram showing the location where it is posted and the location and letter identification of the exit stairs on the floor. The diagram shall indicate the number of doors opening onto the public corridor which must be passed to reach each exit stair. The sign shall be at least 8
inches by 10 inches (203.2 mm by 254 mm), located on the inside of the door and securely attached. The top of such sign shall not be more than 6 feet (1828.8 mm) from the floor level. Such sign shall contain such additional information as the Fire Department may require.

[1030.11] **1031.11 Luminous egress path markings.** Luminous egress path markings in high-rise buildings subject to Section 403.5.5 shall be provided in accordance with Section [4024] 1025 and Appendix S.

[1030.12] **1031.12 Materials for signs.** Signs required by this section shall be of metal or other durable material.

§ 12. Chapter 11 of the New York city building code, as amended by local law number 141 for the year 2013, item 3 of section 1109.2, as added by local law number 51 for the year 2014, section 1109.2.4 as amended by local law number 34 for the year 2018, item 4 of section 1110.2 as amended by local law number 79 for the year 2016 and item 7 of section 1110.3 as amended by local law number 122 for the year 2019, is amended to read as follows:

**CHAPTER 11**
**ACCESSIBILITY**

**SECTION BC 1101**
**GENERAL**

**1101.1 Scope.** The provisions of this chapter and Appendices E[f] and N [and P] shall control the design and construction of facilities for accessibility [to persons] for individuals with [physical] disabilities.

**1101.2 Design.** Buildings and facilities shall be designed and constructed to be accessible in accordance with [this code and] ICC A117.1 and this code.

**1101.3 Special provisions for prior code buildings.** The provisions of this chapter shall apply to alterations, including minor alterations but excluding ordinary repairs, and changes of use or occupancy to prior code buildings, portions of such buildings, and spaces within such buildings in accordance with [Section] Sections 1101.3.1 through 1101.3.5. Alterations within prior code buildings affecting an area containing a primary function shall comply with the requirements of Section 1101.4. This section shall not impose a requirement for greater accessibility than that which would be required for new construction, nor shall it reduce or have the effect of reducing accessibility.

**Exception:** The provisions of this chapter are not applicable to:

1. **[Ordinary repairs.]**

[2] **Group R-3 occupancies in buildings with first occupancy on or before March 13, 1991.**
2. Group R-3 occupancies in buildings with first occupancy after March 13, 1991, and originally constructed in a single structure with fewer than four dwelling or sleeping units.

**1101.3.1 Requirements based on change of occupancy or how a space is used.** Accessible features and construction governed by this chapter shall be provided:

1. To the entire building, as if the building were hereafter erected, where a change is made in the main use or dominant occupancy of such building.

2. Throughout a space, including the immediate entrance(s) thereto, where an alteration is made that is considered either: (i) a change in occupancy classification of such space in accordance with this code, or (ii) a change in the zoning use group of such space in accordance with the *New York City Zoning Resolution*.

**2.2. Entrance within 18 inches (457.2 mm) of the sidewalk.**

2.1. Where the floor elevation of a space is within 18 inches (457.2 mm) of the sidewalk, and the immediate entrance(s) to such space provides direct access to the sidewalk, such immediate entrance(s) shall be provided with an accessible route to the sidewalk. Where the immediate entrance(s) to such space are only through an adjacent space, such as a building lobby, such space shall be provided with an accessible route, through the adjacent space, to the sidewalk.

2.2. Where elevator service is provided in the building, an accessible route shall be required to a rooftop, where prior to a change in use or occupancy, such rooftop was not intended for general public or occupant use.

**3. To provide an accessible route to a space, including rooftops, where prior to a change in use of occupancy or in how such space is used, this chapter would not have required an accessible route for new construction.**

**1101.3.2 Requirements based on value of alterations.** Accessible features and construction governed by this chapter shall be provided:

1. To the entire building undergoing alterations, as if the building were hereafter erected, where the value of alterations exceeds 50 percent of the value of the existing building.

2. To the portion of the building being altered, to the extent of the alteration, including minor alterations but excluding ordinary repairs, where the value of the alteration does not exceed 50 percent of the value of the existing building.

2.1. Within buildings with first occupancies on or before March 13, 1991, bathrooms and powder rooms located in dwelling units in such portion being altered shall comply with this chapter or be permitted to comply with prototype layouts established by rule.

**1101.3.3 Directional accessibility signage.** Directional signage shall be provided in accordance with Section 1110.2 at or in close proximity to inaccessible building entrances,
inaccessible public toilets and bathing facilities, and elevators not serving an accessible route, indicating the route to the nearest like accessible element where such accessible element is provided, such that a person with disabilities will not be required to retrace the approach route from the inaccessible element.

1101.3.4 Identifying accessibility signage. Identifying accessibility signage shall be provided in accordance with Item [7] 5 of Section [1110.1] 1111.1 at accessible building entrances where not all entrances are accessible.

1101.3.5 Waiver of requirements. The commissioner may waive the requirements of this chapter for the alteration of existing prior code buildings, provided [however] that such waiver would not significantly adversely affect provisions for health, safety and security and that equally safe and proper alternatives are prescribed and, [further] that such waiver is based upon a specific finding that strict compliance with the requirement:

1. Would create an undue economic burden;
2. Would not achieve its intended objective;
3. Would be physically or legally impossible;
4. Would be unnecessary in light of alternatives which ensure the achievement of the intended objective or which, without a loss in the level of safety, achieve the intended objective more efficiently, effectively or economically; or
5. Would entail a change so slight as to produce a negligible additional benefit consonant with the purposes of this chapter.

1101.3.5.1 Application process. Each application for a waiver shall be made to the commissioner in writing, setting forth each requirement sought to be waived and the specific reason or reasons therefore. The commissioner shall determine, under all of the circumstances presented by such application, which of such requirements may appropriately be waived. The commissioner shall render such determination in a writing, which shall set forth in detail, the commissioner’s findings and conclusions with respect to each requirement sought to be waived. A copy of such written determination shall be forwarded to the applicant. Such written determination shall be filed with the department and shall be available for public inspection.

1101.3.5.2 Waiver recommendation. The Mayor’s Office for People with Disabilities or its successor agency shall be consulted by and shall advise the commissioner concerning each application for a waiver under Section 1101.3.5.

1101.4 Alterations affecting an area containing a primary function. Where an alteration affects the accessibility to, or contains an area of primary function, the route to the primary function area shall be accessible. The costs of providing the accessible route are not required to exceed 20 percent of the value of the alterations affecting the area of primary function. The accessible route to the primary function area shall include toilet facilities and drinking fountains serving the area of primary function.
Exceptions:

1. This provision does not apply to alterations limited solely to windows, hardware, operating controls, electrical outlets and signs.

2. This provision does not apply to alterations limited solely to mechanical systems, electrical systems, installation or alteration of fire protection systems and abatement of hazardous materials.

3. This provision does not apply to alterations undertaken for the primary purpose of increasing the accessibility of a facility.

4. This provision does not apply to altered areas limited within a Type B or Type B+NYC dwelling unit.
SECTION BC 1102
DEFINITIONS

1102.1 Definitions. The following [words and] terms [shall, for the purposes of this chapter, applicable appendices and as used elsewhere in this code, have the meanings shown herein] are defined in Chapter 2:

ACCESSIBLE. [A site, building, facility or portion thereof that complies with this chapter.]

ACCESSIBLE UNIT. [A dwelling unit or sleeping unit that complies with this code and the provisions for Accessible units in ICC A117.1.]

AREA OF SPORT ACTIVITY.

CIRCULATION PATH. [An exterior or interior way of passage from one place to another for pedestrian travel.]

COMMON USE. [Interior or exterior circulation paths, rooms, spaces or elements that are made available for the shared use of two or more people but are not for public use.]

_DETECTABLE WARNING. [A standardized surface feature built in or applied to walking surfaces or other elements to warn visually impaired persons of hazards on a circulation path.]

DWELLING UNIT (ACCESSIBILITY). [For the purposes of Chapter 11 and applicable appendices: A single unit providing complete, independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation.]

DWELLING UNIT OR SLEEPING UNIT, MULTI[-]STORY. [See “Multistory unit.”]

DWELLING UNIT OR SLEEPING UNIT, TYPE B. [See “Type B unit.”]

EMPLOYEE WORK AREA. [All or any portion of a space used only by employees and only for work. Corridors, toilet rooms, kitchenettes and break rooms are not employee work areas.]

FACILITY. [All or any portion of buildings, structure, site improvements, elements and pedestrian or vehicular routes located on a site.]

HALL CALL CONSOLE.

INTENDED TO BE OCCUPIED AS A RESIDENCE. [This refers to a dwelling unit or sleeping unit that can or will be used all or part of the time as the occupant’s place of abode.]

MULTILEVEL ASSEMBLY SEATING. [Seating that is arranged in distinct levels where each level is comprised of either multiple rows, or single row of box seats accessed from a separate level.]

MULTISTORY UNIT. [A dwelling unit or sleeping unit with habitable space located on more than one story.]

PRIMARY FUNCTION AREAS.
PUBLIC ENTRANCE.[An entrance that is not a service entrance.]

PUBLIC-USE AREAS.[Interior or exterior rooms or spaces that are made available to the general public.]

RESTRICTED ENTRANCE. [An entrance that is made available for public use but on a controlled basis, and that is not a service entrance.]

SELF-SERVICE STORAGE FACILITY. [Real property designed and used for the purpose of renting or leasing individual storage spaces to customers for the purpose of storing and removing personal property on a self-service basis.]

[SERVICES. Includes but is not limited to toilet rooms, drinking fountains, public telephones and food.]

SERVICE ENTRANCE. [An entrance solely for delivery of goods or services.]

SERVICES.

SITE. [A parcel of land bounded by a lot line or a designated portion of a public right-of-way.]

SLEEPING UNIT (ACCESSIBILITY). [For the purposes of Chapter 11 and applicable appendices: A room or space in which people sleep, which can also include permanent provisions for living, eating, and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a dwelling unit are not sleeping units.]

TYPE B UNIT. [A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code and the provisions for Type B units in ICC A117.1, consistent with the design and construction requirements of the federal Fair Housing Act.]

TYPE B+NYC UNIT. [A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code, Section 1004 (Type B Units) of ICC A117.1 as modified by Sections 1107.2.1 through 1107.2.8, and Appendix P of this code.]

[VALUE (OF EXISTING BUILDING OR SPACE).]

VALUE (OF ALTERATIONS, TO DETERMINE REQUIRED ACCESSIBILITY). [The value of alterations shall be determined by adding the estimated cost of the proposed alteration, including minor alterations but excluding ordinary repairs, computed as of the time of submitting the application for construction document approval, or, where no permit is required, computed at the time of the work, to the actual cost of any and all alterations and minor alterations made in the preceding 12-month period. Where the alteration includes an enlargement, the value of the alteration shall include the cost of the enlargement.]

VALUE (OF EXISTING BUILDING OR SPACE.

WHEELCHAIR SPACE.[A space for a single wheelchair and its occupant.]
SECTION BC 1103
SCOPING REQUIREMENTS

1103.1 Where required. Sites, buildings, structures, facilities, elements and spaces, temporary or permanent, shall be accessible to [persons] individuals with [physical] disabilities.

1103.2 General exceptions. Sites, buildings, structures, facilities, elements and spaces shall be exempt from this chapter to the extent specified in this section.

1103.2.1 Specific requirements. Accessibility is not required in buildings and facilities, or portions thereof, to the extent permitted by Sections 1104 through [1110].

1103.2.2 [Prior code buildings. Prior code buildings shall comply with Section 1101.3.3.]

1103.2.3 Employee work areas. All or any portion of a space used exclusively by employees and only for work shall be required to comply only with Section 1103.2.3. However, common use circulation paths, located within employee work areas shall also comply with Section 1104.3.1.

1103.2.3.1 Employee work areas [and work stations]. Spaces and elements within employee work areas shall only be required to comply with Sections [907.5.2.3.2] 907.5.2.3.1, [1007] 1009 and 1104.3.1, and shall be designed and constructed so that individuals with disabilities can approach, enter and exit the work area. In addition, at least one [and] but not less than five percent of fixed seating, tables, desks, and/or work stations surfaces, if provided, within employee work areas shall be located on an accessible route and comply with [applicable sections] and Section 902 (Dining Surfaces and Work Surfaces) of ICC A117.1. Work areas, or portions of work areas, other than raised courtroom stations in accordance with Section 1108.4.1.4, that are less than 300 square feet (27.8 m²) in area and located 7 inches (178 mm) or more above or below the ground or finished floor where the change in elevation is critical to the work operation shall be exempt from all requirements.

1103.2.3.2 Elevated employee work areas. Where the elevation is critical to the proper work operations, work areas or portions of work areas, other than raised courtroom stations, that are less than 300 square feet (30 m²) in area and elevated 7 inches (178 mm) or more above the ground or finished floor shall be exempt from all requirements.

1103.2.4 1103.2.3 Detached dwellings. Detached [one] one- and two-family dwellings [and], their accessory structures and their associated sites and facilities are not required to [be accessible] comply with this chapter.

1103.2.5 1103.2.4 Utility buildings. [Occupancies in] Group U [are exempt from the requirements of] occupancies are not required to comply with this chapter other than the following:

1. In agricultural buildings and livestock shelters, access is required to paved work areas and areas open to the general public.

2. Green houses and stables open to the public.
3. Private garages or carports that contain required accessible parking.

[1103.2.6] **1103.2.5 Construction sites.** Structures, sites and equipment directly associated with the actual processes of construction including, but not limited to, scaffolding, bridging, materials hoists, materials storage or construction trailers are not required to [be accessible] comply with this chapter.

[1103.2.7] **1103.2.6 Raised areas.** Raised areas used for purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands are not required to [be accessible or to be on an accessible route] comply with this chapter.

[1103.2.8] **1103.2.7 Limited access spaces.** Spaces accessed only by ladders, catwalks, crawl spaces, freight elevators that are not part of an accessible route, or very narrow passageways are not required to [be accessible] comply with this chapter.

**1103.2.8 Reserved.**

**1103.2.9 Equipment spaces.** Spaces frequented only by service personnel for maintenance, repair or occasional monitoring of equipment are not required to [be accessible] comply with this chapter. Such spaces include, but are not limited to, elevator pits, elevator penthouses, mechanical, electrical or communications equipment rooms, piping or equipment catwalks, water or sewerage treatment pump rooms and stations, electrical substations and transformer vaults, and highway and tunnel utility facilities.

**1103.2.10 Nongrade single occupant structures.** Single occupant structures that are accessed only by passageways below grade or above grade including, but not limited to, toll booths that are accessed only by bridges or underground tunnels, are not required to be accessible — Reserved.

**1103.2.11 Reserved.**

**1103.2.12 Reserved.**

**1103.2.13 Reserved.**

[1103.2.14] **Detention and correctional facilities.** In detention and correctional facilities, common use areas that are used only by inmates or detainees and security personnel, and that do not serve holding cells or housing cells required to be [accessible pursuant to Section 1107.5.5] Accessible units, are not required to [be accessible or to be on an accessible route] comply with this chapter.

[1103.2.15] **1103.2.14 Walk-in coolers and freezers.** Walk-in coolers and freezers intended for employee use only are not required to [be accessible] comply with this chapter.
SECTION BC 1104
ACCESSIBLE ROUTE

1104.1 Site arrival points. [Accessible routes] At least one accessible route within the site shall be provided from public transportation stops, accessible parking, accessible passenger loading zones, and public streets or sidewalks to the accessible building entrance served.

1104.2 Within a site. At least one accessible route shall connect accessible buildings, accessible facilities, accessible elements and accessible spaces that are on the same site and shall comply with Section 1104.5.

Exceptions:

1. An accessible route is not required between accessible buildings, accessible facilities, accessible elements and accessible spaces that have, as the only means of access between them, a vehicular way not providing for pedestrian access.

2. An accessible route to recreational facilities shall only be required to the extent specified in Section 1110.

1104.3 Connected spaces. When a building[1] or portion of a building[2] is required to be accessible, [an] at least one accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and to the public way.

Exceptions:

1. Stories and mezzanines exempted by Section 1104.4.

2. In a building, room or space used for assembly [areas] purposes with fixed seating, an accessible route shall not be required to serve levels where wheelchair spaces are not provided as permitted by other sections of this chapter.

[2. Accessible routes shall not be required where multiple levels are not required to be connected by an accessible route as permitted by Section 1104.4.]

3. [In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.] Vertical access to elevated employee work stations within a courtroom complying with Section 1108.4.1.4.

4. An accessible route to recreational facilities shall only be required to the extent specified in Section 1110.

1104.3.1 [Circulation paths within employee] Employee work areas. Common use circulation paths within employee work areas shall be accessible routes.

Exceptions: The following exceptions apply only to the common use circulation paths within an employee work area and are not intended to remove the requirement of Section [1103.2.3] 1103.2.2 that employee work areas be designed and constructed so that individuals with
disabilities can approach, enter and exit the employee work area.

1. Common use circulation paths, located within employee work areas that are less than 300 square feet (27.9 m²) in size and defined by permanently installed partitions, counters, casework or furnishings not serving accessible employee work stations that are required in Section 1103.2.3.1 shall not be required to be accessible routes.

2. Common use circulation paths, located within employee work areas, that are an integral component of equipment, shall not be required to be accessible routes.

**1104.3.2 Press boxes.** Press boxes in a building, room or space used for assembly purposes shall be on an accessible route.

**Exceptions:**

1. An accessible route shall not be required to press boxes in bleachers that have a single point of entry at only one level from the bleachers, provided that the aggregate area of all press boxes for each area of sport activity is not more than 500 square feet (46.5 m²) maximum.

2. An accessible route shall not be required to free-standing press boxes that are more than 12 feet (3657.6 mm) above grade provided that the aggregate area of all press boxes for each area of sport activity is not more than 500 square feet (46.5 m²) maximum.

**1104.4 Multilevel buildings and facilities.** At least one accessible route shall connect each accessible level, including mezzanines, and mezzanine in multilevel buildings and facilities.

**Exceptions:**

1. In nonresidential buildings, an accessible route is not required to levels and mezzanines above and below accessible levels where the aggregate area of all such levels and mezzanines that are not provided with accessible routes is not more than 2,500 square feet (232.3 m²). This exception shall not apply to:

   1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces where all such tenant spaces are located on the accessible levels;

   1.2. Levels or mezzanines containing offices of health care providers (Group B or I occupancies);

   1.3. Passenger transportation facilities and airports (Group A-3 or B occupancies); or

   1.4. Levels frequented by the public for assembly purposes other than levels where wheelchair spaces are not required to be provided as determined in accordance with Section 1108.2.4.[

   1.5. Levels frequented by the public for government, public utility or health facility
purposes.

2. Levels or mezzanines that do not contain accessible elements or other spaces as determined by [Sections] Section 1107 or 1108 are not required to be served by an accessible route from an accessible level.

3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.

[3.] 4. Where a two-story building or facility has one story or mezzanine with an occupant load of five or fewer persons that does not contain public use space, that story or mezzanine shall not be required to be connected by an accessible route to the story above or below.

[4. Vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.]

The exemption of a level from accessible route requirements pursuant to the exceptions set forth in this section shall not be construed to automatically exempt such level from other accessibility provisions of this chapter including but not limited to requirements for accessible doors, toilets and level floors and toilet rooms. Such other accessibility provisions remain applicable to such level unless specifically exempted by other sections of this code.

1104.5 Location. Accessible routes shall coincide with or be located in the same area as a general circulation path. Where the circulation path is interior, the accessible route shall also be interior. Where only one accessible route is provided, the accessible route shall not pass through kitchens, storage rooms, restrooms, closets or similar spaces.

Exception: A single accessible route is permitted to pass through a kitchen in an Accessible unit, Type B+NYC unit, or Type B unit.

1104.6 Security barriers. Security barriers including, but not limited to, security bollards and security check points shall not obstruct a required accessible route or accessible means of egress.

Exception: Where security barriers incorporate elements that cannot comply with these requirements, such as certain metal detectors, fluoroscopes or other similar devices, the accessible route shall be permitted to be provided adjacent to security screening devices. The accessible route shall permit individuals with disabilities passing around security barriers to maintain visual contact with their personal items to the same extent provided others passing through the security barrier.

SECTION BC 1105
ACCESSIBLE ENTRANCES

1105.1 Public entrances. In addition to accessible entrances required by Sections 1105.1.1 through 1105.1.8, all public entrances shall be accessible.
Exceptions:

1. An accessible entrance is not required to areas that are not required to be accessible by this chapter or Appendix E or this chapter.

2. Loading and service entrances that are not the only entrance to a building or a tenant space.

3. Revolving doors, revolving gates, or turnstiles shall not be required to be accessible provided that an accessible entrance is available adjacent to such revolving doors, revolving gates or turnstiles.

1105.1.1 Parking garage entrances. Where provided, direct access for pedestrians from parking structures to buildings or facility entrances shall be accessible.

1105.1.2 Entrances from tunnels or elevated walkways. Where direct access is provided for pedestrians from a pedestrian tunnel or elevated walkway to a building or facility, entrances from such access to the building or facility shall be accessible.

1105.1.3 Restricted entrances. Where restricted entrances are provided to a building or facility, all such restricted entrances to the building or facility shall be accessible.

1105.1.4 Entrances for inmates and detainees. Where entrances used only by inmates or detainees and security personnel are provided at judicial facilities, detention facilities or correctional facilities, all such entrances shall be accessible.

1105.1.5 Service entrances. If a service entrance is the only entrance to a building or a tenant space in a facility, that entrance shall be accessible.

1105.1.6 Tenant spaces. All entrances to tenant spaces that are required to be accessible shall be accessible entrances.

   Exception: An accessible entrance is not required to self-service storage units that are not required to be accessible.

1105.1.7 Dwelling units and sleeping units. Doors and doorways at entrance(s) to Accessible units and Type B+NYC units, including hardware, shall comply with Section 404 (Doors and Doorways) of ICC A117.1. Doors and doorways, including hardware, at entrance(s) to Type B units shall comply with Section 1003.5 (Doors and doorways) of ICC A117.1.

Exceptions:

1. An accessible entrance is not required to dwelling units and sleeping units that are not required to be Accessible units, Type B+NYC units, or Type B units.

2. Entrances to multistory dwelling or sleeping units in Group R-2 [occupancy] occupancies as provided in Section 1107.2.5 that are not on the primary entry story to the unit and are not part of the accessible route required in Exception 1 of Section 1107.2.5 shall not be required to be accessible.
[3. In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.]

1105.1.8 **Automatic doors.** In facilities with the occupancies and building occupant loads indicated in Table 1105.1.8, at least one accessible public entrance shall be either a full power-operated door or a low-energy power-operated door.

**Exception:** For ground floor business or mercantile occupancies which are not yet demised for tenancy, the requirements of this section shall not apply until the occupant load for the tenant or tenants has been determined.

**SECTION BC 1106**

**PARKING AND PASSENGER LOADING FACILITIES**

1106.1 **Required.** Where parking is provided, 5 percent of the total number of parking spaces provided for a facility, but not less than one parking space, shall be accessible parking spaces except as otherwise required by Sections 1106.2 through 1106.4 of this code. Van-accessible parking spaces shall be provided in accordance with Section 1106.5 of this code. Accessible parking spaces shall be designed and constructed in accordance with Section 502 (Parking Spaces) of ICC A117.1. Where more than one parking facility is provided on a site, the number of parking spaces required to be accessible shall be calculated separately for each parking facility. Where a determination of the minimum number of parking spaces results in a number containing a decimal of 0.5 or more, the next highest integer shall be used.

**Exception:** This section does not apply to parking spaces used exclusively for buses, trucks, other delivery vehicles, law enforcement vehicles or vehicular impound where lots accessed by the public are provided with an accessible passenger loading zone.

1106.2 **Groups R-2 and R-3.** Where parking is provided for occupancies in Groups R-2 and R-3, which are required to have Accessible, Type B+NYC, or Type B units, the number of accessible parking spaces shall be in compliance with Section 1106.1 and such number of accessible parking spaces shall be dispersed in accordance with Section 1106.6. Where parking is provided within or beneath a building, accessible parking spaces shall also be provided within or beneath the building.

1106.2.1 **Lease, rental, or assignment of spaces.** In a parking facility accessory to Occupancy Group R-2 or R-3 serving only the residents or employees of the management of such occupancy, or provided in compliance with Section 25-412 of the New York City Zoning Resolution, the accessible parking spaces in such facility may be leased, rented or assigned to [a person] an
individual without [physical] disabilities on a no longer than month-to-month basis. Such leases, rentals, or assignments of the accessible parking spaces to [persons] individuals without [physical] disabilities shall be on written condition that such spaces be relinquished immediately at the end of the term of such lease, rental, or assignment to a resident or employee of the management of such occupancy who is [a person] an individual with [physical] disabilities.

1106.3 Hospital outpatient facilities. At least 10 percent, but not less than one, of [patient] care recipient and visitor parking spaces provided to serve hospital outpatient facilities shall be accessible.

1106.4 Rehabilitation facilities and outpatient physical therapy facilities. At least 20 percent, but not less than one, of the portion of [patient] care recipient and visitor parking spaces serving rehabilitation facilities specializing in treating conditions that affect mobility and outpatient physical therapy facilities shall be accessible.

1106.5 Van spaces. For every six or fraction of six accessible parking spaces, at least one [space] shall be a van-accessible parking space. Van-accessible parking spaces shall be designed and constructed in accordance with ICC A117.1, including Section 502 (Parking Spaces).

Exception: In Group R-2 and R-3 occupancies, van-accessible spaces located within private garages not exceeding 300 square feet (27.9 m²) shall be permitted to have vehicular routes, entrances, parking spaces and access aisles with a minimum vertical clearance of 7 feet ([2134] 2133.6 mm).

1106.6 Location. Accessible parking spaces shall be located on the shortest accessible route of travel from adjacent parking to an accessible building entrance. In parking facilities that do not serve a particular building, accessible parking spaces shall be located on the shortest route to an accessible pedestrian entrance to the parking facility. Where buildings have multiple accessible entrances with adjacent parking, accessible parking spaces shall be dispersed and located near the accessible entrances. In Occupancy Groups R-2 and R-3, at least one of each type of parking space shall be accessible.

Exceptions:

1. In multilevel parking structures, van-accessible parking spaces complying with Section 502 (Parking Spaces) of ICC A117.1 may be provided on one level.

2. Accessible parking spaces shall be permitted to be located in different parking facilities if substantially equivalent or greater accessibility is provided in terms of distance from an accessible entrance or entrances, parking fee and user convenience.

3. In an attended parking facility in which vehicles customarily are parked and later returned to their drivers by an attendant employed by the parking facility, [accessible parking spaces need not be designated by a sign or lines if all of the following conditions are met:] the number of accessible parking spaces shall be provided in accordance with Table 1106.7.3 and Section 1106.7.3 of this code.

[3.1. Van accessible parking spaces complying with Section 502 (Parking Spaces) of ICC A117.1 are provided;]
[3.2. A passenger loading zone complying with Section 1106.7 is provided where an attendant shall take control of the vehicles. A vertical clearance of 98 inches (2489 mm) shall be permitted at such loading zone;]

[3.3. At least one accessible parking space shall remain available unless all accessible parking spaces are occupied;]

[3.4. The attendant shall park and retrieve all vehicles not equipped with special controls entering the facility in which a person with disabilities is either the driver or a passenger, provided accessible parking space is available;]

[3.5. The attendant shall direct the drivers of vehicles equipped with special controls to accessible parking spaces. The attendant shall accompany such drivers to and from such space along an accessible route when they enter and exit the facility. If necessary, the accessible route and accessible parking space shall be created by the repositioning of vehicles parked previously by the attendant; and]

[3.6. Each van accessible parking space shall have two permanently and prominently posted signs. One shall include the International Symbol of Accessibility complying with Section 703.6.3.1 of ICC A117.1. The other sign shall note that vehicles parked in such spaces are subject to being moved by an attendant of the parking facility in order to accommodate a vehicle which cannot be accommodated in another accessible parking space. Such signs shall not be obstructed by a vehicle parked in the space.]

4. Mechanical access parking garages shall comply with Section 1106.7.4 of this code.

1106.7 Passenger loading zones. Passenger loading zones shall be designed and constructed in accordance with ICC A117.1 including Section 503 (Passenger Loading Zones). [Where there are curbs between the access aisle and the vehicle pull-up space, a curb ramp complying with ICC A117.1 including Section 406 (Curb Ramps) shall be provided.]

1106.7.1 Continuous loading zones. Where passenger loading zones are provided, at least one accessible passenger loading zone shall be provided within each continuous 100 linear feet (30 400 mm) of loading zone space, or fraction thereof, so that travel between accessible passenger loading zones will not exceed 100 linear feet (30 400 m).

1106.7.2 Medical facilities. A passenger loading zone shall be provided at an accessible entrance to licensed medical and long-term care facilities where people receive physical or medical treatment or care and where the period of stay exceeds 24 hours.

1106.7.3 Valet and attended parking. The number of accessible parking spaces in facilities that utilize valet and attended parking services shall be provided in accordance with Table 1106.7.3, and Sections 1106.7.3.1 and 1106.7.3.2.

### 1106.7.3.1 Valet parking. In a facility utilizing valet parking services in which vehicles are parked and later returned to their drivers by a valet employed by the facility, the number of accessible parking spaces shall be provided in accordance with Table 1106.7.3 of this code. A passenger loading zone complying with Section 1106.7 of this code shall be provided at valet parking services where the valet shall take control of the vehicles. Passenger loading zones shall comply with Section 503 (Passenger Loading Zones) of ICC A117.1.

### 1106.7.3.2 Attended parking. In an attended parking facility in which vehicles customarily are parked and later returned to their drivers by an attendant employed by the parking facility, the number of accessible parking spaces shall be provided in accordance with Table 1106.7.3 of this code.

#### 1106.7.3.2.1 Passenger loading zone. A passenger loading zone complying with Section 1106.7 of this code shall be provided where an attendant shall take control of the vehicles. Passenger loading zones shall comply with Section 503 (Passenger Loading Zones) of ICC A117.1.

#### 1106.7.3.2.2 Retrieval of vehicles. The attendant shall park and retrieve all vehicles not equipped with special controls entering the facility in which an individual with
disabilities is either the driver or a passenger, provided accessible parking space is available.

1106.7.4 Mechanical access parking garages. Mechanical access parking garages shall provide at least one passenger loading zone in compliance with Section 1106.7 at vehicle drop-off and vehicle pick-up areas.

1106.8 Electrical vehicle charging stations. Electrical vehicle charging stations shall comply with Sections 1106.8.1 through 1106.8.5.

Exception: Electrical vehicle charging stations intended for use by a designated vehicle or driver shall not be required to comply with this section.

1106.8.1 Number of accessible vehicle charging stations. Where provided for common use, at least five percent of the total number of electrical vehicle charging stations per facility, but not less than one for each type of electric vehicle charging station, shall be accessible. Where a multiport electric vehicle charging station can simultaneously charge more than one vehicle, the number of electric vehicle charging stations shall be counted as the number of electric vehicles that can be simultaneously charged. The number of accessible vehicle charging stations are in addition to the required accessible parking spaces.

1106.8.2 Electric vehicle charging space. At each electrical vehicle charging station required to be accessible, the charging space shall comply with the requirements for a van accessible parking space complying with Sections 502.2 through 502.5 of ICC A117.1.

1106.8.3 Accessible route. At each electric vehicle charging station required to be accessible, the charging station shall be located along an accessible route. An accessible route shall be provided between the charging station and the charging space.

Exception: In existing facilities with no accessible route, electrical vehicle charging stations are not required to be located along an accessible route.

1106.8.4 Obstructions. Electric vehicle charging stations shall be designed so accessible routes are not obstructed by cables or other elements.

1106.8.5 Electrical vehicle charging station controls. Electric vehicle charging stations and electric vehicle charging station controls shall comply with Sections 309.2 and 309.3 of ICC A117.1.

SECTION BC 1107
DWELLING UNITS AND SLEEPING UNITS

1107.1 General. In addition to the other requirements of this chapter, occupancies having dwelling units or sleeping units shall be provided with accessible features in accordance with this section.

1107.2 Design. Dwelling units and sleeping units which are required to be Accessible units, Type B+NYC units, or Type B units shall comply with this code [including Appendix P where applicable] and the applicable provisions of Chapter 10 of ICC A117.1. [In addition] Type B+NYC units shall further comply with Section 1004 (Type B Units) of ICC A117.1, including any modifications made
by Sections 1107.2.1 through 1107.2.8 of this code. Units required to be Type B+NYC units or Type B units are permitted to be designed and constructed as Accessible units.

1107.2.1 Type B+NYC unit doors and doorways. Doors and doorways at the entrance(s) to Type B+NYC dwelling or sleeping units shall comply with Section 1105.1.6 1105.1.7 of this code. All other doors and doorways within the dwelling or sleeping unit, and patio or balcony doors of such dwelling or sleeping unit, meant for human passage shall comply with Section 1003.5 (Doors and Doorways) of ICC A117.1. [In addition, doors] Doors and doorways serving toilet and bathing rooms [that are required to comply with Appendix P shall also comply with Section P102.3.] shall comply with Section 1003.5 of ICC A117.1.

Exceptions:

1. Maneuvering clearance at doors.

   1.1. Where pull side, latch approach maneuvering clearance is required within the dwelling or sleeping unit for a door without a closer as per Figure 404.2.3.2(f) of ICC A117.1, the minimum maneuvering clearance perpendicular to the doorway shall be permitted to be reduced to 42 inches ([1067] 1066.8 mm).

   1.2. Where exterior spaces are greater than 24 inches (609.6 mm) in clear depth such spaces shall comply with the required door maneuvering clearances on both the interior and exterior side of the door.

2. Door hardware. Door hardware on doors within the dwelling or sleeping unit, except on entrance doors, shall not be required to comply with Section 404.2.6 (Door Hardware) of ICC A117.1 provided such hardware is readily replaceable without the removal or replacement of the door.

3. Future reversibility for bedroom doors. Bedroom doors and frames shall be permitted to be provided with mortised hinge and latch blanks to permit future reversal of the door on the same frame using common hand tools and without further alterations to the door and frame, provided such future swing of the door will not obstruct the maneuvering clearances required at the door or doorway.

4. Storage facility doors. Door maneuvering clearances are not required for doors that are accessed from the interior of a closet within a dwelling unit or sleeping unit.

5. Supplemental toilet and bathing rooms. Where one Type A toilet and bathing room is provided in a Type B+NYC unit in accordance with the exception in Section 1107.2.2 of this code, the doors and doorways to all other toilet and bathing rooms in that dwelling unit or sleeping unit shall not be required to comply with maneuvering clearances on the interior side of the bathroom, but shall comply with Section 1004.5.2 (User Passage Doorways) of ICC A117.1 and shall provide clear opening width of 32 inches ([813] 812.8 mm) minimum.

6. Bathroom and toilet room doors.
6.1. Doors shall not swing into the required clear floor or ground space or clearance for any fixture unless a clear floor or ground space complying with Section 305.3 of ICC A117.1 is provided within the room, beyond the arc of the door swing.

6.2. Bathroom and toilet room doors shall be provided with maneuvering clearances on the toilet room or bathroom side of the door in accordance with Section 404.2.3 of ICC A117.1.

1107.2.2 Type B+NYC unit toilet and bathing rooms. Where toilet and bathing rooms are provided in a Type B+NYC dwelling unit or sleeping unit, all such toilet and bathing rooms shall comply with Appendix P Sections 1107.2.2.1 through 1107.2.2.9. Within each such toilet room, at least one lavatory, and one water closet shall comply with Sections 1107.2.2.1 through 1107.2.2.7. Within each bathing room, at least one lavatory, one water closet, and either a bathtub or shower shall comply with Sections 1107.2.2.1 through 1107.2.2.8. Toilet and bathing fixtures shall be in a single room, such that travel between fixtures does not require travel beyond the room in which the fixtures of such toilet or bathing room is located. Additional fixtures shall comply with Section 1107.2.2.9.

Exception for Type A toilet and bathing room: Where at least one toilet and bathing room complying with Sections 1003.11 (Toilet and Bathing Facility) and 1003.3.2 (Turning Space) of ICC A117.1 is provided within a Type B+NYC dwelling unit or sleeping unit in accordance with Items 1 through 3 of this exception, other toilet and bathing rooms in the same unit shall be required to comply only with Sections 1004.3 (Accessible route), 1004.4 (Walking Surfaces), 1004.5.2 (User Passage Doorways), 1004.9 (Operable Parts) and 1004.11.1 (Grab Bar and Shower Seat Reinforcement) of ICC A117.1. In addition, a vertical grab bar 18 inches (457.2 mm) minimum in length shall be mounted with the bottom of the bar located between 39 inches (990.6 mm) and 41 inches (1041.4 mm) above the floor, and with the center of the bar located at 30 inches (762 mm) from the rear wall. Doors and doorways to such toilet and bathing rooms shall be subject to Section 1107.2.1, Exception 5.

1. Where at least one toilet and bathing room in the Type B+NYC dwelling unit or sleeping unit is constructed in accordance with the Type A toilet and bathing facilities requirements of Section 1003.11 (Toilet and Bathing Facilities), including Section 1003.3.2 (Turning Space), of ICC A117.1 and is in compliance with the following:

2. At least one lavatory, one water closet and either a bathtub or shower within such toilet or bathing facility shall comply with Section 1003.11 of ICC A117.1. Such toilet and bathing fixtures shall be in a single toilet or bathing area, such that travel between fixtures does not require travel beyond the area in which the fixtures of such toilet or bathing room are located.

3. Toilet paper dispensers within such rooms shall comply with Section 604.7 (Dispensers) of ICC A117.1.
1.3. Medicine cabinets, if provided, must include a storage shelf no higher than 44 inches (1117.6 mm) above the floor.

2. Where at least one toilet and bathing room complying with Sections 1003.11 and 1002.3.2 of ICC A117.1 is provided within the Type B+NYC dwelling unit or sleeping unit in accordance with Item 1 of this exception, other toilet and bathing rooms in the same unit shall be required to comply only with Sections 1004.3 (Accessible route), 1004.4 (Walking Surfaces), 1004.5.2 (User Passage Doorways), 1004.9 (Operable Parts) and 1004.11.1 (Grab Bar and Shower Seat Reinforcement) of ICC A117.1. Doors and doorways to such toilet and bathing rooms shall be subject to Section 1107.2.1, Exception 5.

1107.2.2.1 Accessible route. At least one accessible route shall connect all spaces and elements with each toilet and bathing room within a dwelling unit or sleeping unit unless as permitted in Section 1107.2.5, Item 3 of this code. Accessible routes shall comply with ICC A117.1.

1107.2.2.2 Operable parts. Lighting controls, electrical switches and receptacle outlets, and environmental controls shall comply with Section 309 of ICC A117.1.

1107.2.2.3 Knee and toe clearance. Clear floor space at fixtures shall be permitted to include knee and toe clearances complying with Section 306 of ICC A117.1.

1107.2.2.4 Overlap. Clear floor or ground spaces and clearances are permitted to overlap.

1107.2.2.5 Lavatory. Lavatories shall comply with Section 606 of ICC A117.1.

Exception: Cabinetry shall be permitted under the lavatory, provided:

1. Such cabinetry can be removed without removal or replacement of the lavatory;

2. The finish floor extends under such cabinetry; and

3. The walls behind and surrounding such cabinetry are finished.

1107.2.2.6 Mirrors and medicine cabinets. Mirrors above lavatories shall have the bottom edge of the reflecting surface 40 inches (1016 mm) maximum above the floor or ground. Medicine cabinets, if provided, must include a storage shelf no higher than 44 inches (1117.6 mm) above the floor.

1107.2.2.7 Water closet. Water closets shall comply with Sections 1107.2.2.7.1 through 1107.2.2.7.6.

1107.2.2.7.1 Location. The water closet shall be positioned with a wall to the rear and to one side. The centerline of the water closet shall be 18 inches (457.2 mm) from the side wall.

1107.2.2.7.2 Clearance. Clearance around the water closet shall comply with Sections 1107.2.2.7.2.1 through 1107.2.2.7.2.3.
1107.2.2.7.2.1 **Parallel approach.** Where only a parallel approach is provided to the water closet, the clearance shall be 56 inches (1422 mm) minimum, measured perpendicular from the rear wall, and 48 inches (1220 mm) minimum, measured perpendicular from the sidewall. A lavatory complying with Section 1107.2.2.5 shall be permitted on the rear wall, 18 inches (457.2 mm) minimum from the water closet centerline.

1107.2.2.7.2.2 **Forward approach.** Where only a forward approach is provided to the water closet, the clearance shall be 66 inches (1676 mm) minimum, measured perpendicular from the rear wall, and 48 inches (1220 mm) minimum, measured perpendicular from the side wall. A lavatory complying with Section 1107.2.2.5 shall be permitted on the rear wall, 18 inches (457.2 mm) minimum from the water closet centerline.

1107.2.2.7.2.3 **Parallel and forward approach.** Where both a parallel and a forward approach are provided to the water closet, the clearance shall be 56 inches (1422 mm) minimum, measured perpendicular from the rear wall, and 60 inches (1524 mm) minimum, measured perpendicular from the side wall. No fixtures or obstructions, other than the water closet, shall be within the clearance.

1107.2.2.7.3 **Grab bars.** Grab bars for water closets shall comply with Section 609 of ICC A117.1 and shall be provided in accordance with Sections 1107.2.2.7.3.1 through 1107.2.2.7.3.2 of this code. Mounting heights of grab bars shall comply with Section 609.4 of ICC A117.1.

**Exception:** Grab bars are not required to be installed where reinforcement for such grab bars is installed and located to permit future installation of grab bars complying with Section 1107.2.2.7.3 of this code.

**1107.2.2.7.3.1 Fixed side wall grab bars.** Fixed side wall grab bars shall be 42 inches (1066.8 mm) minimum in length, located 12 inches (304.8 mm) maximum from the rear wall and extending 54 inches (1371.6 mm) minimum from the rear wall. In addition, a vertical grab bar 18 inches (457.2 mm) minimum in length shall be mounted with the bottom of the bar located between 39 inches (990.6 mm) and 41 inches (1041.4 mm) above the floor, and with the center of the bar located at 30 inches (762 mm) from the rear wall.

**Exception:** Where a side wall is not available for a 42-inch (1066.8 mm) grab bar, the sidewall grab bar shall be permitted to be 24 inches (609.2 mm) minimum in length, located 12 inches (304.8 mm) maximum from the rear wall.
1107.2.2.7.3.2 Rear wall grab bars. The rear wall grab bar shall be 36 inches (914.4 mm) minimum in length, and extend from the centerline of the water closet 12 inches (304.8 mm) minimum on the side closet to the wall, and 24 inches (609.2 mm) minimum on the transfer side.

**Exception:** Where wall space will not permit a grab bar 36 inches (914.4 mm) minimum in length, reinforcement for a rear wall grab bar 24 inches (609.2 mm) minimum in length centered on the water closet shall be provided.

1107.2.2.7.4 Height. The top of the toilet seat shall be 15 inches (381 mm) minimum and 19 inches (482.6 mm) maximum above the floor or ground.

1107.2.2.7.5 Flush controls. Flush controls shall comply with Section 309 of ICC A117.1. Flush controls shall be located in accordance with one of the following:

1. On the open side of the water closet; or
2. Centrally located on the top of the tank or water closet; or
3. Centrally located on the water closet rear wall.

1107.2.2.7.6 Dispensers. Toilet paper dispensers shall comply with this section. The outlet of the dispenser shall be located within an area 24 inches (609.2 mm) minimum
and 42 inches (1066.8 mm) maximum from the rear wall. The outlet of the dispenser shall be located 18 inches (457.2 mm) minimum above the floor. Dispensers shall comply with Section 609.3 of ICC A117.1.

**FIGURE 1107.2.2.7.6**

**DISPENSER OUTLET LOCATION**

**1107.2.8 Bathing facilities.** Where provided, a bathtub shall comply with Section 1107.2.2.8.1, and a shower compartment shall comply with Section 1107.2.2.8.2.

**1107.2.2.8.1 Bathtubs.** Bathtubs shall comply with Section 607 of ICC A117.1. Lavatories complying with Section 1107.2.2.5 of this code shall be permitted in the clearance required by Section 607.2 of ICC A117.1. Bathtub seats shall not be required.

**Exception:** Where a hand shower in compliance with Section 607.6 of ICC A117.1 is not provided, the owner shall provide such a hand shower at the time an individual with disabilities takes occupancy of the unit, or within 10 days of the date the request is made by an individual with disabilities, whichever is later, at the owner’s expense.

**1107.2.2.8.1.1 Grab bars.** Grab bars for bathtubs shall comply with Section 609 of ICC A117.1 and shall be provided in accordance with Section 607.4 of ICC A117.1.

**Exception:** Grab bars are not required to be installed where reinforcement for such grab bars is installed and located to permit future installation of grab bars complying with Section 1107.2.2.8.1.1.

**1107.2.2.8.2 Showers.** Showers shall comply with Section 608 of ICC A117.1.
Exceptions:

1. For showers other than transfer-type showers, counter tops and cabinetry shall be permitted at the control end of the clearance, provided such counter tops and cabinetry can be removed and the floor finish extends under such cabinetry.

2. Where a hand shower in compliance with Section 608.5 of ICC A117.1 is not provided pursuant to the exception in such section, the owner shall provide such a hand shower at the time an individual with disabilities takes occupancy of the unit, or within 10 days of the date the request is made by an individual with disabilities, whichever is later, at the owner’s expense.

1107.2.8.2.1 Grab bars and seats. Grab bars and seats for showers shall comply with Sections 609 and 610 of ICC A117.1 and shall be provided in accordance with Sections 608.2.3.2 and 608.3 of ICC A117.1.

Exception: Grab bars and seats are not required to be installed where reinforcement for such grab bars and seats is installed and located to permit future installation of grab bars and seats complying with Section 1107.2.8.2.1 of this code.

1107.2.9 Additional fixtures. Additional fixtures provided within toilet and bathing rooms shall comply with Sections 1004.11.1 (Grab Bar and Shower Seat Reinforcement), 1004.11.3.1.1 (Lavatory), 1004.11.3.1.2 (Water Closet) and 1004.11.3.1.3 (Bathing Fixtures) of ICC A117.1.

1107.2.3 Type B+NYC unit kitchen and kitchenette. Where kitchens and kitchenettes are provided in a Type B+NYC dwelling unit or sleeping unit, the primary kitchen or kitchenette shall be constructed in accordance with the kitchen requirements of Section 1003.12 (Kitchen) and 1003.3.2 (Turning Space) of ICC A117.1, including any modifications made by Sections 1107.2.3.1 through 1107.2.3.5 of this code. Secondary kitchens and kitchenettes within the same dwelling unit or sleeping unit shall be required to comply only with Section 1004.12 (Kitchens) of ICC A117.1.

1107.2.3.1 Kitchen counters. A kitchen counter that is required to comply with Section 1003.12.3.2 or 1003.12.4.2 (Height) of ICC A117.1 shall be permitted to be adjustable or designed to be replaceable as a unit at variable heights between 29 inches and 36 inches (737 mm and 914 mm), measured from the floor to the top of the work surface. The owner shall adjust or replace such countertop at the time an individual with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by such individual, whichever is later, at the owner’s expense.

1107.2.3.2 Appliances in kitchen and kitchenette. Appliances in kitchens and kitchenettes shall comply with Section 1003.12.5 (Appliances) of ICC A117.1.

Exception: Where appliances’ controls are not in compliance with Section 309.3
(Height) of ICC A117.1, the owner shall replace such appliances with appliances in conformance with Section 309.3 of ICC A117.1 at the time [a person] an individual with [physical] disabilities takes occupancy of the unit, or within 10 days of the date the request is made by [a person with physical disabilities] such individual, whichever is later, at the owner’s expense. However, the owner shall not be responsible to provide a particular model or type of appliances provided such appliances and controls comply with Sections 1003.12.5 and 309.3 of ICC A117.1.

1107.2.3 Refrigerator/freezers. Combination refrigerators and freezers shall comply with Section 1003.12.5.6 (Refrigerator/Freezer) of ICC A117.1. In addition, where less than 100 percent of storage volume of the freezer is located within 54 inches ([4372] 1371.6 mm) maximum above the floor, such freezer shall be a self-defrosting type.

Exception: Where refrigerators and freezers are not in compliance with this section, the owner shall replace such appliances with complying appliances at the time [a person] an individual with [physical] disabilities takes occupancy of the unit, or within 10 days of the date the request is made by [a person with physical disabilities] such individual, whichever is later, at the owner’s expense. However, the owner shall not be responsible to provide a particular model or type of appliances provided such appliances comply with this section.

1107.2.3.4 Cooktops and ovens. Cooktops and ovens shall comply with [Section] Sections 1003.12.5.4 and 1003.12.5.5 of ICC A117.1, respectively. However, oven controls shall not be required to be located on either side of the oven door, provided such controls comply with Section 1003.12.5.5.4 of ICC A117.1. Where double ovens are provided, at least one oven interior and its controls shall comply with Section 309.3 (Height) of ICC A117.1.

1107.2.3.5 Kitchen and kitchenette storage. Kitchen storage, kitchen cabinets, drawers, and shelf storage areas, within kitchen and kitchenettes [that are required to] shall comply with Section [1003.12] 905 (Storage Facilities) of ICC A117.1 pursuant to Section 1107.2.3 of this code, except overhead cabinets[—shall comply with Section 905 (Storage Facilities) of ICC A117.1]. In addition, at least one storage shelf or cabinet, mounted above the work [counters] surface at 48 inches ([4249] 1220 mm) maximum above the floor, shall be provided.

Exception: Where the storage shelf or cabinet is not provided in accordance with this section, the owner shall install such storage shelf or cabinet in compliance with this section at the time [a person] an individual with [physical] disabilities takes occupancy of the unit, or within 10 days of the date the request is made by [a person with physical disabilities] such individual, whichever is later, at the owner’s expense.

1107.2.4 Type B+NYC unit operable windows. All operable windows required to provide natural ventilation and/or an emergency escape and rescue opening in rooms or spaces in [the] a Type B+NYC dwelling unit or sleeping unit shall comply with Section 1003.13 (Windows) of ICC A117.1.

Exceptions:
1. Where windows that are required to provide natural ventilation are not in compliance with reach ranges specified in Section 309.3 (Height) for operable parts as required by Section 1003.13.1 of ICC A117.1, the operable parts of such windows shall be designed to be operable by the use of adaptive devices. The owner shall provide such adaptive devices at the time [a person with an individual with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by [a person with physical disabilities] such individual, whichever is later, at the owner’s expense.

2. Compliance with Section 1107.2.4 of this code is not required in kitchenettes less than 80 square feet (7.4 m²) in area and equipped with an accessible mechanical means of ventilation complying with the New York City Mechanical Code, and in bathrooms equipped with an accessible mechanical means of ventilation complying with the New York City Mechanical Code.

**1107.2.5 Type B+NYC multistory units.** Multistory Type B+NYC dwelling units or sleeping units shall comply with the following:

1. One of the stories with an accessible entrance shall be designated as the primary entry story to the unit;

2. All rooms, spaces and doors on the primary entry story shall comply with Section 1107.2; and

3. Rooms, spaces or doors located on other than the primary entry story, and interior routes thereto, need not comply with Section 1107.2 where the primary entry story contains equivalent functional facilities. Functional facilities shall include cooking facilities, bathing facilities, laundry equipment, sleeping areas, living areas, dining areas, and outdoor areas such as balconies or terraces.

**Exception:** Functional facilities in compliance with Section 1107.2 need not be located on the primary entry story, but may be located on any story within the dwelling unit or sleeping unit, provided that all rooms, spaces and doors located on such story containing such functional facilities comply with Section 1107.2. Notwithstanding the above, at least one toilet room complying with Section 1107.2.2 shall be provided on the primary entry story. In addition, one of the following conditions shall be met:

1. An accessible external elevator is provided to connect all such stories of the multistory dwelling unit or sleeping unit; or

2. [A stairway complying with Section 504 (Stairways) of ICC A117.1 with a minimum clear width of 36 inches (914 mm) is provided within the multistory dwelling unit or sleeping unit to connect all such stories of the unit; or]

[3-]An accessible route complying with Section 402 (accessible routes) of ICC A117.1 is provided within the dwelling unit or sleeping unit to connect all such stories of the unit.
1107.2.6 Type B+NYC unit raised or sunken floor area. Where a raised or sunken floor area in a portion of a living, dining, or sleeping room within a Type B+NYC dwelling unit or sleeping unit that is permitted by Section 1004.3 (Accessible route, Exception 1 and 2) of ICC A117.1 is provided, steps complying with Section 504 (Stairways) of ICC A117.1 with a minimum clear width of 36 inches (914 mm) shall connect such portion of raised or sunken floor area to an accessible route. In addition, a minimum area of 80 square feet (7.4 m²), and 8 feet (2438 mm) in one dimension, of each of such living, dining, or sleeping room shall be connected by an accessible route that is in compliance with Section 1004.3.2 (Components) of ICC A117.1.

1107.2.7 Type B+NYC unit storage facilities. Where storage facilities are provided within the a Type B+NYC dwelling unit or sleeping unit, they shall comply with Section 905 (Storage Facilities) of ICC A117.1.

Exceptions:

1. A turning space shall not be required in storage facilities greater than 48 inches (12 mm) in depth in compliance with Section 1003.3.2 of ICC A117.1.

2. Where accessible storage elements are not in compliance with Section 905.3 of ICC A117.1, the owner shall relocate such elements to be in compliance with the section at the time an individual with a physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by an individual with physical disabilities, whichever is later, at the owner’s expense.

1107.2.8 Type B+NYC unit laundry equipment. Where washing machines or clothes dryers are provided within the a Type B+NYC dwelling unit or sleeping unit, such equipment shall comply with Section 611 (Washing Machines and Clothes Dryers) of ICC A117.1 and shall be front loading. Laundry equipment in accessible common-use areas as required in Section 1107.3 shall comply with Section E105.2 of Appendix E of this code.

Exception: At the option of the owner, laundry equipment conforming to this section within the dwelling unit or sleeping unit may be provided at the time an individual with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by an individual with physical disabilities, whichever is later, at the owner’s expense. However, the owner shall not be responsible to provide a particular model or type of equipment provided such equipment complies with this section.

1107.3 Accessible spaces. Rooms and spaces available to the general public or available for common use by residents and serving Accessible units, Type B+NYC units[,] or Type B units shall be accessible. Accessible spaces shall include, but not be limited to, spaces for residents’ use, such as laundry rooms, refuse disposal and storage locations, mailbox areas, recreational facilities, assembly and tenants’ meeting rooms, storage rooms, management offices, parking areas, toilet and bathing rooms, kitchen, living and dining areas[,] and any exterior spaces, including patios, terraces and balconies[,] management offices, and stores.

Exception: [In Group I-2 facilities, doors to sleeping units shall be exempted from the requirements for maneuvering clearance at the room side provided the door is a minimum of 44 inches (1118 mm) in width.] Stories and mezzanines exempted by Section 1107.4.
1107.3.1 Mailboxes. Except as otherwise provided by rules of the department for the purposes of complying with rules and regulations established by the United States Postal Service and/or the United States Department of Housing and Urban Development, where mailboxes are provided for each dwelling unit or sleeping unit in an interior location, 100 percent of such mailboxes shall comply with ICC A117.1, and the operable parts of such mailboxes shall be no higher than 48 inches ([1220] mm) above the finished floor.

1107.4 Accessible route. At least one accessible route shall connect accessible building or facility entrances with the required accessible entrance(s) of each Accessible unit, Type B+NYC unit, and Type B unit within the building or facility and with those exterior and interior spaces and facilities that serve the units.

[Exception] Exceptions:

1. Exterior spaces, including but not limited to roof terraces, exterior decks, patios or balconies that are part of Type B+NYC units or Type B units, that are not for public use or common use, that have impervious surfaces, and that are not more than 4 inches ([101.6] mm) below the finished floor level of the adjacent interior space of the unit. Such roof terraces, decks, patios or balconies shall be designed so that accessibility can be readily provided, without modifications to the guard rail heights and structural supports, by the installation of a noncombustible ramp in compliance with Section 405 (Ramps) of ICC A117.1, or a noncombustible level platform, with removable panel for access to floor drainage, that is permeable to weather and in compliance with Section 302 (Floor Surfaces) and Section 303 (Changes in Level) of ICC A117.1.

2. In Group I-3 facilities, an accessible route is not required to connect other levels or mezzanines where Accessible units, all common use areas serving Accessible units and all public use areas are on levels served by an accessible route.

3. In Group R-1 occupancies, an accessible route is not required to connect stories or mezzanines within individual units, provided the accessible level meets the provisions for Accessible units and sleeping accommodations for two persons minimum and a toilet facility are provided on that level.

4. An accessible route between stories is not required where Type B units are exempted by Section 1107.7.

1107.5 Group I. Accessible units shall be provided in Group I occupancies in accordance with Sections 1107.5.1 through [1107.5.6] 1107.5.5.

1107.5.1 Group I-1 [Accessible] Accessible units. [Group I-1 occupancies shall be provided with accessible features in accordance with Section 1107.5.1.1.] In Group I-1 occupancies, at least ten percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units. The remainder shall be Type B+NYC units with all grab bars installed where grab bar reinforcements are required.

Exceptions:
1. In Group I-1 occupancies classified as “convalescent facilities,” one hundred percent of the dwelling units or sleeping units shall be Accessible units.

2. In Group I-1 occupancies where the governmental agency that licenses, funds or approves such facilities documents that such facilities are not targeted for people with conditions that affect mobility, at least five percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units, and the remainder shall be Type B+NYC units. Conditions that affect mobility include conditions requiring the use or assistance of a brace, cane, crutch, prosthetic device, wheelchair, or powered mobility aid; arthritic, neurological, or orthopedic conditions that severely limit one’s ability to walk; respiratory diseases and other conditions which may require the use of portable oxygen; and cardiac conditions that impose significant functional limitations.

1107.5.2 Group I-2 [Nursing] nursing homes [Accessible units]. In nursing homes of Group I-2 occupancies 100 percent of the dwelling units and sleeping units shall be Accessible units.

1107.5.3 Group I-2 [Hospitals] hospitals. In general purpose hospitals, psychiatric facilities, detoxification facilities and residential care/assisted living facilities of Group I-2 occupancies, 100 percent of the dwelling units and sleeping units shall be Accessible units.

1107.5.3.1 Accessible unit entry doors. Entry doors to accessible dwelling units or sleeping units shall not be required to provide the maneuvering clearance beyond the latch side of the door.

1107.5.4 Group I-2 [Rehabilitation] rehabilitation facilities. In hospitals and rehabilitation facilities of Group I-2 occupancies, which specialize in treating conditions that affect mobility, or units within either which specialize in treating conditions that affect mobility, 100 percent of the dwelling units and sleeping units shall be Accessible units.

1107.5.4.1 Enriched assisted living residences [(EARL)] (EALR) and special needs assisted living residences [(SNARL)] (SNALR). In enriched assisted living residences [(EARL)] (EALR) and special needs assisted living residences [(SNARL)] (SNALR) licensed by the New York State Department of Health, at least ten percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units. The remainder shall be Type B+NYC units with all grab bars installed where grab bar reinforcements are required.

1107.5.5 Group I-3. Accessible units shall be provided in Group I-3 occupancies in accordance with Sections 1107.5.5.1 through 1107.5.5.3.

1107.5.5.1 Group I-3 sleeping units. In Group I-3 occupancies, at least two percent of the total number of sleeping units in the facility, but not less than one of the dwelling units and sleeping units in each classification level, shall be Accessible units.

1107.5.5.2 Special holding cells and special housing cells or rooms. In addition to the Accessible units required by Section 1107.5.5.1, where special holding cells or special housing cells or rooms are provided, at least one serving each purpose shall be an Accessible unit. Cells or rooms subject to this requirement include, but are not limited to, those used for
purposes of orientation, protective custody, administrative or disciplinary detention or segregation, detoxification and medical isolation.

**Exception:** Cells or rooms specially designed without protrusions and that are used solely for purposes of suicide prevention shall not be required to include grab bars.

**1107.5.5.3 Medical care facilities.** In addition to any medical isolation cells required by Section 1107.5.5.2 to be Accessible units, 100 percent of the patient sleeping units or cells in medical facilities of Group I-3 occupancies shall be Accessible units.

**1107.6 Group R.** Accessible units, Type B+NYC units and Type B units shall be provided in Group R occupancies in accordance with Sections 1107.6.1 through 1107.6.3.

**1107.6.1 Group R-1.** Accessible units, Type B+NYC units, and Type B units shall be provided in Group R-1 occupancies in accordance with Sections 1107.6.1.1 through 1107.6.1.3.

**Exception:** Boarding houses, dormitories, fraternity houses and sorority houses in Group R-1 occupancies shall comply with Section 1107.6.1.4.

**1107.6.1.1 Accessible units.** Accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1. Where buildings contain more than 50 dwelling units or sleeping units, the number of Accessible units shall be determined per building. Where buildings contain 50 or fewer dwelling units or sleeping units, all dwelling units and sleeping units in Group R-1 occupancies on a site shall be considered to determine the total number of Accessible units. Accessible units shall be dispersed among the various classes of units. Roll-in showers provided in Accessible units shall include a permanently mounted folding shower seat.

#### 1107.6.1.2 Type B+NYC units.
In structures with four or more dwelling units or sleeping units intended to be occupied as a residence, every dwelling unit and sleeping unit intended to be occupied as a residence and not required to be an Accessible unit shall be a Type B+NYC unit unless the number of Type B+NYC units is permitted to be reduced in accordance with Section 1107.7.4. Where no Type B+NYC units are required per Section 1107.7.4, all units not required to be Accessible units shall be Type B units.

**Exception:** The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

#### 1107.6.1.3 Doors and doorways.
In all units, including those not required to be Accessible units, Type B+NYC units, or Type B units, entrances, [7] doors, and doorways providing user passage into and within units shall comply with Section 404.2.2 (Clear Width) of ICC A117.1.

#### 1107.6.1.4 Boarding houses, dormitories, fraternity houses and sorority houses in Group R-1.
Accessible units and Type B+NYC units shall be provided in boarding houses, dormitories, fraternity houses and sorority houses in Group R-1 occupancies in accordance with Sections 1107.6.1.4.1 and 1107.6.1.4.2. Where the building or part thereof contains sleeping units where residents share bathroom or kitchen facilities, or both, bedrooms shall be counted as sleeping units for the purpose of determining the number of units. Where the sleeping units are grouped in suites, only one sleeping unit in each suite shall be permitted to count towards the number of required Accessible units.

#### 1107.6.1.4.1 Accessible units.
Accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1.

#### 1107.6.1.4.2 Type B+NYC units.
Every dwelling unit and every sleeping unit not required to be an Accessible unit shall be a Type B+NYC unit unless the number of Type
B+NYC units is permitted to be reduced in accordance with Section 1107.7.4. Where no Type B+NYC units are required in accordance with Section 1107.7.4, all units shall be Type B units.

**Exception:** The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

### 1107.6.2 Group R-2

Type B+NYC units and Type B units shall be provided in Group R-2 occupancies in accordance with Section 1107.6.2.1.

#### 1107.6.2.1 [Type B and] Type B+NYC units

Every dwelling unit and sleeping unit shall be a Type B+NYC unit.

**Exception:** The number of Type B+NYC units is permitted to be reduced in accordance with Section 1107.7.4.

#### 1107.6.2.2 Type B units

Where no Type B+NYC units are required in accordance with Section 1107.7.4, all units intended to be occupied as a residence shall be Type B units.

**[Exception] Exceptions:**

1. The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

2. Buildings containing fewer than four dwelling units or sleeping units need not provide Type B units.

### 1107.6.3 Group R-3

In Group R-3 occupancies where there are four or more dwelling units or sleeping units intended to be occupied as a residence in a single structure, every dwelling unit and sleeping unit intended to be occupied as a residence shall be a Type B unit.

**Exception:** The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

### 1107.7 General exceptions for Type B units

Where specifically permitted by Section 1107.6, the required number of Type B units is permitted to be reduced in accordance with Sections 1107.7.1 through 1107.7.3.

#### 1107.7.1 Structures without elevator service where Type B units are required

Where no elevator service is provided in a structure or required by other sections of this code, only the dwelling units and sleeping units that are located on stories indicated in Sections 1107.7.1.1 and 1107.7.1.2 are required to be Type B units.

1. **One story with Type B units required.** At least one story containing dwelling units or sleeping units intended to be occupied as a residence shall be provided with an accessible entrance and accessible route from the exterior of the structure and all units intended to be occupied as a residence on that story shall be Type B units.

2. **Other stories with Type B units required.** If other stories containing dwelling
units or sleeping units intended to be occupied as a residence are served by a building entrance that is in proximity to arrival points as indicated in Items 1 and 2, such building entrance shall be accessible and all dwelling units and sleeping units intended to be occupied as a residence served by that entrance on that story shall be Type B units.

1. Where the slopes of the undisturbed site measured between the planned entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less, and

2. Where the slopes of the planned finished grade measured between the entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less.

Where no such arrival points are within 50 feet (15 240 mm) of the entrance, the closest arrival point shall be used unless that arrival point serves the story required by Section 1107.7.1.1.

1107.7.2 Multistory units where Type B units are required. A multistory dwelling unit or sleeping unit which is not provided with elevator service is not required to be a Type B unit. Where a multistory unit is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type B unit and where provided within the unit, a living area, a kitchen and a toilet facility shall be provided on that floor.

1107.7.3 Elevator service to the lowest story with Type B units. Where elevator service in the building is provided for the sole purpose of complying with the provisions of Section 1107.7.1.1 to serve as provides an accessible route only to the lowest story containing dwelling units or sleeping units intended to be occupied as a residence, only the units on that story that are intended to be occupied as a residence on the lowest story served by the elevator are required to be Type B units.

1107.7.4 General exceptions for Type B+NYC units. Where specifically permitted by Sections 1107.5 and 1107.6, the required number of Type B+NYC units is permitted to be reduced in accordance with Section 1107.7.4.1.

1107.7.4.1 Buildings or structures without elevator service where Type B+NYC units are required. In buildings or structures where no elevator service is provided or required by other sections of this code, only the dwelling units and sleeping units that are located on stories indicated in Section 1107.7.4.1.1 are required to be Type B+NYC units.

1107.7.4.1.1 Units located in the cellar, basement, or first floor. In buildings or structures where the lowest story containing dwelling or sleeping units is the cellar, basement, or first floor, at least one such story containing dwelling or sleeping units, regardless of intent to occupy as a residence, shall be provided with an accessible entrance and accessible route from the exterior of the building or structure and all units on that story, regardless of intent to occupy as a residence, shall be Type B+NYC units. Where no dwelling units or sleeping units are located in the cellar, basement, or first floor, Type B units shall be provided where required by Section 1107.7.1 through 1107.7.3.
**Exceptions:**

1. Buildings containing fewer than four dwelling units or sleeping units need not provide Type B units.

2. Group R-2 occupancies in buildings with first occupancy on or before March 13, 1991 need not provide Type B units.

**SECTION BC 1108**

**SPECIAL OCCUPANCIES**

1108.1 **General.** In addition to the other requirements of this chapter and applicable provisions of Appendices E and N, the requirements of Sections 1108.2 through 1108.5 shall apply to specific occupancies.

1108.2 **Assembly area seating.** Assembly areas with seating shall comply with Sections 1108.2.1 through 1108.2.5. Lawn seating shall comply with Section 1108.2.6. Assistive listening systems shall comply with Section 1108.2.7. Performance areas viewed from assembly seating areas shall comply with Section 1108.2.8. Dining and drinking areas shall comply with Section 1108.2.9. [In addition, lawn seating shall comply with Section 1108.2.6.]

1108.2.1 **Services.** If a service or facility is provided in an area that is not required to be accessible in accordance with Section 1108.2.9, the same service or facility shall be provided on an accessible level and shall be accessible.

1108.2.2 **Wheelchair spaces.** In theaters, bleachers, grandstands, stadiums, arenas and other assembly areas, accessible wheelchair spaces, companion seats, and designated aisle seats complying with ICC A117.1, including Section 802 (Assembly Areas), shall be provided in accordance with Sections 1108.2.2.1 through 1108.2.2.4 of this code. Required accessible wheelchair spaces and their companion seats as required in Section 1108.2.5 shall be delineated on the approved seating plans. Such spaces and seats which are unsold 1 day (24 hours) before the event shall be permitted to be released for sale to the public, including individuals without physical disabilities.

1108.2.2.1 **General seating.** Wheelchair spaces shall be provided in accordance with Table 1108.2.2.1.

1108.2.2.2 Luxury boxes, club boxes and suites. In each luxury box, club box[,] and suite within arenas, stadiums and grandstands, wheelchair spaces shall be provided in accordance with Table 1108.2.2.1.

1108.2.2.3 Other boxes. In boxes other than those required to comply with Section 1108.2.2.2, the total number of wheelchair spaces provided shall be determined in accordance with Table 1108.2.2.1. Wheelchair spaces shall be located in not less than 20 percent of all boxes provided.

[1108.2.2.4 Team or player seating. At least one wheelchair space shall be provided in team or player seating areas serving areas of sport activity.]

[Exception: Wheelchair spaces shall not be required in team or player seating areas serving bowling lanes that are not required to be located on an accessible route in accordance with Section 1109.14.1.]

1108.2.3 Companion seats. At least one companion seat complying with ICC A117.1, including Section 802.7 (Companion Seat), shall be provided for each wheelchair space required by Sections 1108.2.2.1 through 1108.2.2.3 of this code.

1108.2.4 Dispersion of wheelchair spaces in multilevel assembly seating areas. In multilevel assembly seating areas, wheelchair spaces shall be provided on the main floor level and on one of each two additional floor or mezzanine levels. Wheelchair spaces shall be provided in each luxury box, club box and suite within assembly facilities.

Exceptions:

1. In multilevel assembly [spaces] seating areas utilized as place of religious worship where the second floor or mezzanine level contains 25 percent or less of the total seating capacity, wheelchair spaces shall be permitted to all be located on the main level.

2. In multilevel assembly seating areas where the second floor or mezzanine level provides 25 percent or less of the total seating capacity and 300 or fewer seats, all wheelchair spaces shall be permitted to be located on the main level.
3. Wheelchair spaces in team or player seating serving areas of sport activity are not required to be dispersed.

1108.2.5 Designed aisle seats. At least [five] 5 percent, but not less than one, of the total number of aisle seats provided shall be designated aisle seats[1] and shall be the aisle seats located closest to accessible routes, and shall comply with ICC A117.1, including Section 802.8 (Designated Aisle Seats).

Exception: Designed aisle seats are not required in team or player seating serving areas of sport activity.

1108.2.6 Lawn seating. Lawn seating areas and exterior overflow seating areas, where fixed seats are not provided, shall connect to an accessible route.

1108.2.7 Assistive listening systems. Each building, room or space used for assembly [area] purposes where audible communications are integral to the use of the space, regardless of the occupancy load of such space, shall have an assistive listening system in compliance with ICC A117.1, including Section 706 (Assistive Listening Systems) and Appendix N of this code.

Exception: Other than in courtrooms, an assistive listening system is not required where there is no audio amplification system.

1108.2.7.1 Receivers.[Receivers] The number and type of receivers shall be provided for assistive listening systems in accordance with Table 1108.2.7.1 of this code[All receivers shall be hearing-aid compatible].

Exceptions:

1. Where a building contains more than one room or space used for assembly [area] purposes, the total number of required receivers shall be permitted to be calculated [according to] based on the total number of seats in the [assembly areas in the] building, provided that all receivers are usable with all systems[1] and if the rooms or spaces used for assembly [areas] purposes required to provide assistive listening are under one management.

2. Where all seats in [an] a building, room or space used for assembly [area] purposes are served by an induction loop assistive listening system, the minimum number of receivers required by Table 1108.2.7.1 of this code to be hearing-aid compatible shall not be required.

NOTE: * = or fraction thereof

1108.2.7.2 **Ticket windows.** Where ticket windows are provided, at least one window at each location shall have an assistive listening system.

1108.2.7.3 **Public address systems.** Where stadiums, arenas and grandstands provide audible public announcements, they shall also provide equivalent text information regarding events and facilities in compliance with Sections [1108.2.7.2.1] 1108.2.7.3.1 and [1108.2.7.2.2] 1108.2.7.3.2.

[1108.2.7.2.1] 1108.2.7.3.1 **Prerecorded text messages.** Where electronic signs are provided and have the capability to display prerecorded text messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.

**Exception:** Announcements that cannot be prerecorded in advance of the event shall not be required to be displayed.

[1108.2.7.2.2] 1108.2.7.3.2 **Real-time messages.** Where electronic signs are provided and have the capability to display real-time messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.

1108.2.8 **Performance areas.** An accessible route shall directly connect the performance area to the assembly seating area where a circulation path directly connects a performance area to an assembly seating area. An accessible route shall be provided from performance areas to ancillary areas or facilities used by performers.

1108.2.9 **Dining and drinking areas.** In dining and drinking areas, [the total] all interior and exterior floor [area allotted for seating and tables] areas shall be accessible and be on an accessible route.

**Exceptions:**

1. **In buildings or facilities not required to provide an** An accessible route between accessible levels [as described] and stories above or below is not required where permitted by Section 1104.4, Exception 1 [an].

2. **An accessible route to dining and drinking areas in a mezzanine seating area** is not required, provided that the mezzanine contains less than [33] 25 percent of the total.
combined area for dining and drinking and the same services, and decor are provided in the accessible area.

2. 3. In sports facilities, tiered dining areas providing seating required to be accessible shall be required to have accessible routes serving at least 25 percent of the dining area, provided that accessible routes serve accessible seating and where each tier is provided with the same services and similar view.

4. Employee-only work areas shall comply with Sections 1103.2.2 and 1104.3.1.

1108.2.9.1 Dining surfaces. Where dining surfaces for the consumption of food or drink are provided, at least 10 percent of the total number of seating and standing spaces, but not less than one, of each type of dining surfaces shall be accessible and be distributed throughout the facility and located on a level accessed by an accessible route.

[Exception: Where food or drink is served at counters exceeding 34 inches (864 mm) in height, such dining surfaces shall not be required to comply with Section 1108.2.9.1 provided equivalent service is available at accessible tables or counters that are in compliance with Section 902 (Dining Surfaces and Work Surfaces) of ICC A117.1 within the same dining area.]

1108.2.9.2 Dining and drinking counters. Where seating is provided at dining or drinking counters, at least one 60 inch (1524 mm) long portion of the counter shall be provided with two accessible seating spaces. Such accessible seating space shall comply with Section 902 (Dining Surfaces and Work Surfaces) of ICC A117.1, and shall not be located within 40 inches (1016 mm) of either end of the counter, so as to provide individuals with disabilities with the same level of service and experience as those provided to others.

Exceptions:

1. Where the linear length of counter is 12 feet (3657.6 mm) or less, one accessible seating space shall be provided, at least 30 inches (762 mm) long, for each accessible seating space required by Section 1108.2.9.1 of this code. Such accessible seating space may be located anywhere along the counter.

2. In Group R-2 occupancies, one accessible seating space shall be provided, at least 30 inches (762 mm) long, for each accessible seating space required by Section 1108.2.9.1 of this code.

1108.3 Self-service storage facilities. Self-service storage facilities shall provide accessible individual self-storage spaces in compliance with Section 1104 of this code and ICC A117.1, including Section 905 (Storage Facilities). The number of required self-storage spaces shall be in accordance with Table 1108.3 of this code.

</tr>
</tbody>
</table>

**1108.3.1 Dispersion.** Accessible individual self-service storage spaces shall be dispersed throughout the various classes of spaces provided. Where more classes of spaces are provided than the number of required accessible spaces, the number of accessible spaces shall not be required to exceed that required by Table 1108.3. Accessible spaces are permitted to be dispersed in a single building of a multibuilding facility.

**1108.4 Judicial facilities.** Judicial facilities shall comply with Sections 1108.4.1 [through 1108.4.3] and 1108.4.2 of this code.

**1108.4.1 Courtrooms.** Each courtroom shall be accessible and comply with ICC A117.1, including Section 807 (Courtrooms), and Sections 1108.4.1.1 through 1108.4.1.5 of this code.

**1108.4.1.1 Jury box.** A wheelchair space complying with ICC A117.1 shall be provided within the jury box.

**Exception:** Adjacent companion seating is not required.

**1108.4.1.2 Gallery seating.** Wheelchair spaces complying with ICC A117.1 shall be provided in accordance with Table 1108.2.2.1 of this code. Designated aisle seats shall be provided in accordance with Section 1108.2.5 of this code.

**1108.4.1.3 Assistive listening systems.** An assistive listening system must be provided. Receivers shall be provided for the assistive listening system in accordance with Section 1108.2.7.1 of this code.

**1108.4.1.4 Employee work stations.** The judge’s bench, clerk’s station, bailiff’s station, deputy clerk’s station and court reporter’s station shall be located on an accessible route. The vertical access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

**1108.4.1.5 Other work stations.** The litigant’s and counsel stations, including the lectern, shall be accessible in accordance with ICC A117.1.

**1108.4.2 Holding cells.** Central holding cells and court-floor holding cells shall comply with Sections 1108.4.2.1 and 1108.4.2.2.

**1108.4.2.1 Central holding cells.** Where separate central holding cells are provided for adult males, juvenile males, adult females or juvenile females, one of each type shall be accessible. Where central holding cells are provided and are not separated by age or [sex] gender, at least one accessible cell shall be provided.
1108.4.2.2 Court-floor holding cells. Where separate court-floor holding cells are provided for adult males, juvenile males, adult females or juvenile females, each courtroom shall be served by one accessible cell of each type. Where court-floor holding cells are provided and are not separated by age or sex, courtrooms shall be served by at least one accessible cell. Accessible cells shall be permitted to serve more than one courtroom.

[1108.4.3 Visiting areas. Visiting areas shall comply with Sections 1108.4.3.1 and 1108.4.3.2.]

[1108.4.3.1 Cubicles and counters. At least 5 percent, but not fewer than one, of the cubicles shall be accessible on both the visitor and detainee sides. Where counters are provided, at least one shall be accessible on both the visitor and detainee sides.]  

[Exception: This requirement shall not apply to the detainee side of cubicles or counters at noncontact visiting areas not serving accessible holding cells.]

[1108.4.3.2 Partitions. Where solid partitions or security glazing separate visitors from detainees, at least one of each type of cubicle or counter partition shall be accessible.]

1108.5 Assembly areas without seating. Assembly areas without seating shall comply with Section 1108.2.7.

SECTION BC 1109
OTHER FEATURES AND FACILITIES

1109.1 General. Accessible building features and facilities shall be provided in accordance with Sections 1109.2 through [1109.16] 1109.15 of this code.

Exception: Type B+NYC and Type B units shall comply with Section 1107 of this code and ICC A117.1.

1109.2 Toilet and bathing rooms. Each toilet room and bathing room shall be accessible. Where a floor level is not required to be connected by an accessible route, the only toilet rooms or bathing rooms provided within the facility shall not be located on the inaccessible floor. Except as provided for in Sections 1109.2.2 and 1109.2.3 of this code, at least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing room shall be accessible.

Exceptions:

1. In nonresidential occupancies, for toilet rooms or bathing rooms accessed only through a private office, not for common or public use, and intended for use by a single occupant of such private office, any of the following alternatives are allowed:
   1.1. Doors are permitted to swing into the clear floor space provided the door swing can be reversed to meet the requirements in Section 603.2.2 (Door Swing) of ICC A117.1; [and]
   1.2. The height requirements for the water closet in Section 604.4 (Height) of ICC A117.1 are not applicable; [and]
   1.3. Grab bars are not required to be installed in a toilet room, provided that the reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
1.4. The requirement for height, knee and toe clearance shall not apply to a lavatory.

2. This section is not applicable to dwelling units, sleeping units and patient toilet and bathing rooms that are not required to be accessible by Section 1107 of this code.

3. Where multiple single-user toilet rooms or bathing rooms are clustered to be within sight of, or adjacent to one another at a single location, at least 50 percent, but not less than one room for each use at each cluster, shall be accessible. In Group R-2 occupancies, where multiple single-user toilet rooms or bathing rooms are clustered, all such rooms must comply with the design and construction requirements of the Fair Housing Act.

4. [Where] In other than Group R-2 occupancies, where no more than one urinal is provided in a toilet room or bathing room, the urinal is not required to be accessible.

5. Toilet rooms or bathing rooms that are part of [critical care] critical care or intensive care patient sleeping rooms serving Accessible units are not required to be accessible.

6. Toilet rooms or bathing rooms designed for bariatrics patients are not required to comply with the toilet room and bathing room requirements in ICC A117.1. The sleeping units served by bariatics toilet or bathing rooms shall not count toward the required number of Accessible sleeping units.

7. Where toilet facilities are primarily for children’s use, required accessible water closets, toilet compartments and lavatories shall be permitted to comply with children’s provision of ICC A117.1.

8. Where multiple single user portable toilet or bathing units are clustered at a single location, [not less than 5] at least 5 percent, but not less than one of the toilet units and bathing units at each cluster shall be accessible. Accessible portable toilet units and bathing units shall be identified by the [International Symbol of Accessibility] dynamic accessibility symbol complying with Section 1110.1 of this code.

1109.2.1 Family or assisted-use toilet and bathing rooms. In assembly and mercantile occupancies, an accessible family or assisted-use toilet room shall be provided where an aggregate of six or more male and female water closets is required. In buildings of mixed occupancy, only those water closets required for the assembly or mercantile occupancy shall be used to determine the family or assisted-use toilet room requirement. In recreational facilities where separate-sex bathing rooms are provided, an accessible family or assisted-use bathing room shall be provided. Fixtures located within family or assisted-use toilet and bathing rooms required by this section are permitted to be included in the number of fixtures required by the [New York City Plumbing Code] New York City Plumbing Code for either the male or female occupants.

Exception: Where each separate-sex bathing room has only one shower or bathtub fixture, a family or assisted-use bathing room is not required.

1109.2.1.1 Standard. Family or assisted-use toilet and bathing rooms shall comply with Sections 1109.2.1.2 through 1109.2.1.7 of ICC A117.1 of this code.

1109.2.1.2 Family or assisted-use toilet rooms. Family or assisted-use toilet rooms shall include only one water closet and only one lavatory. A family or assisted-use bathing room in accordance with Section 1109.2.1.3 shall be considered a family or assisted-use toilet room.
Exception: A urinal is permitted to be provided in addition to the water closet in a family or assisted-use toilet room.

1109.2.1.3 Family or assisted-use bathing rooms. Family or assisted-use bathing rooms shall include only one shower or bathtub fixture. Family or assisted-use bathing rooms shall also include one water closet and one lavatory. Where storage facilities are provided for separate-sex bathing rooms, accessible storage facilities complying with Section 1109.9 shall be provided for family or assisted-use bathing rooms.

1109.2.1.4 Location. Family or assisted-use toilet and bathing rooms shall be located on an accessible route. Family or assisted-use toilet rooms shall be located not more than one story above or below separate-sex toilet rooms. The accessible route from any separate-sex toilet room to a family or assisted-use toilet room shall not exceed 500 feet (152 m).

1109.2.1.5 Prohibited location. In passenger transportation facilities and airports, the accessible route from separate-sex toilet rooms to a family or assisted-use toilet room shall not pass through security checkpoints.

1109.2.1.6 Clear floor space. Where doors swing into a family or assisted-use toilet or bathing room, a clear floor space not less than 30 inches by 48 inches (762 mm by 1219 mm) shall be provided, within the room, beyond the area of the door swing.

1109.2.1.7 Privacy. Doors to family or assisted-use toilet and bathing rooms shall be securable from within the room.

1109.2.2 Water closet compartment. Where water closet compartments are provided in a toilet room or bathing room, at least one wheelchair accessible compartment shall be provided, but not less than one of the total number of compartments shall be wheelchair accessible. Where the combined total water closet compartments and urinals provided in a toilet room or bathing room is six or more, at least one ambulatory accessible water closet compartment shall be provided, but not less than one of the total number of compartments shall be ambulatory accessible, provided in addition to the wheelchair-accessible compartment. Wheelchair-accessible and ambulatory-accessible compartments shall comply with ICC A117.1 including Sections 604.9 (Wheelchair Accessible Compartments) and 604.10 (Ambulatory Accessible Compartments).

1109.2.3 Lavatories. Where lavatories are provided, at least 5 percent, but not less than one, shall be accessible. Where an accessible lavatory is located within the accessible water closet compartment, at least one additional accessible lavatory shall be provided in the multicompartiment toilet room outside the accessible water closet compartment. Where the total lavatories provided in a toilet room or bathing room facility is six or more, at least one lavatory with enhanced reach ranges [in accordance with ICC A117.1] shall be provided.

1109.2.4 Diaper changing accommodations. In assembly [group A] occupancies and mercantile [group M] occupancies on each floor level containing a public toilet room, both male and female occupants shall have access to at least one safe, sanitary and convenient diaper changing station, deck, table or similar amenity, which shall comply with Section 603.5 (Diaper Changing Tables) of ICC A117.1.

1109.3 Sinks. Where sinks are provided, at least five percent, but not less than one, provided in accessible spaces shall comply with ICC A117.1, including Section 606 (Lavatories and Sinks).
**Exception:** Mop or service sinks are not required to be accessible.

**1109.4 Kitchens, kitchenettes and wet bars.** Where kitchen, kitchenettes and wet bars not located within dwelling or sleeping units, are provided in accessible spaces or rooms, they shall be accessible in accordance with ICC A117.1 including Section 804 (Kitchens and Kitchenettes), and Section 1109.9 of this code for storage.

**1109.5 Drinking fountains.** Where drinking fountains are provided on an exterior site, on a floor or within a secured area, the drinking fountains shall be provided in accordance with Sections 1109.5.1 and 1109.5.2.[-]

**1109.5.1 Minimum number.** No fewer than two drinking fountains shall be provided. One drinking fountain shall comply with the requirements for people who use a wheelchair and one drinking fountain shall comply with the requirements for standing persons.

**[Exception] Exceptions:**

1. A single drinking fountain with two separate spouts that complies with the requirements for people who use a wheelchair and standing persons shall be permitted to be substituted for two separate drinking fountains.

2. Where drinking fountains are primarily for children’s use, drinking fountains for people using wheelchairs shall be permitted to comply with the children’s provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

**1109.5.2 More than the minimum number.** Where more than the minimum number of drinking fountains specified in Section 1109.5.1 [are] is provided, 50 percent of the total number of drinking fountains provided shall comply with the requirements for persons who use a wheelchair and 50 percent of the total number of drinking fountains provided shall comply with the requirements for standing persons.

**[Exception] Exceptions:**

1. Where 50 percent of the drinking fountains yields a fraction, 50 percent shall be permitted to be rounded up or down, provided that the total number of drinking fountains complying with this section equals 100 percent of the drinking fountains.

2. Where drinking fountains are primarily for children’s use, drinking fountains for people using wheelchairs shall be permitted to comply with the children’s provisions in ICC A117.1 and drinking fountains for standing children shall be permitted to provide the spout at 30 inches (762 mm) minimum above the floor.

**1109.5.3 Container faucets.** Where a separate faucet designed for filling a container is provided at the drinking fountain pursuant to Section 410.1 of the New York City Plumbing Code, such container faucet shall comply with Section 606.4 of ICC A117.1.

**1109.6 Saunas and steam rooms.** Where provided, saunas and steam rooms shall be accessible. Such saunas and steam rooms shall comply with Section 612 of ICC A117.1.
**Exception:** Where saunas or steam rooms are clustered at a single location, at least 5 percent of the saunas and steam rooms, but not less than one, of each type in each cluster shall be accessible.

**1109.7 Elevators.** All passenger elevators on an accessible route shall be accessible and comply with [3004.3] ICC A117.1 and Chapter 30 of this code.

**Exception:** Section 407.4.6.2.2 (Arrangement) of ICC A117.1 shall not apply.

**[1109.6.1] 1109.7.1 Limited-Use/Limited-Application (LULA) elevators.** LULA elevators shall comply with Section 408 (Limited-Use/Limited-Application Elevators) of ICC A117.1 and with Part [XXV] 5.2 of ASME A17.1 as modified by Appendix K of this code, and shall be limited to a maximum rise of not more than 25 feet (7620 mm) and serving not more than three contiguous levels. In new construction, such LULA elevators shall be permitted:

1. To be a part of the required accessible route where either a wheelchair lift complying with Section 1109.7 is permitted or a private residence elevator complying with Section 409 (Private Residence Elevators) of ICC A117.1 is permitted;

2. To be part of the required accessible route in places of religious services; or

3. In multilevel buildings and facilities not required to have an accessible route pursuant to the exceptions in Section 1104.4.

**[1109.6.1.4] 1109.7.1.1 Prior code buildings.** In prior code buildings, LULA elevators shall comply with Section 408 (Limited-use/Limited-Application Elevators) of ICC A117.1 and with Part 5.2 of ASME A17.1 as modified by Appendix K of this code. LULA elevators shall be limited to a maximum rise of not more than 25 feet (7620 mm) and shall be permitted to be a part of the required accessible route where the total floor area of the entire building is less than 10,000 square feet (929 m²) provided such LULA elevator is limited to a maximum rise of not more than 25 feet, serves not more than three contiguous levels, and elevators are not otherwise required by Chapter 30, as follows:

1. In spaces complying with Section 1109.7.1 of this code where a LULA is permitted in new construction;

2. Where the total floor area of the entire building is less than 10,000 square feet (929 m²); or

3. Where it serves an individual occupancy of less than 10,000 square feet (929 m²) in buildings of 10,000 square feet (929 m²) or more.

**1109.7.2 Destination–oriented elevators.** Where destination-oriented elevators are provided, hall call consoles shall comply with Sections 1109.7.2.1 through 1109.7.2.3. Responding elevator cars shall comply with Section 1109.7.2.5.

**1109.7.2.1 Hall call console number and location.** Hall call consoles shall be located and provided in a number complying with Section 1109.7.2.1.1 or 1109.7.2.1.2, as applicable. Where provided, hall call consoles shall be located on accessible routes connecting to the elevator landings they serve.

**Exception:** Where hall call consoles are an integral part of security barriers, at least one console for each type of use at each distinct location shall be located on an accessible route.
1109.7.2.1.1 Transfer floors, sky lobbies and floors containing building entrances. Elevator landings on transfer floors, sky lobbies and floors containing building entrances shall provide at least one wall-mounted hall call console adjacent to each elevator hoistway entrance. When the accessibility function button is activated, the system shall assign an elevator car located to one side (left or right) of the hall call console to be the responding elevator.

1109.7.2.1.2 Other floors. Floors other than those subject to Section 1109.7.2.1.1 shall provide one hall call console for every five elevators, or fraction thereof, on each side of the elevator landing. The hall call console shall be located immediately adjacent to one or more elevator hoistway entrances. When the accessibility function button is activated, the system shall assign the elevator car located closest to one side (left or right) of the hall call console to be the responding elevator.

1109.7.2.2 Required features. Hall call consoles shall include the features specified in this section. Consoles shall not be flush with the surrounding surfaces and shall protrude or be recessed a minimum of ⅜ inch (19 mm) and a maximum 4 inches (101.6 mm).

1109.7.2.2.1 Accessibility function button. Hall call consoles shall provide accessibility function buttons complying with Section 1109.7.2.2.1.

1109.7.2.2.1.1 Upon Activation. The accessibility function button shall be programmed to activate the audio output required by Section 1109.7.2.2.2.

1109.7.2.2.1.2 Identification. Accessibility function buttons shall be visibly and tactically identified. The visible identification shall consist of the International Symbol of Accessibility or the dynamic accessibility symbol and shall be a minimum height of 5/8 inch (15.9 mm). The visible symbol shall contrast with its background, light-on-dark or dark-on-light. The tactile identification shall consist of three raised dots. All dots shall be the same size and shall have a base diameter of 0.059 inch (1.5 mm) minimum and 0.063 inch (1.6 mm) maximum. Dot height shall be 0.025 inch (0.6 mm) minimum and 0.037 inch (0.9 mm) maximum. The dots shall be spaced ¼ inch (6.4 mm) at base diameter, measured center to center, and shall be arranged in the form of an equilateral triangle with the vertex pointing up.

1109.7.2.2.2 Audio output. Audio output shall be provided for floor selection and responding elevator identification. Audio output shall be initiated upon activation of the accessibility function button and shall comply with Sections 1109.7.2.2.1 and 1109.7.2.2.2.

1109.7.2.2.2.1 Content. Audio output shall include all the information necessary to successfully call and locate the responding elevator without the use of a visual display including, but not limited to operating instructions, floor selection options, confirmation of floor selection, responding elevator car designation, directions to the responding elevator car and error messages.

1109.7.2.2.2.2 Delivery method and volume. Audio output shall be provided through a mechanism that does not require the use of private listening devices, and that is located at the hall call console. Audio output shall commence within one second of the activation of the accessibility function button. Audio output shall be synthesized
speech or recorded or digitized human speech. Volume shall be a minimum of 10 dBA above ambient sound level, measured during peak occupancy, but shall not exceed 80 dB, measured horizontally 36 inches (914.4 mm) from the source. Audio output for floor selection shall commence at the hall call console used within one second of activation of the accessibility function button. Audio output for responding car identification shall commence when the elevator arrives and shall be repeated until the elevator doors begin to close.

1109.7.2.2.3 Visible display screen. Visible display screens, including touchscreens, shall be provided in accordance with this section.

1109.7.2.2.3.1 Contrast. Characters, numbers and symbols shall contrast with the background on which they are displayed at a ratio of 4.5:1 (relative illuminance). The background shall be solid and static.

