	6-1.3	$\frac{3}{4}$ " by 0.055" (No. 16 carbon sheet steel gage) vertical cold-rolled channels, 16" on center with $\frac{3}{8}$ " gypsum lath applied to one face and attached with sheet metal clips. Gypsum plaster each side mixed 1:2 by weight, gypsum to sand aggregate.	—	—	—	2 <sup>d</sup>
	6-2.1	Studless with $\frac{1}{2}$ " full-length plain gypsum lath and gypsum plaster each side. Plaster mixed 1:1 for scratch coat and 1:2 for brown coat, by weight, gypsum to sand aggregate.	—	—	—	2 <sup>d</sup>
	6-2.2	Studless with $\frac{1}{2}$ " full-length plain gypsum lath and perlite or vermiculite gypsum plaster each side.	—	—	2 $\frac{1}{2}$ <sup>d</sup>	2 <sup>d</sup>
	6-2.3	Studless partition with $\frac{3}{8}$ " rib metal lath installed vertically adjacent edges tied 6" on center with No. 18 gage wire ties, gypsum plaster each side mixed 1:2 by weight, gypsum to sand aggregate.	—	—	—	2 <sup>d</sup>
7. Solid perlite and portland cement	7-1.1	Perlite mixed in the ratio of 3 cubic feet to 100 pounds of portland cement and machine applied to stud side of 1 $\frac{1}{2}$ " mesh by 0.058-inch (No. 17 B.W. gage) paper-backed woven wire fabric lath wire-tied to 4"-deep steel trussed wire studs 16" on center. Wire ties of 0.049" (No. 18 B.W. gage) galvanized steel wire 6" on center vertically.	—	—	3 $\frac{1}{8}$ <sup>d</sup>	—
8. Solid neat wood fibered gypsum plaster	8-1.1	$\frac{3}{4}$ " by 0.055-inch (No. 16 carbon sheet steel gage) cold-rolled channels, 12" on center with 2.5-pound flat metal lath applied to one face and tied with 0.049" (No. 18 B.W. gage) wire at 6" spacing. Neat gypsum plaster applied each side.	—	—	2 <sup>d</sup>	—
9. Solid wallboard partition	9-1.1	One full-length layer $\frac{1}{2}$ " Type X gypsum wallboard <sup>e</sup> laminated to each side of 1" full-length V-edge gypsum coreboard with approved laminating compound. Vertical joints of face layer and coreboard staggered at least 3".	—	—	2 <sup>d</sup>	—
10. Hollow (studless) gypsum wallboard partition	10-1.1	One full-length layer of $\frac{5}{8}$ " Type X gypsum wallboard <sup>e</sup> attached to both sides of wood or metal top and bottom runners laminated to each side of 1" x 6" full-length gypsum coreboard ribs spaced 24" on center with approved laminating compound. Ribs centered at vertical joints of face plies and joints staggered 24" in opposing faces. Ribs may be recessed 6" from the top and bottom.	—	—	—	2 $\frac{1}{4}$ <sup>d</sup>
	10-1.2	1" regular gypsum V-edge full-length backing board attached to both sides of wood or metal top and bottom runners with nails or 1 $\frac{5}{8}$ " drywall screws at 24" on center. Minimum width of runners 1 $\frac{5}{8}$ ". Face layer of $\frac{1}{2}$ " regular full-length gypsum wallboard laminated to outer faces of backing board with approved laminating compound.	—	—	4 $\frac{5}{8}$ <sup>d</sup>	—

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE <sup>b</sup> (inches)			
			4 hour	3 hour	2 hour	1 hour
11. Noncombustible studs—interior partition with plaster each side	11-1.1	3 1/4" x 0.044" (No. 18 carbon sheet steel gage) steel studs spaced 24" on center. 5/8" gypsum plaster on metal lath each side mixed 1:2 by weight, gypsum to sand aggregate.	—	—	—	4 3/4 <sup>d</sup>
	11-1.2	3 3/8" x 0.055" (No. 16 carbon sheet steel gage) approved nailable <sup>e</sup> studs spaced 24" on center. 5/8" neat gypsum wood-fibered plaster each side over 3/8" rib metal lath nailed to studs with 6d common nails, 8" on center. Nails driven 1 1/4" and bent over.	—	—	5 5/8	—
	11-1.3	4" x 0.044" (No. 18 carbon sheet steel gage) channel-shaped steel studs at 16" on center. On each side approved resilient clips pressed onto stud flange at 16" vertical spacing, 1/4" pencil rods snapped into or wire tied onto outer loop of clips, metal lath wire-tied to pencil rods at 6" intervals, 1" perlite gypsum plaster, each side.	—	7 5/8 <sup>d</sup>	—	—
	11-1.4	2 1/2" x 0.044" (No. 18 carbon sheet steel gage) steel studs spaced 16" on center. Wood fibered gypsum plaster mixed 1:1 by weight gypsum to sand aggregate applied on 3/4"-pound metal lath wire tied to studs, each side. 3/4" plaster applied over each face, including finish coat.	—	—	4 1/4 <sup>d</sup>	—
12. Wood studs interior partition with plaster each side	12-1.1 <sup>m</sup>	2" x 4" wood studs 16" on center with 5/8" gypsum plaster on metal lath. Lath attached by 4d common nails bent over or No. 14 gage by 1 1/4" by 3/4" crown width staples spaced 6" on center. Plaster mixed 1:1 1/2 for scratch coat and 1:3 for brown coat, by weight, gypsum to sand aggregate.	—	—	—	5 1/8
	12-1.2 <sup>l</sup>	2" x 4" wood studs 16" on center with metal lath and 7/8" neat wood-fibered gypsum plaster each side. Lath attached by 6d common nails, 7" on center. Nails driven 1 1/4" and bent over.	—	—	5 1/2 <sup>d</sup>	—
	12-1.3 <sup>1</sup>	2" x 4" wood studs 16" on center with 3/8" perforated or plain gypsum lath and 1/2" gypsum plaster each side. Lath nailed with 1 1/8" by No. 13 gage by 19/64" head plasterboard blued nails, 4" on center. Plaster mixed 1:2 by weight, gypsum to sand aggregate.	—	—	—	5 1/4
	12-1.4 <sup>1</sup>	2" x 4" wood studs 16" on center with 3/8" Type X gypsum lath and 1/2" gypsum plaster each side. Lath nailed with 1 1/8" by No. 13 gage by 19/64" head plasterboard blued nails, 5" on center. Plaster mixed 1:2 by weight, gypsum to sand aggregate.	—	—	—	5 1/4
13. Noncombustible studs—interior partition with gypsum wallboard each side	13-1.1	0.018" (No. 25 carbon sheet steel gage) channel-shaped studs 24" on center with one full-length layer of 5/8" Type X gypsum wallboard <sup>a</sup> applied vertically attached with 1" long No. 6 drywall screws to each stud. Screws are 8" on center around the perimeter and 12" on center on the intermediate stud. The wallboard may be applied horizontally when attached to 3 5/8" studs and the horizontal joints are staggered with those on the opposite side. Screws for the horizontal application shall be 8" on center at vertical edges and 12" on center at intermediate studs.	—	—	—	2 7/8 <sup>d</sup>
	13-1.2	0.018" (No. 25 carbon sheet steel gage) channel-shaped studs 25" on center with two full-length layers of 1/2" Type X gypsum wallboard <sup>a</sup> applied vertically each side. First layer attached with 1"-long, No. 6 drywall screws, 8" on center around the perimeter and 12" on center on the intermediate stud. Second layer applied with vertical joints offset one stud space from first layer using 1 5/8" long, No. 6 drywall screws spaced 9" on center along vertical joints, 12" on center at intermediate studs and 24" on center along top and bottom runners.	—	—	3 5/8 <sup>d</sup>	—
	13-1.3	0.055" (No. 16 carbon sheet steel gage) approved nailable metal studs <sup>a</sup> 24" on center with full-length 5/8" Type X gypsum wallboard <sup>a</sup> applied vertically and nailed 7" on center with 6d cement-coated common nails. Approved metal fastener grips used with nails at vertical butt joints along studs.	—	—	—	4 7/8

 RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS a.o.p

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE <sup>b</sup> (inches)			
			4 hour	3 hour	2 hour	1 hour
14. Wood studs—interior partition with gypsum wallboard each side	14-1.1 <sup>h,m</sup>	2" × 4" wood studs 16" on center with two layers of 3/8" regular gypsum wallboard <sup>e</sup> each side, 4d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 8" on center first layer, 5d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 8" on center second layer with laminating compound between layers, joints staggered. First layer applied full length vertically, second layer applied horizontally or vertically	—	—	—	5
	14-1.2 <sup>l,m</sup>	2" × 4" wood studs 16" on center with two layers 1/2" regular gypsum wallboard <sup>e</sup> applied vertically or horizontally each side <sup>k</sup> , joints staggered. Nail base layer with 5d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 8" on center face layer with 8d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 8" on center.	—	—	—	5 1/2
	14-1.3 <sup>l,m</sup>	2" × 4" wood studs 24" on center with 5/8" Type X gypsum wallboard <sup>e</sup> applied vertically or horizontally nailed with 6d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 7" on center with end joints on nailing members. Stagger joints each side.	—	—	—	4 3/4
	14-1.4 <sup>l</sup>	2" × 4" fire-retardant-treated wood studs spaced 24" on center with one layer of 5/8" Type X gypsum wallboard <sup>e</sup> applied with face paper grain (long dimension) parallel to studs. Wallboard attached with 6d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 7" on center.	—	—	—	4 3/4 <sup>d</sup>
	14-1.5 <sup>l,m</sup>	2" × 4" wood studs 16" on center with two layers 5/8" Type X gypsum wallboard <sup>e</sup> each side. Base layers applied vertically and nailed with 6d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 9" on center. Face layer applied vertically or horizontally and nailed with 8d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 7" on center. For nail-adhesive application, base layers are nailed 6" on center. Face layers applied with coating of approved wallboard adhesive and nailed 12" on center.	—	—	6	—
	14-1.6 <sup>l</sup>	2" × 3" fire-retardant-treated wood studs spaced 24" on center with one layer of 5/8" Type X gypsum wallboard <sup>e</sup> applied with face paper grain (long dimension) at right angles to studs. Wallboard attached with 6d cement-coated box nails spaced 7" on center.	—	—	—	3 5/8 <sup>d</sup>
15. Exterior or interior walls	15-1.1 <sup>l,m</sup>	Exterior surface with 3/4" drop siding over 1/2" gypsum sheathing on 2" × 4" wood studs at 16" on center, interior surface treatment as required for 1-hour-rated exterior or interior 2" × 4" wood stud partitions. Gypsum sheathing nailed with 1 3/4" by No. 11 gage by 7/16" head galvanized nails at 8" on center. Siding nailed with 7d galvanized smooth box nails.	—	—	—	Varies
	15-1.2 <sup>h,m</sup>	2" × 4" wood studs 16" on center with metal lath and 3/4" cement plaster on each side. Lath attached with 6d common nails 7" on center driven to 1" minimum penetration and bent over. Plaster mix 1:4 for scratch coat and 1:5 for brown coat, by volume, cement to sand.	—	—	—	5 3/8
	15-1.3 <sup>l,m</sup>	2" × 4" wood studs 16" on center with 7/8" cement plaster (measured from the face of studs) on the exterior surface with interior surface treatment as required for interior wood stud partitions in this table. Plaster mix 1:4 for scratch coat and 1:5 for brown coat, by volume, cement to sand.	—	—	—	Varies
	15-1.4	3 5/8" No. 16 gage noncombustible studs 16" on center with 7/8" cement plaster (measured from the face of the studs) on the exterior surface with interior surface treatment as required for interior, nonbearing, noncombustible stud partitions in this table. Plaster mix 1:4 for scratch coat and 1:5 for brown coat, by volume, cement to sand.	—	—	—	Varies <sup>d</sup>

**RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS <sup>a,o,p</sup>**

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE <sup>b</sup> (inches)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls (continued)	15-1.5 <sup>m</sup>	2 1/4" x 3 3/4" clay face brick with cored holes over 1/2" gypsum sheathing on exterior surface of 2" x 4" wood studs at 16" on center and two layers 5/8" Type X gypsum wallboard <sup>d</sup> on interior surface. Sheathing placed horizontally or vertically with vertical joints over studs nailed 6" on center with 1 3/4" x No. 11 gage by 7/16" head galvanized nails. Inner layer of wallboard placed horizontally or vertically and nailed 8" on center with 6d cooler <sup>a</sup> or wallboard <sup>d</sup> nails. Outer layer of wallboard placed horizontally or vertically and nailed 8" on center with 8d cooler <sup>a</sup> or wallboard <sup>d</sup> nails. All joints staggered with vertical joints over studs. Outer layer joints taped and finished with compound. Nail heads covered with joint compound. 0.035 inch (No. 20 galvanized sheet gage) corrugated galvanized steel wall ties 3/4" by 6 3/8" attached to each stud with two 8d cooler <sup>a</sup> or wallboard <sup>d</sup> nails every sixth course of bricks.	—	—	10	—
	15-1.6 <sup>l,m</sup>	2" x 6" fire-retardant-treated wood studs 16" on center. Interior face has two layers of 5/8" Type X gypsum with the base layer placed vertically and attached with 6d box nails 12" on center. The face layer is placed horizontally and attached with 8d box nails 8" on center at joints and 12" on center elsewhere. The exterior face has a base layer of 5/8" Type X gypsum sheathing placed vertically with 6d box nails 8" on center at joints and 12" on center elsewhere. An approved building paper is next applied, followed by self-furred exterior lath attached with 2 1/2", No. 12 gage galvanized roofing nails with a 3/8" diameter head and spaced 6" on center along each stud. Cement plaster consisting of a 1/2" brown coat is then applied. The scratch coat is mixed in the proportion of 1:3 by weight, cement to sand with 10 pounds of hydrated lime and 3 pounds of approved additives or admixtures per sack of cement. The brown coat is mixed in the proportion of 1:4 by weight, cement to sand with the same amounts of hydrated lime and approved additives or admixtures used in the scratch coat.	—	—	8 1/4	—
	15-1.7 <sup>l,m</sup>	2" x 6" wood studs 16" on center. The exterior face has a layer of 5/8" Type X gypsum sheathing placed vertically with 6d box nails 8" on center at joints and 12" on center elsewhere. An approved building paper is next applied, followed by 1" by No. 18 gage self-furred exterior lath attached with 8d by 2 1/2" long galvanized roofing nails spaced 6" on center along each stud. Cement plaster consisting of a 1/2" scratch coat, a bonding agent and a 1/2" brown coat and a finish coat is then applied. The scratch coat is mixed in the proportion of 1:3 by weight, cement to sand with 10 pounds of hydrated lime and 3 pounds of approved additives or admixtures per sack of cement. The brown coat is mixed in the proportion of 1:4 by weight, cement to sand with the same amounts of hydrated lime and approved additives or admixtures used in the scratch coat. The interior is covered with 3/8" gypsum lath with 1" hexagonal mesh of 0.035 inch (No. 20 B.W. gage) woven wire lath furred out 5/16" and 1" perlite or vermiculite gypsum plaster. Lath nailed with 1 1/8" by No. 13 gage by 19/64" head plasterboard glued nails spaced 5" on center. Mesh attached by 1 3/4" by No. 12 gage by 3/8" head nails with 3/8" furrings, spaced 8" on center. The plaster mix shall not exceed 100 pounds of gypsum to 2 1/2 cubic feet of aggregate.	—	—	8 3/8	—
	15-1.8 <sup>l,m</sup>	2" x 6" wood studs 16" on center. The exterior face has a layer of 5/8" Type X gypsum sheathing placed vertically with 6d box nails 8" on center at joints and 12" on center elsewhere. An approved building paper is next applied, followed by 1 1/2" by No. 17 gage self-furred exterior lath attached with 8d by 2 1/2" long galvanized roofing nails spaced 6" on center along each stud. Cement plaster consisting of a 1/2" scratch coat, and a 1/2" brown coat is then applied. The plaster may be placed by machine. The scratch coat is mixed in the proportion of 1:4 by weight, plastic cement to sand. The brown coat is mixed in the proportion of 1:5 by weight, plastic cement to sand. The interior is covered with 3/8" gypsum lath with 1" hexagonal mesh of No. 20 gage woven wire lath furred out 5/16" and 1" perlite or vermiculite gypsum plaster. Lath nailed with 1 1/8" by No. 13 gage by 19/64" head plasterboard glued nails spaced 5" on center. Mesh attached by 1 3/4" by No. 12 gage by 3/8" head nails with 3/8" furrings, spaced 8" on center. The plaster mix shall not exceed 100 pounds of gypsum to 2 1/2 cubic feet of aggregate.	—	—	8 3/8	—

**RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS<sup>a,o,p</sup>**

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE <sup>b</sup> (inches)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls (continued)	15-1.16 <sup>q</sup>	2" × 6" (51 mm x 152 mm) wood studs at 16" centers with double top plates, single bottom plate; interior side covered with 5/8" Type X gypsum wallboard, 4' wide, applied horizontally or vertically with vertical joints over studs and fastened with 2 1/4" Type S drywall screws, spaced 12" on center, exterior side covered with 7/16" wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound; wood structural panels (oriented strand board) fastened with 6d common nails (bright) spaced 12" on center in the field and 6" on center along the panel edges. Cavity to be filled with 5 1/2" mineral wool insulation. Rating established from the gypsum-covered side only.	—	—	—	6 9/16
	15-1.17 <sup>q</sup>	2" × 6" wood studs at 24" centers with double top plates, single bottom plate; interior and exterior side covered with two layers of 5/8" Type X gypsum wallboard, 4' wide, applied horizontally with vertical joints over studs. Base layer fastened with 2 1/4" Type S drywall screws, spaced 24" on center, and face layer fastened with Type S drywall screws, spaced 8" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound. Cavity to be filled with 5 1/2" mineral wool insulation.	—	—	7 3/4	—
16. Exterior walls rated for fire resistance from the inside only in accordance with Section 704.5.	16-1.11 <sup>q</sup>	2" × 4" wood studs at 16" centers with double top plates, single bottom plate; interior side covered with 5/8" Type X gypsum wallboard, 4' wide, applied horizontally unblocked, and fastened with 2 1/4" Type S drywall screws, spaced 12" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound. Exterior covered with 3/8" wood structural panels (oriented strand board), applied vertically, horizontal joints blocked and fastened with 6d common nails (bright) — 12" on center in the field, and 6" on center panel edges. Cavity to be filled with 3 1/2" mineral wool insulation. Rating established for exposure from interior side only.	—	—	—	4 1/2

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm<sup>2</sup>, 1 cubic foot = 0.0283 m<sup>3</sup>.

- a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.
- b. Thickness shown for brick and clay tile are nominal thicknesses unless plastered, in which case thicknesses are net. Thickness shown for concrete masonry and clay masonry is equivalent thickness defined in Section 721.3.1 for concrete masonry and Section 721.4.1.1 for clay masonry. Where all cells are solid grouted or filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, the equivalent thickness shall be the thickness of the block or brick using specified dimensions as defined in Chapter 21. Equivalent thickness may also include the thickness of applied plaster and lath or gypsum wallboard, where specified.
- c. For units in which the net cross-sectional area of cored brick in any plane parallel to the surface containing the cores is at least 75 percent of the gross cross-sectional area measured in the same plane.
- d. Shall be used for nonbearing purposes only.
- e. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with a minimum of 1/16-inch gypsum veneer plaster.
- f. The fire-resistance time period for concrete masonry units meeting the equivalent thicknesses required for a 2-hour fire-resistance rating in Item 3, and having a thickness of not less than 7 7/8 inches is 4 hours when cores which are not grouted are filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, sand or slag having a maximum particle size of 3/8 inch.
- g. The fire-resistance rating of concrete masonry units composed of a combination of aggregate types or where plaster is applied directly to the concrete masonry shall be determined in accordance with ACI 216.1/TMS 216. Lightweight aggregates shall have a maximum combined density of 65 pounds per cubic foot.
- h. See also Note b. The equivalent thickness shall be permitted to include the thickness of cement plaster or 1.5 times the thickness of gypsum plaster applied in accordance with the requirements of Chapter 25.
- i. Concrete walls shall be reinforced with horizontal and vertical temperature reinforcement as required by Chapter 19.
- j. Studs are welded truss wire studs with 0.18 inch (No. 7 B.W. gage) flange wire and 0.18 inch (No. 7 B.W. gage) truss wires.
- k. Nailable metal studs consist of two channel studs spot welded back to back with a crimped web forming a nailing groove.
- l. Wood structural panels shall be permitted to be installed between the fire protection and the wood studs on either the interior or exterior side of the wood frame assemblies in this table, provided the length of the fasteners used to attach the fire protection are increased by an amount at least equal to the thickness of the wood structural panel.
- m. The design stress of studs shall be reduced to 78 percent of allowable  $F_c$  with the maximum not greater than 78 percent of the calculated stress with studs having a slenderness ratio  $l/d$  of 33.
- n. For properties of cooler or wallboard nails, see ASTM C 514, ASTM C 547 or ASTM F 1667.
- o. Generic fire-resistance ratings (those not designated as PROPRIETARY\* in the listing) in the GA 600 shall be accepted as if herein listed.
- p. NCMA TEK 5-8, shall be permitted for the design of fire walls.
- q. The design stress of studs shall be equal to a maximum of 100 percent of the allowable  $F_c$  calculated in accordance with Section 2306.

**TABLE 720.1(3)  
MINIMUM PROTECTION FOR FLOOR AND ROOF SYSTEMS<sup>a,9</sup>**

FLOOR OR ROOF CONSTRUCTION	ITEM NUMBER	CEILING CONSTRUCTION	THICKNESS OF FLOOR OR ROOF SLAB (inches)				MINIMUM THICKNESS OF CEILING (inches)			
			4 hour	3 hour	2 hour	1 hour	4 hour	3 hour	2 hour	1 hour
1. Siliceous aggregate concrete	1-1.1	Slab (no ceiling required). Minimum cover over nonprestressed reinforcement shall not be less than $\frac{3}{4}$ inch. <sup>b</sup>	7.0	6.2	5.0	3.5	—	—	—	—
2. Carbonate aggregate concrete	2-1.1		6.6	5.7	4.6	3.2	—	—	—	—

12. 1½" deep steel roof deck on steel-framing insulation of rigid board consisting of expanded perlite and fibers impregnated with integral asphalt waterproofing; density 9 to 12 pcf secured to metal roof deck by ½" wide ribbons of waterproof, cold-process liquid adhesive spaced 6" apart. Steel joist or light steel construction with metal roof deck, insulation, and Class A or B built-up roof covering. <sup>e</sup>	12-1.1	Gypsum-vermiculite plaster on metal lath wire tied at 6" intervals to ¾" furring channels spaced 12" on center and wire tied to 2" runner channels spaced 32" on center. Runners wire tied to bottom chord of steel joists.	—	—	1	—	—	7/8	—	
13. Double wood floor over wood joists spaced 16" on center. <sup>mn</sup>	13-1.1	Gypsum plaster over 3/8" Type X gypsum lath. Lath initially applied with not less than four 1½" by No. 13 gage by 19/64" head plasterboard blue nails per bearing. Continuous stripping over lath along all joist lines. Stripping consists of 3" wide strips of metal lath attached by 1½" by No. 11 gage by ½" head roofing nails spaced 6" on center. Alternate stripping consists of 3" wide 0.049" diameter wire stripping weighing 1 pound per square yard and attached by No.16 gage by 1½" by 3/4" crown width staples, spaced 4" on center. Where alternate stripping is used, the lath nailing may consist of two nails at each end and one nail at each intermediate bearing. Plaster mixed 1:2 by weight, gypsum-to-sand aggregate.	—	—	—	—	—	7/8	—	
	13-1.2	Cement or gypsum plaster on metal lath. Lath fastened with 1½" by No. 11 gage by 7/16" head barbed shank roofing nails spaced 5" on center. Plaster mixed 1:2 for scratch coat and 1:3 for brown coat, by weight, cement to sand aggregate.	—	—	—	—	—	5/8	—	
	13-1.3	Perlite or vermiculite gypsum plaster on metal lath secured to joists with 1½" by No. 11 gage by 7/16" head barbed shank roofing nails spaced 5" on center.	—	—	—	—	—	5/8	—	
	13-1.4	½" Type X gypsum wallboard <sup>c</sup> nailed to joists with 5d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 6" on center. End joints of wallboard centered on joists.	—	—	—	—	—	—	1/2	
14. Plywood stressed skin panels consisting of 3/8"-thick interior C-D (exterior glue) top stressed skin on 2" x 6" nominal (minimum) stringers. Adjacent panel edges joined with 8d common wire nails spaced 6" on center. Stringers spaced 12" maximum on center.	14-1.1	½"-thick wood fiberboard weighing 15 to 18 pounds per cubic foot installed with long dimension parallel to stringers or 3/8" C-D (exterior glue) plywood glued and/or nailed to stringers. Nailing to be with 5d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 12" on center. Second layer of ½" Type X gypsum wallboard <sup>c</sup> applied with long dimension perpendicular to joists and attached with 8d cooler <sup>a</sup> or wallboard <sup>a</sup> nails at 6" on center at end joints and 8" on center elsewhere. Wallboard joints staggered with respect to fiberboard joints.	—	—	—	—	—	—	1