Exception: Information unrelated to floor levels and their selection shall not be required to comply with Section 1109.7.2.2.3.1.

1109.7.2.2.3.2 Size. Characters, numbers and symbols shall be a minimum height of 5/8 inch (15.9 mm).

1109.7.2.2.3.3 Duration. Elevator assignment characters and numbers shall be displayed for a minimum of five seconds.

1109.7.2.2.4 Floor selection controls. Hall call consoles shall provide a method of floor selection that does not require user vision. Input methods shall comply with Section 1109.7.2.2.4.1 or 1109.7.2.2.4.2.

1109.7.2.2.4.1 Numeric keypad. Numeric keypads shall be a minimum of 2¾ inches (69.9 mm) wide by 5 inches (127 mm) high and shall be arranged in a 12-key ascending telephone keypad layout. Individual keys shall be tactilely discernible, and the number five key shall be tactilely distinct from the other keys. Where the keypad provides an alphabetic overlay on numeric keys, the relationships between letters and digits shall conform to ITU-T Recommendation E.161.

1109.7.2.2.4.2 Step scanner. Step scanners shall consist of three horizontally arranged buttons. The center button shall serve as the “select” button and may also serve as the accessibility function button. The button to the right of the center button shall be the “up” button and the button to the left of the center button shall be the “down” button. When the “up” and “down” buttons are pressed and released, the scanner shall announce the next floor above and below, respectively. When the user releases the “up” or “down” button, the system shall pause to allow the user to press the “select” button. If the “select” button is not chosen, the system shall resume at the next floor in the sequence when the button is again depressed. In buildings with more than ten floor levels, when the “up” or “down” buttons are depressed and held for more than three seconds, the scanner shall present options for floor selection in groups of ten beginning with the next group of ten above or below the floor last announced. An interval of silence, one second minimum and two seconds maximum, shall be provided between such announcements.

Exception: Step scanners may consist of one button, where the application for construction document approval is submitted within six months after the date of
enactment of this section. The button shall serve as the “select” button and may also serve as the accessibility function button.

1109.7.2.2.5 Tactile discernibility. Accessibility function buttons and floor selection controls shall be tactiley discernible and shall be raised above surrounding surfaces. When pressed, buttons shall provide mechanical motion to indicate activation. Where a step scanner complying with Section 1109.7.2.2.4.2 is provided, the “up” and “down” arrows shall include tactiley discernible “up” and “down” arrows. The “up” and “down” arrows shall be tactiley distinct from the tactile marking on the accessibility function button.

1109.7.2.3 Hall call console arrangement. Features of hall call consoles shall be arranged in accordance with Section 1109.7.2.3. Where an accessibility function button complying with Sections 1109.7.2.2.1 and 1109.7.2.3.1 also serves as the “select” button, the provisions of Section 1109.7.2.3.2 shall not apply.

1109.7.2.3.1 Accessibility function button. The accessibility function button shall be located at a height of 36 inches (914.4 mm) minimum and a maximum of 42 inches (1066.8 mm) above the finish floor and shall be nominally centered on the hall call console.

1109.7.2.3.2 Floor selection controls. Floor selection controls shall be located above the accessibility function button and shall be no higher than 48 inches (1220 mm) above the finish floor and shall be nominally centered on the console.

1109.7.2.3.3 Display screens. Where provided, display only screens shall be located above the floor selection controls.

1109.7.2.4 Instructions. Where hall call consoles are provided, written instructions on the proper use shall be posted in a conspicuous location, adjacent to such devices. The instructions shall include, but are not limited to, operating instructions, and console features.

1109.7.2.5 Responding car. When an elevator car responds to a call following activation of the accessibility function button, it shall provide audio output complying with Section 1109.7.2.2.2. In addition, during travel, the responding car shall provide an in-car announcement of all floors on which it stops.

1109.8 Lifts. Platform (wheelchair) lifts shall not be a part of a required accessible route in new construction except as indicated in Items 1 through [9] 10. Platform (wheelchair) lifts shall be installed in accordance with Section 410 (Platform Lifts) of ICC A117.1, and ASME A18.1, and Chapter 30 of this code. Platform (wheelchair) lifts are permitted to be part of a required accessible route in new construction as follows:

1. An accessible route to a performing area and speaker platforms [in Group A occupancies].
2. An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Sections 1108.2.2 through 1108.2.6.
3. An accessible route to spaces that are not open to the general public with an occupant load of not more than five.
4. An accessible route [as permitted in Section 1107.2.5] within [a] an individual dwelling unit or sleeping unit required to be an Accessible unit, Type A unit or Type B unit.
5. An interior accessible route to jury boxes and witness stands; raised courtroom stations including judges’ benches, clerks’ stations, bailiffs’ stations, deputy clerks’ stations and court reporters’ stations; and to depressed areas such as the well of the court.

6. An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible as determined by the commissioner pursuant to the rules of the department.

7. An accessible route to load and unload areas serving amusement rides.

8. An accessible route to play components or soft contained play structures.

9. An accessible route to team or player seating areas serving areas of sport activity.

10. An accessible route where existing exterior site constraints make the use of a ramp or elevator infeasible as determined by the commissioner pursuant to the rules of the department.

1109.8.1 Prior code buildings. In prior code buildings, platform (wheelchair) lifts installed in accordance with Section 410 (Platform Lifts) of ICC A117.1, ASME A18.1, and Chapter 30 of this code, shall be permitted to be a part of the required accessible route.

1109.8 Storage. Where fixed or built-in storage elements [such as] including but not limited to cabinets, coat hooks, shelves, medicine cabinets, lockers, closets[,] and drawers are provided in required accessible spaces, at least [one of each type shall contain storage space complying with ICC A117.1] 5 percent, but not less than one of each type shall be accessible.

1109.9 Equity. Accessible facilities and spaces shall be provided with the same storage elements as provided in the similar nonaccessible facilities and spaces.

1109.9.1 Lockers. Where lockers are provided in accessible spaces, at least five percent, but not less than one, of each type shall be accessible.

1109.9.2 Shelving and display units. Self-service shelves and display units shall be located on an accessible route. Such shelving and display units shall not be required to comply with reach-range provisions.

1109.9.3 Coat hooks and shelves. Where coat hooks and shelves are provided in toilet rooms or toilet compartments, or in dressing, fitting or locker rooms, at least one of each type shall be provided in accessible toilet rooms without toilet compartment, accessible toilet compartments, and accessible dressing, fitting and locker rooms.

1109.9.3 Cycle storage. Cycle storage shall comply with Section 905 (Storage Facilities) of ICC A117.1 and Sections 1109.9.3.1 through 1109.9.3.4 of this code.

1109.9.3.1 Accessible cycle storage. Where cycle storage is provided, 10 percent of the total number, but not less than one, shall be a minimum of 86 inches (2184.4 mm) long and 42 inches (1066.8 mm) wide to accommodate the storage of an accessible cycle.

1109.9.3.2 Accessible route. At least one accessible route shall connect to the accessible cycle storage area.
1109.3.3 Turning space. A turning space shall be provided and comply with Section 304 (Turning Space) of ICC A117.1.

1109.3.4 Loading area. A clear floor space shall be located on the long side of the accessible cycle storage and shall comply with Section 305 (Clear Floor Space) of ICC A117.1.

[1109.9] 1109.10 Detectable warnings. Detectable warnings shall be provided where required in Sections [1109.9.1] 1109.1 through [1109.9.5] 1109.3.

[1109.9.1] 1109.10.1 Detectable warnings at passenger transit platforms. Passenger transit platform edges bordering a drop-off and not protected by platform screens or guards shall have a detectable warning.

Exception: Detectable warnings are not required at bus stops.

[1109.9.2] 1109.10.2 Detectable warnings at hazardous vehicular areas. If a walk crosses or adjoins a vehicular way, and the walking surfaces are not separated by curbs, railings, or other elements between the pedestrian areas and vehicular areas, the boundary between the areas shall be defined by a continuous detectable warning which is 36 inches (914 mm) wide.

[1109.9.3] 1109.10.2 Detectable warnings at pools. The edges of reflecting pools and similar decorative pools without physical barriers, and in which occupants are not expected or permitted to engage in swimming, bathing, therapeutic or other physical activities, shall be provided with detectable warnings.

[1109.9.4] 1109.10.3 Detectable warnings at curb ramps. A curb ramp shall have a detectable warning. The detectable warning shall extend the full width and a depth of 24 inches (609.2 mm) along the curb ramp. The curb ramp shall comply with Section 406 of ICC A117.1.

[1109.9.5] 1109.10.5 Detectable warnings at other locations. Detectable warnings shall be located at hazardous locations on floors, doors, and stairs. Doors that lead to areas that might prove hazardous to a person who is blind, including, but not limited to, doors to leading platforms, boiler rooms, and stages, shall be made identifiable to the touch by a textured surface on the door handle, knob, pull or other operating hardware. This textured surface may be made by knurling or roughening or by material applied to the contact surface. Such textured surfaces shall not be provided for emergency exit doors or any doors other than those to hazardous areas.

[1109.10] 1109.11 Seating at tables, counters and work surfaces. Where seating or standing space at fixed or built-in tables, counters or work surfaces is provided in accessible spaces, at least [5] 10 percent of the total number of seating and standing spaces, but not less than one of each type, shall be accessible. [In Group I-3 occupancy visiting areas at least 5 percent, but not less than one, cubicle or counter shall be accessible on both the visitor and detainee sides.]

[Exceptions] Exception:

[4—] Check-writing surfaces at check-out aisles not required to comply with Section [1109.11.2] 1109.12.2 are not required to be accessible.
[2. In Group I-3 occupancies, the counter or cubicle on the detainee side is not required to be accessible at noncontact visiting areas or in areas not serving accessible holding cells or sleeping units.]

1109.10.1 1109.11.1 Dispersion. Accessible fixed or built-in seating at tables, counters or work surfaces shall be distributed throughout the space or facility containing such elements and located on a level accessed by an accessible route.

1109.11.2 Visiting areas. Visiting areas in judicial facilities and Group I-3 shall comply with Sections 1109.11.2.1 and 1109.11.2.2.

1109.11.2.1 Cubicles and counters. At least 5 percent, but not less than one of the cubicles, shall be accessible on both the visitor and detainee sides. Where counters are provided, at least one shall be accessible on both the visitor and detainee sides.

Exception: This requirement shall not apply to the detainee side of cubicles or counters at noncontact visiting areas not serving Accessible unit holding cells.

1109.11.2.2 Partitions. Where solid partitions or security glazing separate visitors from detainees, at least one of each type of cubicle or counter partition shall be accessible.

1109.12 Service facilities. Service facilities shall provide for accessible features in accordance with Sections 1109.12.1 through 1109.12.5.

1109.12.1 Dressing, fitting and locker rooms. Where dressing rooms, fitting rooms[,] or locker rooms are provided, at least [five] 5 percent, but not less than one, of each type of use in each cluster provided shall be accessible.

1109.12.2 Check-out aisles. Where check-out aisles are provided, accessible check-out aisles shall be provided in accordance with Table 1109.12.2. Where check-out aisles serve different functions, at least one accessible check-out aisle shall be provided for each function. Where check-out aisles serve different functions, accessible check-out aisles shall be provided in accordance with Table 1109.12.2 for each function. Where check-out aisles are dispersed throughout the building or facility, accessible check-out aisles shall also be dispersed. Traffic control devices, security devices and turnstiles located in accessible check-out aisles or lanes shall be accessible.

Exception: Where the public use area is under 5,000 square feet (464.5 m²), not more than one accessible check-out aisle shall be required.

**1109.12.3 Point of sales and service counters.** Where counters are provided for sales or distribution of goods or services, at least one of each type provided shall be accessible. Where such counters are dispersed throughout the building or facility, the accessible counters shall also be dispersed.

**1109.12.4 Food service lines.** Food service lines shall be accessible. Where self-service shelves are provided, at least 50 percent, but not less than one, of each type provided shall be accessible.

**1109.12.5 Queue and waiting lines.** Queue and waiting lines servicing accessible counters or check-out aisles shall be accessible.

**1109.13 Controls, operating mechanisms and hardware.** Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation, and electrical convenience outlets, in accessible spaces, along accessible routes or as parts of accessible elements shall be accessible.

**Exceptions:**

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be accessible.

2. Electrical or communication receptacles serving a dedicated use shall not be required to be accessible.

3. Where two or more outlets are provided in a kitchen above a length of countertop that is uninterrupted by a sink or appliance, one outlet shall not be required to be accessible.

4. Floor electrical receptacles shall not be required to be accessible.

5. HVAC diffusers shall not be required to be accessible.

6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be accessible.

7. Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the release of latch on self-latching devices at 54 inches (1370 mm) maximum and 48 inches (1219 mm) minimum above the finished floor or ground, provided the self-latching devices are not also self-locking devices, operated by means of a key, electronic opener, or integral combination lock, comply with Sections 3109.4 and 3109.5.

8. Electrical panelboards in Type B+NYC units and Type B units shall not be required to be accessible.

9. Within kitchens and bathrooms, lighting controls, electrical switches and receptacle outlets are permitted to be located over cabinets with counter tops 36 inches (914.4 mm) maximum in height and 25½ inches (647.7 mm) maximum in depth.
**1109.13 Operable windows.** Where operable windows are provided in rooms or spaces that are required to be accessible in accordance with Sections 1107.5.1, 1107.5.2, 1107.5.3, 1107.5.4, 1107.6.1.1, [and] or 1107.6.1.4.1, at least one window in each room shall be accessible and each required operable window shall be accessible. Where operable windows are provided in Type B+NYC units in accordance with Section 1107.6.2, such windows shall comply with Section 1107.2.4.

**Exception:** Accessible windows are not required in bathrooms or kitchens unless otherwise required in Section 1107.2.4.

**1109.14 Fuel-dispensing systems.** Fuel-dispensing systems shall [comply with ICC A117.1] be accessible.

**1109.14 Recreational and sports facilities.** Recreational and sports facilities shall be accessible.

**1109.14.1 Recreational and sports facilities exceptions.** Recreational and sports facilities required to be accessible shall be exempt from this chapter to the extent specified in this section.

**1109.14.1.1 Bowling lanes.** An accessible route shall be provided to at least 5 percent, but no less than one, of each type of bowling lane.

**1109.14.1.2 Court sports.** In court sports, at least one accessible route shall directly connect both sides of the court.

**1109.14.1.3 Raised boxing or wrestling rings.** Raised boxing or wrestling rings are not required to be accessible.

**1109.14.1.4 Raised refereeing, judging and scoring areas.** Raised structures used solely for refereeing, judging or scoring a sport are not required to be accessible.

**1109.14.1.5 Raised diving boards and diving platforms.** Raised diving boards and diving platforms are not required to be accessible.

**1109.15 Gaming machines and gaming tables.** Five percent, but not less than one, of each type of gaming table provided shall be accessible and provided with a front approach. Five percent of gaming machines provided shall be accessible and provided with a front approach. Accessible gaming machines shall be distributed throughout the different types of gaming machines provided.

**1109.16 Stairways.** Stairways located alongside accessible routes connecting floor levels that are not connected by an elevator shall be designed and constructed to comply with ICC A117.1 and Chapter 10 of this code.

**1109.17 Refuse disposal, refuse recyclable and refuse storage rooms.** Refuse disposal, refuse recyclable and refuse storage rooms intended for common-use shall comply with this section. Each room must comply with Section 304 (Turning Space), Section 305 (Clear Floor Space), Section 309 (Operable Parts) and Section 404 (Doors and Doorways) of ICC A117.1. The room door is permitted to swing into the room provided that a clear floor space not less than 30 inches by 48 inches (762 mm by 1220 mm) is provided within the room and beyond the arc of the door swing.
Exceptions:

1. An alternative design is permitted provided that all of the following conditions are met:

   1.1. The room shall be designed so that the wheelchair user can enter the room head on, and back out without turning or changing direction.

   1.2. An automatic door complying with Section 404.3 (Automatic Doors) of ICC A117.1 must be provided.

   1.3. The minimum doorway clear opening required by Section 404.3.1 must be increased to a minimum 36 inches (914.4 mm) in power-on and power-off mode.

   1.4. All controls, trash chutes, recycling bins and operating mechanisms intended for operation shall comply with Section 305 (Clear Floor Space) and Section 309 (Operable Parts) of ICC A117.1.

   1.5. An occupancy sensor shall be provided in the refuse room to detect the presence and the absence of occupants. Upon the detection of an occupant in the room, the door shall be maintained in the open position during the entire period of occupancy of the room. Upon the absence of an occupant in the room, the door shall automatically return to the closed position.

   1.6. The automatic door shall return to the closed position in the case of a power failure, upon the activation of the fire alarm systems or upon the activation of smoke detectors.

2. Controls for maintenance and service are not required to comply with this section.

SECTION BC 1110
RECREATIONAL FACILITIES

1110.1 General. Recreational facilities shall be provided with accessible features in accordance with Sections 1110.2 through 1110.4.

1110.2 Facilities serving Group R-2 and R-3 occupancies. Recreational facilities that serve Group R-2 and R-3 occupancies shall comply with Sections 1110.2.1 through 1110.2.3, as applicable.

1110.2.1 Facilities serving Accessible units. In Group R-2 occupancies where recreational facilities serve Accessible units, every recreational facility of each type serving Accessible units shall be accessible.

1110.2.2 Facilities serving Type A, Type B+NYC and Type B units in a single building. In Group R-2 and R-3 occupancies and where there are four or more dwelling units, where common recreational facilities serve a single building containing Type A, Type B+NYC units or Type B units, 25 percent, but not less than one, of each type of recreational facility shall be accessible. Every recreational facility of each type on a site shall be considered to determine the total number of each type that is required to be accessible.
1110.2.3 Facilities serving Type A, Type B+NYC and Type B units in multiple buildings. In Group R-2 and R-3 occupancies, where there are four or more dwelling units within a single structure, on a single site where multiple buildings containing Type A, Type B+NYC units or Type B units are served by common recreational facilities, 25 percent, but not less than one, of each type of recreational facility serving each building shall be accessible. The total number of each type of recreational facility that is required to be accessible shall be determined by considering every recreational facility of each type serving each building on the site.

1110.3 Other occupancies. Recreational facilities not falling within the purview of Section 1110.2 shall be accessible.

1110.4 Recreational facilities. Recreational facilities shall be accessible and shall be on an accessible route to the extent specified in this section.

1110.4.1 Area of sport activity. Each area of sport activity shall be on an accessible route and shall not be required to be accessible except as provided for in Sections 1110.4.2 through 1110.4.14.

1110.4.2 Team or player seating. At least one wheelchair space shall be provided in team or player seating areas serving areas of sport activity.

Exception: Wheelchair spaces shall not be required in team or player seating areas serving bowling lanes that are not required to be accessible in accordance with Section 1110.4.3.

1110.4.3 Bowling lanes. An accessible route shall be provided to at least 5 percent, but not less than one, of each type of bowling lane.

1110.4.4 Court sports. In court sports, at least one accessible route shall directly connect both sides of the court.

1110.4.5 Raised boxing or wrestling rings. Raised boxing or wrestling rings are not required to be accessible or to be on an accessible route.

1110.4.6 Raised refereeing, judging and scoring areas. Raised structures used solely for refereeing, judging or scoring a sport are not required to be accessible or to be on an accessible route.

1110.4.7 Animal containment areas. Animal containment areas that are not within public use areas are not required to be accessible or to be on an accessible route.

1110.4.8 Amusement rides. Amusement rides that move persons through a fixed course within a defined area shall comply with Sections 1110.4.8.1 through 1110.4.8.3.

Exception: Mobile or portable amusement rides shall not be required to be accessible.

1110.4.8.1 Load and unload areas. Load and unload areas serving amusement rides shall be accessible and be on an accessible route. Where load and unload areas have more than one loading or unloading position, at least one loading and unloading position shall be on an accessible route.
1110.4.8.2 Wheelchair spaces, ride seats designed for transfer and transfer devices.
Where amusement rides are in the load and unload position, the following shall be on an accessible route.

1. The position serving a wheelchair space.
2. Amusement ride seats designed for transfer.
3. Transfer devices.

1110.4.8.3 Minimum number. Amusement rides shall provide at least one wheelchair space, amusement ride seat designed for transfer or a transfer device.

Exceptions:

1. Amusement rides that are controlled or operated by the rider are not required to comply with this section.
2. Amusement rides designed primarily for children, where children are assisted on and off the ride by an adult, are not required to comply with this section.
3. Amusement rides that do not provide seats that are built-in or mechanically fastened shall not be required to comply with this section.

1110.4.9 Recreational boating facilities. Boat slips required to be accessible by Sections 1110.4.9.1 and 1110.4.9.2 and boarding piers at boat launch ramps required to be accessible by Section 1110.4.9.3 shall be on an accessible route.

1110.4.9.1 Boat slips. Accessible boat slips shall be provided in accordance with Table 1110.4.9.1. All units on the site shall be combined to determine the number of accessible boat slips required. Where the number of boat slips is not identified, each 40 feet (12 m) of boat slip edge provided along the perimeter of the pier shall be counted as one boat slip for the purpose of this section.

Exception: Boat slips not designed for embarking or disembarking are not required to be accessible or be on an accessible route.

1110.4.9.2 Dispersion. Accessible boat slips shall be dispersed throughout the various types of boat slips provided. Where the minimum number of accessible boat slips has been met, no further dispersion shall be required.

1110.4.9.3 Boarding piers at boat launch ramps. Where boarding piers are provided at boat launch ramps, at least 5 percent, but not less than one, of the boarding piers shall be accessible.

1110.4.10 Exercise machines and equipment. At least one of each type of exercise machine and equipment shall be on an accessible route and shall be in compliance with Section 1104 (Exercise Machines and Equipment) of ICC A117.1.

1110.4.11 Fishing piers and platforms. Fishing piers and platforms shall be accessible and be located on an accessible route and shall be in compliance with Section 1105 (Fishing Piers and Platforms) of ICC A117.1.

1110.4.12 Miniature golf facilities. Miniature golf facilities shall be accessible and shall comply with Section 1107 (Miniature Golf Facilities) of ICC A117.1.

1110.4.13 Swimming pools, wading pools, hot tubs and spas. Swimming pools, wading pools, hot tubs and spas shall be accessible and be on an accessible route.

**Exceptions:**

1. Catch pools or a designated section of a pool used as a terminus for a water slide flume shall not be required to provide an accessible means of entry, provided that a portion of the catch pool edge is on an accessible route.

2. Where spas or hot tubs are provided in a cluster, at least 5 percent, but not less than one spa or hot tub in each cluster, shall be accessible and be on an accessible route.

3. Swimming pools, wading pools, spas and hot tubs that are required to be accessible by Sections 1110.2.2 and 1110.2.3 are not required to provide accessible means of entry into the water.

1110.4.13.1 Raised diving boards and diving platforms. Raised diving boards and diving platforms are not required to be accessible or to be on an accessible route.

1110.4.13.2 Water slides. Water slides are not required to be accessible or to be on an accessible route.
1110.4.14 Shooting facilities with firing positions. Where shooting facilities with firing positions are designed and constructed at a site, at least 10 percent, but not less than one, of each type of firing position shall be accessible and be on an accessible route.

SECTION BC [1110] 1111
SIGNAGE

[1110.1] 1111.1 Signs. Required accessible elements shall be identified by the [International Symbol of Accessibility] dynamic accessibility symbol, in accordance with Figure 1111.1, at the following locations:

1. Accessible parking spaces required by Section 1106.1 [except where]

   Exception: Where the total number of parking spaces provided is [no more than] one, identification of the accessible parking space is not required.

2. Accessible parking spaces required by Section 1106.2.

   Exception: In Group I-1, R-2 and R-3 occupancies, where parking spaces are assigned to specific dwelling units or sleeping units, identification of accessible parking spaces is not required.

3. Accessible passenger loading zones.

4. [Exterior areas of assisted rescue required by Section 1007.6.]

5. Accessible rooms where multiple [single user] single-occupant toilet rooms or bathing rooms are clustered at a single location pursuant to Section 1109.2, Exception 3.

6. Accessible rooms where multiple single user portable toilet or bathing units are clustered at a single location pursuant to Section 1109.2, Exception 6.

7. Accessible entrances where not all entrances are accessible. The sign, where provided, shall include a contact telephone number or instructions to gain access if an otherwise accessible building entrance is locked at all times or locked when the building is otherwise open.

8. Accessible check-out aisles where not all aisles are accessible. The sign, where provided, shall be above the check-out aisle in the same location as the check-out aisle number or type of check-out identification.

9. Family or assisted-use toilet and bathing rooms.

10. Accessible dressing, fitting and locker rooms where not all such rooms are accessible.

11. Accessible areas of rescue assistance in accordance with Section 1009.9.
10. Exterior areas for assisted rescue in accordance with Section 1009.9.

11. In recreational facilities, lockers that are required to be accessible in accordance with Section 1109.9.

12. Accessible seating.

15. Refuse Disposal and Refuse Storage Rooms.

---

**FIGURE 1111.1**

**DYNAMIC ACCESSIBILITY SYMBOL**

[4400.2] 1111.2 Directional signage. Directional signage indicating the route to the nearest like accessible element shall be provided at or in close proximity to the following locations, such that [a person] an individual with disabilities will not be required to retrace the approach route from the inaccessible element.

1. Inaccessible building entrances.

2. Inaccessible public toilets and bathing facilities.

3. Elevators not serving an accessible route.

4. At each separate-sex toilet and bathing room indicating the location of the nearest accessible family or assisted-use toilet [or] and bathing room where provided in accordance with Section 1109.2.1 of this code.
5. At exits and exit stairways serving an accessible space, but not providing an approved accessible means of egress, signage shall be provided in accordance with Section 1007.10 of this code.

6. Where drinking fountains for people using wheelchairs and drinking fountains for standing persons are not located adjacent to each other, directional signage shall be provided indicating the location of the other drinking fountains.

These directional signs shall include the International Symbol of Accessibility dynamic accessibility symbol. Such signs shall comply with either Section 703.2 or Sections 703.3 and 703.4 of ICC A117.1.

**[1110.3] 1111.3 Other signs.** Signage indicating special accessibility provisions shall be provided as follows:

1. Each assembly area required to comply with Section 1108.2.7 of this code shall provide a sign notifying patrons of the availability of assistive listening systems. The sign shall comply with ICC A117.1 requirements for visual characters and shall include the International Symbol of Access for Hearing Loss.

**Exception:** Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an area of rescue assistance, an exterior area for assisted rescue, an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.

3. At areas of rescue assistance, signage shall be provided in accordance with Section 1109.11.

4. At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1109.11.

5. At two-way communication systems, signage shall be provided in accordance with Section 1109.8.2.

6. **Within** interior exit enclosures, stairways and ramps, floor level signage shall be provided in accordance with Section 1023.9.

7. At prior code buildings with one or more inaccessible entrances, signage stating that a portable ramp is available, if provided by the building, shall be provided at each inaccessible building entrance and shall contain the phone number to request such ramp. The use of a portable ramp by any building must comply with all applicable laws and any such ramp shall comply with Section 405 (Ramps) of ICC A117.1, except to the extent the commissioner has waived a requirement pursuant to section 28-313.3.1 of the Administrative Code. All signage posted pursuant to this section shall comply with Section 1110 of this code and be maintained in good
condition. Nothing in this section shall be construed to authorize the provision of a portable ramp where such provision would not otherwise be lawful.

8. Signs identifying the type of access provided on amusement rides required to be accessible by Section 1110.4.8 of this code shall be provided at entries to queues and waiting lines. In addition, where accessible unload areas also serve as accessible load areas, signs indicating the location of the accessible load and unload areas shall be provided at entries to queues and waiting lines. These directional sign characters shall meet the visual character requirements in accordance with Section 703.2 (Visual Characters) of ICC A117.1.

**1110.4.1 Variable message signs.** Where provided in the locations in Sections 1111.4.1 and 1111.4.2 of this code, variable message signs shall comply with the requirements of ICC A117.1.

**1111.4.1 Transportation facilities.** Where provided in transportation facilities, variable message signs conveying transportation-related information shall comply with Section 1111.4.1 of this code.

**1111.4.2 Emergency shelters.** Where provided in buildings that are designated as emergency shelters, variable message signs conveying emergency-related information shall comply with Section 1111.4.2 of this code.

Exception: Where equivalent information is provided in an audible manner, variable message signs are not required to comply with ICC A117.1.

§ 13. Chapter 12 of the New York city building code, as added by local law number 33 for the year 2007, section 1213.2 as amended by local law number 8 for the year 2008, section 1213.1 as amended by local law number 60 for the year 2012, and sections 1202, 1203, 1205, 1206.4, 1207, 1210.1, 1210.2 and 1213.3 as amended by local law number 141 for the year 2013, is amended to read as follows:

**CHAPTER 12**

**INTERIOR ENVIRONMENT**

**SECTION BC 1201**

**GENERAL**

1201.1 Scope. The provisions of this chapter shall govern ventilation, temperature control, lighting, yards and courts, sound transmission, room dimensions, surrounding materials and rodent proofing associated with the interior spaces of buildings.

**SECTION BC 1202**

**DEFINITIONS**

1202.1 [General] Definitions. The following [words and] terms shall, for the purposes of this chapter and as used elsewhere, be defined in [this code, have the meanings shown herein.]** Chapter 2.
HABITABLE SPACE. [All rooms and spaces within a dwelling unit in Group R or I-1, including bedrooms, living rooms, studies, recreation rooms, kitchens, dining rooms and other similar spaces.]

[Exception: The following spaces within a dwelling unit shall not be considered habitable spaces:]

[1. A dining space 55 square feet (5.1 m²) or less located off a living room, foyer or kitchen;]

[2. A kitchenette;]

[3. A bathroom or toilet room;]

[4. A laundry room; and]

[5. A corridor, passageway, or private hall; and a foyer used as an entrance hall in a dwelling unit: not exceeding 10 percent of the total floor area of the dwelling unit; or not exceeding 20 percent of the floor area of the dwelling unit where every habitable room is at least 20 percent larger than the required minimum room sizes established by the New York City Housing Maintenance Code.]

KITCHEN. [A room with 80 square feet (7.4 m²) or more of floor area which is intended, arranged, designed or used for cooking or warming of food.]

KITCHENETTE. [A space with less than 80 square feet (7.4 m²) of floor area which is intended, arranged, designed or used for cooking or warming of food.]

OCCUPYABLE SPACE. [A room or enclosed space, other than a habitable space, designed for human occupancy or use in which individuals may remain for a period of time for rest, amusement, treatment, education, dining, shopping, employment, labor or other similar purposes.]

SUNROOM. [A one-story structure attached to a building with a glazing area in excess of 40 percent of the gross area of the structure’s exterior walls and roof.]

THERMAL ISOLATION. [Physical and space-conditioning separation from conditioned space(s). The conditioned space(s) shall be controlled as separate zones for heating and cooling or conditioned by separate equipment.]

SECTION BC 1203
VENTILATION

1203.1 General. Buildings shall be provided with [natural] ventilation in accordance with Section [1203.4,] 1203.5 of this code and [mechanical ventilation in accordance with] the New York City Mechanical Code [and this chapter. All habitable spaces shall be provided with natural ventilation in accordance with Section 1203.4].

1203.2 [Attic spaces] Ventilation required. Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by [ventilating] ventilation openings protected against the entrance of rain and snow. Blocking and bridging shall be arranged so as not to interfere with the movement of air. [A
An airspace of not less than 1 inch ([25] 25.4 mm) of airspace shall be provided between the insulation and the roof sheathing. The net free ventilating area shall be not be less than 1/150 of the area of the space ventilated. Ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents. Ventilators shall be installed in accordance with the manufacturer’s instructions.

1203.2.1 Openings into attic. Exterior openings into the attic space of any building intended for human occupancy shall be protected to prevent the entry of birds, squirrels, rodents, snakes and other similar creatures. Openings for ventilation having a least dimension of not less than 1/16 inch (1.6 mm) [minimum] and not more than 1/4 inch (6.4 mm) [maximum] shall be permitted. Openings for ventilation having a least dimension larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material with openings having a least dimension of not less than 1/16 inch (1.6 mm) [minimum] and not more than 1/4 inch (6.4 mm) [maximum]. Where combustion air is obtained from an attic area, it shall be in accordance with Chapter 7 of the New York City Mechanical Code.

1203.3 Unvented attic and unvented enclosed rafter assemblies. Unvented attics and unvented enclosed roof framing assemblies created by ceilings applied directly to the underside of the roof framing members/rafters and the structural roof sheathing at the top of the roof framing members shall be permitted where all the following conditions are met:

1. The unvented attic space is completely within the building thermal envelope.

2. No interior Class I vapor retarders are installed on the ceiling side (attic floor) of the unvented attic assembly or on the ceiling side of the unvented enclosed roof framing assembly.

3. Where wood shingles or shakes are used, a minimum 1/4-inch (6.4 mm) vented airspace separates the shingles or shakes and the roofing underlayment above the structural sheathing.

4. Insulation shall be located in accordance with the following:

4.1. Item 4.1.1, 4.1.2, 4.1.3 or 4.1.4 shall be met, depending on the air permeability of the insulation directly under the structural roof sheathing.

4.1.1. Where only air-impermeable insulation is provided, it shall be applied in direct contact with the underside of the structural roof sheathing.

4.1.2. Where air-permeable insulation is provided inside the building thermal envelope, it shall be installed in accordance with Item 4.1. In addition to the air-permeable insulation installed directly below the structural sheathing, rigid board or sheet insulation shall be installed directly above the structural roof sheathing in accordance with the R values in Table 1203.3 for condensation control.

4.1.3. Where both air-impermeable and air-permeable insulation are provided, the air-impermeable insulation shall be applied in direct contact with the underside of the structural roof sheathing in accordance with Item 4.1.1 and shall be in accordance with Item 4.1.2.

1102
with the R values in Table 1203.3 for condensation control. The air-permeable insulation shall be installed directly under the air-impermeable insulation.

4.1.4. Alternatively, sufficient rigid board or sheet insulation shall be installed directly above the structural roof sheathing to maintain the monthly average temperature of the underside of the structural roof sheathing above 45°F (7°C). For calculation purposes, an interior air temperature of 68°F (20°C) is assumed and the exterior air temperature is assumed to be the monthly average outside air temperature of the three coldest months.

4.2. Where preformed insulation board is used as the air-permeable insulation layer, it shall be sealed at the perimeter of each individual sheet interior surface to form a continuous layer.

**Exception:** Section 1203.3 does not apply to special use structures or enclosures such as swimming pool enclosures, data processing centers, hospitals or art galleries.

<sup>a</sup> Contributes to, but does not supersede, thermal resistance requirements for attic and roof assemblies in the New York City Energy Conservation Code.

**1203.4 Under-floor ventilation.** The space between the bottom of the floor joists and the surface under any building except spaces occupied by basements or cellars shall be provided with ventilation openings through foundation walls or exterior walls. Such openings shall be placed so as to provide cross ventilation of the under-floor space.

**[1203.3.1] 1203.4.1 Openings for under-floor ventilation.** The [minimum] net area of ventilation openings shall be not [be] less than 1 square foot for each 150 square feet ([0.09] 304.8 mm<sup>2</sup> for each [13.9] 45,720 mm<sup>2</sup>) of [crawl space] crawl space area. Ventilation openings shall
be covered for their height and width with any of the following materials, provided that the least
dimension of the covering shall not exceed ¼ inch (6.4 mm):

1. Perforated sheet metal plates not less than 0.070 inch (1.8 mm) thick.
2. Expanded sheet metal plates not less than 0.047 inch (1.2 mm) thick.
3. Cast-iron grilles or gratings.
4. Extruded load-bearing vents.
5. Hardware cloth of 0.035 inch (0.89 mm) wire or heavier.
6. Corrosion-resistant wire mesh, with the least dimension not exceeding greater than ⅛ inch (3.2 mm).

**[1203.3.2] 1203.4.2 Exceptions.** The following are exceptions to Sections [1203.3] 1203.4 and [1203.3.1] 1203.4.1:

1. Where warranted by climatic conditions, ventilation openings to the outdoors are not required if ventilation openings to the interior are provided.
2. The total area of ventilation openings is permitted to be reduced to 1/1,500 of the underfloor area where the ground surface is covered with a Class I vapor retarder material and the required openings are placed so as to provide cross ventilation of the space. The installation of operable louvers, in accordance with Section [1203.3.1] 1203.4.1, shall not be prohibited.
3. Ventilation openings are not required where continuously operated mechanical ventilation is provided at a rate of 1.0 cubic foot per minute (cfm) for each 50 square feet (1.02 L/s for each 10 m²) of crawl space floor area and the ground surface is covered with a Class I vapor retarder.
4. Ventilation openings are not required when the ground surface is covered with a Class I vapor retarder, the perimeter walls are insulated and the space is conditioned in accordance with the New York City Energy Conservation Code.
5. For buildings in areas of special flood hazard, the openings for under-floor ventilation for buildings in flood hazard areas shall also comply with the additional requirements of Appendix G.

**[1203.4] 1203.5 Natural ventilation.** Natural ventilation of occupiable and habitable space shall be through openings to the outdoors. The openings shall be of a type permitted under Sections [1203.4.1.1] 1203.5.1.1, [1203.4.1.2] 1203.5.1.2, [1203.4.1.3] 1203.5.1.3 and [1203.4.1.4] 1203.5.1.4. The operating mechanism for such openings shall be provided with ready access so that the openings are readily controllable by the building occupants.

**Exception:** An opening providing the required dimensional operable area shall be permitted to be reduced by limiting devices in accordance with the New York City Health Code, provided that
the owner shall remove such limiting devices where requested by the occupant. In such cases, where required by the New York City Health Code, alternative means of compliance shall be provided in accordance with the New York City Health Code.

[1203.4.4] 1203.5.1 Ventilation area required. Ventilation areas shall be as set forth in Sections [1203.4.1.1] 1203.5.1.1 through [1203.4.1.4] 1203.5.1.4.

[1203.4.1.1] 1203.5.1.1 Occupiable spaces. Where occupiable spaces are not required to be provided with mechanical ventilation in accordance with the New York City Mechanical Code, natural ventilation shall be provided in accordance with Section [1203.4.1.1] 1203.5.1.1. Openings providing required natural ventilation to occupiable spaces shall be windows, doors, louvers, skylights or other similar ventilating openings.

Exceptions:

1. Bathrooms and toilet rooms in Group R or I-1 occupancies shall comply with Section [1203.4.1.1.3] 1203.5.1.3.

2. Kitchenettes in Group R or I-1 occupancies shall comply with Section [1203.4.1.4] 1203.5.1.4.

[1203.4.1.1.1] 1203.5.1.1.1 Minimum opening. The minimum openable area to the outdoors shall be 4 percent of the floor area of the occupiable space being ventilated.

[1203.4.1.1.2] 1203.5.1.1.2 Adjoining spaces. Where occupiable rooms and spaces without openings to the outdoors are ventilated through an adjoining room, the opening to the adjoining room shall be unobstructed and shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 25 square feet (2.3 m²). The minimum openable area of the openings to the outdoors shall be based on the total floor area being ventilated.

Exception: Exterior openings required for ventilation shall be permitted to open into a sunroom or covered patio provided that the openable area between such sunroom addition or covered patio and the interior room shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 20 square feet (1.9 m²). The minimum openable area of the openings to the outdoors shall be based on the total floor area being ventilated.

[1203.4.1.1.3] 1203.5.1.1.3 Openings below grade. Where openings below grade provide required natural ventilation, the outside horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

[1203.4.1.1.4] 1203.5.1.1.4 Mezzanines. Where an interior balcony or mezzanine opens to form part of another room or space, its area shall be added to the area of the room or space in which it is located to compute the ventilation required for both spaces.
**Habitable spaces.** All habitable spaces shall be provided with natural ventilation in accordance with [Section 1203.4.1.2](#) this section. Openings providing required natural ventilation to habitable spaces shall be windows and/or glazed doors to the outdoors.

**Exception:** Group R-3 occupancies. Openable skylights opening directly to the outer air, transparent or translucent panels, or other natural light-transmitting media may be substituted for window openings in Group R-3 occupancies provided that they meet the minimum dimensional requirements of Section [1203.4.1.2.1](#) 1203.5.1.2.1.

**Minimum opening.** The minimum openable area to the outdoors shall be 5 percent of the floor area of the habitable space being ventilated. Every opening providing required natural ventilation shall be at least 12 square feet (1.1 m²) of glazed area, providing a minimum of 6 square feet (0.56 m²) of openable area.

**Exceptions:**

1. Where fresh air is furnished in any habitable room or space by mechanical means supplying a minimum of 40 cubic feet per minute (0.02 m³/s), the free openable area of the openings may be reduced to 2½ percent of the floor area but each such opening shall provide not less than 5½ square feet (0.51 m²) of openable area.

2. The minimum free openable area of a mullioned casement window shall be 5½ square feet (0.51 m²), provided that the minimum ratio of floor area to openable area is met.

**Adjoining spaces.** An alcove or room opening off another room or space shall be considered as a separate room in determining its requirements for ventilation.

**Exceptions:**

1. **Alcoves within Group R-3 dwelling units.** In Group R-3 occupancies, where an opening between the alcove and the room or space is at least 80 percent of the area of the common wall and the floor area of the alcove does not exceed twice the area of the opening, the alcove and the room opening into the alcove may be considered as a single space.

2. **Balconies, partially enclosed.** Exterior openings required for ventilation shall be permitted to open upon a partially enclosed balcony or space above a setback when:

   2.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;
2.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;

2.3. The enclosure of the balcony or space is not more than one story in height; and

2.4. The front of a partially enclosed balcony or space above a setback shall be open to the outer air with an open area equal to at least 75 percent of the floor surface area of such balcony or space.

3. **Balconies, fully enclosed.** Exterior openings required for ventilation shall be permitted to open upon a fully enclosed balcony or space above a setback, including sunroom and patio covers, when:

3.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;

3.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;

3.3. The enclosure of the balcony or space is not more than one story in height;

3.4. The building is of Type I or II construction;

3.5. The outer enclosing walls of the balcony or space are glazed with an area at least 50 percent of the area of the interior enclosing walls of such balcony or space; the glazing may be clear plate glass or slow burning plastic;

3.6. At least 50 percent of the glazed area required by Exception 3.5 of this section is openable; and

3.7. No window from any bathroom, toilet room, kitchen or kitchenette shall open on such balcony or space.

4. **Mezzanines and split-level rooms.** Where a habitable mezzanine or portion of a split-level room or space is not directly served by an opening providing natural ventilation in accordance with Section [1203.4.1.2] 1203.5.1.2, such mezzanine or space shall open for its full width with no obstruction, except for railings, to an adjoining habitable room which is provided with natural ventilation. The floor area of such mezzanine or portion of the split-level room or space shall be added to the floor area of the adjoining room to compute the required ventilation in accordance with Section [1203.4.1.2.4] 1203.5.1.2.1.
The combined space shall also comply with Section [1203.4.1.2.4]
1203.5.1.2.4. When required natural ventilation is not provided, mechanical
ventilation shall be provided to the mezzanine and split-level rooms in
accordance with the New York City Mechanical Code capable of providing 2
cubic feet per minute (0.00094 m$^3$/s) of fresh air per 1 square foot (0.09 m$^2$)
of floor area of mezzanine.

[1203.4.1.2.3] 1203.5.1.2.3 Basements and cellars. Where openings provide natural
ventilation to habitable spaces located in basements or cellars, such opening shall also
comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New
York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State
Multiple Dwelling Law.

[1203.4.1.2.4] 1203.5.1.2.4 Maximum depth of room. No part of any room shall be more
than 30 feet (9144 mm) from a window opening onto a street or yard unless such room
also opens onto a court complying with Section 1206.

Exception: In dwelling units containing more than three habitable rooms in Group
R-1 or R-2 occupancies in buildings of Type I or II construction, rooms may be
greater than 30 feet (9144 mm) in depth provided that all other requirements of
Section [1203.4.1.2] 1203.5.1.2 are met and that the required windows are so located
as to properly light all portions of the room in accordance with Section 1205.

[1203.4.1.3] 1203.5.1.3 Bathrooms and toilet rooms in Group R and I-1 occupancies.
Bathrooms [or] and toilet rooms in Group R or I-1 occupancies shall be provided with natural
ventilation in accordance with Section [1203.4.1.3] 1203.5.1.3, unless provided with
(exhaust) ventilation in accordance with the New York City Mechanical Code. Openings
providing required natural ventilation shall be windows.

Exception: Openable skylights may be substituted for windows provided that the
bathroom or toilet room is on the top story.

[1203.4.1.3.1] 1203.5.1.3.1 Minimum opening. The minimum openable area to the
outdoors shall be 5 percent of the floor area of the space being ventilated. Every window
or skylight providing required natural ventilation shall be at least 3 square feet (0.28 m$^2$)
providing a minimum of 1½ square feet (0.14 m$^2$) of openable area.

[1203.4.1.3.2] 1203.5.1.3.2 Adjoining spaces. Natural ventilation for bathrooms and
toilet rooms may not be through openings from another room or space.

Exception: A bathroom or toilet room may open onto a partially enclosed balcony or
space above a setback conforming with Exception 2 of Section [1203.4.1.2.2] 1203.5.1.2.2.

[1203.4.1.3.3] 1203.5.1.3.3 Basements and cellars. Where openings provide natural
ventilation to bathrooms or toilet rooms located in basements or cellars, such opening
shall also comply with the applicable provisions of Sections 27-2081 through 27-2087 of
the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**[1203.4.1.4]** **1203.5.1.4 Kitchenettes in Group R and I-1 occupancies.** Kitchenettes in Group R or I-1 occupancies shall be provided with natural ventilation in accordance with Section [1203.4.1.4] **1203.5.1.4**, unless provided with [exhaust] ventilation in accordance with the New York City Mechanical Code. Openings providing required natural ventilation shall be windows.

*Exception:* Openable skylights may be substituted for windows provided that:

1. The kitchenette is on the top story;
2. The skylight is 12 inches ([305] 304.8 mm) in its least dimensions;
3. The skylight is at least 4 square feet (0.37 m²) or one-eighth of the area of the kitchenette, whichever is greater; and
4. The skylight provides ventilating openings for at least one-half of its area.

**[1203.4.1.4.1]** **1203.5.1.4.1 Minimum opening.** The minimum openable area to the outdoors shall be 5 percent of the floor area of the space being ventilated. Every window or other opening providing required natural ventilation shall be at least 1 foot ([305] 304.8 mm) wide and at least 3 square feet (0.28 m²) in total area, providing a minimum of 1½ square feet (0.14 m²) of openable area.

*Exception:* Skylights shall comply with the exception of Section [1203.4.1.4] **1203.5.1.4**.

**[1203.4.1.4.2]** **1203.5.1.4.2 Adjoining spaces.** Natural ventilation for kitchenettes shall not be through openings off another room or space.

*Exception:* A kitchenette may open onto a partially enclosed balcony or space above a setback conforming with Exception 2 of Section [1203.4.1.2.2] **1203.5.1.2.2**.

**[1203.4.1.4.3]** **1203.5.1.4.3 Basements and cellars.** Where openings provide natural ventilation to kitchenettes less than 80 square feet (7.4 m²) located in basements or cellars, such opening shall also comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**[1203.4.2]** **1203.5.2 Contaminants exhausted.** Contaminant sources in naturally ventilated spaces, including kitchens, kitchenettes, toilet rooms and bathing rooms, shall be [removed] exhausted in accordance with the New York City Mechanical Code.

**[1203.4.2.1]** **1203.5.2.1 Bathrooms.** Rooms containing bathtubs, showers, spas and similar bathing fixtures in other than Group R and I-1 occupancies shall be mechanically ventilated in accordance with the New York City Mechanical Code, whether or not they are also provided with natural ventilation.
[1203.4.3] **1203.5.3 Openings on yards or courts.** Natural ventilation shall be provided by openings to a public street, space, alley, park, highway, or right-of-way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206. No such opening shall be on a recess of less than 6 feet ([1829] 1828.8 mm) in width.

**Exceptions:**

1. Openings providing natural ventilation to habitable spaces located in basements or cellars shall also comply with the applicable provisions of Sections 27-2081 through 27-2087 of the *New York City Housing Maintenance Code* and Sections 26(8) and 34 of the *New York State Multiple Dwelling Law*.

2. A kitchenette, a bathroom, or a water closet compartment may be located on a recess of less than 6 feet ([1829] 1828.8 mm) in width.

[1203.4.4] **1203.5.4 Measurement of openings.** Dimensions of windows and other openings shall always be taken between stop beads or, if there are no stop beads, between the sides, head, and sill of the sash opening.

[1203.5.] **1203.6 Other ventilation and exhaust systems.** Ventilation and exhaust systems for occupancies and operations involving flammable or combustible hazards or other contaminant sources as covered in the *New York City Mechanical Code* or the *New York City Fire Code* shall be provided as required by both codes.

## SECTION BC 1204
### TEMPERATURE AND HUMIDITY CONTROL

**1204.1 Equipment and systems.** Interior spaces intended for human occupancy shall be provided with active or passive [space heating] space heating systems capable of maintaining [a minimum] an indoor temperature as indicated in Table 1204.1 at a point 3 feet ([914] 914.4 mm) above the finished floor. The heating capacity of heat-producing devices and equipment which are contained in the room and in constant use during occupancy may be deducted from the capacity of the heating system. Portable heating systems shall not be considered as contributing to the capacity of the heating system.

**Exception:** Where specific rooms or spaces are not listed, the temperature shall be determined by the requirements of the listed space to which they most nearly conform or as determined by the registered design professional.

### TABLE 1204.1

</table>

1. Heating systems are not required when occupancy is seasonal and the rooms or buildings are not occupied between November 1st and May 1st of the following year.

2. Heating systems are not required when the processes or activities normally conducted in the space will generate sufficient heat to maintain the prescribed temperatures during the time of occupancy.

3. Spaces where strict process requirements mandate temperatures other than those cited above shall be exempt from the minimum requirements listed in Table 1204.1.

**1204.2 Air conditioning.** Interior spaces intended for human occupancy that are provided with air conditioning shall be provided with active or passive systems that are capable of maintaining 78°F (26°C) at 50-percent relative humidity when the outdoor air temperature is 89°F (32°C) and the coincident wet bulb temperature is 73°F (23°C). Interior spaces without air conditioning shall be provided with mechanical or natural ventilation in compliance with other subsections of this code.
1204.3 Freeze protection. All interior spaces shall be provided with active or passive systems or with methods of construction capable of preventing wet piping systems and vessels from freezing at all times, including permanently installed pipe heat tracing systems.

1204.4 System design. The heating system and air-conditioning system, as applicable, shall be designed to provide sufficient capacity to meet the temperature and humidity requirements of Section 1204 when considering the outdoor air ventilation requirements and all losses in the system and ancillary uses, such as domestic hot water, for which the system is used. The system shall be designed and installed to meet all other applicable provisions of this code.

SECTION BC 1205
LIGHTING

1205.1 General. Every room and space in every building shall be provided with artificial light in accordance with Section 1205.3. Every habitable room and space shall also be provided with natural light by means of exterior glazed openings in accordance with Section 1205.2.

Exceptions: Artificial light need not be provided in rooms or spaces:

1. Occupied exclusively during the daylight hours between 1 hour after sunrise and 1 hour before sunset, and which are provided with natural light meeting the requirements of Section 1205.2; or

2. With less than 40 square feet (3.7 m\(^2\)) of floor area if they are used exclusively for storage purposes or for mechanical facilities containing no rotating or moving parts, no combustion equipment, or no other hazardous equipment.

1205.2 Natural light. Every opening providing required natural light shall be so located so as to properly light all portions of the room. Openings providing required natural light shall be windows or glazed doors.

Exception: Group R-3 occupancies. Skylights, opening directly to the outer air, transparent or translucent panels, or other light-transmitting media, may be substituted for window openings in Group R-3 occupancies provided that they meet the minimum dimensional requirements of Section [1205.2.2] 1205.2.1.

1205.2.1 Minimum opening. The minimum net glazed area shall not be less than 10 percent of the floor area of the room served. Every opening providing required natural light shall be at least 12 square feet (1.1 m\(^2\)) of glazed area.

Exception: For Group R-3 occupancies, the net glazed area shall be not less than 10 percent of the floor area of the room served, or 12 square feet (1.1 m\(^2\)), whichever is greater.

1205.2.2 Adjoining spaces. An alcove or room opening off another room or space shall be considered as a separate room in determining its requirements for natural lighting.

Exceptions:

1. Alcoves within Group R-3 dwelling units. In Group R-3 occupancies, where an
opening between the alcove and the room or space is at least 80 percent of the area of the common wall and the floor area of the alcove does not exceed twice the area of the opening, the alcove and the room opening into the alcove may be considered as a single space.

2. **Balconies, partially enclosed.** Exterior openings required for natural light shall be permitted to open upon a partially enclosed balcony or space above a setback when:

2.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;

2.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;

2.3. The enclosure of the balcony or space is not more than one story in height; and

2.4. The front of a partially enclosed balcony or space above a setback shall be open to the outer air with an open area equal to at least 75 percent of the floor surface area of such balcony or space.

3. **Balconies, fully enclosed.** Exterior openings required for natural lighting shall be permitted to open upon a fully enclosed balcony or space above a setback, including thermally isolated sunroom additions and covered patios, when:

3.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;

3.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the wall forming the partial or full enclosure of the balcony or space;

3.3. The enclosure of the balcony or space is not more than one story in height;

3.4. The building is of Type I or II construction;

3.5. The outer enclosing walls of the balcony or space are glazed with an area at least 50 percent of the area of the interior enclosing walls of such balcony or space; the glazing may be clear plate glass or slow burning plastic;

3.6. At least 50 percent of the glazed area required by Exception 3.5 of this section is openable; and

3.7. No window from any bathroom, toilet room, kitchen or kitchenette shall open on such balcony or space.
4. **Mezzanines and split-level rooms.** Where a habitable mezzanine or portion of a split-level room or space is not directly served by an opening providing natural lighting in accordance with Section 1205.2, such space shall be open for its full width with no obstruction, except for railings, to an adjoining habitable room which is provided with such window or other opening. The floor area of the mezzanine or portion of the split level room or space shall be added to the floor area of the adjoining room to compute the required lighting in accordance with Section 1205.2.1. The combined space shall also comply with Sections 1205.2.4 and 1205.2.7.

**1205.2.3 Basements and cellars.** Where openings provide natural light to habitable spaces located in basements or cellars, such openings shall comply with Sections 1205.2.3.1 through 1205.2.3.2.

**1205.2.3.1 Adequate adjacent space for multiple dwellings.** Where rooms within a dwelling unit in a multiple dwelling are located in a cellar or a basement, such rooms shall have at least one-half of their height and all of their required window surfaces above every part of an “adequate adjacent space.” Such “adequate adjacent space” shall be open to the sky and shall be a continuous surface area not less than 30 feet (9144 mm) in its least dimension abutting at same level or directly below the exterior walls of every part of the basement and cellar portions of such dwelling unit. Such “adequate adjacent space” shall be spaces that are located on the same tax lot or plot in compliance with Section 1206.1 as the building or a public street, space, alley, park, highway or right of way and the level of such areas which abut or adjoin the habitable room shall be at least 6 inches ([152] 152.4 mm) below the window sills of any windows.

**1205.2.3.2 Other applicable laws.** Where openings provide natural lighting to habitable spaces located in basements or cellars, such opening shall comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**1205.2.4 Maximum depth of room.** No part of any room shall be more than 30 feet (9144 mm) from a window opening on a street or yard unless such room also opens onto a legal court in compliance with Section 1206.1.

**Exception:** In dwelling units containing more than three habitable rooms in Group R- 1 or R-2 occupancies in buildings of Type I or II construction, rooms may be greater than 30 feet (9144 mm) in depth provided that all other requirements of Section 1205.2 are met and that the required windows are located so as to properly light all portions of the room.

**1205.2.5 Openings on yards or courts.** Exterior glazed openings shall open directly onto a public street, space, alley, park, highway, or right-of-way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206. No such opening shall be on a recess of less than 6 feet ([1829] 1828.8 mm) in width.

**Exception:** Spaces located in basements or cellars shall also comply with Section 1205.2.3.
1205.2.6 Measurement of glazed areas. Dimensions of windows and other glazed areas shall always be taken between stop beads or, if there are no stop beads, between the sides, head, and sill.

1205.2.7 Height of glazed areas. Height of glazed areas on openings providing natural light shall comply with Sections 1205.2.7.1 and 1205.2.7.2.

1205.2.7.1 Only that portion of glazed areas higher than 30 inches (9144 mm) above the floor shall be considered as providing the required natural lighting.

1205.2.7.2 The top of at least one window or other opening providing required natural lighting to a habitable room shall be a minimum of 7 feet ([2134] 2133.6 mm) above the floor of the room or space served by the window or opening.

**Exception:** Mezzanines. Where the required natural lighting for a habitable mezzanine level is provided by a window(s) on the lower level in accordance with Section 1205.2.2, Exception 4, and where compliance with Section 1205.2.7.2 is not feasible on the mezzanine floor, Section 1205.2.7.2 shall not apply to such mezzanine floor provided that such window(s) is on the opposite wall from the mezzanine, and the top of such window is at least 12 inches ([305] 304.8 mm) above the floor of the mezzanine.

1205.3 Artificial light. Artificial light shall be provided in accordance with Sections 1205.3.1 through 1205.3.5.

1205.3.1 General. Artificial light shall meet the minimum illumination standards set forth in Section 1205.3. Artificial light shall not exceed maximum energy consumption requirements, if applicable, as required by the New York City Energy Conservation Code.

1205.3.2 Rooms and spaces. Artificial light shall be adequate to provide an average illumination of 10 [foot-candles] footcandles (107 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.

1205.3.3 Stairways. Stairways within dwelling units and exterior stairways serving a dwelling unit shall have an illumination level on tread runs of not less than 1 [foot-candle] footcandle (11 lux). Stairs in other occupancies shall be governed by Chapter 10.

1205.3.4 Means of egress. The means of egress shall be illuminated in accordance with Section [1006.1] 1008. Exterior lights near entranceways to multiple dwellings shall also comply with Section 27-2040 of the New York City Housing Maintenance Code.

1205.3.5 Places of assembly. Places of assembly shall be illuminated in accordance with Chapter 10.

1205.4 Reserved.

1205.5 Reserved.
SECTION BC 1206
YARDS AND COURTS

1206.1 General. This section shall apply to yards and courts adjacent to exterior openings that provide required natural light or required natural ventilation. Such yards and courts shall be on the same zoning lot as the building. Where such yard or court is wholly or partially on a different tax lot from the exterior opening which the yard or court serves, a light and air easement or restrictive declaration acceptable to the commissioner shall be recorded against the tax lot or lots where such yard or court is located.

1206.2 Yards. Yards shall [not] be not less than the dimensions prescribed by the New York City Zoning Resolution and other applicable laws, rules, and regulations.

1206.2.1 Rear yard access for multiple dwellings. For multiple dwellings, there shall be direct access from the street to every rear yard through a noncombustible 2-hour fire-resistance-rated passage either in a direct line or through a court, except that the passage may be 1-hour fire-resistance-rated for dwellings not exceeding three stories in height and occupied by not more than two families on any story. Such passage shall be at least 36 inches ([944] 914.4 mm) in clear width and 7 feet ([2134] 2133.6 mm) in height.

Exceptions: No such passage shall be required for:

1. Buildings of Type IA or IB construction.
2. Buildings not exceeding three stories in height, and occupied by not more than one family on any story nor more than three families in all.
3. Buildings not exceeding two stories in height, and occupied by not more than two families on any story nor more than four families in all.

1206.3 Courts. Courts shall not be less than the dimensions prescribed by the New York City Zoning Resolution and other applicable laws, rules and regulations.

1206.3.1 Court access. Access shall be provided to the bottom of courts for cleaning purposes.

1206.3.2 Air intake.Courts more than two stories in height shall be provided with a horizontal air intake at the bottom not less than 10 square feet (0.93 m²) in area and leading to the exterior of the building unless abutting a yard or public way.

Exception: For multiple dwellings more than two stories in height, an air intake with a vertical cross-sectional area of 21 square feet (1.95 m²) and a least minimum dimension of 3 feet ([914] 914.4 mm) shall be provided at or near the lowest level of any court, in accordance with Section 26(7)(a) of the New York State Multiple Dwelling Law.

1206.3.3 Court drainage. The bottom of every court shall be properly graded and drained to a public sewer or other approved disposal system complying with the New York City Plumbing Code. For Group R and I-1 occupancies, such grading and drainage shall also comply with Section 27-2027 of the New York City Housing Maintenance Code. For Group R-1, R-2 and I-1
occupancies, such grading and drainage shall also comply with Section 77 of the New York State Multiple Dwelling Law.

1206.3.4 Court walls for multiple dwellings. All walls enclosing courts of multiple dwellings shall be of light colored materials or shall be painted a light color.

Exceptions:

1. Outer courts that open to a street.

2. Courts that exceed the minimum dimension set forth in the New York City Zoning Resolution by at least 50 percent.

1206.4 Lighting in courts and yards. In Group I-1, R-1 or R-2 occupancies, all yards and courts shall be artificially illuminated with a minimum intensity of not less than 1 foot-candle (11 lux) measured 30 inches (762 mm) above the floor of the lowest level of such yards or courts.

Exception: Such lighting is not required in an inner court that is accessible only from the interior of the building and to which access is restricted for clean-out purposes.

SECTION BC 1207
SOUND TRANSMISSION

1207.1 Scope. This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent dwelling units, between dwelling units and adjacent mechanical equipment spaces, or between dwelling units and adjacent occupancies, and public areas such as halls, corridors, stairs or service areas.

1207.2 Air-borne sound. Walls, partitions and floor/ceiling assemblies separating dwelling units from each other, from adjacent occupancies, from public or service areas, from stairs or from mechanical equipment spaces, including boiler rooms, or elevator or other shafts shall have a sound transmission class (STC) for air-borne noise of not less than 50 based upon laboratory measurements made in accordance with ASTM E 90, or not less than 45 if field tested in accordance with ASTM E 336. Dwelling unit entrance doors shall be installed of assemblies having an STC of not less than 30 based upon laboratory measurements made in accordance with ASTM E 90. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings.

1207.2.1 Masonry. The sound transmission class of concrete masonry and clay masonry assemblies shall be calculated in accordance with TMS 0302 or determined through testing in accordance with ASTM E 90.

1207.2.2 Machine and equipment rooms. Elevator machine rooms and machinery spaces containing equipment totaling more than 75 rated h.p. shall not be located vertically or horizontally adjacent to dwelling units unless the total sound pressure level output of all the equipment in the machine room or space is certified not to exceed the maximum sound pressure levels of Table 1207.2.1 in any octave band.
TABLE 1207.2.1
MAXIMUM SOUND PRESSURE LEVELS FOR MACHINE ROOMS ADJACENT TO DWELLING UNITS, MEASURED IN THE DWELLING UNIT

</table>

a. The maximum sound pressure levels shall be reduced [five] 5 dB in any octave band where the equipment data indicate pure tone generation. The presence of pure tones may be determined by means of one-third octave band analysis. The criterion for a significant pure tone component shall be an audible pure-tone sound together with an increase of the sound pressure level in the corresponding one-third octave band above the mean of the two adjacent one-third of at least:

<table>
<thead>

1207.3 Structure-borne sound. Floor/ceiling assemblies between dwelling units or sleeping units or between a dwelling unit or sleeping unit and a public or service area stair, exterior mechanical equipment, or other mechanical equipment space, including boiler rooms, shall be constructed of assemblies having an impact insulation class (IIC) rating of not less than 50 based upon laboratory measurements made in accordance with ASTM E 492, or not less than 45 if field tested in accordance with ASTM E 1007 in completed construction. See Chapter 30 of this code for additional sound control requirements for elevator machinery.

1207.3.1 Refuse chutes. Metal refuse chutes, metal chute supports, and [or] metal chute bracing shall be free of direct contact with the shaft enclosure and the openings provided in the floor construction. Metal chutes shall be resiliently supported at each structural support location.
Isolators shall provide a minimum static deflection of 0.3 inches (7.62 mm). All chutes shall be plumb.

1207.4 Field testing. Where conditions indicate that the installed construction or equipment does not meet the noise control prescribed in Section 1207, measurements shall be taken to determine conformance or nonconformance.

SECTION BC 1208
INTERIOR SPACE DIMENSIONS

1208.1 Minimum room widths. Habitable spaces, other than a kitchen, shall [not] be not less than 8 feet ([2438] 2438.4 mm) in any plan dimension. Kitchens and kitchenettes shall have a clear passageway of not less than 3 feet ([914] 914.4 mm) between counter fronts and appliances or counter fronts and walls.

Exceptions:

1. A room that complies with the requirements for natural light and natural ventilation and in addition has an unobstructed opening of not less than 60 square feet (5.6 m²) into an immediately adjoining room shall [not] be not less than 7 feet ([2134] 2133.6 mm) in any plan dimension.

2. A habitable dining space that complies with the requirements for natural light and natural ventilation may be less than 8 feet ([2438] 2438.4 mm) in any plan dimension.

3. One-half the number of bedrooms in a dwelling unit containing three or more bedrooms shall [not] be not less than 7 feet ([2134] 2133.6 mm) in any plan dimension.

4. A room in a Group R-1 dwelling or sleeping unit shall [not] be not less than 6 feet ([1829] 1828.8 mm) in any plan dimension.

1208.2 Minimum ceiling heights. Habitable rooms and spaces shall have a ceiling height of not less than 8 feet ([2438] 2438.4 mm). Occupiable spaces and corridors shall have a ceiling height of not less than 7 feet 6 inches (2286 mm). Bathrooms, toilet rooms, kitchens in other than Group I-1 and R occupancies, kitchenettes in Group I-1 or R occupancies, storage rooms and laundry rooms shall [be permitted to] have a ceiling height of not less than 7 feet ([2134] 2133.6 mm). All measurements shall be taken from the finished floor to the finished underside of the ceiling or ceiling beams.

Exceptions:

1. In one- and two-family dwellings, beams or girders spaced not less than 4 feet ([1220] 1220 mm) on center may project not more than 6 inches ([152] 152.4 mm) below the required ceiling height, provided that a clear height of 7 feet ([2134] 2133.6 mm) is maintained.

2. Habitable rooms in basements of one- or two-family dwellings, including any projecting beams, shall have a ceiling height of not less than 7 feet ([2134] 2133.6 mm).
3. Habitable rooms in basements of multiple dwellings may have as many as four beams crossing the ceiling if none of the beams exceeds 12 inches ([305] 304.8 mm) in width or extends below the ceiling more than 6 inches ([452] 152.4 mm).

4. Spaces above and below a mezzanine, other than habitable spaces, shall have a ceiling height of not less than 7 feet ([2134] 2133.6 mm).

1208.2.1 Furred ceiling. Any room with a furred ceiling shall be required to have the minimum ceiling height in two-thirds of the area thereof, but in no case shall the height of the furred ceiling be less than 7 feet ([2134] 2133.6 mm).

Exception: Minimum ceiling heights of habitable rooms and spaces shall not be not less than established in Section 1208.2.

1208.3 Room area. Minimum net floor areas of rooms shall be in accordance with Sections 1208.3.1 and 1208.3.2.

1208.3.1 Habitable rooms and spaces. Every habitable room or space shall have not less than 80 square feet (7.4 m²) in net floor area.

Exceptions:

1. A room that complies with the requirements for natural light and natural ventilation and in addition has an unobstructed opening of not less than 60 square feet (5.6 m²) into an immediately adjoining room shall have not less than 70 square feet (6.5 m²) of net floor area.

2. A habitable dining space, as defined by the New York City Housing Maintenance Code, that complies with the requirements for natural light and natural ventilation may have less than 80 square feet (7.4 m²) of net floor area.

3. A room in a Group R-1 dwelling unit shall have not less than 60 square feet (5.6 m²) of net floor area.

1208.3.2 Dwelling units. In a dwelling unit, at least one habitable room shall have not less than 150 square feet (13.9 m) of net floor area.

Exception: Group R-1 dwelling or sleeping units.

1208.3.2.1. Single room occupancy of a single room. Where a single room within a dwelling unit is used for single room occupancy, as such term is used in Section 27-2074(e) of the New York City Housing Maintenance Code, such room shall have not less than 150 square feet (13.9 m²) of net floor area.

1208.3.2.2 Single room occupancy of a suite of rooms. Where two or more rooms, joined together and separated from all other rooms within a dwelling unit, are used for single room occupancy, as such term is used in Section 27-2074(e) of the New York City Housing Maintenance Code, at least one of such separated rooms shall have not less than 150 square feet (13.9 m²) of net floor area.
1208.4 Reserved.

SECTION BC 1209
ACCESS TO UNOCCUPIED SPACES

1209.1 Crawl spaces. Crawl spaces shall be provided with a minimum of not fewer than one access opening that shall be not less than 18 inches by 24 inches (457.2 mm by 609.6 mm). All crawl spaces shall have a minimum clear height of 18 inches (457.2 mm).

1209.2 Attic spaces. An opening not less than 20 inches by 30 inches (508 mm by 762 mm) shall be provided to any attic area having a clear height of over 30 inches (762 mm). [A] Clear headroom of not less than 30 inches (762 mm) [minimum clear headroom] shall be provided in the attic space [shall be provided] at or above the access opening.

1209.3 Mechanical appliances. Access to mechanical appliances installed in under-floor areas, in attic spaces and on roofs or elevated structures shall be in accordance with the New York City Mechanical Code.

SECTION BC 1210
[SURROUNDING MATERIALS] TOILET AND BATHROOM REQUIREMENTS

1210.1 Required fixtures. The number and type of plumbing fixtures provided in any occupancy shall comply with the New York City Plumbing Code.

1210.2 Finish materials. Walls, floors and partitions in toilet and bathrooms shall comply with Sections 1210.2.1 through 1210.2.4.

1210.2.1 Floors and wall [base-finish-materials] bases. [Toilet,] In other than dwelling units, toilet, bathing[;] and shower room floor finish materials shall have a smooth, hard, nonabsorbent surface. The intersections of such floors with walls shall have a smooth, hard, nonabsorbent vertical base that extends upward onto the walls [at least] not less than 4 inches (101.6 mm).

Exception: [Occupancy Classes] Group I-1, R-1 and R-2 occupancies shall have a vertical base that extends upward onto walls at least 6 inches (152.4 mm).

[1210.2] 1210.2.2 Walls and partitions. Walls and partitions within 2 feet (609.6 mm) of service sinks, urinals and water closets shall have a smooth, hard, nonabsorbent surface, to a height of not less than 4 feet (1220 mm) above the floor, and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture.

Exceptions:

1. Dwelling units.

2. Toilet rooms that are not accessible to the public and [which] that have not more than one water closet.

Accessories such as grab bars, towel bars, paper dispensers and soap dishes, provided on or within walls, shall be installed and sealed to protect structural elements from moisture.
1210.3 Showers. Shower compartments and walls above bathtubs with installed shower heads shall be finished with a smooth, nonabsorbent surface to a height not less than 72 inches (1828.8 mm) above the drain inlet.

1210.4 Waterproof joints. Built-in tubs with showers shall have waterproof joints between the tub and adjacent wall.

1210.3 Privacy. Privacy at water closets and urinals shall be provided in accordance with Sections 1210.3.1 and 1210.3.2.

1210.3.1 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures for privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.

2. Toilet rooms located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.

3. This provision is not applicable to toilet areas located within Group I-3 occupancy housing areas.

1210.3.2 Urinal partitions. Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. The walls or partitions shall begin at a height not more than 12 inches (304.8 mm) from and extend not less than 60 inches (1524 mm) above the finished floor surface. The walls or partitions shall extend from the wall surface at each side of the urinal not less than 18 inches (457.2 mm) or to a point not less than 6 inches (152.4 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater.

Exceptions:

1. Urinal partitions shall not be required in a single-occupant or family or assisted-use toilet room with a lockable door.

2. Toilet rooms located in child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

1210.4 Toilet rooms. Toilet rooms shall not open directly into a room used for the preparation of food for service to the public. In multiple dwellings no toilet room or bathroom shall open onto any kitchen or kitchenette.
SECTION BC 1211
KITCHENS AND KITCHENETTES

1211.1 Sleeping. No kitchen or kitchenette shall be occupied for sleeping purposes.

1211.2 Kitchenettes in multiple dwellings. Except at entrances thereto, every kitchenette in a multiple dwelling shall be surrounded by partitions extending from floor to ceiling, and/or by a soffit dropped 1 foot (304.8 mm) from the ceiling.

SECTION BC 1212
RODENT-PROOFING

1212.1 General. Rodentproofing shall be in accordance with Appendix F.

SECTION BC 1213
REFUSE AND RECYCLABLE STORAGE

1213.1 General. Multiple dwellings shall comply with Section 81 of the New York State Multiple Dwelling Law and Section 27-2021 of the New York City Housing Maintenance Code. In Group R-2 occupancies, space shall be provided for the storage of refuse and recyclables as a common accessory space. The location of such refuse and recyclables storage space shall be clearly identified on the construction documents and configured to permit separate unobstructed access by building personnel to stored refuse and recyclables. Such refuse and recyclables storage space shall be a minimum of 1.5 square feet (0.140 m²) per dwelling unit, or a minimum of 350 square feet (32.516 m²), whichever is less, for the storage of collected refuse and recyclables.

Exceptions:

1. In multiple dwellings required to have a compactor in accordance with Section 1213.2, such refuse and recyclables storage space shall be, in addition to space required for equipment or circulation, a minimum of 1.0 square foot (0.094 m²) per dwelling unit, or a minimum of 350 square feet (32.516 m²), whichever is less, for the storage of collected refuse and recyclables.

2. Refuse and recyclables storage space shall not be required in multiple dwellings equipped with a chute system that provides for source separation of refuse and recyclable materials without cross contamination and an integrated mechanical system to transport such materials off-site that has been approved by the commissioner.

1213.1.1 Interior space. Where an interior room is provided for the storage of refuse and recyclables, such room shall be completely enclosed by construction that has a fire-resistance rating of not less than 2 hours, with self-closing opening protective having a fire protection rating of not less than 1½ hours.

1213.1.2 Exterior space. Where space is provided on the exterior of a building for the storage of refuse and recyclables, such refuse and recyclables storage space shall include a minimum of 4 square feet (0.372 m²) in addition to the space per dwelling unit required by Section 1213.1, shall
be clearly identified on the construction documents, and shall not be located in the public right-of-way.

1213.2 Compactor. A refuse compacting system shall be provided in multiple dwellings in a Group I-1 or R-2 occupancy that are four or more stories in height and contain 12 or more dwelling units, and in buildings of any size occupied as a Group R-1 multiple dwelling. Such system shall be located within a refuse storage room constructed in accordance with Section 1213.1 or in a refuse chute termination room constructed in accordance with Section 713.13.4. The floor within such room shall be constructed of concrete and shall be sloped to a floor drain connected to the building sewer. A hose connection shall be provided within such room.

1213.3 Refuse chute. A multiple dwelling that is five or more stories in height and that contains 9 or more dwelling units shall be provided with a refuse chute, refuse chute access rooms, and refuse chute termination room constructed in accordance with Section 713.13. A minimum of 5 square feet (0.470 m²) of floor area within each refuse chute access room shall be provided for the temporary holding of recyclables. Such floor area shall be clearly identified on the construction documents. In Group I-1 and R-1 occupancies, access to the chute access room shall be permitted to be restricted to employees provided that separate refuse storage rooms are located on each story for general occupant use.

Exceptions:

1. In buildings without an elevator, floor area within refuse chute access rooms for the temporary holding of recyclables is not required.

2. In buildings equipped with separate chutes designated for refuse, for paper and cardboard, and for metal, glass and plastic, and in buildings equipped with a chute system that provides for source separation of recyclable materials without cross contamination, floor area within refuse chute access rooms for the temporary holding of recyclables is not required. Chutes for designated recyclable materials shall be constructed in accordance with Section 713.13.13 of this code.

3. The refuse chute and the occupant use storage rooms shall not be required in transient hotels meeting the following requirements:

   3.1. the refuse is removed from rooms by a daily cleaning service, with the staff using a service elevator that is not accessed by hotel guests;

   3.2. the building is of [Group Type I or [Group Type II construction; or

   3.3. a compactor and refuse storage room is provided in accordance with Section 1213.2.

1213.3.1 Refuse chute access room floor and wall base finish materials. Refuse chute access rooms shall have a smooth, hard and nonabsorbent surface. The intersection of such floors with walls shall have a smooth, hard and nonabsorbent vertical base that extends upward onto the walls at least 4 inches (101.6 mm).
§ 15. Chapter 14 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 14
EXTERIOR WALLS

SECTION BC 1401
GENERAL

1401.1 Scope. The provisions of this chapter shall establish the minimum requirements for exterior: walls; wall coverings; wall openings; windows and doors; architectural trim; balconies; projections; and other appendages.

1401.2 Construction documents. Construction documents for exterior wall coverings required to be tested in accordance with NFPA 285 pursuant to this code shall include the following data and information:

1. Design documentation of the NFPA 285 tested assembly from the manufacturer shall be included in the construction documents. This shall include section and elevation drawings that identify materials and components of the tested assembly, including panel sizes and joint locations. All components used in the tested assembly shall be clearly identified. Material thicknesses, relative locations of components and offsets shall be fully dimensioned.

2. Information shall be provided for verification in accordance with Sections 1706.16 and 1705.20 special inspections.

3. A certification by the applicant that “Any deviation which occurs during the course of installation will be evaluated and approved by the applicant of record or registered design professional. No deviation shall be approved that would result in an assembly that would otherwise fail to pass the acceptance criteria of NFPA 285.”

SECTION BC 1402
DEFINITIONS

1402.1 [General] Definitions. The following [words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.] terms are defined in Chapter 2:

ADHERED MASONRY VENEER. [Veneer secured and supported through the adhesion of an approved bonding material applied to an approved backing.]

ANCHORED MASONRY VENEER. [Veneer secured with approved mechanical fasteners to an approved backing.]

BACKING. [The wall or surface to which the veneer is secured.]

BIRD FRIENDLY MATERIAL. [A material or assembly that has, or has been treated to have a maximum threat factor of 25 in accordance with the American Bird Conservancy Bird Collision Deterrence Material Threat Factor Reference Standard, or with the American Bird Conservancy Bird--
BIRD HAZARD INSTALLATIONS. [Monolithic glazing installations that provide a clear line of sight on the exterior of buildings, including, but not limited to, glass awnings, glass handrails and guards, glass wind break panels, or glass acoustic barriers.]

CURTAIN WALL.[A curtain wall or panel wall system is a nonload-bearing building wall, in skeleton frame construction attached and supported to the structure at every floor or other periodic locations. Assemblies may include glass, metal, precast concrete or masonry elements arranged so as not to exert common action under load and to move independently of each other and the supporting structure.]

EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS). [EIFS are nonstructural, nonload-bearing, exterior wall cladding systems that consist of an insulation board attached either adhesively or mechanically, or both, to the substrate, an integrally reinforced base coat and a textured protective finish coat.]

EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS) WITH DRAINAGE. [An EIFS that incorporates a means of drainage applied over a water-resistive barrier.]

EXTERIOR WALL. [A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.]

EXTERIOR WALL COVERING. [A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding, exterior insulation and finish systems, architectural trim and embellishments such as cornices, soffits, facias, gutters and leaders.]

EXTERIOR WALL ENVELOPE. [A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.]

FENESTRATION.

[FIBER-CEMENT SIDING. A manufactured, fiber-reinforcing product made with an inorganic hydraulic or calcium silicate binder formed by chemical reaction and reinforced with discrete organic or inorganic nonasbestos fibers, or both. Additives that enhance manufacturing or product performance are permitted. Fiber cement siding products have either smooth or textured faces and are intended for exterior wall and related applications.] FIBER-CEMENT SIDING.

FLY-THROUGH CONDITIONS. [One or more panels of glass that provide a clear line of sight through such elements creating the illusion of a void leading to the other side, including parallel glass elements, at a distance of 17 feet (5182 mm) or less, or a convergence of glass sides creating a perpendicular, acute or obtuse corner.]
HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATE (HPL).

METAL COMPOSITE MATERIAL (MCM). [A factory-manufactured panel consisting of metal skins bonded to both faces of a plastic core.]

METAL COMPOSITE MATERIAL (MCM) SYSTEM. [An exterior wall covering fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.]

POLYPROPYLENE SIDING.

PORCELAIN TILE.

VENEER. [A facing attached to a wall for the purpose of providing ornamentation, protection or insulation, but not counted as adding strength to the wall. Veneers are nonstructural in that they do not carry any load other than their own weight.]

VINYL SIDING. [A shaped material, made principally from rigid polyvinyl chloride (PVC) that is used as an exterior wall covering.]

WATER-RESISTIVE BARRIER. [A material behind an exterior wall covering that is intended to resist liquid water that has penetrated behind the exterior wall covering from further intruding into the exterior wall assembly.]

SECTION BC 1403
PERFORMANCE REQUIREMENTS

1403.1 General. The provisions of this section shall apply to exterior walls, exterior wall coverings and components thereof.

1403.2 Weather protection. Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing, as described in Section 1405.4. The exterior wall envelope shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a water-resistive barrier behind the exterior veneer, as described in Section 1404.2, and a means for draining water that enters the assembly to the exterior. Protection against condensation shall be provided as required.

Exceptions:

1. A weather-resistant exterior wall envelope shall not be required over concrete and masonry walls[7] designed to resist water penetration and detrimental effects from freeze/thaw cycling and in accordance with Chapters 19 and 21 of this code, as applicable.

2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1404.2 and 1405.4 of this code, shall not be required for an exterior wall envelope that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions:
2.1. Exterior wall envelope test assemblies shall include at least one opening, one control joint, and where required, one wall/eave interface and one wall sill. [All tested] Tested openings and penetrations shall be representative of the intended end-use configuration.

2.2. Exterior wall envelope test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438.4 mm) in size.

2.3. Exterior wall envelope assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m\(^2\)) for a duration of 2 hours. The exterior wall envelope assemblies shall also be tested at a minimum differential pressure not less than 20 percent of the positive design wind load as calculated per Chapter 16, or 15 pounds per square foot (psf) (0.718 kN/m\(^2\)) for a duration of 15 minutes.

2.4. The exterior wall envelope design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate the test assembly including control joints in the exterior wall envelope, joints at the perimeter of openings\(^3\) or intersections of terminations with dissimilar materials.

3. Exterior insulation and finish systems (EIFS) complying with Section 1408.4.1.

1403.3 Structural. Exterior wall envelope, and the associated openings, shall be designed and constructed to resist safely the superimposed loads required by Chapter 16.

1403.4 Fire resistance. Exterior wall envelope shall be fire-resistance rated as required by other sections of this code with opening protection as required by Chapter 7.

1403.5 Vertical and lateral flame propagation. Exterior walls that contain foam plastic insulation including exterior insulation and finish systems (EIFS), metal composite material (MCM) systems, high-pressure decorative exterior-grade compact laminates (HPL), and fiber-reinforced polymer (FRP) shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. Foam plastic insulation assemblies and FRP shall be tested in accordance with Section 2603.5.5. MCM systems shall be tested in accordance with Section 1407.11. HPL systems shall be tested in accordance with Section 1409.11. Approved NFPA 285 tested assembly design documentation shall be included on the submitted construction documents complying with Section 1401.2. Deviation from the NFPA 285 tested design shall be approved by the registered design professional and additional documentation shall be provided if requested by the department. Combustible exterior wall coverings shall comply with Section 1406 of this code.

Exception: Fiber-reinforced polymer (FRP) where permitted by Section 2613.5 not to be tested.

1403.5.1 Exterior walls with water-resistive barriers. Exterior walls on buildings of Type I, II, III, or IV construction that are greater than 40 feet (12 192 mm) in height above grade plane and contain a combustible water-resistive barrier shall be tested in accordance with and comply with the acceptance criteria of NFPA 285. For the purposes of this section, fenestration products and flashing of fenestration products and water-resistive barrier flashing and accessories at other
locations, including through wall flashings and attachment accessories, shall not be considered part of the water-resistive barrier.

**Exceptions:**

1. Walls in which the water-resistive barrier is the only combustible component and the exterior wall has a wall covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1405.2 of this code.

2. Walls in which the water-resistive barrier is the only combustible component and the water-resistive barrier has a peak heat release rate of less than 150 kW/m² (203.9 hp/m²), a total heat release of less than 20 MJ/m² (18 956 BTU/m²) and an effective heat of combustion of less than 18 MJ/kg (17 060 BTU/lb) as determined in accordance with ASTM E 1354 and has a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723. The ASTM E 1354 test shall be conducted on specimens at the thickness intended for use, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m².

**1403.6 Flood resistance.** For buildings in areas of special flood hazard areas, the exterior wall envelope extending below the design flood elevation shall be resistant to water damage and shall comply with Appendix G.

**1403.7 Thermal and condensation resistance.** The exterior wall envelope shall be designed and constructed for thermal and condensation resistance as necessary to meet the requirements of the *New York City Energy Conservation Code*.

**1403.8 Bird friendly materials.** Bird friendly materials shall be required in accordance with Sections 1403.8.1 through 1403.8.4.

**1403.8.1 Exterior wall envelope.** The exterior wall envelope, and any associated openings, shall be constructed with bird friendly materials up to 75 feet (22 860 mm) above grade. Materials other than bird friendly materials shall not exceed an aggregate of 10 square feet (0.93 m²) within any 10 feet (3048 mm) by 10 feet (3048 mm) square area of exterior wall below 75 feet (22 860 mm) above grade.

**Exceptions:**

1. Where ground floor transparency is required by the *New York City Zoning Resolution*, transparent bird friendly material with a UV-reflective pattern and a maximum threat factor of 27 shall be provided.

2. In areas of special flood hazard and shaded X-Zones where flood resistant glazing is proposed and ground floor transparency is required by the *New York City Zoning Resolution*, transparent bird friendly material with a UV-reflective pattern and a maximum threat factor of 36 shall be provided.

**1403.8.2 Bird hazard installations.** Bird hazard installations shall be constructed of bird friendly materials regardless of their height above grade.
1403.8.3 **Fly-through conditions.** Fly-through conditions located 75 feet (22,860 mm) or less above grade shall be constructed with bird friendly materials.

1403.8.4 **Adjacency to green roofs.** The exterior wall envelope, and any associated openings, installed adjacent to a green roof system on the same building shall be constructed with bird friendly materials up to 12 feet ([3658] 3,657.6 mm) above the walking surface.

1403.9 **Air barrier.** The exterior wall envelope shall be designed and constructed with an air barrier as necessary to meet the requirements of the *New York City Energy Conservation Code* and this code.

**SECTION BC 1404 MATERIALS**

1404.1 **General.** Materials used for the construction of exterior walls shall comply with the provisions of this section. Materials not prescribed herein shall be permitted, provided that any such alternative has been approved.

1404.2 **Water-resistive barrier.** (A minimum of) Not fewer than one layer of No. 15 asphalt felt[,] complying with ASTM D 226 for Type 1 felt[,] or other approved materials[,] shall be attached to the studs or sheathing, with flashing as described in Section 1405.4 of this code, in such a manner as to provide a continuous water-resistive barrier behind the exterior wall veneer. Combustible water-resistive barriers shall comply with special inspection requirements of Chapter 17 of this code.

1404.3 **Wood.** Exterior walls of wood construction shall be designed and constructed in accordance with Chapter 23.

1404.3.1 **Basic hardboard.** Basic hardboard shall conform to the requirements of [AHA] ANSI A135.4.

1404.3.2 **Hardboard siding.** Hardboard siding shall conform to the requirements of [AHA] ANSI A135.6 and, where used structurally, shall be so identified by the label of an approved agency.

1404.4 **Masonry.** Exterior walls of masonry construction shall be designed and constructed in accordance with this chapter and Chapter 21. Masonry units, mortar and metal accessories used in anchored and adhered veneer shall meet the physical requirements of Chapter 21. The backing of anchored and adhered veneer shall be of concrete, masonry, steel framing or wood framing. Continuous insulation meeting the applicable requirements of this code shall be permitted between the backing and the masonry veneer.

1404.5 **Metal.** Exterior walls [of formed steel construction, structural steel or lightweight metal alloys] constructed of cold-formed steel, structural steel or aluminum shall be designed in accordance with Chapters [22 and 20] 20 and 22, as applicable.

1404.5.1 **Aluminum siding.** Aluminum siding shall conform to the requirements of AAMA 1402.

1404.5.2 **Cold-rolled copper.** Copper shall conform to the requirements of ASTM B 370.
1404.5.3 Lead-coated copper. Lead-coated copper shall conform to the requirements of ASTM B 101.

1404.6 Concrete. Exterior walls of concrete construction shall be designed and constructed in accordance with Chapter 19.

1404.7 Glass-unit masonry. Exterior walls of glass-unit masonry shall be designed and constructed in accordance with Chapter 21.

1404.8 Plastics. Plastic panel, apron or spandrel walls as defined in this code shall not be limited in thickness, provided that such plastics and their assemblies conform to the requirements of Chapter 26 and other applicable requirements of this chapter, and are constructed of approved weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16.

1404.9 Vinyl siding. Vinyl siding shall be certified and labeled as conforming to the requirements of ASTM D 3679 by an approved agency.

1404.10 Fiber-cement siding. Fiber-cement siding shall conform to the requirements of ASTM C 1186, Type A, or ISO 8336, Category A, and shall be so identified on labeling listing an approved agency.

1404.11 Exterior insulation finish system (EIFS). EIFS shall be designed and constructed in accordance with Section 1408.

1404.12 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of ASTM D 7254 and those of Section 1404.12.1 or 1404.12.2 of this code by an approved agency. Polypropylene siding shall be installed in accordance with manufacturer’s instructions and the requirements of Section 1405.18 of this code. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1404.12.1 Flame spread index. The certification of the flame spread index shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E 84 or UL 723.

1404.12.2 Distance between adjacent buildings. The distance between a building with polypropylene siding and the adjacent building shall be not less than 10 feet (3048 mm).

1404.13 Foam plastic insulation. Foam plastic insulation used in exterior wall covering assemblies shall comply with Chapter 26 and be fireblocked in accordance with Section 718.2.6.1.

SECTION BC 1405
INSTALLATION OF WALL COVERINGS

1405.1 General. Exterior wall coverings shall be designed and constructed in accordance with the applicable provisions of this section. Installations not prescribed herein shall be permitted, provided that such alternative has been approved. Installations shall be in accordance with approved construction documents where a permit is required. Installations of exterior wall coverings shall comply with the special inspection requirements of Chapter 17.
**1405.2 Weather protection.** [Exterior] The exterior wall envelope shall provide weather protection for the building. The materials of the minimum nominal thickness specified in Table 1405.2 shall be acceptable as approved weather coverings.

**Exception:** Weather coverings not meeting the minimum nominal thicknesses specified in Table 1405.2 shall be permitted provided such alternative has been approved.

For SI: 1 inch = 25.4 mm, 1 ounce = 28.35 g, 1 square foot = 0.093 m².
1133

a. Wood siding of thicknesses less than 0.5 inch shall be placed over sheathing that conforms to Section 2304.6.
b. Exclusive of texture.
c. As measured at the bottom of decorative grooves.
d. 16 ounces per square foot for cold-rolled copper and lead-coated copper, 12 ounces per square foot for copper shingles, high-yield copper and lead-coated high-yield copper.

*Veneer units in this group shall be of an approved type and not be greater than 2 inches in thickness.

1405.3 Vapor retarders. [Class I or II vapor retarders shall be provided on the interior side of frame walls in Zones 5, 6, 7, 8 and Marine 4.] Vapor retarders as described in Section 1405.3.3 shall be provided based on an approved design using accepted engineering practice for hygrothermal analysis.

[Exceptions:]

[1. Basement walls.]

[2. Below-grade portion of any wall.]

[3. Construction where moisture or its freezing will not damage materials.]

1405.3.1 [Class III vapor retarders. Class III vapor retarders shall be permitted where any one of the conditions in Table 1405.3.1 is met.] Reserved.

For SI: 1 pound per cubic foot = 16 kg/m³.

a. Spray foam with a minimum density of 2 lbs/ft³ as applied to the interior cavity side of OSB, plywood, fiberboard, insulating sheathing or gypsum is deemed to meet the insulating sheathing requirement where the spray foam R-value meets or exceeds the specified insulating sheathing R-value.]

1405.3.2 Reserved.

1405.3.3 Material vapor retarder class. The vapor retarder class shall be based on the manufacturer’s certified testing or a tested assembly.

The following shall be deemed to meet the class specified:
1. Class I:  Sheet polyethylene, non-perforated aluminum foil with a perm rating of less than or equal to 0.1.

2. Class II:  Kraft-faced fiberglass batts or paint with a perm rating greater than 0.1 and less than or equal to 1.0.

3. Class III:  Latex or enamel paint with a perm rating of greater than 1.0 and less than or equal to 10.0.

1405.3.4 Minimum clear airspaces and vented openings for vented cladding.  For the purposes of this section, vented cladding shall include the following minimum clear airspaces:

1. Vinyl lap or horizontal aluminum siding applied over a weather-resistive barrier as specified in this chapter.

2. Brick veneer with a clear airspace as specified in this code.

3. Other approved vented claddings.

1405.4 Flashing.  Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect moisture to the exterior. Flashing shall be installed where required at the perimeters of exterior door and window assemblies, penetrations and terminations of exterior wall assemblies, exterior wall intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting trim.

1405.4.1 Exterior wall pockets.  In exterior walls of buildings or structures, wall pockets or crevices in which moisture can accumulate shall be avoided or protected with caps or drips, or other approved means shall be provided to prevent water damage.

1405.4.2 Masonry.  Flashing and weepholes in anchored veneer shall be located in the first course of masonry above finished ground level above the foundation wall or slab, and other points of support, including structural floors, shelf angles and lintels where anchored veneers are designed in accordance with Section 1405.6.

1405.5 Wood veneers.  Wood veneers on exterior walls of buildings of Type I, II, III and IV construction shall be not less than 1-inch (25 mm) nominal thickness, 0.438-inch (11.1 mm) exterior hardboard siding or 0.375-inch (9.5 mm) exterior-type wood structural panels or particleboard and shall conform to the following:

1. The veneer shall not exceed 40 feet (12 190 mm) in height above grade. Where fire-retardant-treated wood is used, the height shall not exceed 60 feet (18 290 mm) in height above grade.

2. The veneer is attached to or furred from a noncombustible backing that is fire-resistance rated as required by other provisions of this code.

3. Where open or spaced wood veneers (without concealed spaces) are used, they shall not project more than 24 inches (609.6 mm) from the building wall.
1405.6 Anchored masonry veneer. Anchored masonry veneer shall comply with the provisions of Sections 1405.6, 1405.7, 1405.8, and 1405.9 and Sections 12.1 [F1] and 12.2 [F2] of TMS 402/ACI 530/ASCE 5, as modified by Chapter 21 of this code.

1405.6.1 Tolerances. Anchored masonry veneers in accordance with Chapter 14 are not required to meet the tolerances in Article 3.3 [F1] of TMS 602 [ACI 530/ASCE 6].

1405.6.2 Seismic requirements. Anchored masonry veneer located in Seismic Design Category C or D shall conform to the requirements of Section 6.2.2.10 of TMS 402/ACI 530/ASCE 5, as modified by Chapter 21 of this code. [Anchored masonry veneer located in Seismic Design Category D shall also conform to the requirements of Section 6.2.2.10.3.3 of TMS 402/ACI 530/ASCE 5.]

1405.7 Stone veneer. Stone Anchored stone veneer units not exceeding 10 inches (254 mm) in thickness shall be anchored directly to masonry, concrete or to stud construction by one of the following methods:

1. With concrete or masonry backing, anchor ties shall be not less than 0.1055-inch (2.68 mm) corrosion-resistant wire, or approved equal, formed beyond the base of the backing. The legs of the loops shall be not less than 6 inches (152 [152.4] mm) in length bent at right angles and laid in the mortar joint, and spaced so that the eyes or loops are 12 inches (305 [304.8] mm) maximum on center [(o.c.)] in both directions. There shall be provided not less than a 0.1055-inch (2.68 mm) corrosion-resistant wire tie, or approved equal, threaded through the exposed loops for every 2 square feet (0.2 m²) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that [it] the tie will lie in the stone veneer mortar joint. The last 2 inches ([51] 50.8 mm) of each wire leg shall have a right-angle bend. One-inch ([25] 25.4 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer.

2. With wood stud backing, a 2-inch by 2-inch ([54] 50.8 mm by [54] 50.8 mm) 0.0625-inch (1.59 mm) [corrosion-resistant] zinc-coated or nonmetallic coated wire mesh with two layers of [water-resistive] water-resistive barrier in accordance with Section 1404.2 shall be applied directly to wood studs spaced [a maximum of] not more than 16 inches (406 [406.4] mm) [o.e.] on center. On studs, the mesh shall be attached with 2-inch [long] ([54] 50.8 mm) long corrosion-resistant steel wire furring nails at 4 inches ([102] 101.6 mm) [o.e.] on center providing a minimum 1.125-inch ([29] 28.58 mm) penetration into each stud and with 8d (0.120 in. diameter) [common] annular threaded nails at 8 inches ([203] 203.2 mm) [o.e.] on center into top and bottom plates or with equivalent wire ties. There shall be not less than a 0.1055-inch (2.68 mm) [corrosion-resistant] zinc-coated or nonmetallic coated wire, or approved equal, [looped through the mesh] attached to the stud with not smaller than an 8d (0.120 in. diameter) [common] annular threaded nail for every 2 square feet (0.2 m²) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that [it] the tie will lie in the stone veneer mortar joint. The last 2 inches ([54] 50.8 mm) of each wire leg shall have a right-angle bend. One-inch ([25] 25.4 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer.

3. With cold-formed steel stud backing, a 2-inch by 2-inch (50.8 mm by 50.8 mm) 0.0625-inch (1.59 mm) zinc-coated or nonmetallic coated wire mesh with two layers of water-resistive
barrier in accordance with Section 1404.2 shall be applied directly to steel studs spaced at not more than 16 inches (406.4 mm) on center. The mesh shall be attached with corrosion-resistant #8 self-drilling, tapping screws at 4 inches (101.6 mm) on center, and at 8 inches (203.2 mm) on center into top and bottom tracks or with equivalent wire ties. Screws shall extend through the steel connection not fewer than three exposed threads. There shall be not less than a 0.1055-inch (2.68 mm) corrosion-resistant wire, or approved equal, attached to the stud with not smaller than a #8 self-drilling, tapping screw extending through the steel framing not fewer than three exposed threads for every 2 square feet (0.2 m²) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that the tie will lie in the stone veneer mortar joint. The last 2 inches (50.8 mm) of each wire leg shall have a right-angle bend. One inch (25.4 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer. The cold-formed steel framing members shall have a minimum bare steel thickness of 0.0428 inches (1.087 mm).

1405.8 Slab-type veneer. [Slab-type] Anchored slab-type veneer units not exceeding 2 inches (50.8 mm) in thickness shall be anchored directly to masonry, concrete or [stud] light-frame construction. For veneer units of marble, travertine, granite or other stone units of slab form, ties of corrosion-resistant dowels in drilled holes shall be located in the middle third of the edge of the units, spaced [a maximum of] not more than 24 inches (610.0 mm) apart around the periphery of each unit with not less than four ties per veneer unit. Units shall not exceed 20 square feet (1.9 m²) in area. If the dowels are not tight fitting, the holes shall be drilled not more than 0.063 inch (1.6 mm) larger in diameter than the dowel, with the hole countersunk to a diameter and depth equal to twice the diameter of the dowel in order to provide a tight-fitting key of cement mortar at the dowel locations [when] where the mortar in the joint has set. Veneer ties shall be corrosion-resistant metal capable of resisting, in tension or compression, a force equal to two times the weight of the attached veneer. If made of sheet metal, veneer ties shall be not smaller in area than 0.0336 by 1 inch (0.853 by 25.4 mm) or, if made of wire, not smaller in diameter than 0.1483-inch (3.76 mm) wire.

1405.9 Terra cotta. [Anchored terra cotta or ceramic units not less than 1⅝ inches (41 mm) thick shall be anchored directly to masonry, concrete or stud construction. Tied terra cotta or ceramic veneer units shall be not less than 1⅝ inches (41 mm) thick with projecting dovetail webs on the back surface spaced approximately 8 inches (203 mm) o.c. The facing shall be tied to the backing wall with corrosion-resistant metal anchors of not less than No. 8 gage wire installed at the top of each piece in horizontal bed joints not less than 12 inches (305 mm) nor more than 18 inches (457 mm) o.c.; these anchors shall be secured to ¼-inch (6.4 mm) corrosion-resistant pencil rods that pass through the vertical aligned loop anchors in the backing wall. The veneer ties shall have sufficient strength to support the full weight of the veneer in tension. The facing shall be set with not less than a 2-inch (51 mm) space from the backing wall and the space shall be filled solidly with Portland cement grout and pea gravel. Immediately prior to setting, the backing wall and the facing shall be drenched with clean water and shall be distinctly damp when the grout is poured.] Anchored terra cotta or ceramic units not less than 1 inch (25.4 mm) thick shall be anchored directly to masonry, concrete or stud construction. Terra cotta or ceramic unit anchorage shall be engineered to transfer loads to stable backup walls utilizing not less than two non-corrosive anchors per unit.

1405.10 Adhered masonry veneer. Adhered masonry veneer shall comply with the applicable requirements in [Section 1405.10.1] this section and Sections [6.1] 12.1 and [6.3] 12.3 of TMS 402/ACI 530/ASCE 5, as modified by Chapter 21 of this code.
1405.10.1 Exterior adhered masonry veneer. Exterior adhered masonry veneer shall be installed in accordance with the manufacturer’s instructions and Section 1405.10.

1405.10.1.1 Water-resistive barriers. Water-resistive barriers shall be installed as required in Section 2510.6.

1405.10.1.2 Flashing. Flashing shall comply with this section and the applicable requirements of Section 1405.4.

1405.10.1.2.1 Flashing at foundation. A corrosion-resistant screed or flashing of a minimum 0.019-inch (0.48 mm) or 26 gage galvanized or plastic with a minimum vertical attachment flange of 3½ inches (88.9 mm) shall be installed to extend not less than 1 inch (25.4 mm) below the foundation plate line on exterior stud walls in accordance with Section 1405.4. The water-resistive barrier shall lap over the exterior of the attachment flange of the screed or flashing.

1405.10.1.3 Clearances. On exterior stud walls, adhered masonry veneer shall be installed not less than 4 inches (101.6 mm) above the earth, or not less than 2 inches (50.8 mm) above paved areas, or not less than ½ inch (12.7 mm) above exterior walking surfaces that are supported by the same foundation that supports the exterior wall.

1405.10.1.4 Adhered masonry veneer installed with lath and mortar. Exterior adhered masonry veneer installed with lath and mortar shall comply with the following.

1405.10.1.4.1 Lathing. Lathing shall comply with the requirements of Section 2510.

1405.10.1.4.2 Scratch coat. A nominal ½-inch (12.7 mm) thick layer of mortar complying with the material requirements of Sections 2103 and 2512.2 shall be applied, encapsulating the lathing. The surface of this mortar shall be scored horizontally, resulting in a scratch coat.

1405.10.1.4.3 Adhering veneer. The masonry veneer units shall be adhered to the mortar scratch coat with a nominal ½-inch (12.7 mm) thick setting bed of mortar complying with Sections 2103 and 2512.2 applied to create a full setting bed for the back of the masonry veneer units. The masonry veneer units shall be worked into the setting bed resulting in a nominal ⅜-inch (9.5 mm) setting bed after the masonry veneer units are applied.

1405.10.1.5 Adhered masonry veneer applied directly to masonry and concrete. Adhered masonry veneer applied directly to masonry or concrete shall comply with the applicable requirements of Section 1405.10, and with the requirements of Section 1405.10.1.4 or 2510.7.

1405.10.1.6 Cold weather construction. Cold weather construction of adhered masonry veneer shall comply with the requirements of Sections 2104 and 2512.4.

1405.10.1.7 Hot weather construction. Hot weather construction of adhered masonry veneer shall comply with the requirements of Section 2104.

1405.10.2 Exterior adhered masonry veneers—porcelain tile. Adhered units shall not exceed ⅝ inch (15.8 mm) thickness and 24 inches (609.6 mm) in any face dimension nor more than 3
square feet (0.28 m$^2$) in total face area and shall not weigh more than 9 pounds psf (0.43 kN/m$^2$). Porcelain tile shall be adhered to an approved backing system.

1405.10.3 Interior adhered masonry veneers. Interior adhered masonry veneers shall have a maximum weight of 20 psf (0.958 kg/m$^2$) and shall be installed in accordance with Section 1405.10. Where the interior adhered masonry veneer is supported by wood construction, the supporting members shall be designed to limit deflection to $1/600$ of the span of the supporting members.

1405.11 Metal veneers. Veneers of metal shall be fabricated from approved corrosion-resistant materials or shall be protected front and back with porcelain enamel, or otherwise be treated to render the metal resistant to corrosion. Such veneers shall be not less than 0.0149-inch (0.378 mm) nominal thickness sheet steel mounted on wood or metal furring strips or approved sheathing on light-frame construction.

1405.11.1 Attachment. Exterior metal veneer shall be securely attached to the supporting masonry or framing members with corrosion-resistant fastenings, metal ties or by other approved devices or methods. The spacing of the fastenings or ties shall not exceed 24 inches (610 mm) either vertically or horizontally, but where units exceed 4 square feet (0.4 m$^2$) in area there shall be not less than four attachments per unit. The metal attachments shall have a cross-sectional area not less than provided by W 1.7 wire. Such attachments and their supports shall be capable of resisting a horizontal force in accordance with the wind loads specified in Section 1609, but in no case less than 20 psf (0.958 kg/m$^2$) designed and constructed to resist the wind loads as specified in Section 1609 for components and cladding.

1405.11.2 Weather protection. Metal supports for exterior metal veneer shall be protected by painting, galvanizing or by other approved coating or treatment. Wood studs, furring strips or other wood supports for exterior metal veneer shall be approved pressure-treated wood or protected as required in Section 1403.2. Joints and edges exposed to the weather shall be caulked with approved durable waterproofing material or by other approved means to prevent penetration of moisture.

1405.11.3 Backup. Masonry backup shall not be required for metal veneer except as is necessary to meet the fire-resistance requirements of this code.

1405.11.4 Grounding. Grounding of metal veneers on buildings shall comply with the requirements of Chapter 27 and the New York City Electrical Code and Chapter 27 of this code.

1405.12 Thin exterior structural glass veneer. The area of a single section of thin exterior structural glass veneer shall not exceed 10 square feet (0.93 m$^2$) where that section is not more than 15 feet (4572 mm) above the level of the sidewalk or grade level directly below, and shall not exceed 6 square feet (0.56 m$^2$) where it is more than 15 feet (4572 mm) above that level. In no event shall thin exterior structural glass veneer be installed more than 35 feet (10 668 mm) above the level of the sidewalk or grade level directly below.

1405.12.1 Length and height. The length or height of any section of thin exterior structural glass veneer shall not exceed 48 inches (1219 mm).
1405.12.2 Thickness. The thickness of thin exterior structural glass veneer shall be not less than 0.344 inch (8.7 mm).

1405.12.3 Application. Thin exterior structural glass veneer shall be set only after backing is thoroughly dry and after application of an approved bond coat uniformly over the entire surface of the backing so as to effectively seal the surface. Glass shall be set in place with an approved mastic cement in sufficient quantity so that at least 50 percent of the area of each glass unit is directly bonded to the backing by mastic not less than ¼ inch (6.4 mm) thick and not more than ⅝ inch (15.9 mm) thick. The bond coat and mastic shall be evaluated for compatibility and shall bond firmly together.

1405.12.4 Installation at sidewalk level. Where thin exterior structural glass veneer extends to a sidewalk surface, each section shall rest in an approved metal molding, and be set at least ¼ inch (6.4 mm) above the highest point of the sidewalk. The space between the molding and the sidewalk shall be thoroughly caulked and made water tight.

1405.12.4.1 Installation above sidewalk level. Where thin exterior structural glass veneer is installed above the level of the top of a bulkhead facing, or at a level more than 36 inches (914.4 mm) above the sidewalk level, the mastic cement binding shall be supplemented with approved nonferrous metal shelf angles located in the horizontal joints in every course. Such shelf angles shall be not less than 0.0478-inch (1.21 mm) thick and not less than 2 inches (50.8 mm) long and shall be spaced at approved intervals, with not less than two angles for each glass unit. Shelf angles shall be secured to the wall or backing with expansion bolts, toggle bolts or by other approved methods.

1405.12.5 Joints. Unless otherwise specifically approved by the commissioner, abutting edges of thin exterior structural glass veneer shall be ground square. Mitered joints shall not be used except where specifically approved for wide angles. Joints shall be uniformly buttered with an approved jointing compound and horizontal joints shall be held to not less than 0.063 inch (1.6 mm) by an approved nonrigid substance or device. Where thin exterior structural glass veneer abuts nonresilient material at sides or top, expansion joints not less than ¼ inch (6.4 mm) wide shall be provided.

1405.12.6 Mechanical fastenings. Thin exterior structural glass veneer installed above the level of the heads of show windows and veneer installed more than 12 feet (3658.6 mm) above sidewalk level shall, in addition to the mastic cement and shelf angles, be held in place by the use of fastenings at each vertical or horizontal edge, or at the four corners of each glass unit. Fastenings shall be secured to the wall or backing with expansion bolts, toggle bolts or by other methods. Fastenings shall be so designed as to hold the glass veneer in a vertical plane independent of the mastic cement. Shelf angles providing both support and fastenings shall be permitted.

1405.12.7 Flashing. Exposed edges of thin exterior structural glass veneer shall be flashed with overlapping corrosion-resistant metal flashing or equivalent and caulked with a waterproof compound in a manner to effectively prevent the entrance of moisture between the glass veneer and the backing.
1405.13 Exterior windows and doors. Windows and doors installed in exterior walls shall conform to the testing and performance requirements of Section 1715.5.

1405.13.1 Installation. Windows and doors shall be installed in accordance with approved the manufacturer’s instructions. Fastener size and spacing shall be provided in such instructions and shall be calculated based on maximum loads and spacing used in the tests.

1405.13.2 Windows in Group R-2 and R-3 occupancies. Windows in Group R-2 and R-3 occupancies shall comply with Sections 1015.9 and 1015.8, respectively.

[1405.13.2 Window sills in R-3 occupancy. In Occupancy Group R-3, one- and two-family dwellings, where the opening of the sill portion of an operable window is located more than 72 inches (1829 mm) above the finished grade or other surface below, the lowest part of the clear opening of the window shall be at a height not less than 24 inches (610 mm) above the finished floor surface of the room in which the window is located. Glazing between the floor and a height of 24 inches (610 mm) shall be fixed or have openings through which a 4-inch (102 mm) diameter sphere cannot pass.]

[Exception: Openings that are provided with window guards that comply with ASTM F 2090.]

[1405.13.3 Windows in R-2 occupancy. Windows in R-2 occupancy shall be subject to any applicable requirements of the New York City Department of Health and Mental Hygiene with regard to window guards.]

1405.14 Vinyl siding. Vinyl siding conforming to the requirements of this section and complying with ASTM D 3679 shall be permitted on exterior walls of buildings located in areas where the [basic wind speed specified in Chapter 16] allowable stress design speed \( V_{asd} \), as determined in accordance with Section 1609.3.1, does not exceed 100 miles per hour (45 m/s) and the building height is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the [basic wind speed] allowable stress design speed \( V_{asd} \), as determined in accordance with Section 1609.3.1, exceeds 100 miles per hour (45 m/s) (44.7 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations [indicating] showing compliance with Chapter 16 of this code shall be submitted. Vinyl siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1405.14.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform [with] to the water-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved the manufacturer’s instructions. Unless otherwise specified in the approved manufacturer’s instructions, nails used to fasten the siding and accessories shall have a minimum 0.313-inch (7.9 mm) head diameter and ⅛-inch (3.18 mm) shank diameter. The nails shall be corrosion resistant and shall be long enough to penetrate the studs or nailing strip at least ¾ inch (19.1 mm). For cold-formed steel light-frame construction, corrosion-resistant fasteners shall be used. Screw fasteners shall penetrate the cold-formed steel framing at least three exposed threads. Other fasteners shall be installed in accordance with the manufacturer's instructions. Where the siding is installed horizontally, the fastener spacing shall not exceed 16 inches (406 mm) horizontally and 12 inches (305 mm) vertically. Where the siding is installed vertically,
the fastener spacing shall not exceed 12 inches ([305] 304.8 mm) horizontally and 12 inches ([305] 304.8 mm) vertically.

1405.15 Cement plaster. Cement plaster applied to exterior walls shall conform to the requirements specified in Chapter 25.

1405.16 Fiber-cement siding. Fiber-cement siding complying with Section 1404.10 shall be permitted on exterior walls of Type I, II, III, IV and V construction for wind pressure resistance or wind speed exposures as indicated by the manufacturer’s listing and label, and [approved] the installation instructions. Where specified, the siding shall be installed over sheathing or materials listed in Section 2304.6 and shall be installed to conform to the water-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with [approved] the manufacturer’s instructions. Unless otherwise specified in the [approved] manufacturer’s instructions, nails used to fasten the siding to wood studs shall be corrosion-resistant round head smooth shank and shall be long enough to penetrate the studs at least 1 inch ([25] 25.4 mm). [For metal framing, all weather screws shall be used and shall penetrate the metal] For cold-formed steel light-frame construction, corrosion-resistant fasteners shall be used. Screw fasteners shall penetrate the cold-formed steel framing at least three exposed full threads. Other fasteners shall be installed in accordance with the manufacturer’s instructions.

1405.16.1 Panel siding. Fiber-cement panels shall comply with the requirements of ASTM C 1186, Type A, minimum Grade II or ISO 8336, Category A, minimum Class 2. Panels shall be installed with the long dimension either parallel or perpendicular to framing. Vertical and horizontal joints shall occur over framing members and shall be [sealed] protected with [caulking] sealant, [covered with] battens or [shall be] flashing. Alternatively, vertical or horizontal joints shall be shiplap or otherwise designed to comply with Section 1403.2 of this code. Panel siding shall be installed with fasteners in accordance with the [approved] manufacturer’s instructions.

1405.16.2 Lap siding. Fiber-cement lap siding having a maximum width of 12 inches ([305] 304.8 mm) shall comply with the requirements of ASTM C 1186, Type A, minimum Grade II or ISO 8336, Category A, minimum Class 2. Lap siding shall be lapped a minimum of 1¼ inches (32 mm) and lap siding not having tongue-and-groove end joints shall have the ends [sealed] protected with caulking, covered with an H-section joint cover, located over a strip of flashing or shall be otherwise designed to comply with Section 1403.2 of this code. Lap siding courses shall be installed with the fastener heads exposed or concealed in accordance with the [approved] manufacturer’s instructions.

1405.17 Fastening. Weather boarding and wall coverings shall be securely fastened with aluminum, copper, zinc, zinc-coated or other approved corrosion-resistant fasteners in accordance with the nailing schedule in Table [2304.9.1] 2304.10.1 or the [approved] manufacturer’s [installation] instructions. Shingles and other weather coverings shall be attached with appropriate [standard shingle] standard-shingle nails to furring strips securely nailed to studs, or with approved mechanically bonding nails, except where sheathing is of wood not less than 1-inch ([25] 25.4 mm) nominal thickness or of wood structural panels as specified in Table [2308.9.3(3)] 2308.6.3(3).

1405.18 Polypropylene siding. Polypropylene siding conforming to the requirements of this section and complying with Section 1404.12 shall be limited to exterior walls of Type VB construction located in areas where the wind speed specified in Chapter 16 does not exceed 100 miles per hour
(44.7 m/s) and the building height is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the basic wind speed exceeds 100 miles per hour (44.7 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations showing compliance with Chapter 16 shall be submitted. Polypropylene siding shall be installed in accordance with the manufacturer’s instructions. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

SECTION BC 1406
COMBUSTIBLE MATERIALS ON THE EXTERIOR SIDE OF EXTERIOR WALLS

1406.1 General. Section 1406 shall apply to exterior wall coverings, exterior balconies and similar projections, bay and oriel windows, decks, porches, porticos, entranceways, and storm enclosures constructed of combustible materials. Combustible water-resistant barriers complying with Section 1403.5.1 shall be permitted in exterior wall coverings. Fireblocking shall be installed in accordance with Section 1406.2.3. Existing building retrofits utilizing combustible exterior wall coverings shall also comply with Section 1406.5. Combustible exterior wall coverings shall be subject to the special inspection requirements of Section 1705.16.

1406.2 Combustible exterior wall coverings. Combustible exterior wall coverings, including architectural trim, shall comply with this section.

[Exception:] Exceptions:

1. Plastics complying with Chapter 26.
2. Metal composite materials (MCM) complying with Section 1407.
3. High-pressure decorative exterior-grade compact laminates (HPL) complying with Section 1409.

1406.2.1 Type I, II, III and IV construction. In buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of combustible materials in accordance with Section 1406.2.1.1, subject to the following limitations:

1. Combustible exterior wall coverings shall not exceed 10 percent of an exterior wall surface area on any given story. Such combustible exterior wall covering shall not be permitted on exterior walls where the fire separation distance is 5 feet (1524 mm) or less.

2. Combustible exterior wall coverings shall be limited to 40 feet (12 192 mm) in height above grade plane.

3. Combustible exterior wall coverings constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation shall not be limited in wall surface area where the fire separation distance is 5 feet (1524 mm) or less and shall be permitted up to 60 feet (18 288 mm) in height above grade plane, regardless of the fire separation distance.

4. Wood veneers shall comply with Section 1405.5.
5. Combustible exterior wall coverings shall not be permitted on buildings of Type IV construction utilizing CLT or SCL complying with Section 602.4.

6. Combustible exterior wall coverings shall not be permitted at exterior balconies in accordance with Section 1406.3.

[1406.2.1] **1406.2.1.1 Ignition resistance.** [Combustible] Where permitted by Section 1406.2.1 of this code, combustible exterior wall coverings shall be tested in accordance with NFPA 268.

**Exceptions:** The following materials are not required to be tested in accordance with NFPA 268. However, such materials shall comply with all other provisions of Section 1406 of this code.

1. Wood or wood-based products.

2. Other combustible materials covered with an exterior weather covering other than vinyl sidings included in and complying with the thickness requirements of Table 1405.2 of this code.

3. Aluminum having a minimum thickness of 0.019 inch (0.48 mm).

[4. Exterior wall coverings on exterior walls of Type V construction.]

[1406.2.1.1] **1406.2.1.1 Fire separation 5 feet or less.** Where installed on exterior walls having a fire separation distance of 5 feet (1524 mm) or less, combustible exterior wall coverings shall not exhibit sustained flaming as defined in NFPA 268.

[1406.2.1.2] **1406.2.1.2 Fire separation greater than 5 feet.** For fire separation distances greater than 5 feet (1524 mm), any exterior wall covering shall be permitted that has been exposed to a reduced level of incident radiant heat flux in accordance with the NFPA 268 test method without exhibiting sustained flaming. The minimum fire separation distance required for the exterior wall covering shall be determined from Table [1406.2.1.2] of this code based on the maximum tolerable level of incident radiant heat flux that does not cause sustained flaming of the exterior wall covering.

For SI: 1 foot = 304.8 mm, 1 Btu/H² × °F = [0.0057] 0.0057 kW/m² × K.

**[1406.2.2 Type I, II, III and IV construction]**. In buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of combustible materials in accordance with Section 1406.2.1 and with the following limitations:

1. Combustible exterior wall coverings shall not exceed 10 percent of the exterior wall surface area on any given story. Such combustible exterior wall coverings shall not be permitted on exterior walls where the fire separation distance is 5 feet (1524 mm) or less.

2. Combustible wall coverings shall be limited to 40 feet (12 192 mm) in height above grade plane.

3. Combustible exterior wall coverings constructed of fire-retardant treated wood complying with Section 2303.2 for exterior installation shall not be limited in wall surface area where the fire separation distance is 5 feet (1524 mm) or less and shall be permitted up to 60 feet (18 288 mm) in height above grade plane regardless of the fire separation distance.

**[1406.2.3 1406.2.2 Location]**. [Where combustible] Combustible exterior wall [covering is] coverings located along the top of exterior walls [such trim] shall be completely backed up by the exterior wall and shall not extend over or above the top of the exterior walls.

**[1406.2.4 1406.2.3 Fireblocking]**. [Where the combustible exterior wall covering is furred from the wall and forms a solid surface, the distance between the back of the covering and the wall shall not exceed 1 5/8 inches (41 mm). Where required by Section 717, the space thereby created shall be fireblocked.] Exterior wall coverings shall be fireblocked in accordance with Section 718.2.6.

**1406.3 Exterior balconies and similar projections**. [Exterior balconies and similar projections shall be permitted to be constructed of combustible materials provided that the exterior balcony or similar projection affords the fire-resistance rating required by Table 601 for floor construction.] Exterior
wall covering on walls abutting balconies, and cladding on the sides and underside of balconies, shall be constructed of noncombustible materials. Exterior walls abutting balconies shall be noncombustible up to 12 feet (3657.6 mm) above the walking surface or to the underside of the balcony above, whichever is less. On cantilevered balconies, the exterior wall abutting the balcony, plus 3 feet (914.4 mm) on each side, shall be constructed of noncombustible materials. On recessed and semirecessed balconies, the exterior walls abutting the balconies shall be constructed of noncombustible materials.

[Exceptions:]

[1. Balconies or similar projections serving as a required exit shall not be constructed of combustible materials.]

[2. Balconies or similar projections on the exterior of buildings of Type I or II construction shall not be constructed of combustible materials.]

Exception: Combustible exterior wall coverings shall be allowed on balconies in Type V construction with a fire separation distance greater than or equal to 5 feet (1524 mm).

1406.4 Bay and oriel windows, decks, porches, porticos, entranceways, and storm enclosures. Bay and oriel windows, decks, porches, porticos, entranceways and storm enclosures shall conform to the type of construction required for the building to which they are attached, including required fire rating, unless otherwise modified by the requirements of this section. For the purposes of this section, such structures shall be referred to as, “appendages.”

Exception: Plastic complying with Chapter 26.

1406.4.1 Appendages on Type I and II construction. Appendages on buildings of Type I or II construction shall be constructed of noncombustible materials. However, on buildings not more than three stories or 40 feet (12 192 mm) in height, whichever is less, fire-retardant-treated wood shall be permitted.

1406.4.2 Appendages on Type III, IV and VA construction. Appendages on buildings of Type III, IV and VA construction may be constructed of combustible materials, provided that all the following conditions are met:

1. Such building does not exceed three stories or 40 feet (12 192 mm) in height, whichever is less.

2. The main use or dominant occupancy of such building is classified in Occupancy Group R-2 or R-3.

3. The appendage has an exterior separation on all exposed sides of at least 15 feet (4572 mm), measured from the outermost surface of the appendage, except that appendages with exposed sides protected by minimum 1-hour fire-rated construction extending at least 36 inches (914.4 mm) above the highest combustible horizontal surface may be located up to a minimum distance of 36 inches (914.4 mm) from any property line.
4. The appendage is so constructed that its removal or destruction will not reduce the structural stability or fire-resistive integrity of the building.

5. The appendage has a superficial area not exceeding 150 square feet (13.9 m²) when viewed from directly above and is included in the area limitations of Table 503 for the entire building.

6. The appendage is not higher than the sills of the second-story windows.

7. The vertical surface area of the combustible portions of the appendage does not exceed 10 percent of the total wall area (windows excluded) of the building.

8. For enclosed appendages, the roof of the appendage has a class A roof covering, and the soffit or ceiling covering the combustible roof framing shall have a minimum 1-hour fire-resistance rating.

**Exception:** Appendages constructed of fire-retardant-treated wood, on buildings not exceeding 3 stories or 40 feet (12 192 mm) in height, whichever is less, need not comply with Items 2 through 8.

**1406.4.3 Appendages on Type VB construction.** Appendages may be constructed of combustible materials on buildings of construction Type VB.

**1406.5 Retrofit of existing buildings.** Combustible materials shall not be permitted for use at the outermost surface of the exterior wall covering for exterior envelope retrofits of existing nonsprinklered buildings over 75 feet (22 860 mm), unless the following conditions are satisfied:

1. The outermost surface of the combustible exterior wall covering shall be interrupted by a noncombustible material at least 3 feet (914.4 mm) high between the top of one opening and the bottom of the opening immediately above to form a continuous band across building elevations.

2. On walls without openings, a 3 feet (914.4 mm) high noncombustible band shall interrupt the outermost surface of the combustible exterior wall covering at least every 15 feet (4572 mm) vertically.

**SECTION BC 1407**

**METAL COMPOSITE MATERIALS (MCM)**

**1407.1 General.** The provisions of this section shall govern the materials, construction and quality of metal composite materials (MCM) for use as exterior wall coverings in addition to other applicable requirements of Chapters 14 and 16.

**1407.1.1 Plastic core.** The plastic core of the MCM shall not contain foam plastic insulation as defined in Section [2602.1] 202.

**1407.1.2 Prohibited locations.** The use of MCM in exterior wall coverings is subject to the following limitations:
1. MCM is prohibited in exterior wall coverings in Type IV construction utilizing cross-laminated timer (CLT) or structural composite lumber (SCL) complying with Section 602.4.

2. MCM is prohibited in exterior wall coverings at exterior balconies in accordance with Section 1406.3.

1407.2 Exterior wall finish. MCM used as exterior wall finish or as elements of [balconies and similar appendages and] bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1407.4 through 1407.14.

1407.3 Architectural trim and embellishments. MCM used as architectural trim or embellishments shall comply with Sections 1407.7 through 1407.14.

1407.4 Structural design. MCM systems shall be designed and constructed to resist wind loads as required by Chapter 16 for components and cladding.

1407.5 Approval. Results of approved tests or an engineering analysis shall be submitted to the commissioner to verify compliance with the requirements of Chapter 16 for wind loads.

1407.6 Weather resistance. MCM systems shall comply with Section 1403 and shall be designed and constructed to resist wind and rain in accordance with this section and the manufacturer’s installation instructions.

1407.7 Durability. MCM systems shall be constructed of approved materials that maintain the performance characteristics required in Section 1407 for the duration of use.

1407.8 Fire-resistance rating. Where MCM systems are used on exterior walls required to have a fire-resistance rating in accordance with Section 705, evidence shall be submitted to the commissioner that the required fire-resistance rating is maintained.

   Exception: MCM systems not containing foam plastic insulation, which are installed on the outer surface of a fire-resistance-rated exterior wall in a manner such that the attachments do not penetrate through the entire exterior wall assembly, shall not be required to comply with this section.

1407.9 [Surface-burning characteristics. Unless otherwise specified, MCM shall have a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.]

[1407.10 Type I, II, III and IV construction. Where installed on buildings of Type I, II, III and IV construction, MCM systems shall comply with Sections 1407.10.1 through 1407.10.3, or Section 1407.11.]

[1407.10.1] Surface-burning characteristics. MCM shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.
**Thermal barriers.** MCM shall be separated from the interior of a building by an approved thermal barrier consisting of 1/2-inch (12.7 mm) or 5/8-inch (15.9 mm) Type X gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 20 minutes of fire exposure in accordance with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance with criteria established by testing in accordance with UL 1715, where the thermal barrier shall remain in place for 20 minutes.

**Exceptions:**

1. The thermal barrier is not required where the MCM system is specifically approved based on tests conducted in accordance with UL 1040 or UL 1715. Such testing shall be performed with the MCM in the maximum thickness intended for use. The MCM system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.

2. The thermal barrier is not required where the MCM is used as elements of balconies and similar appendages, architectural trim or embellishments.

**Full-scale tests.** All MCM systems shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use, including any required fireblocking. Approved NFPA 285 tested assembly design documentation of the MCM system shall be included on the submitted construction documents complying with Section 1401.2 of this code. Deviation from the NFPA 285 tested design shall be approved by the registered design professional and additional documentation shall be provided if requested by the department.

**Alternate conditions.** MCM and MCM systems shall not be required to comply with Sections 1407.10.1 through 1407.10.3 provided such systems comply with Section 1407.11.1 or 1407.11.2.

**Installations up to 40 feet in height.** MCM shall be permitted to be installed no more than 40 feet (12 190 mm) in height above grade provided the MCM is installed in accordance with Sections 1407.11.1.1 and 1407.11.1.2.

1. Where the fire separation distance is 5 feet (1524 mm) or less, the area of MCM shall not exceed 10 percent of the exterior wall surface.

2. Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of exterior wall surface coverage using MCM.

**Installations up to 50 feet in height.** MCM shall be permitted to be installed no more than 50 feet (15 240 mm) in height above grade provided the MCM meets the requirements of Sections 1407.11.2.1 and 1407.11.2.2.
1407.11.2.1 Self-ignition temperature. MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929.

1407.11.2.2 Limitations. Sections of MCM shall not exceed 300 square feet (27.9 m²) in area and shall be separated by a minimum of 4 feet (1219 mm) vertically.

1407.12 Type V construction. MCM shall be permitted to be installed on buildings of Type V construction.

1407.13 Foam plastic insulation. MCM systems containing foam plastic insulation shall also comply with the requirements of Section 2603.

1407.14 Labeling. MCM shall be labeled in accordance with Chapter 17 this code and Section 28-113 of the Administrative Code.

1407.15 Special inspection. MCM shall be subject to special inspection in accordance with Chapter 17.

1407.16 Fireblocking. MCM installations shall be fireblocked in accordance with Section 718.2.6.1.

SECTION BC 1408
EXTERIOR INSULATION AND FINISH SYSTEMS (EIFS)

1408.1 General. The provisions of this section shall govern the materials, construction and quality of exterior insulation and finish systems (EIFS) for use as exterior wall coverings in addition to other applicable requirements of Chapters 7, 14, 16, 17 and 26.

1408.1.1 Prohibited locations. The use of EIFS containing foam plastic insulation in exterior wall coverings is subject to the following limitations:

1. EIFS containing foam plastic insulation is prohibited in exterior wall coverings in Type IV construction utilizing cross-laminated timer (CLT) or structural composite lumber (SCL) complying with Section 602.4.

2. EIFS containing foam plastic insulation is prohibited in exterior wall coverings at exterior balconies in accordance with Section 1406.3.

1408.2 Performance characteristics. EIFS shall be constructed such that it meets the performance characteristics required in ASTM E 2568.

1408.3 Structural design. The underlying structural framing and substrate shall be designed and constructed to resist loads as required by Chapter 16.

1408.4 Weather resistance. EIFS shall comply with Section 1403 and shall be designed and constructed to resist wind and rain in accordance with this section and the manufacturer’s application instructions, environmental conditions in accordance with this section, the approved construction documents and manufacturer’s installation instructions.
1408.4.1 EIFS with drainage. EIFS with drainage shall have an average minimum drainage efficiency of 90 percent when tested in accordance with requirements of ASTM E 2273 and is required on framed walls of Type V construction, residential Group R occupancies.

1408.4.1.1 Water-resistive barrier. For EIFS with drainage, the water-resistive barrier shall comply with Section 1404.2 of this code or ASTM E 2570.

1408.5 Installation. Installation of the EIFS and EIFS with drainage shall be in accordance with the EIFS manufacturer’s instructions and this section.

1408.6 Special inspections. EIFS installations shall comply with the provisions of Chapter 17.

1408.7 Fireblocking. EIFS installations containing foam plastic insulation shall be fireblocked in accordance with Section 718.2.6.1.

1408.8 Foam plastic insulation. EIFS installations containing foam plastic insulation shall be tested and comply with the requirements of Section 2603.

1408.9 Thermal barrier. EIFS installations containing foam plastic insulation shall be separated from the interior of a building in accordance with Section 2603.5.2.

SECTION BC 1409
HIGH-PRESSURE DECORATIVE EXTERIOR-GRADE COMPACT LAMINATES (HPL)

1409.1 General. The provisions of this section shall govern the materials, construction and quality of High-Pressure Decorative Exterior-Grade Compact Laminates (HPL) for use as exterior wall coverings in addition to other applicable requirements of Chapters 14 and 16.

1409.1.1 Prohibited locations. The use of HPL in exterior wall coverings is subject to the following limitations:

1. HPL is prohibited in exterior wall coverings in Type IV construction utilizing cross-laminated timer (CLT) or structural composite lumber (SCL) complying with Section 602.4.

2. HPL is prohibited in exterior wall coverings at exterior balconies and shall comply with Section 1406.3.

1409.2 Exterior wall finish. HPL used as exterior wall covering or as elements of bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1409.4 through 1409.16.

1409.3 Architectural trim and embellishments. HPL used as architectural trim or embellishments shall comply with Sections 1409.7 through 1409.14.

1409.4 Structural design. HPL systems shall be designed and constructed to resist wind loads as required by Chapter 16 for components and cladding.
1409.5 Approval. Results of approved tests or an engineering analysis shall be submitted to the commissioner to verify compliance with the requirements of Chapter 16 for wind loads.

1409.6 Weather resistance. HPL systems shall comply with Section 1403 and shall be designed and constructed to resist wind and rain in accordance with this section and the manufacturer’s instructions.

1409.7 Durability. HPL systems shall be constructed of approved materials that maintain the performance characteristics required in Section 1409 for the duration of use.

1409.8 Fire-resistance rating. Where HPL systems are used on exterior walls required to have a fire-resistance rating in accordance with Section 705, evidence shall be submitted to the commissioner that the required fire-resistance rating is maintained.

Exception: HPL systems not containing foam plastic insulation that are installed on the outer surface of a fire-resistance-rated exterior wall in a manner such that the attachments do not penetrate through the entire exterior wall assembly shall not be required to comply with this section.

1409.9 Surface-burning characteristics. HPL shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested in the minimum and maximum thicknesses intended for use in accordance with ASTM E 84 or UL 723.

1409.10 Thermal barriers. HPL shall be separated from the interior of a building by an approved thermal barrier consisting of 5/8-inch (15.9 mm) Type X gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 20 minutes of fire exposure in accordance with the standard time temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in accordance with criteria established by testing performed in accordance with UL 1715, where the thermal barrier shall remain in place for 20 minutes.

1409.11 Full-scale tests. All HPL systems shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the HPL system with the HPL in the minimum and maximum thicknesses intended for use, including any required fireblocking. Approved NFPA 285 tested assembly design documentation of the HPL system shall be included on the submitted construction documents complying with Section 1401.2 of this code. Deviation from the NFPA 285 tested design shall be approved by the registered design professional and additional documentation shall be provided if requested by the department.

1409.12 Reserved.

1409.13 Foam plastic insulation. HPL systems containing foam plastic insulation shall also comply with the requirements of Section 2603.

1409.14 Labeling. HPL shall be labeled in accordance with this code and Article 113 of title 28 of the Administrative Code.

1409.15 Special inspection. HPL shall be subject to the special inspection requirements of Chapter 17.
1407.16 Fireblocking. HPL installations shall be fireblocked in accordance with Section 718.2.6.1.

SECTION BC 1410
PLASTIC COMPOSITE DECKING

1410.1 Plastic composite decking. Exterior deck boards, stair treads, handrails and guardrail systems constructed of plastic composites, including plastic lumber, shall comply with Section 2612.

§ 16. Chapter 15 of the New York city building code, as amended by local law number 141 for the year 2013, sections 1507.3.9, 1507.5.7, 1507.8.8 and 1507.9.9 as amended by local law number 51 for the year 2014, and sections 1504.9 and 1511 as amended by local law number 94 for the year 2019, is amended to read as follows:

CHAPTER 15
ROOF ASSEMBLIES AND ROOFTOP STRUCTURES

SECTION BC 1501
GENERAL

1501.1 Scope. The provisions of this chapter shall govern the design, materials, construction and quality of roof assemblies, and rooftop structures.

SECTION BC 1502
DEFINITIONS

1502.1 [General] Definitions. The following terms [shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.] are defined in Chapter 2:

AGGREGATE. [In roofing, crushed stone, crushed slag or water-worn gravel used for surfacing for roof coverings.]

BALLAST. [In roofing, ballast comes in the form of large stones or paver systems or light-weight interlocking paver systems and is used to provide uplift resistance to components of the roof assembly systems that are not adhered or mechanically attached to the roof deck.]

BUILDING-INTEGRATED PHOTOVOLTAIC (BIPV) PRODUCT.

BUILT-UP ROOF COVERING. [Two or more layers of felt cemented together and surfaced with a cap sheet, mineral aggregate, smooth coating or similar surfacing material.]

BULKHEAD. [An enclosed rooftop structure enclosing a shaft, stairway, tank or service equipment, or other space not designed or used for human occupancy.]

CONTAINER GARDEN. [A plant or plants maintained in a pot or planters that is at least 6 inches (152 mm) high and located on a roof, terrace, or other horizontal exterior area.]

GREEN ROOF SYSTEM. [A system constructed in-situ consisting of either a roof assembly and additional landscape material components, including growing media, engineered soils, filter fabric, integral drainage systems and roof surface to facilitate the growth of vegetation or a pre-vegetated...]

1152
tray or trays no more than 6 inches (152 mm) high and assembled on top of a roof covering. “See definition for VEGETATIVE ROOF.”

INTERLAYMENT. [A layer of felt or nonbituminous saturated felt not less than 18 inches (457 mm) wide, shingled between each course of a wood-shake roof covering.]

MECHANICAL EQUIPMENT SCREEN. [A partially enclosed rooftop structure used to aesthetically conceal heating, ventilating and air conditioning (HVAC) electrical or mechanical equipment from view.]

METAL ROOF PANEL. [An interlocking metal sheet having a minimum installed weather exposure of 3 square feet (.279 m²) per sheet.]

METAL ROOF SHINGLE. [An interlocking metal sheet having an installed weather exposure less than 3 square feet (.279 m²) per sheet.]

MODIFIED BITUMEN ROOF COVERING. [One or more layers of polymer-modified asphalt sheets. The sheet materials shall be fully adhered or mechanically attached to the substrate or held in place with an approved ballast layer.]

PENTHOUSE. [An enclosed rooftop structure which is designed or used for human occupancy.]

PHOTOVOLTAIC MODULE.

PHOTOVOLTAIC PANEL.

PHOTOVOLTAIC PANEL SYSTEM.

PHOTOVOLTAIC SHINGLES.

POSITIVE ROOF DRAINAGE. [The drainage condition in which consideration has been made for all loading deflections of the roof deck, including ponding instability, and additional slope has been provided to ensure drainage of the roof within 48 hours of precipitation.]

RADIANT BARRIER.

REROOFING. [The process of recovering or replacing an existing roof covering. See “Roof recover” and “Roof replacement.”]

ROOF ASSEMBLY. [A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, substrate or thermal barrier, insulation, vapor retarder and roof covering. This definition of “Roof assembly” is limited in application to the provisions of Chapter 15.]

ROOF COVERING. [The covering applied to the roof deck for weather resistance, fire classification or appearance.]

ROOF COVERING SYSTEM. [See “Roof assembly.”]
ROOF DECK. [The flat or sloped surface not including its supporting members or vertical supports.]

ROOF RECOVER. [The process of installing an additional roof covering over a prepared existing roof covering without removing the existing roof covering.]

ROOF REPAIR.

ROOF REPLACEMENT. [The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.]

ROOF VENTILATION. [The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from, attics, cathedral ceilings or other enclosed spaces over which a roof assembly is installed.]

ROOFTOP STRUCTURE. [An enclosed or unenclosed structure on or above the roof of any part of a building.]

SCUPPER.

SINGLE-PLY MEMBRANE. [A roofing membrane that is field applied using one layer of membrane material (either homogeneous or composite) rather than multiple layers.]

SUSTAINABLE ROOFING ZONE. [Areas of a roof assembly where a solar photovoltaic electricity generating system, a green roof system, or a combination thereof, is installed.]

UNDERLAYMENT. [One or more layers of felt, sheathing paper, nonbituminous saturated felt or other approved material over which a steep-slope roof covering is applied.]

VEGETATIVE ROOF.

SECTION BC 1503
WEATHER PROTECTION

1503.1 General. Roof decks shall be covered with approved roof coverings secured to the building or structure in accordance with the provisions of this chapter. Roof coverings shall be designed and installed in accordance with this code and the approved manufacturer’s instructions such that the roof covering shall serve to protect the building or structure.

1503.2 Flashing. Flashing shall be installed in such a manner so as to prevent moisture entering the wall and roof through joints in copings, through moisture-permeable materials and at intersections with parapet walls and other penetrations through the roof plane.

1503.2.1 Locations. Flashing shall be installed at wall and roof intersections, at gutters, wherever there is a change in roof slope or direction and around roof openings. Where flashing is of metal, the metal shall be corrosion resistant with a thickness of not less than 0.019 inch (0.483 mm) (No. 26 galvanized sheet).

1503.3 Coping. Parapet walls shall be properly coped with noncombustible, weatherproof materials of a width no less than the thickness of the parapet wall.
1503.4 Roof drainage. Design and installation of roof drainage systems shall comply with [this section and] Chapter 11 of the New York City Plumbing Code and this section.

1503.4.1 Secondary [drainage—required] (emergency overflow) drains or scuppers. Where roof drains are required, secondary (emergency overflow) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason. The installation and sizing of secondary (emergency overflow) drains, leaders and conductors shall comply with Chapter 11 of the New York City Plumbing Code, as applicable.

1503.4.2 Scuppers. When scuppers are used for secondary (emergency overflow) roof drainage, the quantity, size, location and inlet elevation of the scuppers shall be sized to prevent the depth of ponding water from exceeding that for which the roof was designed as determined by Section 1503.4.1. Scuppers shall not have an opening dimension of less than 4 inches (102 mm). The flow through the primary system shall not be considered when locating and sizing scuppers.

1503.4.3 Gutters. Gutters [and leaders] placed on the outside of buildings shall be of noncombustible, corrosion-resistant materials, or a minimum of Schedule 40 plastic pipe in accordance with Chapter 11 of the New York City Plumbing Code. Gutters and vertical sections of exterior leaders shall be adequately anchored. Gutters and leaders installed more than 15 feet (4572 mm) above grade shall be designed to resist loads in accordance with Chapter 16 of this code.

1503.6 Crickets and saddles. A cricket or saddle shall be installed on the ridge side of any chimney or penetration greater than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

Exception: Unit skylights installed in accordance with Section 2405.5 and flashed in accordance with the manufacturer’s instructions shall be permitted to be installed without a cricket or saddle.
SECTION BC 1504
PERFORMANCE REQUIREMENTS

1504.1 Wind resistance of roofs. Roof decks and roof coverings shall be designed for wind loads in accordance with Chapter 16 and Sections 1504.2, 1504.3 and 1504.4.

1504.1.1 Wind resistance of asphalt shingles. Asphalt shingles shall comply with Section 1507.2 be tested in accordance with ASTM D 7158. Asphalt shingles shall meet the classification requirements of Table 1504.1.1 of this code for the appropriate maximum wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D 7158 and the required classification in Table 1504.1.1 of this code.

Exception: Asphalt shingles that are not included in the scope of ASTM D 7158 shall be tested and labeled to indicate compliance with ASTM D 3161 and the required classification in Table 1504.1.1 of this code.

1504.2 Wind resistance of clay and concrete tile. Wind loads on clay and concrete tile roof coverings shall be in accordance with Section 1609.

1504.2.1 Testing. Testing of concrete and clay roof tiles shall be in accordance with Sections 1504.2.1.1 and 1504.2.1.2.

1504.2.1.1 Overturning resistance. Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with SBCCI SSTD 11 and this chapter.

1504.2.1.2 Wind tunnel testing. Where concrete and clay roof tiles do not satisfy the limitations in Chapter 16 of this code for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with SBCCI SSTD 11 and this chapter.

1504.3 Wind resistance of nonballasted roofs. Roof coverings installed on roofs in accordance with Section 1507 that are mechanically attached or adhered to the roof deck shall be designed to resist the design wind load pressures for components and cladding in accordance with Section 1609.

1504.3.1 Other roof systems. [Roof systems with built-up] Built-up, modified bitumen, fully adhered or mechanically attached single-ply [through-fastened] roof systems, metal panel roof
systems[...], applied to a solid or closely fitted deck and other types of membrane roof coverings shall [also] be tested in accordance with FM 4474, UL 580 or UL 1897.

1504.3.2 [Metal panel roof systems.] **Structural metal panel roof systems.** [Metal panel roof systems through fastened or standing seam] Where the metal roof panel functions as the roof deck and roof covering and it provides both weather protection and support for loads, the structural metal panel roof system shall comply with this section. Structural standing-seam metal panel roof systems shall be tested in accordance with ASTM E 1592 or FM 4474. Structural through-fastened metal panel roof systems shall be tested in accordance with FM 4474, UL 580 or ASTM E 1592.

[Exception: Metal roofs constructed of cold-formed steel, where the roof deck acts as the roof covering and provides both weather protection and support for structural loads, shall be permitted to be designed and tested in accordance with the applicable referenced structural design standard in Section 2209.1.]

**Exceptions:**

1. Metal roofs constructed of cold-formed steel shall be permitted to be designed and tested in accordance with the applicable referenced structural design standard in Section 2210.1.

2. Metal roofs constructed of aluminum shall be permitted to be designed and tested in accordance with the applicable referenced structural design standard in Section 2002.1.

1504.4 **Ballasted low-slope roof systems.** Ballasted low-slope (roof slope < 2:12) single-ply roof system coverings installed in accordance with Sections 1507.12 and 1507.13 shall be designed in accordance with ANSI/SPRI RP-4 and Section 1504.8 [and ANSI/SPRI RP-4] of this code.

1504.5 **Edge securement for low-slope roofs.** Low-slope membrane roof systems metal edge securement, except gutters, shall be designed and installed for wind loads in accordance with Chapter 16 and tested for resistance in accordance with [ANSI/SPRI ES-1] Test Methods RE-1, RE-2 and RE-3 of ANSI/SPRI/FM 4435 ES-1, except the basic design wind speed V shall be determined in accordance with Chapter 16 of this code.

1504.6 **Physical properties.** Roof coverings installed on low-slope roofs (roof slope < 2:12) in accordance with Section 1507 shall demonstrate physical integrity over the working life of the roof based upon 2,000 hours of exposure to accelerated weathering tests conducted in accordance with ASTM G 152, ASTM G 155 or ASTM G 154. Those roof coverings that are subject to cyclical flexural response due to wind loads shall not demonstrate any significant loss of tensile strength for unreinforced membranes or breaking strength for reinforced membranes when tested as herein required.

1504.7 **Impact resistance.** Roof coverings installed on low-slope roofs (roof slope < 2:12) in accordance with Section 1507 shall resist impact damage based on the results of tests conducted in accordance with ASTM D 3746, ASTM D 4272, CGSB 37-GP-52M or the “Resistance to Foot Traffic Test” in Section 5.5 of FM 4470.
**1504.8 [Aggregate.] Surfacing and ballast materials.** Aggregate, gravel or crushed stone shall not be used as surfacing for roof coverings, and aggregate, gravel or stone used as ballast shall not be used on the roof of a building located in a hurricane-prone region as defined in Section 1609.2, or on any other building with a mean roof height exceeding that permitted by Table 1504.8 based on the exposure category and basic wind speed at the site.

**TABLE 1504.8**

</table>

For SI: 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

- a. Mean roof height as defined in ASCE 7.
- b. For intermediate values of basic wind speed, the height associated with the next higher value of wind speed shall be used, or direct interpolation is permitted.
- c. NP = gravel and stone not permitted for any roof height.
- d. New York City is in a Hurricane-Prone Region pursuant to Section 1609.2.

**1504.9 Reflectance.** Roof coverings on roofs or setbacks with slope equal to or less than two units vertical in 12 units horizontal (17 percent) shall have:

1. A minimum initial solar reflectance of 0.7 in accordance with ASTM C 1549 or ASTM E 1918, and a minimum thermal emittance of 0.75 as determined in accordance with ASTM C 1371 or ASTM E 408; or

2. A minimum SRI of 82 as determined in accordance with ASTM E 1980.

Roof coverings on roofs or setbacks with slope greater than two units vertical in 12 units horizontal (17 percent) shall have:

1. A minimum initial solar reflectance of 0.25 in accordance with ASTM C 1549 or ASTM E 1918, and a minimum thermal emittance of 0.75 as determined in accordance with ASTM C 1371 or ASTM E 408; or

**Exceptions:**

1. Terraces on setbacks comprising less than 25 percent of the area of the largest floor
plate in the building.

2. Any portion of a roof covered by a green roof system, including such a system with agricultural plantings, in compliance with Section 1507.16 of this code.

3. Any portion of a roof used as outdoor recreation space by the occupants of the building that is landscaped, covered by wood decking or covered with a walking surface or other protective surface, provided that such walking surface or protective surface has a minimum initial solar reflectance of 0.3 as determined in accordance with ASTM C 1549 or ASTM E 1918.

4. Ballasted roofs, provided that the ballast has a minimum initial solar reflectance of 0.2 as determined in accordance with ASTM C 1549 or ASTM E 1918.

5. Any portion of a roof that is under mechanical equipment, duckboarding, decking, platform, roof tank, cooling tower or any other rooftop structure or equipment exempted by rule by the commissioner.

6. Any roof or portion of a roof composed of glass, metal, clay or concrete tile or plastic/rubber intended to simulate clay or concrete tile, wood, or slate.

7. Any portion of a roof used by a school or daycare center as a playground for children.

8. Any roof, if the amount of rooftop space not subject to exceptions 1 through 7 is in the aggregate less than 100 square feet (9.3 m²).

**SECTION BC 1505**

**FIRE CLASSIFICATION**

**1505.1 General.** Roof assemblies shall be divided into the classes defined below. Class A, B and C roof assemblies and roof coverings required to be listed by this section shall be tested in accordance with ASTM E 108 or UL 790. In addition, fire-retardant-treated wood roof coverings shall be tested in accordance with ASTM D 2898. The minimum roof coverings installed on buildings shall comply with Table 1505.1 of this code based on the type of construction of the building.

**Exception:** Skylights and sloped glazing that comply with Chapter 24 or Section 2610 of this code.

**TABLE 1505.1**

</tr>
</tbody>
</table>

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m².

a. Unless otherwise required due to the location of the building within a fire district in accordance with Section D102.2.3 in Appendix D.

b. Buildings that are not more than two stories above grade plane and having not more than 6,000 square feet (557.4 m²) of projected roof area and where there is a minimum 10-foot fire-separation distance from the leading edge of the roof to a lot line on all sides of the building, except for street fronts or public ways, shall be permitted to have roofs of No. 1 cedar or redwood shakes and No. 1 shingles in accordance with Section 1505.6.
1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by an approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, or an exposed concrete roof deck.

2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck on noncombustible framing.

3. Class A roof assemblies include minimum 16 ounce per square foot (0.0416 kg/m²) copper sheets installed over combustible decks.

4. Class A roof assemblies include slate installed over ASTM D 226, Type II underlayment over combustible decks.

1505.3 Class B roof assemblies. Class B roof assemblies are those that are effective against moderate fire-test exposure. Class B roof assemblies and roof coverings shall be listed and identified as Class B by an approved testing agency.

1505.4 Class C roof assemblies. Class C roof assemblies are those that are effective against light fire-test exposure. Class C roof assemblies and roof coverings shall be listed and identified as Class C by an approved testing agency.

1505.5 Construction of sloping roofs. Roofs having a slope of more than 60 degrees (1.05 rad) to the horizontal shall be constructed of material having the same fire-resistance rating as required for an exterior nonbearing wall of the building of which it is a part. When the slope is 60 degrees (1.05 rad) or less to the horizontal, the sloping roof shall be constructed as required for the roof of the building. Where the back of a false mansard is exposed to the outdoors, the back shall be covered with noncombustible material or with roof covering as required for the roof of the building.

1505.6 Fire-retardant-treated wood shingles and shakes. Fire-retardant-treated wood shakes and shingles shall be treated by impregnation with chemicals by the full-cell vacuum-pressure process, in accordance with AWPA C1. Each bundle shall be marked to identify the manufactured unit and the manufacturer, and shall also be labeled to identify the classification of the material in accordance with the testing required in Section 1505.1, the treating company and the quality control agency.

1505.7 Special purpose roofs. Special purpose wood shingle or wood shake roofing shall conform [with] to the grading and application requirements of Section 1507.8 or Section 1507.9. In addition, an underlayment of ⅝-inch (15.9 mm) Type X water-resistant gypsum backing board or gypsum sheathing shall be placed under minimum nominal ½-inch[[-thick] (12.7 mm) thick] wood structural panel solid sheathing or 1-inch ([25] 25.4 mm) nominal spaced sheathing.
1505.8 [Photovoltaic systems. Rooftop installed photovoltaic systems that are adhered or attached to the roof covering or photovoltaic modules/shingles installed as roof coverings shall be labeled to identify their fire classification in accordance with the testing required in Section 1505.1.] Building-integrated photovoltaic products. Building-integrated photovoltaic products installed as the roof covering shall be tested, listed and labeled for fire classification in accordance with Section 1505.1.

1505.9 Photovoltaic panels and modules. Rooftop-mounted photovoltaic panel systems shall be tested, listed and identified with a fire classification in accordance with UL 1703. The fire classification shall comply with Table 1505.1 of this code based on the type of construction of the building.

1505.10 Roof gardens and landscaped roofs. Roof gardens and landscaped roofs shall comply with Section 1507.16.

SECTION BC 1506
MATERIALS

1506.1 Scope. The requirements set forth in this section shall apply to the application of roof-covering materials specified herein. Roof coverings shall be applied in accordance with this chapter and the manufacturer’s [installation] instructions. Installation of roof coverings shall comply with the applicable provisions of Section 1507.

1506.2 [Compatibility of materials. Roofs and roof coverings shall be of materials that are compatible with each other and with the building or structure to which the materials are applied.]

1506.3 Material specifications and physical characteristics. Roof-covering materials shall conform to the applicable standards listed in this chapter. In the absence of applicable standards or where materials are of questionable suitability, testing by an approved agency shall be required by the commissioner to determine the character, quality and limitations of application of the materials.

1506.4 [1506.3] Product identification. Roof-covering materials shall be delivered in packages bearing the manufacturer’s identifying marks and approved testing agency labels required in accordance with Section 1505. Bulk shipments of materials shall be accompanied with the same information issued in the form of a certificate or on a bill of lading by the manufacturer.

SECTION BC 1507
REQUIREMENTS FOR ROOF COVERINGS

1507.1 Scope. Roof coverings shall be applied in accordance with the applicable provisions of this section and the manufacturer’s [installation] instructions.

1507.2 Asphalt shingles. The installation of asphalt shingles shall comply with the provisions of this section.

1507.2.1 Deck requirements. Asphalt shingles shall be fastened to solidly sheathed decks.

1507.2.2 Slope. Asphalt shingles shall only be used on roof slopes of two units vertical in 12 units horizontal (17-percent slope) or greater. For roof slopes from two units vertical in 12 units horizontal...
horizontal (17-percent slope) up to four units vertical in 12 units horizontal (33-percent slope), double underlayment application is required in accordance with Section 1507.2.8.

1507.2.3 Underlayment. Unless otherwise noted, required underlayment shall conform to ASTM D 226, Type I, ASTM D 4869, Type I, or ASTM D 6757.

1507.2.4 Self-adhering polymer modified bitumen sheet. Self-adhering polymer modified bitumen sheet shall comply with ASTM D 1970.

1507.2.5 Asphalt shingles. Asphalt shingles shall comply with ASTM D 225 or ASTM D 3462.

1507.2.6 Fasteners. Fasteners for asphalt shingles shall be galvanized, stainless steel, aluminum or copper roofing nails, minimum [12-gage] 12-gage (0.105 [inches]-inch (2.67 mm)) shank with a minimum ⅜ inch-diameter (9.5 mm) head, of a length to penetrate through the roofing materials and a minimum of ¾ inch (19.1 mm) into the roof sheathing. Where the roof sheathing is less than ¾ inch (19.1 mm) thick, the nails shall penetrate through the sheathing. Fasteners shall comply with ASTM F 1667.

1507.2.7 Attachment. Asphalt shingles shall have the minimum number of fasteners required by the manufacturer, but not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 21 units vertical in 12 units horizontal (21:12), shingles shall be installed as required by the manufacturer.

[1507.2.7.1 Wind resistance. Asphalt shingles shall be tested in accordance with ASTM D 7158. Asphalt shingles shall meet the classification requirements of Table 1507.2.7.1(1) for the maximum basic wind speed per Section 1609. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D 7158 and the required classification in Table 1507.2.7.1(1).]  

[Exception: Asphalt shingles not included in the scope of ASTM D 7158 shall be tested and labeled to indicate compliance with ASTM D 3161 and the required classification in Table 1507.2.7.1(2).]

1507.2.8 Underlayment application. For roof slopes from two units vertical in 12 units horizontal (17-percent slope) up to four units vertical in 12 units horizontal (33-percent slope), underlayment shall be two layers applied in the following manner. Apply a minimum 19-inch[-wide] ([483] 482.6 mm) wide strip of underlayment felt parallel with and starting at the eave, fastened sufficiently to hold in place. Starting at the eave, apply 36-inch[-wide] ([914] 914.4 mm) wide sheets of underlayment overlapping successive sheets 19 inches ([483] 482.6 mm) and fastened sufficiently to hold in place. Distortions in the underlayment shall not interfere with the ability of the shingles to seal. For roof slopes of four units vertical in 12 units horizontal (33-percent slope) or greater, underlayment shall be one layer applied in the following manner. Underlayment shall be applied shingle fashion, parallel to and starting from the eave and lapped 2 inches ([51] 50.8 mm), fastened only as necessary to hold in place. Distortions in the underlayment shall not interfere with the ability of the shingles to seal.

1507.2.8.1 Ice barrier. An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches ([649] 609.6 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.
1507.2.9 Flashings. Flashing for asphalt shingles shall comply with this section. Flashing shall be applied in accordance with this section and the asphalt shingle manufacturer’s instructions.

1507.2.9.1 Base and cap flashing. Base and cap flashing shall be installed in accordance with the manufacturer’s instructions. Base flashing shall be of either corrosion-resistant metal of minimum nominal 0.019-inch (0.483 mm) thickness or mineral-surfaced roll roofing weighing a minimum of 77 pounds per 100 square feet (3.76 kg/m²). Cap flashing shall be corrosion-resistant metal of minimum nominal 0.019-inch (0.483 mm) thickness.

1507.2.9.2 Valleys. Valley linings shall be installed in accordance with the manufacturer’s instructions before applying shingles. Valley linings of the following types shall be permitted:

1. For open valleys (valley lining exposed) lined with metal, the valley lining shall be at least 24 inches (609.6 mm) wide and of any of the corrosion-resistant metals in Table 1507.2.9.2.

2. For open valleys, valley lining of two plies of mineral-surfaced roll roofing complying with ASTM D 3909 or ASTM D 6380 shall be permitted. The bottom layer shall be 18 inches (457.2 mm) and the top layer a minimum of 36 inches (914.4 mm) wide.

3. For closed valleys (valleys covered with shingles), valley lining of one ply of smooth roll roofing complying with ASTM D 6380, and at least 36 inches (914.4 mm) wide or types as described in Item 1 or 2 above shall be permitted. Self-adhering polymer modified bitumen underlayment complying with ASTM D 1970 shall be permitted in lieu of the lining material.

For SI: 1 inch = 25.4 mm, 1 pound = 0.454 kg, 1 ounce = 28.35 g, 1 square foot = 0.0929 m².

#### 1507.2.9.3 Drip edge

[Provide drip edge at eaves and gables of shingle roofs. Overlap to be a minimum of 2 inches (51 mm). Eave drip edges shall extend ¼ inch (6.4 mm) below sheathing and extend back on the roof a minimum of 2 inches (51 mm). Drip edge shall be mechanically fastened a maximum of 12 inches (305 mm) o.c. A drip edge shall be provided at eaves and rake edges of shingle roofs. Adjacent segments of the drip edge shall be lapped a minimum of 2 inches (50.8 mm). The vertical leg of drip edges shall be a minimum of 1½ inches (38.1 mm) in width and shall extend a minimum of ¼ inch (6.4 mm) below sheathing. The drip edge shall extend back on the roof a minimum of 2 inches (50.8 mm). Underlayment shall be installed over drip edges along eaves. Drip edges shall be installed over underlayment along rake edges. Drip edges shall be mechanically fastened a maximum of 12 inches (304.8 mm) on center.]

#### 1507.3 Clay and concrete tile

The installation of clay and concrete tile shall comply with the provisions of this section.

##### 1507.3.1 Deck requirements

Concrete and clay tile shall be installed only over solid sheathing or spaced structural sheathing boards.

##### 1507.3.2 Deck slope

Clay and concrete roof tile shall be installed on roof slopes of 2½ units vertical in 12 units horizontal (21-percent slope) or greater. For roof slopes from 2½ units vertical in 12 units horizontal (21-percent slope) to four units vertical in 12 units horizontal (33-percent slope), double underlayment application is required in accordance with Section 1507.3.3.

##### 1507.3.3 Underlayment

Unless otherwise noted, required underlayment shall conform to: ASTM D 226, Type II; ASTM D 2626 or ASTM D 6380, Class M mineral-surfaced roll roofing.

##### 1507.3.3.1 Low-slope roofs

For roof slopes from 2½ units vertical in 12 units horizontal (21-percent slope), up to four units vertical in 12 units horizontal (33-percent slope), underlayment shall be a minimum of two layers applied as follows:
1. Starting at the eave, a 19-inch ([483] 482.6 mm) strip of underlayment shall be applied parallel with the eave and fastened sufficiently in place.

2. Starting at the eave, 36-inch ([914] 914.4 mm) wide strips of underlayment felt shall be applied overlapping successive sheets 19 inches ([483] 482.6 mm) and fastened sufficiently in place.

1507.3.2 High-slope roofs. For roof slopes of four units vertical in 12 units horizontal (33-percent slope) or greater, underlayment shall be a minimum of one layer of underlayment felt applied shingle fashion, parallel to, and starting from the eaves and lapped 2 inches ([51] 50.8 mm), fastened only as necessary to hold in place.

1507.3.4 Clay tile. Clay roof tile shall comply with ASTM C 1167.

1507.3.5 Concrete tile. Concrete roof tile shall comply with ASTM C 1492.

1507.3.6 Fasteners. Tile fasteners shall be corrosion resistant and not less than 11 gage, 5/16-inch (8.0 mm) head, and of sufficient length to penetrate the deck a minimum of ¾ inch (19.1 mm) or through the thickness of the deck, whichever is less. Attaching wire for clay or concrete tile shall be not [be smaller] less than 0.083 inch (2.1 mm). Perimeter fastening areas include three tile courses but not less than 36 inches ([914] 914.4 mm) from either side of hips or ridges and edges of eaves and gable rakes.

1507.3.7 Attachment. Clay and concrete roof tiles shall be fastened in accordance with Table 1507.3.7.

</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 0.447 m/s, 1 pound per square foot = 4.882 kg/m².

a. Minimum fastener size. Corrosion-resistant nails not less than No. 11 gage with 5/16-inch head. Fasteners shall be long enough to penetrate into the sheathing 3/4-inch or through the thickness of the sheathing, whichever is less. Attaching wire for clay and concrete tile shall not be smaller than 0.083 inch.
b. Snow areas. A minimum of two fasteners per tile are required or battens and one fastener.
c. Roof slopes greater than 24:12. The nose of all tiles shall be securely fastened.
d. Horizontal battens. Battens shall be not less than 1 inch by 2 inch nominal. Provisions shall be made for drainage by a minimum of 1/8-inch riser at each nail or by 4-foot-long battens with at least a 1/2-inch separation between battens. Horizontal battens are required for slopes over 7:12.
e. Perimeter fastening areas include three tile courses but not less than 36 inches from either side of hips or ridges and edges of eaves and gable rakes.
f. V_{ed} shall be determined in accordance with Section 1009.3.1.

1507.3.8 Application. Tile shall be applied according to the manufacturer’s [installation] instructions, based on the following:

1. Climatic conditions.
2. Roof slope.
3. Underlayment system.
4. Type of tile being installed.

1507.3.9 Flashing. At the juncture of the roof vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer’s [installation] instructions, and where of metal, shall not be less than 0.019-inch (0.483 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25.4 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) wide underlayment of either one layer of Type I underlayment running the full length of the valley, or a self-adhering polymer-modified bitumen sheet complying with ASTM D 1970, in addition to other required underlayment. For slopes under seven units vertical in 12 units horizontal (58-percent slope), the metal valley flashing underlayment shall be solid cemented to the roofing underlayment or a self-adhering polymer modified bitumen sheet shall be installed.

1507.4 Metal roof panels. The installation of metal roof panels shall comply with the provisions of this section.

1507.4.1 Deck requirements. Metal roof panel roof coverings shall be applied to a solid or closely fitted deck, except where the roof covering is specifically designed to be applied to spaced supports.

1507.4.2 Deck slope. The minimum slope for metal roof panels shall comply with the following:

1. The minimum slope for lapped, nonsoldered seam metal [roofs] roof panels without applied lap sealant shall be three units vertical in 12 units horizontal (25-percent slope).
2. The minimum slope for lapped, nonsoldered seam metal [roofs] roof panels with applied lap sealant shall be one-half unit vertical in 12 units horizontal (4-percent slope). Lap sealants shall be applied in accordance with the approved manufacturer’s [installation] instructions.
3. The minimum slope for standing-seam [of] metal roof panel systems shall be one-quarter unit vertical in 12 units horizontal (2-percent slope).

1507.4.3 Material standards. Metal-sheet roof covering systems that incorporate supporting structural members shall be designed in accordance with Chapter 22. Metal-sheet roof coverings
installed over structural decking shall comply with Table 1507.4.3(1). The materials used for metal-sheet roof coverings shall be naturally corrosion resistant or provided with corrosion resistance in accordance with the standards and minimum thicknesses shown in Table 1507.4.3(2).

‡ Paint systems in accordance with ASTM A 755 shall be applied over steel products with corrosion-resistant coatings complying with ASTM A 792, ASTM A 875, ASTM A 463 or ASTM A 653.

1507.4.4 Attachment. Metal roof panels shall be secured to the supports in accordance with the approved manufacturer’s fasteners. In the absence of manufacturer recommendations, the following fasteners shall be used:

1. Galvanized fasteners shall be used for steel roofs.
2. Copper, brass, bronze, copper alloy or 300 series stainless-steel fasteners shall be used for copper roofs.
3. Stainless-steel fasteners are acceptable for all types of metal roofs.
4. Aluminum fasteners are acceptable for aluminum roofs attached to aluminum supports.

1507.5 Metal roof shingles. The installation of metal roof shingles shall comply with the provisions of this section.

1507.5.1 Deck requirements. Metal roof shingles shall be applied to a solid or closely fitted deck, except where the roof covering is specifically designed to be applied to spaced sheathing.

1507.5.2 Deck slope. Metal roof shingles shall not be installed on roof slopes below three units vertical in 12 units horizontal (25-percent slope).

1507.5.3 Underlayment. Underlayment shall comply with ASTM D 226, Type I or ASTM D 4869.

1507.5.4 Ice barrier. An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches ([640] 609.6 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

1507.5.5 Material standards. Metal roof shingle roof coverings shall comply with Table 1507.4.3(1). The materials used for metal-roof shingle roof coverings shall be naturally corrosion resistant or provided with corrosion resistance in accordance with the standards and minimum thicknesses specified in the standards listed in Table 1507.4.3(2).

1507.5.6 Attachment. Metal roof shingles shall be secured to the roof in accordance with the [approved] manufacturer’s [installation] instructions.
**1507.5.7 Flashing.** Roof valley flashing shall be of corrosion-resistant metal of the same material as the roof covering or shall comply with the standards in Table 1507.4.3(1). The valley flashing shall extend at least 8 inches (203.2 mm) from the centerline each way and shall have a splash diverter rib not less than \( \frac{3}{4} \) inch (19.1 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (101.6 mm). The valley flashing shall extend a 36-inch-wide (914.4 mm) wide underlayment directly under it consisting of either one layer of underlayment running the full length of the valley or a self-adhering polymer-modified bitumen sheet complying with ASTM D 1970, in addition to underlayment required for metal roof shingles. For slopes under seven units vertical in 12 units horizontal (58-percent slope), the metal valley flashing underlayment shall be solid cemented to the roofing underlayment or a self-adhering polymer modified bitumen sheet shall be installed.

**1507.6 Mineral-surfaced roll roofing.** The installation of mineral-surfaced roll roofing shall comply with this section.

**1507.6.1 Deck requirements.** Mineral-surfaced roll roofing shall be fastened to solidly sheathed roofs.

**1507.6.2 Deck slope.** Mineral-surfaced roll roofing shall not be applied on roof slopes below one unit vertical in 12 units horizontal (8-percent slope).

**1507.6.3 Underlayment.** Underlayment shall comply with ASTM D 226, Type I or ASTM D 4869.

**1507.6.4 Ice barrier.** An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (609.6 mm) inside the exterior wall line of the building.

**Exception:** Detached accessory structures that contain no conditioned floor area.

**1507.6.5 Material standards.** Mineral-surfaced roll roofing shall conform to ASTM D 3909 or ASTM D 6380.

**1507.7 Slate shingles.** The installation of slate shingles shall comply with the provisions of this section.

**1507.7.1 Deck requirements.** Slate shingles shall be fastened to solidly sheathed roofs.

**1507.7.2 Deck slope.** Slate shingles shall only be used on slopes of four units vertical in 12 units horizontal (4:12) or greater.

**1507.7.3 Underlayment.** Underlayment shall comply with ASTM D 226, Type I or II or ASTM D 4869, Type III or IV.

**1507.7.4 Ice barrier.** An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall extend from the lowest edges of all roof surfaces to a point at least 24 inches (609.6 mm) inside the exterior wall line of the building.
**Exception:** Detached accessory structures that contain no conditioned floor area.

**1507.7.5 Material standards.** Slate shingles shall comply with ASTM C 406.

**1507.7.6 Application.** Minimum headlap for slate shingles shall be in accordance with Table 1507.7.6. Slate shingles shall be secured to the roof with two fasteners per slate.

</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, °C = (°F – 32)/1.8.

1507.8.1 Deck requirements. Wood shingles shall be installed on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch ([25] 25.4 mm by [102] 101.6 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners.

1507.8.1.1 Solid sheathing required. Solid sheathing is required.

1507.8.2 Deck slope. Wood shingles shall be installed on slopes of not less than three units vertical in 12 units horizontal [(25-percent slope) or greater.] (25-percent slope).

1507.8.3 Underlayment. Underlayment shall comply with ASTM D 226, Type I or ASTM D 4869.
1507.8.4 Ice barrier. An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches ([649] 609.6 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

1507.8.5 Material standards. Wood shingles shall be of naturally durable wood and comply with the requirements of Table 1507.8.5.

1507.8.6 Attachment. Fasteners for wood shingles shall be corrosion resistant with a minimum penetration of ¾ inch (19.1 mm) into the sheathing. For sheathing less than ½ inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Each shingle shall be attached with a minimum of two fasteners.

1507.8.7 Application. Wood shingles shall be laid with a side lap not less than 1½ inches ([38] 38.1 mm) between joints in adjacent courses, and not be in direct alignment in alternate courses. Spacing between shingles shall be ¼ to ⅜ inches (6.4 to 9.5 mm). Weather exposure for wood shingles shall not exceed that set in Table 1507.8.7.

For SI: 1 inch = 25.4 mm.

1507.8.8 Flashing. At the juncture of the roof and vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer’s installation instructions, and where of metal, shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch ([25] 25.4 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches ([102] 101.6 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope)
and over, the valley flashing shall have a 36-inch-wide (914 mm) wide underlayment of either one layer of Type I underlayment running the full length of the valley, or a self-adhering polymer-modified bitumen sheet complying with ASTM D 1970, in addition to other required underlayment. For slopes under seven units vertical in 12 units horizontal (58-percent slope), the metal valley flashing underlayment shall be solid cemented to the roofing underlayment or a self-adhering polymer modified bitumen sheet shall be installed.

1507.9 Wood shakes. The installation of wood shakes shall comply with the provisions of this section and Table 1507.8.

1507.9.1 Deck requirements. Wood shakes shall only be used on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall be not less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. Where 1-inch by 4-inch spaced sheathing is installed at 10 inches (254 mm) o.c., additional 1-inch by 4-inch (25 mm by 102 mm) boards shall be installed between the sheathing boards.

1507.9.1.1 Solid sheathing required. Solid sheathing is required in areas where the average daily temperature in January is 25°F (−4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water.

1507.9.2 Deck slope. Wood shakes shall only be used on slopes of not less than four units vertical in 12 units horizontal (33-percent slope) or greater.

1507.9.3 Underlayment. Underlayment shall comply with ASTM D 226, Type I or ASTM D 4869.

1507.9.4 Ice barrier. An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the lowest edges of all roof surfaces to a point at least 24 inches (609.6 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

1507.9.5 Interlayment. Interlayment shall comply with ASTM D 226, Type I.

1507.9.6 Material standards. Wood shakes shall comply with the requirements of Table 1507.9.6.

For SI: 1 inch = 25.4 mm.

a. For 24-inch by 0.375-inch handsplit shakes, the maximum exposure is 7.5 inches.

**1507.9.9 Flashing.** At the juncture of the roof and vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer’s installation instructions, and where of metal, shall be not less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25.4 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (101.6 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914.4 mm) wide underlayment of either one layer of Type I underlayment running the full length of the valley or a self-adhering polymer-modified bitumen sheet complying with ASTM D 1970, in addition to other required...
underlayment. For slopes under seven units vertical in 12 units horizontal (58-percent slope) the metal valley flashing underlayment shall be solidly cemented to the roofing underlayment or a self-adhering polymer-modified bitumen sheet shall be installed.

1507.10 Built-up roofs. The installation of built-up roofs shall comply with the provisions of this section.

1507.10.1 Slope. Built-up roofs shall have a slope designed and built to provide positive roof drainage.

1507.10.2 Material standards. Built-up roof covering materials shall comply with UL 55A or the standards in Table 1507.10.2 of this code.

| TABLE 1507.10.2 BUILT-UP ROOFING MATERIAL STANDARDS |
|---------------------------------|------------------|
| MATERIAL                        | STANDARD         |
| Acrylic coatings used in roofing| ASTM D 6083      |

| Asphalt adhesive used in roofing| ASTM D 3747      |
| Asphalt cements used in roofing  | ASTM D 3019; D 2822; D 4586 |
| Asphalt-coated glass fiber base sheet | ASTM D 4601 |
| Asphalt coatings used in roofing | ASTM D 1227; D 2823; D 2824; D 4479 |
| Asphalt glass felt              | ASTM D 2178      |
| Asphalt primer used in roofing  | ASTM D 41        |
| Asphalt-saturated and asphalt-coated organic felt base sheet | ASTM D 2626 |
| Asphalt-saturated organic felt  | ASTM D 226       |
| Asphalt used in roofing         | ASTM D 312       |
| Coal-tar cements used in roofing| ASTM D 4022; D 5643 |
| Coal-tar saturated organic felt | ASTM D 227       |
| Coal-tar pitch used in roofing  | ASTM D 450; Type I or II |
| Coal-tar primer used in roofing, dampproofing and waterproofing | ASTM D 43 |
| Glass mat, coal tar             | ASTM D 4990      |
| Glass mat, venting type         | ASTM D 4897      |
| Mineral-surfaced inorganic cap sheet | ASTM D 3909 |
| Thermoplastic fabrics used in roofing | ASTM D 5665, D 5726 |

1507.11 Modified bitumen roofing. The installation of modified bitumen roofing shall comply with the provisions of this section.

1507.11.1 Slope. Modified bitumen membrane roofs shall have a slope designed and built to provide positive roof drainage.

1507.12 Thermoset single-ply roofing. The installation of thermoset single-ply roofing shall comply with the provisions of this section.

1507.12.1 Slope. Thermoset single-ply membrane roofs shall have a slope designed and built to provide positive roof drainage.

1507.12.2 Material standards. Thermoset single-ply roof coverings shall comply with ASTM D 4637, ASTM D 5019 or CGSB 37-GP-52M.

1507.12.3 Ballasted thermoset low-slope roofs. Ballasted thermoset low-slope roofs (roof slope < 2:12) shall be installed in accordance with this section and Section 1504.4, and subject to the limitations of Section 1504.8. [Stone used as ballast shall comply with ASTM D 448.]

1507.13 Thermoplastic single-ply roofing. The installation of thermoplastic single-ply roofing shall comply with the provisions of this section.

1507.13.1 Slope. Thermoplastic single-ply membrane roofs shall have a slope designed and built to provide positive roof drainage.

1507.13.2 Material standards. Thermoplastic single-ply roof coverings shall comply with ASTM D 4434, ASTM D 6754, ASTM D 6878 or CAN/CGSB 37-54.

1507.13.3 Ballasted thermoplastic low-slope roofs. Ballasted thermoplastic low-slope roofs (roof slope < 2:12) shall be installed in accordance with this section and Section 1504.4, and subject to the limitations of Section 1504.8. [Stone used as ballast shall comply with ASTM D 448.]

1507.14 Sprayed polyurethane foam roofing. The installation of sprayed polyurethane foam roofing shall comply with the provisions of this section.

1507.14.1 Slope. Sprayed polyurethane foam roofs shall have a slope designed and built to provide positive roof drainage.

1507.14.2 Material standards. Spray-applied polyurethane foam insulation shall comply with Type III or IV as defined in ASTM C 1029.

1507.14.3 Application. Foamed-in-place roof insulation shall be installed in accordance with the manufacturer’s instructions. A liquid-applied protective coating that complies with [Section 4507.45] Table 1507.14.3 shall be applied no less than 2 hours nor more than 72 hours following the application of the foam.

1507.14.4 Foam plastics. Foam plastic materials and installation shall comply with Chapter 26.

1507.15 Liquid-applied roofing. The installation of liquid-applied roofing shall comply with the provisions of this section.

1507.15.1 Slope. Liquid-applied roofing shall have a slope designed and built to provide positive roof drainage.

1507.15.2 Material standards. Liquid-applied roofing shall comply with ASTM C 836, ASTM C 957, ASTM D 1227[,] or ASTM D 3468, ASTM D 6083, ASTM D 6694 or ASTM D 6947.

1507.16 [Green roof systems] Vegetative roofs, roof gardens and landscaped roofs. [The green roof system] Vegetative roofs, roof gardens and landscaped roofs shall comply with the provisions of this section and New York City Fire Code.

1507.16.1 Design standards. [Green roof systems] Vegetative roofs, roof gardens and landscaped roofs shall comply with ANSI/SPRI RP-14 and ANSI/SPRI VF-1, or with FM DS 1-35.

Exceptions:

1. The aggregate area of landscaping materials or growth media or both on any single roof level of a building or structure is 250 square feet (23.2 m²) or less.

2. The roof area is 22 feet ([6706] 6705.6 mm) or less from grade.

3. The [green] vegetative roof system is a container garden.

1507.16.2 Roof structure. The roof structure shall comply with Chapter 16 for the design of the [green roofs system] vegetative roofs, roof gardens and landscaped roofs.

1507.16.3 Roof covering. Roof covering shall comply with Section 1507.10, 1507.11, 1507.12, 1507.13[,] or 1507.15.

1507.16.4 Slope. The roofing membrane shall have a design slope in accordance with the roof covering utilized. Overburden shall be installed to prevent slippage tested as an assembly.

1507.16.5 Structural fire resistance. The structural frame and roof construction supporting the load imposed upon the roof by the vegetative roof, roof gardens or landscaped roofs shall comply with the requirements of Table 601.

1507.17 Photovoltaic shingles. The installation of photovoltaic shingles shall comply with the provisions of this section.

1507.17.1 Deck requirements. Photovoltaic shingles shall be applied to a solid or closely fitted deck, except where the shingles are specifically designed to be applied over spaced sheathing.

1507.17.2 Deck slope. Photovoltaic shingles shall not be installed on roof slopes less than three units vertical in 12 units horizontal (25-percent slope).
1507.17.3 Underlayment. Unless otherwise noted, required underlayment shall conform to ASTM D 226, ASTM D 4869 or ASTM D 6757.

1507.17.4 Underlayment application. Underlayment shall be applied shingle fashion, parallel to and starting from the eave, lapped 2 inches (50.8 mm) and fastened sufficiently to hold in place.

1507.17.4.1 High wind attachment. Underlayment applied in areas subject to high winds ($V_{	ext{asd}}$ greater than 110 mph (49.1 m/s) as determined in accordance with Section 1609.3.1) shall be applied with corrosion-resistant fasteners in accordance with the manufacturer’s instructions. Fasteners shall be applied along the overlap at not more than 36 inches (914.4 mm) on center. Underlayment installed where $V_{	ext{asd}}$ is not less than 120 mph (53.6 m/s) shall comply with ASTM D 226, Type II, ASTM D 4869, Type IV or ASTM D 6757. The underlayment shall be attached in a grid pattern of 12 inches (304.8 mm) between side laps with a 6-inch (152.4 mm) spacing at the side laps. Underlayment shall be applied in accordance with Section 1507.2.8 except all laps shall be a minimum of 4 inches (101.6 mm). Underlayment shall be attached using metal or plastic cap nails with a head diameter of not less than 1 inch (25.4 mm) with a thickness of not less than 32-gage (0.0134 inch (0.34 mm)) sheet metal. The cap nail shank shall be a minimum of 12 gage (0.105 inch (2.67 mm)) with a length to penetrate through the roof sheathing or a minimum of ¾ inch (19.1 mm) into the roof sheathing.

Exception: As an alternative, adhered underlayment complying with ASTM D 1970 shall be permitted.

1507.17.4.2 Ice barrier. An ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet shall be used instead of normal underlayment and extend from the lowest edges of all roof surfaces to a point not less than 24 inches (609.6 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

1507.17.5 Fasteners. Fasteners for photovoltaic shingles shall be galvanized, stainless steel, aluminum or copper roofing nails, minimum 12-gage (0.105 inch (2.67 mm)) shank with a minimum ⅜-inch (9.5 mm) diameter head, of a length to penetrate through the roofing materials and a minimum of ¾ inch (19.1 mm) into the roof sheathing. Where the roof sheathing is less than ¾ inch (19.1 mm) thick, the nails shall penetrate through the sheathing. Fasteners shall comply with ASTM F 1667.

1507.17.6 Material standards. Photovoltaic shingles shall be listed and labeled in accordance with UL 1703.

1507.17.7 Attachment. Photovoltaic shingles shall be attached in accordance with the manufacturer’s instructions.

1507.17.8 Wind resistance. Photovoltaic shingles shall be tested in accordance with procedures and acceptance criteria in ASTM D 3161. Photovoltaic shingles shall comply with the classification requirements of Table 1504.1.1 of this code for the appropriate maximum nominal
design wind speed. Photovoltaic shingle packaging shall bear a label to indicate compliance with the procedures in ASTM D 3161 and the required classification from Table 1504.1.1 of this code.

SECTION BC 1508
ROOF INSULATION

1508.1 General. The use of above-deck thermal insulation shall be permitted provided such insulation is covered with an approved roof covering and passes the tests of [FM 4450] NFPA 276 or UL 1256 when tested as an assembly.

Exceptions:

1. Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26 of this code.

2. Where a concrete roof deck is used and the above-deck thermal insulation is covered with an approved roof covering.

1508.1.1 Cellulosic fiberboard. Cellulosic fiberboard roof insulation shall conform to the material and installation requirements of Chapter 23.

1508.2 Material standards. Above-deck thermal insulation board shall comply with the standards in Table 1508.2.
TABLE 1508.2

SECTION BC 1509
RADIANT BARRIERS INSTALLED ABOVE DECK

1509.1 General. A radiant barrier installed above a deck shall comply with Sections 1509.2 through 1509.4.

1509.2 Fire testing. Radiant barriers shall be permitted for use above decks where the radiant barrier is covered with an approved roof covering and the system consisting of the radiant barrier and the roof covering complies with the requirements of either FM 4550 or UL 1256.

1509.3 Installation. The low emittance surface of the radiant barrier shall face the continuous airspace between the radiant barrier and the roof covering.

1509.4 Material standards. A radiant barrier installed above a deck shall comply with ASTM C 1313/1313M.

SECTION BC 1510
ROOFTOP STRUCTURES

[1509.1] 1510.1 General. The provisions of this section shall govern the construction of rooftop structures. All rooftop structures shall be subject to the roof area coverage limitations and building height requirements of Chapter 5. Rooftop structures shall be constructed with materials as required for the building, except as provided for in this section.

[1509.2] 1510.2 Bulkheads and penthouses. Bulkheads and penthouses shall comply with the construction requirements of this Section[1509.2].

[1509.2.1] 1510.2.1 Type of construction. Bulkheads and penthouses shall be constructed with walls, floors and roof as required for the building.

Exceptions: Where the total aggregate area of all rooftop structures does not exceed 33 percent of the area of the roof of the building upon which they are erected[1510.2.1], the following shall apply:
1. Bulkheads on buildings of Type I and II construction. The exterior walls and roofs of such bulkheads with a fire separation distance of more than 5 feet (1524 mm) and less than 30 feet (9144 mm) shall be of at least 1-hour fire-resistance-rated noncombustible construction. Walls and roofs with a fire separation distance of 30 feet (9144 mm) or greater shall be of noncombustible construction. Interior framing and walls shall be of noncombustible construction.

2. Bulkheads on buildings of Type III, IV and V construction. The exterior walls of such bulkheads with a fire separation distance of more than 5 feet (1524 mm) and less than 30 feet (9144 mm) shall be at least 1-hour fire-resistance-rated construction. Walls with a fire separation distance of 30 feet (9144 mm) or greater from a common property line shall be of Type IV construction, or noncombustible construction. Roofs shall be constructed of materials and fire-resistance rated as required in Table 601 and Section 603, Item 25.3. Interior framing and walls shall be Type IV or noncombustible or fire-retardant-treated wood construction.

[3. On one-story buildings, combustible unroofed mechanical equipment screens, fences, or similar enclosures are permitted where located with a fire separation distance of at least 20 feet (6096 mm) from adjacent property lines and where not exceeding 4 feet (1219 mm) in height above the roof surface.]

[1509.2.2] 1510.2.2 Penthouses. Enclosed walls of penthouses shall comply with the requirements for exterior walls as per Tables 601 and 602 for the construction class of the building on which they are erected. Roofs of penthouses shall comply with the requirements for roof construction of Table 601 and Chapter 15.

[1509.2.3] 1510.2.3 Bulkheads. An enclosed rooftop structure not intended for human occupancy shall not be used for purposes other than shelter of mechanical equipment or shelter of vertical shaft openings in the roof. Provisions, such as louvers, louver blades or flashing, shall be made to protect the mechanical equipment and the building interior from the elements.

[1509.3 Tank Supports] 1510.3 Tanks. Tanks having a capacity of more than 500 gallons [(2 m³) placed in or on] (1892.7 L) located on the roof deck of a building shall be supported on masonry, reinforced concrete, steel or Type IV construction provided that, where such supports are located in the building above the lowest story, the support shall be fire-resistance rated as required for Type IA construction.