21. Slab reinforced with mesh consisting of 0.042 inch (No. 19 B.W. gage) galvanized steel wire twisted together to form 2" hexagons with straight 0.065 inch (No. 16 B.W. gage) galvanized steel wire woven into mesh and spaced 3". Alternate slab reinforcement shall be permitted to consist of 4" x 8", 0.109/0.238-inch (No. 12/4 B.W. gage), or 2" x 2", 0.083/0.083-inch (No. 14/14 B.W. gage) welded wire fabric. Class A or B roof covering on top.	21-1.1	None	—	—	Varies	—	—	—	—	—
22. Wood joists, floor trusses and flat or pitched roof trusses spaced a maximum 24" o.c. with 1/2" wood structural panels with exterior glue applied at right angles to top of joist or top chord of trusses with 8d nails. The wood structural panel thickness shall not be less than nominal 1/2" less than required by Chapter 23.	22-1.1	Base layer 5/8" Type X gypsum wallboard applied at right angles to joist or truss 24" o.c. with 1 1/4" Type S or Type W drywall screws 24" o.c. Face layer 5/8" Type X gypsum wallboard or veneer base applied at right angles to joist or truss through base layer with 1 7/8" Type S or Type W drywall screws 12" o.c. at joints and intermediate joist or truss. Face layer Type G drywall screws placed 2" back on either side of face layer end joints, 12" o.c.	—	—	—	Varies	—	—	—	1 1/4
23. Steel joists, floor trusses and flat or pitched roof trusses spaced a maximum 24" o.c. with 1/2" wood structural panels with exterior glue applied at right angles to top of joist or top chord of trusses with No. 8 screws. The wood structural panel thickness shall not be less than nominal 1/2" nor less than required by Chapter 22.	23-1.1	Base layer 5/8" Type X gypsum board applied at right angles to steel framing 24" on center with 1" Type S drywall screws spaced 24" on center. Face layer 5/8" Type X gypsum board applied at right angles to steel framing attached through base layer with 1 5/8" Type S drywall screws 12" on center at end joints and intermediate joints and 1 1/2" Type G drywall screws 12 inches on center placed 2" back on either side of face layer end joints. Joints of the face layer are offset 24" from the joints of the base layer.	—	—	—	Varies	—	—	—	1 1/4
24. Wood I-joist (minimum joist depth 9 1/4" with a minimum flange depth of 1 5/16" and a minimum flange cross-sectional area of 2.3 square inches) at 24" o.c. spacing with 1 x 4 (nominal) wood furring strip spacer applied parallel to and covering the bottom of the bottom flange of each member, tacked in place. 2" mineral fiber insulation, 3.5 pcf (nominal) installed adjacent to the bottom flange of the I-joist and supported by the 1 x 4 furring strip spacer.	24-1.1	1/2" deep single leg resilient channel 16" on center (channels doubled at wallboard end joints), placed perpendicular to the furring strip and joist and attached to each joist by 1 1/8" Type S drywall screws. 5/8" Type C gypsum wallboard applied perpendicular to the channel with end joints staggered at least 4' and fastened with 1 1/8" Type S drywall screws spaced 7" on center. Wallboard joints to be taped and covered with joint compound.	—	—	—	Varies	—	—	—	—

(continued)

**Table 720.1(3) Notes.**

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m<sup>3</sup>,  
1 pound per square inch = 6.895 kPa = 1 pound per lineal foot = 1.4882 kg/m.

- a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.
- b. When the slab is in an unrestrained condition, minimum reinforcement cover shall not be less than 1<sup>5</sup>/<sub>8</sub> inches for 4-hour (siliceous aggregate only); 1<sup>1</sup>/<sub>4</sub> inches for 4- and 3-hour; 1 inch for 2-hour (siliceous aggregate only); and <sup>3</sup>/<sub>4</sub> inch for all other restrained and unrestrained conditions.
- c. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with a minimum of <sup>1</sup>/<sub>16</sub>-inch gypsum veneer plaster.
- d. Slab thickness over steel joists measured at the joists for metal lath form and at the top of the form for steel form units.
- e. (a) The maximum allowable stress level for H-Series joists shall not exceed 22,000 psi.  
(b) The allowable stress for K-Series joists shall not exceed 26,000 psi, the nominal depth of such joist shall not be less than 10 inches and the nominal joist weight shall not be less than 5 pounds per lineal foot.
- f. Cement plaster with 15 pounds of hydrated lime and 3 pounds of approved additives or admixtures per bag of cement.
- g. Gypsum wallboard ceilings attached to steel framing shall be permitted to be suspended with 1<sup>1</sup>/<sub>2</sub>-inch cold-formed carrying channels spaced 48 inches on center, which are suspended with No. 8 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire hangers spaced 48 inches on center. Cross-furring channels are tied to the carrying channels with No. 18 SWG galvanized wire (double strand) and spaced as required for direct attachment to the framing. This alternative is also applicable to those steel framing assemblies recognized under Note q.
- h. Six-inch hollow clay tile with 2-inch concrete slab above.
- i. Four-inch hollow clay tile with 1<sup>1</sup>/<sub>2</sub>-inch concrete slab above.
- j. Thickness measured to bottom of steel form units.
- k. Five-eighths inch of vermiculite gypsum plaster plus <sup>1</sup>/<sub>2</sub> inch of approved vermiculite acoustical plastic.
- l. Furring channels spaced 12 inches on center.
- m. Double wood floor shall be permitted to be either of the following:
  - (a) Subfloor of 1-inch nominal boarding, a layer of asbestos paper weighing not less than 14 pounds per 100 square feet and a layer of 1-inch nominal tongue-and-groove finished flooring; or
  - (b) Subfloor of 1-inch nominal tongue-and-groove boarding or <sup>15</sup>/<sub>32</sub>-inch wood structural panels with exterior glue and a layer of 1-inch nominal tongue-and-groove finished flooring or <sup>19</sup>/<sub>32</sub>-inch wood structural panel finish flooring or a layer of Type I Grade M-1 particleboard not less than <sup>5</sup>/<sub>8</sub>-inch thick.
- n. The ceiling shall be permitted to be omitted over unusable space, and flooring shall be permitted to be omitted where unusable space occurs above.
- o. For properties of cooler or wallboard nails, see ASTM C 514, ASTM C 547 or ASTM F 1667.
- p. Thickness measured on top of steel deck unit.
- q. Generic fire-resistance ratings (those not designated as PROPRIETARY\* in the listing) in the GA 600 shall be accepted as if herein listed.

**SECTION 721**  
**CALCULATED FIRE RESISTANCE**

**721.1 General.** *The provisions of this section contain procedures by which the fire resistance of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated fire resistance of concrete, concrete masonry, and clay masonry assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.1. The calculated fire resistance of steel assemblies shall be permitted in accordance with Chapter 5 of ASCE/SFPE 29.*

**721.1.1 Definitions.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**CERAMIC FIBER BLANKET.** *A mineral wool insulation material made of alumina-silica fibers and weighing 4 to 10 pounds per cubic foot (pcf) (64 to 160 kg/m<sup>3</sup>).*

**CONCRETE, CARBONATE AGGREGATE.** *Concrete made with aggregates consisting mainly of calcium or magnesium carbonate, such as limestone or dolomite, and containing 40 percent or less quartz, chert, or flint.*

**CONCRETE, CELLULAR.** *A lightweight insulating concrete made by mixing a preformed foam with portland cement slurry and having a dry unit weight of approximately 30 pcf (480 kg/m<sup>3</sup>).*

**CONCRETE, LIGHTWEIGHT AGGREGATE.** *Concrete made with aggregates of expanded clay, shale, slag or slate or sintered fly ash or any natural lightweight aggregate meeting ASTM C 330 and possessing equivalent fire-resistance properties and weighing 85 to 115 pcf (1360 to 1840 kg/m<sup>3</sup>).*

**CONCRETE, PERLITE.** *A lightweight insulating concrete having a dry unit weight of approximately 30 pcf (480 kg/m<sup>3</sup>) made with perlite concrete aggregate. Perlite aggregate is produced from a volcanic rock which, when heated, expands to form a glass-like material of cellular structure.*

**CONCRETE, SAND-LIGHTWEIGHT.** *Concrete made with a combination of expanded clay, shale, slag, slate, sintered fly ash, or any natural lightweight aggregate meeting ASTM C 330 and possessing equivalent fire-resistance properties and natural sand. Its unit weight is generally between 105 and 120 pcf (1680 and 1920 kg/m<sup>3</sup>).*

**CONCRETE, SILICEOUS AGGREGATE.** *Concrete made with normal-weight aggregates consisting*

mainly of silica or compounds other than calcium or magnesium carbonate, which contains more than 40-percent quartz, chert, or flint.

**CONCRETE, VERMICULITE.** A lightweight insulating concrete made with vermiculite concrete aggregate which is laminated micaceous material produced by expanding the ore at high temperatures. When added to a portland cement slurry the resulting concrete has a dry unit weight of approximately 30 pcf (480 kg/m<sup>3</sup>).

**GLASS FIBERBOARD.** Fibrous glass roof insulation consisting of inorganic glass fibers formed into rigid boards using a binder. The board has a top surface faced with asphalt and kraft reinforced with glass fiber.

**MINERAL BOARD.** A rigid felted thermal insulation board consisting of either felted mineral fiber or cellular beads of expanded aggregate formed into flat rectangular units.

**721.2 Concrete assemblies.** The provisions of this section contain procedures by which the fire-resistance ratings of concrete assemblies are established by calculations.

**721.2.1 Concrete walls.** Cast-in-place and precast concrete walls shall comply with Section 721.2.1.1. Multiwythe concrete walls shall comply with Section 721.2.1.2. Joints between precast panels shall comply with Section 721.2.1.3. Concrete walls with gypsum wallboard or plaster finish shall comply with Section 721.2.1.4.

**721.2.1.1 Cast-in-place or precast walls.** The minimum equivalent thickness of cast-in-place or precast concrete walls for fire-resistance ratings of 1 hour to 4 hours are shown in Table 721.2.1.1. For solid walls with flat vertical surfaces, the equivalent thickness is the same as the actual thickness. The values in Table 721.2.1.1 apply to plain, reinforced or prestressed concrete walls.

**TABLE 721.2.1.1**  
**MINIMUM EQUIVALENT THICKNESS OF CAST-IN-PLACE**  
**OR PRECAST CONCRETE WALLS, LOAD-BEARING**  
**OR NONLOAD-BEARING**

CONCRETE TYPE	MINIMUM SLAB THICKNESS (inches) FOR FIRE-RESISTANCE RATING OF				
	1-hour	1½-hour	2-hour	3-hour	4-hour
Siliceous	3.5	4.3	5.0	6.2	7.0
Carbonate	3.2	4.0	4.6	5.7	6.6
Sand- Lightweight	2.7	3.3	3.8	4.6	5.4
Lightweight	2.5	3.1	3.6	4.4	5.1

For SI: 1 inch = 25.4 mm.

**721.2.1.1.1 Hollow-core precast wall panels.** For hollow-core precast concrete wall panels in which the cores are of constant cross section throughout the length, calculation of the equivalent thickness by dividing the net cross-sectional area (the gross cross section minus the area of the cores) of the panel by its width shall be permitted.

**721.2.1.1.2 Core spaces filled.** Where all of the core spaces of hollow-core wall panels are filled with loose-fill material, such as expanded shale, clay, or slag, or vermiculite or perlite, the fire-resistance rating of the wall is the same as that of a solid wall of the same concrete type and of the same overall thickness.

**721.2.1.1.3 Tapered cross sections.** The thickness of panels with tapered cross sections shall be that determined at a distance  $2t$  or 6 inches (152 mm), whichever is less, from the point of minimum thickness, where  $t$  is the minimum thickness.

**721.2.1.1.4 Ribbed or undulating surfaces.** The equivalent thickness of panels with ribbed or undulating surfaces shall be determined by one of the following expressions:

*For  $s \geq 4t$ , the thickness to be used shall be  $t$*

*For  $s \leq 2t$ , the thickness to be used shall be  $t_e$*

*For  $4t > s > 2t$ , the thickness to be used shall be*

$$t + \left( \frac{4t}{s} - 1 \right) \left( t_e - t \right) \quad (\text{Equation 7-3})$$

where:

$s$  = Spacing of ribs or undulations.

$t$  = Minimum thickness.

$t_e$  = Equivalent thickness of the panel calculated as the net cross-sectional area of the panel divided by the width, in which the maximum thickness used in the calculation shall not exceed  $2t$ .

**721.2.1.2 Multiwythe walls.** *For walls that consist of two wythes of different types of concrete, the fire-resistance ratings shall be permitted to be determined from Figure 721.2.1.2.*

**TABLE 721.2.1.2(1)**  
**VALUES OF  $R_n^{0.59}$  FOR USE IN EQUATION 7-4**

For SI: 1 inch = 25.4 mm, 1 pound per cubic foot = 16.02 kg/m<sup>3</sup>.

a. Dry unit weight of 35 pcf or less and consisting of cellular, perlite or vermiculite concrete.