[1509.3.1] 1510.3.1 Valve and drain. [Such tanks shall have in] On the bottom or on the side near the bottom of the tank, a pipe or outlet, fitted with a suitable [quick opening] quick-opening valve for discharging the contents into a drain in an emergency [through an adequate drain] shall be provided.

[1509.3.2] 1510.3.2 Location. [Such tanks] Tanks shall not be placed over or near a [line of stairs] stairway or an elevator shaft, unless there is a solid roof or floor underneath the tank.

[1509.3.3] 1510.3.3 Tank cover. Unenclosed roof tanks shall have covers sloping toward the [outer edges] perimeter of the tanks.
1509.4 1510.4 Cooling towers. [Cooling towers in excess of 250 square feet (23.2 m²) in base area or in excess of 15 feet (4572 mm) high where located on building roofs more than 50 feet (15 240 mm) high shall be of noncombustible construction.] Cooling towers shall be of noncombustible construction.

Exceptions:

1. [Drip boards and the enclosing construction of wood not less than 1 inch (25 mm) nominal thickness, provided the wood is covered on the exterior of the tower with noncombustible material.] Fill and drift eliminators of limited combustible materials may be considered noncombustible if the cooling towers are provided with automatic sprinkler protection complying with Section 903.

2. [Fill and drift eliminators may be of combustible material if the towers are provided with automatic sprinkler protection complying with Section 903 of this code.] Fill and drift eliminators that comply with Section 908 of the New York City Mechanical Code.

1509.5 1510.5 Steeples, minarets, spires, domes and cupolas. [Any steeple, minaret, spire, dome or cupola shall be of a type of construction not less in fire resistance rating than required for the building to which it is attached except that any such steeple, minaret, spire, dome or cupola that exceeds 85 feet (25 908 mm) in height above grade plane, exceeds 200 square feet (18.6 m²) in horizontal area or is used for any purpose other than a belfry or an architectural embellishment shall be constructed of and supported on Type I or II construction.] Steeples, minarets, spires, domes, cupolas and other similar architectural elements not used for occupancy or storage, shall be constructed of materials consistent with the required type of construction of the building and shall be of a type of construction having fire-resistance ratings not less than required for the building on top of which such steeple, minaret, spire, dome or cupola is built.

1509.5.1 1510.5.1 Noncombustible construction required. [Any steeple, minaret, spire, dome or cupola that exceeds 60 feet (18 288 mm) in height above the highest point at which it comes in contact with the roof, or that exceeds 200 square feet (18.6 m²) in area at any horizontal section, or which is intended to be used for any purpose other than a belfry or architectural embellishment, shall be entirely constructed of and supported by noncombustible materials. Such structures shall be separated from the building below by construction having a fire-resistance rating of not less than 1.5 hours with openings protected with a minimum 1.5-hour fire-protection rating. Such structures placed above the roof of any building more than 50 feet (15 240 mm) in height, shall be of noncombustible material and shall be supported by construction of noncombustible material.] Steeples, minarets, spires, domes and cupolas greater than 60 feet (18 288 mm) in height above the highest point at which such structure contacts the roof as measured to the highest point on such structure, or that exceeds 200 square feet (18.6 m²) in area at any horizontal section, or which is intended to be used for any purpose other than as a belfry or architectural embellishment, or is located on the top of a building greater than 50 feet (1524 mm) in building height shall be constructed of and supported by noncombustible materials and shall be separated from the building below by construction having a fire-resistance rating of not less than 1.5 hours with openings protected in accordance with Section 712. Such structures located
on the top of a building greater than 50 feet (15,240 mm) in building height, shall be supported by noncombustible construction.

1509.5.2 Steeples, minarets and spires. Steeples, minarets, and spires shall have exterior walls constructed as required for the building on top of which they are attached built. The roof covering of spires shall be of a not less than the same class of roof covering as required for the main roof of the rest of the structure.

1509.6 Dormers. Dormers shall have exterior walls as required for the building to which they are attached. The roof covering of dormers shall be of a class of roof covering as required for the main roof of the rest.

1509.7 Greenhouses. Greenhouses used for the cultivation of plants, on the roofs of buildings other than buildings of Type V construction, shall be constructed of noncombustible framework and shall be glazed with plain or wire glass, or light transmitting plastic glazing complying with the requirements of Section 2606. The floors of greenhouses shall be constructed to be at least equal to the requirements for roof construction on Table 601 for the construction class of the building on which it is located.

1509.8 Protective guards. Buildings greater than 22 feet (6706 mm) in height with roof slopes less than 2.4 units vertical in 12 units horizontal (20-percent slope) shall be provided with a parapet, railing, fence, or combination thereof, not less than 42 inches (1067 mm) in height. Railings or fences may be located inward from the face of the exterior wall a distance not exceeding 6 feet (1828.8 mm). Railings guards or fences shall be of noncombustible material, except on buildings of Type V construction. Railings shall be constructed to comply with the requirements of Sections 1012 and 1607.7.

1509.8.1 Fences on roofs used for recreational purposes. Rooftops used for recreational purposes shall be provided with wire fencing at least 10 feet (3048 mm) in height. Openings in the fence shall not permit the passage of a 4-inch-diameter (101.6 mm) diameter sphere. Where ball games are played on rooftops the wire fencing shall be extended to provide an overhead closure.

1509.9 Miscellaneous combustible roof structures. The following roof structures may be constructed of combustible material if less than 12 feet (3657.6 mm) high above the roof: antenna supports; flagpoles; clothes drying frames; duckboarding; deck or platforms that do not cover more than 20 percent of the contiguous roof area at that level.

1510.10 Mechanical equipment screens. Mechanical equipment screens shall be constructed of the materials specified for the exterior walls in accordance with the type of construction of the building.

1510.10.1 Type V construction. The height of mechanical equipment screens located on the roof decks of buildings of Type V construction, as measured from grade plane to the highest point on the mechanical equipment screen, shall be permitted to exceed the maximum building height allowed for the building by other provisions of this code where complying with any one of the following limitations, provided the fire separation distance is greater than 5 feet (1524 mm):
1. Where the fire separation distance is not less than 20 feet (6096 mm), the height above grade plane of the mechanical equipment screen shall not exceed 4 feet (1220 mm) more than the maximum building height allowed;

2. The mechanical equipment screen shall be constructed of noncombustible materials;

3. The mechanical equipment screen shall be constructed of fire-retardant-treated wood complying with Section 2303.2 for exterior installation; or

4. Where the fire separation distance is not less than 20 feet (6096 mm), the mechanical equipment screen shall be constructed of materials having a flame spread index of 25 or less when tested in the minimum and maximum thicknesses intended for use with each face tested independently in accordance with ASTM E 84 or UL 723.

[1509.10] **1510.11 Photovoltaic systems.** Rooftop mounted photovoltaic systems shall be designed in accordance with this section.

[1509.10.1] **1510.11.1 Wind resistance.** Rooftop mounted photovoltaic systems shall be designed for wind loads for component and cladding in accordance with Chapter 16 using an effective wind area based on the dimensions of a single unit frame.

[1509.10.2] **1510.11.2 Fire classification.** Rooftop mounted photovoltaic [systems] panels and modules shall have the [same] fire classification [as the roof assembly required by] in accordance with Section [1505] 1505.9.

[1509.10.3] **1510.11.3 Installation.** Rooftop mounted photovoltaic [systems] panels and modules shall be installed in accordance with the manufacturer’s [installation] instructions.

[1509.10.4] **1510.11.4 Photovoltaic panels and modules.** Photovoltaic panels and modules rooftop mounted on top of a roof shall be listed and labeled in accordance with UL 1703 and shall be installed in accordance with the manufacturer’s [installation] instructions.

**SECTION BC [1540] 1511 REROOFING**

[1540.1] **1511.1 General.** Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

**[Exception] Exceptions:**

1. Section 1504.9 shall not apply if the area to be recovered or replaced is less than 50 percent of the roof area and less than 500 square feet (46.5 m²).

2. Recovering or replacing an existing roof covering shall not be required to meet the requirement for secondary (emergency overflow) drains or scuppers in Section 1503.4 for roofs that provide for positive roof drainage. For the purposes of this exception, existing secondary drainage or scupper systems required in accordance with this code shall not be removed unless they are replaced by secondary drains or scuppers designed and installed in accordance with Section 1503.4.
[1510.1.4] **1511.1.1 Slope.** Reroofs shall provide positive drainage.

[1510.2] **1511.2 Structural and construction loads.** Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.

[1510.3] **Recovering versus replacement.** New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.

2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.

3. Where the existing roof has two or more applications of any type of roof covering.

**1511.3 Roof replacement.** Roof replacement shall include the removal of all existing layers of roof coverings down to the roof deck.

**Exception:** Where the existing roof assembly includes an ice barrier membrane that is adhered to the roof deck, the existing ice barrier membrane shall be permitted to remain in place and covered with an additional layer of ice barrier membrane in accordance with Section 1507.

**1511.3.1 Roof recover.** The installation of a new roof covering over an existing roof covering shall be permitted where any of the following conditions occur:

**Exceptions:**

1. Where the new roof covering is installed in accordance with the roof covering manufacturer’s instructions.

2. Complete and separate roofing systems, such as standing-seam metal roof panel systems, that are designed to transmit the roof loads directly to the building’s structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.

3. Metal panel, metal shingle [1] and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section [1540.4] 1511.4.

4. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.

**1511.3.1.1 Exceptions.** A roof recover shall not be permitted where any of the following conditions occur:
1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.

2. Where the existing roof covering is slate, clay, cement or asbestos-cement tile.

3. Where the existing roof has two or more applications of any type of roof covering.

[1510.4] 1511.4 Roof recovering. Where the application of a new roof covering over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with gypsum board, mineral fiber, glass fiber or other approved materials securely fastened in place.

[1510.5] 1511.5 Reinstallation of materials. Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Aggregate surfacing materials shall not be reinstalled.

[1510.6] 1511.6 Flashings. Flashings shall be reconstructed in accordance with [approved manufacturer’s [installation] instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.

1511.7 Roof assembly. Roof assembly shall be designed and constructed to meet the requirements of the New York City Energy Conservation Code.

SECTION BC [4514] 1512
SOLAR PHOTOVOLTAIC PANELS/MODULES AND REQUIRED SUSTAINABLE ROOFING ZONES

[4514.1] 1512.1 Solar photovoltaic panels/modules. Solar photovoltaic panels/modules installed upon a roof or as an integral part of a roof assembly shall comply with the requirements of this code and the New York City Fire Code.

[4514.1.4] 1512.1.1 Structural fire resistance. The structural frame and roof construction supporting the load imposed upon the roof by the photovoltaic panels/modules shall comply with the requirements of Table 601 of this code.

[4514.2] 1512.2 Sustainable roofing zone. A sustainable roofing zone shall be required on 100 percent of the roof. For such sustainable roofing zone:

1. A contiguous area of a sustainable roofing zone measuring less than 200 square feet (18.5 m²), or in the case of a building five stories or less in height where the main use or dominant occupancy is classified as Group R, such an area measuring less than 100 square feet (9.20 m²), shall be equipped with at least a solar photovoltaic electricity generating system if such system would accommodate at least 5.44 hp (4kW) of solar photovoltaic electricity generating capacity, as determined by the department; and

2. A sustainable roofing zone with a slope less than or equal to two units vertical in 12 units horizontal (17percent) that would accommodate less than 5.44 hp (4kW) of solar photovoltaic
electricity generating capacity, as determined by the department, shall be equipped with at least a green roof system.

Exceptions:

1. Areas required to be set aside for setbacks or access pursuant to the New York City Fire Code, the New York City Construction Codes, or the Zoning Resolution of the City of New York.

2. Areas occupied by rooftop structures, mechanical equipment, towers, parapets, guardrails, solar thermal systems, and appurtenances.

[2.] Areas occupied by obstructions related to stormwater management practices including, but not limited to, cisterns, or reuse systems that are installed to comply with site connection or stormwater construction permits issued by the department of environmental protection.

[3.] Terraces on setbacks comprising less than 25 percent of the area of the largest floor plate in the building.

[4.] Recreational spaces that are principal to the use of the building on which the rooftop is located.

[5.] A roof assembly with a slope greater than two units vertical in 12 units horizontal (17 percent) that would accommodate less than 4kW of solar photovoltaic electricity generating capacity.

[6.] Areas where site conditions are determined by the department to be unfavorable to either a solar photovoltaic electricity generating system or a green roof system.

§ 17. Chapter 16 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 16
STRUCTURAL DESIGN

SECTION BC 1601
GENERAL

1601.1 Scope. The provisions of this chapter shall govern the structural design of buildings, structures and portions thereof regulated by this code. [Note: Where the text in this Code refers to ASCE 7, the 2005 edition shall be used; and where the text in this Code refers to ASCE 7-10, the 2010 edition shall be used.]

1601.1.1 Referenced standards. Where this code makes reference to the nationally recognized standard ASCE 7, such standard shall be as modified for New York City in accordance with this chapter.
1601.2 Special provisions for prior code buildings. The provisions of Sections 1601.2.1 through 1601.2.4 shall apply to structural work on prior code buildings.

1601.2.1 Use of this code. Notwithstanding the applicant’s election to use the 1968 Building Code or prior code, the structural calculations shall be permitted to be performed in accordance with this code provided that the structural safety of the prior code building is not reduced. Notwithstanding the provisions of Section 28-101.4.4 of the [Administrative Code], the use of Load and Resistance Factor Design (LRFD) engineering calculations shall not be deemed to reduce structural safety provided the properties of the existing materials are determined using accepted engineering principles.

1601.2.2 Live loads. Loads indicated in the applicable prior code shall be permitted for structural calculations using engineering formulas from this code provided that the structural safety of the prior code building is not reduced.

1601.2.3 Seismic loads. The determination as to whether seismic requirements apply to an alteration shall be made in accordance with the 1968 Building Code and interpretations by the department relating to such determinations. Any applicable seismic loads and requirements, including for the bracing of architectural, mechanical, plumbing, fuel gas, fire suppression and electrical systems and equipment, shall be permitted to be determined in accordance with this chapter or the 1968 Building Code and reference standard RS 9-6 of such code.

1601.2.4 Wind loads. All alterations, minor alterations, and ordinary repairs, to the extent of such work, shall be permitted to be performed in accordance with the wind load requirements set forth in the 1968 Building Code, or where the 1968 Building Code so authorizes, the code in effect prior to December 6, 1968.

Exceptions:

1. Equipment, appliances and supports that are exposed to wind shall be designed and installed to resist the wind pressures determined in accordance with Section 1609.

2. Wind loads on glass shall not be permitted to be calculated in accordance with the code in effect prior to December 6, 1968.

3. When the wind surface area of a prior code building or structure is increased by more than 5 percent in any direction or there is a permanent decrease of the lateral force capacity by more than 20 percent in any direction, the entire building or structure shall be designed to resist the design wind load as calculated pursuant to the applicable code, but not less than 5 psf (0.24k N/m²).

SECTION BC 1602
DEFINITIONS AND NOTATIONS

1602.1 Definitions. The following [words and terms shall, for the purposes of this code, have the meanings shown herein] terms are defined in Chapter 2:
ALLOWABLE STRESS DESIGN. [A method of proportioning structural members, such that elastically computed stresses produced in the members by nominal loads do not exceed specified allowable stresses (also called “working stress design”).]

BALCONY, EXTERIOR. [See ASCE-7-]

DEAD LOAD. [The weight of materials of construction incorporated into the building, including but not limited to walls, floors, roofs, ceilings, stairways, built-in partitions, finishes, cladding and other similarly incorporated architectural and structural items, and the weight of fixed service equipment, such as cranes, plumbing stacks and risers, electrical feeders, heating, ventilating and air-conditioning systems and automatic sprinkler systems.]

DECK. [See ASCE-7-]

DESIGN STRENGTH. [The product of the nominal strength and a resistance factor (or strength reduction factor).]

DIAPHRAGM. [A horizontal or sloped system acting to transmit lateral forces to the vertical-resisting elements. When the term “diaphragm” is used, it shall include horizontal bracing systems.]

Diaphragm, blocked. [In light-frame construction, a diaphragm in which all sheathing edges not occurring on a framing member are supported on and fastened to blocking.]

Diaphragm boundary. [In light-frame construction, a location where shear is transferred into or out of the diaphragm sheathing. Transfer is either to a boundary element or to another force-resisting element.]

Diaphragm chord. [A diaphragm boundary element perpendicular to the applied load that is assumed to take axial stresses due to the diaphragm moment.]

[Diaphragm, flexible. A diaphragm is flexible for the purpose of distribution of story shear and torsional moment where so indicated in Section 12.3.1 of ASCE 7-10.]

[Diaphragm, rigid. A diaphragm is rigid for the purpose of distribution of story shear and torsional moment when the lateral deformation of the diaphragm is less than or equal to two times the average story drift.]

DURATION OF LOAD. The period of continuous application of a given load, or the aggregate of periods of intermittent applications of the same load.

ESSENTIAL FACILITIES. [Buildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, snow or earthquakes.]

FABRIC PARTITION. [A partition consisting of a finished surface made of fabric, without a continuous rigid backing, that is directly attached to a framing system in which the vertical framing members are spaced greater than 4 feet (1219 mm) on center.]

FACTORED LOAD. [The product of a nominal load and a load factor.]

1191
HELIPAD.

ICE-SENSITIVE STRUCTURE.

IMPACT LOAD. [The load resulting from moving machinery, elevators, craneways, vehicles and other similar forces and kinetic loads, pressure and possible surcharge from fixed or moving loads.]

LIMIT STATE. [A condition beyond which a structure or member becomes unfit for service and is judged to be no longer useful for its intended function (serviceability limit state) or to be unsafe (strength limit state).]

LIVE [LOADS] LOAD. [Those loads produced by the use and occupancy of the building or other structure and do not include construction or environmental loads such as wind load, snow load, rain load, earthquake load, flood load or dead load.]

LIVE [LOADS] LOAD (ROOF). [Those loads produced (1) during maintenance by workers, equipment and materials; and (2) during the life of the structure by movable objects such as planters and by people.]

LOAD AND RESISTANCE FACTOR DESIGN (LRFD). [A method of proportioning structural members and their connections using load and resistance factors such that no applicable limit state is reached when the structure is subjected to appropriate load combinations. The term “LRFD” is used in the design of steel and wood structures.]

LOAD EFFECTS. [Forces and deformations produced in structural members by the applied loads.]

LOAD FACTOR. [A factor that accounts for deviations of the actual load from the nominal load, for uncertainties in the analysis that transforms the load into a load effect, and for the probability that more than one extreme load will occur simultaneously.]

LOADS. [Forces or other actions that result from the weight of building materials, occupants and their possessions, environmental effects, differential movement and restrained dimensional changes. Permanent loads are those loads in which variations over time are rare or of small magnitude, such as dead loads. All other loads are variable loads (see also “Nominal loads”).]

NOMINAL LOADS. [The magnitudes of the loads specified in this chapter (dead, live, soil, wind, snow, rain, flood and earthquake).]

[NOTATIONS.]

[D = Dead load.]

[E = Combined effect of horizontal and vertical earthquake-induced forces as defined in Section 12.4.2 of ASCE 7-10.]

[F = Load due to fluids with well-defined pressures and maximum heights.]
\[F_r=\text{Flood load in accordance with Chapter 5 of ASCE 7.}\]

\[H=\text{Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.}\]

\[L=\text{Live load, except roof live load, including any permitted live load reduction.}\]

\[L_r=\text{Roof live load including any permitted live load reduction.}\]

\[plf=\text{pounds per linear foot.}\]

\[psig=\text{pounds per square inch gauge.}\]

\[R=\text{Rain load.}\]

\[S=\text{Snow load.}\]

\[T=\text{Self-straining force arising from contraction or expansion resulting from temperature change, shrinkage, moisture change, creep in component materials, movement due to differential settlement or combinations thereof.}\]

\[W=\text{Load due to wind pressure.}\]

**OTHER STRUCTURES.** [Structures, other than buildings, for which loads are specified in this chapter.]

**PANEL (PART OF A STRUCTURE).** [The section of a floor, wall or roof comprised between the supporting frame of two adjacent rows of columns and girders or column bands of floor or roof construction.]

**RESISTANCE FACTOR.** [A factor that accounts for deviations of the actual strength from the nominal strength and the manner and consequences of failure (also called “strength reduction factor”).]

**RISK CATEGORY.** [See definition for “Structural Occupancy Category.”]

**STRENGTH, NOMINAL.** [The capacity of a structure or member to resist the effects of loads, as determined by computations using specified material strengths and dimensions and equations derived from accepted principles of structural mechanics or by field tests or laboratory tests of scaled models, allowing for modeling effects and differences between laboratory and field conditions.]

**STRENGTH, REQUIRED.** [Strength of a member, cross section or connection required to resist factored loads or related internal moments and forces in such combinations as stipulated by these provisions.]

**STRENGTH DESIGN.** [A method of proportioning structural members such that the computed forces produced in the members by factored loads do not exceed the member design strength. The term “strength design” is used in the design of concrete and masonry structural elements.]
**[STRUCTURAL OCCUPANCY CATEGORY.** A category used to determine structural requirements based on occupancy.]

**SUSCEPTIBLE BAY.**

**VEHICLE BARRIER.** [SYSTEM. A system of building components near open sides of a garage floor or ramp or building walls that act as restraints for vehicles.]

**NOTATIONS.**

\[D\] = Dead load.
\[D_i\] = Weight of ice in accordance with Chapter 10 of ASCE 7.
\[E\] = Combined effect of horizontal and vertical earthquake induced forces as defined in Section 12.4.2 of ASCE 7.
\[F\] = Load due to fluids with well-defined pressures and maximum heights.
\[F_a\] = Flood load in accordance with Chapter 5 of ASCE 7.
\[H\] = Load due to lateral earth pressures, ground water pressure or pressure of bulk materials.
\[L\] = Roof live load greater than 20 psf (0.96 kN/m²) and floor live load.
\[L_r\] = Roof live load of 20 psf (0.96 kN/m²) or less.
\[R\] = Rain load.
\[S\] = Snow load.
\[T\] = Cumulative effects of self-straining load forces and effects.
\[V_{asd}\] = Allowable stress design wind speed, miles per hour (mph) (km/hr) where applicable.
\[V\] = Basic design wind speeds, miles per hour (mph) (km/hr) determined from Table 1609.3 of this code.
\[W\] = Load due to wind pressure.
\[W_i\] = Wind-on-ice in accordance with Chapter 10 of ASCE 7.

**SECTION BC 1603**

**CONSTRUCTION DOCUMENTS**

**1603.1 General.** Construction documents shall include drawings that show the sizes, sections and relative locations of structural members with floor levels, column centers and offsets fully dimensioned. The design loads and other information pertinent to the structural design required by Sections 1603.1.1 through 1603.1.10 shall be clearly indicated on such drawings of parts of the building or structure.

**Exception:** In lieu of the requirements of Sections 1603.1.1 through 1603.1.10, construction documents for buildings constructed in accordance with the conventional light-frame construction
provisions of Section 2308 shall include drawings that indicate the following structural design information:

1. Floor and roof dead and live loads.
2. Ground snow load, $P_g$.
3. Basic design wind speed \((3\text{-second gust})\), $V_s$, miles per hour (mph) (km/hr) and allowable stress design wind speed, $V_{sd}$, as determined in accordance with Section 1609.3.1 and wind exposure.
4. Seismic design category and site class.
5. Flood design data, if located in flood hazard areas [established in Section G102.2 of Appendix G].
6. Design load-bearing values of soils or rock under shallow foundations and/or the design load capacity of deep foundations.

1603.1.1 Floor live load. The uniformly distributed, concentrated and impact floor live load used in the design shall be indicated for floor areas. [Live] Use of live load reduction [of the uniformly distributed floor live loads, if used] in [the design,] accordance with Section 1607.11 shall be indicated for each type of live load used in the design.

1603.1.2 Partition loads. The equivalent uniform partition loads or, in lieu of these, a statement to the effect that the design was predicated on actual partition loads.

1603.1.3 Roof live load. The roof live load used in the design shall be indicated for roof areas [(Section 1607.11)] (Section 1607.13).

1603.1.4 Roof snow load data. The ground snow load, $P_g$, shall be indicated. The following additional information shall also be provided, regardless of whether snow loads govern the design of the roof:

1. Flat-roof snow load, $P_f$.
2. Snow exposure factor, $C_e$.
3. Snow load importance factor, $I_s$.
4. Thermal factor, $C_t$.
5. Slope factor(s), $C_s$.
6. Drift surcharge load(s), $P_d$, where the sum of $P_d$ and $P_f$ exceeds 20 psf (0.96 kN/m²).
7. Width of snow drift(s), $w$. 

1195
1603.1.5 Wind design data. The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the [lateral force-resisting] lateral force-resisting system of the [building] structure:

1. Basic design wind speed [(3-second gust)], \( V \), miles per hour (km/hr) and/or allowable stress design wind speed, \( V_{asd} \), as determined in accordance with Section 1609.3 and 1609.3.1.

2. [Wind importance factor, \( I \), and structural occupancy] Risk category.

3. Wind exposure. [Where] Applicable wind direction if more than one wind exposure is utilized [the wind exposure and applicable wind direction shall be indicated].

4. [The applicable] Applicable internal pressure coefficient.

5. [Components and cladding. The design] Design wind pressures [in terms of psf (kN/m²)] to be used for [the design of] exterior component and cladding materials not specifically designed by the registered design professional responsible for the design of the structure, psf (kN/m²).

6. Design base shear.

1603.1.6 Earthquake design data. The following information related to seismic loads shall be shown, regardless of whether seismic loads govern the design of the [lateral force-resisting] lateral force-resisting system of the [building] structure:

1. Risk category.

[1-] 2. Seismic importance factor, [I, and structural occupancy category] \( I_e \).

[2-] 3. Mapped spectral response [accelerations] acceleration parameters, \( S_s \) and \( S_l \).

[3-] 4. Site class.

[4-] 5. [Spectral] Design spectral response [coefficients] acceleration parameters, \( S_{DS} \) and \( S_{D1} \).

[7-] 8. Design base shear(s).

[8-] 9. Seismic response coefficient(s), CS.

[9-] 10. Response modification [factor] coefficient(s), R.

[10-] 11. Analysis procedure used.
1603.1.7 Geotechnical information. The design load-bearing values of soils or rock under shallow foundations and/or the design load capacity of deep foundations shall be shown on the construction [drawings] documents.

1603.1.8 Flood [load. Buildings] hazard areas. Construction documents for buildings and other structures located in [areas of special] flood hazard areas shall [meet the design requirements of Section 5.3 of ASCE 7. The structural design shall be based on the design loads stated in Section 5.4 of ASCE 7.] comply with provisions of Section G104.2.1.

1603.1.9 Special loads. Special loads that are applicable to the design of the building, structure or portions thereof [shall be indicated along with the specified section of this code that addresses the special loading condition], including but not limited to the loads of machinery or equipment, and that are greater than the specified floor and roof loads shall be specified by their descriptions and locations.

1603.1.9.1 Photovoltaic panel systems. The dead load of rooftop-mounted photovoltaic panel systems, including rack support systems, shall be indicated on the construction documents.

1603.1.10 Superimposed dead loads. The uniformly distributed superimposed dead loads used in the design shall be indicated for floor and roof areas.

[1603.1.11 Other loads. Other loads used in the design, including but not limited to the loads of machinery or equipment, which are of greater magnitude than the loads defined in the specified floor and roof loads shall be indicated by their descriptions and locations.]

SECTION BC 1604
GENERAL DESIGN REQUIREMENTS

1604.1 General. Building, structures and parts thereof shall be designed and constructed in accordance with strength design, load and resistance factor design, allowable stress design, empirical design or conventional construction methods, as permitted by the applicable material chapters and referenced standards.

1604.2 Strength. Buildings and other structures, and parts thereof, shall be designed and constructed to support safely the factored loads in load combinations defined in this code without exceeding the appropriate strength limit states for the materials of construction. Alternatively, buildings and other structures, and parts thereof, shall be designed and constructed to support safely the nominal loads in load combinations defined in this code without exceeding the appropriate specified allowable stresses for the materials of construction. Loads and forces for occupancies or uses not covered in this chapter shall be subject to the approval of the commissioner.

1604.3 Serviceability. Structural systems and members thereof shall be designed to have adequate stiffness to limit deflections [and lateral drift. See Section 12.12.1 of ASCE 7-10 for drift limits applicable to earthquake loading.] as indicated in Table 1604.3 of this code. Drift limits applicable to earthquake loading shall be in accordance with ASCE 7 Chapter 12, 13, 15 or 16, as applicable.

</table>

For SI: 1 foot = 304.8 mm.

a. For structural roofing and siding made of formed metal sheets, the total load deflection shall not exceed \(l/60\). For secondary roof structural members supporting formed metal roofing, the live load deflection shall not exceed \(l/150\). For secondary wall members supporting formed metal siding, the design wind load deflection shall not exceed \(l/90\). For roofs, this exception only applies when the metal sheets have no roof covering.

b. For interior partitions not exceeding 6 feet in height and flexible, folding, and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.15.

c. Interior partitions exceeding 6 feet in height and flexible, folding, and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.15.

d. Roofing and siding used under dry conditions and used under dry conditions shall be permitted to be estimated as the immediate dead load deflection only. For wood structural members having a moisture content of less than 16 percent at time of installation, the deflection resulting from \(0.5D\) shall be permitted to be substituted for the deflection resulting from \(L + D\). The deflection limit for the \(D + (L + D)\) load combination only applies to the deflection due to the creep component of long-term dead load deflection for long-term dead load deflection. For lumber, structural glued laminated timber, prefabricated wood I joists, and structural composite lumber members that are dry at time of installation and used under dry conditions, the deflection resulting from \(0.5D\) shall be permitted to be substituted for the deflection resulting from \(L + D\). The value of \(0.5D\) shall not be used in combination with ANSI/AWC NDS provisions for long-term loading.

e. The [above] preceding deflections do not ensure against ponding. Roofs that do not have sufficient slope or camber to [ensure] ensure adequate drainage shall be investigated for ponding. See Section 1611 for rain and ponding requirements and Section 1502.4 for roof drainage requirements. Chapter 8 of ASCE 7.

f. The wind load \(w\) shall be permitted to be taken as \(0.42\) times the "component and cladding" loads or directly calculated using the 10-year mean return interval wind speed for the purpose of determining deflection limits [in Table 1604.3]. Deflection limits therein shall not exceed that specified in Section 1604.3.7.

g. For steel structural members, the deflection due to creep component of long-term dead load shall be permitted to be taken as zero.

h. For aluminum structural members, the deflection due to creep component of long-term dead load shall be permitted to be taken as zero. For aluminum structural members supporting edge of glass, the total load deflection shall not exceed \(l/175\) for each glass lite or \(l/60\) for the entire length of the member, whichever is more stringent. For aluminum sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed \(l/120\).

i. \(I = \text{Length of the member between supports}\). For cantilever members, \(l\) shall be taken as twice the length of the cantilever.

1604.3.1 Deflections. The deflections of structural members shall not exceed the more restrictive of the limitations of Sections 1604.3.2 through 1604.3.5 or that permitted by Table 1604.3.

1604.3.2 Reinforced concrete. The deflection of reinforced concrete structural members shall not exceed that permitted by ACI 318.
1604.3.3 Steel. The deflection of steel structural members shall not exceed that permitted by AISC 360, AISI [HSS S-100, ASCE 3] S100, ASCE 8, and SJI CI-1.0, SJI JG-1.1, SJI K-1.1, or SJI LH/DLH-1.1] SJI 100 or SJI 200, as applicable.

1604.3.4 Masonry. The deflection of masonry structural members shall not exceed that permitted by TMS 402 [ACI 530/ASCE 5], as modified by Chapter 21 of this code.

1604.3.5 Aluminum. The deflection of aluminum structural members shall not exceed that permitted by AA ADM1.

1604.3.6 Limits. [For limits on the deflection of structural members, refer to the relevant material design standards. Should a design standard not provide for deflection limits, deflection of structural members over span, L, shall not exceed that permitted by Table 1604.3.] The deflection limits of Section 1604.3.1 shall be used unless more restrictive deflection limits are required by a referenced standard for the element or finish material.

1604.3.7 Framing supporting glass. The deflection of framing members supporting glass subjected to 0.6 times the “component and cladding” wind loads shall not exceed either of the following:

1. \( \frac{1}{175} \) of the length of span of the framing member, for framing members having a length not more than 13 feet 6 inches (4115 mm).

2. \( \frac{1}{240} \) of the length of span of the framing member + \( \frac{1}{4} \) inch (6.4 mm), for framing members having a length greater than 13 feet 6 inches (4114.8 mm).

1604.4 Analysis. Load effects on structural members and their connections shall be determined by methods of structural analysis that take into account equilibrium, general stability, geometric compatibility and both short- and long-term material properties.

Members that tend to accumulate residual deformations under repeated service loads shall have included in their analysis the effects of added deformations expected to occur during their service life. Secondary stresses in trusses shall be considered and, where of significant magnitude, their effects shall be provided for in the design.

Any system or method of construction to be used shall be based on a rational analysis in accordance with well-established principles of mechanics. Such analysis shall result in a system that provides a complete load path capable of transferring loads from their point of origin to the load-resisting elements.

The total lateral force shall be distributed to the various vertical elements of the lateral force-resisting system in proportion to their rigidities, considering the rigidity of the horizontal bracing system or diaphragm. Rigid elements that are assumed not to be a part of the lateral force-resisting system shall be permitted to be incorporated into buildings provided that their effect on the action of the system is considered and provided for in the design. [Except where diaphragms are flexible, or are permitted to be analyzed as flexible] A diaphragm is rigid for the purpose of distribution of story shear and torsional moment when the lateral deformation of the diaphragm is less than or equal to two times the average story drift. Where required
by ASCE 7, provisions shall be made for the increased forces induced on resisting elements of the structural system resulting from torsion due to eccentricity between the center of application of the lateral forces and the center of rigidity of the [lateral force-resisting] lateral force-resisting system.

Every structure shall be designed to resist the effects caused by the forces specified in this chapter including overturning [effects caused by the lateral forces specified in this chapter], uplift and sliding. [See Section 1609 for wind loads, Section 1610 for lateral soil loads and Section 1613 for earthquake loads.] Where sliding is used to isolate the elements, the effects of friction between sliding elements shall be included as a force.

1604.5 [Structural occupancy] Risk category. Each building and structure shall be assigned a [structural occupancy] risk category in accordance with Table 1604.5 of this code. Where a referenced standard specifies an occupancy category, the risk category shall not be taken as lower than the occupancy category specified therein. Where a referenced standard specifies that the assignment of a risk category be in accordance with ASCE 7, Table 1.5-1, Table 1604.5 of this code shall be used in lieu of ASCE 7, Table 1.5-1.

a. [For the purpose of Section 1616.2, Structural Occupancy Categories I and II are considered Seismic Use Group I, Structural Occupancy Category III is considered Seismic Use Group II and Structural Occupancy Category IV is equivalent to Seismic Use Group III.] For purposes of occupant load calculation, occupancies required by Table 1004.1.3 to use gross floor area calculations shall be permitted to use net floor areas to determine the total occupant load.

b. Where approved by the commissioner, the classification of buildings and other structures as Risk Category III or IV based on their quantities of toxic, highly toxic or explosive materials is permitted to be reduced to Risk Category II, provided it can be demonstrated by a hazard assessment in accordance with Section 1.5.3 of ASCE 7 that a release of the toxic, highly toxic or explosive materials is not sufficient to pose a threat to the public.

1604.5.1 Multiple occupancies. Where a building or structure is occupied by two or more occupancies not included in the same [structural occupancy] risk category, it shall be assigned the classification of the highest [structural occupancy] risk category corresponding to the various occupancies. Where buildings or structures have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a building or structure provides required access to, required egress from or shares life safety components with another portion having a higher [structural occupancy] risk category, both portions shall be assigned to the higher [structural occupancy] risk category.

Exception: Where a storm shelter designed and constructed in accordance with ICC 500 is provided in a building, structure or portion thereof normally occupied for other purposes, the risk category for the normal occupancy of the building shall apply unless the storm shelter is a designated emergency shelter in accordance with Table 1604.5 of this code.

1604.5.2 Importance factors. Importance factors for snow, ice, wind and seismic loads shall be determined in accordance with ASCE 7. Table 1604.5.2.5.2 based on the [Structural Occupancy Category or] risk category assigned in accordance with Table 1604.5 of this code.

1201
1604.6 In-situ load tests. The commissioner is authorized to require an engineering analysis or a load test, or both, of any construction whenever there is reason to question the safety of the construction for the intended occupancy. Engineering analysis and load tests shall be conducted in accordance with Section [1714] 1708.

1604.7 Preconstruction load tests. Materials and methods of construction that are not capable of being designed by recognized approved engineering analysis or that do not comply with the applicable material design referenced standards [listed in Chapter 35], or alternative test procedures in accordance with Section [1712] 1709, shall be load tested in accordance with Section [1715] 1710.

1604.8 Anchorage. Buildings and other structures, and portions thereof, shall be provided with anchorage in accordance with Sections 1604.8.1 through 1604.8.4, as applicable.

1604.8.1 General. Anchorage of the roof to walls and columns, and of walls and columns to foundations, shall be provided to resist the uplift and sliding forces that result from the application of the prescribed loads and load combinations.

[1604.8.2 Walls. Walls shall be anchored to floors, roofs and other structural elements that provide lateral support for the wall. Such anchorage shall provide a positive direct connection capable of resisting the horizontal forces specified in this chapter but not less than the minimum strength design horizontal force specified in Section 11.7.3 of ASCE 7, substituted for “E” in the load combinations of Section 1605.2 or 1605.3. Concrete and masonry walls shall be designed to resist bending between anchors where the anchor spacing exceeds 4 feet (1219 mm). Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Section 1609 for wind design requirements and Section 1613 for earthquake design requirements.]

1604.8.2 Structural walls. Walls that provide vertical load-bearing resistance or lateral shear resistance for a portion of the structure shall be anchored to the roof and to all floors and members that provide lateral support for the wall or that are supported by the wall. The connections shall be capable of resisting the horizontal forces specified in Section 1.4.4 of ASCE 7 for walls of structures assigned to Seismic Design Category A and to Section 12.11 of ASCE 7 for walls of structures assigned to all other seismic design categories. Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Sections 1609 of this code for wind design requirements and Section 1613 of this code for earthquake design requirements.

1604.8.3 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable.
Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. Connections of decks with cantilevered framing members to exterior walls or other framing members shall be designed for both of the following:

1. The reactions resulting from the dead load and live load specified in Table 1607.1, or the snow load specified in Section 1608, in accordance with Section 1605, acting on all portions of the deck.

2. The reactions resulting from the dead load and live load specified in Table 1607.1, or the snow load specified in Section 1608, in accordance with Section 1605, acting on the cantilevered portion of the deck, and no live load or snow load on the remaining portion of the deck.

1604.8.4 Non-structural walls and partitions. Walls not meeting the requirements of Section 1604.8.2 and partitions shall be laterally supported with sufficient mechanical anchorage to resist the loads imposed per this code, including but not limited to live loads, wind loads, and earthquake loads.

1604.9 Counteracting structural actions. Structural members, systems, components and cladding shall be designed to resist forces due to earthquake and wind, with consideration of overturning, sliding and uplift. Continuous load paths shall be provided for transmitting these forces to the foundation. Where sliding is used to isolate the elements, the effects of friction between sliding elements shall be included as a force.

1604.10 Loads on storm shelters. Loads and load combinations on storm shelters shall be determined in accordance with ICC 500.

SECTION BC 1605
LOAD COMBINATIONS

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2 or 1605.3;

2. The load combinations specified in Chapters 18 through 23; and

3. The seismic load [combinations with] effects including overstrength [factors specified] factor in accordance with [Section 12.4.3.2] Sections 2.3.6 and 2.4.5 of ASCE 7-10, where required by [Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7-10] Chapters 12, 13, and 15 of ASCE
7. With the simplified procedure of [ASCE 7-10] Section 12.14 of ASCE 7, the seismic load [combinations with] effects including overstrength [factors specified] factor in accordance with Section 12.14.3.2 and Chapter 2 of ASCE 7(-10) shall be used.

Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Where the load combinations with overstrength factor in [Section 12.4.3.2] Sections 2.3.6 and 2.4.5 of ASCE 7(-10) apply, they shall be used as follows:

1. The basic combinations for strength design with overstrength factor in lieu of Equations 16-5 and 16-7 in Section [1605.2.4] 1605.2.

2. The basic combinations for allowable stress design with overstrength factor in lieu of Equations 16-12, [16-43] 16-14 and [16-45] 16-16 in Section 1605.3.1.

**1605.1.1 Stability.** Regardless of which load combinations are used to design for strength, where overall structure stability (such as stability against overturning, sliding, or buoyancy) is being verified, use of the load combinations specified in Section 1605.2 or 1605.3 shall be permitted. Where the load combinations specified in Section 1605.2 are used, strength reduction factors applicable to soil resistance shall be provided by a registered design professional. The stability of retaining walls shall be verified in accordance with Section [1806.2] 1807.2.

**1605.2 Load combinations using strength design or load and resistance factor design.**

[1605.2.1 Basic load combinations.] Where strength design or load and resistance factor design is used, buildings and other structures, and portions thereof, shall be designed to resist the most critical effects resulting from the following combinations of factored loads:

\[1.4(D + F)\]  
\[1.2(D + F) + T + 1.6(L + H) + 0.5(L_e or S or R)\]  
\[1.2(D + F) + 1.6(L + H) + 0.5(L_e or S or R)\]  
\[1.2D + 1.6(L_e or S or R) + (f_L or 0.8W)\]  
\[1.2(D + F) + 1.6(L_e or S or R) + 1.6H + (f_L or 0.5W)\]  
\[1.2D + 1.6W + f_L + 0.5(L_e or S or R)\]  
\[1.2(D + F) + 1.0W + f_L + 1.6H + 0.5(L_e or S or R)\]  
\[1.2D + 1.0E + f_L + f_S\]  
\[1.2(D + F) + 1.0E + f_L + 1.6H + f_S\]  
\[0.9D + 1.6W + 1.6H\]
[0.9D + 1.0E + 1.6H]
0.9(D + F) + 1.0E + 1.6H  (Equation 16-7)

where:

\( f_1 = \begin{cases} 
1.0 & \text{for floors in places of public assembly for live loads in excess of 100 pounds per square foot (4.79 kN/m}^2), \text{ and} \\
0.5 & \text{for other live loads.} 
\end{cases} \)

\( f_2 = \begin{cases} 
0.7 & \text{for roof configurations (such as saw tooth) that do not shed snow off the structure,} \\
0.2 & \text{for other roof configurations.} 
\end{cases} \)

[Exception:] Exceptions:

1. Where other factored load combinations are specifically required by the other provisions of this code, such combinations shall take precedence.

2. Where the effect of \( H \) resists the primary variable load effect, a load factor of 0.9 shall be included with \( H \) where \( H \) is permanent and \( H \) shall be set to zero for all other conditions.

1605.2.2 Other loads. Where a structure is located in a V zone or Coastal A zone and \( F_a \) is to be considered in design, in addition to the load combinations of Equations 16-1 through 16-7, the structure and portions thereof shall resist the most critical effects of the load combinations of Equations 16-8 and 16-10. Where a structure is located in an A zone and \( F_a \) is to be considered in design, in addition to the load combinations of Equations 16-1 through 16-7, structures and portions thereof shall resist the most critical effects of the load combinations of Equation 16-9 and 16-11. Where ice loads are to be considered in design, the load combinations of Section 2.3.4 of ASCE 7 shall be used. Refer to the following sections for other load combinations:

Flood Load Combinations:

\[ 1.2D + 1.6W + 2.0F_a + f_1L + 0.5(L_r \text{ or } S \text{ or } R) \]
\[ 1.2(D + F) + 1.0W + 2.0F_a + f_1L + 1.6H + 0.5(L_r \text{ or } S \text{ or } R) \]  (Equation 16-8)

\[ 1.2D + 0.8W + 1.0F_a + f_1L + 0.5(L_r \text{ or } S \text{ or } R) \]
\[ 1.2(D + F) + 0.5W + 1.0F_a + f_1L + 1.6H + 0.5(L_r \text{ or } S \text{ or } R) \]  (Equation 16-9)

\[ 0.9D + 1.6W + 2.0F_a + 1.6H \]
\[ 0.9D + 1.0W + 2.0F_a + 1.6H \]  (Equation 16-10)

\[ 0.9D + 0.8W + 1.0F_a + 1.6H \]
\[ 0.9D + 0.5W + 1.0F_a + 1.6H \]  (Equation 16-11)
1605.3 Load combinations using allowable stress design. Load combinations for allowable stress design shall be in accordance with Section 1605.3.1 or 1605.4.

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

\[ D + F \]  \quad \text{(Equation 16-12)}

\[ \frac{[D + H + F + L + T]}{D + H + F + L} \]  \quad \text{(Equation 16-13)}

\[ D + H + F + (L_r \text{ or } S \text{ or } R) \]  \quad \text{(Equation 16-14)}

\[ \frac{[D + H + F + 0.75(L + T) + 0.75(L_r \text{ or } S \text{ or } R)]}{D + H + F + 0.75(L) + 0.75(L_r \text{ or } S \text{ or } R)} \]  \quad \text{(Equation 16-15)}

\[ \frac{[D + F + H + (W \text{ or } 0.7E)]}{D + H + F + (0.6W \text{ or } 0.7E)} \]  \quad \text{(Equation 16-16)}

\[ \frac{[D + H + F + 0.75(W \text{ or } 0.7E) + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)]}{D + H + F + 0.75(0.6W) + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)} \]  \quad \text{(Equation 16-17)}

\[ \frac{[0.6 + W + H]}{D + H + F + 0.75(0.7E) + 0.75L + 0.75S} \]  \quad \text{(Equation 16-18)}

\[ \frac{[0.6 + 0.7E + H]}{0.6D + 0.6W + H} \]  \quad \text{(Equation 16-19)}

\[ 0.6(D + F) + 0.7E + H \]  \quad \text{(Equation 16-20)}

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.

2. Flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads of 30 psf (1.44 kN/m²) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.

3. Where the effect of H resists the primary variable load effect, a load factor of 0.6 shall be included with H where H is permanent and H shall be set to zero for all other conditions.
4. In Equation 16-19, the wind load, \( W \), is permitted to be reduced in accordance with Exception 2 of Section 2.4.1 of ASCE 7.

5. In Equation 16-20, 0.6 \( D \) is permitted to be increased to 0.9 \( D \) for the design of special reinforced masonry shear walls complying with Chapter 21.

1605.3.1.1 Stress increases. Increases in allowable stresses specified in the appropriate material chapter or the referenced standards shall not be used with the load combinations of Section 1605.3.1, except that increases shall be permitted in accordance with Chapter 23.

1605.3.1.2 Other loads. Where a structure is located in a V zone or Coastal A zone and \( F_a \) is to be considered in design, in addition to load combinations of Equations 16-12 through [46-49] 16-20, structures and portions thereof shall resist the most critical effects of load combinations of Equations [16-20] 16-21, [16-22] 16-23 and [16-24] 16-25. Where a structure is located in an A zone and \( F_a \) is to be considered in design, in addition to load combinations of Equations 16-12 through [46-49] 16-20, structures and portions thereof shall resist the most critical effects of load combinations of Equations [16-24] 16-22, [16-23] 16-24 and [16-25] 16-26. Where ice loads are to be considered in design, the load combinations of Section 2.4.3 of ASCE 7 shall be used. [Refer to the following sections for other loads:]

**Flood Load Combinations:**

\[
[D + H + F + 1.5F_a + W] \quad \text{(Equation 16-20)}
\]

\[
D + H + F + 0.6W + 1.5F_a \quad \text{(Equation 16-21)}
\]

\[
[D + H + F + 0.75F_a + W] \quad \text{(Equation 16-21')}
\]

\[
D + H + F + 0.6W + 0.75F_a \quad \text{(Equation 16-22)}
\]

\[
[D + H + F + 0.75W + 0.75L + 0.75(L_c or S or R) + 1.5F_a] \quad \text{(Equation 16-22')}
\]

\[
D + H + F + 0.75(0.6W) + 0.75L + 0.75(L_c or S or R) + 1.5F_a \quad \text{(Equation 16-23)}
\]

\[
[D + H + F + 0.75W + 0.75L + 0.75(L_c or S or R) + 0.75F_a] \quad \text{(Equation 16-23')}
\]

\[
D + H + F + 0.75(0.6W) + 0.75L + 0.75(L_c or S or R) + 0.75F_a \quad \text{(Equation 16-24)}
\]

\[
[0.6D + W + H + 1.5F_a] \quad \text{(Equation 16-24')}
\]

\[
0.6D + 0.6W + H + 1.5F_a \quad \text{(Equation 16-25)}
\]

\[
[0.6D + W + H + 0.75F_a] \quad \text{(Equation 16-25')}
\]

\[
0.6D + 0.6W + H + 0.75F_a \quad \text{(Equation 16-26)}
\]
1605.4 **Heliports and helistops.** Heliport and helistop landing areas shall be designed for the following loads, combined in accordance with Section 1605:

1. Dead load, $D$, plus the gross weight of the helicopter, $D_h$, plus snow load, $S$.

2. Dead load, $D$, plus two single concentrated impact loads, $L$, approximately 8 feet (2438 mm) apart applied anywhere on the touchdown pad (representing each of the helicopter’s two main landing gear, whether skid type or wheeled type), having a magnitude of 0.75 times the gross weight of the helicopter. Both loads acting together total 1.5 times the gross weight of the helicopter.

3. Dead load, $D$, plus a uniform live load, $L$, of 100 psf (4.79 kN/m²). [Exception: Landing areas designed for helicopters with gross weights not exceeding 3,000 pounds (13.34 kN) in accordance with Items 1 and 2 shall be permitted to be designed using a 40 psf (1.92 kN/m²) uniform live load in Item 3, provided the landing area shall be identified with a 3,000-pound (13.34 kN) weight limitation and the 40 psf (1.92 kN/m²) uniform live load shall not be reduced. The landing area weight limitation shall be indicated by the numeral “3” (kips) located in the bottom right corner of the landing area as viewed from the primary approach path. The indication for the landing area weight limitation shall be a minimum 5 feet (1524 mm) in height.]

1605.5 **Structural integrity load combinations—alternate load path method.** Where specifically required by Sections 1614 through 1617, elements and components shall be designed to resist the forces calculated using the following combination of factored loads:

$$ D + f_1L + f_2W $$

where:

- $f_1 = 0.25$ for buildings in **Risk Category II.**
- $f_1 = 0.5$ for buildings in **Risk Category III or IV.**
- $f_2 = 0$ for buildings in **Risk Category II.**
- $f_2 = 0.33$ for buildings in **Risk Category III or IV.**

The live load component $f_1L$ need not be greater than the reduced live load.

1605.6 **Structural integrity load combinations—vehicular impact and gas explosions.** Where specifically required by Sections 1615 through 1617, elements and components shall be designed to resist the forces calculated using the following combination of factored loads:

$$ 1.2D + A_k + (0.5L or 0.2S) $$

$$ 0.9D + A_k + 0.2W $$

Where $A_k$ is the load effect of the vehicular impact or gas explosion.
[1605.7] 1605.6 Structural integrity load combinations—specific local resistance method. Where the specific local resistance method is used in a key element analysis, the specified local loads shall be used as specified in Section [1616.7] 1617.6.

SECTION BC 1606
DEAD LOADS

1606.1 General. Dead loads are those loads defined in [Section 1602.1] Chapter 2 of this code. Dead loads shall be considered permanent loads.

1606.2 Design dead load. For purposes of design, the actual weights of materials of construction and fixed service equipment shall be used. In the absence of definite information, values used shall be subject to the approval of the commissioner.

SECTION BC 1607
LIVE LOADS

1607.1 General. Live loads are those loads defined in [Section 1602.1] Chapter 2 of this code.

[Notes to Table 1607.4]

For SI:

1. inch = 25.4 mm, 1 square inch = 645.16 mm²,
2. square inch = 645.16 mm² = 0.000696 m²,
3. pound per square foot = 0.0479 kN/m²,
4. pound per cubic foot = 16 kg/m³.

a. Floors in garages or portions of buildings used for the storage of motor vehicles shall be designed for the uniformly distributed live loads of this Table [4602.4] or the following concentrated loads: (1) for garages restricted to passenger vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of [4.5] 4.5 inches by [4.5] 4.5 inches; (2) for mechanical parking structures without slab or deck which are used for storing passenger vehicles only, 2,250 pounds per wheel.

b. The loading applies to stack room floors that support nonmovable, double-faced library book stacks, subject to the following limitations:
   1. The nominal book stack unit height shall not exceed 90 inches;
   2. The nominal shelf depth shall not exceed 12 inches for each face; and
   3. Parallel rows of double-faced book stacks shall be separated by aisles not less than 36 inches wide.

c. Design in accordance with [the EC1 Standard on Bleachers, Folding and Tiltable Seating and Grandstands] Section 1029.

d. The concentrated wheel load of 20,000 pounds shall be applied as follows: 8,000 pounds on an area of 20 square inches, 20,000 pounds on a 20 inch by 10 inch area.

e. The concentrated wheel load shall be applied on an area of 20 square inches.

[f] Minimum concentrated load on stair treads (on area of 4 square inches) is 300 pounds.

[g] Where snow loads occur that are in excess of the design conditions, the structure shall be designed to support the loads due to the increased loads caused by drift buildup or a greater snow design determined by the department (see Section 1608). For special purpose roofs, see Section 1607.11.2.2. The minimum concentrated load on stair treads shall be applied on an area of 2 inches by 2 inches. This load need not be assumed to act concurrently with the uniform load.

[h] See Section 1604.3.3 for decks attached to exterior walls. Where snow loads occur that are in excess of the design conditions, the structure shall be designed to support the loads due to the increased loads caused by drift buildup or a greater snow design determined by the department (see Section 1608).

[i] Live loads for assembly spaces other than those described in this table shall be determined from the occupant load requirements as established by Section 1016 of this code. When using the formula 1,000/(net floor area per occupant) but shall not be less than 50 psf nor more than 100 psf. See Section 1604.8.3 for decks attached to exterior walls.

[j] For establishing live loads for occupancies not specifically listed herein, refer to [References Standard ASCE 7] for guidance. Uninhabitable attics without storage are those where the maximum clear height between the joists and rafters is less than 42 inches, or where there are not two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses. This live load need not be assumed to act concurrently with any other live load requirements.

[k] [Roofs used for other special purposes shall be designed for appropriate loads as approved by the commissioner.] Uninhabitable attics with storage are those where the maximum clear height between the joists and rafters is 42 inches or greater, or where there are two or more adjacent trusses with web configurations capable of accommodating an assumed rectangle 42 inches in height by 24 inches in width, or greater, within the plane of the trusses.
The live load need only be applied to those portions of the joists or truss bottom chords where both of the following conditions are met:

i. The attic area is accessible from an opening not less than 20 inches in width by 30 inches in length that is located where the clear height in the attic is a minimum of 30 inches; and

ii. The slopes of the joists or truss bottom chords are no greater than two units vertical in 12 units horizontal.

The remaining portions of the joists or truss bottom chords shall be designed for a uniformly distributed concurrent live load of not less than 10 pounds per square foot.

Attic spaces served by stairways other than the pull-down type shall be designed to support the minimum live load specified for habitable attics and sleeping rooms.

Areas of occupiable roofs, other than roof gardens and assembly areas, shall be designed for appropriate loads as approved by the department. Unoccupied landscaped areas of roofs shall be designed in accordance with Section 1607.13.3.

Live load reduction is not permitted.

Live load reduction is only permitted in accordance with Section 1607.11.1.2 or Item 1 of Section 1607.11.2.

Live load reduction is only permitted in accordance with Section 1607.11.1.3 or Item 2 of Section 1607.11.2.

1607.2 Loads not specified. For occupancies or uses not designated in Table 1607.1, the live load shall be determined in accordance with a method approved by the commissioner.

1607.2.1 Stage areas using scenery or scenic elements. Scenery battens and suspension systems shall be designed for a load of 30 pounds per linear foot (437.7 N/m) of batten length. Loft block and head block beams shall be designed to support vertical and horizontal loads corresponding to a 4-inch (101.6 mm) spacing of battens for the entire depth of the gridiron. Direction and magnitude of total forces shall be determined from the geometry of the rigging system including load concentrations from spot line rigging. Locking rails shall be designed for a uniform uplift of 500 psf (2.40 kN/m²) with a 1,000 pound (454 kg) concentration. Impact factor for batten design shall be 75 percent and for loft and head block beams shall be 25 percent. A plan drawn to a scale not less than ¼ inch (6.4 mm) = 1 foot (305 mm) shall be displayed in the stage area indicating the framing plan of the rigging loft and the design loads for all members used to support scenery or rigging. Gridirons over stages shall be designed to support a uniformly distributed live load of 50 psf (2.40 kN/m²) in addition to the rigging loads indicated.

1607.3 Uniform live loads. The live loads used in the design of buildings and other structures shall be the maximum loads expected by the intended use or occupancy but shall in no case be less than the minimum uniformly distributed [unit] live loads [required by] given in Table 1607.1.

1607.4 Concentrated live loads. Floors, roofs and other similar surfaces shall be designed to support the uniformly distributed live loads prescribed in Section 1607.3 or the concentrated [load, in pounds (kilonewtons),] live loads, given in Table 1607.1, whichever produces the greater load effects. Unless otherwise specified, the indicated concentration shall be assumed to be uniformly distributed over an area [2.5] of 2½ feet by [2.5] 2½ feet [762 mm × 762 mm] (762 mm by 762 mm) shall be located so as to produce the maximum load effects in the structural members.

1607.5 Partition loads. In office buildings and in other buildings where partition locations are subject to change, provisions for partition weight shall be made, whether or not partitions are shown on the construction documents, unless the specified live load is 80 psf (3.83 kN/m²) or greater. Weights of all partitions shall be considered, using either actual weights at locations shown on the plans or the equivalent uniform load given in Section 1607.5.2. Partition loads shall be taken as superimposed dead loads.

1607.5.1 Actual loads. Where actual partition weights are used, the uniform design live load may be omitted from the strip of floor area under each partition.

1607.5.2 Equivalent uniform load. The equivalent uniform partition loads in Table 1607.5 may be used in lieu of actual partition weights except for bearing partitions or partitions in toilet room...
areas (other than in one- and two-family dwellings), at stairs and elevators, and similar areas where partitions are concentrated. In such cases, actual partition weights shall be used in design. [Except as otherwise exempted, equivalent uniform partition loads shall be used in areas where partitions are not definitely located on the plans, or in areas where partitions are subject to rearrangement or relocation.]

[1607.6 Garages.]

[1607.6.1 Passenger vehicle garages. Areas used for, and restricted by physical limitations of clearance to, the transit or parking of passenger vehicles shall be designed for the uniformly distributed and concentrated loads for parking areas for such vehicles as provided in Table 1607.1 applied without impact. An exception is made for members or constructions which, because of physical limitations, cannot be subjected to direct load from the vehicle or from a jack or hoist used to raise or suspend the vehicle. Such members or constructions shall be designed for the loads corresponding to the actual usage.]

For SI: 1 pound per linear foot = 0.01459 kN/m, 1 pound = 0.004448 kN, 1 ton = 8.90 kN.

a. An H loading class designates a two-axle truck with a semitrailer. An HS loading class designates a tractor truck with a semitrailer. The numbers following the letter classification indicate the gross weight in tons of the standard truck and the year the loadings were instituted.

b. See Section 1607.6.1 for the loading of multiple spans.

[1607.6.2 Truck and bus garages. Minimum live loads for garages having trucks or buses shall be as specified in Table 1607.6, but shall not be less than 50 psf (2.40 kN/m²), unless other loads are specifically justified and approved by the commissioner. Actual loads shall be used where they are greater than the loads specified in the table.]

[1607.6.2.1 Truck and bus garage live load application. The concentrated load and uniform load shall be uniformly distributed over a 10-foot (3048 mm) width on a line normal to the centerline of the lane placed within a 12-foot-wide (3658 mm) lane. The loads shall be placed within their individual lanes so as to produce the maximum stress in each structural member.
Vertical impact shall be taken as 10 percent of the vertical load. Single spans shall be designed for the uniform load in Table 1607.6 and one simultaneous concentrated load positioned to produce the maximum effect. Multiple spans shall be designed for the uniform load in Table 1607.6 on the spans and two simultaneous concentrated loads in two spans positioned to produce the maximum negative moment effect. Multiple span design loads, for other effects, shall be the same as for single spans.

1607.6 Helipads. Helipads shall be designed for the following live loads:

1. A uniform live load, \( L \), as specified in Items 1.1 and 1.2. This load shall not be reduced.

   1.1. 40 psf (1.92 \( kN/m^2 \)) where the design basis helicopter has a maximum take-off weight of 3,000 pounds (13.35 kN) or less.

   1.2. 60 psf (2.87 \( kN/m^2 \)) where the design basis helicopter has a maximum take-off weight greater than 3,000 pounds (13.35 kN).

2. A single concentrated live load, \( L \), of 3,000 pounds (13.35 kN) applied over an area of 4.5 inches by 4.5 inches (114.3 mm by 114.3 mm) and located so as to produce the maximum load effects on the structural elements under consideration. The concentrated load is not required to act concurrently with other uniform or concentrated live loads.

3. Two single concentrated live loads, \( L \), 8 feet (2438.4 mm) apart applied on the landing pad (representing the helicopter’s two main landing gear, whether skid type or wheeled type), each having a magnitude of 0.75 times the maximum take-off weight of the helicopter, and located so as to produce the maximum load effects on the structural elements under consideration. The concentrated loads shall be applied over an area of 8 inches by 8 inches (203.2 mm by 203.2 mm) and are not required to act concurrently with other uniform or concentrated live loads.

Landing areas designed for a design basis helicopter with maximum take-off weight of 3,000 pounds (13.35 kN) shall be identified with a 3,000 pound (13.34 kN) weight limitation. The landing area weight limitation shall be indicated by the numeral “3” (kips) located in the bottom right corner of the landing area as viewed from the primary approach path. The indication for the landing area weight limitation shall be a minimum 5 feet (1524 mm) in height.

1607.7 Heavy Vehicle loads. Floors and other surfaces that are intended to support vehicle loads greater than a 10,000-pound (4535.9 kg) gross vehicle weight rating shall comply with Sections 1607.7.1 through 1607.7.5.

1607.7.1 Loads. Where any structure does not restrict access for vehicles that exceed a 10,000-pound (4535.9 kg) gross vehicle weight rating, those portions of the structure subject to such loads shall be designed using the vehicular live loads, including consideration of impact and fatigue, in accordance with the NYSDOT Bridge Manual and the NYSDOT LRFD Bridge Design Specifications.
Alternatively, it shall be acceptable to utilize the design live loads for sidewalks as shown in Table 1607.1.

1607.7.2 Fire truck and emergency vehicles. Where a structure or portions of a structure are designated as fire access roads as defined in Chapter 5 of the New York City Fire Code, the structure shall be designed for the live loading specified in Section 1607.7.1 of this code or those identified in Chapter 5 of the New York City Fire Code, whichever produces the greater load effects.

1607.7.3 Heavy vehicle garages. Garages designed to accommodate vehicles that exceed a 10,000-pound (4535.9 kg) gross vehicle weight rating, shall be designed using the live loading specified by Section 1607.7.1. Vertical impact shall be taken as 10 percent of the vertical load.

Exception: The vehicular live loads and load placement are allowed to be determined using the actual vehicle weights for the vehicles allowed onto the garage floors, provided such loads and placement are based on rational engineering principles and are approved by the department, but shall not be less than 50 psf (2.9 kN/m²). This live load shall not be reduced.

1607.7.4 Forklifts and movable equipment. Where a structure is intended to have forklifts or other movable equipment present, the structure shall be designed for the total vehicle or equipment load and the individual wheel loads for the anticipated vehicles as specified by the owner of the facility. These loads shall be posted in accordance with Section 1607.7.5.

1607.7.4.1 Impact and fatigue. Impact loads and fatigue loading shall be considered in the design of the supporting structure. For the purposes of design, the vehicle and wheel loads shall be increased by 30 percent to account for impact.

1607.7.5 Posting. The maximum weight of vehicles allowed into or on a garage or other structure shall be posted by the owner or the owner’s authorized agent in accordance with Article 118 of Chapter 1 of Title 28 of the Administrative Code.

[1607.7] 1607.8 Loads on handrails, guards, grab bars, and seats [and vehicle barrier systems]. Handrails[,] and guards[,] shall be designed and constructed for the structural loading conditions set forth in Section 1607.8.1. Grab bars, accessible seats, shower seats and accessible benches [and vehicle barrier systems] shall be designed and constructed [to] for the structural loading conditions set forth in [this section] Section 1607.8.2.

[1607.7.1] 1607.8.1 [Handrail assemblies] Handrails and guards. [Handrail assemblies] Handrails and guards shall be designed to resist a linear load of 50 [plf] pounds per linear foot (0.73 kN/m) [applied in any direction at the top and to transfer this load through the supports to the structure] in accordance with Section 4.5.1.1 of ASCE 7. Glass handrail assemblies and guards shall also comply with Section 2407.

Exceptions:
1. For one- and two-family dwellings, only the single concentrated load required by Section [1607.7.1.1] 1607.8.1.1 shall be applied.

2. In Group I-3, F, H[1], and S occupancies, for areas that are not accessible to the general public and that have an occupant load no greater than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).

[1607.7.1.1] 1607.8.1.1 Concentrated load. [Handrail] Handrails and guards shall be [able] designed to resist a [single] concentrated load of 200 pounds (0.89 kN) [applied in any direction at any point, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building. This load need not be assumed to act concurrently with the loads specified in the preceding paragraph] in accordance with Section 4.5.1.1 of ASCE 7.

[1607.7.1.2] 1607.8.1.2 [Components] Intermediate rails. Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to [withstand a horizontally applied normal] resist a concentrated load of 50 pounds (0.22 kN) [on an area equal to 1 square foot (0.93 m²), including openings and space between rails] in accordance with Section 4.5.1.1 of ASCE 7, a vertically downward load of 50 pounds per foot (0.73 kN/m), and a concentrated upward load of 50 pounds (0.22 kN) applied at the most critical location. Reactions due to this loading are not required to be applied simultaneously with one another, and are not required to be superimposed with those of Section [1607.7.1] 1607.8.1 or [1607.7.4.1] 1607.8.1.1. The railings, balusters and components shall be designed separately for the effect of wind when the total wind load on the panel or component exceeds 50 pounds (0.22 kN). The wind load need not be combined with any other live load.

[1607.7.2] 1607.8.2 Grab bars, shower seats and dressing room bench seats. Grab bars, shower seats and dressing room bench [seat systems] seats shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point on the grab bar or seat so as to produce the maximum load effects.

[1607.7.3] 1607.9 Vehicle [barrier systems] barriers. Vehicle [barrier systems] barriers for passenger vehicles shall be designed to resist a [single] concentrated load of 6,000 pounds (26.70 kN)[applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, two loading conditions shall be analyzed. The first condition shall apply the load at a height of 1 foot, 6 inches (457 mm) above the floor or ramp surface] in accordance with Section 4.5.3 of ASCE 7.

[The second loading condition shall apply the load at 2 feet, 3 inches (686 mm) above the floor or ramp surface. The more severe load condition shall govern the design of the barrier restraint system. The load shall be assumed to act on an area not to exceed 1 square foot (0.0929 m²), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in Section 1607.7.4.1] Garages accommodating trucks and buses shall be designed in accordance with [a recognized] an approved method [acceptable to the commissioner] that contains [provision] provisions for traffic railings.

[1607.7.3.1] 1607.9.1 Columns in parking areas. Unless specially protected, columns in parking areas subject to impact of moving vehicles shall be designed to resist the lateral load due
to impact [and this load shall be considered a variable load]. For passenger vehicles, this lateral load shall be taken as a minimum service live load of 6,000 pounds (26.70 kN) applied at least 1 foot 6 inches (457.2 mm) above the roadway, and acting simultaneously with other design loads. In addition, columns in parking areas shall meet the requirements of Section 1615 for structural integrity. Vehicle barrier systems in garages accommodating trucks and buses shall be designed in accordance with NYSDOT Bridge Manual and the NYSDOT LRFD Bridge Design Specifications.

1607.10 Impact loads. The live loads specified in Sections 1607.3 through 1607.9 shall be assumed to include adequate allowance for impact conditions. Provisions shall be made in the structural design for uses and loads that involve unusual vibration and impact forces.

1607.10.1 Elevators. Members, elements and components subject to dynamic loads shall be increased by 100 percent for impact and the structural supports from elevators shall be designed within the limits of stress for impact loads and deflection limits prescribed by ASME A17.1, as modified by Appendix K of this code.

1607.10.2 Machinery. For the purpose of design, the weight of machinery and moving loads shall be increased as follows to allow for impact: (1) elevator machinery, 100 percent; (2) light machinery, shaft- or motor-driven, 20 percent; (3) and (i) reciprocating machinery or power-driven units, 50 percent; (4) hangers for floors or balconies, 33 percent. Percentages shall be increased where specified by the manufacturer.

1607.10.3 Elements supporting building maintenance equipment. In addition to any other applicable live loads, structural elements that support hoists for façade access and building maintenance equipment shall be designed for a live load of 2.5 times the rated load of the hoist or the stall load of the hoist, whichever is greater.

Equipment installed temporarily to facilitate construction, demolition, alteration, or inspection shall be subject to the requirements of Chapter 33.

1607.10.4 Fall arrest and lifeline anchorages. In addition to any other applicable live loads, lifeline anchorages and structural elements that support lifeline anchorages shall be designed for a live load of at least 3,100 pounds (13.8 kN) for each attached lifeline, in every direction that a fall arrest load may be applied.

1607.10.5 Railroad equipment. Minimum loads (including vertical, lateral, longitudinal, and impact) and the distribution thereof shall meet the applicable requirements of Chapter 15 of the AREMA Manual for Railway Engineering.

1607.10.6 Assembly structures. Seating areas in grandstands, stadiums, and similar assembly structures shall be designed to resist the simultaneous application of a horizontal swaying load of at least 24 plf (36 kg/m) of seats applied in a direction parallel to the row of the seats, and of at least 10 plf (15 kg/m) of seats in a direction perpendicular to the row of the seats. When this load is used in combination with wind for outdoor structures, the wind load shall be one-half of the design wind load.
Reduction in uniform live loads. Except for uniform live loads at roofs, all other minimum uniformly distributed live loads, \(L_o\), in Table 1607.1 are permitted to be reduced in accordance with Section [1607.9.1] 1607.11.1 or [1607.9.2] 1607.11.2. [Roof uniform] Uniform live loads [other than special purpose roofs of Section 1607.11.2.2] at roofs are permitted to be reduced in accordance with Section [1607.11.2] 1607.13.2. [Roof uniform live loads of special purpose roofs are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2.]

### General Basic uniform live load reduction

Subject to the limitations of Sections [1607.9.1] 1607.11.1 through [1607.9.4] 1607.11.4 and Table 1607.1, members for which a value of \(K_{LL}A_T\) is 400 square feet (37.16 m\(^2\)) or more are permitted to be designed for a reduced uniformly distributed live load, \(L\), in accordance with the following equation:

\[
L = L_o \left( 0.25 + \frac{15}{\sqrt{K_{LL}A_T}} \right)
\]

For SI:

\[
L = L_o \left( 0.25 + \frac{4.57}{\sqrt{K_{LL}A_T}} \right)
\]

where:

- \(L\) = Reduced design live load per square foot [(square meter)] (m\(^2\)) of area supported by the member.
- \(L_o\) = Unreduced design live load per square foot [(square meter)] (m\(^2\)) of area supported by the member (see Table 1607.1).
- \(K_{LL}\) = Live load element factor (see Table [1607.9.1] 1607.11.1).
- \(A_T\) = Tributary area, in square feet [(square meter)] (m\(^2\)).

\(L\) shall not be less than 0.50\(L_o\) for members supporting one floor and \(L\) shall not be less than 0.40\(L_o\) for members supporting two or more floors.

#### Table [1607.9.1] 1607.11.1

</tbody>
</table>

One-way slabs. The tributary area, \(A_T\), for use in Equation [16-22] 16-23 for one-way slabs shall not exceed an area defined by the slab span times a width normal...
to the span of 1.5 times the slab span.

[1607.9.1.2] 1607.11.1.2 Heavy live loads. Live loads that exceed 100 psf (4.79 kN/m²) shall not be reduced.

Exceptions:

1. The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall be not less than L as calculated in Section [1607.9.4] 1607.11.1.

2. For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

[1607.9.1.3] 1607.11.1.3 Passenger vehicle garages. The live loads shall not be reduced in passenger vehicle garages.

Exception: The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section [1607.9.4] 1607.11.1.

[1607.9.1.4] Special occupancies. Live loads of 100 psf (4.79 kN/m²) or less at areas where fixed seats are located shall not be reduced in public assembly occupancies or in areas used for retail or wholesale sales.

[1607.9.1.5] 1607.11.1.4 [Special structural elements] Flat Slab and Flat Plate Construction. Live loads shall not be reduced for one-way slabs except as permitted in Section 1607.9.1.1. Live loads shall not be reduced for calculating shear stresses at the heads of columns in flat slab or flat plate construction.

[1607.9.1.6] Roof members. Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced for roof members except as specified in Section 1607.11.2.

[1607.9.2] 1607.11.2 [Alternate floor] Alternative uniform live load reduction. As an alternative to Section [1607.9.4] 1607.11.1[.-floor] and subject to the limitations of Table 1607.1, uniformly distributed live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.

2. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m²) except that the design live load for members supporting two or more floors is permitted to be reduced by a maximum of 20 percent.

Exception: For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.
3.2 A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.

4.3 For live loads not exceeding 100 psf (4.79 kN/m²), the design live load for any structural member supporting 150 square feet (13.94 m²) or more is permitted to be reduced in accordance with Equation [16-27] 16-31.

5.4 For one-way slabs, the area, A, for use in Equation [16-27] 16-31 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

\[
R = 0.08 (A - 150) \quad \text{[(Equation 16-30)] (Equation 16-31)}
\]

For SI: \( R = 0.861(A - 13.94) \)

Such reduction shall not exceed the smallest of:
1. 40 percent for [horizontal members] members supporting one floor;
2. 60 percent for [vertical members] members supporting two or more floors; or
3. \( R \) as determined by the following equation:

\[
R = 23.1 \left(1 + \frac{D}{L_o}\right) \quad \text{[(Equation 16-31)] (Equation 16-32)}
\]

where:

\[
A = \text{Area of floor or roof supported by the member, square feet (m}^2)\text{.}
\]

\[
D = \text{Dead load per square foot (m}^2\text{) of area supported.}
\]

\[
L_o = \text{Unreduced live load per square foot (m}^2\text{) of area supported.}
\]

\[
R = \text{Reduction in percent.}
\]

[1607.10] **1607.12** Distribution of floor loads. Where uniform floor live loads are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full dead loads on all spans in combination with the floor live loads on spans selected to produce the greatest load effect at each location under consideration. [It shall be] Floor live loads are permitted to [reduce floor live loads] be reduced in accordance with Section [1607.9] 1607.11.

[1607.11] **1607.13** Roof loads. The structural supports of roofs and marquees shall be designed to resist wind and, where applicable, snow and earthquake loads, in addition to the dead load of construction and the appropriate live loads as prescribed in this section, or as set forth in Table 1607.1. The live loads acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.

[1607.11.1] **1607.13.1** Distribution of roof loads. Where uniform roof live loads are reduced to less than 20 psf (0.96 kN/m²) in accordance with Section [1607.11.2.1] 1607.13.2.1 and are applied to the design of structural members arranged so as to create continuity, the reduced roof live loads shall be applied to adjacent spans or to alternate spans, whichever produces the most unfavorable load effect. See Section [1607.11.2] 1607.13.2 for reductions in minimum roof live loads and Section 7.5 of ASCE 7 for partial snow loading.
Arches and gabled frames. The following simplification is permissible:

1. Live load placed on one-half of the span adjacent to one support.
2. Live load placed on the center one-fourth of the span.
3. Live load placed on \( \frac{3}{8} \) of the span adjacent to each support.

Reduction in roof live loads. The minimum uniformly distributed live loads of roofs and marquees, \( L_o \), in Table 1607.1 are permitted to be reduced in accordance with Section 1607.11.2.1 or 1607.11.2.2.

Ordinary roofs, awnings and canopies. Ordinary flat, pitched and curved roofs, and awnings and canopies other than of fabric construction supported by lightweight rigid skeleton structures, are permitted to be designed for a reduced uniformly distributed roof live load, \( L_r \), as specified in the following equations or other controlling combinations of loads as specified in Section 1605, whichever produces the greater load effect.

In structures such as greenhouses, where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equations shall not be used unless approved by the commissioner.

\[
L_r = L_o R_1 R_2
\]

where:

\[
12 \leq L_r \leq 20
\]

For SI:

\[
L_r = L_o R_1 R_2
\]

where:

\[
0.58 \leq L_r \leq 0.96
\]

\( L_o \) = Unreduced roof live load per square foot (m²) of horizontal projection supported by the member (see Table 1607.1).

\( L_r \) = Reduced live load per square foot (m²) of horizontal projection supported by the member.

The reduction factors \( R_1 \) and \( R_2 \) shall be determined as follows:

\[
R_1 = 1 \text{ for } A_t \leq 200 \text{ square feet (18.58 m}^2)\]

(See Equation 16-33)
\[ R_1 = 1.2 - 0.001A_t \] for 200 square feet \( < A_t < 600 \) square feet \[(Equation \ 16-34)\]

\[(Equation \ 16-35)\]

For SI: \( 1.2 - 0.011A_t \) for 18.58 square meters \( < A_t < 55.74 \) square meters

\[ R_1 = 0.6 \] for \( A_t \geq 600 \) square feet \((55.74 \text{m}^2)\) \[(Equation \ 16-35)\] \[(Equation \ 16-36)\]

where:

\[ A_t = \text{Tributary area (span length multiplied by effective width) in square feet (m}^2) \text{ supported by any structural member, and} \]

\[ F = \text{for a sloped roof, the number of inches of rise per foot (for SI: } F = 0.12 \times \text{slope, with slope expressed percentage or for an arch or dome, the rise-to-span ratio multiplied by 32.)} \]

\[ R_2 = 1 \] for \( F \leq 4 \) \[(Equation \ 16-36)\] \[(Equation \ 16-37)\]

\[ R_2 = 1.2 - 0.05F \] for \( 4 < F < 12 \) \[(Equation \ 16-37)\] \[(Equation \ 16-38)\]

\[ R_2 = 0.6 \] for \( F \geq 12 \) \[(Equation \ 16-38)\] \[(Equation \ 16-39)\]

where:

\[ F = \text{For a sloped roof, the number of inches of rise per foot (for SI: } F = 0.12 \times \text{slope, with slope expressed as a percentage), or for an arch or dome, the rise-to-span ratio multiplied by 32.} \]

[1607.11.2.2] 1607.13.3 [Special-purpose] Occupiable roofs. [Roofs] Areas of roofs that are occupiable, such as vegetative roofs, roof gardens, marquees, and roofs used for similar purposes shall be designed for a minimum live load, \( L_o \), as specified in Table 1607.1. Such live loads, and marquees are permitted to be have their uniformly distributed live loads reduced in accordance with Section 1607.9. Live loads of 100 psf (4.79 kN/m^2) or more at areas or roofs classified as Group A occupancies shall not be reduced.

[1607.11.3 Green roofs. Where roofs utilize a green roof system and are not intended for human occupancy, the uniform design live load in the area covered by the green roof shall be 20 psf (0.958 kN/m^2). The weight of the landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil. Where roofs utilize a green roof system and are used for human occupancy, the minimum live load shall be as specified in Table 1607.1 or Section 1607.11.2.2, whichever is greater.]

1607.13.3.1 Vegetative and landscaped roofs. The weight of all landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil as determined in accordance with Section 3.1.4, of ASCE 7. The uniform design live load in unoccupied landscaped areas on roofs shall be 20 psf (0.958 kN/m^2). The uniform design live
load for occupied landscaped areas on roofs shall be determined in accordance with Table 1607.1 of this code.

[1607.11.4] 1607.13.4 Awnings, [x] canopies, and sun control devices. Awnings, canopies, and sun control devices shall be designed for uniform live loads as required in Table 1607.1 as well as for snow loads and wind loads as specified in Sections 1608 and 1609.

[1607.11.5] Hanging loads. Girders and roof trusses (other than joists) over garage areas regularly utilized for the repair of vehicles and over manufacturing floors or storage floors used for commercial purposes shall be capable of supporting, in addition to the specified live and wind loads, a concentrated live load of 2,000 pounds (908 kg) applied at any lower chord panel point for trusses, and at any point of the lower flange for girders.

1607.13.5 Photovoltaic panel systems. Roof structures that provide support for photovoltaic panel systems shall be designed in accordance with Sections 1607.13.5.1 through 1607.13.5.4, as applicable.

1607.13.5.1 Roof live load. Roof structures that support photovoltaic panel systems shall be designed to resist each of the following conditions:

1. Applicable uniform and concentrated roof loads with the photovoltaic panel system dead loads.

   Exception: Roof live loads need not be applied to the area covered by photovoltaic panels where the clear space between the panels and the roof surface is 24 inches (609.6 mm) or less.

2. Applicable uniform and concentrated roof loads without the photovoltaic panel system present.

1607.13.5.2 Photovoltaic panels or modules. The structure of a roof that supports solar photovoltaic panels or modules shall be designed to accommodate the full solar photovoltaic panels or modules and ballast dead load, including concentrated loads from support frames in combination with the loads from Section 1607.13.5.1 and other applicable loads. Where applicable, snow drift loads created by the photovoltaic panels or modules shall be included.

1607.13.5.3 Photovoltaic panels or modules installed as an independent structure. Solar photovoltaic panels or modules that are independent structures and do not have accessible/occupied space underneath are not required to accommodate a roof photovoltaic live load, provided the area under the structure is restricted to keep the public away. All other loads and combinations in accordance with Section 1605 shall be accommodated.

Solar photovoltaic panels or modules that are designed to be the roof, span to structural supports, and have accessible/occupied space underneath shall have the panels or modules and all supporting structures designed to support a roof photovoltaic live load, as defined in Section 1607.13.5.1 in combination with other applicable loads. Solar photovoltaic panels or modules in this application are not permitted to be classified as “not accessible” in accordance with Section 1607.13.5.1.
1607.13.5.4 Ballasted photovoltaic panel systems. Roof structures that provide support for ballasted photovoltaic panel systems shall be designed, or analyzed, in accordance with Section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding.

1607.13.6 Hanging loads. Girders and roof trusses (other than joists) over garage areas regularly utilized for the repair of vehicles and over manufacturing floors or storage floors used for commercial purposes shall be designed in accordance with Section 1604.4; checked in accordance with Section 1604.3.6 for deflections; and checked in accordance with Section 1611 for ponding.

[1607.12] 1607.14 Crane loads. The crane live load shall be the rated capacity of the crane. Design loads for the runway beams, including connections and support brackets, of moving bridge cranes and monorail cranes shall include the maximum wheel loads of the crane and the vertical impact, lateral and longitudinal forces induced by the moving crane.

[1607.12.1] 1607.14.1 Maximum wheel load. The maximum wheel loads shall be the wheel loads produced by the weight of the bridge, as applicable, plus the sum of the rated capacity and the weight of the trolley with the trolley positioned on its runway at the location where the resulting load effect is maximum.

[1607.12.2] 1607.14.2 Vertical impact force. The maximum wheel loads of the crane shall be increased by the percentages shown below to determine the induced vertical impact or vibration force:

- Monorail cranes (powered) 25 percent
- Cab-operated or remotely operated bridge cranes (powered) 25 percent
- Pendant-operated bridge cranes (powered) 10 percent
- Bridge cranes or monorail cranes with hand-gear bridge, trolley and hoist 0 percent

[1607.12.3] 1607.14.3 Lateral force. The lateral force on crane runway beams with electrically powered trolleys shall be calculated as 20 percent of the sum of the rated capacity of the crane and the weight of the trolley. The lateral force shall be assumed to act horizontally at the traction surface of a runway beam, in either direction perpendicular to the beam, and shall be distributed according to the lateral stiffness of the runway beam and supporting structure.

[1607.12.4] 1607.14.4 Longitudinal force. The longitudinal force on crane runway beams, except for bridge cranes with hand-gear bridges, shall be calculated as 10 percent of the maximum wheel loads of the crane. The longitudinal force shall be assumed to act horizontally at the traction surface of a runway beam, in either direction parallel to the beam.

[1607.13] 1607.15 Interior walls and partitions. Interior walls and partitions that exceed 6 feet ([1829] 1828.8 mm) in height, including their finish materials, shall have adequate strength and
stiffness to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m²).

[Exception: Fabric partitions complying with Section 1607.13.1 shall not be required to resist the minimum horizontal load of 5 psf (0.24 kN/m²).]

1607.13.1 1607.15.1 Fabric partitions. Fabric partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength and stiffness to resist the following load conditions:

1. [A] The horizontal distributed load [of 5 psf (0.24 kN/m²)] need only be applied to the partition framing. The total area used to determine the distributed load shall be the area of the fabric face between the framing members to which the fabric is attached. The total distributed load shall be uniformly applied to such framing members in proportion to the length of each member.

2. A concentrated load of 40 pounds (0.176 kN) applied to an 8-inch diameter (203 mm) area of the fabric face at a height of 54 inches (1372 mm) above the floor.

1607.15.2 Fire Walls. In order to meet the structural stability requirements of Section 706.2 where the structure on either side of the wall has collapsed, fire walls and their supports shall be designed to withstand a minimum horizontal allowable stress load of 5 psf (0.240 kN/m²).

SECTION BC 1608 SNOW LOADS

1608.1 General. Design snow loads shall be determined in accordance with Chapter 7 of ASCE 7, but the design roof load shall not be less than that determined by Section 1607.

1608.2 Ground snow loads. The ground snow loads to be used in determining the design snow loads for roofs is 25 psf (1.2 kN/m²).

1608.3 Flat roof snow loads. The flat roof snow load, \( \rho_f \), on a roof with a slope equal to or less than 5 degrees (0.09 rad) (1 inch per foot = 4.76 degrees) shall be calculated in accordance with Section 7.3 of ASCE 7.]

1608.3.1 Exposure factor. The value for the snow exposure factor, \( C_e \), used in the calculation of \( \rho_f \) shall be determined from Table 1608.3.1.

<table>
<thead>
<tr>
<th>TERRAIN CATEGORY</th>
<th>EXPOSURE OF ROOF</th>
<th>EXPOSURE FACTOR, ( C_e )</th>
</tr>
</thead>
<tbody>
<tr>
<td>A (see Section 1609.4)</td>
<td>Fully-exposed</td>
<td>1.1</td>
</tr>
<tr>
<td>B (see Section 1609.4)</td>
<td>Partially-exposed</td>
<td>1.0</td>
</tr>
<tr>
<td>C (see Section 1609.4)</td>
<td>Sheltered</td>
<td>1.0</td>
</tr>
</tbody>
</table>

For SI: 1 mile = 1609 m.

a. The terrain category and roof exposure condition chosen shall be representative of the anticipated conditions during the life of the structure. An exposure factor.
shall be determined for each roof of a structure.

Definitions of roof exposure are as follows:

1. Fully exposed shall mean roofs exposed on all sides with no shelter afforded by terrain, higher structures or trees. Roofs that contain several large pieces of mechanical equipment, parapets which extend above the height of the balanced snow load, or other obstructions are not in this category.

2. Partially exposed shall include all roofs except those designated as "fully exposed" or "sheltered."

3. Sheltered roofs shall mean those roofs located tight in among conifers that qualify as "obstructions."

4. Obstructions within a distance of 10 h_o provide "shelter," where h_o is the height of the obstruction above the roof level. If the only obstructions are a few deciduous trees that are leafless in winter, the "fully exposed" category shall be used except for terrain category "A." Note that these are heights above the roof. Heights used to establish the terrain category in Section 1609.4 are heights above the ground.

[1608.3.2 Thermal factor. The value for the thermal factor, C_t, used in the calculation of \( \rho_f \) shall be determined from Table 1608.3.2.]

<table>
<thead>
<tr>
<th>TABLE 1608.3.2</th>
<th>THERMAL CONDITION</th>
<th>C_t</th>
</tr>
</thead>
<tbody>
<tr>
<td>All structures except as indicated below</td>
<td>1.0</td>
<td></td>
</tr>
<tr>
<td>Structures kept just above freezing and others with cold, ventilated roofs in which the thermal resistance (R-value) between the ventilated space and the heated space exceeds 25h ( \cdot ) ft(^2) ( \cdot ) °F/Btu</td>
<td>1.1</td>
<td></td>
</tr>
<tr>
<td>Unheated structures</td>
<td>1.2</td>
<td></td>

<td>0.85</td>
<td></td>
</tr>
</tbody>
</table>

\(^a\) For SI: 1 h \( \cdot \) ft\(^2\) \( \cdot \) °F/Btu = 0.176 m\(^2\) \( \cdot \) K/W.

a. The thermal condition shall be representative of the anticipated conditions during winters for the life of the structure.

b. A continuously heated greenhouse shall mean a greenhouse with a constantly maintained interior temperature of 50°F or more during winter months. Such greenhouse shall also have a maintenance attendant on duty at all times or a temperature alarm system to provide warning in the event of a heating system failure.

[1608.3.3 Snow load importance factor. The value for the snow load importance factor, I_s, used in the calculation of \( \rho_f \) shall be determined in accordance with Table 1604.5.2 based on the Structural Occupancy Category determined in accordance with Table 1604.5. Greenhouses that are occupied for growing plants on production or research basis, without public access, shall be included in Structural Occupancy Category I.]

[1608.3.4 Reserved.]

[1608.3.5 1608.3 Ponding instability. For roofs with a slope less than 1/4 inch per foot (1.19 degrees), the design calculations shall include verification of the prevention of] Susceptible bays of roofs shall be evaluated for ponding instability in accordance with [Section 7.14] Chapters 7 and 8 of ASCE 7.

[1608.3.6 Ice. For ice loads to be used in the design of ice-sensitive structures, such as open framed or guyed towers, refer to Chapter 10 of ASCE 7.]

[1608.4 Sloped roof snow loads. The snow load, p_s, on a roof with a slope greater than 5 degrees (0.09 rad) (1 inch per foot = 4.76 degrees) shall be calculated in accordance with Section 7.4 of ASCE 7.]

[1608.5 Partial loading. The effect of not having the balanced snow load over the entire loaded roof area shall be analyzed in accordance with Section 7.5 of ASCE 7.]

[1608.6 Unbalanced snow loads. Unbalanced roof snow loads shall be determined in accordance with Section 7.6 of ASCE 7. Winds from all directions shall be accounted for when establishing unbalanced snow loads.]
[1608.7 Drifts on lower roofs. In areas where the ground snow load, $P_g$, as determined by Section 1608.2, is equal to or greater than 5 psf (0.240 kN/ m²), roofs shall be designed to sustain localized loads from snowdrifts in accordance with Section 7.7 of ASCE 7.]

[1608.8 Roof projections. Drift loads due to mechanical equipment, penthouses, parapets and other projections above the roof shall be determined in accordance with Section 7.8 of ASCE 7.]

[1608.9 Sliding snow. The extra load caused by snow sliding off a sloped roof onto a lower roof shall be determined in accordance with Section 7.9 of ASCE 7.]

SECTION BC 1609
WIND LOADS

1609.1 Applications. Buildings, structures and parts thereof shall be designed to withstand the minimum wind loads prescribed herein. Decreases in wind loads shall not be made for the effect of shielding by other structures.

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with [Chapter 6] Chapters 26 to 31 of ASCE 7 [with the basic]. The type of opening protection required, the basic design wind speed, $V$, and the exposure category for a site is permitted to be determined in accordance with [Sections 1609.3 through 1609.4] Section 1609.4 [with the basic]. [Wind loads may also be determined using provisions of the alternate methods described in Section 1609.6.] Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. [Reserved] Subject to the limitations of Section 1609.1.1.1, the provisions of ICC 600 shall be permitted for applicable Group R-2 and R-3 buildings.

2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of [the AF&PA] AWC WFCM.

3. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.

6. Wind tunnel tests in accordance with [Section 6.6] ASCE 49 and Sections 31.4 and 31.5 of ASCE 7 [subject to the limitations in Section 1609.1.1.2].

The wind speeds in Section 1609.3 are basic design wind speeds, $V$, and shall be converted in accordance with Section 1609.3.1 to allowable stress design wind speeds, $V_{asd}$, when the provisions of the standards referenced in Exceptions 4 and 5 are used.
1609.1.1.1 Applicability. The provisions of ICC 600[AF&PA] are applicable only to buildings located within Exposure B or C as defined in Section 1609.4. The provisions of ICC 600, AWC WFCM and AISI S230 shall not apply to buildings sited on the upper half of an isolated hill, ridge or escarpment meeting the following conditions:

1. The hill, ridge or escarpment is 60 feet (18 288 mm) or higher if located in Exposure B or 30 feet (9144 mm) or higher if located in Exposure C;

2. The maximum average slope of the hill exceeds 10 percent; and

3. The hill, ridge or escarpment is unobstructed upwind by other such topographic features for a distance from the high point of 50 times the height of the hill or 1 mile (1.61 km) to 2 miles (3.22 km), whichever is greater.