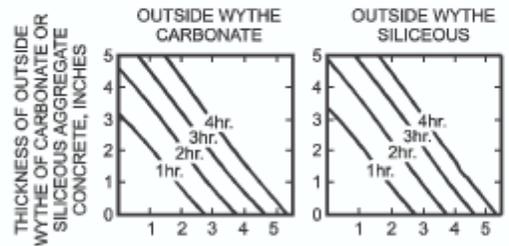

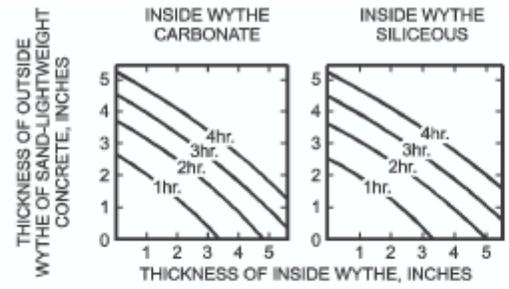

b. The  $R_n^{0.59}$  value for one ½" to 3 ½" airspace is 3.3. The  $R_n^{0.59}$  value for two ½" to 3 ½" airspaces is 6.7.

c. The fire-resistance rating for this thickness exceeds 4 hours.

**TABLE 721.2.1.2(2)**  
**FIRE-RESISTANCE RATINGS BASED ON  $R^{0.59}$**

$R^a$ , MINUTES	$R^{0.59}$
60	11.20
120	16.85
180	21.41
240	25.37

a. Based on Equation 7-4.

THICKNESS OF INSIDE WYTHE OF SAND-LIGHTWEIGHT CONCRETE, INCHES

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.1.2  
FIRE-RESISTANCE RATINGS OF  
TWO-WYTHE CONCRETE WALLS**

**721.2.1.2.1 Two or more wythes.** *The fire-resistance rating for wall panels consisting of two or more wythes shall be permitted to be determined by the formula:*

$$R = (R_1^{0.59} + R_2^{0.59} + \dots + R_n^{0.59})^{1.7} \quad \text{(Equation 7-4)}$$

where:

$R$  = The fire endurance of the assembly, minutes.

$R_1, R_2,$  and  $R_n$  = The fire endurences of the individual wythes, minutes. Values of  $R_n^{0.59}$  for use in Equation 7-4 are given in Table 721.2.1.2(1). Calculated fire-resistance ratings are shown in Table 721.2.1.2(2).

**721.2.1.2.2 Foam plastic insulation.** *The fire-resistance ratings of precast concrete wall panels consisting of a layer of foam plastic insulation sandwiched between two wythes of concrete shall be permitted to be determined by use of Equation 7-4. Foam plastic insulation with a total thickness of less than 1 inch (25 mm) shall be disregarded. The Rn value for thickness of foam plastic insulation of 1 inch (25 mm) or greater, for use in the calculation, is 5 minutes; therefore  $Rn^{0.59} = 2.5$ .*

**721.2.1.3 Joints between precast wall panels.** *Joints between precast concrete wall panels which are not insulated as required by this section shall be considered as openings in walls. Uninsulated joints shall be included in determining the percentage of openings permitted by Table 704.8. Where openings are not permitted or are required by this code to be protected, the provisions of this section shall be used to determine the amount of joint insulation required. Insulated joints shall not be considered openings for purposes of determining compliance with the allowable percentage of openings in Table 704.8.*

**721.2.1.3.1 Ceramic fiber joint protection.** *Figure 721.2.1.3.1 shows thicknesses of ceramic fiber blankets to be used to insulate joints between precast concrete wall panels for various panel thicknesses and for joint widths of  $\frac{3}{8}$  inch (9.5 mm) and 1 inch (25 mm) for fire-resistance ratings of 1 hour to 4 hours. For joint widths between  $\frac{3}{8}$  inch (9.5 mm) and 1 inch (25 mm), the thickness of ceramic fiber blanket is allowed to be determined by direct interpolation. Other tested and labeled materials are acceptable in place of ceramic fiber blankets.*

**721.2.1.4 Walls with gypsum wallboard or plaster finishes.** *The fire-resistance rating of cast-in-place or precast concrete walls with finishes of gypsum wallboard or plaster applied to one or both sides shall be permitted to be calculated in accordance with the provisions of this section.*

**TABLE 721.2.1.4(1)  
MULTIPLYING FACTOR FOR FINISHES ON NONFIRE-EXPOSED SIDE OF WALL**

TYPE OF FINISH APPLIED TO MASONRY WALL	TYPE OF AGGREGATE USED IN CONCRETE OR CONCRETE MASONRY			
	Concrete: siliceous or carbonate Masonry: siliceous or calcareous gravel	Concrete: sand lightweight concrete Masonry: limestone, cinders or unexpected slag	Concrete: lightweight concrete Masonry: expanded shale, clay or slate	Concrete: pumice, or expanded slag
Portland cement-sand plaster	1.00	0.75 <sup>a</sup>	0.75 <sup>a</sup>	0.50 <sup>a</sup>
Gypsum-sand plaster or gypsum wallboard	1.25	1.00	1.00	1.00
Gypsum-vermiculite or perlite plaster	1.75	1.50	1.50	1.25

For SI: 1 inch = 25.4 mm.

a. For portland cement-sand plaster  $\frac{5}{8}$  inch or less in thickness and applied directly to the masonry on the nonfire-exposed side of the wall, the multiplying factor shall be 1.00.

**TABLE 721.2.1.4(2)  
TIME ASSIGNED TO FINISH MATERIALS ON  
FIRE-EXPOSED SIDE OF WALL**

FINISH DESCRIPTION	TIME (minute)
Gypsum wallboard	
$\frac{3}{8}$ inch	10
$\frac{1}{2}$ inch	15
$\frac{5}{8}$ inch	20
2 layers of $\frac{3}{8}$ inch	25
1 layer $\frac{3}{8}$ inch, 1 layer $\frac{1}{2}$ inch	35
2 layers $\frac{1}{2}$ inch	40
Type X gypsum wallboard	
$\frac{1}{2}$ inch	25
$\frac{5}{8}$ inch	40
Portland cement-sand plaster applied directly to concrete masonry	See Note a
Portland cement-sand plaster on metal lath	
$\frac{3}{4}$ inch	20
$\frac{7}{8}$ inch	25
1 inch	30
Gypsum sand plaster on $\frac{3}{8}$ -inch gypsum lath	
$\frac{1}{2}$ inch	35
$\frac{5}{8}$ inch	40
$\frac{3}{4}$ inch	50
Gypsum sand plaster on metal lath	
$\frac{3}{4}$ inch	50
$\frac{7}{8}$ inch	60
1 inch	80

For SI: 1 inch = 25.4 mm.

a. The actual thickness of portland cement-sand plaster, provided it is  $\frac{5}{8}$  inch or less in thickness, shall be permitted to be included in determining the equivalent thickness of the masonry for use in Table 721.3.2.

**721.2.1.4.1 Nonfire-exposed side.** Where the finish of gypsum wallboard or plaster is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of the finish shall first be corrected by multiplying the actual thickness of the finish by the applicable factor determined from Table 721.2.1.4(1) based on the type of aggregate in the concrete. The corrected thickness of finish shall then be added to the actual or equivalent thickness of concrete and fire-resistance rating of the concrete and finish determined from Table 721.2.1.1, Figure 721.2.1.2 or Table 721.2.1.2(1).

**721.2.1.4.2 Fire-exposed side.** Where gypsum wallboard or plaster is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table 721.2.1.4(2) shall be added to the fire-resistance rating determined from Table 721.2.1.1 or Figure 721.2.1.2, or Table 721.2.1.2(1) for the concrete alone, or to the rating determined in Section 721.2.1.4.1 for the concrete and finish on the nonfire-exposed side.

**721.2.1.4.3 Nonsymmetrical assemblies.** For a wall having no finish on one side or different types or thicknesses of finish on each side, the calculation procedures of Sections 721.2.1.4.1 and 721.2.1.4.2 shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values.

**Exception:** For an exterior wall with more than 5 feet (1524 mm) of horizontal separation, the fire shall be assumed to occur on the interior side only.

**721.2.1.4.4 Minimum concrete fire-resistance rating.** Where finishes applied to one or both sides of a concrete wall contribute to the fire-resistance rating, the concrete alone shall provide not less than one-half of the total required fire-resistance rating. Additionally, the contribution to the fire resistance of the finish on the nonfire-exposed side of a load-bearing wall shall not exceed one-half the contribution of the concrete alone.

**721.2.1.4.5 Concrete finishes.** Finishes on concrete walls that are assumed to contribute to the total fire-resistance rating of the wall shall comply with the installation requirements of Section 721.3.2.5.

**721.2.2 Concrete floor and roof slabs.** Reinforced and prestressed floors and roofs shall comply with Section 721.2.2.1. Multicourse floors and roofs shall comply with Sections 721.2.2.2 and 721.2.2.3,

respectively.

**721.2.2.1 Reinforced and prestressed floors and roofs.** The minimum thicknesses of reinforced and prestressed concrete floor or roof slabs for fire-resistance ratings of 1 hour to 4 hours are shown in Table 721.2.2.1.

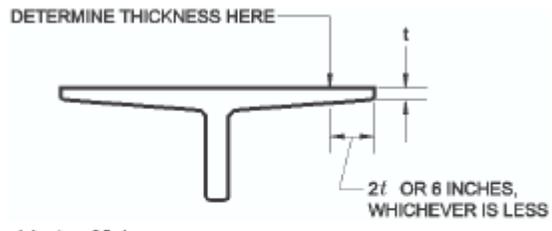

**TABLE 721.2.2.1  
MINIMUM SLAB THICKNESS (inches)**

CONCRETE TYPE	FIRE-RESISTANCE RATING (hour)				
	1	1½	2	3	4
Siliceous	3.5	4.3	5.0	6.2	7.0
Carbonate	3.2	4.0	4.6	5.7	6.6
Sand-lightweight	2.7	3.3	3.8	4.6	5.4
Lightweight	2.5	3.1	3.6	4.4	5.1

For SI: 1 inch = 25.4 mm.

**721.2.2.1.1 Hollow-core prestressed slabs.** For hollow-core prestressed concrete slabs in which the cores are of constant cross section throughout the length, the equivalent thickness shall be permitted to be obtained by dividing the net cross-sectional area of the slab including grout in the joints, by its width.

**721.2.2.1.2 Slabs with sloping soffits.** The thickness of slabs with sloping soffits (see Figure 721.2.2.1.2) shall be determined at a distance  $2t$  or 6 inches (152 mm), whichever is less, from the point of minimum thickness, where  $t$  is the minimum thickness.

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.1.2**  
**DETERMINATION OF SLAB THICKNESS**  
**FOR SLOPING SOFFITS**

**721.2.2.1.3 Slabs with ribbed soffits.** *The thickness of slabs with ribbed or undulating soffits (see Figure 721.2.2.1.3) shall be determined by one of the following expressions, whichever is applicable:*

*For  $s \geq 4t$ , the thickness to be used shall be  $t$*

*For  $s \leq 2t$ , the thickness to be used shall be  $te$*

*For  $4t > s > 2t$ , the thickness to be used shall be*

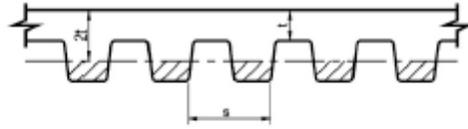

$$t + \left( \frac{4t}{s} - 1 \right) \left( t_e - t \right) \quad (\text{Equation 7-5})$$

where:

$s$  = Spacing of ribs or undulations.

$t$  = Minimum thickness.

$t_e$  = Equivalent thickness of the slab calculated as the net area of the slab divided by the width, in which the maximum thickness used in the calculation shall not exceed  $2t$ .

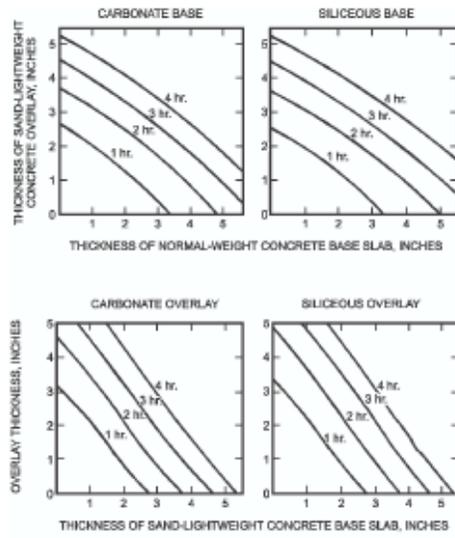

NEGLECT SHADED AREA IN CALCULATION OF EQUIVALENT THICKNESS

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.1.3**  
**SLABS WITH RIBBED OR UNDULATING SOFFITS**

**721.2.2.2 Multicourse floors.** *The fire-resistance ratings of floors that consist of a base slab of concrete with a topping (overlay) of a different type of concrete shall comply with Figure 721.2.2.2.*

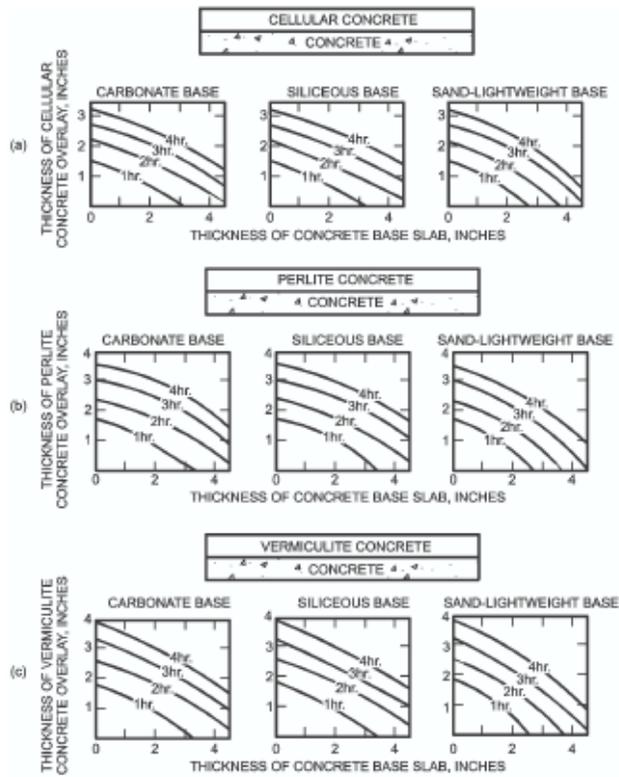

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.2**  
**FIRE-RESISTANCE RATINGS FOR TWO-COURSE**  
**CONCRETE FLOORS**

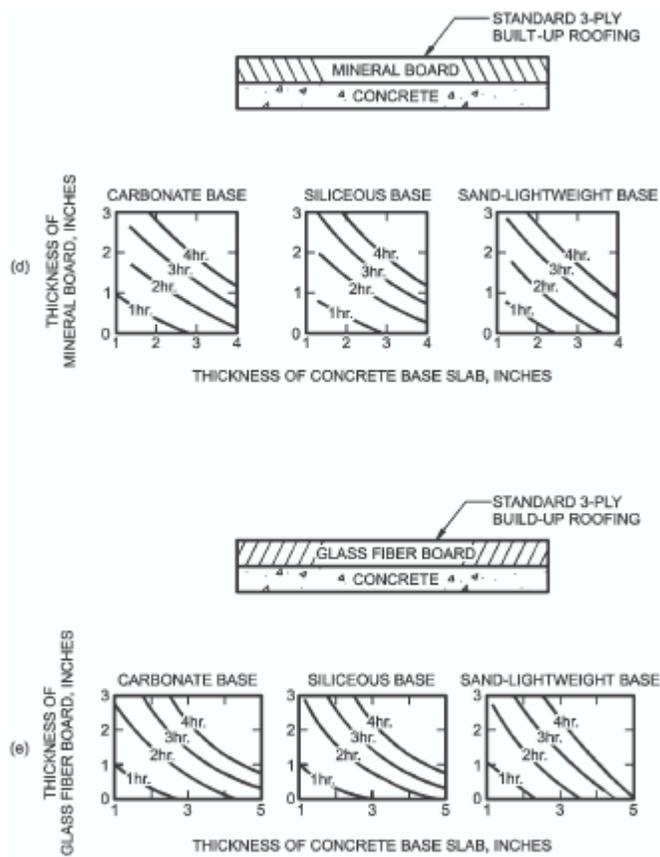

**721.2.2.3 Multicourse roofs.** *The fire-resistance ratings of roofs which consist of a base slab of concrete with a topping (overlay) of an insulating concrete or with an insulating board and built-up roofing shall comply with Figures 721.2.2.3(1) and 721.2.2.3(2).*

**721.2.2.3.1 Heat transfer.** *For the transfer of heat, three-ply built-up roofing contributes 10 minutes to the fire-resistance rating. The fire-resistance rating for concrete assemblies such as those shown in Figure 721.2.2.3(1) shall be increased by 10 minutes. This increase is not applicable to those shown in Figure 721.2.2.3(2).*

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.3(1)  
FIRE-RESISTANCE RATINGS FOR CONCRETE  
ROOF ASSEMBLIES**

For SI: 1 inch = 25.4 mm.

**FIGURE 721.2.2.3(2)**  
**FIRE-RESISTANCE RATINGS FOR CONCRETE**  
**ROOF ASSEMBLIES**

**721.2.2.4 Joints in precast slabs.** *Joints between adjacent precast concrete slabs need not be considered in calculating the slab thickness provided that a concrete topping at least 1 inch (25 mm) thick is used. Where no concrete topping is used, joints must be grouted to a depth of at least one-third the slab thickness at the joint, but not less than 1 inch (25 mm), or the joints must be made fire resistant by other approved methods.*

**721.2.3 Concrete cover over reinforcement.** *The minimum thickness of concrete cover over reinforcement in concrete slabs, reinforced beams and prestressed beams shall comply with this section.*

**721.2.3.1 Slab cover.** *The minimum thickness of concrete cover to the positive moment reinforcement shall comply with Table 721.2.3(1) for reinforced concrete and Table 721.2.3(2) for prestressed concrete. These tables are applicable for solid or hollow-core one-way or two-way slabs with flat undersurfaces. These tables are applicable to slabs that are either cast in place or precast. For precast prestressed concrete not covered elsewhere, the procedures contained in PCI MNL 124 shall be acceptable.*

**721.2.3.2 Reinforced beam cover.** *The minimum thickness of concrete cover to the positive moment reinforcement (bottom steel) for reinforced concrete beams is shown in Table 721.2.3(3) for fire-resistance ratings of 1 hour to 4 hours.*

**721.2.3.3 Prestressed beam cover.** *The minimum thickness of concrete cover to the positive moment prestressing tendons (bottom steel) for restrained and unrestrained prestressed concrete beams and stemmed units shall comply with the values shown in Tables 721.2.3(4) and 721.2.3(5) for fire-resistance ratings of 1 hour to 4 hours. Values in Table 721.2.3(4) apply to beams 8 inches (203 mm) or greater in width. Values in Table 721.2.3(5) apply to beams or stems of any width, provided the cross-section area is not less than 40 square inches (25 806 mm<sup>2</sup>). In case of differences between the values determined from Table 721.2.3(4) or 721.2.3(5), it is permitted to use the smaller value. The concrete cover shall be calculated in accordance with Section 721.2.3.3.1. The minimum concrete cover for nonprestressed reinforcement in prestressed concrete beams shall comply with Section 721.2.3.2.*

**721.2.3.3.1 Calculating concrete cover.** *The concrete cover for an individual tendon is the minimum thickness of concrete between the surface of the tendon and the fire-exposed surface of the beam, except that for ungrouped ducts, the assumed cover thickness is the minimum thickness of concrete between the surface of the duct and the fire-exposed surface of the beam. For beams in which two or more tendons are used, the cover is assumed to be the*

*average of the minimum cover of the individual tendons. For corner tendons (tendons equal distance from the bottom and side), the minimum cover used in the calculation shall be one-half the actual value. For stemmed members with two or more prestressing tendons located along the vertical centerline of the stem, the average cover shall be the distance from the bottom of the member to the centroid of the tendons. The actual cover for any individual tendon shall not be less than one-half the smaller value shown in Tables 721.2.3(4) and 721.2.3(5), or 1 inch (25 mm), whichever is greater.*

**TABLE 721.2.3(1)**  
**COVER THICKNESS FOR REINFORCED CONCRETE FLOOR OR ROOF SLABS (inches)**

CONCRETE AGGREGATE TYPE	FIRE-RESISTANCE RATING (hours)									
	Restrained					Unrestrained				
	1	1½	2	3	4	1	1½	2	3	4
Siliceous	¾	¾	¾	¾	¾	¾	¾	1	1¼	1⅝
Carbonate	¾	¾	¾	¾	¾	¾	¾	¾	1¼	1¼
Sand-lightweight or lightweight	¾	¾	¾	¾	¾	¾	¾	¾	1¼	1¼

For SI: 1 inch = 25.4 mm.

**TABLE 721.2.3(2)**  
**COVER THICKNESS FOR REINFORCED CONCRETE FLOOR OR ROOF SLABS (inches)**

CONCRETE AGGREGATE TYPE	FIRE-RESISTANCE RATING (hours)									
	Restrained					Unrestrained				
	1	1½	2	3	4	1	1½	2	3	4
Siliceous	¾	¾	¾	¾	¾	1⅛	1½	1¾	2¾	2¾
Carbonate	¾	¾	¾	¾	¾	1	1⅜	1⅝	2¼	2¼
Sand-lightweight or lightweight	¾	¾	¾	¾	¾	1	1⅜	1½	2	2¼

For SI: 1 inch = 25.4 mm.

**TABLE 721.2.3(3)**  
**MINIMUM COVER FOR MAIN REINFORCING BARS OF REINFORCED CONCRETE BEAMS<sup>c</sup>**  
**(APPLICABLE TO ALL TYPES OF STRUCTURAL CONCRETE)**

RESTRAINED OR UNRESTRAINED <sup>a</sup>	BEAM WIDTH <sup>b</sup> (inches)	FIRE-RESISTANCE RATING (hours)				
		1	1½	2	3	4
Restrained	5	¾	¾	¾	1 <sup>a</sup>	1¼ <sup>a</sup>
	7	¾	¾	¾	¾	¾
	≥ 10	¾	¾	¾	¾	¾
Unrestrained	5	¾	1	1¼	—	—
	7	¾	¾	¾	1¾	3
	≥ 10	¾	¾	¾	1	1¾

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of ¾ inch is adequate for ratings of 4 hours or less.
- For beam widths between the tabulated values, the minimum cover thickness can be determined by direct interpolation.
- The cover for an individual reinforcing bar is the minimum thickness of concrete between the surface of the bar and the fire-exposed surface of the beam. For beams in which several bars are used, the cover for corner bars used in the calculation shall be reduced to one-half of the actual value. The cover for an individual bar must be not less than one-half of the value given in Table 721.2.3(3) nor less than ¾ inch.

**TABLE 721.2.3(4)**  
**MINIMUM COVER FOR PRESTRESSED CONCRETE BEAMS 8 INCHES OR GREATER IN WIDTH**

RESTRAINED OR UNRESTRAINED <sup>a</sup>	CONCRETE AGGREGATE TYPE	BEAM WIDTH <sup>b</sup> (inches)	FIRE-RESISTANCE RATING (hours)				
			1	1½	2	3	4
Restrained	Carbonate or siliceous	8	1½	1½	1½	1¾ <sup>a</sup>	2½ <sup>a</sup>
	Carbonate or siliceous	≥ 12	1½	1½	1½	1½	1⅞ <sup>a</sup>
	Sand lightweight	8	1½	1½	1½	1½	2 <sup>a</sup>
	Sand lightweight	≥ 12	1½	1½	1½	1½	1⅝ <sup>a</sup>
Unrestrained	Carbonate or siliceous	8	1½	1¾	2½	5 <sup>c</sup>	—
	Carbonate or siliceous	≥ 12	1½	1½	1⅞ <sup>a</sup>	2½	3
	Sand lightweight	8	1½	1½	2	¾	—
	Sand lightweight	≥ 12	1½	1½	1⅝	2	2½

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of ¾ inch is adequate for 4-hour ratings or less.
- For beam widths between 8 inches and 12 inches, minimum cover thickness can be determined by direct interpolation.
- Not practical for 8-inch-wide beam but shown for purposes of interpolation.

**TABLE 721.2.3(5)**  
**MINIMUM COVER FOR PRESTRESSED CONCRETE BEAMS OF ALL WIDTHS**

RESTRAINED OR UNRESTRAINED <sup>a</sup>	CONCRETE AGGREGATE TYPE	BEAM AREA <sup>b</sup> A (square inches)	FIRE-RESISTANCE RATING (hours)				
			1	1½	2	3	4
Restrained	All	40 ≤ A ≤ 150	1½	1½	2	2½	—
	Carbonate or siliceous	150 < A ≤ 300	1½	1½	1½	1¾	2½
		300 < A	1½	1½	1½	1½	2
	Sand lightweight	150 < A	1½	1½	1½	1½	2
Unrestrained	All	40 ≤ A ≤ 150	2	2½	—	—	—
	Carbonate or siliceous	150 < A ≤ 300	1½	1¾	2½	—	—
		300 < A	1½	1½	2	3 <sup>c</sup>	4 <sup>c</sup>
	Sand lightweight	150 < A	1½	1½	2	3 <sup>c</sup>	4 <sup>c</sup>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. Tabulated values for restrained assemblies apply to beams spaced more than 4 feet on center. For restrained beams spaced 4 feet or less on center, minimum cover of ¾ inch is adequate for 4-hour ratings or less.
- b. The cross-sectional area of a stem is permitted to include a portion of the area in the flange, provided the width of the flange used in the calculation does not exceed three times the average width of the stem.
- c. U-shaped or hooped stirrups spaced not to exceed the depth of the member and having a minimum cover of 1 inch shall be provided.

**721.2.4 Concrete columns.** *Concrete columns shall comply with this section.*

**TABLE 721.2.4**  
**MINIMUM DIMENSION OF CONCRETE COLUMNS (inches)**

TYPES OF CONCRETE	FIRE-RESISTANCE RATING (hours)				
	1	1½	2 <sup>a</sup>	3 <sup>a</sup>	4 <sup>b</sup>
Siliceous	8	9	10	12	14
Carbonate	8	9	10	11	12
Sand-lightweight	8	8½	9	10½	12

For SI: 1 inch = 25 mm.