[1609.1.1.2 Wind tunnel test limitations. The lower limit on pressures for main wind-force-resisting systems and components and cladding shall be in accordance with Sections 1609.1.1.2.1 and 1609.1.1.2.2:]

[1609.1.1.2.1 Lower limits on main wind-force-resisting system. Base overturning moments determined from wind tunnel testing shall be limited to not less than 80 percent of the design base overturning moments determined in accordance with Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates that lower vaults result from the aerodynamic coefficient of the building, rather than shielding from other structures. The 80 percent limit shall be permitted to be adjusted by the ratio of the frame load at critical wind directions as determined from wind tunnel testing without specific adjacent buildings, but including appropriate upwind roughness, to that determined in Section 6.5 of ASCE 7. In no case shall the limiting value be less than 50 percent of the design base overturning moments determined in accordance with Section 6.5 of ASCE 7.]

[1609.1.1.2.2 Lower limits on components and cladding. The design pressures for components and cladding on walls or roofs shall be selected as the greater of: (i) the wind tunnel test results; or (ii) 80 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs, as determined in Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates that lower values result from the aerodynamic coefficient of the building, rather than shielding from nearby structures. Alternatively, limited tests at a few wind directions without specific adjacent buildings, but in the presence of an appropriate upwind roughness, shall be permitted to be used to demonstrate that the lower pressures are due to the shape of the building and not to shielding. In no case shall the limiting value be less than 65 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs, as determined in Section 6.5 of ASCE 7.]

[1609.1.2 Protection from wind borne debris. The following buildings shall be protected with an impact-resistant covering or glazing in accordance with the Missile Levels and Wind Zones specified in ASTM E 1886 and ASTM E 1996 or other approved test methods and performance criteria:]
2. Buildings in Structural Occupancy Category III, as defined in Table 1604.5, located in Exposure D, as defined in Section 1609.4, where the glazing of such building encloses places of assembly for 300 or more persons or areas of in-place shelter.]

[Exception: Glazing protection in accordance with Section 1609.1.2 shall not be required if the glazing is located more than 60 feet (18 288 mm) above the ground and more than 30 feet (9144 mm) above aggregate-surfaced roofs, including roofs with gravel or stone ballast located within 1,500 feet (457.2 m) of the building.]

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resistant standard or ASTM E1996 and ASTM E1886 referenced herein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the large missile test of ASTM E1996.

2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the small missile test of ASTM E1996.

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11.1 mm) and maximum panel span of 8 feet (2438.4 mm) shall be permitted for opening protection in buildings with a mean roof height of 33 feet (10 058 mm) or less that are classified as a Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7, with corrosion-resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 of this code with corrosion-resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 45 feet (13 716 mm) or less where $V_{asld}$ determined in accordance with Section 1609.3.1 of this code does not exceed 140 mph (63 m/s).

2. Glazing in Risk Category I or II buildings, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.

3. Glazing in Risk Category III or IV buildings located over 60 feet (18 288 mm) above the ground.
### TABLE 1609.1.2
WIND-BORNE DEBRIS PROTECTION FASTENING SCHEDULE FOR WOOD STRUCTURAL PANELS

<table>
<thead>
<tr>
<th>FASTENER TYPE</th>
<th>FASTENER SPACING (inches)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>No. 10 wood-screw-based anchor with 2-inch embedment length</td>
<td>16</td>
</tr>
<tr>
<td>¾-inch diameter lag-screw-based anchor with 2-inch embedment length</td>
<td>16</td>
</tr>
</tbody>
</table>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448 N, 1 mile per hour = 0.447 m/s.

a. This table is based on 140 mph wind speeds and a 45-foot mean roof height.
b. Fasteners shall be installed at opposing ends of the wood structural panel. Fasteners shall be located a minimum of 1 inch from the edge of the panel.
c. Anchors shall penetrate through the exterior wall covering with an embedment length of 2 inches minimum into the building frame. Fasteners shall be located a minimum of 2½ inches from the edge of concrete block or concrete.
d. Where panels are attached to masonry or masonry/stucco, they shall be attached using vibration-resistant anchors having a minimum ultimate withdrawal capacity of 2,500 pounds.

1609.1.2.1 Louvers. Louvers protecting intake and exhaust ventilation ducts not assumed to be open that are located within 30 feet (9144 mm) of grade shall meet the requirements of [an approved impact resisting standard or the large missile test of ASTM E 1996] AMCA 540.

1609.1.2.2 Application of ASTM E1996. The text of Section 6.2.2 of ASTM E1996 shall be substituted as follows:

6.2.2 Unless otherwise specified, select the wind zone based on the strength design wind speed, \( V \), as follows:

6.2.2.1 Wind Zone 1—130 mph ≤ basic design wind speed, \( V < 140 \text{ mph} \).

6.2.2.2 Delete.

6.2.2.3 Delete.

6.2.2.4 Delete.

[1609.1.2.2] 1609.1.2.3 Garage doors. Garage door glazed opening protection for windborne debris shall meet the requirements of an approved impact-resisting standard or ANSI/DASMA 115.

1609.1.3 Minimum wind loads. The design wind | loads | pressure, \( p \), used in the design of the main wind-force-resisting system shall not be less than [10 psf (0.479 kN/m²)] 16 psf (0.766 kN/m²) multiplied by the area of the building or structure projected on a vertical plane normal to the wind direction. In the calculation of design wind | loads for | pressure, \( p \), used in the design of components and cladding for buildings, the algebraic sum of the pressures acting on opposite faces shall be taken into account. The design pressure for components and cladding of buildings shall not be less than [20 psf (0.958 kN/m²)] 32 psf (1.533 kN/m²) acting in either direction normal to the surface. The design force for open buildings and other structures shall not be less than [40 psf (0.479 kN/m²)] 16 psf (0.766 kN/m²) multiplied by the area \( A_f \).

1609.1.4 Anchorage against overturning, uplift and sliding. Structural members and systems and components and cladding in a building or structure shall be anchored to resist wind-induced
overturning, uplift and sliding and to provide continuous load paths for these forces to the foundation.

Where a portion of the resistance to these forces is provided by dead load, the dead load, including the weight of soils and foundations, shall be taken as the minimum dead load likely to be in place during a design wind event.

1609.1.5 Wind and seismic detailing. Lateral-force-resisting systems shall meet seismic detailing requirements and limitations prescribed in this code, even when wind code prescribed load effects are greater than seismic load effects.

1609.1.6 Wind tunnel test limitations. The lower limit on pressures for main wind-force-resisting systems and components and cladding shall be in accordance with this section.

1609.1.6.1 Lower limits on main wind-force-resisting system. Base overturning moments determined from wind tunnel testing shall be limited to not less than 80 percent of the design base overturning moments determined in accordance with Section 27.2 of ASCE 7 unless the wind tunnel results and testing procedure are peer reviewed by an independent wind tunnel laboratory. In no case shall the limiting value be less than 70 percent of the design base overturning moments determined in accordance with Section 27.2 of ASCE 7.

1609.1.6.2 Lower limits on components and cladding. The design pressures for components and cladding on walls or roofs shall be selected as the greater of: (i) the wind tunnel test results; or (ii) 80 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs, as determined in Section 30.5 of ASCE 7, unless the wind tunnel results and testing procedure are peer reviewed by an independent wind tunnel laboratory. In no case shall the limiting value be less than 70 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs, as determined in Section 30.5 of ASCE 7.

1609.1.6.3 Scope of peer review by independent wind tunnel laboratory. When applicable, the peer reviewer of the wind tunnel test shall:

1. Be retained by or on behalf of the owner and shall be independent from the wind tunnel laboratory that performed the tests and the report shall bear no conflict of interest.

2. Have a minimum of 10 years of technical expertise in the application of wind tunnel studies on buildings comparable to that being reviewed.

3. Have experience in performing or evaluating boundary layer wind tunnel studies and shall be familiar with the technical issues and regulations governing the wind tunnel procedure in ASCE 49.

4. Review the wind tunnel report, including but not limited to wind climate data and modeling, data analysis, boundary layer modeling, building modeling, significant influential buildings, resulting wind loads and other relevant issues identified by the reviewer.
5. Review the wind tunnel report for cladding and envelope pressures, if applicable.

6. Submit a report to the department summarizing the results of their review, and shall state whether the wind tunnel test and the results meet the industry standard, the New York City Building Code and are appropriate for the project.

1609.2 Definitions. [The following words and terms shall, for] For the purposes of Section 1609,[, have the meanings shown herein:] and as used elsewhere in the code, the following terms are defined in Chapter 2:

BUILDINGS AND OTHER STRUCTURES, FLEXIBLE. [Buildings and other structures that have a fundamental natural frequency less than 1 Hz.]

BUILDING, ENCLOSED. [A building that does not comply with the requirements for open or partially enclosed buildings.]

BUILDING, LOW-RISE. [Enclosed or partially enclosed buildings that comply with the following conditions:]

[1. Mean roof height, \( h \), less than or equal to 60 feet (18.288 mm).]

[2. Mean roof height, \( h \), does not exceed least horizontal dimension.]

BUILDING, OPEN. [A building having each wall at least 80 percent open. This condition is expressed for each wall by the equation:]

\[
A_o \geq 0.8A_g \tag{Equation 16-39}
\]

[where:

\( A_o \) = Total area of openings in a wall that receives positive external pressure, in square feet (m\(^2\)).

\( A_g \) = The gross area of that wall in which \( A_o \) is identified, in square feet (m\(^2\)).]

BUILDING, PARTIALLY ENCLOSED. [A building that complies with both of the following conditions:]

[1. The total area of openings in a wall that receives positive external pressure exceeds the sum of the areas of openings in the balance of the building envelope (walls and roof) by more than 40 percent, and]

[2. The total area of openings in a wall that receives positive external pressure exceeds 4 square feet (0.37 m\(^2\)) or 1 percent of the area of that wall, whichever is smaller, and the percentage of openings in the balance of the building envelope does not exceed 20 percent. These conditions are expressed by the following equations:]

\[
A_o \geq 1.104A_{gr} \tag{Equation 16-40}
\]

\[
A_o \geq 4 \text{ square feet (0.37 m}^2\) \text{ or } \geq 0.01A_{gr} \text{ whichever is smaller, and } A_{gr}/A_{gr} \leq 0.20 \tag{Equation 16-41}
\]
[where:]

\[ A_o, A_g \] are as defined for an open building.

\[ A_{oi} = \text{The sum of the areas of openings in the building envelope (walls and roof) not including } A_o, \text{ in square feet } (m^2). \]

\[ A_{gi} = \text{The sum of the gross surface areas of the building envelope (walls and roof) not including } A_g, \text{ in square feet } (m^2). \]

**BUILDING, SIMPLE DIAPHRAGM.** [A building in which wind loads are transmitted through floor and roof diaphragms to the vertical lateral-force-resisting systems.]

**COMPONENTS AND CLADDING.** [Elements of the building envelope that do not qualify as part of the main wind-force-resisting system.]

**EAVE HEIGHT, \( h_1 \).** [The distance from the ground surface adjacent to the building to the roof eave line at the particular wall. If the distance of the eave varies along the wall, the average distance shall be used.]

**EFFECTIVE WIND AREA.** [The area used to determine \( GC_p \). For component and cladding elements, the effective wind area in Tables 1609.6.2.1(2) and 1609.6.2.1(3) is the span length multiplied by an effective width that need not be less than one third the span length. For cladding fasteners, the effective wind area shall not be greater than the area that is tributary to an individual fastener.]

**HURRICANE-PRONE REGIONS.** [New York City is within the hurricane-prone region.]

**IMPORTANCE FACTOR, \( I \).** [A factor that accounts for the degree of hazard to human life and damage to property.]

**MAIN WIND FORCE-RESISTING SYSTEM.** [An assemblage of structural elements assigned to provide support and stability for the overall structure. The system generally receives wind loading from more than one surface.]

**MEAN ROOF HEIGHT.** [The average of the roof eave height and the height to the highest point on the roof surface, except that eave height shall be used for roof angle of less than or equal to 10 degrees (0.1745 rad).]

**[WIND-BORNE DEBRIS REGION.]** [New York City is not in the wind-borne debris region.]

**WIND SPEED, \( V (BASIC) \).**

**WIND SPEED, \( V_{bas} \) (ALLOWABLE STRESS DESIGN).**

**WIND-BORNE DEBRIS REGION.** [New York City is not in the wind-borne debris region.]

1609.3 Basic design wind speed. The basic design wind speed, \( V \), in mph, for New York City is 98 mph (43.8 m/s). The basic wind speed is measured at 33 feet (10.058 m) above ground in Exposure C as a 3-second gust speed. This wind speed is based on local wind climate with a nominal annual
probability of 0.02 (nominal 50-year mean recurrence interval) which is obtained by dividing the 700 year mean recurrence wind speed by $\sqrt{1.6}$. Determining wind speed shall be that of Table 1609.3.

**TABLE 1609.3**

<table>

Note: Values are ultimate design 3-second gust wind speeds in miles per hour at 33 feet (10,058 mm) above ground for Exposure Category C.

1609.3.1 Wind speed conversion. When required, the 3-second gust wind speed, $V_{3S}$, can be converted to a fastest mile wind speed, $V_{fm}$, using Equation 16-42 below. Where required, the basic design wind speed, $V$, of Table 1609.3 shall be converted to allowable stress design wind speed, $V_{asd}$, using Equation 16-40.

$$V_{fm} = \left( \frac{V_{asd} - 10.5}{1.05} \right)$$

$$V_{asd} = 0.79V$$

1609.3.2 Wind speed for serviceability design. Table 1609.3.2 presents 3-second gust wind speeds for mean recurrence intervals (MRI) of 10, 25, 50 and 100 years. These wind speeds may be used for serviceability applications such as drift and habitability.

**TABLE 1609.3.2**

Note: Values are 3-second gust wind speeds in miles per hour at 33 feet (10,058 mm) above ground for Exposure Category C.

1609.4 Exposure category. For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. When applying the simplified wind load method of Section 1609.6, a single exposure category shall be used based upon the most restrictive for any given wind direction.

1609.4.1 Wind directions and sectors. For each selected wind direction at which the wind loads are to be evaluated, the exposure of the building or structure shall be determined for the two upwind sectors extending 45 degrees (0.79 rad) either side of the selected wind direction. The
exposures in these two sectors shall be determined in accordance with Sections 1609.4.2 and 1609.4.3 and the exposure resulting in the highest wind loads shall be used to represent winds from that direction.

1609.4.2 Surface roughness categories. A ground surface roughness within each 45-degree (0.79 rad) sector shall be determined for a distance upwind of the site as defined in Section 1609.4.3 from the categories defined below, for the purpose of assigning an exposure category as defined in Section 1609.4.3.

**Surface Roughness B.** Urban and suburban areas, wooded areas or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger.

**Surface Roughness C.** Open terrain with scattered obstructions having heights generally less than 30 feet (9144 mm). This category includes flat open country, grasslands, and limited water surfaces per Figure 1609.4.3.

**Surface Roughness D.** Flat, unobstructed areas and water surfaces[, including areas in hurricane-prone regions]. This category includes smooth mud flats, salt flats and unbroken ice.

1609.4.3 Exposure categories. An exposure category shall be determined in accordance with the following:

Figure 1609.4.3 provides the exposure categories at the shore lines for wind directions approaching over the water within the city boundaries.

**Exposure B.** For buildings with a mean roof height of less than or equal to 30 feet (9144 mm), Exposure B shall apply where the ground surface roughness [condition], as defined by Surface Roughness B, prevails in the upwind direction for a distance of at least 1,500 feet (457.2 m). For buildings with a mean roof height greater than 30 feet (9144 mm), Exposure B shall apply where Surface Roughness B prevails in the upwind direction for a distance of at least 2,600 feet ([792] 792.5 m) or 20 times the height of the building, whichever is greater.

[**Exception:** For buildings whose mean roof height is less than or equal to 30 feet (9144 mm), the upwind distance is permitted to be reduced to 1,500 feet (457 m).]

**Exposure C.** Exposure C shall apply where it is shown in Figure 1609.4.3 or for all cases where [Exposures] Exposure B or D does not apply.

**Exposure D.** Exposure D shall apply where the ground surface roughness, as defined by Surface Roughness D, prevails in the upwind direction for a distance of at least 5,000 feet (1524 m) or 20 times the height of the building, whichever is greater. Exposure D shall [extend inland from] also apply where the [shoreline for ground surface roughness immediately upwind of the site is B or C, and the site is within a distance of 600 feet ([182.9] 182.9 m) or 20 times the [height of the building height], whichever is greater, from an Exposure D condition as defined in the previous sentence.
Figure 1609.4.3 (1)
NEW YORK CITY WIND EXPOSURE: MANHATTAN SHORELINE

Notes:
- Exposure C: Buildings within a distance of 2,600 feet from shoreline.
- Exposure D: Buildings within a distance of 2,600 feet or 20 times building height from the shoreline, whichever is greater.
- Exposure E: Coastal zone, see Section 1609.4.
Importance factor. Buildings and other structures shall be assigned a wind load importance factor.
factor, \( I \), in accordance with Table 1604.5.2 based on the Structural Occupancy Category determined by Table 1604.5.

[1609.6 Simplified wind load methods.]

[1609.6.1 Scope] The procedures in Section 1609.6 shall be permitted to be used for determining and applying wind pressures in the design of enclosed buildings as listed below:

1. For buildings with flat, gabled or hipped roofs having a mean roof height not exceeding the least horizontal dimension or 60 feet (18,288 mm), whichever is less, the use of Section 1609.6.2, Simplified Procedure I, is permitted.

2. For buildings located within any Borough with a mean roof height of not more than 200 feet (60,960 mm) not located in Exposure C or D in accordance with Section 1609.4, the use of Section 1609.6.3, Simplified Procedure II, is permitted.

3. For buildings located within the Borough of Manhattan with a mean roof height of not more than 300 feet (91,440 mm) and not located in Exposure C or D in accordance with Section 1609.4, the use of Section 1609.6.3, Simplified Procedure II, is permitted.

[1609.6.2 Simplified Design Procedure I (for low-rise buildings).]

1. The wind shall be assumed to come from any horizontal direction.

2. An importance factor \( I \) shall be determined in accordance with Section 1609.5.

3. An exposure category shall be determined in accordance with Section 1609.4.

4. A height and exposure adjustment coefficient, \( \lambda \), shall be determined from Table 1609.6.2.1(4).

[1609.6.2.1 Main wind force-resisting system.] Simplified design wind pressures, \( p_s \), for the main wind force-resisting systems represent the net pressures (sum of internal and external) to be applied to the horizontal and vertical projections of building surfaces as shown in Figure 1609.6.2.1. For the horizontal pressures (Zones A, B, C, D), \( p_s \) is the combination of the windward and leeward net pressures. \( p_s \) shall be determined from Equation 16-43.

\[
p_s = \lambda I w P_{s30}
\]

([Equation 16-43])

[where:]

\[
\lambda = \text{Adjustments factor for building height and exposure from Table 1609.6.2.1(4)}
\]

\[
I = \text{Importance factor as defined in Section 1609.5}
\]

\[
P_{s30} = \text{Simplified design wind pressure for Exposure B, at } h = 30 \text{ feet (9144 mm), and for } I = 1.0, \text{ from Table 1609.6.2.1(1).}
\]
For SI: 1 foot = 304.8 mm, 1 degree = 0.0174 rad.

Notes:
1. Pressures are applied to the horizontal and vertical projections for Exposure B, at \( h = 30 \) feet, for \( I = 1.0 \). Adjust to other exposures and heights with adjustment factor \( \lambda \).
2. The load patterns shown shall be applied to each corner of the building in turn as the reference corner.
3. For the design of the longitudinal MWFRS, use \( \theta = 0^\circ \) and locate the Zone E/F, G/H boundary at the mid-length of the building.
4. Load Cases 1 and 2 must be checked for \( 25^\circ < \theta \leq 45^\circ \). Load Case 2 at \( 25^\circ \) is provided only for interpolation between \( 25^\circ \) to \( 30^\circ \).
5. Plus and minus signs signify pressures acting toward and away from the projected surface, respectively.
6. For roof slopes other than those shown, linear interpolation is permitted.
7. The total horizontal load shall not be less than that determined by assuming \( P_S = 0 \) in Zones B and D.
8. The zone pressures represent the following:
   - Horizontal pressure zones — Sum of the windward and leeward net (sum of internal and external) pressures on vertical projection of:
     A — End zone of wall
     B — End zone of roof
     C — Interior zone of wall
     D — Interior zone of roof
   - Vertical pressure zones — Net (sum of internal and external) pressures on horizontal projection of:
     E — End zone of windward roof
     F — End zone of leeward roof
     G — Interior zone of windward roof
     H — Interior zone of leeward roof
9. Where Zone E or G falls on a roof overhang on the windward side of the building, use \( E_{OH} \) and \( G_{OH} \) for the pressure on the horizontal projection of the overhang.
   - Overhang on the leeward and side edges shall have the basic zone pressure applied.
10. Notations:
   a. 10 percent of least horizontal dimension or 0.4h, whichever is smaller, but not less than either 1 percent of least horizontal dimension or 3 feet.
   b. Mean roof height, in feet (meters), except that eave height shall be used for roof angles < 10°.
   c. Angle of plane of roof from horizontal, in degrees.

**TABLE 1609.6.2.1(1)**

For SI: 1 foot = 304.8 mm.

a. All table values shall be adjusted for other exposures and heights by multiplying by the above coefficients.

1609.6.2.1 Minimum pressures. The load effects of the design wind pressures from Section 1609.6.2.1 shall not be less than assuming the pressures, \( p_s \), for Zones A, B, C and D all equal to +20 psf (0.96 kN/m²), while assuming Zones E, F, G, and H all equal to 0 psf.

1609.6.2.2 Components and cladding. Net design wind pressures, \( p_{net} \), for the components and cladding of buildings represent the net pressures (sum of internal and external) to be applied normal to each building surface as shown in Figure 1609.6.2.2. The net design wind pressure, \( p_{net} \), shall be determined from Equation 16-44:

\[
p_{net} = \lambda p_{net,30}
\]

\[ (\text{Equation 16-44}) \]

where:

\[
\lambda = \text{Adjustments factor for building height and exposure from Table 1609.6.2.1(4)}. \\
I = \text{Importance factor as defined in Section 1609.5}. \\
p_{net,30} = \text{Net design wind pressure for Exposure B, at } h = 30 \text{ feet (9144 mm), and for } I_w = 1.0, \text{ from Tables 1609.6.2.1(2) and 1609.6.2.1(3)}. \]
1244

FIGURE 1609.6.2.2 COMPONENT AND CLADDING PRESSURE

For SI: 1 foot = 304.8 mm, 1 degree = 0.0174 rad.

Notes:
1. Pressures are applied normal to the surface for Exposure B, at $h = 30$ feet, for $I_w = 1.0$. Adjust to other exposures and heights with adjustment factor $\lambda$.
2. Plus and minus signs signify pressures acting toward and away from the surfaces, respectively.
3. For hip roofs with $\theta \leq 25^\circ$, Zone 3 shall be treated as Zone 2.
4. For effective areas between those given, the value is permitted to be interpolated, otherwise use the value associated with the lower effective area.
5. Notation:
   a: 10 percent of least horizontal dimension or 0.4$h$, whichever is smaller, but not less than either 4 percent of least horizontal dimension or 3 feet.
   $h$: Mean roof height, in feet (meters), except that eave height shall be used for roof angles $<10^\circ$.
   $\theta$: Angle of plane of roof from horizontal, in degrees.

1609.6.2.2.1 Minimum pressures. The positive design wind pressures, $p_{net}$, from Section 1609.6.2.2 shall not be less than $+20$ psf ($1.44$ kN/m$^2$), and the negative design wind pressures, $p_{net}$, from Section 1609.6.2.2 shall not be less than $-20$ psf ($-1.44$ kN/m$^2$).

1609.6.2.3 Load case. Members that act as both part of the main wind force resisting system and as components and cladding shall be designed for each separate load case.

1609.6.3 Simplified Design Procedure II.

1609.6.3.1 Main wind-force-resisting system. Main wind-force-resisting systems shall comply with the following:
1. The building shall be designed for the following net lateral wind pressure to be applied to the horizontal projection of the building surfaces:

1.1. From 0 to 100 feet (0 to 30480 mm) elevation 20 psf (0.96 kN/m²);

1.2. From 100 to 300 feet (30480 to 91440 mm) elevation 25 psf (1.2 kN/m²);

2. An importance factor, I, shall be determined in accordance with Section 1609.5 and shall be applied to the pressures indicated above.

1609.6.3.2 Design wind load cases. The main wind force resisting system of buildings, whose wind loads have been determined pursuant to Section 1609.6.3, shall be designed for wind load cases as defined below:

[Case 1.] Full design wind pressure acting on the projected area perpendicular to each principal axis of the structure, considered separately along each principal axis.

[Case 2.] Seventy-five percent of the design wind pressure acting on the projected area perpendicular to each principal axis of the structure to be applied eccentric to the center of the exposure with eccentricity equal to 15 percent of the exposure width, considered separately for each principal direction.

[Case 3.] Wind loading as defined in Case 1 for each orthogonal direction, but considered to act simultaneously at 75 percent of the specified value.

1609.6.3.3 Components and cladding. Net design wind positive and negative pressures (pressure and suction) for the components and cladding of buildings represent the net (sum of internal and external) to be applied normal to each building surface. The net design wind positive and negative shall not be less than 30 psf (1.44 kN/m²), except at the corners of the building with a width equivalent to 10 percent of the building’s width at its side, the net design wind negative pressure for the components and cladding shall not be less than:

(i) 45 psf (2.16 kN/m²) for the portion of the building between 200 feet (60.76 meters) to 300 feet (91.44 meters) height above ground and (ii) 40 psf (1.92 kN/m²) for the portion of the building between 100 feet (30.48 meters) to 199 feet (60.66 meters) in height above ground.

1609.6.3.4 Roof. The design pressure and suction acting over the entire roof including purlins, roofing, and other roof elements (including their fastenings) shall not be less than 30 psf (1.44 kN/m²).

1609.6.3.5 Other building elements. The following building elements of buildings whose wind loads have been determined under the provisions of Section 1609.6.3 shall be designed for wind pressures shown in Section 1609.6.3.1 multiplied by the following shape factors given in Table 1609.6.3.5.
TABLE 1609.6.3.5

[1609.6.3.5.1 Eaves and cornices. Eaves, cornices, and overhanging elements of the buildings shall be designed for upward pressures twice the values given in Section 1609.6.3.1.]

[1609.7] 1609.5 Roof systems. Roof systems shall be designed and constructed in accordance with Sections 1609.5.1 through 1609.5.3, as applicable.

[1609.7.1] 1609.5.1 Roof deck. The roof deck shall be designed to withstand the wind pressures determined under either the provisions of Section 1609.6 for buildings satisfying the height and other requirements of the simplified methods or in accordance with Section 1609.1.1 for buildings of any height.

[1609.7.2] 1609.5.2 Roof coverings. Roof coverings shall comply with the requirements for roof decks pursuant to Section [1609.7.1] 1609.5.1.

Exceptions:

1. Rigid tile roof coverings that are air permeable and installed over a roof deck complying with Section [1609.7.4] 1609.5.1 are permitted to be designed in accordance with Section [1609.7.3] 1609.5.3.

2. Asphalt shingles installed over a roof deck complying with Section [1609.7.4] 1609.5.1 shall comply with the wind-resistance requirements of Section [1507.2.7.4] 1504.1.1.

[1609.7.3] 1609.5.3 Rigid tile. Wind loads on rigid tile roof coverings shall be determined in accordance with the following equation:

\[ M_a = q_b C_L b LL_a(1.0 - G_{Cp}) \]  
((Equation 16-45)) (Equation 16-41)

For SI: \[ M_a = q_b C_L b LL_a(1.0 - G_{Cp}) / 1,000 \]

where:

\( b \) = Exposed width, feet (mm) of the roof tile.

\( C_L \) = Lift coefficient. The lift coefficient for concrete and clay tile shall be 0.2 or shall be determined by test in accordance with Section [1716.2] 1711.2.

\( G_{Cp} \) = Roof pressure coefficient for each applicable roof zone determined from Chapter [6] 30 of ASCE 7. Roof coefficients shall not be adjusted for internal pressure.
\( L = \) Length, feet (mm) of the roof tile.

\( L_a = \) Moment arm, feet (mm) from the axis of rotation to the point of uplift on the roof tile. The point of uplift shall be taken at 0.76\( L \) from the head of the tile and the middle of the exposed width. For roof tiles with nails or screws (with or without a tail clip), the axis of rotation shall be taken as the head of the tile for direct deck application or as the top edge of the batten for batten applications. For roof tiles fastened only by a nail or screw along the side of the tile, the axis of rotation shall be determined by testing. For roof tiles installed with battens and fastened only by a clip near the tail of the tile, the moment arm shall be determined about the top edge of the batten with consideration given for the point of rotation of the tiles based on straight bond or broken bond and the tile profile.

\( M_a = \) Aerodynamic uplift moment, feet-pounds (N-mm) acting to raise the tail of the tile.

\( q_h = \) Wind velocity pressure, psf (kN/m²) determined from Section 6.5.10 of ASCE 7.

Concrete and clay roof tiles complying with the following limitations shall be designed to withstand the aerodynamic uplift moment as determined by this section.

1. The roof tiles shall be either loose laid on battens, mechanically fastened, mortar set or adhesive set.
2. The roof tiles shall be installed on solid sheathing that has been designed as components and cladding.
3. An underlayment shall be installed in accordance with Chapter 15.
4. The tile shall be single lapped interlocking with a minimum head lap of not less than 2 inches (51.8 mm).
5. The length of the tile shall be between 1.0 and 1.75 feet (305.3 and 533.4 mm).
6. The exposed width of the tile shall be between 0.67 and 1.25 feet (204.2 and 381 mm).
7. The maximum thickness of the tail of the tile shall not exceed 1.3 inches (33 mm).
8. Roof tiles using mortar set or adhesive set systems shall have at least two-thirds of the tile’s area free of mortar or adhesive contact.

[1609.8 Wind on temporary structures. Wind on temporary structures shall be permitted to be designed for reduced wind loading in accordance with the requirements of Section 1618.]

1609.6 Simplified design procedure. Use of the simplified design procedure shall comply with Sections 1609.6.1 through 1609.6.5.
1609.6.1 **Scope.** The procedures in Section 1609.6 shall be permitted to be used for determining and applying wind pressures in the design of enclosed buildings in Risk Category I and II as listed below:

1. For buildings located within any borough with a mean roof height of not more than 200 feet (60 960 mm) and not located in Exposure C or D in accordance with Section 1609.4, the use of Section 1609.6 shall be permitted.

2. For buildings located within the Borough of Manhattan with a mean roof height of not more than 300 feet (91 440 mm) and not located in Exposure C or D in accordance with Section 1609.4, the use of Section 1609.6 shall be permitted.

1609.6.2 **Main windforce-resisting systems.** Main windforce-resisting systems shall comply with the following:

1. The building shall be designed for the following net lateral wind pressure to be applied to the horizontal projection of the building surfaces:
   
   1.1. From 0 to 100 feet (0 to 30 480 mm) elevation 32 psf (1.54 kN/m²).
   
   1.2. From 100 to 300 feet (30 480 to 91 440 mm) elevation 40 psf (1.92 kN/m²).

1609.6.3 **Design wind load cases.** The main windforce-resisting system of buildings, whose wind loads have been determined pursuant to Section 1609.6.1, shall be designed for wind load cases as defined below:

   **Case 1.** Full design wind pressure acting on the projected area perpendicular to each principal axis of the structure, considered separately along each principal axis.

   **Case 2.** Seventy-five percent of the design wind pressure acting on the projected area perpendicular to each principal axis of the structure to be applied eccentric to the center of the exposure with eccentricity equal to 15 percent of the exposure width, considered separately for each principal direction.

   **Case 3.** Wind loading as defined in Case 1 for each orthogonal direction, but considered to act simultaneously at 75 percent of the specified value.

1609.6.4 **Components and cladding.** Net design wind positive and negative pressures (pressure and suction) for the components and cladding of buildings represent the net pressures (sum of internal and external) to be applied normal to each building surface. The net design wind positive and negative pressures shall not be less than 48 psf (12.30 kN/m²), except at the corners of the building with a width equivalent to 10 percent of the building’s width at its side, the net design wind negative pressure for the components and cladding shall not be less than: (i) 72 psf (3.46 kN/m²) for the portion of the building between 200 feet (60 960 mm) to 300 feet (91 440 mm) height above ground and (ii) 64 psf (3.07 kN/m²) for the portion of the building between 100 feet (30 480 mm) to 199 feet (60 656 mm) in height above ground.
**1609.6.5 Roof.** The design pressure and suction acting over the entire roof including purlins, roofing, and other roof elements (including their fastenings) shall be not less than 48 psf (2.30 kN/m$^2$).

**1609.7 Attached canopies on buildings.** Canopies attached to buildings shall comply with Section 1609.7.1 or 1609.7.2, as applicable.

For SI: 1 foot = 304.8 mm.

![Figure 1609.7 Schematic of attached canopy on buildings with h>60 ft.](image)

**Figure 1609.7 Schematic of attached canopy on buildings with h>60 ft.**

**1609.7.1 Buildings with h≤60 ft.** The design wind pressure for canopies attached to walls of buildings with h≤60 ft. shall follow Chapter 30 of ASCE 7.

**1609.7.2 Buildings with h>60 ft.** The design wind pressure for canopies attached to walls of buildings with h>60 ft. and $h_{c}/h < 0.5$, as shown on Figure 1609.7, shall be from the following equation:

$$P = q_b(GC_{pn}) \text{ (lb/ft}^2)$$

*(Equation 16-42)*

Where:

$q_b$ = velocity pressure at mean roof height $h$ per Chapter 26 of ASCE 7.

$GC_{pn}$ = net pressure coefficient for attached canopies given in Table 1609.7.
1609.8 Wind load on structures during construction. Structures during construction shall comply with Sections 1609.8.1 and 1609.8.2.

1609.8.1 Design wind speed. Design wind speed during construction for a construction period of less than 5 years may be reduced as follows:

Unless otherwise directed by the commissioner, the basic design wind speed may be reduced to 110 mph for all risk categories, corresponding to 1.7 percent probability of exceedance in 5 years. The basic design wind speed refers to the ultimate design 3-second gust wind speed at 33 feet (10 058.4 mm) above ground for Exposure Category C, as defined in Section 1609.3.

1609.8.2 Frameworks without cladding. For unenclosed frames and elements, the appropriate drag factors and wind effect on successive elements shall be accounted for per recognized standards and references, or in accordance with suitable wind tunnel testing.

SECTION BC 1610
SOIL LATERAL LOADS

1610.1 General. Foundation walls and retaining walls shall be designed to resist lateral soil [and hydrostatic] loads. The soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless otherwise determined by a geotechnical investigation report prepared in accordance with Section 1802. Foundation walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top shall be permitted to be designed for active pressure. Design lateral pressure from hydrostatic, dynamic, or surcharge loads shall be added to the lateral earth pressure load, as applicable. For hydrostatic lateral pressure, see Section 1806.2. Design lateral pressure shall be increased if soils at the site are expansive. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1805.4.2 and 1805.4.3.

Exception: Foundation walls extending not more than 8 feet (2438.4 mm) below grade and laterally supported at the top by flexible diaphragms shall be permitted to be designed for active pressure.

For SI: 1 pound per square foot per foot of depth = 0.157 kPa/m, 1 foot = 304.8 mm.
a. Design lateral soil loads are given for moist conditions for the specified soils at their optimum densities. Actual field conditions shall govern. Submerged or saturated soil pressures shall include the weight of the buoyant soil plus the hydrostatic loads.
b. Unsuitable as backfill material.
c. The definition and classification of soil materials shall be in accordance with ASTM D 2487.

**SECTION BC 1611**

**RAIN LOADS**

**1611.1 Design rain loads.** Each portion of a roof shall be designed to sustain the load of rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow.

\[
R = 5.2 \left( d_s + d_h \right) \tag{Equation 16-46} \tag{Equation 16-43}
\]

\[
[\text{For SI: } R = 0.0098 \left( d_s + d_h \right) ]
\]

For SI: \( R = 0.0098 \left( d_s + d_h \right) \)

where:

\[
d_h \quad \text{Additional depth of water on the undeflected roof above the inlet of secondary drainage system at its design flow (i.e., the hydraulic head), in inches (mm).}
\]

\[
d_s \quad \text{Depth of water on the undeflected roof up to the inlet of secondary drainage system when the primary drainage system is blocked (i.e., the static head), in inches (mm).}
\]

\[
R \quad \text{Rain load on the undeflected roof, in psf (kN/m^2). When the phrase “undeflected roof” is used, deflections from loads (including dead loads) shall not be considered when determining the amount of rain on the roof.}
\]

**1611.2 Ponding instability.** [For roofs with a slope less than \( \frac{1}{4} \) inch per foot \([1.19 \text{ degrees (0.0208 rad))})\], the design calculations shall include verification of adequate stiffness to preclude progressive deflection in accordance with Section 8.4 of ASCE 7. It is susceptible bays of roofs shall be evaluated for ponding instability in accordance with Section 8.4 ASCE 7.]

1251
1611.3 Controlled drainage. roofs equipped with hardware to control the rate of drainage shall be equipped with a secondary drainage system at a higher elevation that limits accumulation of water on the roof above that elevation. Such roofs shall be designed to sustain the load of rainwater that will accumulate on them to the elevation of the secondary drainage system plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow determined from Section 1611.1. Such roofs shall also be checked for ponding instability in accordance with Section 1611.2.

SECTION BC 1612

FLOOD LOADS

1612.1 General. The requirements for flood loads shall be as specified in Appendix G of this code. Buildings and other structures located in whole or in part in flood hazard areas shall meet the requirements of Section 5.3 of ASCE 7 and Appendix G of this code. The structural design shall be based on the design loads stated in Section 5.4 of ASCE 7, the load combinations of Section 1605, and Appendix G of this code.

1612.2 Reserved.

1612.3 Reserved.

1612.4 Reserved.

1612.5 Reserved.

SECTION BC 1613

EARTHQUAKE LOADS

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7, excluding Chapter 14 and Appendix 11A. The seismic design category for a structure shall be determined in accordance with either Section 1613 or ASCE 7.

Exceptions:

1. One- and two-family dwellings three stories or less in height.

2. The seismic force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.

3. Agricultural storage structures intended only for incidental human occupancy.

4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
1613.1.1 Seismic importance factor. The value for the seismic load importance factor, I, used in the calculation of E shall be determined in accordance with Table 1604.5.2 based on the Risk Category determined in accordance with Table 1604.5.

1613.2 Definitions. The following [words and terms shall, for the purposes of this section, have the meanings shown herein:] terms are defined in Chapter 2:

**DESIGN EARTHQUAKE GROUND MOTION.** [The earthquake ground motion that buildings and structures are specifically proportioned to resist in Section 1613.]

**MAXIMUM CONSIDERED EARTHQUAKE (MCE) GROUND MOTION.** [The most severe earthquake effects considered by this standard more specifically defined in the following two terms.]

**MAXIMUM CONSIDERED EARTHQUAKE GEOMETRIC MEAN (MCE\(_G\)) PEAK GROUND [ACCELERATIONS] ACCELERATION.** [The most severe earthquake effects considered by this standard determined for geometric mean peak ground acceleration and without adjustment for targeted risk. The MCE\(_G\) peak ground acceleration adjusted for site effects (PGA\(_M\)) is used in this standard for evaluation of liquefaction, lateral spreading, seismic settlements, and other soil-related issues. The PGA\(_M\) values adjusted for site effects are provided in Table 1813.2.1 or can be derived from the site-specific procedures provided in Section 21.5 of ASCE 7-10.]

**[RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE\(_R\)) GROUND MOTION RESPONSE ACCELERATIONS.** The most severe earthquake effects considered by this standard determined for the orientation that results in the largest maximum response for horizontal ground motions and with adjustment for targeted risk. The MCE\(_R\) Ground Motion values can be determined from general procedure in Section 1613.5.3 or can be derived from the site-specific procedures provided in Sections 21.1 and 21.2 of ASCE 7-10.]

**MECHANICAL SYSTEMS.** [For the purposes of determining seismic loads in ASCE 7-10, mechanical systems shall also include fire protection, plumbing and fuel gas systems as specified therein.]

**ORTHOGONAL.** [To be in two horizontal directions, at 90 degrees (1.57 rad) to each other.]

**RISK-TARGETED MAXIMUM CONSIDERED EARTHQUAKE (MCE\(_R\)) GROUND MOTION RESPONSE ACCELERATIONS.**

**SEISMIC DESIGN CATEGORY.** [A classification assigned to a structure based on its risk category and the severity of the design earthquake ground motion at the site.]

**[SEISMIC FORCE-RESISTING] SEISMIC FORCE-RESISTING SYSTEM.** [The part of the structural system that has been considered in the design to provide the required resistance to the prescribed seismic forces.]

**SITE CLASS.** [A classification assigned to a site based on the types of soils present and their engineering properties as defined in Section 1613.5.2.]

**SITE COEFFICIENTS.** [The values of, \(F_a\) and, \(F_v\), indicated in Tables 1613.5.3(1) and 1613.5.3(2), respectively,]
**Seismic ground motion values.** Seismic ground motion values shall be determined in accordance with this section.

**Mapped acceleration parameters.** The mapped maximum considered earthquake spectral response acceleration at short periods ($S_s$) shall be $0.281$ g and at [1-second] 1-s period ($S_1$) shall be $0.073$ g. The mapped long-period transition period ($T_L$) shall be $6.0$ seconds. Alternatively, electronic values of mapped acceleration parameters $S_s$ and $S_1$ and other seismic design parameters provided at the U.S. Geological Survey (USGS) website at https://doi.org/10.5066/F7NK3C76 may be used as per the guidelines of ASCE 7, Section 11.4.

**Site class definitions.** Based on the site soil properties, the site shall be classified as either Site Class A, B, C, D, E or F in accordance with Table 1613.5.2 Chapter 20 of ASCE 7, and this code. Where the soil properties are not known in sufficient detail to determine the site class, Site Class D shall be used unless the commissioner or geotechnical data determines that Site Class E or F soils are present at the site.

</tr>
</tbody>
</table>
Very high plasticity clays (H > 25 feet with plasticity index PI > 75)

3. Very high plasticity clays (H > 25 feet with plasticity index PI > 75)

4. Very thick soft/medium stiff clays (H > 120 feet)

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m², 1 pound per square foot = 0.0479 kPa. N/A = Not applicable

[1613.5.3] 1613.3.3 Site coefficients and [risk-targeted] adjusted maximum considered earthquake [(MCE)] spectral response acceleration parameters. The [(MCE)] maximum considered earthquake spectral response acceleration [parameters] for short periods, S_MS, and at 1-second period, S_M1, adjusted for site class effects shall be determined by Equations [16-47] 16-44 and [16-48] 16-45, respectively:

\[ S_{MS} = F_a S \]  \hspace{1cm} \text{[Equation 16-47]} \hspace{1cm} \text{[Equation 16-44]}

\[ S_{M1} = F_v S_1 \]  \hspace{1cm} \text{[Equation 16-48]} \hspace{1cm} \text{[Equation 16-45]}

where:

- \( F_a \) = Site coefficient defined in Table [1613.5.3(1)] 1613.3.3(1).
- \( F_v \) = Site coefficient defined in Table [1613.5.3(2)] 1613.3.3(2).
- \( S_S \) = The mapped MCER spectral accelerations for short periods as determined in Section [1613.5.1] 1613.3.1.

\( S_I \) = The mapped MCER spectral accelerations for a 1-s period as determined in Section [1613.5.4] 1613.3.1.

**Exception:** When electronic values of mapped acceleration parameters are used as per Section 1613.3.1 of this code, the site coefficients, \( F_a \) and \( F_v \), cannot be taken from Tables 1613.3.3(1) and 1613.3.3(2) of this code. Rather, general procedures in Chapter 11 of ASCE 7 shall be followed to determine \( F_a \) and \( F_v \).

### TABLE [1613.5.3(1)] 1613.3.3(1)

\(^a\) Site-specific geotechnical investigation and dynamic site response analyses shall be performed to determine appropriate values, except that for structures with periods of vibration equal or less than 0.5 second, values of \( F_a \) for liquefiable soils are permitted to be taken equal to the values for the site class determined without regard to liquefaction in Section [1613.5.5] 1613.3.4.1.
TABLE [1613.5.3(2)] 1613.3.3(2)
VALUES OF SITE COEFFICIENT $F_v$ AS A FUNCTION OF SITE CLASS AND MAPPED SPECTRAL RESPONSE ACCELERATION AT 1-SECOND PERIOD ($S_i$)\textsuperscript{a}

\textsuperscript{a} Site-specific geotechnical investigation and dynamic site response analyses shall be performed to determine appropriate values, except that for structures with periods of vibration equal or less than 0.5 second, values of $F_v$ for liquefiable soils are permitted to be taken equal to the values for the site class determined without regard to liquefaction in Section [1613.5.5] 1613.3.4.1.

[1613.5.4] 1613.3.4 Design spectral response acceleration parameters. Five-percent damped design spectral response acceleration at short periods, $S_{DS}$, and at [1-second] 1-s period, $S_{D1}$, shall be determined from [Equation 16-49] Equations 16-46 and [16-50] 16-47, respectively:

$$S_{DS} = \frac{2}{3} S_{MS} \tag{16-49}$$

$$S_{D1} = \frac{2}{3} S_{M1} \tag{16-50}$$

where $S_{MS}$ = The MCE\textsubscript{R} spectral response accelerations for short periods as determined in Section [1613.5.3] 1613.3.3.

where $S_{M1}$ = The MCE\textsubscript{R} spectral response accelerations for a 1-second period as determined in Section [1613.5.3] 1613.3.3.

\textsuperscript{1613.5.5} 1613.3.4.1 Site classification for seismic design. Site classification for Site Class C, D or E shall be determined from Table [1613.5.5] 1613.3.4.1. The notations presented below apply to only materials encountered above rock meeting Class 1a, 1b, or 1c as defined in Section [1804] 1803 or rock with shear wave velocity greater than 2,500 feet per second (762 meters per second) to a maximum depth of 100 feet (30 480 mm). Profiles containing distinctly different soil and rock layers shall be subdivided into those layers designated by a number that ranges from 1 to n at the bottom where there is a total of n distinct layers in the upper 100 feet (30 480 mm). The symbol i then refers to any one of the layers between 1 and n. For situations in which site investigations, performed in accordance with Chapter 20 of ASCE 7, reveal rock conditions consistent with Site Class B, but site-specific velocity measurements are not made, the site coefficients $F_a$, $F_v$, and $F_{PGA}$ shall be taken as unity (1.0).

where:

$v_{si}$= The shear wave velocity in feet per second (m/s).
d_i = The thickness of any layer between 0 and 100 feet (30 480 mm).

\[ \sum_{i=1}^{n} d_i = 100 \text{ feet (30 480 mm)} \]

where:

N_i is the Standard Penetration Resistance (ASTM D1586) not to exceed 100 blows/foot (328 blows/m) as directly measured in the field without corrections. When refusal is met for a rock layer of Class 1d, N_i shall be less than or equal to 100 blows/foot (328 blows/m) provided that the extent of the Class 1d material is confirmed by a boring to a depth where Class 1c or better rock is determined, not to exceed 100 feet (30 480 mm). Alternatively, if this boring is not performed, site classification should be based on all soil material that is above the Class 1d layer.

\[ \sum_{i=1}^{n} \bar{N}_i = \bar{N} \]

\[ \bar{N}_{ci} = \frac{d_i}{\sum_{i=1}^{m} \bar{N}_i} \]

where:

\[ \sum_{i=1}^{m} d_i = d_s \]

Use d_i and N_i for cohesionless soil layers only in Equation [16-42] 16-50.

\[ d_i = \text{The total thickness of cohesionless soil layers in the top 100 feet (30 480 mm).} \]

\[ m = \text{The number of cohesionless soil layers in the top 100 feet (30 480 mm).} \]

\[ S_{ui} = \text{The undrained shear strength in psf (kPa), not to exceed 5,000 psf (240 kPa), ASTM D 2166 or ASTM D 2850.} \]

\[ S_{u} = \frac{d_c}{\sum_{i=1}^{k} d_i} \]

where:
\[ \sum_{i=1}^{k} dt = d_c \]

de = The total thickness (100-ds) (For SI: 30 480-ds) of cohesive soil layers in the top 100 feet (30 480 mm).
k = The number of cohesive soil layers in the top 100 feet (30 480 mm).
PI = The plasticity index, ASTM D 4318.
w = The moisture content in percent, ASTM D 2216.

Where a site does not qualify under the criteria for Site Class F and there is a total thickness of soft clay greater than 10 feet (3048 mm) where a soft clay layer is defined by \( s_u < 500 \text{ psf} \) (24 kPa), \( w \geq 40 \) percent, and \( PI > 20 \), it shall be classified as Site Class E. The shear wave velocity for rock, Site Class B, shall be either measured on site or estimated by a geotechnical engineer or engineering geologist/seismologist for competent rock with moderate fracturing and weathering. Softer and more highly fractured and weathered rock shall either be measured on site for shear wave velocity or classified as Site Class C. The hard rock category, Site Class A, shall be supported by shear wave velocity measurements either on site or on profiles of the same rock type in the same formation with an equal or greater degree of weathering and fracturing. Where hard rock conditions are known to be continuous to a depth of 100 feet (30 480 mm), surficial shear wave velocity measurements are permitted to be extrapolated to assess \( v_s \). The rock categories, Site Classes A and B, shall not be used if there is more than 10 feet (3048 mm) of soil between the rock surface and the bottom of the spread footing or mat foundation.

</tbody>
</table>

For SI: 1 foot per second = 304.8 mm per second, 1 pound per square foot = 0.0479 kN/m².
a. If the \( s_u \) method is used and the \( N_s \) and \( s_u \) criteria differ, select the category with the softer soils (for example, use Site Class E instead of D).

[1613.5.5.1] 1613.3.4.1.1 Steps for classifying a site. The following steps shall be performed during the classification of a site:

1. Check for the four categories of Site Class F requiring site-specific evaluation. If the site corresponds to any of these categories, classify the site as Site Class F and conduct a site-specific evaluation according to ASCE 7[-40] and the requirements of Section [4843] 1815.

2. Check for the existence of a total thickness of soft clay > 10 feet (3048 mm) where a soft clay layer is defined by: \( s_u < 500 \text{ psf} \) (24 kPa), \( w \geq 40 \) percent and \( PI > 20 \). If these criteria are satisfied, classify the site as Site Class E.

3. Categorize the site using one of the following three methods with \( v_s \), \( N_s \), and \( s_u \) and computed in all cases as specified.
3.1. \( v_s \) for the top 100 feet (30 480 mm) (\( v_s \) method).

3.2. \( N \) for the top 100 feet (30 480 mm) (N method).

3.3. \( N_{ch} \) for cohesionless soil layers (PI < 20) in the top 100 feet (30 480 mm) and average, \( s_u \), for cohesive soil layers (PI > 20) in the top 100 feet (30 480 mm) (\( s_u \) method).

**[1613.5.6] 1613.3.5 Determination of seismic design category.** All structures shall be assigned a seismic design category based on their risk category [determined in accordance with Table 1604.5] and the design spectral response acceleration parameters, \( S_{DS} \) and \( S_{D1} \), determined in accordance with Section [1613.5.4] 1613.3.4 of this code or the site-specific procedures of ASCE 7 [40]. Each building and structure shall be assigned to the more severe seismic design category in accordance with Table [1613.5.6(1) or 1613.5.6(2)] 1613.3.5 of this code, irrespective of the fundamental period of vibration of the structure, \( T \).

**Exception:** When electronic values of mapped acceleration parameters are used as per Section 1613.3.1, the seismic design category for Risk Category IV structures shall not differ from the values in Table 1613.3.5.

[1613.5.6.1] 1613.3.5.1 Alternative seismic design category determination. The seismic design category is permitted to be determined from Table [1613.5.6(1)] 11.6-1 of ASCE 7 alone, except for Risk Category IV structures for which Table 1613.3.5 of this code shall be used, when all of the following apply:

1. In each of the two orthogonal directions, the approximate fundamental period of the structure, $T_a$, [as] in each of the two orthogonal directions determined in accordance with Section 12.8.2.1 of ASCE 7-10, is less than 0.8 $T_s$, [as] determined in accordance with Section 11.4.5 11.4.6 of ASCE 7-10.

2. In each of the two orthogonal directions, the fundamental period of the structure used to calculate the story drift is less than $T_s$.

3. Equation 12.8-2 of ASCE 7-10 is used to determine the seismic response coefficient, $C_s$.

4. The diaphragms are rigid[7] or are permitted to be idealized as [defined] rigid in accordance with Section 12.3.1 of ASCE 7-10 or, for diaphragms [that are] permitted to be idealized as flexible in accordance with Section 12.3.1 of ASCE 7, the distances between [the] vertical elements of the [seismic-force-resisting] seismic force-resisting system do not exceed 40 feet (12 192 mm).

[1613.5.6.2] 1613.3.5.2 Simplified design procedure. Where the alternate simplified design procedure of ASCE 7-10 is used, the seismic design category shall be determined in accordance with ASCE 7-10.

[1613.6 Alternatives to ASCE 7-10. The provisions of Section 1613.6 shall be permitted as alternatives to the relevant provisions of ASCE 7-10.]

[1613.6.1 Additional seismic-force-resisting systems for seismically isolated structures. Add the following exception to the end of Section 17.5.4.2 of ASCE 7-10:]

[Exception: For isolated structures designed in accordance with this standard, the Structural System Limitations and the Structural Height Limits in Table 1613.8 for ordinary steel...]

1260
concentrically braced frames (OCBFs) as defined in Chapter 11 of ASCE 7-10 and ordinary moment frames (OMFs) as defined in Chapter 11 of ASCE 7-10 are permitted to be taken as 160 feet (48 768 mm) for structures assigned to Seismic Design Category D, provided that the following conditions are satisfied:

1. The value of \( R_1 \) as defined in Chapter 17 of ASCE 7-10 is taken as 1.

2. For OMFs and OCBFs, design is in accordance with AISC 341.]

[1613.7] 1613.4 Structural separations. All structures shall be separated from adjacent structures. When a structure adjoins a property line not common to a public way (typically side or rear lot lines), that structure shall also be set back from the property line by at least 1 inch ([25] 25.4 mm) for each 50 feet (15 240 mm) of height and a minimum of 1 inch ([25] 25.4 mm) for structures with heights less than 50 feet (15 240 mm). For structures in Seismic Design Category D, refer to ASCE 7-10 for additional requirements.

Exception: Smaller separations or property line setbacks shall be permitted when justified by rational analysis based on maximum expected ground motions with a minimum separation of 1 inch ([25] 25.4 mm) along the full height of the structure.

[1613.7.1] 1613.4.1 Masonry structures. For structures adjacent to existing unreinforced masonry bearing wall structures, the structural separation shall be filled with a material with a minimum compressive strength of 25 psi (172.37 kPa) and a maximum compressive strength of 100 psi (689.74 kPa). Additionally, when the adjacent wall is a party wall, the party wall shall be made secure by the party responsible for the new construction as per Chapter 33.

[1613.7.2] 1613.4.2 Covers. The infill material shall be covered on all sides and shall meet the appropriate provisions of Chapter 26. The covering must be of adequate strength to resist the wind loads for cladding as specified in Chapter 16 and shall conform to all applicable provisions in Chapter 14.

[1613.7.3] 1613.4.3 Covers wider than 5 inches (127 mm). When a building separation wider than 5 inches (127 mm) is created pursuant to Section [1613.7] 1613.4, such separation, at the roof level of the proposed new building, or at the roof level of an existing adjoining building where if that building is lower than the proposed new building, shall have a horizontal cover/closure that conforms with the following:

1. The cover/closure material shall be noncombustible; and

Exception: The cover/closure material used shall be permitted to be combustible material in accordance with Section [1509.9] 1510.9 if all the material on the appropriate roof conforms to the limitations therein, there are no masonry openings in either wall abutting the building separation, and both buildings are noncombustible.
2. The cover/closure shall be capable of withstanding the roof live load of 30 psf (1.43 kPa), securely fastened to the new building, and be of a type that would be capable of preventing unauthorized or accidental access to the space.

[1613.8] \textbf{1613.5 ASCE 7[-10], Table 12.2-1}. Modify ASCE 7[-10], Table 12.2-1 as follows:

**1613.6 Ballasted photovoltaic panel systems.** Ballasted, roof-mounted photovoltaic panel systems need not be rigidly attached to the roof or supporting structure. Ballasted non-penetrating systems shall be designed and installed only on roofs with slopes not more than one unit vertical in 12 units horizontal. Ballasted non-penetrating systems shall be designed to resist sliding and uplift resulting from lateral and vertical forces as required by Section 1605 of this code, using a coefficient of friction.
determined by acceptable engineering principles. In structures assigned to Seismic Design Category C or D, ballasted nonpenetrating systems shall be designed to accommodate seismic displacement determined by nonlinear response-history analysis or shake-table testing, using input motions consistent with ASCE 7 lateral and vertical seismic forces for nonstructural components on roofs.

SECTION BC 1614
ATMOSPHERIC ICE LOADS

1614.1 General. Ice-sensitive structures shall be designed for atmospheric ice loads in accordance with Chapter 10 of ASCE 7.

SECTION BC 1615
STRUCTURAL INTEGRITY DEFINITIONS

1615.1 Definitions. The following terms are defined in Chapter 2:

ALTERNATE LOAD PATH. [A secondary or redundant load path capable of transferring the load from one structural element to other structural elements.]

ALTERNATE LOAD PATH METHOD. [A design approach that accounts for an extreme event by providing alternate load paths for elements that are no longer able to carry load. In an alternate load path design, key elements are considered notionally removed, one at a time, and the structure is designed to transfer the loads from the removed element to other structural elements, as required by Section 1616.]

ASPECT RATIO. [The height of any portion of a building divided by its least dimension at the elevation from which the height is being measured.]

COLLAPSE (STRUCTURAL). [Failure of a structural element to the extent that it can no longer support any load.]

ELEMENT (STRUCTURAL). [A structural member or structural assembly.]

KEY ELEMENT. [An element of the structural system, including its connections, that meets one or more of the following criteria:]

[1. An element which when lost, results in more than local collapse.]

[2. An element that braces a key element, the failure of which results in failure of the key element (further secondary elements need not be considered key elements).]

[3. An element whose tributary area exceeds 3,000 square feet (279 square meters) on a single level.]

LOCAL COLLAPSE. [Failure of a structural element that results in the collapse of areas being directly supported by that element and not extending vertically more than three stories.]
RESPONSE RATIO. [The ratio of an ultimate response quantity (e.g., deflection) to its value at yield.]

ROTATION. [The angle, measured at the ends of a member, whose tangent is equal to the deflection of the member at midspan divided by half the length of the member.]

SPECIFIC LOCAL LOAD. [A load applied to a structural element or structural system as specified in Section 1616.7.]

SPECIFIC LOCAL RESISTANCE METHOD. [A design approach that accounts for extreme event loads by providing sufficient strength for elements that may fail. In a specific local resistance design, key elements are designed for specific local loads as required by Section 1616.]

SECTION BC 1616  STRUCTURAL INTEGRITY—PRESCRIPTIVE REQUIREMENTS

1615.1 Scope. The intent of these provisions is to enhance structural performance under extreme event scenarios by providing additional overall system redundancy and local robustness. All structures shall be designed to satisfy the prescriptive requirements of this section.

Exception: Structures in Risk Category I of Table 1604.5 and structures in Occupancy Group R-3 are exempt from the requirements of Sections 1614 through 1617.

1615.2 Continuity and ties. All structural elements shall have a minimum degree of continuity and shall be tied together horizontally and vertically as specified in Chapters 19, 21, and 22 for concrete, masonry and steel, respectively.

1615.3 Lateral bracing. Floor and roof diaphragms or other horizontal elements shall be tied to the lateral load-resisting system.

1615.4 Reserved.

1615.5 Vehicular impact. Structural columns that are directly exposed to vehicular traffic shall be designed for vehicular impact. Structural columns that are adequately protected by bollards, guard walls, vehicle arrest devices or other elements do not need to be designed for vehicular impact. The load combinations for vehicular impact shall be as specified in Section 1605.6.

Specific loads for vehicular impact shall be as follows:

1. Exterior corner columns shall be designed for a concentrated load of 40 kips applied horizontally in any direction from which a vehicle can approach at a height of either 18 inches (457.2 mm) or 36 inches (914.4 mm) above the finished driving surface, whichever creates the worst effect.

2. All other exterior columns exposed to vehicular traffic, and columns within loading docks, and columns in parking garages along the driving lane shall be designed for a
concentrated load of 20 kips applied horizontally in any direction from which a vehicle can approach at a height of either 18 inches (457.2 mm) or 36 inches (914.4 mm) above the finished driving surface, whichever creates the worst effect.

[1615.6] **1616.5 Gas explosions.** In buildings with gas piping operating at pressures in excess of 15 psig (193.4 kPa gauge), all key elements and their connections within 15 feet (4572 mm) of such piping shall be designed to resist a potential gas explosion. The structure shall be designed to account for the potential loss of the affected key elements one at a time by the alternate load path [Alternative Load Path] method. Load combinations for the alternate load path [Alternative Load Path] shall be as specified in Section [1605.5] 1605.4. In lieu of the alternate load path [Alternative Load Path] method, the affected key elements shall be designed to withstand a load of 430 psf (20.6 kPa) applied using the load combinations specified in Section [1605.6] 1605.5. The load shall be applied along the entire length of the element, and shall be applied in the manner and direction that produces the most damaging effect.

Exceptions:

1. If a structural enclosure designed to resist the specified pressure is provided around the high-pressure gas piping, only the key elements within the structural enclosure need to comply with this section.

2. A reduced pressure for gas explosions can be used based on an engineering analysis approved by the commissioner.

[1615.6.1] **1616.5.1 Explosion prevention and deflagration venting.** The structural design and installation of explosion prevention systems and deflagration venting shall be in accordance with the requirements of Appendices E and G of the *New York City Fuel Gas Code*, as well as the *New York City Fire Code*, and the rules and regulations of the department.

**SECTION BC [1616] 1617 STRUCTURAL INTEGRITY—KEY ELEMENT ANALYSIS**

[1616.1] **1617.1 Scope.** A key element analysis shall be performed for the following buildings:

1. Buildings included in [Structural Occupancy] Risk Category IV as defined in this chapter.

2. Buildings with the aspect ratios of seven or greater.

3. Buildings greater than 600 feet ([182.9 m]) in height or more than 1,000,000 square feet (92 903 m²) in gross floor area.

4. Buildings taller than seven stories where any element, except for walls greater than 10 feet ([3.048 m]) in length, supports in aggregate more than 15 percent of the building area.
5. Buildings designed for areas with 3,000 or more occupants in one area in close proximity, including fixed seating and grandstand areas.

6. When specifically ordered by the commissioner.

[1616.2] 1617.2 Load combinations. Where specifically required by Section [1616.4] 1617.1, elements and components shall be designed to resist the forces calculated using the combination specified in Section [1605.5] 1605.4 or [1605.7] 1605.6 as applicable.

[1616.3 Reserved.]

[1616.4] 1617.3 Seismic and wind. When the code-prescribed seismic or wind design produces greater effects, the seismic or wind design shall govern, but the detailing requirements and limitations prescribed in this and referenced sections shall also be followed.

[1616.5] 1617.4 Joints. Where a structure is divided by joints that allow for movement, each portion of the structure between joints shall be considered as a separate structure.

[1616.6] 1617.5 Key element analysis. Where key elements are present in a structure, the structure shall be designed to account for their potential loss one at a time by the alternate load path method or by the specific local resistance method as specified in Section [1616.7] 1617.6.

[1616.7] 1617.6 The specific local resistance method. Where the specific local resistance method is used, key elements shall be designed using specific local loads as follows:

1. Each compression element shall be designed for a concentrated load equal to 2 percent of its axial load but not less than 15 kips, applied at midspan in any direction, perpendicular to its longitudinal axis. This load shall be applied in combination with the full dead load and 50 percent of the live load in the compression element.

2. Each bending element shall be designed for the combination of the principal acting moments plus an additional moment, equal to 10 percent of the principal acting moment applied in the perpendicular plane.

3. Connections of each tension element shall be designed to develop the smaller of the ultimate tension capacity of the member or three times the force in the member.

4. All structural elements shall be designed for a reversal of load. The reversed load shall be equal to 10 percent of the design load used in sizing the member.

[1616.8] 1617.7 Design criteria. Alternate load path method and/or specific local resistance method for key elements shall conform to the appropriate design criteria as determined from Sections [1616.9, 1616.10 and] 1617.8 through [1616.11] 1617.10. [Load combinations for the alternate load path method shall be as specified in Section 1605.5.]

[1616.9] 1617.8 Analysis procedures. All structural analysis for specific local loads or alternate load paths shall be made by one of the following methods:
1616.1 Static elastic analysis. For analysis of this type, dynamic effects of member loss or dynamic effects of specific local loads need not be considered. The structural demand is obtained from linear static analysis. However, structural member capacity is based on ultimate capacity of the entire cross section. The demand/capacity ratio of structural elements shall not exceed one.

1616.2 Dynamic inelastic analysis. For analysis of this type, dynamic effects of member loss or specific local loads shall be considered. The structure does not need to remain elastic; however, the response ratio and rotation limits obtained from Table 1616.3 shall not be exceeded.

1617.8.3 Energy methods. Static inelastic analysis using energy equilibrium may also be used. The structure does not need to remain elastic; however, the response ratio and rotation limits obtained from Table 1616.3 shall not be exceeded.

</table>

For SI: 1 degree = 0.01745 rad.

Note: Table 1616.3 is intended for SDOF and simplified MDOF response calculations and a low level of protection. Table 1616.3 does not apply for explicit finite element methods that calculate the performance of the structural elements in response to the specified loading intensity. Steel joists: downward loading 6 degrees, upward loading ductility of 2.

1617.9 Minimum response. Structural response of elements determined using a dynamic inelastic analysis shall not be less than 80 percent of the structural response determined using a static elastic analysis.

1617.10 Strength reduction factors. For structural design for specific local loads or alternate load paths, all strength reduction factors may be multiplied by 1.1.

BC 1618

STRUCTURAL PEER REVIEW

1618.1 General. The provisions of this section specify where structural peer review is required, how and by whom it is to be performed.
Where required. A structural peer review of the primary structure shall be performed and a report provided for the following buildings:

1. Buildings included in [Structural Occupancy] Risk Category IV as defined in this chapter and more than 50,000 square feet (4645 m²) of framed area.

2. Buildings with aspect ratios of seven or greater.

3. Buildings greater than 600 feet (183 m) in height or more than 1,000,000 square feet (92 903 m²) in gross floor area. Rooftop structures may be excluded from building height in accordance with Section 504.3.

4. Buildings taller than seven stories where any element, except for walls greater than 10 feet (3.048 meters) in length, supports in aggregate more than 15 percent of the building area.

5. Buildings designed using nonlinear time history analysis or with special seismic energy dissipation systems.

6. Buildings designed for areas with 3,000 or more occupants in one area in close proximity, including fixed seating and grandstand areas.

7. Buildings where a structural peer review is requested by the commissioner.

Structural peer review. It shall be verified that the structural design is in general conformance with the requirements of this code.

Geotechnical peer review. Geotechnical peer reviews are required to be performed in accordance with Section d.

Structural peer reviewer. The structural peer review shall be performed by a qualified independent structural engineer who has been retained by or on behalf of the owner. A structural peer reviewer shall meet the requirements of the rules of the department.

Independence. In order to satisfy the requirement that the peer reviewer be independent, the department requires that the peer reviewer must not engage in any activities that may conflict with their objective judgment and integrity, including but not limited to having a financial and/or other interest in the design, construction, installation, manufacture or maintenance of structures or components that they are reviewing.

Extent of the structural peer review. The structural peer review shall comply with Sections 1618.6.1 and 1618.6.2.

Scope. The structural peer reviewer shall review the plans and specifications submitted with the permit application for general compliance with the structural and foundation
design provisions of this code. The reviewing engineer shall perform the following tasks at a minimum:

1. Confirm that the design loads conform to this code.

2. Confirm that other structural design criteria and design assumptions conform to this code and are in accordance with generally accepted engineering practice.

3. Review geotechnical and other engineering investigations that are related to the foundation and structural design and confirm that the design properly incorporates the results and recommendations of the investigations.

4. Review the structural frame and the load supporting parts of floors, roofs, walls, shallow foundation elements, deep foundation caps, connection of deep foundation elements to deep foundation caps, and permanent rock or soil anchor connection to the structural elements. Cladding, cladding framing, stairs, equipment supports, ceiling supports, non-loadbearing partitions, railings and guards, and other secondary structural items shall be excluded.

5. Confirm that the structure has a complete load path.

6. Perform independent calculations for a representative fraction of systems, members, and details to check their adequacy. The number of representative systems, members, and details verified shall be sufficient to form a basis for the reviewer’s conclusions.

7. Verify that performance-specified structural components (such as certain precast concrete elements) have been appropriately specified and coordinated with the primary building structure.

8. Verify that the design engineer of record complied with the structural integrity provisions of the code.

9. Review the structural and architectural plans for the building. Confirm that the structural plans are in general conformance with the architectural plans regarding loads and other conditions that may affect the structural design.

10. Confirm that major mechanical items are accommodated in the structural plans.

11. Attest to the general completeness of the structural plans and specifications.

12. Review performance based design.

[1617.5.2] 1618.6.2 Structural design criteria. If the design criteria and design assumptions are not shown on the drawings or in the computations, the structural engineer of record shall provide a statement of these criteria and assumptions for the reviewer. In addition, the design engineer shall provide information and/or calculations, if requested by the peer reviewer.

[1617.6] 1618.7 Structural peer review report. The structural peer review report shall comply with Sections 1618.7.1 through 1618.7.3.
[1617.6.1] 1618.7.1 General. The reviewing engineer shall submit a report to the department stating whether or not the structural design shown on the plans and specifications generally conforms to the structural and foundation requirements of this code.

[1617.6.2] 1618.7.2 Contents. The report shall demonstrate, at a minimum, compliance with Items 1 through 12 of Section [1617.5.1] 1618.6.1. In addition, the report shall also include the following:

1. A list of construction documents, including the latest revision dates submitted to the department for approval, as well as geotechnical reports, wind tunnel studies and other reports utilized in the design.

2. The codes and standards used in the structural design of the project.

[2] 3. The structural design criteria, including loads and performance requirements.

[3] 4. The basis for design criteria that are not specified directly in applicable codes and standards. This should include reports by specialty consultants such as wind tunnel study reports and geotechnical reports. Generally, the report should confirm that existing conditions at the site have been investigated as appropriate and that the design of the proposed structure is in general conformance with these conditions.

5. The basis of performance-based design and its appropriateness of use.

6. A statement that the qualification and independence of the peer reviewer is in accordance with Section 1618.5.

7. Peer review reports shall provide an unconditional statement that must be either an acceptance or rejection of code compliance of the structural design required to be reviewed by this section.

8. The structural peer review reports shall contain a statement that geotechnical peer review reports and/or wind tunnel peer review reports, when required, have been received with an unconditional statement of acceptance by the authors of those reports.

[1617.6.3] 1618.7.3 Phased submission. If an application is submitted for a permit for the construction of foundations or any other part of a building before the construction documents for the whole building have been submitted, then the structural peer review and report shall be phased. The structural peer reviewer shall be provided with sufficient information on which to make a structural peer review of the phased submission. In addition to the requirements of this section, phased submission of the report shall include any changes made to the initial structural peer review evaluation. The geotechnical peer review report need not be submitted concurrently with the structural peer review report.

[1617.7] 1618.8 Responsibility. The responsibilities of the engineer of record and peer reviewer shall be as laid out in Sections 1618.8.1 through 1618.8.4.
1618.8.1 Structural engineer of record. The structural engineer of record shall retain sole responsibility for the structural design. The activities and reports of the structural peer reviewer shall not relieve the structural engineer of record of this responsibility.

1618.8.2 Structural peer reviewer. The structural peer reviewer’s report states his or her opinion regarding the design by the engineer of record. The standard of care to which the structural peer reviewer shall be held in the performance of the structural peer review and report is that level of skill and care are consistent with structural peer review services performed by professional engineers licensed in the State of New York for similar type projects. The structural peer reviewer shall not be responsible for the conclusions of the wind and geotechnical peer review reports.

1618.8.3 Revisions of design. The structural engineer of record shall identify that a new review is required based upon changes to the design documents relevant to the scope of the peer review. The structural peer reviewer shall review the items that have been affected and shall revise the structural peer review report.

1618.8.4 Disputes. When a dispute arises between the applicant of record and the peer reviewer regarding compliance with Section 1618 that cannot be resolved by these parties, such dispute shall be reported to the department in the form of a letter from the applicant of record. The department may make a final decision or may accept a change of the peer reviewer.

1618.9 Change to peer reviewer. The peer reviewer cannot be changed without the express consent of the department. The current peer reviewer must submit both a written letter to the borough commissioner detailing the reason for the withdrawal request and a report of the structural peer review findings to date. If a change of peer reviewer is approved, a revised submission indicating the replacement peer reviewer shall be filed with the department.

SECTION [1618] 1619
[LOADS ON] TEMPORARY STRUCTURES AND TEMPORARY CONSTRUCTION INSTALLATIONS

1618.1 General. Installations governed by this code shall be defined as temporary when such installations are intended to be taken apart or removed after a limited period following their installation, including, but not limited to, tents, scaffolds, sidewalk sheds, cranes, and run back structures. Temporary installations shall comply with all the provisions of this code, except as described in Sections 1618.1.1 through 1618.3.2.

1618.1.1 Duration. Such limited period shall not exceed one year for temporary installations used in construction operations covered by Chapter 33. For temporary installations covered by Section 3103, the limited period shall not exceed ninety days. The limited period shall be counted from the date the temporary installation is substantially installed.

1618.1.1.1 Extension of time. Subject to the approval of the commissioner, a request to extend the time for a temporary installation, subject to the limits in Section 1618.1.1, shall be accompanied by the submission of a report from a registered design professional that certifies the following:
[1. Such registered design professional performed an inspection within the last 30 days to confirm that the installation complies with the requirements of the approved construction documents for the temporary installation; and]

[2. The action plan required by Section 1618.3:]

[2.1. Is still in effect;]

[2.2. Has been revised to reflect the current conditions of the installation; or]

[2.3. Is no longer required, as the installation has been retrofitted to comply with the loads for new construction without any reduction, pursuant to Section 1618.2.]

[1618.1.2 Construction documents. Any temporary installation utilizing the exemptions and load reductions in the structural design shall be prominently indicated on drawings as temporary, and all reduced loads shall be indicated on the drawings. The environmental load mitigations shall be indicated on the construction documents. The construction documents shall be maintained at the site of the temporary installation and be available to the department upon request.]

[1618.2 Loads. Temporary installations shall be designed and constructed to resist the loads required by Chapter 16 of this code for new construction.]

[Exception: Temporary installations that are accompanied by an action plan in accordance with Section 1618.3 shall be permitted to reduce the design environmental loads required by Chapter 16 of this code as follows:]

[1. Seismic. Temporary installations shall be permitted to use 2 percent of the design dead and live load in lieu of the seismic forces required by Section 1614 in load combinations including seismic forces. This load shall be distributed in proportion to the design loads, shall be applied in any horizontal direction and need not be combined with other environmental loads.]

[2. Wind. The wind design for temporary installations shall be computed as required by Section 1609. The basic wind speed used to design the structure shall be permitted to be reduced by applying a factor of 0.8.]

[3. Other environmental forces. Other environmental forces, including, but not limited to, snow, flood ice, and temperature differential effects, shall be permitted to be reduced as appropriate for the limited exposure of the installation.]

[1618.3 Action plan. All temporary installations reducing the design environmental loads in accordance with Section 1618.2 shall include environmental load mitigation measures as part of an action plan. The action plan measures shall be indicated on the drawings.]

[1618.3.1 Implementation. The action plan shall be such that it may be reliably implemented in one day’s notice or less as appropriate for the actions.]

[1618.3.2 Components. The action plan shall, at a minimum, include the following:]

1276
1619.1 General. Temporary construction installations that are required by this code to be designed by a registered design professional, and all temporary structures, shall comply with all the provisions of this code, except as described in Sections 1619.3 and 1619.4.

1619.2 Definitions. The following terms are defined in Chapter 2:

TEMPORARY CONSTRUCTION INSTALLATIONS.

TEMPORARY STRUCTURES.

1619.3 Temporary construction installations. Temporary construction installations shall be subject to the requirements of this section and Chapter 33.

1619.3.1 Design drawings for temporary construction installations. Design loads, including location and intensity of live loads, shall be indicated on the design drawings for temporary construction installations. Drawings for multilevel temporary construction installations shall indicate the maximum number of levels to be loaded simultaneously and the maximum design loads. Any temporary construction installation utilizing authorized exemptions and load reductions in the structural design shall be indicated on drawings as temporary, and all reduced loads shall be indicated on the drawings. The environmental load mitigations shall be indicated on the design drawings. The design drawings shall be maintained at the site of the temporary construction installation and be made available to the department upon request.

1619.3.2 Loads for temporary construction installations. Temporary construction installations shall be designed and constructed to resist the loads and load combinations required by this chapter for permanent construction and Chapter 33 of the building code. Live loads shall not be less than the code prescribed value or the maximum loads for the use of a temporary construction installation as noted on the design drawings.
Exceptions:

1. Load reductions may be utilized where permitted by Section 1619.3.3.

2. Derricks not permanently mounted to a building shall not be subject to the loads and load combinations of this chapter. Such derricks shall instead be subject to the requirements of Section 3319 and rules promulgated by the commissioner. However, temporary construction installations used to support such derricks shall be subject to the loads and load combinations of this chapter.

3. Mobile cranes shall not be subject to the loads and load combinations of this chapter. Mobile cranes shall instead be subject to the requirements of Section 3319 and rules promulgated by the commissioner. However, temporary construction installations used to support mobile cranes shall be subject to the loads and load combinations of this chapter.

1619.3.3 Load reductions for temporary construction installations. Temporary construction installations shall be permitted to reduce the design environmental loads required by this chapter in accordance with the specifications below. An action plan for load reductions shall be required in accordance with Section 1619.5.

1. Seismic resistance. Temporary construction installations do not need to consider seismic design. These installations, other than supports of excavation, shall be designed for a minimum of 2 percent of the dead and live load as a service level lateral force. This load shall be used in lieu of seismic forces required by Section 1613 in load combinations including seismic forces. This load shall be distributed in proportion to the design loads, applied in any horizontal direction, and need not be combined with other environmental loads.

2. Wind. The wind design for temporary construction installations shall be computed as required by Section 1609. The basic wind speed used to design the temporary construction installation shall be permitted to be reduced by applying a factor of 0.8.

Exceptions: The following are exceptions to item 2 concerning load reductions for wind design:

1. Mast climbers shall not be permitted to reduce wind loads.

2. Suspended scaffolds shall be designed for an out of service wind speed of at least 45 mph (72.4 kph), or a lower speed when so specified by the scaffold manufacturer.

3. Other environmental forces. Other environmental forces, including but not limited to snow, flood, ice, and temperature differential effects, shall be permitted to be reduced as appropriate for the limited seasonal exposure of the temporary construction installation.

1619.3.4 Permit renewal for temporary construction installations that utilize an action plan. Where a temporary construction installation requires an action plan in accordance with Section
1619.5, the application to renew the permit for such temporary construction installation shall be accompanied by the submission of a report from a registered design professional certifying, based on an inspection of the temporary construction installation performed by the registered design professional within 30 days prior to the submittal of the permit renewal application, that the action plan:

1. Is still in effect;

2. Has been revised to reflect the current conditions of the temporary structure; or

3. Is no longer required, as the temporary structure has been retrofitted to comply with the loads for new construction without any reduction, pursuant to Section 1619.3.2.

1619.4 Temporary structures. Temporary structures shall be subject to the requirements of Section 3103.1 and this section.

1619.4.1 Design drawings for temporary structures. Design loads, including location and intensity of live loads, shall be indicated on the design drawings for temporary structures. Drawings for multilevel temporary structures shall indicate the maximum number of levels to be loaded simultaneously and the maximum design loads. Any temporary structure utilizing authorized exemptions and load reductions in the structural design shall be indicated on drawings as temporary, and all reduced loads shall be indicated on the drawings. The environmental load mitigations shall be indicated on the design drawings. The design drawings shall be maintained at the site of the temporary structure and be made available to the department upon request.

1619.4.2 Loads for temporary structures. Temporary structures shall be designed and constructed to resist the loads and load combinations required by this chapter. Live loads shall not be less than the code prescribed value or the maximum loads for the use of a temporary structure as noted on the design drawings.

   Exception: Load reductions may be utilized where permitted by Section 1619.4.3.

1619.4.3 Load reductions for temporary structures. Temporary structures shall be permitted to reduce the design environmental loads required by this chapter in accordance with the specifications below. An action plan for load reductions shall be required in accordance with Section 1619.5.

   1. Seismic resistance. Temporary structures do not need to consider seismic design. Temporary structures shall be designed for a minimum of 2 percent of the dead and live load as a service level lateral force. This load shall be used in lieu of seismic forces required by Section 1613 in load combinations including seismic forces. This load shall be distributed in proportion to the design loads, applied in any horizontal direction, and need not be combined with other environmental loads.

   2. Wind. The wind design for temporary structures shall be computed as required by Section 1609. The basic wind speed used to design the structure shall be permitted to be reduced by applying a factor of 0.8.
**Exception:** In lieu of applying a factor of 0.8, temporary structures may be removed from service at the environmental conditions determined by the manufacturer of the temporary structure. The threshold for removal of service shall be indicated on the design drawings required by Section 1619.4.1 as well as the action plan required by Section 1619.5.

3. Other environmental forces. Other environmental forces, including but not limited to snow, flood, ice, and temperature differential effects, shall be permitted to be reduced as appropriate for the limited seasonal exposure of the temporary structure.

1619.4.4 Duration of time for temporary structures. Temporary structures shall be erected for a limited period not exceeding ninety days in accordance with Article 111 of Title 28 of the Administrative Code. Such limited period shall be counted from the date the temporary structure is substantially completed.

**Exception:** Where the commissioner has approved a request to extend the duration of time for a temporary structure in accordance with Section 1619.4.5.

1619.4.5 Extension of time for temporary structures. Subject to the approval of the commissioner, the duration of time for a temporary structure may be extended by increments not to exceed ninety days. Each request to extend the time for a temporary structure shall be accompanied by the submission of a report from a registered design professional certifying the following:

1. Such registered design professional performed an inspection within the last 30 days to confirm that the temporary structure complies with the requirements of the approved construction documents for the temporary structure; and

2. Where an action plan is utilized in accordance with Section 1619.5:

   2.1. It is still in effect;

   2.2. It has been revised to reflect the current conditions of the temporary structure; or

   2.3. It is no longer required, as the temporary structure has been retrofitted to comply with the loads for new construction without any reduction, pursuant to Section 1619.4.2.

1619.5 Action plan. All temporary structures or temporary construction installations with reduced design environmental loads in accordance with Sections 1619.3.3 or 1619.4.3 shall include environmental load mitigation measures as part of an action plan to protect the public. The action plan measures shall be indicated on the design drawings required by Sections 1619.3.1 or 1619.4.1.

**Exception:** An action plan is not required for:

1. Derricks not permanently mounted to a building. Derricks not permanently mounted to a building shall be secured in accordance with a wind action plan as specified in rules promulgated by the commissioner.
2. Mobile cranes. Mobile cranes shall be secured in accordance with a wind action plan as specified in rules promulgated by the commissioner.

3. A suspended scaffold. Suspended scaffolds shall be secured in accordance with the requirements of Section 3314; requirements for securing suspended scaffolds shall be indicated on design drawings when required by Section 3314.

1619.5.1 Implementation. The action plan shall be such that it can be reliably implemented within one day of notice or less as appropriate for the actions.

1619.5.2 Components. The action plan shall, at a minimum, include the following:

1. Threshold of predicted environmental loads;
2. Method of monitoring environmental loads;
3. Name of party responsible for monitoring loads and determining implementation of action plan;
4. Name of party responsible for implementing the action plan;
5. Evacuation procedures;
6. Safety zone, standoff distance or standoff perimeter as appropriate. Safety zone, standoff distance or standoff perimeter shall not extend beyond the property line;
7. Any other activities, such as the addition or removal of structural and/or nonstructural elements, removal of loads or creating sacrificial elements so that the structure may resist unreduced forces as required for permanent structures;
8. Plan to prevent wind-born debris; and
9. Verification that the design and procedures shall not adversely impact other structures.

§ 18. Chapter 17 of the New York city building code, as amended by local law number 141 for the year 2013, table 1704.3 as amended by local law number 51 for the year 2014, section 1704.33 as amended by local law number 116 for the year 2019, is amended to read as follows:
CHAPTER 17
[STRUCTURAL TESTS AND] SPECIAL INSPECTIONS AND TESTS

SECTION BC 1701
GENERAL

1701.1 Scope. The provisions of this chapter shall govern the inspection of quality, workmanship and requirements for construction. Materials, inspection and testing shall conform to the applicable standards listed in this code or in the rules of the department. See Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to materials, testing and inspections.

1701.2 New materials. See Chapter 1 of Title 28 of the Administrative Code for additional provisions.

1701.3 Used materials. See Chapter 1 of Title 28 of the Administrative Code.

SECTION BC 1702
DEFINITIONS

1702.1 [General: The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.] Definitions. The following terms are defined in Chapter 2:

APPROVED AGENCY. [See Chapter 1 of Title 28 of the Administrative Code.]

APPROVED FABRICATOR. [An established and qualified person, firm or corporation approved by the commissioner to custom manufacture or build products or assemblies regulated by this code.]

CERTIFICATE OF COMPLIANCE. [A certificate stating that materials meet specified standards, that work was done in compliance with approved construction documents and other applicable provisions of law, or with respect to specified service equipment, a certificate issued by the department authorizing the operation of such equipment.]

FABRICATED ITEM. [Products and assemblies regulated by this code that are custom manufactured, or built prior to their incorporation into the work at the job site. Fabricated items shall not include listed, labeled or approved products or assemblies.]

INSPECTION CERTIFICATE. [An identification applied on a product by an approved agency containing the name of the manufacturer, the function and performance characteristics, and the name and identification of the approved agency that indicates that the product or material has been inspected and evaluated by such approved agency. An inspection certificate shall also mean a certificate issued by the department upon satisfactory completion of an inspection or test.]

INTUMESCENT FIRE-RESISTANT COATINGS. [Thin-film liquid mixture applied to substrates which expands into a protective foamed layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.]

LABEL. [An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name...]

1282
and identification of an approved agency and that indicates that a representative sample of the product or material has been tested and evaluated by an approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner.]”

**MANUFACTURER’S DESIGNATION.** [An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules.]

**MARK.** [An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material.]

**MASTIC FIRE-RESISTANT COATINGS.** [Liquid mixture applied to a substrate that provides fire-resistant protection of a substrate when exposed to flame or intense heat.]

**SPECIAL INSPECTION.** [Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections, to ensure compliance with approved construction documents and referenced standards as required by this chapter or elsewhere in this code or its referenced standards.]

**SPECIAL INSPECTION, CONTINUOUS.** [The full-time observation of work requiring special inspection by a special inspector who is continuously present in the area where the work is being performed.]

**SPECIAL INSPECTION, PERIODIC.** [The intermittent observation of work requiring special inspection by a special inspector who is present in the area where the work has been or is being performed and at the completion of the work. All work requiring special inspection shall remain accessible and exposed until approved by the special inspector.]

**SPECIAL INSPECTOR.** [See Chapter 1 of Title 28 of the Administrative Code.]

**SPRAYED FIRE-RESISTANT MATERIALS.** [Cementitious or fibrous materials that are sprayed to provide fire-resistant protection of the substrates.]

**SUPERINTENDENT OF CONSTRUCTION.** [See Chapter 1 of Title 28 of the Administrative Code.]

**SECTION BC 1703 APPROVALS**

See Chapter 1 of Title 28 of the Administrative Code.

**SECTION BC 1704 RESPONSIBILITIES FOR SPECIAL INSPECTIONS AND TESTS**

**1704.1 General.** Where application is made for construction as described in this section, one or more special inspection agencies meeting the requirements of Sections 28-114.1 and 28-115.1 of the Administrative Code shall be retained by the owner to provide inspections during construction on the types of work listed under Section [1704] 1705 and elsewhere in this code. These inspections are in addition to the other inspections required by Section 110, elsewhere in this code, and Section 28-116.
of the Administrative Code. The special inspector shall be acceptable to the registered design professional of record.

**Exception:** Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by the Education Law of the State of New York and applicable regulations governing the professional registration and certification of engineers or architects.

**1704.1.1 Responsibilities.** Special inspection responsibilities of registered design professionals of record, special inspection agencies, and permit holders shall meet the applicable requirements of this section.

**1704.1.1.1 Responsibilities of the registered design professional of record.** The registered design professional of record shall have the following duties and responsibilities:

1. **[Construction document requirements]** **Identification of required special inspections.** The registered design professional of record shall identify the materials, equipment, installation, fabrication, erection or placement of components and connections, or construction operations for the work indicated on the construction documents that are subject to special inspections on the construction documents and in any other form supplied by the department prior to the approval of the construction documents.

2. **Respond to field discrepancies.** The registered design professional of record shall respond to special inspector reports of uncorrected discrepancies and shall approve remedial measures.

3. **Review of shop drawings and other submittals.** Where shop or working drawings, and other submittals have been provided, the registered design professional of record shall review such shop drawings for conformance with the approved design. The registered design professional shall acknowledge conformance with the approved design on such documents.

4. **Deviations from approved construction documents.** The registered design professional of record shall submit to the department and the special inspection agency written documentation of the professional’s approval of deviations from the approved construction documents. All such deviations approved by the registered design professional of record shall be filed with the department on amended construction documents in accordance with Section 28-104.3 of the Administrative Code.

**[1704.1.2] 1704.1.1.2 Responsibilities of the special inspection agency.** The special inspection agency shall have the following duties and responsibilities:

1. **Independence.** The special inspection agency shall be independent of the contractors responsible for the work being inspected. The registered design professional of record is permitted to act as the approved special inspection agency and such agency’s
personnel are permitted to act as special inspectors for the work designed by the registered design professional of record, provided those personnel meet the qualification requirements of this section to the satisfaction of the department.

2. **Qualifications.** The special inspection agency shall ensure that qualified special inspectors are provided to perform special inspections in accordance with the rules of the department. Upon request of the registered design professional of record, the special inspection agency shall provide proof of inspector’s and agency’s qualifications, certifications, and other documents demonstrating compliance with department rules and regulations.

[2.] 3. **Construction documents.** The special inspection agency shall examine all approved construction documents that relate to the work that is the subject of the special inspections to confirm that the documents are sufficient to enable the proper performance of the special inspection. The special inspection agency shall confirm that any shop drawings or sketches have been accepted by the registered design professional of record. Acceptance shall be demonstrated in writing by the registered design professional of record on the documents. All approved shop drawings, submittals and/or sketches are to be located on site and accessible to the special inspector at time of inspection.

[3.] 4. **Inspection.** The special inspection agency shall observe work subject to special inspection to confirm that the work that is the subject of the special inspection is in compliance with the approved construction documents; with the approved shop drawings, where provided; and with the special inspection requirements of this code and department rules and regulations.

5. **Tests.** Where specifically required by this code, the performance of testing shall be by qualified special inspectors working for the special inspection agency. In all other instances, the special inspection agency shall observe testing to confirm that testing activities that are subject to special inspection are in compliance with the prescribed testing procedures.

[4.] 6. **Reports.** The special inspection agency shall prepare reports of its inspections and tests, and such reports shall indicate that work inspected was or was not performed in conformance with approved construction documents.

[4.1] 6.1. **Format.** Special inspection reports and records of special inspections shall be in the form and format supplied by the commissioner.

[4.2] 6.2. **Discrepancies.** Discrepancies shall be brought to the immediate attention of the contractor and, when applicable, to the attention of the superintendent of construction, for correction. If the discrepancies are not corrected, the discrepancies shall also be brought to the attention of the owner, and the registered design professional of record prior to the completion of that phase of the work in a timely manner to allow for correction of the discrepancies.
[4.3] **6.3. Hazardous conditions.** The special inspector shall report conditions noted as hazardous to life, safety or health that are not immediately corrected to the immediate attention of the commissioner.

[4.4] **6.4. Final report.** Prior to issuance of a certificate of occupancy or letter of completion, a final report documenting the required special inspections, including any required performance or witnessing of tests, and correction of all discrepancies noted in the inspections shall be submitted to the department, certifying compliance with approved construction documents, deviations approved by the registered design professional of record in accordance with Section 1704.1.1.1 Item 4 of this code, and the administrative and procedural requirements of this code.

[4.5] **6.5 Approval of partially completed work.** Reports of partially completed work shall be accepted when such reports indicate that the inspected work has been completed in accordance with the construction documents, and indicate the extent and the condition of the remaining work.

[4.6] **6.6 Maintain records.** The special inspection agency shall maintain records of inspections for a period of 6 years from the date of project sign off, or the special inspection agency’s final submittal or report of completed inspection. Such records shall be supplied to the commissioner upon request. The commissioner may require that special inspection reports be filed with the department and/or that such reports be otherwise made accessible for review.

[1704.1.3] **1704.1.1.3 Responsibilities of the permit holder.** The permit holder shall have the following duties and responsibilities:

1. **Statement of special inspections.** The application for permit shall include a statement of relevant special inspections as a condition for permit issuance on forms supplied by the department. This statement shall include:

   1.1. A complete list of materials and work included in the permit application requiring special inspections by this section and elsewhere in this code and the inspections to be performed on such work and materials; and

   1.2. A list of the special inspection agencies retained by the owner for conducting the special inspections listed on the approved plans. Within each category of work, multiple special inspectors or special inspection agencies may be employed.