- a. The minimum dimension is permitted to be reduced to 8 inches for rectangular columns with two parallel sides at least 36 inches in length.
- b. The minimum dimension is permitted to be reduced to 10 inches for rectangular columns with two parallel sides at least 36 inches in length.

**721.2.4.1 Minimum size.** *The minimum overall dimensions of reinforced concrete columns for fire-resistance ratings of 1 hour to 4 hours shall comply with Table 721.2.4.*

**721.2.4.2 Minimum cover for R/C columns.** *The minimum thickness of concrete cover to the main longitudinal reinforcement in columns, regardless of the type of aggregate used in the concrete, shall not be less than 1 inch (25 mm) times the number of hours of required fire resistance or 2 inches (51 mm), whichever is less.*

**721.2.4.3 Columns built into walls.** *The minimum dimensions of Table 721.2.4 do not apply to a reinforced concrete column that is built into a concrete or masonry wall provided all of the following are met:*

- 1. The fire-resistance rating for the wall is equal to or greater than the required rating of the column;*
- 2. The main longitudinal reinforcing in the column has cover not less than that required by Section 721.2.4.2; and*
- 3. Openings in the wall are protected in accordance with Table 715.4.*

*Where openings in the wall are not protected as required by Section 715.4, the minimum dimension of columns required to have a fire-resistance rating of 3 hours or less shall be 8 inches (203 mm), and 10 inches (254 mm) for columns required to have a fire-resistance rating of 4 hours, regardless of the type of aggregate used in the concrete.*

**721.2.4.4 Precast cover units for steel columns.** *See Section 721.5.1.4.*

**721.3 Concrete masonry.** *The provisions of this section contain procedures by which the fire-resistance ratings of concrete masonry are established by calculations.*

**721.3.1 Equivalent thickness.** *The equivalent thickness of concrete masonry construction shall be determined in accordance with the provisions of this section.*

**721.3.1.1 Concrete masonry unit plus finishes.** *The equivalent thickness of concrete masonry assemblies,  $T_{ew}$ , shall be computed as the sum of the equivalent thickness of the concrete masonry unit,  $T_e$ , as determined by Section 721.3.1.2, 721.3.1.3, or 721.3.1.4, plus the equivalent thickness of finishes,  $T_{ef}$ , determined in accordance with Section 721.3.2:*

$$T_{ca} = T_e + T_f \quad (\text{Equation 7-6})$$

$T_e = V_n/LH =$  Equivalent thickness of concrete masonry unit (inch) (mm).

where:

$V_n$  = Net volume of masonry unit (inch<sup>3</sup>) (mm<sup>3</sup>).

$L$  = Specified length of masonry unit (inch) (mm).

$H$  = Specified height of masonry unit (inch) (mm).

**721.3.1.2 UngROUTed or partially grouted construction.**  $T_e$  shall be the value obtained for the concrete masonry unit determined in accordance with ASTM C 140.

**721.3.1.3 Solid grouted construction.** The equivalent thickness,  $T_e$ , of solid grouted concrete masonry units is the actual thickness of the unit.

**721.3.1.4 Airspaces and cells filled with loose-fill material.** The equivalent thickness of completely filled hollow concrete masonry is the actual thickness of the unit when loose-fill materials are: sand, pea gravel, crushed stone, or slag that meet ASTM C 33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders that comply with ASTM C 331; or perlite or vermiculite meeting the requirements of ASTM C 549 and ASTM C 516, respectively.

**721.3.2 Concrete masonry walls.** The fire-resistance rating of walls and partitions constructed of concrete masonry units shall be determined from Table 721.3.2. The rating shall be based on the equivalent thickness of the masonry and type of aggregate used.

**721.3.2.1 Finish on nonfire-exposed side.** Where plaster or gypsum wallboard is applied to the side of the wall not exposed to fire, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The thickness of gypsum wallboard or plaster shall be corrected by multiplying the actual thickness of the finish by applicable factor determined from Table 721.2.1.4(1). This corrected thickness of finish shall be added to the equivalent thickness of masonry and the fire-resistance rating of the masonry and finish determined from Table 721.3.2.

**721.3.2.2 Finish on fire-exposed side.** Where plaster or gypsum wallboard is applied to the fire-exposed side of the wall, the contribution of the finish to the total fire-resistance rating shall be determined as follows: The time assigned to the finish as established by Table 721.2.1.4(2) shall be added to the fire-resistance rating determined in Section 721.3.2 for the masonry alone, or in Section 721.3.2.1 for the masonry and finish on the nonfire-exposed side.

**721.3.2.3 Nonsymmetrical assemblies.** For a wall having no finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this section shall be performed twice, assuming either side of the wall to be the fire-exposed side. The fire-resistance rating of the wall shall not exceed the lower of the two values calculated.

**Exception:** For exterior walls with more than 5 feet (1524 mm) of horizontal separation, the fire shall be assumed to occur on the interior side only.

**721.3.2.4 Minimum concrete masonry fire-resistance rating.** *Where the finish applied to a concrete masonry wall contributes to its fire-resistance rating, the masonry alone shall provide not less than one-half the total required fire-resistance rating.*

**721.3.2.5 Attachment of finishes.** *Installation of finishes shall be as follows:*

- 1. Gypsum wallboard and gypsum lath applied to concrete masonry or concrete walls shall be secured to wood or steel furring members spaced not more than 16 inches (406 mm) on center (o.c.).*
- 2. Gypsum wallboard shall be installed with the long dimension parallel to the furring members and shall have all joints finished.*
- 3. Other aspects of the installation of finishes shall comply with the applicable provisions of Chapters 7 and 25.*

**TABLE 721.3.2  
MINIMUM EQUIVALENT THICKNESS (inches) OF BEARING OR NONBEARING CONCRETE MASONRY WALLS<sup>a,b,c,d</sup>**

TYPE OF AGGREGATE	FIRE-RESISTANCE RATING (hours)														
	1/2	3/4	1	1 1/4	1 1/2	1 3/4	2	2 1/4	2 1/2	2 3/4	3	3 1/4	3 1/2	3 3/4	4
Pumice or expanded slag	1.5	1.9	2.1	2.5	2.7	3.0	3.2	3.4	3.6	3.8	4.0	4.2	4.4	4.5	4.7
Expanded shale, clay or slate	1.8	2.2	2.6	2.9	3.3	3.4	3.6	3.8	4.0	4.2	4.4	4.6	4.8	4.9	5.1
Limestone, cinders or unexpanded slag	1.9	2.3	2.7	3.1	3.4	3.7	4.0	4.3	4.5	4.8	5.0	5.2	5.5	5.7	5.9
Calcareous or siliceous gravel	2.0	2.4	2.8	3.2	3.6	3.9	4.2	4.5	4.8	5.0	5.3	5.5	5.8	6.0	6.2

For SI: 1 inch = 25.4 mm.

- a. Values between those shown in the table can be determined by direct interpolation.
- b. Where combustible members are framed into the wall, the thickness of solid material between the end of each member and the opposite face of the wall, or between members set in from opposite sides, shall not be less than 93 percent of the thickness shown in the table.
- c. Requirements of ASTM C 55, ASTM C 73 or ASTM C 90 shall apply.
- d. Minimum required equivalent thickness corresponding to the hourly fire-resistance rating for units with a combination of aggregate shall be determined by linear interpolation based on the percent by volume of each aggregate used in manufacture.

**721.3.3 Multiwythe masonry walls.** *The fire-resistance rating of wall assemblies constructed of multiple wythes of masonry materials shall be permitted to be based on the fire-resistance rating period of each wythe and the continuous airspace between each wythe in accordance with the following formula:*

$$R_A = (R_1^{0.59} + R_2^{0.59} + \dots + R_n^{0.59} + A_1 + A_2 + \dots + A_n)^{1.7}$$

(Equation 7-7)

where:

$R_A$  = Fire endurance rating of the assembly (hours).

$R_1, R_2, \dots, R_n$  = Fire endurance rating of wythes for 1, 2,  $n$  (hours), respectively.

$A_1, A_2, \dots, A_n$  = 0.30, factor for each continuous airspace for 1, 2,  $\dots, n$ , respectively, having a depth of  $1/2$  inch (12.7 mm) or more between wythes.

**721.3.4 Concrete masonry lintels.** *Fire-resistance ratings for concrete masonry lintels shall be determined based upon the nominal thickness of the lintel and the minimum thickness of concrete masonry or concrete, or any combination thereof, covering the main reinforcing bars, as determined according to Table 721.3.4, or by approved alternate methods.*

**TABLE 721.3.4

For SI: 1 inch = 25.4 mm.

**721.4 Clay brick and tile masonry.** *The provisions of this section contain procedures by which the fire-resistance ratings of clay brick and tile masonry are established by calculations.*

**721.4.1 Masonry walls.** *The fire-resistance rating of masonry walls shall be based upon the equivalent thickness as calculated in accordance with this section. The calculation shall take into account finishes applied to the wall and airspaces between wythes in multiwythe construction.*

**721.4.1.1 Equivalent thickness.** *The fire-resistance ratings of walls or partitions constructed of solid or hollow clay masonry units shall be determined from Table 721.4.1(1) or 721.4.1(2). The equivalent thickness of the clay masonry unit shall be determined by Equation 7-8 when using Table 721.4.1(1). The fire-resistance rating determined from Table 721.4.1(1) shall be permitted to be used in the calculated fire-resistance rating procedure in Section 721.4.2.*

**721.4.1.1.1 Hollow clay units.** *The equivalent thickness,  $T_e$ , shall be the value obtained for hollow clay units as determined in accordance with ASTM C 67.*

$$T_e = V_n / LH \quad \text{(Equation 7-8)}$$

where:

$T_e$  = The equivalent thickness of the clay masonry unit (inches).

$V_n$  = The net volume of the clay masonry unit (inch<sup>3</sup>).

$L$  = The specified length of the clay masonry unit (inches).

$H$  = The specified height of the clay masonry unit (inches).

**721.4.1.1.2 Solid grouted clay units.** *The equivalent thickness of solid grouted clay masonry units shall be taken as the actual thickness of the units.*

**721.4.1.1.3 Units with filled cores.** *The equivalent thickness of the hollow clay masonry units is the actual thickness of the unit when completely filled with loose-fill materials of: sand, pea gravel, crushed stone, or slag that meet ASTM C 33 requirements; pumice, scoria, expanded shale, expanded clay, expanded slate, expanded slag, expanded fly ash, or cinders in compliance with ASTM C 331; or perlite or vermiculite meeting the requirements of ASTM C 549 and ASTM C 516, respectively.*

**721.4.1.2 Plaster finishes.** *Where plaster is applied to the wall, the total fire-resistance rating shall be determined by the formula:*

$$R = (R_n^{0.59} + pl) 1.7 \quad \text{(Equation 7-9)}$$

where:

$R$  = The fire endurance of the assembly (hours).

$R_n$  = The fire endurance of the individual wall (hours).

$pl$  = Coefficient for thickness of plaster.

Values for  $R_n^{0.59}$  for use in Equation 7-9 are given in Table 721.4.1(3). Coefficients for thickness of plaster shall be selected from Table 721.4.1(4) based on the actual thickness of plaster applied to the wall or partition and whether one or two sides of the wall are plastered.

**721.4.1.3 Multiwythe walls with airspace.** *Where a continuous airspace separates multiple wythes of the wall or partition, the total fire-resistance rating shall be determined by the formula:*

$$R = (R_1^{0.59} + R_2^{0.59} + \dots + R_n^{0.59} + as)^{1.7} \quad \text{(Equation 7-10)}$$

where:

$R$  = The fire endurance of the assembly (hours).

$R_1, R_2$  and  $R_n$  = The fire endurance of the individual wythes (hours).

$as$  = Coefficient for continuous airspace.

Values for  $R_n^{0.59}$  for use in Equation 7-10 are given in Table 721.4.1(3). The coefficient for each continuous airspace of  $1/2$  inch to  $3 1/2$  inches (12.7 to 89 mm) separating two individual wythes shall be 0.3.

**721.4.1.4 Nonsymmetrical assemblies.** *For a wall having no finish on one side or having different types or thicknesses of finish on each side, the calculation procedures of this section shall be performed twice, assuming either side to be the fire-exposed side of the wall. The fire resistance of the wall shall not exceed the lower of the two values determined.*

**Exception:** *For exterior walls with more than 5 feet (1524 mm) of horizontal separation, the fire shall be assumed to occur on the interior side only.*

**TABLE 721.4.1(1)  
FIRE-RESISTANCE PERIODS OF CLAY MASONRY WALLS**

MATERIAL TYPE	MINIMUM REQUIRED EQUIVALENT THICKNESS FOR FIRE RESISTANCE <sup>a,b,c</sup> (inches)			
	1 hour	2 hour	3 hour	4 hour
Solid brick of clay or shale <sup>d</sup>	2.7	3.8	4.9	6.0
Hollow brick or tile of clay or shale, unfilled	2.3	3.4	4.3	5.0
Hollow brick or tile of clay or shale, grouted or filled with materials specified in Section 721.4.1.1.3	3.0	4.4	5.5	6.6

For SI: 1 inch = 25.4 mm.

a. Equivalent thickness as determined from Section 721.4.1.1.

b. Calculated fire resistance between the hourly increments listed shall be determined by linear interpolation.

c. Where combustible members are framed in the wall, the thickness of solid material between the end of each member and the opposite face of the wall, or between members set in from opposite sides, shall not be less than 93 percent of the thickness shown.

d. For units in which the net cross-sectional area of cored brick in any plane parallel to the surface containing the cores is at least 75 percent of the gross cross-sectional area measured in the same plane.