2. **Identification of registered design professionals providing design documents for certain construction operations.** The registered design professionals responsible for the production of design, sequence of construction operations or shop drawings for projects that require design pursuant to Chapter 33, shall file documentation of their intent to perform those duties on forms supplied by the department. The registered design professionals preparing such documents shall also be subject to the
responsible for the scope of work covered in the design, sequence of construction operations or shop drawings for which they are responsible.

3. Required notification to special inspection agencies. The holder of a permit covering work requiring a special inspection shall notify the relevant special inspectors or special inspection agencies in writing at least 72 hours before the commencement of any work requiring special inspection. The permit holder shall make available the most current approved construction documents to the special inspection agency.

4. Access for special inspection. The construction or work for which special inspection is required shall remain accessible and exposed for special inspection purposes until completion of the required special inspections.

5. [Deficiencies] Resolution of discrepancies. The permit holder shall be responsible for the [correction] resolution of identified [deficiencies] discrepancies. A satisfactory inspection by a special inspection agency or the acceptance by the department of a satisfactory report of an inspection by a special inspection agency shall not be construed to be an approval by the department of a violation of the provisions of this code or of any other provision of law.

1704.2 Inspection of fabricators. Where fabrication of structural members, and other regulated products is performed on the premises of a fabricator’s shop, special inspection and progress inspection of the fabricated items shall be required by this section, the New York City Construction Codes, and [in] Chapter 1 of Title 28 of the Administrative Code.

1704.2.1 Fabrication and implementation procedures. The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator’s ability to conform to approved construction documents and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator’s scope of work.

Exception: Special inspections and progress inspections as required by Section 1704.2 shall not be required where the fabricator is approved in accordance with [Section 1704.2.2 and with] Chapter 1 of Title 28 of the Administrative Code, except as required by Section 1704.2.2 of this code.

1704.2.2 Fabricator approval. Work that is subject to special inspection and performed on the approved fabricator’s premises shall be inspected by the special inspection agency in accordance with Section 1704.2.2.3. Approval of fabricators shall be based upon review of the fabricator’s written procedural and quality control manuals and periodic auditing of fabrication practices by an approved agency.
1704.2.2.1 Certificate of intent to fabricate. For all work where approval is sought based upon Section 1704.2.2, the approved fabricator shall submit a certificate of intent to fabricate such work to the department identifying the work to be performed as an approved fabricator, and that such work shall be performed in accordance with the approved construction documents, referenced standards and applicable provisions of law and for which site the work is being fabricated prior to fabricating any items for such project.

1704.2.2.2 Fabricator’s certificate of compliance. For all fabricated items, the approved fabricator shall submit a certificate of compliance to the department stating that the work was performed in accordance with the approved construction documents, referenced standards and applicable provisions of law.

1704.2.2.3 In-plant special inspections. The owner shall engage an approved special inspection agency to perform special inspections for the portion of the work performed in the approved fabricator’s premises. These inspections shall at a minimum include: (i) one visit to the fabricator’s premises during the course of the subject work to verify the fabricator’s compliance with the written and procedural quality control manuals; and (ii) inspection of 5 percent of the subject work to verify compliance with the approved construction documents. [Such inspection is permitted to be performed in either the fabricator’s premises or at the construction site.]

SECTION BC 1705
REQUIRED SPECIAL INSPECTIONS AND TESTS

1705.1 General. Special inspections and tests of structural elements and nonstructural components of buildings and structures shall meet the applicable requirements of this section.

1705.1.1 Special cases. Special inspections shall be required for proposed work that is, in the opinion of the commissioner, unusual in its nature, including, but not limited to:

1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.

2. Unusual design applications of materials described in this code.

3. Materials and systems required to be installed in accordance with manufacturer’s instructions that prescribe additional requirements not contained in this code or in standards referenced by this code.

1705.1.1.1 Qualifications. Where special inspections are required for proposed work in accordance with Section 1705.1.1, the special inspection shall be performed by special inspectors qualified to inspect the work to be inspected. The qualifications of the special inspector shall be acceptable to the commissioner.

[1704.3] 1705.2 Steel construction. The special inspections of new installations and alterations to existing installations of steel elements in buildings and structures shall be as required by [Section}
Exceptions:

1. Special inspection of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator’s ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and mill test reports for the main stress-carrying elements are capable of being determined.

2. [The] When specified by the registered design professional, the special inspector [need not be continuously present] shall have the option to perform periodic inspections during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.

2.1. Single-pass fillet welds not exceeding $5/16$ inch (7.9 mm) in size.

2.2. Floor and roof deck welding.

2.3. Welded studs when used for structural diaphragm.

2.4. Welded sheet steel for cold-formed steel members.

2.5. Welding of stairs and railing systems.

For SI: 1 inch = 25.4 mm.

a. A minimum of 10 percent of shear studs shall be verified for strength of welded connection. If failure is evident on one or more, then the strength of all shear studs shall be verified.

b. Turn of the nut bolting shall be continuously inspected. Exception: Periodic inspection shall be acceptable when the contractor's procedures have been established and verified for compliance by the special inspector.

2.6. Welding of connections where the calculated connection strength is at least twice the required strength of the connection. Such connections shall be specifically indicated on the approved construction documents.

</tbody>
</table>

For SI 1 inch = 25.4 mm.
a. A minimum of 10% of shear studs shall be verified for strength of welded connection. If failure is evident on one or more, then the strength of all shear studs shall be verified.
b. Welding of indirect and direct butt joints shall be continuously inspected.

[1704.3.1] 1705.2.1 Welding. Welding inspection and welding inspector qualification shall be in compliance with this section and the rules of the department.

[1704.3.1.1] 1705.2.1.1 Structural steel. Welding inspection and welding inspector qualification for structural steel shall be in accordance with AWS D1.1.

[1704.3.1.2] 1705.2.1.2 Cold-formed steel deck. Welding inspection and welding inspector qualification for cold-formed steel floor and roof decks shall be in accordance with [AWS D1.3] SDI QA/QC.

[1704.3.1.3] 1705.2.1.3 Reinforcing steel. Welding inspection and welding inspector qualification for reinforcing steel shall be in accordance with AWS D1.4 and ACI 318.

[1704.3.2] 1705.2.2 Details. The special inspector shall perform an inspection of the steel frame to verify compliance with the details shown on the approved construction documents, such as bracing, stiffening, member locations and proper application of joint details at each connection, including connections designed for seismic effects.

[1704.3.3] 1705.2.2 High-strength bolts. Installation of high-strength bolts shall be inspected in accordance with this section and AISC 360.

Exception: Installation of high strength bolts in bearing type connections where the calculated connection strength is at least twice the required strength of the connection. Inspection of such connections shall be made under Section [1704.3.2] 1705.2.2. Such connections shall be clearly indicated on the approved construction documents.

[1704.3.3.1] 1705.2.3.1 General. While the work is in progress, the special inspector shall determine that the requirements for bolts, nuts, washers and paint; bolted parts and installation and tightening in such standards are met. For bolts requiring pretensioning, the special inspector shall observe the preinstallation testing and calibration procedures when such procedures are required by the installation method or by project plans or specifications; determine that all plies of connected materials have been drawn together and properly snugged and monitor the installation of bolts to verify that the selected procedure for installation is properly used to tighten bolts. For joints required to be tightened only to the snug-tight condition, the special inspector need only verify that the connected materials have been drawn together and properly snugged.
[1704.3.3.2] 1705.2.3.2 Periodic inspection. Inspection of bolt installation for pretensioning is permitted to be performed on a periodic basis when using the turn-of-nut method with matchmarking techniques, the direct tension indicator method or the alternate design fastener (twist-off bolt) method. Joints designated as snug tight need be inspected only on a periodic basis.

[1704.3.3.3] 1705.2.3.3 Continuous inspection. Inspection of bolt installation for pretensioning using the calibrated wrench method or the turn-of-nut method without matchmarking shall be performed on a continuous basis.

1705.2.4 Special inspection for seismic resistance. In addition to the other special inspection requirements of this code, special inspections of structural steel seismic force resisting systems and structural steel elements shall be performed in accordance with Section 1705.2.4.1 and 1705.2.4.2.

1705.2.4.1 Seismic force-resisting systems. Special inspections of structural steel in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B, C or D shall be performed in accordance with the quality assurance requirements of AISC 341.

Exception: Special inspections per Section 1705.2.4.1 are not required in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.

1705.2.4.2 Structural steel elements. Special inspections of structural steel elements in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B, C or D other than those covered in Section 1705.2.4.1 of this code, including struts, collectors, chords and foundation elements, shall be performed in accordance with the quality assurance requirements of AISC 341.

Exception: Special inspections of structural steel elements per Section 1705.2.4.2 are not required in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B or C with a response modification coefficient, R, of 3 or less.

1705.2.5 Testing for seismic resistance of structural steel. Nondestructive testing for seismic resistance shall be in accordance with Section 1705.2.5.1 or 1705.2.5.2, as applicable.

1705.2.5.1 Seismic force-resisting systems. Nondestructive testing of structural steel in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B, C, or D shall be performed in accordance with the quality assurance requirements of AISC 341.
**Exception:** Nondestructive testing is not required in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B or C that are not specifically detailed for seismic resistance, with a response modification coefficient, $R$, of 3 or less, excluding cantilever column systems.

1705.2.5.2 Structural steel elements. Nondestructive testing of structural steel elements in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B, C or D other than those covered in Section 1705.2.5.1, including struts, collectors, chords and foundation elements, shall be performed in accordance with the quality assurance requirements of AISC 341.

**Exception:** Nondestructive testing of structural steel elements is not required in the seismic force-resisting systems of buildings and structures assigned to Seismic Design Category B or C with a response modification coefficient, $R$, of 3 or less.

[1704.3.4] 1705.2.6 Cold-formed steel construction. Special inspections for prefabricated and site built cold-formed steel [light-frame] construction and assemblies used structurally shall be as required by this section and Table [1704.3.4] 1705.2.6. [The special inspector shall verify the size, quality, framing, erection, and both temporary and permanent bracing.]

3. **Inspection of framing connections and anchorages:**

a. Verify that screws, bolts, and other fasteners conform to approved construction document requirements for diameter, length, quantity, spacing, edge distance, and location.

b. Verify that manufactured connectors, such as joist hangers, caps, straps, clips, ties, hold-downs, and anchors conform to approved construction document requirements for manufacturer, type, gauge, and fastener requirements.

c. Post-installed connections to concrete.

4. **Inspection of welding:**

a. Inspect welds in accordance with S240 Section D6.6.

b. Additional requirements for welds performed as a part of a lateral force-resisting system.

5. **Bracing:**

a. Verify that temporary bracing, shoring, jacks, etc., are installed, and not removed until no longer necessary, in accordance with the approved construction.

[1704.4] 1705.3 Concrete construction. The special inspections and verifications for concrete construction shall be as required by this section and Table [1704.4] 1705.3.

Exceptions:

1. Special inspection shall not be required when specifically indicated as not required on the approved construction documents for:

   [1.1. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 Mpa).]

   [1.2. Concrete foundation(s) for lightweight fences and recreational equipment.]

   [1.3. Concrete patios, site furnishings, garden walls, driveways, sidewalks and similar construction.]

   1.1. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 Mpa).

   1.2. Concrete foundation(s) for lightweight fences and recreational equipment.

   1.3. Concrete patios, site furnishings, garden walls, driveways, sidewalks and similar construction.

2. Testing required by Table [1704.4.1] 1705.3, Item 6, may be waived by the registered design professional who prepared the approved structural construction documents when such waiver is specifically indicated on such construction documents in the following cases:

   2.1. Where the total concrete placement on a given project is less than 50 cubic yards ([38] 38.2 m³).
2.2. Isolated spread concrete footings of R-3 buildings three stories or less above grade plan that are fully supported on earth or rock.

2.3. Continuous concrete footings supporting walls of R-3 buildings three stories or less above grade plan that are fully supported on earth or rock where the structural design of the footing is based on a specified compressive strength, \( f'_{c} \), no greater than 2,500 pounds per square inch (psi) (17.2 Mpa), and the compressive strength used in the footing construction is at least 4,000 psi (27.6 Mpa).

[1704.4.1] 1705.3.1 Materials. In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the commissioner shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapters [3] 19 and 20 of ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section [1903.5.2] 1903.6.2 of this code.

[1704.4.2] 1705.3.2 Concrete construction. When the specified compressive strength of concrete in a column is greater than 1.4 times that specified for a floor system, the special inspections for concrete construction shall also comply with the requirements of Section [1908.2.1] 1908.1.4.

[1704.5] 1705.4 Masonry construction. Masonry construction shall be inspected and verified in accordance with the requirements of Sections [1704.5.4] 1705.4.1 through [1704.5.3] 1705.4.3, depending on the structural occupancy risk category of the building or structure.

Exception: Special inspections shall not be required for:

1. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112, or 2113, respectively.

2. Alterations to existing masonry, where the quantity of replaced masonry is less than 10 square feet (0.93 m²) in any 100 square feet (9.3 m²) of wall area, when specifically exempted on the approved construction documents.

4. As masonry construction begins, the following shall be verified to ensure compliance:

- b. Construction of mortar joints.
- c. Location of reinforcement, connectors, prestressing tendons and anchorages.
- d. Grouting of prestressing bonded tendons and anchorages.
- e. Grade and size of prestressing tendons and anchorages.

5. During construction the inspection program shall verify:

- a. Size and location of structural elements.
- b. Type, size and location of anchors including other details of anchorage of masonry to structural members, frames or other construction.
- c. Specified size, grade and type of reinforcement, anchor bolts, prestressing tendons and anchorages.
- d. Welding of reinforcing bars.
- e. Preparation, construction and protection of masonry during cold weather (temperature below 32°F) or hot weather (temperature above 90°F).
- f. Application and measurement of prestressing force.

6. Prior to grouting, the following shall be verified to ensure compliance:

- a. Grout space is clean.
- b. Placement of reinforcement and connectors, prestressing tendons and anchorages.
- d. Construction of mortar joints.
- e. Grout placement shall be verified to ensure compliance.
- f. Grouting of prestressing bonded tendons.
- g. Preparation of any required grout specimens, mortar specimens and/or prisms shall be observed.

---

**[1704.6] 1705.5 Wood construction.** Special inspections of site-built assemblies shall be in accordance with Sections 1705.5.1 through 1705.5.4. Special inspections of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with Section [1704.2] 1705.10. [Special inspections of site-built assemblies shall be in accordance with Section 1704.1.]

**[1704.6.1] 1705.5.1 High-load diaphragms.** High-load diaphragms designed in accordance with Table [2306.2(2) 2306.2(2)] shall be installed with subject to special inspections as indicated in Section 1704.1. The special inspector shall inspect the wood structural panel sheathing to ascertain whether it is of the grade and thickness shown on the approved construction documents. Additionally, the special inspector must verify the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, the number of fastener lines and that the spacing between fasteners in each line and at edge margins agrees with the approved construction documents.

**[1704.6.2] 1705.5.2 Metal-plate-connected wood trusses.** In addition to the requirements of Section 1704.1, metal-plate-connected wood trusses shall be subject to special inspection in accordance with [Section] Sections [1704.6.2.1] 1705.5.2.1 and [1704.6.2.2] 1705.5.2.2.

For SI: °C = (°F) − 32, 1 square foot = 0.0929m².

[a. The specific standards referenced are those listed in Chapter 35.]

**1704.6.2.1** **1705.5.2.1 Erection.** The use of all metal-plate-connected wood trusses shall be subject to special inspection for compliance with the approved construction documents, the requirements of Sections 1704.1, and the following:

1. All installed materials shall be clean, straight and otherwise undamaged. Members and parts shall not be stretched, bent, or otherwise distorted unless such forming is in the integral part of the design. The special inspector shall ensure that damaged members are not used for construction.

2. Profiles of members used structurally shall conform to the dimensions specified in the approved construction documents. The installation shall be inspected for compliance with the approved construction documents regarding locations, positions, beam separators, bearing surfaces, fasteners, screws, bolts and bracing, as applicable.

3. Temporary bracing, shoring, jacks, etc., shall not be removed until the special inspector determines that the construction conforms with the approved construction document.

4. Where prefabricated metal-plate-connected wood trusses are utilized, such prefabricated wood structural elements and assemblies shall also comply with Section 1704.2 1705.10. Where any metal-plate connectors are utilized in site-built assemblies, such connections and assemblies shall be subject to special inspection for compliance with the requirements of the approved construction documents and manufacturers’ instructions.

**1704.6.2.2** **1705.5.2.2 Metal-plate-connected wood trusses spanning 60 feet or greater.** Where a truss clear span is 60 feet (18 288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the approved truss submittal package.
[1704.6.3] **1705.5.3 Prefabricated wood I-joists.** The fabrication of prefabricated wood I-joists shall be subject to special inspections in accordance with Section 1704.2 and the requirements of Section 2303.1.2.

[1704.6.3.1] **1705.5.3.1 Erection.** The erection of prefabricated wood I-joists shall be subject to special inspection for compliance with the approved construction documents, the requirements of Sections 1704.1, and the following:

1. All installed materials shall be clean, straight and otherwise undamaged. Members and parts shall not be stretched, bent, or otherwise distorted unless such forming is in the integral part of the design. The special inspector shall ensure that damaged members are not used for construction.

2. Profiles of members used structurally shall conform to the dimensions specified in the approved construction documents. The installation shall be inspected for compliance with the approved construction documents regarding locations, positions, beam separators, bearing surfaces, fasteners, screws, bolts and bracing, as applicable.

3. The size, location, and number of penetrations shall be inspected for compliance with the approved construction documents and manufacturers’ instructions.

4. Temporary bracing, shoring, jacks, etc., shall not be removed until the special inspector determines that they are no longer needed.

[1704.6.4] **1705.5.4 Other structural wood construction.** All other structural wood construction shall be subject to progress inspections for the structural frame to the extent required by Section 110.3.3.

**1705.5.5 Special inspection for seismic resistance.** For the seismic force-resisting systems of structures assigned to Seismic Design Category C or D:

1. Continuous special inspection shall be required during field gluing operations of elements of the seismic force resisting system.

2. Periodic special inspection shall be required for nailing, bolting, anchoring and of other elements of the seismic force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces, shear panels and hold-downs.

**Exception:**

1. Special inspections are not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other elements of the seismic force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (101.6 mm) on center.

2. Where adhesive anchors require continuous special inspection elsewhere in this code, continuous special inspection shall be provided.
1705.5.6 Type IV construction. Special inspections of Type IV construction utilizing cross-laminated timber or structural composite lumber elements shall be in accordance with Table 1705.5.6.

</table>

1. The identifying designation of the deep foundation element and the date of installation, including the start and end times.

2. The size, material, and allowable capacity as specified in the contract drawings.

3. The elevation of the minimum required depth of penetration, and the final tip elevation and butt elevation.

4. For driven piles, record the type and size of hammer and record the number of blows per foot of penetration from the start of driving until the final blow count required by the contract drawings is reached.

5. For driven or drilled piles filled with concrete or grout:

   5.1. Prior to placing concrete, inspect the inside of the pile for alignment and damage. Record the results of the inspection, noting whether or not the pile is in compliance with Sections 1808, 1809, and 1810, and contract requirements.

   5.2. Witness the placement of concrete or grout inside the deep foundation element, and record the volume placed. Note the date and time of placement, and whether...
or not the concrete or grout was placed in compliance with Sections 1808, 1809, and 1810, and contract requirements.

[6. For drilled or vibrated deep foundation elements, record the equipment and method used for installation and record the time for each foot of penetration from the start of installation until completion.]

[7. For deep foundation elements requiring a rock socket:]

[7.1. Record the equipment and method of drilling the rock socket. Record the top elevation and bottom elevation of the rock socket, as well as the time for each foot of drilling the rock socket.]

[7.2. Inspect the rock socket as required by contract drawings. Record the results of the inspection and note whether or not the rock socket complies with the requirements of Sections 1808, 1809, and 1810, and the contract requirements.]

[8. Record the elevation of splices and note whether or not the splices were installed and located in compliance with the requirements of Sections 1808, 1809, and 1810, and the contract requirements.]

[9. For methods of deep foundation element installation not covered by Items 1 through 8 above, perform additional inspection as required by the contract drawings and record the results noting whether or not the deep foundation elements comply with the requirements of Sections 1808, 1809, and 1810, and the contract requirements.]

[1704.8.2 Records of testing of deep foundations elements. The records of testing of deep foundation elements shall include but not be limited to the following:]

[1. For load test requiring a load or reaction frame, inspect the construction of the load or reaction frame. Record the results of the inspection and note whether or not the frame complies with the design drawings for the frame signed and sealed by a registered design professional.]

[2. The identifying designation for the element being tested, and the date of the testing, including the start and end time.]

[3. Record the method of performing the test, including the equipment being used, as well as the test results, noting whether or not the method of testing and the test results comply with the requirements of Sections 1808, 1809, and 1810, and the contract requirements.]

1705.7.3 Cast-in-place deep foundation elements. The installation and testing of driven or drilled cast-in-place deep foundation elements shall be subject to special inspections as specified in Tables 1705.7, 1705.7.1, 1705.7.2 and 1705.7.3, as applicable.

1704.8.4 1705.7.4 Additional inspection. For methods of deep foundation element installation not covered in Section 1705.7, perform an additional inspection as required by the approved construction documents and record the results noting whether or not the deep foundation element installation complies with the requirements of Sections 1810, 1811, and 1812, and the construction documents. For steel deep foundation elements, perform an additional inspection in accordance with Section [1704.3.1] 1705.2. For concrete or grout deep foundation elements, and concrete or grout-filled deep foundation elements, perform an additional inspection in accordance with Section [1704.4.1] 1705.3. For concrete or grout, and concrete or grout filled deep foundation elements, perform an additional inspection in accordance with Section [1704.4.1] 1705.3.

1704.8.4 1705.7.5 Submittal of records of [installation and testing] special inspections. The special inspector’s submittal of installation records for the inspection of the installation of each deep foundation element, and the special inspection agency shall submit to the commissioner records when required, of deep foundation elements at the request of the commissioner. The submittal shall include the following:

1. A location plan showing the designation identifying each deep foundation element, and the locations of required testing, where applicable.
2. A written summary of the installation and testing performed, signed by the special inspector, including a statement verifying that all installation and testing complies with the requirements of Sections 1808, 1809, and 1810, and 1811 and 1812, and the contract requirements for the installation and testing of each deep foundation element. The special inspection agency shall also submit records of testing of deep foundation elements at the request of the commissioner. The submittal shall include the following:

1705.8 Prestressed rock and soil anchors installation and testing and grout inspection. Special inspection for the installation and testing of permanent prestressed rock and soil anchors shall be performed in accordance with Section 1705.8.1 and Table 1705.8.1. Special inspection for the installation and testing of grout inspection shall be performed in accordance with Section 1705.8.2.
1705.8.1 Prestressed rock and soil anchors. The installation and testing of permanent prestressed rock and soil anchors shall be subject to special inspections. A special inspector shall be present during the installation of each anchor, including all drilling, grouting, tendon splicing (including corrosion protection) and placement, and installation of any accessories such as trumpets and bearing plates. The special inspector shall also be present for all required load testing and shall create a report containing a log for each element installed and for each load test performed. The special inspection agency shall submit to the commissioner records of the installation of each rock anchor, and where testing is required, the special inspection agency shall also submit records of the testing. The special inspection agency shall submit to the commissioner records of the installation and testing of each anchor.

</tr>
</tbody>
</table>

**1705.8.1.1 Records of anchor element installation.** The record of installation of each anchor element shall include, but not be limited to, the following:

1. The identifying designation of the anchor element and the date of installation, including the start and end times.

2. The size, material, details of corrosion protection, and allowable capacity as specified in the contract drawings.

3. Unbonded and bonded lengths of tendons, including strata for the bond zone.

4. The date and time of the witnessing of the placement of grout inside the anchor element, the volume placed, and whether or not the grout was placed in compliance with Section 1815 and contract requirements.
5. Equipment and method used for installation and record the time for penetration from the start of installation until completion.

1705.8.1.2 Records of testing of anchor elements. The records of testing of anchor elements shall include, but not be limited to, the following:

1. The results of the inspection and note the lock-off load.

2. The identifying designation for the element being tested, and the date of the testing, including the start and end time.

3. The method of performing the test, including the equipment being used, as well as the test results, noting whether or not the method of testing and the test results comply with the requirements of Section 1815.

1705.8.2 Grout inspection. Grout inspection shall be in accordance with Sections 1705.3 and 1815.8.

[1704.9 Vertical masonry foundation elements. Special inspection shall be performed in accordance with Section 1704.5 for vertical masonry foundation elements.]

[Exception: Piers for support of lightweight fences, recreational equipment, site furnishings and similar construction, unless special inspection is specifically noted as required on the approved construction documents.]

[1704.10 Wall panels, curtain walls and veneers. Special inspection is required for exterior architectural wall panels and the anchoring of veneers designed for installation on buildings above a height of 40 feet (12 192 mm). Special inspection of masonry veneer on such structures shall be in accordance with Section 1704.5.]

[Exceptions: Special inspection of wall panels, curtain walls and veneers is not applicable to:

1. Repairs and replacement in kind of gaskets or seals; or

2. Reglazing other than 4-sided structural silicone glazing.]

[1704.10.1 Design and installation documents. The special inspector shall become familiar with and retain a copy of the approved construction documents, and the following items, as applicable, approved by the registered design professional of record:

1. Shop drawings,

2. Instructions for the sequence of component installation,

3. Samples and/or mock-ups, if supplied.]

[1704.10.2 Inspection program. The special inspector shall field check the site conditions at the time the structure is prepared for component installation, and periodically during component
installation, to verify the following work is performed in compliance with the approved construction documents, including that:

1. The supporting structure for components being installed is aligned and within specified tolerances required for the components;

2. Required inserts are installed;

3. Framing components are installed and aligned as specified, and without structural defects or weakness;

4. Anchors are placed, welded, bolted and finished as specified, as applicable;

5. Weeps, flashings and tubes are installed as specified and functioning;

6. Joinery and end dams are sealed as specified;

7. Sealing materials with specified adhesive and movement capabilities are installed;

8. Gaskets, tapes, seals, insulation, flashing and other materials that are barriers to air and water movement, vapor drive, and heat loss are installed as specified;

9. Joint filler materials that accommodate specified horizontal and vertical movement are installed in accordance with the manufacturers’ instructions; and

10. Any other observations pertinent to safety of performance of the wall system.

1705.9 Helical pile foundations. Special inspections shall be performed continuously during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque and other pertinent installation data as required by the registered design professional of record. The approved geotechnical report and the construction documents prepared by the registered design professional and standards established by the commissioner pursuant to Section 28-113.2.2 of the Administrative Code shall be used to determine compliance. The special inspection agency shall submit to the department records of the inspection of the installation of helical piles on forms provided by the department.

1705.10 Reserved.

1705.11 Reserved.

1705.12 Special inspections for seismic resistance. Special inspections for seismic resistance shall be required as specified in Sections 1705.12.1 through 1705.12.5, unless exempted by the exceptions of Section 1704.2.

1705.12.1 Designated seismic systems. For structures assigned to Seismic Design Category C or D, the special inspector shall examine designated seismic systems requiring seismic qualification in accordance with Section 13.2.2 of ASCE 7 and verify that the label, anchorage and mounting conform to the certificate of compliance.
1705.12.2 Access floors. Periodic special inspection is required for the anchorage of access floors in structures assigned to Seismic Design Category D.

1705.12.3 Plumbing, mechanical, fuel gas, and electrical components. Periodic special inspection of plumbing, mechanical and electrical components shall be required for the following:

1. Anchorage of electrical equipment for emergency and standby power systems in structures assigned to Seismic Design Category C or D.

2. Installation and anchorage of piping systems designed to carry hazardous materials and their associated mechanical units in structures assigned to Seismic Design Category C or D.

3. Installation and anchorage of ductwork designed to carry hazardous materials in structures assigned to Seismic Design Category C or D.

4. Installation and anchorage of vibration isolation systems in structures assigned to Seismic Design Category C or D where the approved construction documents require a nominal clearance of ¼ inch (6.4 mm) or less between the equipment support frame and restraint.

5. Installation and anchorage of stainless steel flexible multiple leg hose assemblies in structures assigned to Seismic Design Category C or D.

1705.12.4 Storage racks. Periodic special inspection is required for the anchorage of storage racks that are 8 feet (2438.4 mm) or greater in height in structures assigned to Seismic Design Category D.

1705.12.5 Seismic isolation systems. Periodic special inspection shall be provided for seismic isolation systems in seismically isolated structures assigned to Seismic Design Category B, C or D during the fabrication and installation of isolator units and energy dissipation devices.

1705.13 Testing for seismic resistance. Testing for seismic resistance shall be required as specified in Sections 1705.13.1 through 1705.13.3, unless exempted from special inspections by the exceptions of Section 1704.2.

1705.13.1 Nonstructural components. For structures assigned to Seismic Design Category B, C. or D where the requirements of Section 13.2.1 of ASCE 7 for nonstructural components, supports or attachments are met by seismic qualification as specified in Item 2 therein, the registered design professional shall specify on the approved construction documents the requirements for seismic qualification by analysis, testing or experience data. Certificates of compliance for the seismic qualification shall be submitted to the commissioner.

1705.13.2 Designated seismic systems. For structures assigned to Seismic Design Category C or D and with designated seismic systems that are subject to the requirements of Section 13.2.2 of ASCE 7 for certification, the registered design professional shall specify on the approved construction documents the requirements to be met by analysis, testing or experience data as specified therein. Certificates of compliance documenting that the requirements are met shall be submitted to the commissioner.
1705.13.3 Seismic isolation systems. Seismic isolation systems in seismically isolated structures assigned to Seismic Design Category B, C, or D shall be tested in accordance with Section 17.8 of ASCE 7.

[1704.11] 1705.14 Sprayed fire-resistant materials. Special inspections for sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be in accordance with Sections [1704.11.1] 1705.14.1 through [1704.11.7] 1705.14.7. Special inspections shall be based on the fire-resistance design as designated in the approved construction documents. The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. Special inspections shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings, where applicable.

[1704.11.1] 1705.14.1 Physical and visual tests. The special inspections shall include the following tests and observations to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.

2. Thickness of application.

3. Density in pounds per cubic foot (kg/m³).

5. Condition of finished application.

[1704.11.1-1704.11.2] 1705.14.2 Structural member surface conditions. The surfaces shall be prepared in accordance with the approved fire-resistance design and the written instructions of approved manufacturers. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.

[1704.11.3] 1705.14.3 Application. The substrate shall have a minimum ambient temperature before and after application as specified in the written instructions of approved manufacturers. The area for application shall be ventilated during and after application as required by the written instructions of approved manufacturers.

[1704.11.4] 1705.14.4 Thickness. The thickness of the sprayed fire-resistant materials shall comply with the following:

1. No more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members shall be less than the thickness required by the approved fire-resistance design.

2. In no case shall the thickness be less than the minimum allowable thickness required by Section 1704.11.4.1.

1705.14.4 Thickness. No more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural members...
shall be less than the thickness required by the approved fire-resistance design, but in no case less than the minimum allowable thickness required by Section 1705.14.4.1.

[1704.11.4.1] 1705.14.4.1 Minimum allowable thickness. For design thicknesses 1 inch (25.4 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus ¼ inch (6.4 mm). For design thicknesses less than 1 inch (25.4 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections [1704.11.4.2] 1705.14.4.2 and [1704.11.4.3] through 1705.14.4.9 of this code.

[1704.11.4.2] 1705.14.4.2 Floor, roof and wall assemblies. The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, making not less than four measurements for each 1,000 square feet (93.0 m²) of the sprayed area in each story or portion thereof.

[1704.11.4.2.1] 1705.14.4.3 Cellular decks. Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305.0 mm by 305.0 mm) in size. A minimum of four measurements shall be made, located symmetrically within the square area.

[1704.11.4.2.2] 1705.14.4.4 Fluted decks. Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305.0 mm by 305.0 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides. The average of the measurements shall be reported.

[1704.11.4.3] 1705.14.4.5 Structural framing members. The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

[1704.11.4.3.1] 1705.14.4.5.1 Beams and girders. At beams and girders thickness measurements shall be made at nine locations around the beam or girder at each end of a one 12-inch (305.0 mm) length.

[1704.12.4.3.2] 1705.14.4.5.2 Joists and trusses. At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a one 12-inch (305.0 mm) length.

[1704.11.4.3.3] 1705.14.4.5.3 Wide-flanged columns. At wide-flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a one 12-inch (305.0 mm) length.

[1704.11.4.3.4] 1705.14.4.5.4 Hollow structural section and pipe columns. At hollow structural section and pipe columns, thickness measurements shall be made at a minimum of not fewer than four locations around the column at each end of a one 12-inch (305.0 mm) length.
1704.11.5 Density. The density of the sprayed fire-resistant material shall not be less than the density specified in the approved fire-resistance design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232.3 m²) or portion thereof of the sprayed area in each story, samples shall be taken at a distance of no less than 50 LF from another sample or 10 LF from any starting edge of an application of a specific type of material.

2. From beams, girders, trusses and columns at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232.3 m²) of floor area or portion thereof in each story.

1704.11.6 Bond strength. The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to floor, roof and wall assemblies and structural members shall not be less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections 1704.11.6.1 through 1704.11.6.3 of this code.

Exception: For high-rise buildings, as described in Section 403 of this code, refer to the requirements for minimum bond strength in Table 403.2.4 of this code.

1704.11.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232.3 m²) or part thereof of the sprayed area in each story. Samples shall be obtained from locations no less than 50 LF (15 240 mm) apart or 10 LF (3048 mm) from any starting edge of an application of a specific type of material.

1704.11.6.2 Structural members. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, joists, trusses, columns and other structural members at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232.3 m²) of floor area or portion thereof in each story.

1704.11.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted when the sprayed fire-resistant material is applied to a primed, painted or encapsulated surface for which acceptable bond-strength performance between these coatings and the fire-resistant material has not been determined. A bonding agent approved by the SFRM manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be less than required values.

1704.11.7 Inspection of existing sprayed fire-resistant materials during alterations in office spaces and spaces classified in Occupancy Group B. In office spaces and spaces classified in Occupancy Group B, where an alteration exposes any required sprayed fire-resistant materials on structural members or where, pursuant to an alteration, persons are required
to enter or access areas in which such sprayed fire-resistant materials are capable of being observed, the existing required sprayed fire-resistant materials shall be subject to special inspection. [Such inspection shall require a determination, based on visual inspection, (i) that the existing sprayed fire-resistant materials as originally applied or installed comply with the applicable requirements of this code, including those for installation methods, materials, thickness and coverage; and (ii) that, since their original application, the integrity of the existing sprayed fire-resistant materials has not been compromised, damaged or displaced, by the current alteration or by any prior alteration or other event.] Such inspection shall require the special inspector to perform a visual inspection and report the existing sprayed fire-resistant materials and conditions to the registered design professional.

1704.12 1705.15 Mastic and intumescent fire-resistant coatings. Special inspections and tests for mastic and intumescent fire-resistant coatings applied to structural elements and decks shall be in accordance with AWCI 12-B. Special inspections and tests shall be based on provisions of AWCI 12-B and the fire-resistance design as designated in the approved construction documents.

1704.13 Exterior insulation and finish systems (EIFS) 1705.16 Combustible exterior wall coverings. Special inspections shall be required for all exterior wall coverings containing combustible materials installed more than 15 feet (4572 mm) above adjacent finished grades and alterations to existing exterior wall coverings containing combustible materials installed more than 15 feet (4572 mm) above adjacent finished grades. Exterior insulation and finish system (EIFS) applications, metal composite materials (MCM), high-pressure decorative exterior-grade compact laminates (HPL) and exterior wall covering containing combustible veneers, combustible framing, combustible water-resistive barriers and foam plastic insulation installed more than 15 feet (4572 mm) above adjacent finished grades and alterations to existing [EIFS] installations more than 15 feet (4572 mm) above adjacent finished grades shall be inspected in accordance with Section 1705.16.1.

Exceptions

1. Water-resistive barriers that are the only combustible component in the exterior wall covering satisfying the requirements of Exceptions 1 or 2 of Section 1403.5.1.

2. Type VB construction up to 40 feet (12 192 mm) or less in height above grade.

1704.13.1 1705.16.1 Inspection program. The special inspection shall include verification of [•] compliance with the approved construction documents for the following: [•] attachment to structure[s]; component properties; thicknesses, orientation, cavity sizes and location of thermal barriers, fireblocking, and cavity closures; installation of waterproofing membranes, weeps, drains, mold prevention features are as specified; and conformance with the manufacturers’ installation [guidelines] instructions, and NFPA 285 tested assembly design documentation. The special inspector shall verify that individual components required to be labeled in accordance with this code do bear such labels.

1704.13.2 1705.16.2 Water-resistive barrier coating. A water-resistive barrier coating complying with ASTM E 2570 requires special inspection of the water-resistive barrier coating when installed over a sheathing substrate. Inspection of water-resistive barrier coating must verify conformance with approved construction documents, manufacturer’s installation instructions, and NFPA 285 tested assembly design documentation.
1705.16.3 Thermal barrier. The special inspector shall confirm the installation of the thermal barrier is in accordance with the approved construction documents, manufacturer’s installation instructions, and NFPA 285 tested assembly design documentation.

**Exception:** Foam plastic insulation installation on one-story buildings not required to have thermal barrier complying with Section 2603.4.1.4 of this code.

1705.16.4 Fireblocking. The special inspector shall confirm the installation of fireblocking is in accordance with Chapter 7 of this code, the approved construction documents, manufacturer’s installation instructions, and NFPA 285 tested assembly design documentation.

**Exception:** EIFS systems and exterior wall coverings not required to have fireblocking pursuant to Section 718.2.6.1 of this code.

[1704.14 Special cases. Special inspections shall be required for proposed work that is, in the opinion of the commissioner, unusual in its nature, such as, but not limited to, the following examples:]

[1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.]

[2. Unusual design applications of materials described in this code.]

[3. Materials and systems required to be installed in accordance with additional manufacturer’s instructions that prescribe requirements not contained in this code or in standards referenced by this code.]

[1704.14.1 Qualifications. Where special inspections are required for proposed work in accordance with Section 1704.14, the special inspection shall be performed by special inspectors qualified to inspect the work to be inspected. The qualifications of the special inspector shall be acceptable to the commissioner.]

1705.17 Fire-resistant penetrations and joints. Special inspections for through-penetrations, membrane penetration firestops, fire-resistant joint systems, and perimeter fire barrier systems that are tested and listed in accordance with Sections 714.3.1.2, 714.4.2, 715.3 and 715.4 shall comply with Sections 1705.17.1 and 1705.17.2.

1705.17.1 Penetration firestops. Inspections of penetration firestop systems that are tested and listed in accordance with Sections 714.3.1.2 and 714.4.2 of this code shall be conducted by an approved special inspection agency in accordance with ASTM E 2174.

1705.17.2 Joint systems. Inspection of fire-resistant joint systems that are tested and listed in accordance with Sections 715.3 and 715.4 of this code shall be conducted by an approved special inspection agency in accordance with ASTM E 2393.

[1704.15 Special inspection for smoke control. Smoke] 1705.18 Testing for smoke control. Testing of smoke control systems shall be [tested] witnessed in its entirety by a special inspector in accordance with Sections [1704.15.1] 1705.18.1 and 909.
Exception: Post-fire smoke purge systems that are not required to function as a smoke control system shall be permitted to be inspected pursuant to the special inspection requirements of Section [1704.16] 1705.21.

[1704.15.1] 1705.18.1 Testing scope. The test scope shall be as follows:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.

2. Prior to occupancy and after sufficient completion for the purposes of pressure difference testing, flow measurements and detection and control verification.

[1704.15.2 Qualifications. Special inspection agencies for smoke control shall have expertise in fire protection engineering and mechanical engineering and certification as air balancers.]

1705.19 Vertical masonry foundation elements. Special inspection shall be performed in accordance with Section 1705.4 for vertical masonry foundation elements.

Exception: Piers for support of lightweight fences, recreational equipment, site furnishings and similar construction, unless special inspection is specifically noted as required on the approved construction documents.

1705.20 Wall panels, curtain walls and veneers. Special inspection is required for exterior architectural wall panels, curtain walls and the anchoring of veneers for the full height of the installation when any portion of the wall panel, curtain wall and veneer installation exceeds an elevation of 40 feet (12,192 mm) above grade. Special inspection of masonry veneer on such structures shall be in accordance with Section 1705.4. Special inspection of combustible exterior wall covering shall be in accordance with Section 1705.16.

Exceptions: Special inspection of wall panels, curtain walls and the anchoring of veneers is not applicable to:

1. Repairs and replacement in kind of gaskets or seals; [or]

2. Reglazing other than 4-sided structural silicone glazing[,] for which a permit is required; or

3. Where exempted by the rules of the department.

1705.20.1 Design and installation documents. The special inspector shall become familiar with and retain a copy of the approved construction documents, and the following items, as applicable, approved by the registered design professional of record:

1. Shop drawings.

2. Instructions for the sequence of component installation.

3. Samples and/or mock-ups, if supplied.
4. Required fire-resistance rating and performance standard listings, as applicable.

1705.20.2 Inspection program. The special inspector shall field check the site conditions at the time the structure is prepared for component installation, and periodically during component installation, to verify the following work is performed in compliance with the approved construction documents, including that:

1. The supporting structure for components being installed is aligned and within specified tolerances required for the components;

2. Required inserts are installed;

3. Framing components are installed and aligned as specified, and without structural defects or weakness;

4. Anchors are placed, welded, bolted and finished as specified, as applicable:
   a. Inspection of welding of anchors shall be inspected in accordance with Section 1705.3. Inspection of bolting of anchors shall be in accordance with Section 1705.4. Inspection of the installation of post-installed anchors shall be in accordance Section 1705.37.

5. Weeps, flashings and tubes are installed as specified and functioning;

6. Joinery and end dams are sealed as specified;

7. Sealing materials with specified adhesive and movement capabilities are installed;

8. Gaskets, tapes, seals, insulation, flashing and other materials that are barriers to air and water movement, vapor drive, and heat loss are installed as specified;

9. Joint filler materials that accommodate specified horizontal and vertical movement are installed in accordance with the manufacturers’ instructions; and

10. Fireblocking and thermal barrier within combustible exterior wall coverings are installed as specified.

[1704.16] 1705.21 Special inspection for mechanical systems. Mechanical systems [regulated which] require a certificate of compliance in accordance with Section 28-116.4.1 of the Administrative Code shall be inspected for conformance with the approved construction documents.

[1704.16.1] 1705.21.1 Tests for mechanical systems. Tests of mechanical systems shall be performed in accordance with applicable sections of the code including Sections [507.16] 507.6, 1011, 1108 and 1208 of the New York City Mechanical Code. The special inspector shall witness all required tests.

[Exception:] 1705.21.2 Factory built equipment. Listed and labeled self-contained factory-built equipment and appliances deemed by the registered design professional to meet the design,
manufacture and factory test requirements of this code shall be field tested in accordance with the manufacturers’ installation and operational test standards.

1704.16.2 1705.21.3 Special inspection of mechanical systems. Inspections of mechanical systems shall include the following as applicable to the system:

1. Visual certification that required components of such systems are complete in accordance with the manufacturers’ installation guidelines and the approved construction documents;

2. Supports, hangers,[,] and vibration isolation equipment are properly spaced and anchored to supporting structure;

   2.1. Seismic bracing shall be inspected in accordance with Section 1705.12.

3. Installation of required signage and safety instructions;

4. Electrical components are installed and electrical sign-off issued;

5. Ventilation balancing report is complete and in accordance with design documents and the system is operating as designed;

6. Required labeling, operational instructions and safety signage properly posted;

7. All related special inspections for such systems are complete;

8. The installation of exterior mechanical equipment for compliance with the approved construction documents, including, as applicable:

   8.1. Equipment specified;

   8.2. Equipment location;

   8.3. Installation and attachment details;

   8.4. Vibration isolation installation; and

   8.5. Other items specified by the applicant of record for the mechanical equipment design necessary to verify compliance with Section [928.2.4] 313.2.1 of the New York City Mechanical Code.

9. [Required fire] Fire and smoke dampers are installed and functioning properly.

1704.17 1705.22 Special inspection for fuel storage and fuel-piping systems. Fuel-oil storage equipment, including tanks, pumps, valves, transfer, return, fill and vent piping, hangers and bracing, fill and vent terminals, and related systems regulated by Section [1308] 1305 of the New York City Mechanical Code, shall be inspected for conformance with the approved construction documents and the manufacturers’ installation standards. Testing of fuel storage tanks and piping shall be performed in accordance with Section [1308] 1305 of the New York City Mechanical Code. Special
inspection of seismic bracing shall be performed in accordance with Section [1707.7] 1705.12 of this code.

Exceptions:

1. [Testing for listed] Listed fuel oil storage tanks 660 gallons (2498 L) or less in capacity, supplied with a label or manufacturer’s certification attesting that the tank was factory tested to a testing standard indicated in Section 1308.1 of the New York City Mechanical Code.

2. Systems and equipment exempt from service equipment certificate of compliance in accordance with Section 28-116.4.1 of the Administrative Code.

[1704.18] 1705.23 High-pressure-steam piping and high temperature hot water piping. High-pressure-steam piping and high temperature hot water piping regulated by Section [1210] 1211 of the New York City Mechanical Code, shall be subject to special inspection in accordance with this section. Special inspection of seismic bracing shall be performed in accordance with Section [1707.7] 1705.12 of this code.

[1704.18.1] 1705.23.1 Welding. The special inspector shall verify the qualifications of the welder and the quality of the welding materials and equipment prior to welding operations. The special inspector shall review the proposed welding procedures for compliance with applicable standards listed in Section [4240.2.2] 1211.2.2 of the New York City Mechanical Code.

[1704.18.2] 1705.23.2 Welding operations. The special inspector shall perform periodic inspection of the pipe joining and welding operations in accordance with the above. Radiographic testing shall be applied to connections as indicated in Section [1210.2.2] 1211.2.2 of the New York City Mechanical Code. Unacceptable connections and installations shall be rejected.

[1704.18.3] 1705.23.3 Testing of high-pressure-steam systems and high temperature hot water piping systems. Hydrostatic testing shall be performed on the completed installation of new and altered systems in accordance with Section [4240.2.3] 1211.2.3 of the New York City Mechanical Code. The special inspector shall witness all required hydrostatic tests.

Exception: Testing requirements shall not apply to alteration or repairs to existing piping systems in which the integrity of the piping is not affected. Such alterations shall be visually inspected for compliance with the approved construction documents.

[1704.19] 1705.24 High-pressure-gas piping. High-pressure-gas piping regulated in Section 406 of the New York City Fuel Gas Code shall be subject to special inspection in accordance with this section. Special inspection of seismic bracing shall be performed in accordance with Section [1707.7] 1705.12 of this code.

[1704.19.1] 1705.24.1 Welding. The special inspector shall verify the qualifications of the welder, the quality of the welding materials and equipment prior to welding operations. The special inspector shall review the proposed welding procedures for compliance with applicable standards listed in Section 406 of the New York City Fuel Gas Code.
**1704.19.2 Welding operations.** The special inspector shall perform periodic special inspection for the pipe joining and welding operations in accordance with the above. Radiographic testing shall be performed to the connections as indicated in Section [406.4] 406 of the *New York City Fuel Gas Code*.

**1704.19.3 Testing of high-pressure-gas piping.** Pressure testing shall be performed on the completed installation of new and altered systems in accordance with Section [406.4] 406 of the *New York City Fuel Gas Code*. The special inspector shall witness all required pressure tests.

**1704.20 Structural stability.** Special inspection for structural stability is an inspection of a structure to verify the ability of such structural system to remain in position, or revert to the original position or another stable equilibrium position acceptable by this code, without incurring damage to the structural system from the activity or load to which it had been subjected until the completion of construction. Such special inspection shall be required for construction work as specified in this section or elsewhere in this code. Structural materials and methods of construction utilized in temporary protections shall be subject to special inspection when such materials and methods of construction would be subject to special inspection as a permanent installation in accordance with the applicable sections of this chapter, including but not limited to special inspections for concrete, welding structural steel, and pile driving deep foundation installation. The registered design professional responsible for plans for a new building, alteration, or other work requiring structural stability inspections shall identify those areas on the plans submitted to the department in accordance with Section 1704.1.1.1. The means and methods of implementing the structural stability measures shall be prepared by a registered design professional and filed with the department where required in this section and elsewhere in this code.

**Exception:** Alterations consisting of the replacement of existing exterior lintels located less than 75 feet (22 860 mm) above curb level spanning less than 4 feet ([1219] 1220 mm) and existing interior headers spanning less than 4 feet ([1219] 1220 mm), provided the size of the existing span is not increased, shall be exempt from special inspection for structural stability.

**1704.20.1 Soil percolation tests.** Soil percolation tests shall be performed at the site of a proposed individual on-site private sewage disposal system installation to determine the suitability of the soil and site. Such test shall be performed under the supervision of a special inspector. The results of the percolation tests shall be filed on forms provided by the department, stating the suitability of the site and the capacity of the subsoil for the proposed use. The registered design professional of record for the dry-well system shall be notified immediately if the results of the percolation test demonstrate that the approved system may not function as designed.

**1704.20.1 Structural stability of Alterations to existing structures.** Alterations to existing structures in which loads are transferred from one structural system of structural elements to another, such as installation of columns or girders, replacement of existing bearing walls, the creation of openings or slots in existing walls, girders or floors, alteration of arches, rigid frames, trusses in frame buildings, where the stability or integrity of a structural system is to be temporarily diminished, or where otherwise required by the commissioner, shall be subject to special inspections in accordance with Sections [1704.20.6] 1705.25.7 through [1704.20.10] 1705.25.10.
1705.25.2 Construction operations influencing adjacent structures. Where construction operations have the potential to affect structurally the condition or occupancy of the subject structure and/or an adjacent structure, the structural stability of such structures shall be subject to special inspections in accordance with Sections 1704.20.6 through 1704.20.10.

1705.25.3 Excavations. Methods employed to protect the sides of excavations meeting the requirements of Item exception 1 of Section 3304.4.1, and blasting for the purpose of excavation shall be subject to special inspections in accordance with Sections 1704.20.6 through 1704.20.10.

1702.20.1 1705.25.3.1 Slurry. The proportions and installation of slurry mixtures to protect the sides of excavations shall be subject to special inspection. Slurry mix proportions and installation procedures shall be provided by a registered design professional, and the special inspection agency shall verify compliance with the approved procedures.

1705.25.3.2 New foundations. In addition to the special inspection for structural stability, any new foundation elements installed as part of support of excavation operations shall be subject to special inspection as a permanent installation in accordance with the applicable sections of this chapter, including, but not limited to, special inspection for concrete, structural steel, and deep foundation installation.

1705.25.3.3 Effect of blasting. Adjoining properties shall be subject to special inspection for structural stability due to the effects of blasting when blasting is utilized for excavation.

1705.25.4 Underpinning and alternate methods of support of buildings and adjacent property. Underpinning of structures and alternate methods of support of buildings and adjacent property shall be subject to special inspections in accordance with Sections 1704.20.6 through 1704.20.10.

1705.25.4.1 New foundations. In addition to the special inspection for structural stability, any new foundation elements installed as part of underpinning operations shall be subject to special inspection as a permanent installation in accordance with the applicable sections of this chapter, including, but not limited to, special inspection for concrete, structural steel, and deep foundation installation.

1705.25.5 Demolition. Demolition operations shall be subject to special inspection in accordance with Sections 1705.25.5.1 and 1705.25.5.2 as applicable to the operations.

1705.25.5.1 Mechanical means and methods of demolition. Where mechanical demolition equipment, other than handheld devices, is to be used in the full or partial demolition of a building from within the building, or is to be used within the building to remove debris or move material, such demolition operation shall be subject to special inspection in accordance with Sections 1704.20.6 through 1704.20.10. The special inspector shall visit the site at a minimum of three times: before demolition operations start, during demolition, and at the conclusion of demolition. Additionally, the special inspector shall visit the site at minimum intervals identified in the design documents and set forth in Section 1705.25.8.2.
1705.25.5.2 Other means of demolition. Where full or partial demolition of a weakened structure as specified in Section 3306.7 or the demolition of a masonry wall with a height to thickness ratio of 16 or greater is proposed, or the demolition of a floor structure directly supported by such wall, such demolition operation shall be subject to special inspection in accordance with Sections 1705.25.7 through 1705.25.10. The special inspector shall visit the site a minimum of three times: before demolition operations start, during demolition, and at the conclusion of demolition. Additionally, the special inspector shall visit the site at minimum intervals identified in the design documents and set forth in Section 1705.25.8.2.

1704.20.5 1705.25.6 Raising and moving of a building. A periodic special inspection shall be required in accordance with Sections [1704.20.6] 1705.25.7 through [1704.20.10] 1705.25.10 where the lowest above-grade floor or the lowest subgrade floor of a building is to be raised, lifted, elevated or moved.

1704.20.6 1705.25.7 Inspection program. Prior to commencement of work requiring special inspection per Section 1705.25, the special inspector shall review the approved construction documents, related reports, and contractor’s [proposed] sequence of operations and [determine the] confirm that all areas of work [that require requiring special inspection per Section 1705.25 have] design documents addressing the structural stability temporary protections and sequence. A written statement shall be [prepared, mutually acceptable to the contractor and the special inspector] included in the design documents prepared in accordance with Section 1705.25.8, indicating:

1. The portions of work requiring design documents in accordance with Section [1704.20.7] 1705.25.8.
2. The names and addresses of the licensed professionals that have been engaged to supply design documents for applicable work.
3. [The approximate dates for delivery of] Where filing of plans is required, the application and permit numbers for the design documents for the applicable work.
4. A schedule of [periodic] special inspections, at agreed intervals, including adequate frequency to assure the contractor’s continued compliance with the proposed designs and sequence of construction operations. At a minimum, the site must be inspected twice, once at a pre-construction meeting with the contractor and once during construction operations.

1704.20.7 1705.25.8 Design documents. Design documents, including shop drawings, sketches and written descriptions of proposed work regarding structural stability in construction operations shall be prepared by a registered design professional in the employ of the owner or the contractor. [Such Where required by this section or elsewhere in this code, the work associated with the structural stability protection methods shall be filed with the department. When filing of the design of protection methods is not required, such designs may be revised at any time by the registered design professional. Copies of the special inspection log book, the design documents and revisions thereof, shall be maintained at the job site, and at the office of the special inspector, available for use and review at all reasonable times, until the work subject to special inspection is complete. In the case of alteration to existing structures, the structural stability design documents shall be reviewed by the registered design professional of record.
1705.25.8.1 Monitoring. The design documents for structural stability shall include any requirements for monitoring of the subject structure and/or adjacent structures, as determined by the registered design professional responsible for the design. The monitoring plan shall be specific to the buildings to be monitored and operations to be undertaken, and shall specify the scope and frequency of monitoring, acceptable tolerances, and reporting criteria for when tolerances are exceeded, including when the department is required to be notified. The monitoring plan shall include provisions for daily monitoring, at a minimum, until the structural stability protection methods are no longer necessary. Such monitoring can be accomplished by remote means, in-person monitoring or any combination thereof.

1705.25.8.1.1 Additional monitoring requirements for demolition. The design documents for structural stability shall identify and specify the monitoring required for the demolition operation and be specific to all phases of the demolition operation. These specifications must be part of the requirements identified for special inspection.

1705.25.8.2 Additional requirements for design documents for demolition. Design documents for demolition shall indicate a project-specific required minimum interval for special inspections. A written statement of what the special inspection must include shall be provided on the design documents. The minimum special inspection interval must be incorporated into the demolition sequence. Building components and phases of demolition deemed to be structurally critical must be identified for inspection. A monitoring protocol must be provided in accordance with the requirements of Section 1705.25.8.1.1.

1705.25.8.3 Additional requirements for design documents for underpinning and alternate methods of support of buildings and adjacent property. Design documents for underpinning and alternate methods of support of buildings and adjacent property shall comply with the requirements of Section 1817. Such drawings shall indicate a project-specific required minimum interval for special inspections. A written statement of what the special inspection must include shall be provided on the design documents. The minimum special inspection interval must be incorporated into the sequence of operations. Building components and phases of operations deemed to be structurally critical must be identified for inspection. A monitoring protocol must be provided in accordance with the requirements of Section 1705.25.8.1.1. At a minimum, underpinning shall be subject to continuous special inspection for structural stability of the structure being underpinned while work is occurring.

1705.25.8.4 Additional requirements for design documents for protection of the sides of excavations and blasting. Design documents for protection of the sides of excavations and blasting methods of support of buildings and adjacent property shall indicate a project-specific required minimum interval for special inspections. A written statement of what the special inspection must include shall be provided on the design documents. The minimum special inspection interval must be incorporated into the sequence of operations. Building components and phases of operations deemed to be structurally critical must be identified for inspection. A monitoring protocol must be provided in accordance with the requirements of Section 1705.25.8.1.1. At a minimum, protection of the sides of excavations and blasting work shall be subject to continuous special inspection for structural stability of the structure or adjacent property being affected while work is occurring.
[1704.20.8] **1705.25.9 Inspection during construction operations.** The special inspector shall visit the jobsite at agreed intervals, assess the ongoing work and verify that operations conform with the design documents. Deficiencies shall be reported as required by Section 1704.1.2. In the event unsafe conditions are discovered, the commissioner and the registered design professional employed by the contractor shall be immediately notified by the special inspector.

[1704.20.9] **1705.25.10 Records of special inspections.** The special inspection logbook shall be maintained at the special inspector’s office and shall contain the following information:

1. Project identification, application number and address.
2. Date and time of each inspection.
3. Names of personnel who performed each inspection.
4. Dates of on-site and off-site meetings, names of the participants and a summary of the conversations.
5. Any significant observations or instructions given related to structural stability in any of the following:
   5.1. Deviations from the design documents.
   5.2. Anticipated field conditions.
   5.3. Proper execution of the work.
   5.4. Safe jobsite conditions.
   5.5. Precautions taken to maintain safe conditions, if work is stopped for any reason.

**1705.26 Tenant protection plan compliance.** When alteration, partial demolition, or construction operations are performed at occupied multiple dwellings, the special inspector shall periodically verify compliance with a tenant protection plan as provided for in Chapter 1 of Title 28 of the Administrative Code and Section 3303.10 of this code. Special inspections for compliance with the tenant protection plan shall comply with Sections 1705.26.1 and 1705.26.2 of this code.

**Exceptions:** Special inspection for tenant protection plan compliance is not required where the scope of the work is limited to:

1. A three-family home;
2. The interior of a single dwelling unit of an occupied multiple dwelling with no disruption to the essential services of other units, where such dwelling is owner-occupied. For a dwelling unit within a property that is owned by a condominium or held by a shareholder of a cooperative corporation under a proprietary lease, the unit must be occupied by the owners of record for such unit; or
3. The interior of a single dwelling unit of an occupied multiple dwelling three stories or less in height.

1705.26.1 Inspection frequency. Special inspections shall be performed throughout the duration of the tenant protection plan at sufficient periodic intervals to verify compliance with the tenant protection plan throughout the course of work. At a minimum, inspections shall be performed:

1. Prior to the start of construction and/or demolition to document conditions prior to work;

2. At the start of construction and/or demolition;

3. Once per week during construction and/or demolition;

4. After a tenant protection plan violation has been issued to verify that the violation was corrected;

5. When the location of the alteration or construction operations performed in conjunction with the tenant protection plan has moved to another location; and

6. Whenever construction or demolition operations have changed, requiring changes in methods of protection.

1705.26.2 Reporting. A written record of the special inspections performed for the tenant protection plan shall be maintained in a log prepared by the special inspector. The log shall include an entry for each inspection and shall indicate that the alteration or construction operation is being performed in accordance with the tenant protection plan. Copies of the special inspection log book shall be maintained at the job site, and at the office of the special inspector, and shall be available for use and review at all reasonable times, until the work subject to special inspection is complete.

[1704.21] 1705.27 Private on-site storm water disposal systems and detention facilities. Storm water detention and retention systems required to comply with Section 1114 of the New York City Plumbing Code, and roof detention facilities shall be inspected for compliance with the provisions of this section.

[1704.21.1] 1705.27.1 Subsurface investigation special inspection. Soil borings, testpits and soil percolation testing shall be subject to the special inspection requirements of this section.

[1704.21.1.1] 1705.27.1.1 Soil borings and testpits. Prior to the approval of construction documents, soil borings and testpits shall be performed in accordance with the provisions of Section 1114.2.1 of the New York City Plumbing Code. Soil borings and testpits shall be performed under the supervision of a special inspector. The results of the soil borings and testpits shall be filed on forms provided by the department.

[1704.21.1.2] 1705.27.1.2 Soil percolation tests. Prior to the approval of construction documents, soil percolation tests shall be performed in accordance with the provisions of Section 1114.2.2 of the New York City Plumbing Code at the site of a proposed on-site stormwater drainage and detention facility installation to determine the suitability of the soil and site. Such test shall be performed under the supervision of a special inspector. The results
of the percolation tests shall be filed on forms provided by the department, stating the suitability of the site and the capacity of the subsoil for the proposed use. The registered design professional of record for the dry-well system shall be notified immediately if the results of the percolation test demonstrate that the system may not function as designed.

[1704.21.2] 1705.27.2 Installation special inspection. Private on-site stormwater disposal systems and detention facilities shall be inspected for conformance with the approved construction documents. Minor variations, based on actual site conditions, shall be acceptable at the discretion of the registered design professional of record. Verification shall include:

1. Materials of construction.
2. [Bedding] Compliance of bedding, per Section 306 of the New York City Plumbing Code, of pipe and facilities.
3. Placement and installation of fill materials.
4. Volume of drywell and detention facilities.
5. Installation of volume flow control devices.
7. Overall conformance with the approved construction documents.
8. Detention tanks, and roofs used for stormwater detention, shall be filled with water to demonstrate water tightness for a 2-hour duration or as specified by the registered design professional or the manufacturer’s specifications.

[1704.22] 1705.28 Individual on-site private sewage disposal systems. Individual on-site private sewage disposal systems shall be inspected in accordance with the rules of the department.

[1704.23] 1705.29 Sprinkler system special inspection. New and altered sprinkler systems shall be inspected in accordance with Sections 903 and 1704.23.1. The permit holder responsible for the sprinkler work shall perform all required acceptance tests, complete and sign the appropriate contractor’s material and test certifications. The special inspector shall witness all required tests and shall verify that all installations of all materials, fittings, hangers, assemblies and signage are in accordance with the approved construction documents, that painting of the sprinkler system required by Section 903.6 of this code has been performed and that the contractor has transmitted required maintenance literature and instruction to the owner. The special inspector shall verify that the material and test certification forms have been transmitted to the Fire Department and the Department of Buildings. Seismic bracing shall be inspected in accordance with Section 1707.7.1.

Exception: [The special inspection agency need not witness the hydrostatic pressure test when such test is witnessed by the department.] If the department witnesses a hydrostatic pressure test, it need not be witnessed by the special inspection agency.
1704.23.4 1705.29.1 Hydrostatic pressure testing. All new or altered sprinkler systems in buildings shall undergo successful hydrostatic pressure testing by a licensed master plumber or licensed fire suppression piping contractor in accordance with the requirements of this code, including Section 901.5 of this code, and NFPA 13.

Exceptions:Modification of six or fewer sprinklers:

1. May be tested under working pressure in lieu of hydrostatic testing, or

2. Need not be witnessed by a special inspection when the hydrostatic test is performed by the licensed installing contractor.

1704.24 1705.30 Standpipe system special inspection. New and altered standpipe systems shall be inspected in accordance with Sections 905 and 1704.24.1. Fire pump tests associated with standpipe systems shall be tested in accordance with Section 1705.30.2. The permit holder responsible for the standpipe work shall perform all required acceptance tests, and complete and sign the appropriate contractor’s material and test certifications. The special inspector shall witness all required tests, verify that installation of all materials, fittings, hangers, assemblies and signage are in accordance with the approved construction documents, that painting of the standpipe system required by Section 905.11[ of this code] has been performed and that the contractor has transmitted required maintenance literature and instruction to the owner. The special inspector shall verify that the material and test certification forms have been transmitted to the Fire Department and the Department of Buildings. Seismic bracing shall be inspected in accordance with Section 1707.7.

Exception: The special inspection agency need not witness the hydrostatic pressure test [shall not be required] when such test is witnessed by the department.

1704.24.1 1705.30.1 Hydrostatic pressure testing. All new or altered standpipe systems in buildings shall undergo successful hydrostatic pressure testing by a licensed master plumber or licensed fire suppression piping contractor in accordance with the requirements of this code, including Section 901.5, Sections [4-1] 1704.24.1 through [4-5] 1705.30.1.5 and NFPA 14.

Exception: When the standpipe system is exposed to freezing conditions, a hydrostatic pressure test required by this section may be postponed until such conditions no longer exist, notwithstanding any requirement that the standpipe be maintained in a state of readiness, provided that the system undergoes an interim test with dry nitrogen or air using a compressor in accordance with NFPA 14. Any such air pressure tests shall be witnessed by the special inspector unless witnessed by the department.

1704.24.1.1 1705.30.1.1 New buildings under construction. For standpipes required to comply with Section 3303.8 of this code, an initial hydrostatic pressure test of the entire system shall be performed when the building reaches a height of 75 feet (22 860 mm) and additional successful hydrostatic pressure tests of the entire system shall be performed at 175 feet (53 340 mm), and at every 100 feet (30 480 mm) in height thereafter. The permit holder shall perform a final acceptance test of the completed system in accordance with the requirements of Section 901.5[ of this code].
**1704.24.1.2** **1705.30.1.2** Enlargements or additions to existing system. Where there is an enlargement that triggers a new standpipe system or there is an addition to an existing standpipe system, hydrostatic pressure tests of the entire system shall be performed for every 75 feet (22 860 mm) of additional height added to the system. The permit holder shall perform a final acceptance test of the completed system in accordance with the requirements of Section 901.5 [of this code].

**1704.24.1.3** **1705.30.1.3** Removal of stories, including full demolitions. Where stories are removed from a building served by an existing standpipe system, hydrostatic pressure tests of the entire system shall be performed prior to the commencement of work.

**1704.24.1.4** **1705.30.1.4** Alterations. For alterations not covered under Sections [1704.24.1.2] **1705.30.1.2** or [1704.24.1.3] **1705.30.1.3** above, the permit holder shall perform a final acceptance test of the completed system in accordance with the requirements of Section 901.5 [of this code].

**1704.24.1.5** **1705.30.1.5** Readiness. No standpipe system shall be considered in readiness until there has been a successful hydrostatic pressure test.

**1705.30.2** Fire pump tests. Fire pump tests associated with standpipe systems shall be tested in accordance with Section 913.5 of this code. The special inspector shall witness all required tests and shall verify that all installations comply with NFPA 20 and are in accordance with the approved construction documents.

**1705.31** Heating systems. Special inspection shall be required for new and altered boilers and heating systems. All boilers and heating systems, including chimney connectors, shall be inspected for compliance with the approved construction documents. New heating systems shall be tested in accordance with Section 1011 of the New York City Mechanical Code. Alterations to heating systems shall be subjected to applicable tests for the altered portions of the system and to verify its satisfactory operation within the existing system. Special inspection of seismic bracing shall be performed in accordance with Section [1707.7] **1705.12** of this code.

**Exception:** Tests and inspections need not duplicate any valid tests or inspections previously certified by the commissioner or a duly authorized insurance company.

**1705.32** Chimneys and vents. New and altered chimneys and vents, replacing an existing appliance in accordance with Section 503.5.6 of the New York City Fuel Gas Code, or change in appliance in accordance with Section 507 of the New York City Fuel Gas Code and Section 807 of the New York City Mechanical Code shall be subject to special inspection. The chimney or vent shall be inspected to verify compliance with the approved construction documents, and proper clearance or isolation from adjacent combustible construction. Testing of the chimney or vent shall be performed as applicable in accordance with Section 810 of the New York City Mechanical Code and Section 503.5.6 of the New York City Fuel Gas Code. Special inspection of seismic bracing shall be performed in accordance with Section [1707.7] **1705.12** of this code.

**Exception:** A pressurized smoke test need not be performed on an existing negative pressure chimney if the lining of such chimney is not affected by alterations and the registered design professional specifies on the approved construction documents that such test does not need to be
performed on such chimney. Refer to Section 810 of the New York City Mechanical Code and Section 503.5.6 of the New York City Fuel Gas Code for smoke test requirements. A pressurized smoke test need not be performed on existing and new Listed Type B gas vents and Type L vents. Listed Type B gas vents and Type L vents shall be visually inspected for the presence of a continuous inner wall, proper installation, and no damage or deterioration via readily accessible areas of the vent system, such as the appliance, tee caps, cleanout openings, or termination. The vent system shall be inspected for proper clearances, protection and damage.

1705.32.1 Reuse of existing chimneys. When a new heating system appliance is installed, the special inspector shall verify the condition of the existing chimney lining and breaching. Deficiencies shall be reported as required by Section 1704.1.1.2.

1704.27 Fire-resistant penetrations and joints. Special inspections for through penetrations, membrane penetration firestops, fire resistant joint systems, and perimeter fire barrier systems that are tested and listed in accordance with Sections 713.4.1.1.2, 713.4.1.2, 714.3 and 714.4 shall comply with Sections 1704.27.1 and 1704.27.2.

1704.27.1 Penetration firestops. Inspections of penetration firestop systems that are tested and listed in accordance with Sections 713.4.1.1.2 and 713.4.1.2 shall be conducted by an approved special inspection agency in accordance with ASTM E 2174.

1704.27.2 Joint systems. Inspection of fire resistant joint systems that are tested and listed in accordance with Sections 714.3 and 714.4 shall be conducted by an approved special inspection agency in accordance with ASTM E 2393.

1704.28 Aluminum construction. The special inspections for structural aluminum elements of buildings and structures shall be as required by Section 1705.33.1.

1704.28.1 Welding operations. All welding operations of aluminum elements shall be subject to special inspection for compliance with this code, AA ADM and AWS D1.2.

Exception: Welding operations in connections where the calculated stresses in the welds are less than 50 percent of the basic allowable values. Such connections shall be specifically indicated on the approved construction documents.

1704.29 Flood zone compliance. Special inspection for flood zone compliance shall be as required by Appendix G of this code.

1704.30 Photoluminescent] 1705.35 Luminous exit path markings. The installation of photoluminescent egress luminous exit path markings shall be subject to special inspection in accordance with the requirements of Section 1025.8. The special inspector shall verify that approved photoluminescent egress luminous exit path markings were provided and installed in accordance with department rules and regulations Section 1704, the approved construction documents, and manufacturer’s instructions.

1704.31 Emergency and standby power systems (generators). The installation of generators as part of emergency and standby power systems shall be subject to special inspection. The special inspector shall: perform visual inspections; verify that the installations of all materials,
equipment and signage complies with the installation standards; and verify that the installation of the generator and associated connections complies with the approved construction documents. The special inspector shall witness tests that verify the automatic operation of the emergency or standby power system in accordance with NFPA 110 and NFPA 111[1], as such standards may have been amended by the New York City Electrical Code or this code]. Deficient results shall be rejected, and deficiencies shall be corrected and successfully retested in the presence of the special inspector prior to sign-off of the emergency or standby power system special inspection. Special inspection of seismic bracing shall be performed in accordance with Section [1702.7] 1705.12 of this code.

[1704.32] 1705.37 Post-installed anchors. The installation of post-installed mechanical anchors, adhesive anchors, and screw anchors shall comply with Table [1704.32] 1705.37. The special inspection shall include the verification of compliance with approved construction documents and standards established by the commissioner pursuant to Section 28-113.2.2 of the Administrative Code.

[1704.33 **Tenant protection plan.** When alteration, partial demolition, or construction operations are performed at occupied multiple dwellings, the department shall periodically verify compliance with a tenant protection plan as provided for in Chapter 1 of Title 28 of the Administrative Code and Section 3303.10.]

1705.38 **Special inspection for nonpotable water systems.** Testing and inspection of nonpotable water systems shall be in accordance with Chapter 13 of the *New York City Plumbing Code*. The special inspector shall witness all required tests in accordance with Chapter 13 of the *New York City Plumbing Code*.

1705.38.1 **Tests for nonpotable water systems.** Tests of nonpotable water systems shall be performed in accordance with Sections 1705.38.1.1 through 1705.38.1.2 of this code.

1704.38.1.1 **Water storage tanks.** Water storage tanks shall be tested in accordance with Sections 1302.12.2 and 1303.15.4 of the *New York City Plumbing Code*.

1705.38.1.2 **Roofwashers.** Roofwashers shall be tested in accordance with Section 1303.15.2 of the *New York City Plumbing Code*.

1705.38.2 **Special inspection of nonpotable water systems.** Inspections of nonpotable water systems shall include the following as applicable to the system:

---

1350
**1705.38.2.1** Visual inspection that components of such systems are complete in accordance with the manufacturers’ instructions and the approved construction documents;

**1705.38.2.2** Required labeling, operational instructions and safety signage properly posted.

**1705.38.2.3** **Inspection of vermin and insect protection.** Inlets and vents to the system shall be inspected in accordance with Sections 1302.12.5 and 1303.15.7 of the *New York City Plumbing Code*.

**1705.39** Special inspection for exhaust and vent systems in plenums and ducts. Chimneys, vents, and exhaust systems under positive pressure that penetrate ducts or plenums installed in accordance with exceptions 1 and 2 of Section 601.4 of the *New York City Mechanical Code* shall be inspected for conformance with the approved construction documents.

**1705.39.1** **Visual inspection.** Visual inspection shall confirm that joints, seams, and connections of covered mechanical systems are securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes.

**1705.39.2** **Smoke test.** The special inspection shall include witnessing the system smoke test performed in accordance with Section 810 of the *New York City Mechanical Code*.

[1707.7 Mechanical, plumbing, fuel gas, and electrical components.** Special inspection for mechanical, plumbing, fuel gas, and electrical systems and equipment shall be as follows:**]

[1. Periodic special inspection is required during the anchorage of electrical equipment for emergency or standby power systems in structures assigned to Seismic Design Category C or D.]
[2. Periodic special inspection is required during the installation of piping systems intended to carry flammable, combustible or highly toxic contents and their associated mechanical units in structures assigned to Seismic Design Category C or D.]

[3. Periodic special inspection is required during the installation of HVAC ductwork that will contain hazardous materials in structures assigned to Seismic Design Category C or D.]

(1707.8 Seismic isolation system. There shall be periodic special inspection during the fabrication and installation of isolator units and energy dissipation devices if used as part of the seismic isolation system.)

SECTION BC [1711] 1706 DESIGN STRENGTHS OF MATERIALS

(1711.1) 1706.1 Conformance to standards. The design strengths and permissible stresses of any structural material that are identified by a manufacturer’s designation as to manufacture and grade by mill tests, or the strength and stress grade is otherwise confirmed to the satisfaction of the commissioner shall conform to the specifications and methods of design of accepted engineering practice or the rules of the department in the absence of applicable standards.

(1711.2) 1706.2 New materials. For materials that are not specifically provided for in this code, the design strengths and permissible stresses shall be established by tests as provided for in Section [1712] 1707.

**SECTION BC [1712] 1707 ALTERNATIVE TEST PROCEDURE**

(1712.1) 1707.1 General. In the absence of rules or other approved standards, and upon special application by a registered design professional the commissioner shall make, or cause to be made, the necessary tests and investigations; or the commissioner shall accept duly authenticated reports from approved agencies in respect to the quality and manner of use of new materials or assemblies as provided for in Article 113 of Chapter 1 of Title 28 of the Administrative Code. The cost of all tests and other investigations required under the provisions of this code shall be borne by the permit applicant.

**SECTION BC [1713] TEST SAFE LOAD**

(1713.1) Where required. Where proposed construction is not capable of being designed by approved engineering analysis, or where proposed construction design method does not comply with
the applicable material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section 1715. The commissioner shall accept certified reports of such tests conducted by an approved testing agency, provided that such tests meet the requirements of this code and approved procedures.

SECTION BC [1714] 1708
IN-SITU LOAD TESTS

[1714.1] 1708.1 General. Whenever there is a reasonable doubt as to the stability or load-bearing capacity of a completed building, structure or portion thereof for the expected loads, an engineering assessment shall be required. The engineering assessment shall involve either a structural analysis or an in-situ load test, or both. The structural analysis shall be based on actual material properties and other as-built conditions that affect stability or load-bearing capacity, and shall be conducted in accordance with the applicable design standard. If the structural assessment determines that the load-bearing capacity is less than that required by the code, load tests shall be conducted in accordance with Section [1714.2] 1708.2. If the building, structure or portion thereof is found to have inadequate stability or load-bearing capacity for the expected loads, modifications to ensure structural adequacy or the removal of the inadequate construction shall be required.

[1714.2] 1708.2 Test standards. Structural components and assemblies shall be tested in accordance with the appropriate material standards listed in Chapter 35. In the absence of a standard that contains an applicable load test procedure, the test procedure shall be developed by a registered design professional and approved. The test procedure shall simulate loads and conditions of application that the completed structure or portion thereof will be subjected to in normal use.

[1714.3] 1708.3 In-situ load tests. In-situ load tests shall be conducted in accordance with Section [1714.3.1] 1708.3.1 or [1714.3.2] Section 1708.3.2 and shall be supervised by a registered design professional. The test shall simulate the applicable loading conditions specified in Chapter 16 as necessary to address the concerns regarding structural stability of the building, structure or portion thereof.

[1714.3.1] 1708.3.1 Load test procedure specified. Where a standard listed in Chapter 35 contains an applicable load test procedure and acceptance criteria, the test procedure and acceptance criteria in the standard shall apply. In the absence of specific load factors or acceptance criteria, the load factors and acceptance criteria in Section [1714] 1708.3.2 shall apply.

[1714.3.2] 1708.3.2 Load test procedure not specified. In the absence of applicable load test procedures contained within a standard referenced by this code or acceptance criteria for a specific material or method of construction, such existing structure shall be subjected to a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components that are not a part of the seismic-load-resisting system, the test load shall be equal to two times the unfactored design loads. The test load shall be left in place for a period of 24 hours. The structure shall be considered to have successfully met the test requirements where the following criteria are satisfied:

1. Under the design load, the deflection shall not exceed the limitations specified in Section 1604.3.
2. Within 24 hours after removal of the test load, the structure shall have recovered not less than 75 percent of the maximum deflection.

3. During and immediately after the test, the structure shall not show evidence of failure.

SECTION BC [1715] 1709
PRECONSTRUCTION LOAD TESTS

[1715.1] 1709.1 General. In evaluating the physical properties of materials and methods of construction that are not capable of being designed by approved engineering analysis or do not comply with applicable material design standards listed in Chapter 35, the structural adequacy shall be predetermined based on the load test criteria established in this section.

[1715.2] 1709.2 Load test procedures specified. Where specific load test procedures, load factors and acceptance criteria are included in the applicable design standards listed in Chapter 35, such test procedures, load factors and acceptance criteria shall apply. In the absence of specific test procedures, load factors or acceptance criteria, the corresponding provisions in Section [1715.3] 1709.3 shall apply.

[1715.3] 1709.3 Load test procedures not specified. Where load test procedures are not specified in the applicable design standards listed in Chapter 35, the load-bearing and deformation capacity of structural components and assemblies shall be determined on the basis of a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components and assemblies that are not a part of the seismic-load-resisting system, the test shall be as specified in Section [1715.3.1] 1709.3.1. Load tests shall simulate the applicable loading conditions specified in Chapter 16.

[1715.3.1] 1709.3.1 Test procedure. The test assembly shall be subjected to an increasing superimposed load equal to not less than two times the superimposed design load. The test load shall be left in place for a period of 24 hours. The tested assembly shall be considered to have successfully met the test requirements if the assembly recovers not less than 75 percent of the maximum deflection within 24 hours after the removal of the test load. The test assembly shall then be reloaded and subjected to an increasing superimposed load until either structural failure occurs or the superimposed load is equal to two and one-half times the load at which the deflection limitations specified in Section [1715.3.2] 1709.3.2 were reached, or the load is equal to two and one-half times the superimposed design load. In the case of structural components and assemblies for which deflection limitations are not specified in Section [1715.3.2] 1709.3.2, the test specimen shall be subjected to an increasing superimposed load until structural failure occurs or the load is equal to two and one-half times the desired superimposed design load. The allowable superimposed design load shall be taken as the lesser of:

1. The load at the deflection limitation given in Section [1715.3.2] 1709.3.2.

2. The failure load divided by 2.5.

3. The maximum load applied divided by 2.5.
Deflection. The deflection of structural members under the design load shall not exceed the limitations in Section 1604.3.

Wall and partition assemblies. Load-bearing wall and partition assemblies shall sustain the test load both with and without window framing. The test load shall include all design load components. Wall and partition assemblies shall be tested both with and without door and window framing.

Exterior window and door assemblies. The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1715.5.1 or 1715.5.2 Section 1709.5.2.

Exception: Structural wind load design pressures for window units smaller than the size tested in accordance with Section 1715.5.1 or 1715.5.2 shall be permitted to be higher than the design value of the tested unit provided such higher pressures are determined by accepted engineering analysis. All components of the small unit shall be the same as the tested unit. Where such calculated design pressures are used, they shall be validated by an additional test of the window unit having the highest allowable design pressure.

Exterior windows and doors. Exterior windows and doors shall be tested and labeled as conforming to AAMA/WDMA/CSA 101/I.S.2/A440. The label shall state the name of the manufacturer, the approved labeling agency and the product designation as specified in AAMA/WDMA/CSA 101/I.S.2/A440. Products tested and labeled as conforming to AAMA/NWWDA 101/I.S.2/AAMA/WDMA/CSA 101/I.S.2/A440 shall not be subject to the requirements of Sections 2403.2 and 2403.3.

Exterior windows and door assemblies not provided for in Section 1715.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Structural performance of garage doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403 of this code. The design pressure for testing shall be calculated in accordance with Chapter 16 of this code. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

Skylights and sloped glazing. Skylights and sloped glazing shall comply with the requirements of Chapter 24.

Test specimens. Test specimens and construction shall be representative of the materials, workmanship and details normally used in practice. The properties of the materials used to construct the test assembly shall be determined on the basis of tests on samples taken from the load assembly or on representative samples of the materials used to construct the load test assembly. Required tests shall be conducted or witnessed by an approved agency.
SECTION BC 1710
TEST SAFE LOAD

1710.1 Where required. Where proposed construction is not capable of being designed by approved engineering analysis, or where proposed construction design method does not comply with the applicable material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section 1711. The commissioner shall accept certified reports of such tests conducted by an approved testing agency, provided that such tests meet the requirements of this code and approved procedures.

SECTION BC [4746] 1711
MATERIAL AND TEST STANDARDS

[4746.1] 1711.1 Test standards for joist hangers and connectors. Test standards for joist handlers and connectors shall be in accordance with Sections 1711.1.1 through 1711.2.2.

[4746.1.1] 1711.1.1 Test standards for joist hangers. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D 1761, using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AF&PA NDS for the joist and headers.

Exception: The joist length shall not be required to exceed 24 inches (609.6 mm).

[4746.1.2] 1711.1.2 Vertical load capacity for joist hangers. The vertical load capacity for the joist hanger shall be determined by testing a minimum of three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load of the joist hanger shall be the lowest value determined from the following:

1. The lowest ultimate vertical load for a single hanger from any test divided by three (where three tests are conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).

2. The average ultimate vertical load for a single hanger from all tests divided by six (where six or more tests are conducted).

3. The average from all tests of the vertical loads that produce a vertical movement of the joist with respect to the header is 0.125 inch (3.2 mm).

4. The sum of the allowable design loads for nails or other fasteners utilized to secure the joist hanger to the wood members and allowable bearing loads that contribute to the capacity of the hanger.

5. The allowable design load for the wood members forming the connection.

[4746.1.3] 1711.1.3 Torsional moment capacity for joist hangers. The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment of the joist hanger shall be the
average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 0.125 inch (3.2 mm).

[1716.1.4] 1711.1.4 Design value modifications for joist hangers. Allowable design values for joist hangers that are determined by Item 4 or 5 in Section [1716.1.2] 1711.1.2 shall be permitted to be modified by the appropriate duration of loading factors as specified in AF&PA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section [1716.1.2] 1711.1.2. Allowable design values determined by Item 1, 2 or 3 in Section [1716.1.2] 1711.1.2 shall not be modified by duration of loading factors.

[1716.2] 1711.2 Concrete and clay roof tiles. Concrete and clay roof tiles shall be tested in accordance with Sections 1711.2.1 and 1711.2.2.

[1716.2.1] 1711.2.1 Overturning resistance. Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with ICC SBCCI SSTD 11 and Chapter 15.

[1716.2.2] 1711.2.2 Wind tunnel testing. When roof tiles do not satisfy the limitations in Chapter 16 for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with ICC SBCCI SSTD 11 and Chapter 15.

§ 19. Chapter 18 of the New York city building code as added by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 18
SOILS AND FOUNDATIONS

SECTION BC 1801
GENERAL [AND DEFINITIONS]

1801.1 Scope. The provisions of this chapter shall apply to building and foundation systems in those areas not subject to scour or water pressure by wind and wave action. Buildings and foundations subject to such scour or water pressure loads shall be designed in accordance with Chapter 16 and Appendix G. [(Note: Where the text in this Code refers to ASCE 7, the 2005 edition shall be used; and where the text in this Code refers to ASCE 7-10, the 2010 edition shall be used.)]

1801.2 Design. Allowable bearing pressures, allowable stresses and design formulas provided in this chapter shall be used with the allowable stress design load combinations specified in Section 1605.3. The quality and design of materials used structurally in excavations and foundations shall [conform to] comply with the requirements specified in Chapters 16, 19, 21, 22 and 23. Excavations and fills shall also comply with Chapter 33.

1801.2.1 Foundation design for seismic overturning. Where foundations are proportioned using the load combinations of Sections 1605.2 or 1605.3.1 and the computation of seismic overturning effects is by equivalent lateral force or modal analysis, the proportioning shall be in accordance with Section 12.13.4 of ASCE [7-10]. 7.
[1801.3-Definitions.] 1802.1 General. The following terms [shall, for the purposes of this chapter, have the meanings shown herein.] are defined in Chapter 2:

AUGERED-CAST-IN-PLACE PILES. [Augered cast in place piles are constructed by pumping grout into an augered hole during the withdrawal of the auger. The pile is reinforced with a single reinforcing bar, a reinforcing steel cage or a structural steel section.]

CAISSON PILES. [Steel cased piles constructed by advancing a steel shell seated into rock and drilling of an unexcavated socket within the rock. The shell and socket are filled with a steel core section or steel reinforcing and concrete or grout.]

COMPACTED CONCRETE PILES. [Compacted concrete piles are constructed by filling a driven casing with low-strength concrete and compacting the concrete as the casing is withdrawn.]

COMPOSITE PILES. [Composite piles consist of two or more approved pile types joined together.]

CONCRETE-FILLED STEEL PIPE AND TUBE PILES. [Concrete-filled steel pipe and tube piles are constructed by driving a steel pipe or tube section into the soil and filling the pipe or tube section with concrete. The steel pipe or tube section is left in place during and after the deposition of the concrete. For the purposes of this code these piles shall be considered driven piles.]

DAMPPROOFING. [Dampproofing is a protective measure applied to building foundation walls and slabs to prevent moisture from passing into interior spaces.]

DEEP FOUNDATIONS. [Deep foundations are comprised of concrete, grout, wood or steel structural elements either driven, drilled or jacked into the ground or cast in place. Deep foundations are relatively slender in comparison to their length, with lengths exceeding 12 times the least horizontal dimension. Deep foundations derive their load-carrying capacity through skin friction, end bearing, or a combination thereof.]

DRILLED DISPLACEMENT PILES.

DRIVEN UNCASED PILES. [Driven uncased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole that is later filled with concrete. The steel casing is lifted out of the hole during the deposition of the concrete. Driven uncased piles are not permitted under the provisions of this code.]

ENLARGED BASE PILES. [Enlarged base piles are cast-in-place concrete piles constructed with a base that is larger than the diameter of the remainder of the pile. The enlarged base is designed to increase the load-bearing area of the pile in end bearing. Enlarged base piles include piles installed by driving a precast concrete tip or by compacting concrete into the base of the pile to form an enlarged base.]

[HELICAL PILES. Helical piles are manufactured deep foundation steel elements consisting of a shaft and one or more helical bearing plates (helices) screwed into the ground by application of
torque on the shaft. The various products marketed as screw piles, torque anchors, and helical piers are considered helical piles.]

[H-PILES. Steel H-piles are constructed by driving a steel H-shaped section into the ground.]

FIXED HEADED PILE (DEEP FOUNDATION). [A pile connected to a pile cap in a manner that prevents rotation of the pile head.]

FREE HEADED PILE. [A pile with a head that is free to rotate.]

GEOTECHNICAL CAPACITY OF DEEP FOUNDATIONS. [The load that can be supported by the soil or rock surrounding deep foundation as determined using a recognized method of analysis or as established by load tests. The geotechnical capacity can be developed through skin friction, end bearing, or a combination thereof.]

HELICAL PILES.

H-PILES.

LIQUEFACTION. [For granular soils, liquefaction is defined as the loss of shear strength in soils resulting from increased pore-water pressure and reduced effective stress that may develop as a result of cyclic loading during earthquakes. For cohesive soils with a plasticity index of less than 20, liquefaction is defined as any transient softening and increased cyclic shear strains that may occur during earthquakes.]

MICROPILE. [A micropile is a drilled and grouted deep foundation element with a diameter that measures 5 inches (127 mm) to 14 inches (356 mm) that develops its load-carrying capacity by means of a bond zone in soil (also commonly known as a minipile).]

PERMANENT PRESTRESSED ROCK AND SOIL ANCHORS.

PIER FOUNDATION. [A pier foundation is a shallow foundation element of masonry or cast-in-place concrete construction. Piers are relatively short in comparison to their width, with lengths less than or equal to 12 times the least horizontal dimension of the pier. Piers derive their load-carrying capacity from end bearing on soil or rock.]

RETAINING WALL. [A wall that resists lateral or other forces caused by soil, rock, water or other materials, thereby limiting lateral displacement and the movement of the supported materials. Basement walls and vault walls that are parts of buildings and underground structures, including but not limited to utility vault structures, tunnels and transit stations, are not considered retaining walls.]

SHALLOW FOUNDATION. [A shallow foundation is an individual or strip footing, a mat foundation, a slab-on-grade foundation or a similar foundation element.]

UNDERPINNING. [The alteration of an existing foundation to transfer loads to a lower bearing stratum using new piers, piles, or other structural support elements installed below the existing foundation.]
WATERPROOFING. [Waterproofing is a protective measure applied to building foundation walls and slabs to prevent moisture and liquid water from passing into interior spaces.]

SECTION BC [1802] 1803 GEOTECHNICAL INVESTIGATIONS AND MATERIAL CLASSIFICATIONS

[1802.1] 1803.1 General. Geotechnical investigations shall be subject to special inspections in accordance with Sections [1704.7, 1704.8 and 1704.9] 1705.6, 1705.7 and 1705.19 and be conducted in accordance with Sections [1802.2] 1803.2 through [1802.7] 1803.7. An engineer shall scope, supervise and approve the subsurface investigation and the classification of the soil and rock encountered.

[1802.2] 1803.2 Where required. A geotechnical investigation shall be performed and report shall be conducted for:

1. New structures;
2. Horizontal enlargements;
3. Vertical enlargements or alterations necessitating new foundations or resulting in additional loading that exceeds 5 percent of the existing foundation design capacity; or
4. As required by the commissioner or applicant of record.

The geotechnical investigation shall be performed in accordance with Sections [1802.4] 1803.4 through [1802.6] 1803.6. For structures in Seismic Design Category C or D, the requirements of Sections [1802.2.1] 1803.2.1 and [1802.2.2] 1803.2.2 shall also apply.

[1802.2.1] 1803.2.1 Seismic Design Category C. For structures assigned to Seismic Design Category C in accordance with Section 1613, the geotechnical investigation shall include an evaluation of the following potential geologic and seismic hazards resulting from earthquake motions: slope instability, liquefaction and surface rupture due to faulting or lateral spreading. Peak ground acceleration for use in liquefaction analyses shall be determined in accordance with Section 1816.2.1.:

1. Slope instability.
2. Liquefaction. Peak ground accelerations for use in such analyses shall be determined in accordance with Section 1816.2.1.
3. Total and differential settlement.
4. Surface displacement due to faulting or seismically induced lateral spreading or lateral flow.

[1802.2.2] 1803.2.2 Seismic Design Category D. For structures assigned to Seismic Design Category D in accordance with Section 1613, the requirements for Seismic Design Category C, given in] geotechnical investigation shall meet the
requirements of Section 1802.2.1 shall be met. In addition, the following shall be conducted:

1803.2.1 and the following as applicable:

1. A determination of dynamic seismic lateral earth pressures on [basement, cellar,] foundation walls and retaining walls supporting more than 6 feet (1828.8 mm) of in situ soil or backfill height due to design earthquake ground motions. Peak ground acceleration for use in lateral pressure analyses shall be determined in accordance with Section 1813.2.1.

2. The potential for liquefaction and soil strength loss evaluated for site peak ground acceleration, earthquake magnitude and source characteristics consistent with the maximum considered earthquake ground motions. Peak ground accelerations for use in such analyses shall be determined in accordance with Section 1816.2.1.

3. An assessment of potential consequences of [any] liquefaction and soil strength loss, including [estimation of differential settlement, lateral movement or reduction in foundation soil bearing capacity. Mitigation measures shall be addressed. Such measures shall be given consideration in the design of the structure and shall include, but are not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements or any combination of these measures], but not limited to, the following:

   3.2. Lateral soil movement.
   3.3. Lateral soil loads on foundations.
   3.4. Reduction in foundation soil-bearing capacity and lateral soil reaction
   3.5. Soil downdrag and reduction in axial and lateral soil reaction for pile foundations.
   3.6. Increases in soil lateral pressures on retaining walls.
   3.7. Flotation of buried structures.

4. Discussion of mitigation measures such as, but not limited to, the following:

   4.1. Selection of appropriate foundation type and depths.
   4.2. Selection of appropriate structural systems to accommodate anticipated displacements and forces.
   4.3. Ground stabilization.
   4.4. Any combination of these measures and how they shall be considered in the design of the structure.
1802.3 Material classification. Soil and rock classification shall be based on materials disclosed by borings, test pits or other subsurface exploration methods. Soil classifications shall be determined in accordance with ASTM D2487 (refer to Table 1802.3.1) and the supplemental definitions contained herein. Rock classifications shall be determined in accordance with generally accepted engineering practice and the supplemental definitions contained herein. Laboratory tests shall be conducted to ascertain these classifications where deemed necessary by the engineer responsible for the geotechnical investigation or the commissioner.

BEDROCK.

1. **Hard sound rock** (Class 1a). Includes crystalline rocks, such as gneiss, granite, diabase and mica schist. Characteristics are as follows: the rock rings when struck with pick or bar; the rock does not disintegrate after exposure to air or water; the rock breaks with sharp fresh fracture; cracks are unweathered, less than \( \frac{1}{8} \)-inch (3.2 mm) wide, and generally no closer than 3 feet (914.4 mm) apart; and the RQD (rock quality designation) with a double tube, NX-size diamond core barrel is generally 85 percent or greater for each 5-foot (1524 mm) run; or core recovery with BX-size core is generally 85 percent or greater for each 5-foot (1524 mm) run.

2. **Medium hard rock** (Class 1b). Includes crystalline rocks of paragraph 1 of this subdivision, plus marble and serpentinite. Characteristics are as follows: all those listed in paragraph 1 of this subdivision, except that cracks may be \( \frac{1}{4} \)-inch (6.4 mm) wide and slightly weathered, generally spaced no closer than 2 feet (609.6 mm) apart; and the RQD with a double tube, NX-size diamond core barrel is generally between 50 and 85 percent for each 5-foot (1524 mm) run; or core recovery with BX-size core is generally 50 to 85 percent for each 5-foot (1524 mm) run.

3. **Intermediate rock** (Class 1c). Includes rocks described in paragraphs 1 and 2 of this subdivision, plus cemented shales and sandstone. Characteristics are as follows: the rock gives dull sound when struck with pick or bar; does not disintegrate after exposure to air or water; broken pieces may show moderately weathered surfaces; may contain fracture and moderately weathered zones up to 1 inch (25.4 mm) wide spaced as close as 1 foot (305 mm) apart; and the RQD with a double tube, NX-size diamond core barrel is generally 35 to 50 percent for each 5-foot (1524 mm) run; or a core recovery with BX-size core of generally 35 to 50 percent for each 5-foot (1524 mm) run.

4. **Soft rock** (Class 1d). Includes rocks described in paragraphs 1, 2, and 3 of this subdivision in highly weathered condition, plus talc schist and poorly cemented shales and sandstones. Characteristics are: rock may soften on exposure to air or water; may contain highly weathered zones up to 3 inches (76.2 mm) wide but filled with stiff soil; and either the RQD with a double tube, NX-size diamond core barrel is less than 35 percent for each 5-foot (1524 mm) run or core recovery with BX-size core of generally less than 35 percent for each 5-foot (1524 mm) run, or a standard penetration resistance value of N60 greater than 50 blows per foot (0.3 meters).

SANDY GRAVEL AND GRAVELS. Consists of coarse-grained material with more than half of the coarse fraction larger than the #4 size sieve and contains little or no fines (GW and GP). The density of these materials shall be determined in accordance with the following:
Dense (Class 2a). These materials have a standard penetration test \( N \)-value greater than 30 blows per 1 foot (0.3 meter).

Medium (Class 2b). These materials have a standard penetration test \( N \)-value between 10 and 30 blows per 1 foot (0.3 meter).

Loose (Class 6). These materials have a standard penetration test \( N \)-value less than 10 blows per 1 foot (0.3 meter). These materials shall be considered nominally unsatisfactory bearing materials.

GRANULAR SOILS. These materials are coarse-grained soils consisting of gravel and/or sand with appreciable amounts of fines and gravel. Soil types include GM, GC, SW, SP, SM and SC. The density of granular materials shall be determined in accordance with the following:

Dense (Class 3a). These materials have a standard penetration test \( N \)-value of greater than 30 blows per 1 foot (0.3 meter).

Medium (Class 3b). These materials have a standard penetration test \( N \)-value of between 10 and 30 blows per 1 foot (0.3 meter).

Loose (Class 6). These materials have a standard penetration test \( N \)-value of fewer than 10 blows per 1 foot (0.3 meter). These materials shall be considered nominally unsatisfactory bearing materials.

CLAYS. For soil types SC, CL and CH in the absence of sufficient laboratory data, the consistency of clay materials shall be determined in accordance with the following:

Hard (Class 4a). Clay requiring picking for removal, a fresh sample of which cannot be molded by pressure of the fingers; or having an unconfined compressive strength in excess of 4 TSF (383 kPa); or having a standard penetration test where the \( N \)-value is greater than 30 blows per 1 foot (0.3 meter).

Stiff (Class 4b). Clay that can be removed by spading, a fresh sample of which requires substantial pressure of the fingers to create an indentation; or having an unconfined compressive strength of between 1 TSF ([96] 95.8 kPa) and 4 TSF (383 kPa); or having a standard penetration test where the \( N \)-value is between 8 and 30 blows per 1 foot (0.3 meter).

Medium (Class 4c). Clay that can be removed by spading, a fresh sample of which can be molded by substantial pressure of the fingers; or having an unconfined compressive strength of between 0.5 TSF ([48] 47.9 kPa) and 1 TSF ([96] 95.8 kPa); or having a standard penetration test where the \( N \)-value is between 4 and 8 blows per 1 foot (0.3 meter).

Soft (Class 6). Clay, a fresh sample of which can be molded with slight pressure of the fingers; or having an unconfined compressive strength of less than 0.5 TSF ([48] 47.9 kPa); or having a standard penetration test where the \( N \)-value is fewer than 4 blows per 1 foot (0.3 meter). This material shall be considered nominally unsatisfactory bearing material.
SILTS AND CLAYEY SILTS. For soil types ML and MH in the absence of sufficient laboratory data, the consistency of silt materials shall be determined in accordance with the following:

**Dense (Class 5a).** Silt with a standard penetration test where the value of $N_{60}$ greater than 30 blows per 1 foot (0.3 meter).

**Medium (Class 5b).** Silt with a standard penetration test where the value of $N_{60}$ between 10 and 30 blows per 1 foot (0.3 meter).

**Loose (Class 6).** Silt with a standard penetration test where the value of $N_{60}$ fewer than 10 blows per 1 foot (0.3 meters). This material shall be considered nominally unsatisfactory bearing material.

</table>

**Notes:**

1. Boundary classifications: Soils possessing characteristics of two groups are designated by combinations of group symbols. For example CM-CG, well-graded gravel-sand mixture with clay binder.

2. All sieve sizes on this chart are U.S. standard.

3. Adapted by Corps of Engineers and Bureau of Reclamation, January 1957.
Investigation. An engineer shall scope and supervise the geotechnical investigation. The geotechnical investigation shall be sufficient for evaluating soil and rock conditions including material classification, stratigraphy, groundwater, slope stability, soil and rock strength, adequacy of load-bearing soils and rock, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction and expansiveness. The investigation shall comply with Sections 1802.4.1 through 1803.4.4.

Scope of investigation. The scope of the geotechnical investigation, including the number, types and depths of borings, the number of test pits or the number of alternative test methods; the equipment used to drill and sample; the in-situ testing; and the laboratory testing program shall be determined by the engineer responsible for the investigation, subject to the requirements of this chapter.

1. Borings shall be uniformly distributed under the structure or distributed in accordance with load patterns imposed by the structure.

2. [As] At a minimum, investigations for structures shall include:

   2.1. One exploratory boring for built-over areas up to and including 750 square feet (69.7 m²).

   2.2. Two exploratory borings for built-over areas greater than 750 square feet (69.7 m²) but less than 5,000 square feet (464.5 m²), and at least one additional boring for each additional 2,500 square feet (232.3 m²), or part thereof, of built-over areas up to 20,000 square feet (1858.1 m²).

   2.3. At least one boring for each additional 5,000 square feet (464.5 m²), or part thereof, of built-over areas in excess of 20,000 square feet (1858.1 m²).

3. At a minimum, investigations for retaining walls greater than 10 feet (3.05 m) in height shall include one exploratory boring for every 50 linear feet (15.24 m) of wall.

4. Borings shall be taken into bedrock, or to an adequate depth below the top of the load-bearing strata to demonstrate that the foundation loads have been sufficiently dissipated and to evaluate global stability of retaining walls.

5. For structures having an average area load (dead plus live) of 1,000 pounds per square foot (47.9 kN/m²) or more, at least one boring for every 10,000 square feet (929 m²) of footprint area shall penetrate at least 100 feet (30 480 mm) below the curb grade or 5 feet (1524 mm) into bedrock of Class 1c or better, whichever is less.

6. At least one-half of the borings satisfying this requirement shall be located within the limits of the built-up area and the remainder shall be within 25 feet (7620 mm) of the built-up area limits.

7. For structures to be supported on deep foundations, the required number of borings shall be not less than two borings, and based on a minimum of one boring per 2,000 square feet.
for the first 20,000 square feet \( (1860 \text{ m}^2) \) and one boring per every additional 4,000 square feet \( (609.6 \text{ m}^2) \) thereafter.

8. All boring, sampling, and in-situ testing operations shall be subject to special inspection in accordance with [Section 1704.7.4] Table 1705.6.

**Exception:** Test pits may be substituted for borings for one and two-story structures, and may be used only to establish the top of rock, where practical, for taller structures. For taller structures, the engineer shall submit a test pit observation report to the commissioner, for one and two-story structures, the registered design professional may submit a test pit observation report to the commissioner.

[1802.4.2] **1803.4.2 Existing data.** [At the request of the engineer responsible for the geotechnical investigation, the suitable] Suitable borings, test pits, probings, and the logs and records that were obtained as part of earlier exploration programs by an engineer other than the engineer performing the geotechnical investigation and that meet the requirements of this section may only be used as partial fulfillment of the requirements of [this section, subject to the approval of the commissioner] Section 1803.4.1. [Additional borings shall be made at the direction of the engineer responsible for the geotechnical investigation when uncertainty exists as to the accuracy of the available information or specific new project or loading conditions indicate the need for additional information.] Additional boring(s) shall be made to fulfill the requirements of Section 1803.4.1, with a minimum of one additional boring required.

[1802.4.3] **1803.4.3 Groundwater table.** The geotechnical investigation shall determine the existing groundwater table.

[1802.4.4] **1803.4.4 Compressible soils.** In areas containing compressible soils, the geotechnical investigation shall determine the extent of these soils in the plan area of the structure and shall be subject to the requirements of Section [1802.3] 1803.3.

[1802.5] **1803.5 Soil and rock sampling.** The soil boring and sampling procedures and apparatus shall be in accordance with ASTM D1586 and ASTM D1587 and generally accepted engineering practice. The rock coring, sampling procedure and apparatus shall be in accordance with ASTM D2113 and generally accepted engineering practice. Rock cores shall be obtained with a double-tube core barrel with a minimum outside diameter of 2\(\frac{3}{8}\) inches (73 mm). With the approval of the engineer responsible for the geotechnical investigation, smaller-diameter double-tube core barrels may be used under special circumstances such as telescoping casing to penetrate boulders, or space limitations requiring the use of drill rigs incapable of obtaining large-diameter cores.

[1802.5.1] **1803.5.1 Bedrock support.** Where the foundation design relies on rock to support footings, [piles] deep foundations or caisson sockets, or permanent prestressed rock anchors, a sufficient number of rock corings shall extend at least 10 feet (3048 mm) below the lowest level of bearing to provide assurance of the rock soundness and be drilled to sufficient depths to assess the competency of the rock and its load-bearing capacity, but no less than 10 feet (3048 mm) below the lowest level of bearing. [Where foundations are to rest on bedrock and such rock is exposed over a part or all of the area of the building, borings are not required in those areas where rock is exposed, provided the following requirements are met:]
The presence of defects or the inclination of bedding planes in the rock are of such size and location so as not to affect stability of the foundation.

The foundation is not designed for bearing pressures exceeding those permitted in Table 1802.3.

Alternative investigative methods. The engineer responsible for the geotechnical investigation may engage specialized technicians to conduct alternative investigative methods such as cone penetrometer testing (CPT) performed in accordance with ASTM D3441 or ASTM D5778. Data from these investigations may be used to (1) supplement soil boring and rock coring information, provided there is a demonstrated correlation between the findings, and (2) determine material properties for static and seismic or liquefaction analyses. Subject to the approval of the commissioner, alternative exploration methods may replace borings on a one-to-one basis, but in no case shall there be fewer than half the required standard borings as per Section 1802.4.1 and no less than two standard borings. The boring depth requirements of Section 1802.4.1 shall be accomplished with borings. The alternative investigative methods must be capable of extending to the depths of the required borings. Other in-situ testing methods, such as geophysical, vane shear, and pressuremeter, may be used to determine engineering design parameters, but may not be used as a substitute for the required number of borings.

Material disposition. Soil and rock samples shall be maintained in an accessible location by the permit holder or owner and made available to the engineer responsible for the geotechnical investigation and to the department, until the foundation work has been completed and accepted, or until 1 year after the investigation is complete, whichever is longer.

Conditions requiring geotechnical reports. The owner or applicant of record shall submit a written report to the commissioner for any of the following conditions:

1. Any load-bearing value greater than those in Section 1804 is claimed.
2. The structure is determined to be in Seismic Design Category C or D in accordance with Section 1613.
3. Test pits are implemented in lieu of borings as per Section 1802.4.1.
4. The structure will bear on or above compressible soils (see Section 1804.2.2), uncontrolled fill (see Section 1804.2.3), or artificially treated soils (see Section 1804.2.4).
5. As required by the commissioner.

Geotechnical reports. A geotechnical engineering report shall be prepared for all sites and submitted to the commissioner.

Exception: One- and two-family dwellings no more than three stories in height shall not require a geotechnical report except where any of the following exist:
1. Shallow foundations are used that bear on or above compressible soils (see Section 1803.4.4), uncontrolled fill (see Section 1806.2.3), or artificially treated soils (see Section 1806.2.4);

2. Underpinning is required;

3. The structure is within the special flood hazard area;

4. Dewatering is required;

5. Test pits are implemented in lieu of borings as per Section 1803.4.1; or

6. As required by the commissioner.

[1802.6.2] 1803.6.1 Information required in geotechnical reports. The geotechnical report shall be prepared by the engineer responsible for the geotechnical investigation and shall be signed and sealed. The geotechnical report submitted to the commissioner shall include the foundation system shown on the drawings submitted to the department. The report shall include, but need not be limited to, the following information:

1. A description of the planned structure.

2. A plot showing the location of test borings, excavations, probes, and/or other exploration techniques.

3. A complete record of the soil and/or rock sample descriptions.

4. A record of the soil and/or rock profile.

5. Elevation of the groundwater table (if encountered), base flood elevation (if applicable), and design flood elevation.

6. Results of in-situ or geophysical testing.

7. Results of laboratory testing.

8. Recommendations for foundation type and design criteria, including but not limited to allowable bearing capacity of natural or compacted soil and/or rock; soil stiffness parameters required for design of the foundations; mitigation of the effects of liquefaction (if applicable); site class; Mapped MCE$_R$ spectral acceleration parameters (SS and S1); design spectral response acceleration parameters (SDS and SD1); site adjusted peak ground acceleration (PGAM); differential settlement and varying soil and/or rock strength; and the effects of adjacent loads.

9. Design lateral earth pressures on foundation walls and other retaining walls.

10. Recommendations for the evaluation of adjacent properties potentially impacted by the proposed construction.
11. Where dewatering is required, recommendations for the maximum permissible drawdown outside the site.

12. Expected total and differential settlement.

13. Special design and construction provisions for footings or foundations founded on expansive soils, as necessary.

14. Compacted fill material properties and testing in accordance with Section 1803.5 1804.6.

15. Controlled low-strength material properties and testing in accordance with Section 1803.6 1804.7.

16. A list of anticipated special inspections required for construction of earthwork and foundations.

17. For deep foundations reports, the requirements outlined in Section 1808.2.2 1810.2.2.

18. For permanent prestressed rock and soil anchor reports, the requirements outlined in Section 1815.2.

19. Soil and rock parameters to be used to determine the safe slope of temporary excavations pursuant to Section 3304.4.1.

**Construction documents.** Construction documents shall be prepared in accordance with Section 106.7.1.

**SECTION BC [1803] 1804 EXCAVATION, GRADING AND FILL**

**Excavations near foundations.** Excavations for any purpose shall not reduce vertical or lateral support for any foundation without first evaluating if underpinning or protecting the foundation against detrimental lateral or vertical movement, or both, is required. Where required, underpinning or shoring shall be provided in accordance with Section 1814 1817.

**Placement of backfill.** The excavation outside the foundation shall be backfilled with soil that is free of organic material, construction debris, or boulders. A controlled low-strength material (CLSM) can be used as backfill in lieu of soil. Soil backfill shall be placed in lifts and compacted in a manner that does not damage the foundation or the waterproofing or dampproofing material.

**Exception:** Controlled low-strength material need not be compacted.

**Surcharge.** No fill or other surcharge loads shall be placed adjacent to any building or structure unless such building or structure is capable of withstanding the additional loads caused by the fill or the surcharge.
**Exception:** Grading for landscaping purposes shall be permitted where done with walk-behind equipment where the grade is not increased more than one foot (304.8 mm) from original design grade, or where approved by the commissioner.

[1803.3] 1804.4 **Site grading.** The ground immediately adjacent to the foundation shall be sloped away from the structure as needed, or an approved alternate method of diverting water away from the foundation shall be used, where surface water would detrimentally affect the foundation material (soil and/or rock). Grading shall not be detrimental to the bearing material of adjacent structures. Site grading shall also comply with Section 1101.11 of the *New York City Plumbing Code*.

[1803.3.1] 1804.4.1 **Seepage.** In an excavation where soil and groundwater conditions are such that an inward or upward seepage might be produced in materials intended to provide vertical or lateral support for foundation elements or for adjacent foundations, excavating methods shall control or prevent the inflow of ground water to prevent disturbance of the soil material in the excavation or beneath existing buildings. No foundation shall be placed on soil that has been disturbed by seepage unless remedial measures have been taken.

[1803.4] 1804.5 **Grading and filling in flood hazard areas.** Grading and/or filling in areas of special flood hazard shall not be permitted except as permitted in Appendix G.

[1803.5] 1804.6 **Compacted fill material.** Where foundations will bear on compacted fill material, the compacted fill shall comply with the provisions of a geotechnical report prepared, signed and sealed by the engineer, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.

2. Specifications for material to be used as compacted fill.

3. Test method(s) to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.

4. Maximum allowable thickness of each lift of compacted fill material.

5. Field test method(s) for determining the in-place dry density of the compacted fill.

6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.

7. Number and frequency of field tests required to determine compliance with Item 6.

8. Acceptable types of compaction equipment for the specified fill materials.

[1803.6] 1804.7 **Controlled low-strength material (CLSM).** Where footings will bear on controlled low-strength material (CLSM), the CLSM shall comply with the provisions of a geotechnical report prepared, signed and sealed by the engineer, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of the CLSM.

2. Specifications for the CLSM.
3. Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.

4. Test methods for determining the acceptance of the CLSM in the field.

5. Number and frequency of field tests required to determine compliance with Item 4.

**SECTION BC 1805**
**DAMPPROOFING AND WATERPROOFING**

**1805.1 Where required.** Walls or portions thereof that retain soil or rock and enclose interior spaces and floors below grade shall be waterproofed or dampproofed in accordance with this section, with the exception of those spaces containing occupancy groups other than residential and institutional where such omission is not detrimental to the building or occupancy. Ventilation for crawl spaces shall comply with Section 1203.3.

**1805.1.1 Flood hazard areas.** Buildings and structures in areas of special flood hazard shall comply with Appendix G.

**1805.2 Dampproofing required.** Where hydrostatic pressure will not occur as determined by Section 1803, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AWC TR7.

**1805.2.1 Floors.** Dampproofing materials for floors shall be installed between: (i) the floor and (ii) the base course required by Section 1805.4.1 or the sub-floor. Subgrade for the dampproofing material shall be prepared in accordance with manufacturer’s recommendations. Dampproofing material shall be installed in accordance with manufacturer’s recommendations and protected after placement. Any damaged areas and punctures must be repaired prior to placement of slab. All penetrations shall be sealed as per manufacturer’s recommendations.

**1805.2.2 Walls.** Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level as determined by the registered design professional and shall be installed in accordance with manufacturer’s recommendations. Dampproofing at walls shall overlap or extend past the slab dampproofing such that there are no gaps or breaches in the dampproofing system.

**1805.3 Waterproofing required.** Where the geotechnical investigation required by Section 1803 indicates that a hydrostatic pressure condition exists, walls and floors shall be waterproofed in accordance with this section.

**1805.3.1 Floors.** Floors required to be waterproofed shall be designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected. Waterproofing shall be accomplished by creating a continuous water seal below the floor using appropriate waterproofing materials. Joints, penetrations and other interruptions shall be sealed in accordance with manufacturer’s recommendations. Floor waterproofing must be transitioned to accomplish a complete tie-in with the foundation wall waterproofing.
**1805.3.2 Walls.** Walls required to be waterproofed shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected. Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (304.8 mm) above the maximum elevation of the groundwater table or as directed by the registered design professional. The remainder of the wall shall be dampproofed in accordance with Section 1805.2.2. Joints, penetrations and other interruptions shall be sealed in accordance with manufacturer’s recommendations.

**1805.3.3 Joints and penetrations.** Joints in or between walls and floors, and penetrations of walls and floors shall be sealed utilizing methods and materials approved by the registered design professional. Joints, penetrations and other interruptions shall be sealed in accordance with the manufacturer’s recommendations.

**1805.4 Subsoil drainage system.** Where it is determined that there is a potential for infiltration or seepage, a subsoil drainage system shall be permitted to be used to control this inflow, provided that:

1. The below ground space is waterproofed or dampproofed per Sections 1805.2 and 1805.3; and
2. The estimated discharge from the drainage system is less than or equal to the amount allowed by the agency having jurisdiction.

**1805.4.1 Drainage course.** A drainage course shall consist of washed gravel, crushed natural stone or other suitable drainage medium acceptable to the engineer. Recycled concrete aggregate is not acceptable for use in a drainage course where a subsoil drainage system is used.

**1805.4.2 Foundation drain.** A foundation drain shall be installed where required by the registered design professional. The foundation drain, including layout, materials, and cleanouts, shall be designed by the registered design professional.

**1805.4.3 Drainage discharge.** The drainage course and foundation drain shall discharge by gravity or mechanical means into an approved drainage system that complies with the *New York City Plumbing Code* and any other laws or requirements of agencies having jurisdiction.

**1805.5 In situ walls.** In situ walls (such as slurry walls, tangent pile walls, and secant pile walls) with joints sealed by grouting or other methods acceptable to the engineer shall not require waterproofing or dampproofing unless required by the engineer.
SECTION BC [1804] 1806
ALLOWABLE LOAD-BEARING VALUES OF SOILS AND ROCK

[1804.1] 1806.1 Design. The allowable bearing pressures provided in Table [1804.1] 1806.1 shall be used with the allowable stress design load combinations specified in Section 1605.3.

</tbody>
</table>

Notes:
1. Where there is doubt as to the applicable classification of a soil or rock stratum, the allowable bearing pressure applicable to the lower class of material to which the given stratum might conform shall apply.
2. The tabulated values of allowable bearing pressures apply only for massive rocks, or for sedimentary or foliated rocks where the strata are level or nearly so, and then only if the area has ample lateral support. The allowable bearing pressure for tilted strata and their relation to nearby slopes or excavations shall be evaluated by the engineer responsible for the geotechnical investigation. The tabulated values for Class 1a materials (hard sound rock) may be increased by 25 percent provided the engineer performs additional tests and/or analyses substantiating the increase.
3. For intermediate conditions, values of allowable bearing pressure shall be estimated by interpolation between indicated extremes.
4. Footing embedment in soils shall be in accordance with Section [1809.3] 1809.3 and the width of the loaded area shall not be less than 18 inches (457.2 mm), unless analysis demonstrates that the proposed construction will have a minimum factor of safety of 2.0 against shear failure of the soil.
5. Estimates of settlements shall govern the allowable bearing pressure, subject to the maximums given in this table, and as provided in Section [1804.2] 1804.2.
6. Allowable bearing pressure of clay soils shall be established on the basis of the strength of such soils as determined by field or laboratory tests and shall provide a factor of safety against failure of the soil of not less than 2.0 computed on the basis of a recognized procedure of soils analysis, shall account for probable settlements of the building and shall not exceed the tabulated maximum values.
7. Allowable bearing pressure may be increased due to embedment of the foundation. The allowable bearing pressure for intermediate rock (1c), medium hard rock (1b), and hard sound rock (1a) shall apply where the loaded area is on the rock surface. Where the loaded area is below the rock surface and is fully confined by the adjacent rock mass and provided that the adjacent rock mass above the bearing surface is of [1804.2.3] rock class 3 or better, and the rock mass has not been shattered by blasting or otherwise is or has been rendered unsound, the allowable bearing pressure may be increased 10 percent of the base value for each 1 foot (0.3 meters) of embedment below the surface of the adjacent rock surface in excess of 1 foot (0.3 meters), but shall not exceed 200 percent of the values.
The allowable bearing pressure for soils of Classes 2, 3, 4, and 5 determined in accordance with Notes 3, 4, and 5 above, shall apply where the loaded area is embedded 4 feet (1220 mm) or less in the bearing stratum. Where the loaded area is embedded more than 4 feet (1220 mm) below the adjacent surface of the bearing stratum, and is fully confined by the weight of the adjacent soil, the allowable bearing pressure may be increased 5 percent of the base value for each 1-foot (305 mm) additional embedment, but shall not exceed twice the values. Increases in allowable bearing pressure due to embedment shall not apply to soft rock, clays, silts and soils of Classes 6 and 7.

The allowable bearing pressure for soils of Classes 2, 3, 4, and 5 determined in accordance with this table and the notes thereto, may be increased up to ⅓ where the density of the bearing stratum below the bottom of the footings increases with depth and is not underlain by materials of a lower allowable bearing pressure. Such allowable bearing pressure shall be demonstrated by a recognized means of analysis that the probable settlement of the foundation due to compression, and/or consolidation does not exceed acceptable limits for the proposed building.

The maximum toe pressure for eccentrically loaded footings may exceed the allowable bearing pressure by up to 25 percent if it is demonstrated that the heel of the footing is not subjected to tension.

**Allowable bearing pressure.** The allowable bearing pressure for supporting soil and rock [at or near the surface] shall not exceed the values specified in Table [1804.1] 1806.1, unless data to substantiate the use of a higher value are developed and contained in the engineer’s geotechnical report, and the commissioner approves such value. Allowable bearing pressure shall be considered to be the pressure at the base of a foundation in excess of the [stabilized overburden pressure] effective stress existing at the same level prior to construction operations.

**Nominally unsatisfactory bearing material.** Organic silts, organic clays, peats, soft clays, loose granular soils, loose silts, and varved silts shall be considered nominally unsatisfactory bearing material. The allowable bearing pressure shall be determined independently of Table [1804.1] 1806.1 subject to the following:

1. For varved silts, the soil bearing pressure produced by the proposed building shall not exceed 2 tons per square foot (192 kPa), except that for desiccated or over consolidated soils, higher bearing pressures are allowed subject to approval by the commissioner.

2. For organic silts or clays, peats, soft clays, loose granular soils, or loose silts, the engineer responsible for the geotechnical investigation shall establish the allowable soil bearing pressure based upon the soil’s specific engineering properties. This may require that the soils be preconsolidated, artificially treated or compacted.

3. A report prepared, signed and sealed by the engineer is required to be filed with the department to substantiate the design soil pressures to be used on soil materials and shall contain, at a minimum:

3.1. Sufficient laboratory test data on the compressible material to indicate the soil strength and the preconsolidation pressure, coefficient of consolidation, coefficient of compressibility, permeability, secondary compression characteristics, and Atterberg limits.

3.2. Where the design contemplates improvement of the natural bearing capacity and/or reduction in settlements by virtue of preloading, cross sections showing the amount of fill and surcharge to be placed, design details showing the required time for surcharging, and computations showing the amount of settlement to be expected during surcharging and the estimated amount and rate of settlement expected to occur after the structure has been completed, including the influence of dead and live loads of the structure.
3.3. A detailed analysis showing that the anticipated future settlement will not adversely affect the performance of the structure.

3.4. Where strip drains, sand drains, or stone columns are to be used, computations showing the diameter, spacing, and anticipated method of installation of such drains.

3.5. Records of settlement plate elevations and pore pressure readings, before, during, and after surcharging.

[1804.2.2] 1806.2.2 Controlled fills. Fills shall be considered as satisfactory bearing material of the applicable class when placed in accordance with the following procedures and subject to the special inspection provisions of Chapter 17:

1. Area to be filled shall be stripped of all organic materials, rubbish and debris.
2. Fill shall not be placed when frozen or on frozen or saturated subgrade.
3. The special inspection agency shall approve the subgrade prior to fill placement.
4. Fill material shall consist of gravel, crushed rock, recycled concrete aggregate, well-graded sand or a mixture of these, or equivalent materials with a maximum particle size of 3 inches (76.2 mm) and a maximum of 10 percent passing the #200 sieve.
5. Fill shall be placed and compacted in lifts, not exceeding 12 inches ([305] 304.8 mm), at its optimum moisture content, plus or minus 2 percent, and to not less than a density of 95 percent of the optimum density as determined by ASTM D1557.
6. Fill density shall be verified by in-place tests made on each lift.

[1804.2.2.1] 1806.2.2.1 Allowable bearing pressure of controlled fills. Provided the capacity of the underlying soil is not exceeded, the allowable bearing pressure of controlled fill shall be limited to:

1. 6 tons per square foot ([766 kPa]) (574.6 kPa) for gravel and crushed rock.
2. 3 tons per square foot ([383 kPa]) (287.3 kPa) for recycled concrete aggregate and well-graded sand.

[1804.2.3] 1806.2.3 Uncontrolled fills. Fills other than controlled fill may be considered as satisfactory bearing material of applicable class, subject to the following:

1. Where spread footings will be used, the soil within the built-up area shall be explored using test pits at every column. All test pits shall extend to depths equal to the smaller width of the footing and at least one test pit shall penetrate at least 8 feet ([2438] 2438.4 mm) below the level of the bottom of the proposed footings. All test pits shall be backfilled with properly compacted fill. Borings may be used in lieu of test pits, provided that continuous samples of at least 3 inches ([76] 76.2 mm) in diameter are recovered. Where mat foundations will be used, one test pit or minimum 3 inch ([76] 76.2 mm) diameter sampler boring shall be provided for every 1,000 square feet ([232.3 m²]) (92.9 m²) of
building footprint area. For continuous concrete footings, one test pit or minimum 3 inch (76.2 mm) diameter sampler boring shall be provided for every 25 linear feet (7.62 m) (7620 mm).

2. The building area shall be additionally explored using one standard boring for every 2,500 square foot (232.3 m²) of building footprint area. These borings shall be carried to a depth sufficient to penetrate into natural ground, but not less than 20 feet (6096 mm) below grade.

3. The fill shall be composed of material that is free of voids and free of extensive inclusions of mud and organic materials such as paper, wood, garbage, cans, or metallic objects and debris.

4. The allowable soil bearing pressure on satisfactory uncontrolled fill material shall not exceed 2 tons per square foot (191.5 kPa). One and two-family dwellings may be founded on satisfactory uncontrolled fill provided the dwelling site has been explored using at least one test pit, penetrating at least 8 feet (2438.4 mm) below the level of the bottom of the proposed footings, and the fill has been found to be composed of material that is free of voids and generally free of mud and organic materials, such as paper, garbage, cans, or metallic objects, and debris. Test pits shall be backfilled with properly compacted fill.

[1804.2.4] 1806.2.4 Artificially treated soils. Nominally unsatisfactory soil materials that are artificially compacted, cemented, or preconsolidated may be used for the support of buildings, and nominally satisfactory soil materials that are similarly treated may be used to resist soil bearing pressures in excess of those indicated in Table [1804.1] 1806.1. The engineer shall develop treatment plans and procedures and post-treatment performance and testing requirements, and submit such plans, procedures, and requirements to the commissioner for approval. After treatment, a sufficient amount of sampling and/or in-situ tests shall be performed in the treated soil to demonstrate the efficacy of the treatment for the increased bearing pressure.

[1804.3 Reserved.]

SECTION BC 1807
RETAINING WALLS AND OTHER RETAINING STRUCTURES

1807.1 General. Retaining walls shall be designed in accordance with Section 1807.2.

1807.2 Design. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and the effects of water pressure, including uplift. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, lateral soil pressures on both sides of the keyway shall be considered in the sliding analysis.

1807.2.1 Design lateral soil loads. Retaining walls shall be designed for the lateral soil loads set forth in Section 1605.

Exception: Where the structural design of a retaining wall is based on load factor design, the load factors in Section 1605.2 may be modified as follows: where water can freely flow over
the top of the wall, the wall may be designed for a water pressure equal to that caused by a groundwater table elevation at the top of the wall. For this condition, the load factor for the groundwater pressure may be reduced to 1.2. The load factor for the lateral earth pressure shall remain at 1.6.

1807.2.2 Safety factor. Retaining walls shall be designed to resist the lateral action of soil to produce sliding and overturning with a minimum safety factor of 1.5 in each case. The load combinations of Section 1605 shall not apply to this requirement. Instead, design shall be based on 0.7 times nominal earthquake loads, 1.0 times other nominal loads, and investigation with one or more of the variable loads set to zero. The safety factor against lateral sliding shall be taken as the available soil resistance at the base of the retaining wall foundation divided by the net lateral force applied to the retaining wall.

Exception: Where earthquake loads are included, the minimum safety factor for retaining wall sliding and overturning shall be 1.1.

1807.3 Temporary retaining structures. Structural members for temporary retaining structures may be designed with a 20 percent increase in the allowable bending stress only.

SECTION BC 1808
RESERVED

SECTION BC [1805] 1809
SHALLOW FOUNDATIONS

[1805.1] 1809.1 General. Shallow foundations shall be designed and constructed in accordance with Sections [1805.4] 1809.1 through [1805.9] 1809.6. Shallow foundations shall be constructed on suitable bearing materials established in accordance with the requirements of Sections [1803] 1804 and [1804] 1806.

[1805.2] 1809.2 Stepped footings. The top surface of footings shall be level. The bottom surface of footings [is] shall be permitted to have a slope not exceeding one unit vertical in 10 units horizontal (10-percent slope). Footings shall be stepped where necessary to change the elevation of the top surface of the footing or where the surface of the ground slopes more than one unit vertical in 10 units horizontal (10-percent slope).

[1805.3] 1809.3 Depth of footings. The minimum depth of shallow foundations below the undisturbed ground surface shall be 12 inches (305 mm). Where applicable, the depth of shallow foundations shall also conform to Section [1805.3.1] 1809.3.1.

[1805.3.4] 1809.3.1 Frost protection. Except where otherwise protected from frost, shallow foundations, pile caps, and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:

1. Extending a minimum of 4 feet (1220 mm) below the lowest adjacent permanent exposed grade;

**Exception:** Grade beams shall be embedded a minimum of 18 inches (457.2 mm) below the lowest adjacent permanent exposed grade.

2. Constructing in accordance with [ASCE 32] ASCE 32; or

3. Erecting on solid rock.

**Exception:** Free-standing buildings meeting all of the following conditions shall not be required to be frost protected:

1. Classified in Structural Occupancy Category I (see Table 1604.5);

2. Area of 400 square feet (37.1 m²) or less; and

3. Eave height of 10 feet (3048 mm) or less.

[1805.3.2] **1809.3.2 Foundations on frozen soil.** Shallow foundations shall not bear on frozen soil.

**Exception:** Temporary structures may bear on frozen soil if the soil is maintained in a frozen condition throughout the service life of the temporary structures being supported. The method of maintaining the soil in a frozen condition shall be approved by the commissioner.

[1805.4] **1809.4 Shallow foundations at different levels.** Where shallow foundations are supported at different levels, or are at different levels from the shallow foundations of adjacent structures, the influence of the pressures under the higher foundation on the stability of the lower foundations shall be considered in the design. The design shall consider the requirements for lateral support of the material supporting the higher foundation, the additional load imposed on the lower foundations, and assessment of the effects of dragdown on piles deep foundations supporting adjacent buildings or compression of soils supporting adjacent buildings.

[1805.5] **1809.5 Shallow foundations.** Shallow foundations shall be designed and constructed in accordance with Sections [1805.5.1] 1809.5.1 through [1805.5.6] 1809.5.8.

[1805.5.1] **1809.5.1 Design.** Shallow foundations shall be designed so that the allowable bearing capacity of the soil is not exceeded, and that differential settlements are within the allowable limits for the structure. The minimum width of shallow foundations shall be 18 inches (457.2 mm).

[1805.5.1.1] **1809.5.1.1 Design loads.** Shallow foundations shall be designed for the most unfavorable effects due to the combinations of loads specified in Section 1605.3. The dead load shall include the weight of shallow foundations and overlying fill. Reduced live loads, as specified in Section [1607.9] 1607.11, are permitted to be used in the design of shallow foundations.
[1805.5.1.2] 1809.5.1.2 Vibratory loads. Where machinery operations or other vibrations are transmitted through the shallow foundations, consideration shall be given in the shallow foundation design to prevent detrimental disturbances of the soil.

[1805.5.1.3] 1809.5.1.3 Shifting or moving soils. When the possibility of shifting or moving soil exists, the short and long term impact of such soils shall be considered in the design of shallow foundations.

[1805.5.2] 1809.5.2 Concrete shallow foundations. The design, materials and construction of concrete shallow foundations shall comply with Sections [1805.5.2.1] 1809.5.2.1 through [1805.5.2.5] 1809.5.2.5 and the provisions of Chapter 19.

[1805.5.2.1] 1809.5.2.1 Concrete strength. Concrete in shallow foundations shall have a specified compressive strength ($f'_c$) of not less than 2,500 pounds per square inch (psi) [(17.237 kPa)] (17.24 MPa) at 28 days.

[1805.5.2.2] 1809.5.2.2 Footing seismic ties. Where a structure is assigned to Seismic Design Category D in accordance with Section 1613, individual spread footings founded on soil defined in Section [1613.5.2] 1613.3.2 as Site Class E or F shall be interconnected by ties. Ties shall be capable of carrying, in tension or compression, a force equal to the product of the larger footing load times the seismic coefficient SDS divided by 10 unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade.

[1805.5.2.3] 1809.5.2.3 Plain concrete footings. The thickness of plain concrete footings supporting walls of other than light-frame construction shall not be less than 8 inches ([203] 203.2 mm) where placed on soil.

Exception: For plain concrete footings supporting Group R-3 occupancies, the thickness is permitted to be 6 inches ([152] 152.4 mm), provided that the footing does not extend beyond a distance greater than the thickness of the footing on either side of the supported wall.

[1805.5.2.4] 1809.5.2.4 Placement of concrete. Concrete shallow foundations shall not be placed through water unless a tremie or other method approved by the commissioner is used. Where placed under or in the presence of water, the concrete shall be deposited by approved means to ensure minimum segregation of the mix and negligible turbulence of the water.

[1805.5.2.5] 1809.5.2.5 Protection of concrete. No shallow foundation shall be placed on frozen soils unless the soils are maintained in frozen condition throughout the service life of the structure being supported. No foundation shall be placed in freezing weather unless provision is made to maintain the underlying soil free of frost. Concrete shallow foundations shall be protected from freezing during depositing and for a period of not less than five days thereafter. Water shall not be allowed to flow through the deposited concrete.

[1805.5.3] 1809.5.3 Masonry-unit footings. The design, materials and construction of masonry-unit footings shall comply with the provisions of Chapter 21.
[1805.5.4] 1809.5.4 **Steel grillage footings.** Grillage footings of structural steel [shapes] elements shall be separated with approved steel spacers and be entirely encased in concrete with at least 6 inches ([152] 152.4 mm) on the bottom and at least 4 inches ([102] 101.6 mm) at all other points. The spaces between the [shapes] elements shall be completely filled with concrete or cement grout.

[1805.5.5] 1809.5.5 **Timber footings.** Refer to Chapter 23.

[1805.5.6] 1809.5.6 **Wood foundations.** Refer to Chapter 23.

[1805.5.7] 1809.5.7 **Pier foundations.** The design, materials, and construction of pier foundations shall conform to the requirements of Sections [1805.5.2] 1809.5.2, [1805.5.3] 1809.5.3, and [1805.5.7.1] 1809.5.7.1 through [1805.5.7.6] 1809.5.7.6.

**Exception:** Piers shall be load tested as a deep foundation in accordance with the applicable portions of Section [1808] 1810 when the bearing stratum is not physically available for inspection during construction as required by Chapter 17.

[1805.5.7.1] 1809.5.7.1 **Dimensions and height.** The minimum horizontal dimension of piers shall be 2 feet ([640] 609.6 mm), and the height shall not exceed 12 times the least horizontal dimension.

[1805.5.7.2] 1809.5.7.2 **Concrete design.** Where adequate lateral support is furnished by the surrounding materials defined in Section [1808.7] 1810.7 of this code, piers may be constructed of plain or reinforced concrete and the requirements of ACI 318 shall apply.

**Exception:** Where adequate lateral support is not provided, and the ratio of unsupported height to least horizontal dimension does not exceed three, piers of plain concrete shall be designed and constructed as pedestals in accordance with ACI 318. Where the unsupported height to least horizontal dimension exceeds three, piers shall be constructed of reinforced concrete, and shall conform to the requirements for columns in ACI 318.

[1805.5.7.3] 1809.5.7.3 **Reinforcement placement.** Reinforcement shall be tied and placed as a unit in the pier prior to placement of concrete.

**Exception:** Steel dowels embedded 5 feet (1524 mm) or less in the pier may be placed individually. Reinforcement is permitted to be wet set and the concrete cover that is otherwise required to measure a minimum of 2½ inches ([64] 63.5 mm) may be reduced to 2 inches ([51] 50.8 mm) for Groups R-3 and U occupancies not exceeding two stories of light-frame construction, provided the construction method is approved by the commissioner.

[1805.5.7.4] 1809.5.7.4 **Concrete placement.** Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to fill the full lateral dimensions of each pier. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.
[1805.5.7.5] **Steel shell.** Where concrete piers are entirely encased within a circular steel shell, and the area of the shell steel is considered reinforcing steel, the steel shall be protected under the conditions specified in Section [1808.2.12] 1810.2.12. Horizontal joints in the shell shall be spliced to comply with Section [1808.2.14] 1810.2.11.

[1805.5.7.6] **Dewatering.** Where piers are carried to depths below the groundwater level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the subgrade in dry conditions.

[1805.5.8] **Foundation walls.** Concrete and masonry foundation walls shall be designed in accordance with Chapter 19 or 21, respectively.

[1805.5.8.1] **Foundation wall thickness.** The minimum thickness of concrete and masonry foundation walls shall comply with Section [1805.5.8.1.1] 1809.5.8.1.1.

[1805.5.8.1.1] **Thickness based on walls supported.** The thickness of foundation walls shall not be less than the thickness of the wall supported, except that foundation walls of at least 8 inch (203) mm nominal width are permitted to support brick-veneered frame walls and 10 inch wide (254 mm) cavity walls.

[1805.5.8.2] **Foundation wall drainage.** Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections [1807.4.2] 1805.4.2 and [1807.4.3] 1805.4.3.

[1805.5.8.3 Reserved.]

[1805.6 Reserved.]

[1805.7 Reserved.]

[1805.8 Reserved.]

[1805.9] **Seismic requirements.** For structures assigned to Seismic Design Category C or D, provisions of ACI 318 [Section 21.12] 18.13, as modified by Section [1805] 1908 of this code, shall apply when not in conflict with the provisions of Section [1805] 1809 of this code. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

**Exceptions:**

1. Group R or U occupancies of light-framed construction and two stories or fewer in height are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.

2. One and two-family dwellings not more than three stories in height are not required to comply with the provisions of ACI 318, [Sections 21.10.1 through 21.10.3] Section 18.11, as modified by Section 1908 of this code.

[SECTION BC 1806]

[RETAINING WALLS AND OTHER RETAINING STRUCTURES]
[1806.1 General. Retaining walls shall be designed in accordance with Sections 1806.2.]

[1806.2 Design. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, lateral soil pressures on both sides of the keyway shall be considered in the sliding analysis.]

[1806.2.1 Design lateral soil loads. Retaining walls shall be designed for the lateral soil loads set forth in Section 1605.]

[Exception: Where the structural design of a retaining wall is based on load factor design, the load factors in Section 1605.2 may be modified as follows: where water can freely flow over the top of the wall, the wall may be designed for a water pressure equal to that caused by a groundwater table elevation at the top of the wall. For this condition, the load factor for the groundwater pressure may be reduced to 1.2. The load factor for the lateral earth pressure shall remain at 1.6.]

[1806.2.2 Safety factor. Retaining walls shall be designed to resist the lateral action of soil to produce sliding and overturning with a minimum safety factor of 1.5 in each case. The load combinations of Section 1605 shall not apply to this requirement. Instead, design shall be based on 0.7 times nominal earthquake loads, 1.0 times other nominal loads, and investigation with one or more of the variable loads set to zero. The safety factor against lateral sliding shall be taken as the available soil resistance at the base of the retaining wall foundation divided by the net lateral force applied to the retaining wall.]

[Exception: Where earthquake loads are included, the minimum safety factor for retaining wall sliding and overturning shall be 1.1.]

[1806.3 Temporary retaining structures. Structural members for temporary retaining structures may be designed with a 20 percent decrease in the computed bending moment only.]

[SECTION BC 1807
[DAMPPROOFING AND WATERPROOFING]

[1807.1 Where required. Walls or portions thereof that retain soil or rock and enclose interior spaces and floors below grade shall be waterproofed or dampproofed in accordance with this section, with the exception of those spaces containing occupancy groups other than residential and institutional where such omission is not detrimental to the building or occupancy. Ventilation for crawl spaces shall comply with Section 1203.3.]

[1807.1.1 Flood hazard areas. Buildings and structures in areas of special flood hazard shall comply with Appendix G.]

[1807.2 Dampproofing required. Where hydrostatic pressure will not occur as determined by Section 1802, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AF&PA TR7.]
1807.2.1 Floors. Dampproofing materials for floors shall be installed between: (i) the floor and (ii) the base course required by Section 1807.4.1 or the sub-floor. Subgrade for the dampproofing material shall be prepared in accordance with manufacturer’s recommendations. Dampproofing material shall be installed in accordance with manufacturer’s recommendations, and protected after placement. Any damaged areas and punctures must be repaired prior to placement of slab. All penetrations shall be sealed as per manufacturer’s recommendations.

1807.2.2 Walls. Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level as determined by the registered design professional and shall be installed in accordance with manufacturer’s recommendations. Dampproofing at walls shall overlap or extend past the slab dampproofing such that there are no gaps or breaches in the dampproofing system.

1807.3 Waterproofing required. Where the geotechnical investigation required by Section 1802 indicates that a hydrostatic pressure condition exists, walls and floors shall be waterproofed in accordance with this section.

1807.3.1 Floors. Floors required to be waterproofed shall be designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected. Waterproofing shall be accomplished by creating a continuous water seal below the floor using appropriate waterproofing materials. Joints, penetrations and other interruptions shall be sealed in accordance with manufacturer’s recommendations. Floor waterproofing must be transitioned to accomplish a complete tie-in with the foundation wall waterproofing.

1807.3.2 Walls. Walls required to be waterproofed shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected. Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the groundwater table or as directed by the registered design professional. The remainder of the wall shall be dampproofed in accordance with Section 1807.2.2. Joints, penetrations and other interruptions shall be sealed in accordance with manufacturer’s recommendations.

1807.3.3 Joints and penetrations. Joints in or between walls and floors, and penetrations of walls and floors shall be sealed utilizing methods and materials approved by the registered design professional. Joints, penetrations and other interruptions shall be sealed in accordance with the manufacturer’s recommendations.

1807.4 Subsoil drainage system. Where it is determined that there is a potential for infiltration or seepage, a subsoil drainage system shall be permitted to be used to control this inflow, provided that:

1. The below ground space is waterproofed or dampproofed per Sections 1807.2 and 1807.3; and

2. The estimated discharge from the drainage system is less than or equal to the amount allowed by the agency having jurisdiction.
[1807.4.1 Drainage course. A drainage course shall consist of washed gravel, crushed natural stone or other suitable drainage medium acceptable to the engineer. Recycled Concrete Aggregate is not acceptable for use in a drainage course where a subsoil drainage system is used.]

[1807.4.2 Foundation drain. A foundation drain shall be installed where required by the registered design professional. The foundation drain, including layout, materials, and cleanouts, shall be designed by the registered design professional.]

[1807.4.3 Drainage discharge. The drainage course and foundation drain shall discharge by gravity or mechanical means into an approved drainage system that complies with the New York City Plumbing Code and any other laws or requirements of agencies having jurisdiction.]

[1807.5 In situ walls. In situ walls (such as slurry walls, tangent pile walls, and secant pile walls) with joints sealed by grouting or other methods acceptable to the engineer shall not require waterproofing or dampproofing unless required by the engineer.]

SECTION BC [1808] 1810 DEEP FOUNDATIONS

[1808.1] 1810.1 Scope. Deep foundation elements, including but not limited to timber piles, precast concrete piles, structural steel piles, cast-in-place concrete piles, caisson piles, drilled displacement piles, composite piles, and helical piles, shall comply with Section [1808. In addition,] 1810; driven piles shall comply with Section [1809] 1811; cast-in-place concrete piles shall comply with Section [1810] 1812; composite piles shall comply with Section [1811] 1813; and helical piles shall comply with Section [1812] 1814.

[1808.2 Piles] 1810.2 Deep foundations—general requirements.

[1808.2.1] 1810.2.1 General. [Piles] Deep foundations shall be designed and installed in accordance with the requirements of the geotechnical investigation and report required by Section [1802] 1803 and Sections [1808] 1810 through [1812] 1814.

[1808.2.2] 1810.2.2 Additional geotechnical investigation and report requirements. Where [pil]e deep foundations are used, the geotechnical investigation and report provisions of Section [1802] 1803 shall be expanded to include, but not be limited to, consideration of the following:

1. [Suitable-pile] Recommended deep foundation types and [installed] their capacities.
2. Designation of bearing stratum or strata.
   [3. Driving criteria.]
4. Reductions for group action, where necessary.
5. Load test requirements.
Installation procedures.

Protection of adjacent structures due to installation.

Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).

Pile load test requirements.

Durability of pile materials.

Designation of bearing stratum or strata.

Reductions for group action, where necessary.

Special inspection. Special inspections for deep foundations shall be performed by an engineer in accordance with Sections [1704.8] 1705.7 and [1704.9] 1705.19.

Pile caps. Pile caps shall be of reinforced concrete, and shall include all elements to which piles deep foundations are connected, including grade beams and mats. The soil immediately below the pile cap shall not be considered as carrying any vertical load. The tops of piles deep foundations shall be embedded not fewer than 3 inches ([76] 76.2 mm) into pile caps and the caps shall extend at least 4 inches ([102] 101.6 mm) beyond the outermost edges of piles the deep foundation elements. The tops of piles deep foundations shall be cut back to sound material before capping. Pile caps shall be protected from the effects of frost in accordance with Section [1805.3.1] 1809.3.1.

More than one pile type, pile capacity or method of pile installation for deep foundations. In the conditions described below, the several parts of the building supported on the different pile types or different pile capacities of deep foundations shall be separated by suitable joints providing for differential movement, or analysis shall be prepared by the engineer, establishing to the satisfaction of the commissioner that the proposed construction is adequate and safe, and showing that the probable settlements and differential settlements to be expected will be tolerable to the structure and not result in instability of the building.

The load test requirements of Section [1808.4] 1810.4 shall apply separately and distinctly to each different deep foundation type, or capacity of piling or equipment used, or method of installation, except where analysis of the probable, comparative behavior of the different type or capacity of the deep foundation or the method of installation indicates that data on one type or capacity of deep foundation permit a reliable extrapolation of the probable behavior of other types or capacities of deep foundations. The requirements of this section apply to the following proposed conditions:

1. Construction of a foundation for a building incorporating more than one type or capacity of deep foundations;

2. Modification of an existing foundation by the addition of piles of a deep foundations differing from the type or capacity of the existing deep foundation;
3. Construction or modification of a foundation utilizing different methods or more than one method of installation, or using different types or capacities of equipment (such as different types of hammers having markedly different striking energies or speeds); or

4. Support of part of a building on deep foundations and part on shallow foundations.

**1808.2.6 Settlement analysis.** The settlement of an individual deep foundation or groups of deep foundations shall be estimated based on approved methods of analysis. The predicted settlement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any stresses to exceed allowable values.

**1808.2.7 Use of existing deep foundations.** Deep foundations left in place where a structure has been demolished shall not be used for the support of new construction unless the existing deep foundations are load tested in accordance with Section 1810.4, original installation and testing records of the existing deep foundations are available, or the new loads are no more than half the calculated previous loads on the existing deep foundations. The engineer shall determine and certify that the existing deep foundations are sound and meet the requirements of this code.

**1808.2.8 Special types of deep foundations.** The use of types of deep foundations not specifically mentioned herein is permitted, subject to the approval of the commissioner, upon the submission of acceptable test data, calculations and other information relating to the structural properties and load capacity of such deep foundations. The allowable stresses shall not in any case exceed the limitations specified herein.

**1808.2.9 Minimum spacing of deep foundations.** Minimum spacing of deep foundations shall: (i) provide for adequate distribution of the load on the deep foundation group into the supporting soil or rock, (ii) account for installation effects, and (iii) be in accordance with the recommendations of Section 1808.2.2.

**1808.2.10 Deep foundations located near a lot line.** Deep foundations located near a lot line shall be designed on the assumption that the adjacent lot will be excavated to a depth of 10 feet (3048 mm) below the nearest legally established curb level. Where such excavation would reduce the embedded length of the deep foundation, the portion of the deep foundation exposed shall be deemed to provide no lateral or vertical support, and the load-carrying determination shall discount the resistance offered by the soil that is subject to potential excavation.

**1808.2.11 Splices.** Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the deep foundation element during installation and thereafter and shall be of adequate strength to transmit the vertical and lateral loads (including tensions) and the moments occurring in the deep foundation section at the location of the splice without exceeding the allowable stresses for such materials as established in Table 1808.8. In all cases, splices shall develop at least 50 percent of the bending capacity of the deep foundation. In all cases, splices situated in the upper 10 feet (3048 mm) of the deep foundation shall be capable of resisting (at allowable working stresses) the applied moments and shears. For individual deep foundation elements or
groups comprised of two [piles] deep foundation elements, splices in the upper 10 feet (3048 mm) also shall be capable of resisting the moment and shear that would result from an assumed eccentricity of the [pile] load on the deep foundation of 3 inches (76.2 mm). For [piles] deep foundations located near a lot line, the applied moment and shears of such [piles] deep foundations shall be determined on the basis that the adjacent site will be excavated to a depth of 10 feet (3048 mm) below the nearest established curb level as required in Section [1808.2.10] 1810.2.10.

Exception: For caissons core beams, the splice shall develop the lesser of 50 percent of the capacity of the core in bending or twice the design bending moment carried by the core at the location of the splice, provided that the core splice is not within two caisson diameters of any splice in the casing.

[1808.2.12] 1810.2.12 Protective treatment of [pile] deep foundation materials. Where boring records or site conditions indicate possible deleterious action on [pile materials] deep foundation elements because of soil constituents or other aggressive environmental factors (such as chemical seepage, the presence of salt water, electrical current, changing water levels or other factors), the [pile materials] deep foundation elements shall be adequately protected by materials, methods or processes approved by the engineer. Protective materials shall be applied to the [piles] deep foundations so as not to be rendered ineffective by driving. The effectiveness of such protective measures for the particular purpose shall have been thoroughly established by satisfactory service records or other evidence.

[Piles] Deep foundations installed in ash, garbage, or cinder fills; [piles] deep foundations that are free-standing in or near a seawater environment; [piles] deep foundations used for the support of chemical plants or coal storage; [piles] deep foundations under similar conditions of chemical seepage or aggressive action; and [piles] deep foundations that are used for support of electrical generating plants, shall be investigated regarding the need for special protective treatment. Where special protective treatment is indicated by the engineer, such [piles] deep foundations shall be protected against deterioration by encasement, coating or other device acceptable to the engineer.

[1808.2.13] 1810.2.13 Minimum concrete cover. The minimum concrete cover for cast-in-place and precast concrete piles shall be as shown in Table [1808.2.13] 1810.2.13.

**1808.3 Allowable [pile] deep foundation loads.** Allowable [pile] deep foundation loads shall be determined in accordance with Sections [1808.3.1] 1810.3.1 through [1808.3.5] 1810.3.5.

**1808.3.1 Determination of allowable individual axial compressive loads.** The allowable individual axial compressive loads on [piles] deep foundations shall be the lesser of the allowable structural capacity of the element [and] or the allowable geotechnical capacity of the element. This allowable load shall be determined by an engineer experienced in geotechnical engineering and shall be approved by the commissioner as described below:

1. The allowable structural capacity of the [pile] deep foundation shall be determined in accordance with Sections [1808] 1810 through [1813 of this code] 1816.

2. The allowable geotechnical capacity of the [pile] deep foundation shall be calculated using a recognized method of analysis[1] and a minimum factor of safety of 2 with respect to failure.

3. The allowable geotechnical capacity shall be demonstrated by load tests.

**Exceptions:**

1. Allowable loads for [piles] deep foundations installed by jacking shall be determined in accordance with Section [1808.3.2] 1810.3.2.

2. [Caissons] Caisson piles socketed into Class 1a through 1c material as defined in Table [1804.1] 1806.1.

3. Driven [piles] deep foundations with allowable loads less than or equal to 40 tons (392.7 kN) (30 tons (294.2 kN) for timber piles).

4. Micropiles with allowable loads less than or equal to 20 tons (196.1 kN), provided all of the following criteria are satisfied:
4.1. The maximum allowable bond stress between the soil and the grout is less than or equal to 4 psi (27.6 kPa).

4.2. The minimum bond zone diameter is greater than or equal to 9 inches (228.6 mm).

4.3. The bond zone is formed entirely in Class 3b or better soils.

[1808.3.1.1] 1810.3.1.1 Group effects. The allowable load determined in Section [1808.3.1] 1810.3.1 shall account for [pile] group effects on deep foundations. The analysis of group effects shall be performed by an engineer experienced in geotechnical engineering and calculated using recognized methods of analysis. This analysis shall include a bearing capacity and settlement analysis of the anticipated [pile groups] group(s) of deep foundations and shall consider the presence of weaker soil strata that may be present below the deep foundation element.

[1808.3.1.2] 1810.3.1.2 Down-drag. Where [piles] deep foundations are installed through subsiding fills or other subsiding strata and derive support from underlying firmer materials, consideration shall be given to the downward frictional forces that may be imposed on the [piles] deep foundations by the subsiding upper strata.

[1808.3.1.3] 1810.3.1.3 Bearing stratum. The plans for the proposed work shall establish, in accordance with the requirements relating to allowable bearing pressure, the bearing stratum to which the [piles] deep foundations in the various sections of the building must penetrate and the approximate elevations of the top of such bearing stratum. Where penetration of a given distance into the bearing strata is required for adequate distribution of the loads, such penetration shall be shown on the plans. The indicated elevations of the top of the bearing strata shall be modified by such additional data as may be obtained during construction. All [piles] deep foundations shall penetrate to or into the designated bearing stratum.

[1808.3.2 Piles] 1810.3.2 Deep foundations installed by jacking or other static forces. The allowable capacity of a [pile] deep foundation installed by jacking or other static forces shall be not more than 50 percent of the load or force used to install the [pile] deep foundation to the required penetration, except for [piles] deep foundations jacked into position for underpinning. The allowable capacity of each deep foundation used for permanent underpinning [pile] shall not exceed the larger of the following values: ⅔ of the total jacking force used to obtain the required penetration if the load is held constant for 7 hours without measurable settlement; or ½ of the total jacking force at final penetration if the load is held for a period of 1 hour without measurable settlement. The jacking resistance used to determine the working load shall not include the resistance offered by nonbearing soils, soils which are to be excavated or soils where support will dissipate with time.

[1808.3.3] 1810.3.3 Helical piles. The allowable axial compressive load for helical piles shall be in accordance with the requirements of Section [1842] 1814.

[1808.3.4] 1810.3.4 Allowable uplift load. Where required by the design, the allowable uplift load for a single [pile] deep foundation shall be determined in accordance with accepted engineering practices based on a minimum factor of safety of three or by uplift load tests.
performed in accordance with Section [1808.4.2.1] 1810.4.2.1. Where uplift load tests are performed, the maximum allowable uplift load shall not exceed the ultimate load capacity divided by a factor of safety of two. The allowable uplift load for a [pile] deep foundation group shall not exceed the sum of the allowable uplift loads of the individual [piles] deep foundations in the group, nor the uplift capacity calculating the group action of the [pile] deep foundation in accordance with accepted engineering practice where the calculated ultimate group capacity is divided by a safety factor of 2.5.

[1808.3.5] 1810.3.5 Allowable lateral load. The allowable lateral load of a single [pile] deep foundation element or a [pile] group thereof shall be determined by an approved method of analysis in accordance with accepted engineering practice. The maximum allowable lateral load of a [pile] deep foundation shall be 1 ton (8.9 kN), unless verified by lateral load test. Load testing, where required, shall be in accordance with Section [1808.4.3] 1810.4.3. See Sections [1808.4.3.1] 1810.4.3.1 and [1808.4.3.2] 1810.4.3.2 for determining the allowable lateral load from the results of lateral load tests.

[1808.3.5.1] 1810.3.5.1 Group effects. Lateral capacities for [pile] deep foundation groups shall be modified to account for group effects in accordance with accepted engineering practice.

[1808.4] 1810.4 Load tests. Where required, [piles] deep foundations shall be load tested in accordance with the requirements of Sections [1808.4.1] 1810.4.1 through [1808.4.3] 1810.4.3.

[1808.4.4] 1810.4.1 Compressive load tests. Where load tests are required per Section [1808.3] 1810.3 or [1808.4.1.1.1] 1810.4.1.1.1, the [piles] deep foundations shall be load tested in accordance with the applicable section.

[1808.4.1.1] 1810.4.1.1 Required number of load tests. Where load tests are required, at least one test shall be performed in each area of the foundation site within which the subsurface soil conditions are “substantially similar” in character, as determined by the engineer, and at least one test shall be performed for each [pile] deep foundation type for the entire foundation installation of the building or group of buildings on a site occupying a total area of 5,000 square feet (465 m²) or less. Where load tests are required, at least two load tests shall be performed for a site having a footprint between 5,000 square feet (465 m²) and 30,000 square feet (2787 m²), and one additional load test shall be performed for each 20,000 square feet (1860 m²) of added footprint area. For conditions where multiple [pile] deep foundation types or capacities are used, refer to Section [1808.2.5] 1810.2.5.

[1808.4.1.1.1] 1810.4.1.1.1 Additional load tests. Where [installed pile] load bearing capacities of the installed deep foundations are in doubt, [the piles] are considered non-conforming by the engineer, or [as] where required by the commissioner, additional [piles] deep foundation elements shall be load tested to establish the allowable capacity. For friction-based deep foundations [piles] where the actual production [pile] deep foundation lengths vary more than 25 percent from that of the [test pile] deep foundations initially installed and load tested, the engineer shall determine if additional load tests are required to establish the allowable [pile] capacity of the deep foundation. The number of additional load tests shall be determined by the engineer or commissioner.
1808.4.1.2 Load test apparatus and inspection requirements. The apparatus and structure to be used in making the load test shall be designed by an engineer. Load tests shall be performed under the observation of the special inspector. A complete record of such tests shall be filed with the commissioner.

1808.4.1.3 Compressive load test procedures. Compressive load tests shall be conducted in accordance with ASTM D1143 standard procedures and the following conditions:

1. Dial extensometer gages shall provide readings to the nearest 0.001 inch (0.025 mm). Electrical transducers may be used to make settlement observations, provided that backup measurements are made utilizing dial extensometers as described herein at sufficient times to validate the transducer readings.

2. If the allowable axial compressive load is less than or equal to the Basic Maximum Allowable [Pile Load] Loads on Deep Foundations in Table 1808.4.1.3, the total test load shall remain in place for a minimum of 12 hours, and shall be held until the average rate of settlement as measured over a 12-hour period does not exceed 0.001 inches (0.025 mm) per hour. The total load shall be removed in decrements not exceeding 25 percent of the total load at 1 hour intervals or longer. For cases where the allowable [pile] load on the deep foundation is greater than the values prescribed in Table 1808.4.1.3, refer to Section 1808.4.1.5.

3. In addition to observations required by ASTM D1143, settlement observations shall be performed 24 hours after the entire test load has been removed.

Exception: A static load test for drilled [piles] deep foundations using an embedding load transfer mechanism shall be considered acceptable, provided that the test is performed in general accordance with ASTM D1143 – Quick Load Test Method. The [pile] deep foundation shall be suitably instrumented to evaluate the load transfer through soil or rock at multiple locations along the shaft.

4. Any temporary supporting capacity that the soil might provide to the [pile] deep foundation during a load test, but which would be dissipated with time, shall be eliminated by casing off or by other suitable means, such as increasing the total test load to account for such temporary capacity.

For SI: 1 ton = 907.18 kg.

[1808.4.1.4] 1810.4.1.4 High strain, dynamic compressive test methods. High strain, dynamic compressive test methods performed in accordance with ASTM D4945 shall be permitted to be used where [three] two or more load tests are required and subject to the approval of the commissioner. In such case, at least one high strain dynamic test shall be performed as a calibration on a static load tested [pile] deep foundation or nearby [pile] deep foundation driven to comparable resistance. No more than one-half of the required number of load tests may be performed by high strain dynamic methods. High strain dynamic tests shall be performed under the supervision of an engineer experienced in the methods used. The number of high strain dynamic tests shall be at least twice the number of replaced static load tests.

[1808.4.1.5] 1810.4.1.5 Acceptance criteria. The allowable [pile] load of a deep foundation shall be the lesser of the two values computed as follows:

1. Fifty percent of the applied load causing a net settlement of the [pile] tested deep foundation of not more than \( \frac{1}{100} \) of 1 inch per ton (0.25 mm per 8.9 kN) of applied load. Net settlement in this paragraph is defined as gross settlement due to the total test load minus the rebound after removing 100 percent of the test load.

2. Fifty percent of the applied load causing a net settlement of the [pile] tested deep foundation of ¾ inch ([49] 19.1 mm). Net settlement in this paragraph is defined as the gross settlement due to the total test load less the amount of elastic shortening in the [pile] deep foundation section due to total test load. The elastic shortening shall be calculated as if the [pile] deep foundation is designed [as an] for end-bearing [pile] or
Alternatively, the net settlement may be measured directly using a telltale or other suitable instrumentation.

**1808.4.1.5.1 Substantiation of higher allowable loads.** The basic maximum allowable [pile] loads of deep foundations tabulated in Table 1808.4.1.3 may be exceeded where a higher value can be substantiated on the basis of load tests and analysis, except for the loads for timber and helical piles. The provisions of Section 1808.4.1 shall be supplemented, as follows: the final load increment shall remain in place for a total of not less than 24 hours; single [test piles] tested deep foundations shall be subjected to cyclical loading in accordance with ASTM D1143 or suitably instrumented with telltales and strain gauges so that the movements of the [pile] tip and butt of the deep foundation may be independently determined and load transfer to the soil evaluated. A complete record demonstrating satisfactory performance of the test shall be submitted to the commissioner.

**1808.4.2 Uplift load test.** Where uplift load tests are required, one uplift load test shall be conducted in each area of substantially similar subsurface conditions up to 5,000 square feet (465 m²) of building footprint where [piles] deep foundations are subjected to uplift, and not less than two uplift load tests shall be conducted for each area of building footprint where [piles] deep foundations are subjected to uplift between 5,000 square feet (465 m²) and 30,000 square feet ([2787] 2787.1 m²) and for such area one additional [upload] uplift load test shall be conducted for each 20,000 square feet ([1860] 1858.1 m²) of additional area of building footprint where [piles] deep foundations are subject to uplift. For conditions where multiple [pile] types or capacities of deep foundations are used, refer to Section 1808.2.5.

**1808.4.2.1 Uplift load test procedures.** Uplift load tests shall be conducted in accordance with ASTM D3689 standard procedures and the following conditions:

1. Dial extensometer gages shall provide readings to the nearest 0.001 inch (0.025 mm). Electrical transducers may be used to make settlement observations provided that backup measurements are made utilizing dial extensometers as described herein at sufficient times to validate the transducer readings.

2. Any temporary supporting capacity that the soil might provide to the [pile] deep foundation during a load test, but which would be dissipated with time, shall be eliminated by casing off or by other suitable means, such as increasing the total test load to account for such temporary capacity.

**1808.4.2.2 Uplift load test apparatus and inspection requirements.** The apparatus and structure to be used in making the load test shall be designed by an engineer. Load tests shall be performed under the observation of the special inspector. A complete record of such tests shall be filed with the commissioner.

**1808.4.3 Lateral load tests.** Where testing is required, lateral load tests shall be performed in accordance with ASTM D3966. A minimum of two [piles] deep foundations shall be tested for every area of similar subsurface conditions. For conditions where multiple [pile] types or capacities of deep foundations are used, refer to Section 1808.2.5.
[1808.4.3.1] 1810.4.3.1 Free headed [piles] deep foundations. For [piles] deep foundations whose heads are to be designed to be free to rotate in the final structure, the maximum test load shall be at least twice the proposed design working load. In the absence of specific project requirements as determined by the engineer, the resulting allowable load shall not be more than one-half of that test load that produces a gross lateral movement of 1 inch ([25] 25.4 mm) of the deep foundation at the ground surface.

[1808.4.3.2] 1810.4.3.2 Fixed headed [piles] deep foundations. For [piles] deep foundations whose heads are designed to be fixed in the final structure, the results of the load test shall be used to verify the input parameters used in the lateral load analysis. In the absence of specific project requirements as determined by the engineer, the allowable load shall be the load that produces a gross lateral movement of \(\frac{3}{8}\) of an inch (9.5 mm) of the deep foundation at the ground surface in the lateral load analysis.

[1808.4.3.3] 1810.4.3.3 Lateral load test procedures. Lateral load tests shall be conducted in accordance with ASTM D3966 standard procedures. In addition, dial extensometer gages shall provide readings to the nearest 0.001 inch (0.025 mm). Electrical transducers may be used to make deflection observations, provided that backup measurements are made utilizing dial extensometers as described herein at sufficient times to validate the transducer readings.

[1808.4.3.4] 1810.4.3.4 Load test apparatus and inspection requirements. The apparatus and structure to be used in making the load test shall be designed by an engineer. Lateral load tests shall be performed under the observation of the special inspector. A complete record of such tests shall be filed with the commissioner.

[1808.5] 1810.5 Installation. Installation of [piles] deep foundations shall be subject to the requirements of Sections [1808.5.1] 1810.5.1 through [1808.5.8] 1810.5.8.

[1808.5.1] 1810.5.1 Protection of [piles] deep foundations during installation. [Piling] Deep foundations shall be handled and installed to the required penetration and resistance by methods that leave the [piles’] deep foundations’ strength unimpaired and that develop and retain the [piles’] deep foundations’ required load-bearing resistance. Any damaged [pile] deep foundation shall be satisfactorily repaired or the [pile] deep foundation shall be rejected. As an alternative and subject to the approval by the commissioner, deep foundations that are damaged [or], misaligned [piles or piles], or do not [reaching] reach their design tip elevation may be used at a reduced fraction of the design load based on an analysis by the engineer.

[1808.5.2] 1810.5.2 Equipment. Equipment and methods of installation shall be such that [piles] deep foundations are installed in their proper position and alignment without damage. Equipment shall be maintained in good working order.

[1808.5.3] 1810.5.3 Preexcavation. The use of jetting, augering or other methods of preexcavation shall be subject to the approval of the commissioner. Where permitted, preexcavation shall be carried out in the same manner as used for [piles] deep foundation elements subject to load tests and in such a manner that will not impair the carrying capacity of the [piles] deep foundation elements already in place or damage adjacent structures. [Pile] The element tips of deep foundations shall be [driven] advanced below the preexcavated depth until the required resistance or penetration is obtained.
[1808.5.4] 1810.5.4 Minimum [pile penetrations] penetration of deep foundations. [Piles] Deep foundations shall penetrate the minimum distance required to develop the required load capacity of the [pile] deep foundation as established by the required penetration resistance and load tests as applicable.

[1808.5.5] 1810.5.5 Damage to adjacent structures or [piles] deep foundations. [Piles] Deep foundations shall be installed in such a manner and sequence as to prevent distortion or damage that affects the structural integrity of the [piles] deep foundations being installed, or previously installed adjacent [piles] deep foundations. The sequence of the installation shall avoid compacting the surrounding soil to the extent that other [piles] deep foundations cannot be installed properly, and shall prevent ground movements that are capable of damaging adjacent structures. [Piles] Deep foundations shall be installed with adequate provision for the protection of adjacent buildings and property.

[1808.5.6] 1810.5.6 Identification. All [pile materials] deep foundation elements shipped or delivered to the job site shall be identified for conformity to the specified grade and this identification shall be maintained continuously from the point of manufacture to the point of installation. Such shipment or delivery shall be accompanied by a certification from the material supplier or manufacturer indicating conformance with the construction documents. Such certification shall be made available to the engineer of record and the department. In the absence of adequate data, [pile materials] deep foundation elements shall be tested by an approved agency to determine conformity [to] the specified grade. The approved agency shall furnish a certification of compliance to the engineer of record, or upon request to the commissioner.

[1808.5.7] 1810.5.7 Deep foundation location plan. A plan showing the location and designation of [piles] deep foundations by an identification system shall be filed with the commissioner prior to installation of such [piles] deep foundations. Detailed records for individual [piles] deep foundations shall bear an identification corresponding to that shown on the plan.

[1808.5.8] 1810.5.8 Installation of [piles] deep foundations. [Piles] Deep foundations within the area of influence of a given, satisfactorily tested [pile] deep foundation shall be installed to the same installation criteria as the [successful test pile] satisfactorily tested deep foundation. The same equipment that was used to install the [test pile] satisfactorily tested deep foundation, identically operated in all aspects, shall be used to install the [piles] deep foundation. All [piles] deep foundation shall be of the same type, size and shape as the [test pile] satisfactorily tested deep foundation. All [piles] deep foundations within the area of influence as represented by a given satisfactorily tested [test pile] deep foundation shall bear in, or on, the same bearing stratum as the [test pile] satisfactorily tested deep foundation.

[1808.6] 1810.6 Tolerances. Tolerances for [piles] deep foundations shall be in accordance with the requirements of Sections [1808.6.4] 1810.6.1 through [1808.6.4] 1810.6.4.

[1808.6.1] 1810.6.1 Tolerance in the location of the head of the [pile] deep foundation. A tolerance of 3 inches (76.2 mm) from the designed location shall be permitted in the installation of each [pile] deep foundation as measured from [the pile] its head, without reduction in load capacity of the [pile] deep foundation group unless otherwise noted on the foundation plans. When [piles] deep foundations are installed outside of this tolerance, the true loading on such [piles] deep foundations shall be analytically determined from a survey that defines the
actual location of the [piles] deep foundations as installed and using the actual eccentricity in the [pile] deep foundation group with respect to the line of action of the applied load.

[1808.6.2] 1810.6.2 Out of plumb tolerance. If the axis of any [pile] deep foundation is installed out of plumb or deviates from the specified batter by more than 4 percent, the design of the foundation shall be modified to resist the resulting vertical and lateral forces. In types of [piles] deep foundations for which subsurface inspection is not possible, this determination shall be made on the exposed section of the [pile] deep foundation, which [section,] at the time of checking axial alignment, shall not be less than 2 feet ([640] 609.6 mm) in length. In [pile] deep foundations that can be checked for axial alignment below the ground surface, the sweep of the [pile] deep foundation axis shall not exceed 4 percent of the embedded length.

[1808.6.3] 1810.6.3 Bent-piles Deep foundations that are bent during installation. The load-bearing capacity of [piles] deep foundations discovered to have a sharp or sweeping bend shall be determined using an approved method of analysis by the engineer responsible for the [pile] deep foundation design in accordance with accepted engineering practice or by load testing a representative [pile] deep foundation.

[1808.6.4] 1810.6.4 Mislocated-piles Deep foundations that are mislocated during installation. The maximum compressive load on any [pile] deep foundation due to mislocation shall not exceed 110 percent of the allowable design load. If the total load on any [pile] deep foundation, so determined, is in excess of 110 percent of the allowable load-bearing capacity, correction shall be made by installing additional [piles] deep foundations or by other methods of load distribution as required to reduce the maximum [pile] load to 110 percent of the allowable [pile] deep foundation capacity.

[1808.7] 1810.7 Lateral support. Lateral support for [piles] deep foundation elements shall be in accordance with the requirements of Sections [1808.7.1] 1810.7.1 through [1808.7.4] 1810.7.4.

[1808.7.1] 1810.7.1 Buckling of [piles] deep foundations. Any soil other than soil with no shear strength shall be deemed to afford sufficient lateral support to the [pile] deep foundation to prevent buckling and to permit the design of the [pile] deep foundation in accordance with accepted engineering practice and the applicable provisions of this code.

[1808.7.2] 1810.7.2 Unbraced [piles] deep foundations. [Piles] Deep foundation elements standing unbraced in air, water or soils with no shear strength shall be designed as columns in accordance with the provisions of this code. Such [piles] deep foundations driven into firm ground can be considered fixed and laterally supported at 5 feet (1524 mm) below the ground surface and in soft material at 10 feet (3048 mm) below the ground surface unless otherwise prescribed by the engineer.

[1808.7.3] 1810.7.3 Bracing at tops of [piles] deep foundations. [Piles] Deep foundations shall be braced to provide lateral stability and resist eccentric loads and moments in all directions. Three or more [piles] deep foundations connected by a rigid cap shall be considered braced, provided that the [pile] deep foundations are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A [two-pile] group of two deep foundation elements in a rigid cap shall be considered to be braced along the axis connecting the two [piles] deep foundations.
Methods used to brace [piles] deep foundations shall be subject to the approval of the commissioner.

[Piles] Deep foundations supporting walls shall be driven alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and moments due to lateral forces, or the [wall piles] deep foundations supporting the wall are adequately braced. A single row of [piles] deep foundations without bracing is permitted for one and two-family dwellings and lightweight construction not exceeding two stories or 35 feet (10 668 mm) in height, provided the centers of the [piles] deep foundations are located within the width of the wall.

[1808.7.4] **1810.7.4 Bracing of short [piles] deep foundations.** All pile caps supported by [piles] deep foundations that penetrate less than [ten feet] 10 feet (3048 mm) below cutoff level or less than [ten feet] 10 feet (3048 mm) below ground level shall be braced against lateral movement. Such bracing may consist of connection to other pile caps that encompass [piles] deep foundations embedded more than [ten feet] 10 feet (3048 mm) below those levels. The heads of the [piles] deep foundations shall be fixed in the cap. In no case shall more than fifty percent of the [piles] deep foundations in the foundation of any building penetrate less than [ten feet] 10 feet (3048 mm) below cut-off level or less than [ten feet] 10 feet (3048 mm) below ground level.

**Exception:** The requirements of this section shall not apply to caisson piles.

[1808.7.4.1–Piles] **1810.7.4.1 Deep foundations located near a lot line.** Where the embedded length of [piles] deep foundations located near a lot line would be reduced to less than [ten feet] 10 feet (3048 mm) by excavation of the adjacent site to a depth of [ten feet] 10 feet (3048 mm) below the nearest established curb level, the provisions of Section [1808.7.4] 1810.7.4 shall apply.

[1808.8] **1810.8 Allowable stresses.** Allowable stresses for [piles] deep foundations shall be as listed in Table [1808.8] 1810.8.

**Exception:** Allowable stresses greater than those specified in Table [1808.8] 1810.8 in Sections [1809] 1811 and [1840] 1812 shall be permitted where supporting data justifying such higher stresses are filed and approved by the commissioner.

</table>

For SI: 1 pound per square inch = 6.895 kPa.

^[a]: $f'_c$ is the specified compressive strength of the concrete or grout, $f_{pc}$ is the compressive stress on the gross concrete section due to effective prestress forces only; $f_y$ is the specified yield strength of reinforcement; $F_y$ is the specified minimum yield stress of structural steel; $F_u$ is the specified minimum tensile stress of structural steel.

^[c]: The stresses specified apply to the gross cross-sectional area [within the concrete surface] for precast concrete piles. The stresses specified shall apply to the concrete cross-sectional area for all other deep foundation elements. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

**[1808.9 Seismic Design Categories C & D.]**

**[1808.9.1] 1810.9 Seismic design of [piles] deep foundations.** Seismic design of [piles] deep foundation elements for structures assigned to Seismic Design Categories C & D shall be performed in accordance with Sections [1808.9.1 through 1808.9.3] 1810.9.1 and 1810.9.2.
1808.9.2.1 Seismic Design Category C. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, individual pile caps or piles deep foundations shall be interconnected by ties. Ties shall be capable of carrying, in tension and compression, a force equal to the lesser of: (i) the product of the larger of the pile cap or column design gravity load times the seismic coefficient, $S_{DS}$, divided by 10, or (ii) 25 percent of the smaller of the pile or column design gravity load, unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade, reinforced concrete slabs on grade, or confinement by competent rock, hard cohesive soils or very dense granular soils.

1808.9.2.1 Connection to pile cap. For structures assigned to Seismic Design Category C or D in accordance with Section 1613, concrete deep foundation elements consisting of concrete shall be connected to the pile cap by embedding the element reinforcement or field-placed dowels anchored in the element into the pile cap for a distance equal to their development length in accordance with ACI 318. It shall be permitted to connect precast, prestressed piles deep foundations to the pile cap by developing the element prestressing strands into the pile cap, provided the connection is ductile. For deformed bars, the development length is the full development length for compression, or tension in the case of uplift, without reduction for excess reinforcement in accordance with Section 25.4.10 of ACI 318. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the element shall be permitted, provided the design is such that any hinging occurs in the confined region. The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipes, tubes or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section. Concrete-filled steel pipes or tubes shall have reinforcement of not less than 0.01 times the cross sectional area of the concrete fill, developed into the cap and extending into the concrete fill a length equal to two times the required cap embedment, but not less than the development length in tension of the reinforcement.

Exception: Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile deep foundation. Splices of pile deep foundation segments shall develop the full strength of the pile deep foundation, but the splice need not develop the nominal strength of the pile deep foundation in tension, shear and bending when the splice has been designed to resist axial and shear forces and moments from the load combinations of Section 12.4 of ASCE 7-10.

1808.9.2.2 Design details. Moments, shears and lateral deflections used for design of deep foundations shall be established considering the nonlinear interaction of the shaft and soil, as recommended by the engineer. Where the ratio of the depth of embedment of the pile-to-pile center-to-center diameter or width of deep foundations is less than or equal to six, the pile deep foundation may be assumed to be rigid. Group effects from soil on lateral pile deep foundation nominal strength shall be included where pile deep foundation center-to-center spacing in the direction of lateral force is less than eight pile diameters. Group effects on vertical nominal strength of deep foundations shall be included where pile deep foundation center-to-center spacing is less than three pile diameters. The uplift soil nominal strength of deep foundations shall...
be taken as the pile uplift strength as limited by the frictional force developed between the soil and the pile deep foundation.

Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of the pile deep foundation, provisions shall be made so that those specified lengths or extents are maintained after pile deep foundation cutoff.

[1808.9.3] 1810.9.2 Seismic Design Category D. Where a structure is assigned to Seismic Design Category D in accordance with Section 1613, the requirements for Seismic Design Category C given in Section [1808.9.2] 1810.9.1 shall be met. Provisions of ACI 318, Section [21.12.4] 18.13.4, shall also apply when not in conflict with the provisions of Sections [1808] 1810 through [1813] 1816. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less in height are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.

2. Detached one and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section [21.12.4] 18.13.4.

3. Section [21.12.4.4(a)] 18.13.4.4(a) of ACI 318 shall not apply to concrete piles.

[1808.9.3.1] 1810.9.2.1 Design details for piles deep foundations and grade beams. Design details for deep foundations and grade beams shall comply with the following:

[Piles] 1. Deep foundations shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile-structure interaction coupled with pile deformations of deep foundations induced by lateral pile resistance of deep foundations to structure seismic forces.

2. Concrete piles on Site Class E or F sites, as determined in Section [1613.5.2] 1613.3.2 of this code, shall be designed and detailed in accordance with Sections [21.12.4.1, 21.12.4.2 and 21.12.4.3] 1813.4.1 and 1813.4.2 of ACI 318 within a distance of seven [pile] diameters of the deep foundation element of the pile cap and the interfaces of soft to medium stiff clay or liquefiable strata. For precast prestressed concrete piles, detailing provisions as given in Sections [1809.6.3.2.1] 1811.6.3.2 and [1809.6.3.2.2] 1811.6.3.2.2 of this code shall apply.

3. Grade beams shall be designed as beams in accordance with ACI 318, Chapter [24] 18. When grade beams have the capacity to resist the forces from the load combinations in Section 1605.4 of this code, they need not conform to ACI 318, Chapter [24] 18.
1808.9.3.2 1810.9.2.2 Connection to pile cap. For piles deep foundations required to resist uplift forces or provide rotational restraint, design of anchorage of [pile] deep foundations into the pile cap shall be provided considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage into the pile cap shall be capable of developing the following:

1. In the case of uplift, the lesser of the nominal tensile strength of the longitudinal reinforcement in a concrete pile, or the nominal tensile strength of a steel pile, or the [pile] deep foundation uplift soil nominal strength factored by 1.3 or the axial tension force resulting from the load combinations of Section 12.4 of ASCE 7[-10].

2. In the case of rotational restraint, the lesser of the axial and shear forces, and moments resulting from the load combinations of Section 12.4 of ASCE 7[-10] or development of the full axial, bending and shear nominal strength of the [pile] deep foundation.

1808.9.3.3 1810.9.2.3 Flexural strength. Where the vertical, lateral-force-resisting elements are columns, the grade beam or pile cap flexural strengths shall exceed the column flexural strength.

1808.9.3.4 1810.9.2.4 [Batter piles] Battered deep foundations. The connection between [batter piles] deep foundations that are battered and grade beams or pile caps shall be designed to resist the nominal strength of the [pile] deep foundation acting as a short column. [Batter piles] Battered deep foundations and their connections shall be capable of resisting forces and moments from the load combinations of Section 12.4 of ASCE 7[-10].

SECTION BC 1809 1811 DRIVEN [PILES] DEEP FOUNDATIONS

1809.1 1811.1 General. Driven [piles] deep foundations shall be designed and installed in accordance with Sections 1808 1810 and 1809.2 through 1809.7 1811.7. Driven deep foundation elements shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving and service loads.

1809.2 1811.2 Equipment. Equipment and methods of installation shall be such that [piles] deep foundations are installed in their proper position and alignment, without damage. Equipment shall be maintained in good working order.

1809.2.1 Pile driving 1811.2.1 Driving hammer for deep foundations. The hammer to be used to drive [piles] deep foundations shall deliver a maximum energy consistent with the size, strength and weight of the driven [piles] deep foundations. The [pile driving] hammer shall travel freely in the leads. The hammer shall deliver its rated energy, and measurements shall be made of the fall of the ram or other suitable data shall be obtained at intervals necessary to verify the actual energy delivered during the final 20 blows of the hammer.

1809.2.2 1811.2.2 Cushion or cap block. The cushion or cap block shall be a solid block of hardwood with its grains parallel to the axis of the [pile] deep foundation and enclosed in a tight-fitting steel housing, or other accepted equivalent assembly. If laminated materials are used, their type and construction shall be such that their strength is equal to or greater than hardwood. Wood
chips, pieces of rope, hose, shavings, automobile tires or similar materials shall not be used. Cap block cushions shall be replaced if burned, crushed, or otherwise damaged. Other cushion materials may be used subject to the approval of the engineer. The introduction of fresh hammer cushion or [pile] pile-driving cushion material just prior to final penetration is not permitted.

[1809.2.3] 1811.2.3 Followers. Followers shall not be used unless permitted in writing by the engineer responsible for the [pile] driving operation of the deep foundation. The required driving resistance shall account for the losses of driving energy transmitted to the [pile] deep foundation because of the follower. The follower shall be a single length section, be provided with a socket or hood carefully fitted to the top of the [pile] deep foundation to minimize loss of energy and to prevent damage to the [pile] deep foundation, and have sufficient rigidity to prevent “whip” during driving.

[1809.3] 1811.3 Driving criteria. The allowable compressive load on steel and concrete piles, where determined solely by the application of an approved wave equation analyses approved by the engineer, shall not exceed 40 tons ([356] 392.3 kN). The allowable compressive loads on timber piles, where determined solely by the wave equation analyses approved by the engineer, shall not exceed 30 tons ([267] 294.2 kN). For allowable loads greater than these values, the wave equation method of analysis may be used to establish initial driving criteria, but final driving criteria and the allowable load shall be verified by load tests in accordance with Section [1808.4] 1810.4. Minimum driving resistance and hammer energy may be determined in accordance with Tables [1809.3(a)] 1811.3(a) and [1809.3(b)] 1811.3(b).
### TABLE 1809.3(a) 1811.3(a)

</table>

For SI: 1 foot = 304.8 mm, 1 ton = 907.18 kg.

a. Final driving resistance shall be the sum of tabulated values plus resistance exerted by nonbearing materials. The driving resistance of nonbearing materials shall be taken as the resistance experienced by the pile during driving, but which will be dissipated with time and may be approximated as described in Section [1809.3] 1811.3.

b. The hammer energy indicated is the rated energy.

c. Sustained driving resistance. Where piles are to bear in soft rock, the minimum driving resistance shall be maintained for the last 6 inches, unless a higher sustained driving resistance requirement is established by load test. Where piles are to bear in soil Classes 2 through 5, the minimum driving resistance shall be maintained for the last twelve inches unless load testing demonstrates a requirement for higher sustained driving resistance. No pile needs to be driven to a resistance that penetrates in blows per inch (blows per [25] 25.4 mm) more than twice the resistance indicated in this table, nor beyond the point at which there is no measurable net penetration under the hammer blow.

d. The tabulated values assume that the ratio of total weight of pile to weight of striking part of the hammer does not exceed 3.5. If a larger ratio is to be used, or for other conditions for which no values are tabulated, the driving resistance shall be as approved by the commissioner.

e. For intermediate values of pile capacity, minimum requirements for driving resistance may be determined by straight line interpolation.

</tbody>
</table>

For SI: 1 ton = 907.18 kg, 1 inch = 25.4 mm.

Notes:
1. The driving resistance exerted by nonbearing materials is the resistance experienced by the pile during driving, but which will be dissipated with time and may be approximated as described in Section 1809.3(b) 1811.3.
2. The hammer energy indicated is the rated energy.
3. Sustained driving resistance. Where piles are to bear in soft rock, the minimum driving resistance shall be maintained for the last 6 inches (152.4 mm), unless a higher sustained driving resistance requirement is established by load test. Where piles are to bear in soil Classes 2 through 5, the minimum driving resistance measured in blows per inch (blows per 25 mm) shall be maintained for the last 12 inches unless load testing demonstrates a requirement for higher sustained driving resistance. No pile need be driven to a resistance that penetrates in blows per inch (blows per 25 mm) more than twice the resistance indicated in this table nor beyond the point at which there is no measurable net penetration under the hammer blow.
4. The minimum driving resistance shall be determined by the following formula:

\[ P = \frac{2W_pH}{(S + 0.1)} \text{ or } P = \frac{2E}{(S + 0.1)} \]

where:
- \( P \) = Allowable pile load in pounds.
- \( W_p \) = Weight of pile in pounds.
- \( W_h \) = Weight of striking part of hammer in pounds.
- \( H \) = Actual height of fall of striking part of hammer in feet.
- \( E \) = Rated energy delivered by the hammer per blow in foot/lbs.
- \( S \) = Penetration of pile per blow, in inches, after the pile has been driven to a depth where successive blows produce approximately equal net penetration.

The value of \( W_p \) shall not exceed three times \( W_h \).