**TABLE 721.4.1(2)  
FIRE-RESISTANCE RATINGS FOR BEARING STEEL FRAME  
BRICK VENEER WALLS OR PARTITIONS**

WALL OR PARTITION ASSEMBLY	PLASTER SIDE EXPOSED (hours)	BRICK FACED SIDE EXPOSED (hours)
Outside facing of steel studs: $\frac{1}{2}$ " wood fiberboard sheathing next to studs, $\frac{3}{4}$ " airspace formed with $\frac{3}{4}$ " $\times$ $1\frac{5}{8}$ " wood strips placed over the fiberboard and secured to the studs; metal or wire lath nailed to such strips, $3\frac{3}{4}$ " brick veneer held in place by filling $\frac{3}{4}$ " airspace between the brick and lath with mortar. Inside facing of studs: $\frac{3}{4}$ " unsanded gypsum plaster on metal or wire lath attached to $\frac{5}{16}$ " wood strips secured to edges of the studs.	1.5	4
Outside facing of steel studs: 1" insulation board sheathing attached to studs, 1" airspace, and $3\frac{3}{4}$ " brick veneer attached to steel frame with metal ties every 5th course. Inside facing of studs: $\frac{7}{8}$ " sanded gypsum plaster (1:2 mix) applied on metal or wire lath attached directly to the studs.	1.5	4
Same as above except use $\frac{7}{8}$ " vermiculite—gypsum plaster or 1" sanded gypsum plaster (1:2 mix) applied to metal or wire.	2	4
Outside facing of steel studs: $\frac{1}{2}$ " gypsum sheathing board, attached to studs, and $3\frac{3}{4}$ " brick veneer attached to steel frame with metal ties every 5th course. Inside facing of studs: $\frac{1}{2}$ " sanded gypsum plaster (1:2 mix) applied to $\frac{1}{2}$ " perforated gypsum lath securely attached to studs and having strips of metal lath 3 inches wide applied to all horizontal joints of gypsum lath.	2	4

For SI: 1 inch = 25.4 mm.

8	$1\frac{1}{2}$	$1\frac{1}{2}$	$1\frac{3}{4}$	3
10 or more	$1\frac{1}{2}$	$1\frac{1}{2}$	$1\frac{1}{2}$	$1\frac{3}{4}$

For SI: 1 inch = 25.4 mm.

NP = Not permitted.

**TABLE 721.4.1(6)**  
**REINFORCED CLAY MASONRY COLUMNS**

COLUMN SIZE	FIRE-RESISTANCE RATING (hour)			
	1	2	3	4
Minimum column dimension (inches)	8	10	12	14

For SI: 1 inch = 25.4 mm.

**721.4.2 Multiwythe walls.** *The fire-resistance rating for walls or partitions consisting of two or more dissimilar wythes shall be permitted to be determined by the formula:*

$$R = (R_1^{0.59} + R_2^{0.59} + \dots + R_n^{0.59})^{1.7} \quad \text{(Equation 7-11)}$$

where:

$R$  = The fire endurance of the assembly (hours).

$R_1, R_2$  and  $R_n$  = The fire endurance of the individual wythes (hours).

Values for  $R_n^{0.59}$  for use in Equation 7-11 are given in Table 721.4.1(3).

**721.4.2.1 Multiwythe walls of different material.** For walls that consist of two or more wythes of different materials (concrete or concrete masonry units) in combination with clay masonry units, the fire-resistance rating of the different materials shall be permitted to be determined from Table 721.2.1.1 for concrete; Table 721.3.2 for concrete masonry units or Table 721.4.1(1) or 721.4.1(2) for clay and tile masonry units.

**721.4.3 Reinforced clay masonry lintels.** Fire-resistance ratings for clay masonry lintels shall be determined based on the nominal width of the lintel and the minimum covering for the longitudinal reinforcement in accordance with Table 721.4.1(5).

**721.4.4 Reinforced clay masonry columns.** The fire-resistance ratings shall be determined based on the last plan dimension of the column in accordance with Table 721.4.1(6). The minimum cover for longitudinal reinforcement shall be 2 inches (51 mm).

**721.5 Steel assemblies.** The provisions of this section contain procedures by which the fire-resistance ratings of steel assemblies are established by calculations.

**721.5.1 Structural steel columns.** The fire-resistance ratings of steel columns shall be based on the size of the element and the type of protection provided in accordance with this section.

**721.5.1.1 General.** These procedures establish a basis for determining the fire resistance of column assemblies as a function of the thickness of fire-resistant material and, the weight,  $W$ , and heated perimeter,  $D$ , of steel columns. As used in these sections,  $W$  is the average weight of a structural steel column in pounds per linear foot. The heated perimeter,  $D$ , is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 721.5.1(1).

**721.5.1.1.1 Nonload-bearing protection.** The application of these procedures shall be limited to column assemblies in which the fire-resistant material is not designed to carry any of the load acting on the column.

**721.5.1.1.2 Embedments.** In the absence of substantiating fire-endurance test results, ducts, conduit, piping, and similar mechanical, electrical, and plumbing installations shall not be embedded in any required fire-resistant materials.

**721.5.1.1.3 Weight-to-perimeter ratio.** Table 721.5.1(1) contains weight-to-heated-perimeter ratios ( $W/D$ ) for both contour and box fire-resistant profiles, for the wide flange shapes most often used as columns. For different fire-resistant protection profiles or column cross

*sections, the weight-to-heated-perimeter ratios (W/D) shall be determined in accordance with the definitions given in this section.*

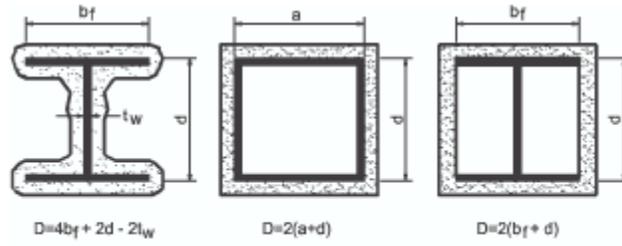

**721.5.1.2 Gypsum wallboard protection.** *The fire resistance of structural steel columns with weight to-heated-perimeter ratios (W/D) less than or equal to 3.65 and which are protected with Type X gypsum wallboard shall be permitted to be determined from the following expression:*

$$R = 130 \left[ \frac{h(W/D)}{2} \right]^{0.75} \quad (\text{Equation 7-12})$$

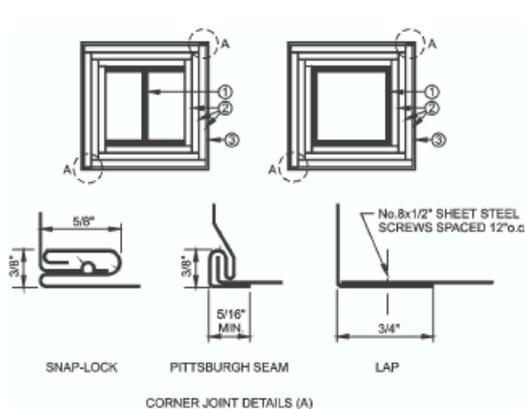

where:

- $R$  = Fire resistance (minutes).
- $h$  = Total thickness of gypsum wallboard (inches).
- $D$  = Heated perimeter of the structural steel column (inches).
- $W'$  = Total weight of the structural steel column and gypsum wallboard protection (pounds per linear foot).
- $W'$  =  $W + 50hD/144$ .

**721.5.1.2.1 Attachment.** *The gypsum wallboard shall be supported as illustrated in either Figure 721.5.1(2) for fire-resistance ratings of 4 hours or less, or Figure 721.5.1(3) for fire-resistance ratings of 3 hours or less.*

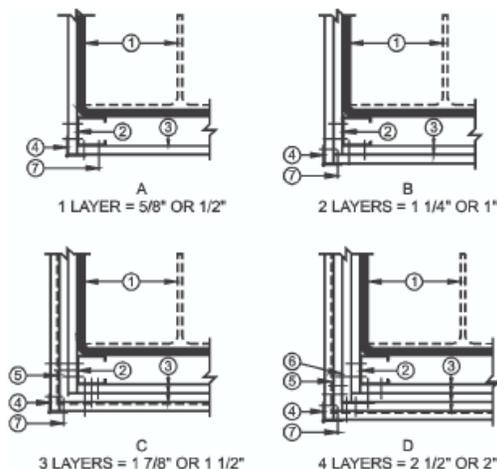

**FIGURE 721.5.1(1)**  
**DETERMINATION OF THE HEATED PERIMETER**  
**OF STRUCTURAL STEEL COLUMNS**

**FIGURE 721.5.1(2)**  
**GYPSON WALLBOARD PROTECTED STRUCTURAL STEEL**  
**COLUMNS WITH SHEET STEEL COLUMN COVERS**

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

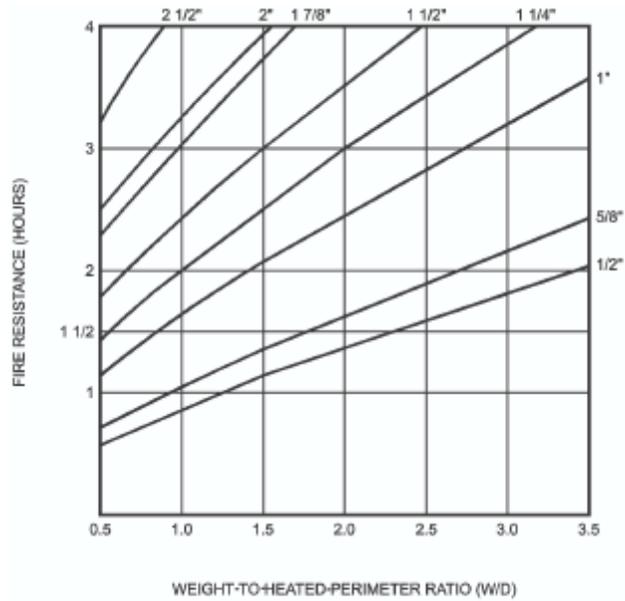

1. Structural steel column, either wide flange or tubular shapes.
2. Type X gypsum wallboard in accordance with ASTM C 36. For single-layer applications, the wallboard shall be applied vertically with no horizontal joints. For multiple-layer applications, horizontal joints are permitted at a minimum spacing of 8 feet, provided that the joints in successive layers are staggered at least 12 inches. The total required thickness of wallboard shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (*W/D*) of the column. For fire-resistance ratings of 2 hours or less, one of the required layers of gypsum wallboard may be applied to the exterior of the sheet steel column covers with 1-inch long Type S screws spaced 1 inch from the wallboard edge and 8 inches on center. For such installations, 0.0149-inch minimum thickness galvanized steel corner beads with 1 1/2-inch legs shall be attached to the wallboard with Type S screws spaced 12 inches on center.
3. For fire-resistance ratings of 3 hours or less, the column covers shall be fabricated from 0.0239-inch minimum thickness galvanized or stainless steel. For 4-hour fire-resistance ratings, the column covers shall be fabricated from 0.0239-inch minimum thickness stainless steel. The column covers shall be erected with the Snap Lock or Pittsburgh joint details. For fire-resistance ratings of 2 hours or less, column covers fabricated from 0.0269-inch minimum thickness galvanized or stainless steel shall be permitted to be erected with lap joints. The lap joints shall be permitted to be located anywhere around the perimeter of the column cover. The lap joints shall be secured with 1/2-inch-long No. 8 sheet metal screws spaced 12 inches on center. The column covers shall be provided with a minimum expansion clearance of 1/8 inch per linear foot between the ends of the cover and any restraining construction.

**FIGURE 721.5.1(3)**  
**GYPSON WALLBOARD PROTECTED STRUCTURAL STEEL**  
**COLUMNS WITH STEEL STUD/SCREW ATTACHMENT SYSTEM**

For SI: 1 inch = 25.4 mm, 1 foot = 305 mm.