[1809.4] 1811.3.1 Capacity as indicated by resistance to penetration. Where subsurface investigation and general experience in the area indicate that the soil that must be penetrated by the pile deep foundation consists of glacial deposits containing boulders, or fills containing rip-rap, excavated detritus, masonry, concrete or other obstructions in sufficient numbers to present a hazard to the installation of the pile deep foundations, the selection of type of pile deep foundation and penetration criteria shall be subject to the approval of the commissioner, but in no case shall the minimum penetration resistance be less than that stated in Tables 1809.3(a) 1811.3(a) and 1809.3(b) 1811.3(b).

[1809.4] 1811.4 Installation of driven piles deep foundations. Driven pile deep foundations shall be installed in accordance with Section 1808.2.6 1810.2 and Sections 1809.4.1 1811.4.1 through 1809.4.3 1811.4.3.

[1809.4] 1811.4.1 Driving near fresh concrete. Piles Deep foundations shall not be driven adjacent to fresh concrete that is less than 3 days old without approval by the engineer.

[1809.4] 1811.4.2 Heaved piles deep foundations. Piles Deep foundations that have heaved during the driving of adjacent piles deep foundations shall be redriven as necessary to develop the required capacity and penetration, or the capacity of the pile deep foundation shall be verified by load tests in accordance with Section 1808.4 1810.4.

[1809.4] 1811.4.3 Use of vibratory drivers. Vibratory drivers shall only be used to install piles deep foundation elements where the pile deep foundation is subsequently seated by an
impact hammer to the final driving criteria established in accordance with Section [1809.3] 1811.3.

[1809.5] 1811.5 Timber piles. Timber piles shall be designed in accordance with the [AF&PA NDS] AWC NDS.

[1809.5.1] 1811.5.1 Materials. Round timber piles shall conform to ASTM D 25. Sawn timber piles shall conform to DOC PS-20.

[1809.5.2] 1811.5.2 Preservative treatment. Timber piles used to support permanent structures shall be treated in accordance with this section unless it is established that the tops of the untreated timber piles will be below the lowest groundwater level assumed to exist during the life of the structure as specified in Section [1808.2.12] 1810.2.12. Preservative and minimum final retention shall be in accordance with AWPA [C3] U1 (Commodity Specification E, Use Category 4C) for round timber piles and AWPA [C24] U1 (Commodity Specification A, Use Category 4B) for sawn timber piles. Preservative-treated timber piles shall be subject to a quality control program administered by an approved agency. [Pile cuts] Cuts to timber piles shall be treated in accordance with AWPA M4.

[1809.5.3] 1811.5.3 Defective timber piles. Any sudden decrease in driving resistance of a timber pile shall be investigated [with regard to the possibility of] for possible damage. If the sudden decrease in driving resistance cannot be correlated to load-bearing data, the timber pile shall be removed for inspection or rejected.

[1809.5.4] 1811.5.4 Sizes of timber piles. Timber piles shall be of adequate size to resist the applied loads without creating stresses in the timber pile material in excess of 1,200 psi (8.27 MPa) for piles of southern pine, Douglas fir, oak, or other wood of comparable strength; or 800 psi (5.52 MPa) for timber piles of cedar, Norway pine, spruce or other wood of comparable strength. Timber piles of 25 tons (222.5 kN) of capacity or more shall have a minimum 8-inch tip ([203] 203.2 mm) with uniform taper. Timber piles of less than 25 tons (222.5 kN) of capacity shall have a minimum 6-inch ([152] 152.4 mm) tip with uniform taper. All timber piles, regardless of capacity, driven to end bearing on bedrock of Classes 1a to 1d and compact gravels and sands of Class 2a shall have a minimum 8-inch ([203] 203.2 mm) tip and a uniform taper. Any species of wood may be used for timber piles that conforms to ASTM D 25 and that will stand the driving stresses.

[1809.5.5] 1811.5.5 Lagged or inverted timber piles. The use of lagged or inverted timber piles is permitted. Double lagging shall be adequately connected to the basic timber pile material to transfer the full load from the basic timber pile material to the lagging without exceeding values of allowable stress as established in Chapter 23. The connection for single lagging shall be proportioned for half the timber pile load. The diameter of any inverted timber pile at any section shall be adequate to resist the applied load without exceeding the stresses specified in Section [1809.5.4] 1811.5.4, but in no case shall it be less than 8 inches ([203] 203.2 mm).

[1809.6] 1811.6 Precast concrete piles.
[1809.6.4] 1811.6.1 General. The materials, reinforcement and installation of precast concrete piles shall conform to Sections [1809.6.4] 1811.6.1.1 through [1809.6.4] 1811.6.1.3.

[1809.6.1.1] 1811.6.1.1 Design and manufacture. Piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving and service loads.

[1809.6.1.2] 1811.6.1.1 Minimum dimension. The minimum horizontal dimension shall be 8 inches ([203] 203.2 mm). Corners of square precast concrete piles shall be chamfered.

[1809.6.1.3] 1811.6.1.2 Reinforcement. Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced not more than 4 inches ([102] 101.6 mm) apart, center to center, for a distance of 2 feet ([609] 609.6 mm) from the ends of the precast concrete pile; and not more than 6 inches ([152] 152.4 mm) elsewhere except that at the ends of each precast concrete pile, the first five ties or spirals shall be spaced 1 inch ([25] 25.4 mm) center to center. The gage of ties and spirals shall be as follows:

1. For precast concrete piles having a least horizontal dimension of 16 inches ([406] 406.4 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage).

2. For precast concrete piles having a least horizontal dimension of more than 16 inches ([406] 406.4 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage).

3. For precast concrete piles having a least horizontal dimension of 20 inches (508 mm) and larger, wire shall not be smaller than ¼ inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage).

[1809.6.1.4] 1811.6.1.3 Installation. [Piles] Precast concrete piles shall be handled and driven so as not to cause injury or overstressing in a manner that affects durability or strength. A precast concrete pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength (f’c), and not less than the strength sufficient to withstand handling and driving forces.

[1809.6.2] 1811.6.2 Precast nonprestressed concrete piles. Precast nonprestressed concrete piles shall conform to Sections [1809.6.2] 1811.6.2.1 through [1809.6.2] 1811.6.2.4.

[1809.6.2.1] 1811.6.2.1 Materials. Concrete shall have a 28-day specified compressive strength (f’c) of not less than 3,000 psi (20.68 MPa).

[1809.6.2.2] 1811.6.2.2 Minimum reinforcement. The minimum amount of longitudinal reinforcement shall be 0.8 percent of the concrete section and consist of at least four bars.
Seismic reinforcement in Seismic Design Category C. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, longitudinal reinforcement with a minimum steel ratio of 0.01 shall be provided throughout the length of precast concrete piles. Within three pile diameters a distance equivalent to three times the diameter of the deep foundation element of the bottom of the pile cap, the longitudinal reinforcement shall be confined with closed ties or spirals of a minimum ⅜-inch (9.5 mm) diameter. Ties or spirals shall be provided at a maximum spacing of eight times the diameter of the smallest longitudinal bar, not to exceed 6 inches (152 mm). Throughout the remainder of the precast nonprestressed concrete pile, the closed ties or spirals shall have a maximum spacing of 16 times the smallest longitudinal-bar diameter, not to exceed 6 inches (152 mm).

Seismic reinforcement in Seismic Design Category D. Where a structure is assigned to Seismic Design Category D in accordance with Section 1613, the requirements of Seismic Design Category C shall apply, except that transverse reinforcement shall comply with requirements of Section 1810.1.2.5.

Allowable stresses. For allowable stresses, see Table 1808.8.

Concrete cover. For concrete cover requirements, see Table 1808.2.13.

Precast prestressed concrete piles. Precast prestressed concrete piles shall conform to the requirements of Sections 1809.6.3.1 through 1809.6.3.4.

Materials. Prestressing steel shall conform to ASTM A 416. Concrete shall have a 28-day specified compressive strength ($f'_c$) of not less than 5,000 psi (34.48 MPa).

Design. Precast prestressed concrete piles shall be designed to resist stresses induced by handling and driving as well as by loads. The effective prestress in the pile shall not be less than 400 psi (2.76 MPa) for precast prestressed concrete piles less than 30 feet (9144 mm) in length, 550 psi (3.79 MPa) for precast prestressed concrete piles between 30 and 50 feet (9144 mm and 15 240 mm) in length and 700 psi (4.83 MPa) for precast prestressed concrete piles greater than 50 feet (15 240 mm) in length. Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.

Design in Seismic Design Category C. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, precast prestressed concrete piles shall have transverse reinforcement in accordance with this section. The minimum volumetric ratio of spiral reinforcement shall not be less than the amount required by the following formula for the upper 20 feet (6096 mm) of the precast prestressed concrete pile.
\[ \rho_s = 0.04 \left( \frac{f'_c}{f_{yh}} \right) (2.8 + 2.34 \left( \frac{P}{f'_c A_g} \right)) \]

where:

- \( A_g \) = Pile cross-sectional area square inches (\( \text{mm}^2 \)).
- \( f'_c \) = Specified compressive strength of concrete, psi (MPa).
- \( f_{yh} \) = Yield strength of spiral reinforcement \( \leq 85,000 \) psi (586 MPa).
- \( P \) = Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.
- \( \rho_s \) = Spiral reinforcement index (vol. spiral/vol. core).

[At least] Not less than one-half the volumetric ratio required by Equation [18-4] 18-1 shall be provided below the upper 20 feet (6096 mm) of the pile.

[The pile cap connection by means of dowels as indicated in Section 1808.9 is permitted. Pile cap connection by means of developing pile reinforcing strand is permitted provided that the pile reinforcing strand results in a ductile connection.]

**Exception:** The minimum spiral reinforcement index required by Equation 18-1 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, \( \Omega_0 \). In such cases, minimum spiral reinforcement index shall be as specified in Section 1811.6.1.2 of this code.

**[1809.6.3.2.2] 1811.6.3.2.2 Design in Seismic Design Category D.** Where a structure is assigned to Seismic Design Category D in accordance with Section [1613.5.6] 1613.3.5, the requirements for Seismic Design Category C in Section [1809.6.3.2.1] 1811.6.3.2.1 shall be met, in addition to the following:

1. Requirements in ACI 318, Chapter [24] 18, do not apply, unless specifically referenced.

2. Where the total [pile] length of the deep foundation in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the precast prestressed concrete pile. Where the precast prestressed concrete pile length exceeds 35 feet (10 668 mm), the ductile [pile] region of the deep foundation shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least [pile] dimension of the precast prestressed concrete pile.

3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least [pile] dimension of the deep foundation element, six times the diameter of the longitudinal strand[.] or 8 inches ([203] 203.2 mm), whichever is smaller.
4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of the spiral to a 90-degree (1.6-rad) hook or by use of a mechanical or welded splice complying with Section 25.5.7 of ACI 318.

5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:

\[
\rho_s = 0.25 \left( \frac{f^{'c}}{f_{yh}} \right) \left( \frac{A_{ch}}{A_{g}} \right) \left( 0.5 + \left( \frac{1.4 P}{f^{'c} A_{g}} \right) \right)
\]  
\[
\text{[Equation 18-5]}
\]

\[
[0.5 + \left( \frac{1.4 P}{f^{'c} A_{g}} \right) \text{]}
\]

[buts not less than:]

\[
\rho_s = 0.06 \left( \frac{f^{'c}}{f_{yh}} \right) \left( 2.8 + 2.34 \left( \frac{P}{f^{'c} A_{g}} \right) \right)
\]  
\[
\text{(Equation 18-2)}
\]

\[
\rho_s = 0.12 \left( \frac{f^{'c}}{f_{yh}} \right) \left( 0.5 + \left( \frac{1.4 P}{f^{'c} A_{g}} \right) \right)
\]  
\[
\text{[Equation 18-6]}
\]

\[
[\geq 0.12 f^{'c}/f_{yh}]\]

[and need] but not exceed:

\[
\rho_s = 0.021 \]  
\[
\text{[Equation 18-7]} \text{ (Equation 18-3)}
\]

where:

\[
A_g = \text{Pile cross-sectional area, square inches (mm}\,^2).\n\]
\[
A_{ch} = \text{Core area defined by spiral outside diameter, square inches (mm}\,^2).\n\]
\[
f^{'c} = \text{Specified compressive strength of concrete, psi (MPa).}\n\]
\[
f_{yh} = \text{Yield strength of spiral reinforcement } \leq 85,000 \text{ psi (586 MPa).}\n\]
\[
P = \text{Axial load on pile, pounds (kN), as determined from Equations 16-5 and 16-7.}\n\]
\[
\rho_s = \text{Volumetric ratio (vol. spiral/ vol. core).}\n\]

This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.

**Exception:** The minimum spiral reinforcement required by Equation 18-2 shall not apply in cases where the design includes full consideration of load combinations specified in ASCE 7, Section 2.3.6 and the applicable overstrength factor, \(\Omega_0\). In such cases, minimum spiral reinforcement index shall be as specified in Section 1811.6.1.2.

6. When transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with [spacings] spacing, s, and perpendicular to dimension, \(h_c\), shall conform to:
\[ A_{sh} = 0.3 s h_c \left( \frac{f'c}{f_{yh}} \right) \left( \frac{A_g}{A_{ch}} - 1.0 \right) \left( 0.5 + \frac{1.4P}{f'cA_g} \right) \]  \hspace{1cm} \text{(Equation 18-8)}  
\[ A_{sh} = 0.12s h_c \left( \frac{f'c}{f_{yh}} \right) \left( 0.5 + \frac{1.4P}{f'cA_g} \right) \]  \hspace{1cm} \text{(Equation 18-9)}

but not less than:

\[ A_{sh} = 0.12s h_c \left( \frac{f'c}{f_{yh}} \right) \left( 0.5 + \frac{1.4P}{f'cA_g} \right) \]  \hspace{1cm} \text{(Equation 18-5)}

where:

- \( f_{yh} \) = Yield strength of transverse reinforcement \( \leq 70,000 \text{ psi (483 MPa)} \).
- \( h_c \) = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).
- \( s \) = Spacing of transverse reinforcement measured along length of pile, inch (mm).
- \( A_{sh} \) = Cross-sectional area of transverse reinforcement, square inches (mm²).
- \( f'c \) = Specified compressive strength of concrete, psi (MPa).

The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks.

Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.

[1809.6.3.3] **1811.6.3.3 Allowable stresses.** For allowable stresses, see Table [1808.8] 1810.8.

[1809.6.3.4] **1811.6.3.4 Concrete cover.** For concrete cover requirements, see Table [1808.2.13] 1810.2.13.

[1809.7] **1811.7 Structural steel piles.** Structural steel piles shall conform to the requirements of Sections [1809.7.1] 1811.7.1 through [1809.7.4] 1811.7.6.

[1809.7.1] **1811.7.1 Materials.** Structural steel \[\text{piles, steel pipe and fully welded} \] H-piles and structural steel sheet piling shall conform to the material requirements in ASTM A6. Steel pipe piles shall conform to the material requirements in ASTM A252. Welded built-up steel piles shall be fabricated from plates \[\text{shall} \] that conform to the material requirements in ASTM A 36, \[\text{ASTM A-252} \] ASTM A283, ASTM A572, ASTM A588[\] or ASTM A690 \[\text{ASTM A-913 or ASTM A-992} \].

**1811.7.1.1 Structural steel pipe piles to be welded.** Structural steel pipe piles to be fabricated or spliced by welding shall be subject to qualification requirements of AWS D1.1 for unlisted base metals. Structural steel pipe piles to be welded shall have a carbon equivalency (CE) not exceeding 0.45 as defined by AWS D1.1 and a sulfur content not exceeding 0.05%. Carbon equivalency and sulfur content shall be determined by mill certificates or by chemical analysis, for a minimum of two samples per 1,000 linear feet (304 800 mm) of pipe or part thereof, where mill certificates are unavailable.
1811.7.1.2 **High strength pipe.** High strength pipe meeting the strength requirements of API 5L (N80) and API 5CT (N80) shall be permitted for use as structural steel pipe piles. All such pipe and casing shall meet the minimum tensile requirements of ASTM A252, Grade 3 with a minimum elongation of 15 percent, except that the yield strength shall be a minimum of 80 ksi (551.6 MPa). The following requirements shall also apply:

1. Mill certificates shall be provided.

2. Where mill certificates are not available, a minimum of two coupon tests per 1,000 linear feet (304.800 mm) of pipe or part thereof shall be performed. Testing procedures shall meet the requirements set forth in Section 18 of ASTM A252.

3. Welding shall be in accordance with Section 1811.7.1.1. In addition, welded seams and splices shall be complete joint penetration welds. Reinforcing steel shall not be welded to high strength pipe.

[1809.7.2] **1811.7.2 Allowable stresses.** For the allowable stresses for materials used in structural steel piles see Table [1808.8] 1810.8.

[1809.7.3] **1811.7.3 Dimensions of Structural Steel H-piles.** Sections of structural steel H-piles shall comply with the requirements for HP shapes in ASTM A6 or the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.

2. The nominal depth in the direction of the web shall not be less than 8 inches ([203] 203.2 mm).

3. Flanges and web shall have a minimum nominal thickness of ⅜ inch (9.5 mm).

[1809.7.4] **1811.7.4 Dimensions of structural steel pipe piles.** Structural steel pipe piles driven open ended shall have a nominal outside diameter of not less than 8 inches ([203] 203.2 mm). The pipe shall have a minimum of 0.34 square inch ([219] 219.4 mm²) of steel in cross section to resist each 1,000 foot-pounds (1356 N·m) of [pile hammer] energy from the hammer used to install deep foundation elements or the equivalent strength for steels having a yield strength greater than 35,000 psi ([244] 241.3 MPa), or the wave equation analysis shall be permitted to be used to assess compression stresses induced by driving to evaluate if the structural steel pipe pile section is appropriate for the selected hammer. Where pipe wall thickness less than 0.188 inch (4.8 mm) is driven open ended, a suitable cutting shoe shall be provided.

[1811.7.5] **Built-up structural steel piles fabricated from plates.** Built-up sections of steel piles fabricated from welded plates shall comply with the following:
1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.

2. The nominal depth in the direction of the web shall not be less than 8 inches (203.2 mm).

3. Flanges and web shall have a minimum nominal thickness of ⅜ inch (9.5 mm).

**1811.7.6 Structural steel sheet piling.** Individual sections of structural steel sheet piling shall conform to the profile indicated by the manufacturer, and shall conform to the general requirements specified by ASTM A6.

**SECTION BC [4810] 1812 CAST-IN-PLACE CONCRETE PILES**

**[4810.1] 1812.1 General.** The materials, reinforcement and installation of cast-in-place concrete piles shall conform to Sections [4810.1.1] 1812.1.1 through [4810.1.3] 1812.1.3.

**[4810.1.1] 1812.1.1 Materials.** Concrete or grout shall have a 28-day specified compressive strength \( f'c \) of not less than 2,500 psi (17.24 MPa), except in micropiles and caisson piles where the minimum compressive strength shall be 4,000 psi \( (27.580 \text{ kPa}) (27.58 \text{ MPa}) \). Where concrete is placed through a funnel hopper at the top of the cast-in-place concrete pile, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches \( (101.6 \text{ mm}) \) and not more than 6 inches \( (152.4 \text{ mm}) \). Where concrete or grout is to be pumped, the mix design shall be such that material produced is suitable for pumping.

Grout shall consist of a pumpable mixture of portland cement, water, and any required fine aggregate, supplemental cementitious materials, or admixtures as permitted by Chapter 19 of this code. Grout proportioning shall be determined from trial mixes or on the basis of field experience using documented test results provided that such test results are not older than 24 months. The water to cement ratio of grout shall not exceed 0.45. The required average compressive strength of grout shall be determined in a manner consistent with the procedures outlined in ACI 301 as utilized for concrete. The evaluation of grout compressive strength shall be in accordance with procedures established for concrete in Chapter 19 of this code. All grout mix design shall be submitted for review and approval of the registered design professional of record. Copies of the grout mix design shall be submitted to the department.

**1812.1.1.1 Concrete sampling and testing.** Sampling and testing of concrete shall be in accordance with Chapter 19.

**1812.1.1.2 Grout sampling and testing.** Sampling and testing of grout shall be in accordance with Sections 1812.1.1.2.1 through 1812.1.1.2.3.

**1812.1.1.2.1 Interval.** Grout samples shall be collected and testing shall be performed for the lesser of the following conditions:
1. each element installed;
2. each batch of site-mixed grout; or
3. each load of ready-mixed grout used.

**1812.1.1.2 Compressive strength.** Compressive strength tests shall be performed using cylinders having a maximum diameter of 3 inches (72.3 mm). Grout shall be tested in accordance with ASTM C39. A minimum of six (6) samples shall be prepared for each test group.

**1812.1.1.2.3 Specific gravity.** Specific gravity testing shall be performed using the American Petroleum Institute (API) Recommended Practice 13B-1 or in accordance with ASTM C138.

**[1810.1.2] 1812.1.2 Placement of reinforcement.** Reinforcement, where required, shall be placed in accordance with Section [1810.3.4] 1812.3.4 and shall be assembled, tied together, and placed in the cast-in-place concrete pile as a unit before concrete or grout is placed.

**Exceptions:** Where approved by the engineer, reinforcement may be placed after the cast-in-place concrete piles are filled with concrete or grout under the following situations:

1. Tied reinforcement in augered uncased cast-in-place concrete piles, while the concrete or grout is still in a semifluid state.
2. Tied reinforcement in cast-in-place concrete piles filled with grout, while the grout is in a semifluid state.
3. Steel dowels embedded 5 feet (1524 mm) or less in the cast-in-place concrete pile while the concrete or grout is still in a semifluid state.

**[1810.1.2.1] 1812.1.2.1 Design cracking moment.** The design cracking moment ($\Phi M_n$) for a cast-in-place deep foundation element not enclosed by a structural steel pipe or tube shall be determined using the following equation:

$$\Phi M_n = \frac{3\sqrt{f'cS_m}}{S_m}$$  \hspace{1cm} [(Equation 18-11)] (Equation 18-6)

For SI: $\Phi M_n = 0.25\sqrt{f'cS_m}$

where:

- $f'c =$ Specified compressive strength of concrete or grout, psi
- $S_m =$ Elastic section modulus, neglecting reinforcement and casing, cubic inches

**[1810.1.2.2] 1812.1.2.2 Required reinforcement.** Where subject to uplift, or where the required moment strength determined using the load combinations of Section 1605.2 exceeds the design cracking moment determined in accordance with Section [1810.1.2.1] 1812.1.2.1, cast-in-place concrete piles not enclosed by a structural steel pipe or tube shall be reinforced.
Reinforcement in Seismic Design Categories C & D. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, reinforcement shall be provided in accordance with Section 1810.1.2.4. Where a structure is assigned to Seismic Design Category D, reinforcement shall be provided in accordance with Section 1810.1.2.5.

Seismic reinforcement in Seismic Design Category C. For structures assigned to Seismic Design Category C in accordance with Section 1613, cast-in-place concrete pile elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis. A minimum of four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided throughout the minimum reinforced length of the element as defined below starting at the top of the element. The minimum reinforced length of the element shall be the greatest of the following:

1. One-third of the element length;
2. A distance of 10 feet (3048 mm);
3. Three times the least element dimension; or
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.1.2.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.

Transverse reinforcement shall consist of closed ties or spirals with a minimum diameter of \(\frac{3}{8}\) inch (9.5 mm). Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152.4 mm) or 8-longitudinal-bar diameters, within a distance of three times the least element dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the reinforced length.

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than manufacturer’s standard No. 14 gage (0.068 inch) (1.73 mm) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

Seismic reinforcement in Seismic Design Category D. For structures assigned to Seismic Design Category D in accordance with Section 1613, cast-in-place concrete pile elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis. A minimum of four longitudinal
bars, with a minimum longitudinal reinforcement ratio of 0.005, shall be provided throughout the minimum reinforced length of the element as defined below starting at the top of the element.

The minimum reinforced length of the element shall be the greatest of the following:

1. One-half of the element length;
2. A distance of 10 feet (3048 mm);
3. Three times the least element dimension; or
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section [1810.3.9.1] 1812.1.2.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.

Transverse reinforcement shall consist of closed ties or spirals no smaller than No. 3 bars for elements with a least dimension of up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section [1810.1.2.5.1] 1812.1.2.5.1 or [1810.1.2.5.2] 1812.1.2.5.2, the spacing of transverse reinforcement shall not exceed the least of the following:

1. 12 longitudinal bar diameters;
2. One-half the least dimension of the element; or
3. 12 inches ([305] 304.8 mm).

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than manufacturer’s standard [gage] No. 14 gage (0.068 inch) (1.73 mm) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

[1810.1.2.5.1] 1812.1.2.5.1 Site Classes A through D. For Site Class A, B, C and D, transverse confinement reinforcement shall be provided in the element in accordance with Sections [21.6.4.2] 18.7.5.2, through [21.6.4.4] 18.7.5.4 of ACI 318 within three times the least element dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section [21.6.4.4(a)] 18.7.5.4(a) of ACI 318 shall be permitted.
[1810.1.2.5.2] 1812.1.2.5.2 Site Classes E and F. For Site Class E or F, transverse confinement reinforcement shall be provided in the element in accordance with Sections [21.6.4.2] 18.7.5.2 through [21.6.4.4] 18.7.5.4 of ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata of Class 4b or better and strata that are liquefiable or are composed of material meeting Class 4c or 6.

[1810.1.3] 1812.1.3 Concrete or grout placement. Concrete or grout shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete or grout shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the cast-in-place concrete pile, the concrete shall not be chuted directly into the cast-in-place concrete pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the cast-in-place concrete pile. Grout for auger cast piles shall be pumped through a hollow stem auger and shall be maintained as fluid throughout placement.

[1810.2] 1812.2 Enlarged base piles. Enlarged base piles shall conform to the requirements of Sections [1810.2.1] 1812.2.1 through [1810.2.5] 1812.2.5.

[1810.2.4] 1812.2.1 Materials. The maximum size of coarse aggregate for concrete shall be ¾ inch (19.1 mm). Concrete to be compacted shall have a zero slump.

[1810.2.2] 1812.2.2 Allowable stresses. For allowable stresses, see Table [1808.8] 1810.8.

[1810.2.3] 1812.2.3 Installation. Enlarged bases formed either by compacting concrete or driving a precast base shall be formed in or driven into granular soils. [Pile] Enlarged base piles shall be constructed in the same manner as successful [prototype test piles driven] enlarged base test piles installed for the project. [Pile] Enlarged base pile shafts extending through peat or other organic soil shall be encased in a permanent steel casing. Where a cased shaft is used, the shaft shall be adequately reinforced to resist column action or the annular space around the enlarged base pile shaft shall be filled sufficiently to re-establish lateral support by the soil. Where [pile] heave of an enlarged base pile or other deep foundation occurs, the enlarged base pile or other deep foundation shall be replaced unless it is demonstrated that the enlarged base pile or other deep foundation is undamaged and capable of carrying twice its design load.

[1810.2.4] 1812.2.4 Load-bearing capacity. [Pile] The load-bearing capacity of enlarged base piles shall be verified by load tests in accordance with Section [1808.4] 1810.4.

[1810.2.5] 1812.2.5 Concrete and grout cover. For minimum concrete and grout cover requirements, see Table [1802.13] 1803.13.

[1810.3] 1812.3 Drilled, drilled displacement, or augered uncased piles. Drilled, drilled displacement, or augered uncased piles shall conform to Sections [1810.3.4] 1812.3.1 through [1810.3.5] 1812.3.5.

[1810.3.4] 1812.3.1 Allowable stresses. For allowable stresses, see Table [1808.8] 1810.8.
[1810.3.2] **1812.3.2 Dimensions.** The minimum diameter of drilled or drilled displacement piles shall be 8 inches (203.2 mm). The minimum diameter of augered uncased piles shall be 12 inches (305.304.8 mm).

[1810.3.3] **1812.3.3 Installation.** Where pile shafts for drilled piles are formed through unstable soils and concrete is placed in an open-drilled hole, a steel liner shall be inserted in the hole prior to placing the concrete. Where the steel liner is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the liner at a sufficient height to offset any hydrostatic or lateral soil pressure.

Where drilled displacement piles are used, the auger segments shall be installed into the ground with both a vertical force and a torque such that the soil is displaced laterally within the ground. The void created after installation shall be filled with grout or concrete.

Where grout is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. An initial head of grout shall be established and maintained on the auger flights before withdrawal. The auger shall be withdrawn in a continuous manner in increments of about 12 inches (305.304.8 mm) each. Grout pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Grout volumes shall be measured to ensure that the volume of grout placed in each drilled pile is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any drilled pile is interrupted or a loss of grout pressure occurs, the drilled pile shall be re-drilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or grout pressure was lost and reformed.

Augered cast-in-place piles shall not be installed within a distance equivalent to the center-to-center spacing equivalent to six times the diameter of a drilled pile filled with concrete or grout less than 12 hours old, unless approved by the engineer. The level at which return of the grout occurs during withdrawal shall be recorded. If the grout level in any completed drilled pile drops during installation of an adjacent drilled pile, the drilled pile shall be replaced. The installation shall be performed under the direct supervision of the engineer. The engineer shall certify to the commissioner that the drilled piles were installed in compliance with the approved construction documents.

[1810.3.4] **1812.3.4 Reinforcement.** For drilled piles installed with a hollow-stem auger, where full-length longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed through ducts in the auger prior to filling the drilled pile with concrete. Concrete cover for reinforcement of the drilled pile shall be in accordance with Table 1808.2.13 1810.2.13.

**Exception:** Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the drilled pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the drilled piles are completely concreted but while concrete is still in a semifluid state.
Reinforcement in Seismic Design Category C or D. Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1613, the corresponding requirements of Sections [1810.1.2.3] 1812.1.2.3 through [1810.1.2.5] 1812.1.2.5 shall be met.

Driven uncased piles. Driven uncased piles shall not be permitted.

Steel-cased piles. Steel-cased piles shall comply with the requirements of Sections [1810.5.1] 1812.5.1 through [1810.5.4] 1812.5.4.

Materials. Shells or casings for steel cased piles shall be of steel and be sufficiently strong to resist collapse and sufficiently water tight to exclude any foreign materials during the placing of concrete. Steel shells shall have a sealed tip with a diameter of not less than 8 inches (203.2 mm).

Allowable stresses. For allowable stresses, see Table [1808.8] 1810.8.

Shell thickness. The thickness of the steel shell shall not be less than manufacturer’s standard No. 14 gage (0.068 inch) (1.75 mm) minimum.

Shell type. The shell shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.

Strength. The ratio of steel yield strength ($f_y$) to 28-day specified compressive strength ($f'_c$) shall not be less than six.

Diameter. The nominal diameter of steel cased piles shall not be greater than 16 inches (406.4 mm).

Installation. Steel shells shall be mandrel driven for their full length in contact with the surrounding soil. The steel shells shall be driven in such order and with such pacing as to ensure against distortion of or injury to steel cased piles already in place. A steel cased pile shall not be driven within four and one-half average diameters of a steel cased pile filled with concrete less than 24 hours old unless approved by the commissioner. Concrete shall not be placed in steel shells within heave range of driving.

Reinforcement. Reinforcing shall be required for unsupported lengths of steel cased piles or where the steel cased pile is designed to resist uplift or unbalanced lateral loads. For minimum concrete cover requirements, see Table [1808.2.13] 1810.2.13.

Seismic reinforcement. Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1613, the reinforcement requirements of Sections [1810.1.2.3] 1812.1.2.3 through [1810.1.2.5] 1812.1.2.5 shall be met.

Concrete-filled steel pipe and tube piles. Concrete-filled steel pipe and tube piles shall conform to the requirements of Sections [1810.6.4] 1812.6.4 through [1810.6.5] 1812.6.5.
[1810.6.1] **1812.6.1 Materials.** Steel pipe and tube sections used for concrete-filled steel pipe and tube piles shall conform to ASTM A252 or ASTM A283. Concrete shall conform to Section [1810.1.1] 1812.1.1. The maximum coarse aggregate size shall be ¾ inch (19.1 mm).

[1810.6.2] **1812.6.2 Allowable stresses.** For allowable stresses, see Table [1808.8] 1810.8.

[1810.6.3] **1812.6.3 Minimum dimensions.** Concrete-filled steel pipe and tube piles shall have a nominal outside diameter of not less than 8 inches ([203] 203.2 mm) and a minimum wall thickness in accordance with Section [1809.3.4] 1811.7.4. For mandrel driven pipe piles, concrete-filled steel pipe and tube piles driven with a mandrel, the minimum wall thickness shall be 1/10 inch (2.5 mm).

[1810.6.4] **1812.6.4 Reinforcement.** Reinforcement steel shall conform to Section [1810.1.2] 1812.1.2. For minimum concrete cover requirements see Table [1808.2.13] 1810.2.13.

[1810.6.4.1] **1812.6.4.1 Seismic reinforcement.** Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1613, minimum reinforcement no less than 0.01 times the cross-sectional area of the pile concrete within the concrete-filled steel pipe and tube piles shall be provided in the top of the pile concrete-filled steel pipe and tube piles with an embedment length equal to two times the required cap embedment anchorage into the pile cap, but not less than the tension development length of the reinforcement. The wall thickness of the steel pipe shall not be less than 3/16 inch ([5] 4.8 mm).

[1810.6.5] **1812.6.5 Placing concrete.** The placement of concrete shall conform to Section [1810.1.3] 1812.1.3.

[1810.7] **1812.7 Caisson piles.** Caisson piles shall conform to the requirements of Sections [1810.7.1] 1812.7.1 through [1810.7.7] 1812.7.7.

[1810.7.1] **1812.7.1 Construction.** Caisson piles shall consist of a shaft section of concrete or grout-filled pipe, extending to bedrock, with an uncased socket drilled into bedrock of Class 1c or better and filled with concrete or grout. The caisson pile shall have a full-length structural steel core, full length steel reinforcing, or a sub core or steel reinforcing installed in the rock socket and extending into the pipe portion a distance equal to the socket depth. The minimum outside diameter of the caisson pile shall be 7 inches ([194] 177.8 mm), and the diameter of the rock socket shall be approximately equal to the inside diameter of the caisson pile.

**1812.7.1.1 Drilling with air.** Where existing structures may be affected by subsurface disturbances, air drilling shall be prohibited.

[1810.7.2] **1812.7.2 Materials.** Pipe and steel cores for caisson piles shall conform to the material requirements in Section [1809.3] 1811.7. Pipes shall have a minimum wall thickness of ¾ inch (9.5 mm) and shall be fitted with a suitable steel-driving shoe or cutting teeth welded to the bottom
of the pipe. Concrete or grout shall have a 28-day specified compressive strength ($f'_c$) of not less than 4,000 psi (27.58 MPa).

**1810.7.2.1 Reinforcing bars.** For the purposes of Section 1810.7, threaded bars conforming to ASTM A615 and ASTM A722 shall be considered the same as deformed reinforcing bars.

**1810.7.3 Rock socket design.** The depth of the rock socket in Class 1c rock or better shall be sufficient to develop the full load-bearing capacity of the caisson pile based upon the sum of the allowable bearing pressure on the bottom of the socket in accordance with Table 1804.1 plus an allowable bond stress of 200 psi (1379 kPa) on the sides of the socket. The depth of the socket in Class 1c rock or better below the bottom of the pipe shall not be less than 3 feet (914 mm) or the outside diameter of the pipe.

**1810.7.3.1 Increased allowable bond stress.** Load tests, with instrumentation in the rock socket to demonstrate the transfer of force to the rock, shall be performed to justify the use of bond stresses above 200 psi (1379 kPa). The number of load tests shall be in accordance with the requirements of Section 1808.4.1.1. A minimum factor of safety of 2 shall be applied to the ultimate test load where an increase in allowable bond stress is sought. A report summarizing the methods and results of the load test shall be submitted to the commissioner for approval.

**1812.7.4 Structural core and steel reinforcing.** The gross cross-sectional area of the structural steel core or bundled center reinforcing shall not exceed 30 percent of the gross area of the caisson pile. For reinforcing placed at the perimeter of the caisson pile, the area of the reinforcing shall not exceed 8 percent of the area inside the casing. Minimum concrete cover shall be in accordance with Table 1808.2.13.

**1810.7.4.1 Splicing of steel reinforcing.** Steel reinforcing shall be spliced in accordance with the requirements of ACI 318.

**1810.7.4.2 Seismic reinforcement.** Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1613, the reinforcement requirements of Section 1810.6.4.1 shall be met.

**1810.7.5 Allowable stresses.** For allowable stresses, see Table 1808.8.
Installation. The rock socket and [pile] steel pipe shall be thoroughly cleaned of foreign materials before filling with concrete or grout. Steel cores shall be set within 6 inches ([125] 152.4 mm) above the base of the rock socket. Concrete shall not be placed through water except where a tremie or other method approved by the commissioner is used.

Drilling with air. Where existing structures may be affected by subsurface disturbances, air drilling shall be prohibited.

Rock socket inspection. Caisson pile rock sockets shall be subject to special inspection in accordance with Section [1704.9] 1705.19. All caisson pile rock sockets shall be inspected to verify rock quality. Inspection may be accomplished by direct observation, by video methods or by a core boring performed prior to the drilling of the socket.

Materials. Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A615 Grade 60 or 75 or ASTM A722 Grade 150. The steel pipe or casing shall have a minimum yield strength of 45,000 psi ([340] 310.3 MPa) and a minimum elongation of 15 percent as shown by mill certifications or two coupon test samples per 40,000 pounds ([18160] 18 143.7 kg) of pipe or casing.

Dimensions. Micropiles shall have an outside diameter of between 5 and 14 inches (127 and [356] 355.6 mm). The steel pipe shall have a minimum wall thickness of 3/16 inch (4.8 mm).

Design. Micropiles shall develop their load-carrying capacity by means of a bond zone in soil. The design of micropiles shall not consider end bearing. Micropiles shall be grouted and have either a steel pipe or steel reinforcement at every section along the length. It shall be permitted to transition compression loads from the steel pipe to the deformed reinforcing bars by extending the bars into the pipe section by at least their development length in tension, in accordance with ACI 318.

Reinforcement. For micropiles or portions thereof grouted inside a temporary or permanent casing or a hole drilled with grout, the steel pipe or steel reinforcement shall be designed to carry at least 40 percent of the design compression load. Micropiles or portions thereof grouted in an open hole in soil without temporary or permanent casing and without suitable means of verifying the hole diameter during grouting shall be designed to carry the entire compression load in the reinforcing steel. Where a steel pipe is used for reinforcement, the portion of the grout enclosed within the pipe is permitted to be included in the determination of the allowable stress in the grout.

Seismic reinforcement. For structures assigned to Seismic Design Category C, a permanent steel casing shall be provided from the top of the micropile down to
the point of zero curvature. For structures assigned to Seismic Design Category D, the micropile shall be approved by the commissioner in accordance with Section 28-113.2 of the [New York City] Administrative Code. The alternative system design, supporting documentation and test data shall be submitted to the commissioner for review and approval.

[1810.8.4] 1812.8.4 Splices. Splices in reinforcing bars shall be made in accordance with ACI 318. Splices in the steel pipe or casing shall be made by use of flush threaded joints, or by welded joints. Reductions for the structural capacity of the threaded joint casing at splice locations shall be accounted for in the design.

[1810.8.5] 1812.8.5 Installation. Micropile [deep foundation] elements shall be permitted to be formed in holes advanced by rotary or percussive drilling methods, with or without casing. The elements shall be grouted with a fluid cement grout. The grout shall be pumped through a tremie pipe extending to the bottom of the element until grout of suitable quality returns at the top of the element. The following requirements apply to specific installation methods:

1. For micropiles grouted inside a temporary casing, the reinforcing bars shall be inserted prior to withdrawal of the casing. The casing shall be withdrawn in a controlled manner with the grout level maintained at the top of the element to ensure that the grout completely fills the drill hole.

[2. For a micropile or portion thereof grouted in an open drill hole in soil without a temporary casing, the minimum design diameter of the drill hole shall be verified by a suitable device prior to grouting.]

3. Subsequent micropiles shall not be drilled near elements that have been grouted until the grout has had sufficient time to harden.

4. Micropiles shall be grouted as soon as possible after drilling is completed.

5. For micropiles designed with a full-length casing, the casing shall be pulled back to the top of the bond zone and reinserted or some other suitable means employed to assure grout coverage outside the casing.

[1810.8.5.1] 1812.8.5.1 Drilling with air. Where existing structures may be affected by subsurface disturbances, air drilling shall be prohibited.

[1810.8.6] 1812.8.6 Pressure grouted bond zone. Micropiles shall be installed with a pressure grouted bond zone. The bond zone shall be formed entirely in soil of Class 4 or better and the grout shall be placed under pressure exceeding 1.5 times the existing total [overburden pressure] stress at the midpoint of the bond zone. The bond zone shall be formed by extending the casing to the bottom of the bond zone and withdrawing the casing while the grout is being pumped under pressure. The casing above the bond zone shall remain in place permanently. Reinforcing to the bond zone shall be placed in the casing to the depth of the bond zone prior to placing grout.
SECTION BC [1811] 1813
COMPOSITE PILES

[1811.1] 1813.1 General. Composite piles shall conform to the requirements of Sections [1811.2] 1813.2 through [1811.5] 1813.5.

[1811.2] 1813.2 Design. Composite piles consisting of two or more approved pile types of deep foundations shall be designed to meet the conditions of installation.

[1811.3] 1813.3 Limitation of load. The maximum allowable load shall be limited by the capacity of the weakest section incorporated in the composite pile.

[1811.4] 1813.4 Splices. Splices between concrete and steel or wood sections shall be designed to prevent separation both before and after the concrete portion has set, and to ensure the alignment and transmission of the total pile load on the composite pile. Splices shall be designed to resist uplift caused by upheaval during driving of adjacent piles deep foundations, and shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section.

[1811.5] 1813.5 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C or D, in accordance with Section 1613 and where concrete and steel are used as part of the composite pile assembly, the concrete reinforcement shall comply with Sections [1810.1.2.3] 1812.1.2.3 and [1810.1.2.5] 1812.1.2.5 and the steel section shall comply with Section [1809.7.4] 1811.7.4 or Section [1810.6.4.1] 1812.6.4.1.

SECTION BC [1812] 1814
HELICAL PILES

[1812.1] 1814.1 General. Helical piles may be used to support axial compression, or resist axial tension and lateral loads. All helical pile foundation systems shall be approved by the commissioner in accordance with Section 28-113.2 of the Administrative Code.

[1812.2] 1814.2 Design. Design of helical pile foundations shall be based on a geotechnical investigation in accordance with Sections [1802] 1803 and [1808.2] 1810.2 with the following additional conditions stated in Sections [1812.2.1] 1814.2.1 and [1812.2.2] 1814.2.2.

Exception: For the repair of residential porches, stoops and slab on grades, helical test probes may be used to substitute for test borings, provided the helical pile has a torque to capacity ratio approved in accordance with Section 28-113.2.1 of the Administrative Code.

[1812.2.1] 1814.2.1 Corrosion testing requirements. Tests shall be performed in each soil layer for soil resistivity, soil pH, organic content and sulphate concentration. The device or system shall not be used in conditions that are indicative of a potential helical pile corrosion situation, as defined by soil resistivity less than 1,000 ohm-cm, pH less than 5.5, soils with high organic content, sulfate concentrations greater than 1,000 ppm, landfills, or mine waste.
[1812.2.2] **1814.2.2 Protective treatment.** In addition to the protective treatment requirements of Section [1808.2.12] 1810.2.12, helical pile design shall consider the abrasive action inherent in the installation process when protective exterior treatment is specified as helical pile protection.

[1812.3] **1814.3 Determination of allowable loads.** The allowable load of helical piles shall be in accordance with the applicable provisions of Section [1808.3] 1810.3. In addition, the requirements of this section shall apply.

[1812.3.4] **1814.3.1 Allowable axial tension and compression.** The allowable axial tension and compression load shall not exceed 30 tons (267 kN).

[1812.3.2] **1814.3.2 Allowable lateral load.** The allowable lateral load resisted by a helical pile shall not exceed 3 tons (29.4 kN).

[1812.4] **1814.4 Load tests.** Load tests shall be in accordance with Sections [1808.4] 1810.4 and [1812.4.1] 1814.4.1 through [1812.4.4] 1814.4.4.

[1812.4.1] **1814.4.1 Compression load test procedures.** The allowable axial compression load of a helical pile shall be verified by load tests in accordance with the requirements of Section [1808.4] 1810.4, except that ASTM D1143 may be conducted using the Quick Load Test Loading Procedure. Following each compression load test, the [test] helical pile being tested shall be removed by unscrewing and inspected for any deformations to the helices to verify the structural integrity of the shaft and its connections.

[1812.4.1.1] **1814.4.1.1 Required number of axial compression load tests.** The number of axial compression load tests shall satisfy Section [1808.4] 1810.4.

Exception: Load tests on helical piles shall not be required, provided the following conditions are satisfied:

1. The helical pile has a torque to capacity ratio approved in accordance with Section 28-113.2.1 of the Administrative Code;

2. The torque correlation shall demonstrate a factor of safety (FS) of 2.5 on the allowable load; and

3. The maximum allowable axial compression load on the helical pile shall be 10 tons (98 kN).

[1812.4.1.2] **1814.4.1.2 Acceptance criteria.** The allowable load on the helical pile shall be computed in accordance with Section [1808.4.1.5] 1810.4.1.5.

[1812.4.2] **1814.4.2 Axial tension load test procedures.** The allowable axial tension load of a helical pile shall be verified by load testing in accordance with Section [1808.4] 1810.4 of this code; however, it shall be permitted to use the Quick Load Test Loading Procedure of ASTM D3689. Following the tension load test, the helical pile shall be removed by unscrewing, and shall be inspected for any deformations to the helices and to verify the structural integrity of the shaft and connections.
[1812.4.2.1] **1814.4.2.1 Required number of axial tension load tests.** The number of axial tension load tests shall satisfy Section [1808.4] 1810.4, but with a minimum of one test.

[1812.4.3] **1814.4.3 Lateral load test procedures.** The allowable lateral load of a helical pile shall be verified with load testing in accordance with Section [1808.4] 1810.4. Following the lateral load test, the helical pile shall be removed by unscrewing and inspected for any deformations to the helices to verify the structural integrity of the shaft and connections.

[1812.4.3.1] **1814.4.3.1 Required number of lateral load tests.** The number of lateral load tests shall satisfy Section [1808.4] 1810.4, but shall not be fewer than one test.

[1812.4.3.2] **1814.4.3.2 Acceptance criteria.** The allowable lateral load on the helical pile shall be computed in accordance with Sections [1808.4.3.1] 1810.4.3.1 and [1808.4.3.2] 1810.4.3.2.

[1812.4.4] **1814.4.4 Additional load tests.** Additional axial compression, axial tension and lateral load tests shall be performed for questionable construction as required by Section [1808.4.1.1.1] 1810.4.1.1.1.

[1812.5] **1814.5 Minimum installation torque.** Where load tests are required, the helical pile being tested shall be used to determine the minimum required site-specific torque for installation of production helical piles. For each helical pile, the special inspector shall measure and log the installation torque for each foot of depth and the final torque in the helice’s soil-bearing zone. The shaft advancement shall equal or exceed 85 percent of helix pitch per revolution at time of final torque measurement. Where load tests are not required, installation torque shall be in accordance with the exception defined under Section [1812.4.3] 1814.4.3.

[1812.6] **1814.6 Internal stability of helical piles to resist overturning and translation.** Where bracket assemblies or structural eccentric forces cause bending, the resulting moment of the helical pile shall ensure stability in accordance with Section [1808.2.5] 1810.2.5 and general engineering practice. Where side-mount brackets are used and a stability analysis indicates that there is insufficient internal stability to resist overturning and translation, helical piles shall be installed staggered or other means shall be designed to provide stability and prevent rotation of the foundation.

[1812.7] **1814.7 Buckling.** When helical piles are embedded in soils of Classes 6 and 7, a buckling analysis shall be performed by a recognized method. The allowable axial compressive load shall be not more than two-thirds of the calculated load-causing buckling. The additional bending moments due to bracket assemblies, structural eccentric forces and coupling rigidity shall be appropriately included in the buckling analysis.

[1812.8] **1814.8 Shaft flexural capacity.** Where a moment is transmitted to a single helical pile, a structural analysis shall be conducted to verify that the shaft is capable of resisting the moment with acceptable deflection.

[1812.9] **1814.9 Side-mount bracket assembly test.** Where side-mount brackets are used, each bracket assembly shall be proof-tested to a minimum 110 percent of allowable load to demonstrate
that the bracket assembly is capable of transferring the loads to the helical pile. The load shall be applied in six equal increments. The 110 percent test load shall be held for a minimum 30 minutes without bracket assembly distortion or deformation. Side-mount brackets for permanent applications shall be encased in concrete with a minimum embedment of 3 inches (76.2 mm). Concrete used to encase side-mount brackets shall meet the requirements of Sections 1903, 1904, 1905 and 1906.

**[1812.10] 1814.10 Minimum spacing of helical piles.** Minimum spacing between the center lines of helical piles shall be four times the largest helix plate diameter.

**[1812.11] 1814.11 Installation.** Equipment used for the installation of helical piles shall be as recommended by the helical pile manufacturer.

**[1812.12] 1814.12 Special inspection.** The installation of helical piles shall be subject to the special inspection requirements in Section [4704.8] 1705.7 and the following requirements:

1. The special inspector shall prepare a report of special inspections of helical piles and submit such report to the department in a manner acceptable to the commissioner. In addition to the requirements of Section [4704.8] 1705.7, this report shall also include, at a minimum, the following:

   1.1. Helical pile type and product specification sheet for each helical pile installed as published by the manufacturer.

   1.2. Make and model of the equipment used for installation.

   1.3. Make and model number of the torque indicator used to measure installation torque.

   1.4. Calibration records for the torque indicators used to install the helical piles.

   1.5. The installation speed (rpm) of the helical pile.

   1.6. From axial load tests and the site specific torque to capacity relationship, the minimum torque required to achieve the allowable load of the helical pile in tension or compression.

   1.7. For each helical pile, the installation torque for each foot of depth and the final torque in the helice’s soil-bearing zone. The shaft advancement shall equal or exceed 85 percent of helix pitch per revolution at time of final torque measurement.

2. Field welds performed in the installation of a helical pile foundation system shall additionally be subject to the special inspection requirements of Section [4704.3] 1705.2.

**SECTION BC 1815 PERMANENT PRESTRESSED ROCK AND SOIL ANCHORS**

**1815.1 General.** Rock and soil anchors discussed in this document are cement grouted, prestressed tendons (bars or strands) that are installed in soil or rock. Permanent prestressed rock and soil anchors shall be designed and constructed in accordance with Sections 1815.2 through 1815.8 and PTI DC35.1.
1815.2 Additional geotechnical investigation and report requirements. Where prestressed rock and soil anchors are used, the geotechnical investigation and report provisions of Section 1803.6 shall be expanded to include, but not be limited to, consideration of the following:

1. Recommended anchor types and capacities.
2. Suitable center-to-center spacing of anchor elements.
3. Minimum unbonded and bonded lengths of tendons, including appropriate rock or soil stratum or strata for the bond zone.
4. The effects of groundwater or voids including grout loss and reduced grout to ground bond.
5. Installation procedures.
6. Durability of anchor materials and minimum corrosion protection requirements.
7. Lock-off load and lift-off load requirements.
8. Reductions for group action, where necessary.
9. Protection of adjacent structures due to anchor installation.

1815.3 Materials. Materials used in prestressed rock and soil anchors shall conform to the following:

1. Bar tendons. Bar tendons shall conform to the requirements of ASTM A722 or shall be comprised of tested materials not covered by ASTM A722 but have mechanical properties meeting or exceeding those specified by ASTM A722 and which have been cold stressed and stress relieved.
2. Strand tendons. Strand tendons shall conform to the requirements of ASTM A416 or ASTM A882.
3. Grout. Grout shall consist of a pumpable mixture of portland cement, water, and any required fine aggregate, supplemental cementitious materials, or admixtures as permitted by Chapter 19. Grout shall have a minimum unconfined compressive strength \( f'_{cu} \) equal to 4,000 psi (27 579 kpa).
4. Corrosion protection. All anchors shall meet PTI DC35.1 requirements for Class I protection (Encapsulated Tendons).

1815.4 Design. Anchors shall be designed in accordance with Sections 1815.4.1 through 1815.4.5.

1815.4.1 Ultimate bond strength. The average ultimate bond strength along the interface between anchor grout and the ground shall be determined by a generally accepted means of analysis and confirmed by load testing performed in accordance with Section 1815.5.
1815.4.2 Applicable strata. The bonded zone of anchors shall not be formed in soils designated as Class 6 or Class 7.

1815.4.3 Bonded zone. The bonded zone of anchors shall be fully located within materials of similar character and strength.

1815.4.4 Group capacity. Group capacity of anchors shall be determined by a generally accepted means of analysis and shall:

1. Ignore any contribution from soil or rock materials located beyond the property limits of the proposed structure.

2. Not exceed that of the sum of all individual anchor loads.

1815.4.5 Structural aspects.

1. Anchors design loads shall be based upon the load combinations specified in Section 1605.3.

2. Anchor design, lock-off, and test loads shall be in accordance with PTI DC35.1.

3. The cross section of the anchor tendons shall not be considered to contribute to the sliding or lateral resistance of any foundation element by means of shear friction.

4. Anchor design and lock-off loads shall consider the effects of long-term creep or changes in prestress resulting from deformation.

1815.5 Load testing. Load testing shall be in accordance with PTI DC35.1. Extended creep tests shall be performed for any anchors designed with bonded zones located within materials designated as Class 1d, Class 4 or Class 5.

1815.6 Installation. Installation procedures shall comply with the following:

1. Anchors shall be installed through fully cased boreholes. Open hole drilling shall only be permitted through stable bedrock.

2. Anchors having bond zones formed in soil shall be pressure grouted to at least 1.5 times the total stress at the midpoint of the bond zone.

1815.7 Grout sampling and testing. Sampling and testing of grout shall be performed in accordance with Section 1812.1.1.2.

1815.8 Special inspection. The installation and testing of prestressed rock and soil anchors shall be subject to special inspection in accordance with the requirements of Section 1705.19.
SECTION BC [1813] 1816
LIQUEFACTION ANALYSIS

[1813.1] 1816.1 General. An assessment of the liquefaction potential shall be determined for each building site except Structural Occupancy/Risk Category I structures. The evaluation of liquefaction potential shall include the following considerations:

1. Noncohesive granular soils below groundwater table and less than 50 feet (15 240 mm) below the ground surface shall be considered to have potential for liquefaction.

2. The potential for liquefaction on level ground shall be determined on the basis of the risk categories associated with the standard penetration resistance normalized to an energy of 60 percent efficiency (N_{60}) values of N_{60} at the site, as defined in Figure [1813.1] 1816.1, or a site-specific analysis performed by a geotechnical engineer.

3. Clays, silts and clayey silts below the groundwater table and less than 50 feet (15 240 mm) below the ground surface with a plasticity index less than 20 shall be considered to have potential for liquefaction. The susceptibility of the fine grained soils shall be evaluated in accordance with generally accepted engineering practice or a site-specific analysis performed by a geotechnical engineer.

---

**Note:**
1) Diagram is applicable only to soils below the groundwater table.
2) N_{60} is the standard penetration resistance normalized to an energy of 60 percent efficiency.
3) See Table 1804.5 for Structural Risk Occupancy/Risk Category definitions.
4) [Structural Risk Occupancy/Risk Category I] structures are exempt from liquefaction assessment.
[1813.2] **1816.2 Site-specific analyses.** In evaluating liquefaction potential, the analysis shall consider the following parameters: peak ground acceleration, earthquake magnitude, magnitude scaling factor, effective overburden pressure stress, hammer energy, cone penetration resistance (where applicable), and fines content. If a site response analysis is conducted, bedrock acceleration time histories and a shear wave velocity profile based on in-situ measurements may be utilized. These analyses may consider the results of laboratory cyclic shear tests. Where borings are drilled for the purpose of site-specific analyses and for the purpose of evaluating liquefaction potential, the drilling and sampling procedures and apparatus shall be in accordance with ASTM D6066.

[1813.2.1] **1816.2.1 Peak ground acceleration.** Peak ground acceleration shall be determined based on either [(1)] (i) a site-specific study taking into account soil amplification effects as specified in Section [11.4.7] 11.4.8 of ASCE 7-10 or [(2)] (ii) the Maximum Considered Geometric Mean peak ground acceleration adjusted for site class effects PGA<sub>M</sub> as provided in Table [1813.2.1] 1816.2.1 without adjustment for targeted risk.

[1813.3] **1816.3 Foundation design analysis.** The foundation design analysis shall consider an assessment of the potential consequences of any liquefaction and soil strength loss, including an estimation of total and differential settlement, lateral movement or reduction in foundation soil-bearing capacity, and may incorporate the potential benefits of any proposed mitigation measures. Such measures may be given consideration in the design of the structure and may include, but are not limited to, ground improvement, pore pressure dissipation, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements, or any combination of these measures.

In evaluating the potential for liquefaction, the effect of settlements induced by seismic motions and loss of soil strength shall be considered. The analysis performed shall incorporate the effects of the maximum considered earthquake (MCE) peak ground acceleration, appropriate earthquake magnitudes and duration consistent with the design earthquake ground motions as well as uncertainty and variability of soil properties across the site. The MCE peak ground acceleration, seismically induced cyclic stress ratios and pore pressure development may be determined from a site-specific study taking into account soil amplification effects and design ground motions appropriate for the seismic hazard. Other recognized methods of analysis may be used in the evaluation process subject
to the approval of the commissioner. Effects of liquefaction shall be considered in the design except when the following conditions exist:

1. Structures classified as Risk Category I.

2. When the calculated cyclic resistance ratio (CRR) is greater than or equal to the calculated cyclic stress ratio (CSR) for Risk Category II and III structures.

3. When the calculated CRR is greater than 1.2 times the calculated CSR for Risk Category IV structures.

[1813.4] **1816.4 Design considerations.** Where liquefaction is determined to be probable, the following considerations shall be addressed in the design:

1. Liquefiable soils shall be considered to have no passive (lateral) resistance or bearing capacity value for the design earthquake, unless shown otherwise by accepted methods of analysis. The engineer shall submit an analysis for review and approval by the commissioner, demonstrating that the proposed construction is safe against the effects of soil liquefaction.

2. Where liquefiable soils are present in sloped ground or over sloped nonliquefiable substrata and where lateral displacement is possible, the engineer shall submit a stability analysis for review and approval by the commissioner, demonstrating that the proposed construction is safe against failure of the soil and that the effects of potential lateral displacements are acceptable.

SECTION BC [1814] **1817 UNDERPINNING AND ALTERNATE METHODS OF SUPPORT OF BUILDINGS AND ADJACENT PROPERTY**

[1814.1] **1817.1 General.** Where the protection and/or support of a structure or property adjacent to an excavation is required, an engineer shall prepare a preconstruction report summarizing the condition of the structure or property. The preconstruction report shall be prepared based on an examination of the structure or property, the review of available documents and, if necessary, the excavation of test pits. The engineer shall determine the requirements for underpinning or other protection and prepare site and structure-specific plans, including details and sequence of work for submission to the commissioner. Such protection may be provided by underpinning, sheeting, and bracing, or by other means acceptable to the commissioner. Proposed work may disturb, displace or otherwise affect the lateral or vertical support of property or buildings, an engineer shall evaluate the need for and methods to maintain the stability and integrity of the building(s), utilities or soil adjacent to such activity.

[1814.1.1 Underpinning and bracing.** Underpinning piers, walls, piles and footings shall be designed as permanent structural elements and installed in accordance with provisions of this chapter and Chapter 33 and shall be inspected in accordance with the provisions of Chapter 17. Underpinning shall be designed and installed in such manner so as to limit the lateral and vertical displacement of the adjacent structure to permissible values as established in accordance with Section 1814.3. The sequence of installation and the requirements for sheeting, preloading, wedging with steel wedges, jacking or dry packing shall be identified in the design. The design
shall take into account the effects on foundation and structure produced by the lateral earth pressure exerted on the underpinning. Lateral support for underpinning, if needed, shall be accounted for during the design of the new construction. The design and construction sequence of temporary lateral supports used prior to the installation of the foundation walls shall be included on the design drawings.

1817.2 Minimum requirements for undeveloped adjacent property. The minimum requirements for construction documents for support of adjacent property which does not contain a building, such as, but not limited to, empty lots, court yards, front yards, or rear yards, shall include the following information:

1. Existing grade of the adjacent property.

2. Plans, cross-sections, and elevations as necessary, to illustrate all unique conditions of the support of excavation, including the depth of the proposed excavation, the subsurface conditions, surcharge loading, the proposed method of support, sequence of construction, required material properties, and additional details as required by Section 3304.

3. Details and criteria for monitoring, including but not limited to criteria and thresholds for movements, and dewatering as specified in Chapters 17, 18 and 33.

4. The elevation of the water table, need for dewatering as noted in the Geotechnical Report, and the maximum permissible drawdown outside of the project site.

1817.3 Evaluation of adjacent buildings for suitable method of support. At the time of foundation plan approval, an engineer shall submit an evaluation report to the department assessing the condition of the existing building and the subsurface conditions of the construction site and adjacent property. The report shall also identify acceptable method(s) of support, including underpinning or alternate methods of support, for the building. This evaluation shall be performed in accordance with the requirements of Section 1817.3.1 through 1817.3.6.

1817.3.1 Assessment of the building and the subsurface conditions: The engineer shall assess the condition of the existing building, and the subsurface conditions of the construction site and adjacent property, to an extent sufficient for determining acceptable method(s) of support, including underpinning or alternate methods of support. As necessary, the assessment shall be based on visual observations, calculations, review of the geotechnical report prepared for the project in accordance with Section 1803.6 and review of other available documentation. The investigation shall include, as necessary, but need not be limited to, the following items:

1. An evaluation of the vertical load path of the building as it relates to the location of the proposed underpinning or alternate method of support.

2. An evaluation of the lateral load path of the building as it relates to the location of the proposed underpinning or alternate method of support.

3. Calculations of the vertical and lateral loads at the foundations to be underpinned or supported by an alternate method of support.
4. A determination of the type and condition of the above grade elements to be supported or potentially affected by the work.

5. A survey of deviations from plumb or horizontal position of the building.

6. Identification of conspicuous structural defects, including but not limited to: bowing, significant cracking, structural degradation or unusual slenderness. A detailed description of such items shall be provided, with photographs and mapping if possible.

7. A determination of acceptable thresholds for maximum vertical and lateral movement, maximum permissible vibrations, the required monitoring and the protocols for exceedances.

8. A determination of the type and condition of the foundation elements to be supported or potentially affected by the work.

9. A test pit at each substantial change in foundation type or building geometry. Records of the test pits shall include the following:
   a. A description of the construction materials and condition of the footing, foundation wall and/or foundation system.
   b. The bottom elevation of the wall(s) and/or footing(s).
   c. The classification of the soil or rock the foundation bears upon.
   d. Photographs and sketches of the test pit.

10. An assessment of the allowable bearing pressure of the soils supporting the existing foundation(s) per Section 1806.

11. An assessment of potential reductions to the allowable bearing pressure due to the proposed excavation.

12. The lateral earth, surcharge, and water pressures that will be present on the elements of the proposed underpinning or alternate method of support.

13. An analysis of the subsurface conditions and their potential impacts on the underpinning or alternate method of support work such as, but not limited to: high water table and need for dewatering, loose soils, potentially running soils, presence of boulders, or other factors that could impact the design or construction of the underpinning or alternate method of support.

14. An assessment of the allowable bearing pressure of the soils supporting the underpinning or alternate method of support during the installation sequence and in the permanent condition.

15. An assessment of the anticipated settlement during the underpinning or alternate method of support, and soil and foundation work.
16. Any additional information requested by the commissioner.

1817.3.2 Additional requirements for buildings with rubble foundation elements. For buildings with rubble foundation elements, an assessment of the condition of the rubble element shall be performed. If the rubble foundation elements are in poor condition, recommendations for addressing the poor conditions shall be provided.

1817.3.3 Additional requirements for unreinforced masonry buildings. Where the building being supported is of unreinforced masonry construction, the lateral stability of the masonry walls and their ability to resist the loads imposed shall be verified.

**Exception:** If it is not possible to verify the lateral stability of the masonry walls, lateral support shall be provided at the floor levels of the adjacent building prior to installation of the underpinning or alternate method of support. Such lateral support shall be shown on the construction documents.

1817.3.4 Additional requirements for use of rock support. Where in situ Class 1a, 1b, or 1c rock is proposed for use in place of constructed methods of support, a subsurface investigation shall be conducted to assess the properties of the rock. Site-specific data shall be obtained to determine the predominant strike and dip of the joints, foliation, and/or other discontinuities in the rock. Recommendations for any rock stabilization necessary for the proposed work shall be provided.

1817.3.5 Evaluation report. The evaluation report shall include the following items:

1. The address of the property.

2. A description of the acceptable method(s) of support, including underpinning or alternate methods of support, that were evaluated and found to be feasible.

3. A description of any required modifications to reinforce the existing building prior to the start of the underpinning or alternate method of support work.

4. A summary of the assessment required by Sections 1817.3.1 through 1817.3.4, including all test pit records, where performed, and any additional items deemed necessary by the engineer.

5. A list of all assumptions made in preparation of the evaluation report and a detailed plan for the verification of such assumptions.

6. If the engineer determined that specific items listed in Sections 1817.3.1 through 1817.3.4 were not required, a statement shall be included explaining the basis for that determination for each item that was not included.

1817.3.6 Responsibility for the report. If more than one engineer participates in performing the required assessments of the building and subsurface conditions, and the author of the evaluation report is relying on the work of these additional engineer(s) in preparing the evaluation report, the findings of the additional engineer(s) shall be included as signed and sealed appendices to the evaluation report.
1817.4 Suitable Methods of Support. Where a method of support for an existing building is required, such underpinning or alternate method of support shall be designed as a permanent structural element specific to the building using the methods described in Sections 1817.4.1 through 1817.4.3. The underpinning or alternate method of support shall be installed in accordance with provisions of this chapter and Chapter 33 and shall be inspected in accordance with the provisions of Chapter 17.

1817.4.1 Underpinning. If the foundation loads are to be transferred to a lower bearing level, underpinning consisting of concrete piers, drilled piles, jacked piles, bracket piles, or similar engineered systems to transfer the existing building loads below the bottom of the proposed excavation shall be installed.

The bearing pressure at the base of the underpinning shall be computed accounting for all vertical loads and any overturning moments present due to lateral earth and water pressures, and shall be less than or equal to the allowable bearing pressure of the bearing stratum.

1817.4.2 Alternate methods of support. In lieu of underpinning, an excavation support system and/or lateral bracing designed to restrict the movements of the adjacent buildings within the established threshold levels may be installed. Such excavation support systems may consist of secant piles, slurry walls, tangent pile walls, jet grouting, pressed-in continuous sheeting, or similar engineered system.

[1814.2] 1817.4.3 Use of rock support. Existing structures founded at a level above the level of adjacent new construction may be supported on Class 1a, 1b, and 1c rock in lieu of underpinning, [sheeting and bracing or retaining walls,] provided [that a report by the engineer substantiates the safety of the proposed construction. The engineer shall also certify that the he or she has inspected the exposed rock and the jointing therein and has determined whether supplemental support of the rock face is required.] the requirements of Section 1817.3.4 are satisfied.

1817.5 Design requirements. The underpinning or alternate method of support for adjacent buildings shall be designed by an engineer and plans filed with the department for approval prior to the commencement of the work.

1817.5.1 New construction. Materials and design shall be in accordance with the requirements of this code for new construction.

1817.5.2 Incorporation of the evaluation report. The design shall incorporate the findings of the evaluation report and any additional evaluation and investigation deemed necessary by the engineer performing the design. If the evaluation report did not conclusively demonstrate the suitability of an underpinning or alternate method of support, such method of support shall not be used.

1817.5.3 Deviations from the evaluation report. The engineer designing the method of support may be an engineer other than the engineer who submitted the evaluation report. If the engineer designing the method of support does not accept the evaluation report or finds it insufficient, a new evaluation report shall be submitted to the department. Similarly, if a method of support other than one(s) determined to be suitable in the evaluation report is proposed for use, an additional evaluation report shall be submitted to the department justifying the suitability of the method of
support now proposed. The revised report may be submitted along with the construction documents for the design of the method of support. Alternatively, minor exceptions to the report may be incorporated into the design documents if explicitly indicated on the design documents along with the engineer’s reason for override.

1817.5.4 Design loads and load combinations. Underpinning, alternate methods of support and any associated lateral support system, shall be designed for the loads and load combinations listed in Sections 1817.5.4.1 and 1817.5.4.2.

1817.5.4.1 Loads from the existing building. A computation shall be performed to establish the vertical and lateral loads on the elements of the method of support from the existing building. Loads and load combinations shall be computed in accordance with the requirements of Chapter 16 or where permitted for loads of prior codes for prior code buildings.

1817.5.4.1.1 Unconfirmed load path. Where the evaluation of Section 1817.3 is unable to visually confirm the load path from the existing building, pit-pier underpinning where all horizontal loads are transferred directly to a raker or tension anchor bracing system that braces every pit-pier is permissible.

Exception: Raker bracing or tension anchors need not be installed where it is demonstrated by calculation, according to data provided by the investigation per Section 1817.3.1, that the underpinning system, analyzed independently as a retaining wall that supports the soil and water behind it, calculated both (i) with and (ii) without accounting for vertical loads from the structure above, has satisfactory bearing pressures and is stable with a 1.5 factor of safety against overturning and sliding. This exception shall not be utilized in unreinforced masonry buildings in which access to verify the lateral stability of masonry walls is not possible as per Section 1817.3.3.

1817.5.4.2 Soil and water pressures. The design shall include at rest soil pressures, water pressures, and any surcharge pressures that arise from the adjacent portions of the building being underpinned or supported by an alternate method of support.

1817.5.5 Anticipated deflection. A calculation shall be performed for the anticipated deflection of the method of support system and its effect on the supported building.

1817.5.6 Factor of safety. Methods of support shall be designed to provide a minimum factor of safety of 1.5 for sliding and overturning for all loads and all anticipated interim conditions.

1817.5.7 Sequence. The design of the method of support shall account for the means and methods of installation, sequence of operations, and all the load transfers and associated support conditions for all phases of the work.

1817.6 Minimum requirements for construction documents. Construction documents for methods of support of adjacent buildings shall include the following information:

1. Indicate the type of adjacent foundation, including type of material.
2. The bearing elevation(s) of the adjacent building foundation and its soil classification.

3. For deep foundations, type and location including top and bottom elevations of deep foundation elements.

4. The elevations of all floor levels at grade and below in the adjacent building.

5. Plans, cross-sections, and elevations views as necessary, to illustrate all conditions of the adjacent building relevant to the operation, including the below grade portions and the depth of the proposed excavation.

6. Details and criteria for monitoring the building or wall being supported, including but not limited to criteria and thresholds for movements as specified in Section 1817.9 and Chapters 17 and 33.

7. A fully detailed design of the method of support including any required bracing.
   a. For pit-pier underpinning, a detailed design for the timber shoring of the pit excavations shall also be provided.

8. A step by step procedure describing the installation of the elements of the method of support.
   a. For pit-pier underpinning, the procedure shall include a diagram indicating the sequence of the pit installation and a detailed procedure of the installation of the shoring for the pit excavations.

9. The elevation of the water table, need for dewatering as noted in the evaluation report, and the maximum permissible drawdown.

10. References alerting the contractor and the special inspector to review the evaluation report of the adjacent building prior to the start of work.

11. Plans, sections, and elevation views of all methods of support.

12. Soil classification of the required bearing stratum for the elements of the method of support.
   a. For pit-pier underpinning, also include the required allowable bearing pressure below the pier.

13. A load table or diagram shall be provided to indicate the following:
   a. Total gravity load in underpinning pier or alternate method of support.
   b. Total lateral load in underpinning piers or alternate method of support.

1817.7 Additional requirements for pit-pier underpinning. When the method of support selected is pit-pier underpinning, the design shall meet the following minimum criteria:

1. After installation of each pit-pier, the approach pit shall be back filled.
2. In no case shall the general site excavation expose more than one third of the total height of a pit-pier, unless:

2.1. A pit-pier bracing system designed by the engineer is installed or;

2.2. The calculated capacity of the individual pit-pier to resist lateral loading at a greater depth is identified on the drawings.

3. Pit-piers shall be preloaded by wedging, use of permanent jacks, or by other means designed by the engineer.

4. Any voids between the bottom of the foundation and the top of the pit-pier shall be filled with dry-pack or equivalent. Dry-pack shall be composed of nonshrink material and be no more than 3 inches in thickness.

5. The need for jacking and all associated jacking requirements shall be determined by the engineer responsible for the underpinning design.

6. The width of pit-piers shall not exceed 4 feet unless the calculations determine that a wider pit-pier is acceptable.

7. Shear transfer shall be designed and installed between adjacent pit-piers.

8. The bottom of pit-pier elevation shall be a minimum of one foot below the bottom of the future adjacent excavation.

1817.7.1 Pit-pier excavation. Pit-pier excavation shall be subject to the requirements of Section 1817.7.1.1 through 1817.7.1.8.

1817.7.1.1 Excavation Methods. Pit-pier excavations shall be performed using hand held tools. Excavation using backhoes or other mechanical means to excavate the pit-piers is prohibited.

1817.7.1.2 Clear distance between open pits. Clear distance between open pits shall be determined by the evaluation report and shall not be less than 12 feet (3657.6 mm).

1817.7.1.3 Pit Excavation below the lowest installed lagging board. Lagging boards shall be installed as the excavation proceeds to limit soil loss. In no case shall excavation proceed more than 2 feet (609.6 mm) below the lowest installed lagging board. At completion of pit excavation, the pit shall be fully lagged.

1817.7.1.4 Backpacking. Backpacking of any voids shall be performed at each excavation lift.

1817.7.1.5 Excavation below the water table. Pit excavation shall not proceed below the water table. If the depth of the underpinning requires excavation below the existing water
table, a dewatering system shall be installed prior to the start of the excavation. The
dewatering system shall be tested via test pit or piezometer to confirm that the water table has
been sufficiently drawn down prior to the start of the pit underpinning work.

1817.7.1.6 Variable depth pits. Where construction requires adjacent pits to be excavated to
differing depths, the deeper pit-pier shall be constructed first.

1817.7.1.7 Multi-tier pit-pier underpinning. Where multi-tier pit-pier underpinning is
utilized, the upper piers shall be braced prior to the excavation of the lower pier and the
installation of upper and lower piers staggered, unless the design per Section 1817.5 and
drawings include explicit methods that will ensure that the installation of lower tiers shall not
displace the tiers above.

1817.7.1.8 Use of tension anchors. When tension anchors are utilized, the effects of vertical
and horizontal force components shall be accounted for including any potential additional
displacements.

1817.8 Additional requirements for deep foundation elements used in underpinning. Where the
method of support includes deep foundation systems such as pile supported underpinning or tie
anchors, the requirements of Chapter 18 and Sections 1817.8.1 through 1817.8.5 shall be met.

1817.8.1 Pile design. Piles used for underpinning shall be designed in accordance with Sections
1810.3 and 1810.4.

1817.8.2 Load testing of underpinning piles. Piles used for underpinning are subject to the load
testing criteria of Section 1810.4.

1817.8.3 Eccentric pile loads. Piles used for underpinning shall be designed to sustain all
moments that are generated due to any eccentricities of the load on the pile.

1817.8.4 Spanning between piles. Unless new grade beams are provided, calculations shall be
performed to confirm that the existing foundation can support the required loads spanning
between the pile supports.

1817.8.5 Piles used as excavation support elements. If underpinning piles are to be used as
excavation support elements, a calculation of the anticipated pile deflection shall be performed
and its impacts on the supported building shall be assessed by the engineer.

[1814.3] 1817.9 Monitoring. When excavation, foundation construction, [or] underpinning, or an
alternate method of support is required, adjacent structures and properties shall be monitored in
accordance with a plan prepared by the engineer. The engineer shall develop the scope of the
monitoring program, including location and type of instruments, frequency and duration of readings,
frequency of reporting, maximum allowable time to report readings (timely reporting), reporting
requirements, and permissible movement and vibration criteria. This scope shall take into account the
structures, buildings or property to be monitored and the conditions thereof. The monitoring
program shall include necessary actions to address exceedances. These actions shall include
notification of the commissioner. Monitoring of historic and landmarked structures shall be subject
to special requirements as determined by the department. Where the building to be monitored is subject to underpinning or alternate methods of support, the monitoring plan shall be determined by the engineer designing such work.

1817.10 Special Inspection. Special inspection shall be conducted in accordance with Chapter 17.

SECTION BC 1818
GEOTECHNICAL PEER REVIEW

1818.1 General. The provisions of this section specify where geotechnical peer review is required, how and by whom it is to be performed.

1818.2 Where required. A geotechnical peer review shall be performed and a report shall be required in the following instances:

1. Where structural peer review is required pursuant to Section 1618.

2. For structures of Risk Category III or IV where the seismic site class is Site Class F.

3. Where performance based foundation design is utilized.

4. As required by the commissioner.

1818.3 Geotechnical peer review qualifications: The geotechnical peer review shall be performed by a qualified independent geotechnical engineer who has been retained by or on behalf of the owner. A geotechnical peer reviewer shall meet the requirements of the rules of the department.

1818.3.1 Independence. In order to satisfy the requirement that the peer reviewer be independent, the department requires that the peer reviewer must not engage in any activities that may conflict with their objective judgment and integrity, including but not limited to having a financial and/or other interest in the design, construction, installation, manufacture or maintenance of structures or components that they are reviewing.

1818.4 Extent of Geotechnical Peer Review. The extent of the geotechnical peer review shall be performed in accordance with Section 1818.4.1.

1818.4.1 Scope. The geotechnical peer reviewer shall review the plans and specifications submitted with the permit application for general compliance with the foundation design provisions of this code. The reviewing engineer shall perform the following tasks at a minimum:

1. Confirm that the subsurface investigation meets the requirements of this code.

2. Confirm that the geotechnical report and supplemental reports, including foundation recommendations and testing, meet the requirements of this code.

3. Provide independent check on foundation capacities. This check must include the structural and geotechnical capacity of the foundation element, if not covered by the structural peer review.
4. Where uplift resistance is required, provide independent check on prestressed anchor or pile design.

5. Perform independent settlement calculations.

6. Confirm the design assumptions made by the geotechnical and structural engineers pertaining to the soil-foundation structure interaction are coordinated and consistent.

7. Confirm that potential impacts on adjacent structures due to foundation construction have been addressed in accordance with this code.

8. Review seismic analysis including any site-specific analysis, associated mitigation methods, and analyses pertaining to liquefaction for conformance with codes.

1818.5 Geotechnical peer review report. The geotechnical peer review report shall comply with Section 1818.5.1 through 1818.5.3.

1818.5.1 General. The reviewing engineer shall submit a report to the department stating whether or not the geotechnical design shown on the plans, reports and specifications generally conforms to the requirements of this code.

1818.5.2 Contents. The report shall demonstrate, at a minimum, compliance with Items 1 through 8 of Section 1818.4.1. In addition, the report shall also include the following:

1. The codes and standards used in the geotechnical design of the project.

2. The basis for design criteria that are not specified directly in applicable codes and standards. This should include reports by consultants such as geotechnical reports and site specific seismic studies. Generally, the report should confirm that existing conditions at the site have been investigated appropriately and that the design of the proposed foundations is in general conformance with these conditions.

4. A statement that the qualification and independence of the peer reviewer is in accordance with Section 1818.3.

5. Peer review reports shall provide an unconditional statement that must be either an acceptance or rejection of code compliance of the geotechnical design required to be reviewed by this section.

1818.5.3 Phased submission. If an application is submitted for a permit for the construction of foundations or any other part of a building before the construction documents for the whole building have been submitted, then the geotechnical peer review and report shall be phased. The geotechnical peer reviewer shall be provided with sufficient information on which to make a geotechnical peer review of the phased submission. In addition to the requirements of this section, phased submission of the report shall include any changes made to the initial geotechnical peer review evaluation. The geotechnical peer review report need not be submitted concurrently with the structural peer review report.
1818.6 Responsibility. Responsibility shall be as provided for in Section 1818.6.1 through 1818.6.4.

1818.6.1 Engineer of record. The engineer of record for the foundation design shall retain sole responsibility for the geotechnical design. The activities and reports of the geotechnical peer reviewer shall not relieve the engineer of record for the foundation design of this responsibility.

1818.6.2 Geotechnical peer reviewer. The geotechnical peer reviewer’s report states his or her opinion regarding the design by the engineer of record for the foundation design. The standard of care to which the geotechnical peer reviewer shall be held in the performance of the geotechnical peer review and report is that level of skill and care are consistent with geotechnical peer review services performed by professional engineers licensed in the State of New York for similar type projects. The geotechnical peer reviewer shall not be responsible for the accuracy of the subsurface investigation data or the conclusions of the structural peer review reports.

1818.6.3 Revisions of design. The engineer of record for the foundation design shall identify that a new review is required based upon changes to the design documents relevant to the scope of the peer review. The geotechnical peer reviewer shall review the items that have been affected and shall revise the geotechnical peer review report.

1818.6.4 Disputes. When a dispute arises between the applicant of record and the peer reviewer regarding compliance with Section 1818 that cannot be resolved by these parties, such dispute shall be reported to the department in the form of a letter from the applicant of record. The department may make a final decision or may accept a change of the peer reviewer.

1818.7 Change to peer reviewer. The peer reviewer cannot be changed without the express consent of the department. The current peer reviewer must submit both a written letter to the borough commissioner detailing the reason for the withdrawal request and a report of the geotechnical peer review findings to date. If a change of peer reviewer is approved, a revised PW1 must be submitted indicating the replacement peer reviewer.

§ 20. Chapter 19 of the New York city building code, as amended by local law number 141 for the year 2013, is amended to read as follows:

CHAPTER 19
CONCRETE

SECTION BC 1901
GENERAL

1901.1 Scope. The provisions of this chapter shall govern the materials, quality control, design and construction of concrete used in structures.

1901.1.1 Referenced standards. Where this code makes reference to the nationally recognized standard ACI 318, such standard shall be as modified for New York City in accordance with Section 1908 of this code. Where sections within ACI 318 are referenced in other chapters and appendices of ACI 318, the provisions of this chapter shall apply.
1901.2 Plain and reinforced concrete. Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as amended in Section 1908 of this code. Except for the provisions of Sections 1904 and 1910, the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil. Precast concrete diaphragms in buildings assigned to Seismic Design Category C or D shall be designed in accordance with the requirements of ASCE 7, Section 14.2.4.

1901.3 Source and applicability. Sections 1902 through 1907 of this chapter are derived from the provisions for structural concrete in ACI 318. Where sections within Chapters 2 through 7 of ACI 318 are referenced in other chapters and appendices of ACI 318, the provisions of Sections 1902 through 1907 of this code shall apply.

1901.3 Anchoring to concrete. Anchoring to concrete shall be in accordance with ACI 318 as amended in Section 1908, and applies to cast-in (headed bolts, headed studs and hooked J- or L-bolts), post-installed expansion (torque-controlled and displacement-controlled), undercut and adhesive anchors.

1901.4 Composite structural steel and concrete structures. Systems of structural steel acting compositely with reinforced concrete shall be designed in accordance with Section 2206.

1901.5 Construction documents. The construction documents for structural concrete construction shall include:

1. [Specified] The specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.

2. [Specified] The specified strength or grade of reinforcement.

3. [Size] The size and location of structural elements, reinforcement[,] and anchors.

4. Provision for dimensional changes resulting from creep, shrinkage and temperature.

5. [Magnitude] The magnitude and location of prestressing forces.

6. Anchorage length of reinforcement and location and length of lap splices.

7. Type and location of mechanical and welded splices of reinforcement.

8. Details and location of contraction or isolation joints specified for plain concrete.

10. Stressing sequence for posttensioning tendons.

11. For structures assigned to Seismic Design Category D, a statement if slab on grade is designed as a structural diaphragm [(see Section 2112.3.4 of ACI 318)].
12. Exposure classes per ACI 318, Section 19.3.1, and Section 1904.2 of this code [chapter and Section 4.2 of ACI 318].

13. Areas of mass-concrete where a thermal control plan is required.

1901.6 Special [inspection] inspections and tests. [The special inspection] Special inspections and tests of concrete elements of buildings and structures, and concreting operations, shall be [in accordance with] as required by Chapter 17.

SECTION BC 1902
DEFINITIONS

1902.1 [General] Definitions. The [words and terms] following term is defined in [this section and ACI 318 shall, for the purposes of this chapter and as used elsewhere in this code for concrete construction, have the meanings shown herein and in ACI 318, as modified by Section 1908.1.1 of this chapter.] Chapter 2:

MASS CONCRETE. [Any volume of concrete with dimensions large enough to require that measures be taken to cope with generation of heat from hydration of the cement and attendant volume change to minimize cracking, reduction of compressive strength, and/or delayed ettringite formation.]

SECTION BC 1903
SPECIFICATIONS FOR TESTS AND MATERIALS

1903.1 General. Materials used to produce concrete, concrete itself and testing thereof shall comply with the applicable standards listed in ACI 318 and this section.[Where required, special inspections and tests shall be in accordance with Chapter 17.]

1903.2 [Cementitious materials. Cementitious materials used to produce concrete shall comply with ACI 318, Section 3.2.] Special inspections. Where required, special inspections and tests shall be in accordance with Chapter 17.

1903.3 [Aggregates. Aggregates used in concrete shall comply with ACI 318, Section 3.3.]

Glass fiber-reinforced concrete. Glass fiber-reinforced concrete (GFRC) and the materials used in such concrete shall be in accordance with the PCI MNL 128 standard.

1903.4 Flat wall insulating concrete form (ICF) systems. Insulating concrete form material used for forming flat concrete walls shall conform to ASTM E 2634.

1903.5 Water. Water used in mixing concrete shall be clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials or other substances that are deleterious to concrete or steel reinforcement and shall comply with ACI 318, Section [3.4] 26.4.1.3.

[1903.5] 1903.6 Steel reinforcement. Reinforcement and welding of reinforcement to be placed in concrete construction shall conform to the requirements of ACI 318, [Section 3.5] Chapter 20, and this section.
[1903.5.4] 1903.6.1 Reinforcement type. Steel reinforcement used in concrete construction shall comply with ACI 318, [Section 3.5] Chapter 20.

[1903.5.2] 1903.6.2 Welding. Welding of reinforcing bars shall conform to AWS D1.4 and ACI 318, Section [3.5.2] 26.6.4. Type and location of welded splices and other required welding of reinforcing bars shall be indicated on the construction documents or in the project specifications. The ASTM reinforcing bar specifications, except for ASTM A 706, shall be supplemented to require a report of material properties necessary to conform to the requirements in AWS D1.4. A written welding procedure shall be provided to the registered design professional of record for approval prior to any welding. All welding shall be subject to special inspection by a special inspection agency.

[1903.6] 1903.7 Admixtures. Admixtures to be used in concrete shall be subject to prior approval by the registered design professional of record and shall comply with ACI 318, Section [3.6] 26.4.1.4. Admixtures shall be included in the concrete design mix submittals.

[1903.7] 1903.8 Storage of materials. The storage of materials for use in concrete shall comply with ACI 318, Section [3.7] 26.5.1, and the provisions of Sections [1903.7.4] 1903.8.1 and [1903.7.2] 1903.8.2 of this chapter.

[1903.7.4] 1903.8.1 Manner of storage. Cementitious materials and aggregates shall be stored in such a manner as to prevent deterioration or intrusion of foreign matter.

[1903.7.2] 1903.8.2 Unacceptable material. Any material that has deteriorated or has been contaminated shall not be used for concrete.

[1903.8] Glass fiber reinforced concrete. Glass fiber reinforced concrete (GFRC) and the materials used in such concrete shall be in accordance with the PCI MNL 128 standard.

[1903.9] Flat wall insulating concrete form (ICF) systems. Insulating concrete form material used for forming flat concrete walls shall conform to ASTM E 2634.

SECTION BC 1904
DURABILITY REQUIREMENTS

1904.1 General. Concrete shall be designed and proportioned to comply with the durability, strength, exposure, and other requirements as specified in [Section 4.1 of] ACI 318 and Sections 1904.2 through 1904.5 of this chapter.

1904.2 Exposure categories and classes. Concrete shall be assigned to exposure classes in accordance with ACI 318, Section [4.2] 19.3.1, based on:

1. Exposure to freezing and thawing in a moist condition or exposure to deicing chemicals;
2. Exposure to sulfates in water or soil;
3. Exposure to water where the concrete is intended to have low permeability; and
4. Exposure to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.

**1904.3 Concrete properties.** Concrete mixtures shall conform to the most restrictive [maximum water-cementitious materials ratios and minimum specified concrete compressive strength] requirements of ACI 318, Section [4.3] 19.3.2, based on the exposure classes assigned in Section 1904.2 of this chapter.

**Exception:** For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete is permitted to comply with the requirements of Table 1904.3 of this chapter in lieu of the requirements of ACI 318, Table [4.3.1] 19.3.2.1.

**TABLE 1904.3**

<table>
<thead>
<tr>
<th>TYPE OR LOCATION OF CONCRETE CONSTRUCTION</th>
<th>MINIMUM SPECIFIED COMpressive STRENGTH (f'c)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basement walls, foundation walls, exterior walls and other vertical concrete surfaces, basement slabs, interior slabs on grade except for garage floor slabs, and foundations not exposed to the weather</td>
<td>3,000(^a)</td>
</tr>
<tr>
<td>Driveways, curbs, walks, patios, porches, carport slabs, steps and other flatwork exposed to the weather, and garage floor slabs</td>
<td>3,500(^b)</td>
</tr>
<tr>
<td>Structural concrete exposed to weather</td>
<td>4,500</td>
</tr>
</tbody>
</table>

For SI: 1 pound per square inch = 0.00689 MPa.

a. Concrete in these locations that can be subjected to freezing and thawing during construction shall be of air-entrained concrete in accordance with Section 1904.2.

b. Concrete shall be air entrained in accordance with Section 1904.4.1.

**1904.4 Freezing and thawing exposures.** Concrete that will be exposed to freezing and thawing, in the presence of moisture, with or without deicing chemicals being present, shall comply with ACI 318, Section 19.3.3, and Sections 1904.4.1 and 1904.4.2 of this code.

**1904.4.1 Air entrainment.** Concrete exposed to freezing and thawing while moist shall be air entrained in accordance with ACI 318, [Section 4.4.1] Sections 19.3.3.1 and 19.3.3.3.

**1904.4.2 Deicing chemicals.** For concrete exposed to freezing and thawing in the presence of moisture and deicing chemicals, the maximum weight of fly ash, other pozzolans, silica fume or slag that is included in the concrete shall not exceed the percentages of the total weight of cementitious materials permitted by Table 1904.4.2.

**TABLE 1904.4.2**

<table>
<thead>
<tr>
<th>CEMENTITIOUS MATERIALS</th>
<th>MAXIMUM PERCENT OF TOTAL CEMENTITIOUS MATERIALS BY WEIGHT(^a,b)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fly ash or other pozzolans conforming to ASTM C 618</td>
<td>25(^a)</td>
</tr>
<tr>
<td>Slag conforming to ASTM C 989</td>

</tr>
<tr>
<td>Silica fume conforming to ASTM C 1240</td>
<td>10</td>
</tr>
</tbody>
</table>
Total of fly ash or other pozzolans, slag and silica fume | 50c
--- | ---
Total of fly ash or other pozzolans and silica fume | 35c

a. The total cementitious material also includes ASTM C 150, ASTM C 595, ASTM C 845 and ASTM C 1157 cement.
b. The maximum percentages shall include:
   1. Fly ash or other pozzolans present in Type IP or I (PM) blended cement, ASTM C 595, or ASTM C 1157.
   2. Slag used in the manufacture of an IS or I (SM) blended cement, ASTM C 595, or ASTM C 1157.
c. Fly ash or other pozzolans and silica fume shall constitute no more than 25 and 10 percent, respectively, of the total weight of the cementitious materials. The amount of fly ash or other pozzolans conforming to ASTM C 618 shall be permitted to be increased in accordance with footnote d, provided the maximum percentage of supplemental cementitious materials does not exceed the maximum values stated in Table 1904.4.2 when combining multiple types of supplemental cementitious materials.
d. Amount of fly ash or other pozzolans conforming to ASTM C 618 in a given concrete mixture can be increased to 35% provided that the concrete is not placed during cold weather as defined by ACI 306 or that the concrete is membrane cured and protected from freezing until the concrete has attained 3,500 psi.

1904.5 Alternative cementitious materials for sulfate exposure. Combinations of cementitious materials for use in sulfate-resistant concrete that are alternative to those listed in ACI 318, [Table 4.3.4] Table 19.3.2.1, shall be permitted in accordance with ACI 318, Section [4.5.4] 26.4.2.2.

SECTION BC 1905
CONCRETE QUALITY, MIXING AND PLACING

1905.1 General. The required strength and durability of concrete shall be governed by compliance with the proportioning, testing, mixing and placing provisions of Sections 1905.1.1 through 1905.13 of this code and ACI 318.

1905.1.1 Strength. Concrete shall be proportioned to provide an average compressive strength in accordance with Section 1905.3, and shall satisfy the durability criteria of Section 1904. Concrete shall be produced to minimize the frequency of strengths below \( f'_{c} \) in compliance with Section 1905.6.3.3. For concrete designed and constructed in accordance with this chapter, \( f'_{c} \) shall not be less than 2,500 psi (17.22 MPa). No maximum specified compressive strength shall apply unless restricted by a specific provision of this code or ACI 318.

1905.1.2 Cylinder tests. Requirements for \( f'_{c} \) shall be based on tests of cylinders made and tested in accordance with Section 1905.6.3.