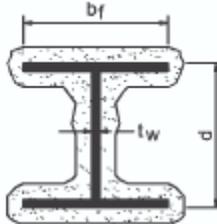

1. Structural steel column, either wide flange or tubular shapes.
2. 1 1/8-inch deep studs fabricated from 0.0179-inch minimum thickness galvanized steel with 1 1/16 or 1 7/16-inch legs. The length of the steel studs shall be 1/2 inch less than the height of the assembly.
3. Type X gypsum wallboard in accordance with ASTM C 36. For single-layer applications, the wallboard shall be applied vertically with no horizontal joints. For multiple-layer applications, horizontal joints are permitted at a minimum spacing of 8 feet, provided that the joints in successive layers are staggered at least 12 inches. The total required thickness of wallboard shall be determined on the basis of the specified fire-resistance rating and the weight-to-heated-perimeter ratio (*W/D*) of the column.
4. Galvanized 0.0149-inch minimum thickness steel corner beads with 1 1/2-inch legs attached to the wallboard with 1-inch-long Type S screws spaced 12 inches on center.
5. No. 18 SWG steel tie wires spaced 24 inches on center.
6. Sheet metal angles with 2-inch legs fabricated from 0.0221-inch minimum thickness galvanized steel.
7. Type S screws, 1 inch long, shall be used for attaching the first layer of wallboard to the steel studs and the third layer to the sheet metal angles at 24 inches on center. Type S screws 1 3/4-inch long shall be used for attaching the second layer of wallboard to the steel studs and the fourth layer to the sheet metal angles at 12 inches on center. Type S screws 2 1/4 inches long shall be used for attaching the third layer of wallboard to the steel studs at 12 inches on center.

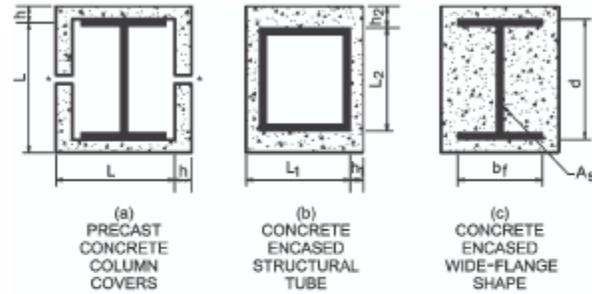

For SI: 1 inch = 25.4 mm, 1 pound per linear foot/inch = 0.059 kg/m/mm.

**FIGURE 721.5.1(4)**  
**FIRE RESISTANCE OF STRUCTURAL STEEL COLUMNS**  
**PROTECTED WITH VARIOUS THICKNESSES OF**  
**TYPE X GYPSUM WALLBOARD**

- a. The W/D ratios for typical wide flange columns are listed in Table 721.5.1(1). For other column shapes, the W/D ratios shall be determined in accordance with Section 720.5.1.1.

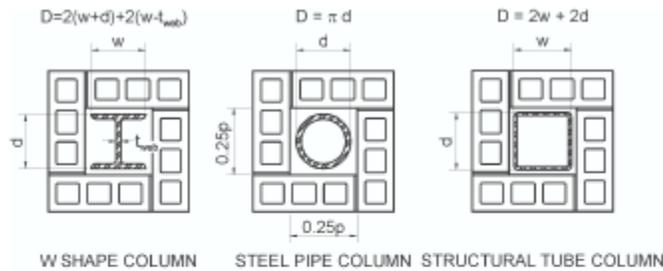

**FIGURE 721.5.1(5)**  
**WIDE FLANGE STRUCTURAL STEEL COLUMNS WITH**  
**SPRAY-APPLIED FIRE-RESISTANT MATERIALS**

**FIGURE 721.5.1(6)**  
**CONCRETE PROTECTED STRUCTURAL STEEL COLUMNS<sup>a</sup>**

- When the inside perimeter of the concrete protection is not square,  $L$  shall be taken as the average of  $L_1$  and  $L_2$ . When the thickness of concrete cover is not constant,  $h$  shall be taken as the average of  $h_1$  and  $h_2$ .
- Joints shall be protected with a minimum 1 inch thickness of ceramic fiber blanket but in no case less than one-half the thickness of the column cover (see Section 720.2.1.3).

For SI: 1 inch = 25.4 mm.

**FIGURE 721.5.1(7)**  
**CONCRETE OR CLAY MASONRY PROTECTED STRUCTURAL STEEL COLUMNS**

- $d$  = Depth of a wide flange column, outside diameter of pipe column, or outside dimension of structural tubing column (inches).
- $t_{web}$  = Thickness of web of wide flange column (inches).
- $w$  = Width of flange of wide flange column (inches).

**721.5.1.2.2 Gypsum wallboard equivalent to concrete.** *The determination of the fire resistance of structural steel columns from Figure 721.5.1(4) is permitted for various thicknesses of gypsum wallboard as a function of the weight-to-heated-perimeter ratio (W/D) of the column. For structural steel columns with weight-to-heated-perimeter ratios (W/D) greater than 3.65, the thickness of gypsum wallboard required for specified fire-resistance ratings shall be the same as the thickness determined for aW14 x 233 wide flange shape.*

**721.5.1.3 Spray-applied fire-resistant materials.** *The fire resistance of wide-flange structural steel columns protected with spray-applied fire-resistant materials, as illustrated in Figure 721.5.1(5), shall be permitted to be determined from the following expression:*

$$R = [C_1 (W / D) + C_2] h \quad \text{(Equation 7-13)}$$

where:

- $R$  = Fire resistance (minutes).
- $h$  = Thickness of spray-applied fire-resistant material (inches).
- $D$  = Heated perimeter of the structural steel column (inches).
- $C_1$  and  $C_2$  = Material-dependent constants.
- $W$  = Weight of structural steel column (pounds per linear foot).

**721.5.1.3.1 Material-dependent constants.** *The material-dependent constants, C1 and C2, shall be determined for specific fire-resistant materials on the basis of standard fire endurance tests in accordance with Section 703.2. Unless evidence is submitted to the commissioner substantiating a broader application, this expression shall be limited to determining the fire resistance of structural steel columns with weight-to-heated-perimeter ratios (W/D) between the largest and smallest columns for which standard fire-endurance test results are available.*

**721.5.1.3.2 Spray-applied identification.** *Spray-applied fire-resistant materials shall be identified by density and thickness required for a given fire-resistance rating.*

**721.5.1.4 Concrete-protected columns.** *The fire resistance of structural steel columns protected with concrete, as illustrated in Figure 721.5.1(6) (a) and (b), shall be permitted to be determined from the following expression:*

$$R = R_o (1 + 0.03m) \quad (\text{Equation 7-14})$$

where:

$$R_o = 10 (W/D)^{0.7} + 17 (h^{1.6}/k_c^{0.2}) \times (1 + 26 (H/p_c c_c h (L + h))^{0.8})$$

As used in these expressions:

- $R$  = Fire endurance at equilibrium moisture conditions (minutes).
- $R_o$  = Fire endurance at zero moisture content (minutes).
- $m$  = Equilibrium moisture content of the concrete by volume (percent).
- $W$  = Average weight of the steel column (pounds per linear foot).
- $D$  = Heated perimeter of the steel column (inches).
- $h$  = Thickness of the concrete cover (inches).
- $k_c$  = Ambient temperature thermal conductivity of the concrete (Btu/hr ft °F).
- $H$  = Ambient temperature thermal capacity of the steel column =  $0.11W$  (Btu/ft °F).
- $p_c$  = Concrete density (pounds per cubic foot).
- $c_c$  = Ambient temperature specific heat of concrete (Btu/lb °F).
- $L$  = Interior dimension of one side of a square concrete box protection (inches).

**721.5.1.4.1 Reentrant space filled.** For wide-flange steel columns completely encased in concrete with all reentrant spaces filled [Figure 721.5.1(6)(c)], the thermal capacity of the concrete within the reentrant spaces shall be permitted to be added to the thermal capacity of the steel column, as follows:

$$H = 0.11W + (p_c / 144)(b_f d - A_s) \quad (\text{Equation 7-15})$$

where:

$b_f$  = Flange width of the steel column (inches).

$d$  = Depth of the steel column (inches).

$A_s$  = Cross-sectional area of the steel column (square inches).

**721.5.1.4.2 Concrete properties unknown.** *If specific data on the properties of concrete are not available, the values given in Table 721.5.1(2) are permitted.*

**721.5.1.4.3 Minimum concrete cover.** *For structural steel column encased in concrete with all reentrant spaces filled, Figure 721.5.1(6)(c) and Tables 721.5.1(7) and 721.5.1(8) indicate the thickness of concrete cover required for various fire-resistance ratings for typical wide-flange sections. The thicknesses of concrete indicated in these tables also apply to structural steel columns larger than those listed.*

**721.5.1.4.4 Minimum precast concrete cover.** *For structural steel columns protected with precast concrete column covers as shown in Figure 721.5.1(6)(a), Tables 721.5.1(9) and 721.5.1(10) indicate the thickness of the column covers required for various fire-resistance ratings for typical wide-flange shapes. The thicknesses of concrete given in these tables also apply to structural steel columns larger than those listed.*

**721.5.1.4.5 Masonry protection.** *The fire resistance of structural steel columns protected with concrete masonry units or clay masonry units as illustrated in Figure 721.5.1(7), shall be permitted to be determined from the following expression:*

$$R = 0.17 (W/D)^{0.7} + [0.285 (T_e^{1.6}/K^{0.2})] \\ [1.0 + 42.7 \{ (A_s/d_m T_e) / (0.25p + T_e) \}^{0.8}]$$

(Equation 7-16)

where:

- $R$  = Fire-resistance rating of column assembly (hours).
- $W$  = Average weight of steel column (pounds per foot).
- $D$  = Heated perimeter of steel column (inches) [see Figure 721.5.1(7)].
- $T_e$  = Equivalent thickness of concrete or clay masonry unit (inches) (see Table 721.3.2 Note a or Section 721.4.1).
- $K$  = Thermal conductivity of concrete or clay masonry unit (Btu/hr ft °F) [see Table 721.5.1(3)].
- $A_s$  = Cross-sectional area of steel column (square inches).
- $d_m$  = Density of the concrete or clay masonry unit (pounds per cubic foot).
- $p$  = Inner perimeter of concrete or clay masonry protection (inches) [see Figure 721.5.1(7)].

**721.5.1.4.6 Equivalent concrete masonry thickness.** *For structural steel columns protected with concrete masonry, Table 721.5.1(5) gives the equivalent thickness of concrete masonry required for various fire-resistance ratings for typical column shapes. For structural steel columns protected with clay masonry, Table 721.5.1(6) gives the equivalent thickness of concrete masonry required for various fire-resistance ratings for typical column shapes.*

For SI: 1 inch = 25.4 mm.

a. The tabulated thicknesses are based upon the assumed properties of structural lightweight concrete given in Table 721.5.1(2).

**721.5.2 Structural steel beams and girders.** *The fire-resistance ratings of steel beams and girders shall be based upon the size of the element and the type of protection provided in accordance with this section.*

**721.5.2.1 Determination of fire resistance** *These procedures establish a basis for determining resistance of structural steel beams and girders which differ in size from that specified in approved fire-resistant assemblies as a function of the thickness of fire-resistant material and the weight (W) and heated perimeter (D) of the beam or girder. As used in these sections, W is the average weight of a structural steel member in pounds per linear foot (plf). The heated perimeter, D, is the inside perimeter of the fire-resistant material in inches as illustrated in Figure 721.5.2.*

**721.5.2.1.1 Weight-to-heated perimeter.** *The weight-to-heated-perimeter ratios (W/D), for both contour and box fire-resistant protection profiles, for the wide flange shapes most often used as beams or girders are given in Table 721.5.1(4). For different shapes, the weight-to-heated-perimeter ratios (W/D) shall be determined in accordance with the definitions given in this section.*

**721.5.2.1.2 Beam and girder substitutions.** *Except as provided for in Section 721.5.2.2, structural steel beams in approved fire-resistant assemblies shall be considered the minimum permissible size. Other beam or girder shapes shall be permitted to be substituted provided that the weight-to-heated-perimeter ratio (W/D) of the substitute beam is equal to or greater than that of the beam specified in the approved assembly.*

**721.5.2.2 Spray-applied fire-resistant materials.** *The provisions in this section apply to unrestrained structural steel beams and girders protected with spray-applied fire-resistant materials. Larger or smaller unrestrained beam and girder shapes shall be permitted to be substituted for beams specified in approved unrestrained or restrained fire-resistant assemblies provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:*

$$h_2 = \left[ \frac{(W_1 / D_1) + 0.60}{(W_2 / D_2) + 0.60} \right] h_1 \quad (\text{Equation 7-17})$$

where:

$h$  = Thickness of spray-applied fire-resistant material in inches.

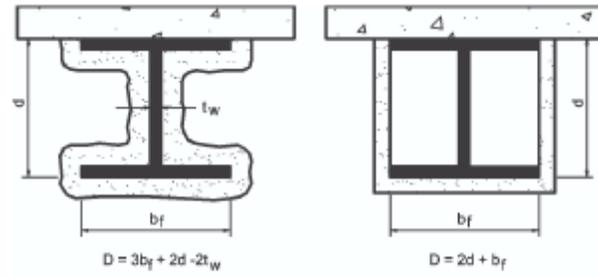

$W$  = Weight of the structural steel beam or girder in pounds per linear foot.

$D$  = Heated perimeter of the structural steel beam or girder in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the approved assembly.

**721.5.2.2.1 Minimum thickness.** Equation 7-17 is limited to beams with a weight-to-heated-perimeter ratio (W/D) of 0.37 or greater. The minimum thickness of fire-resistant material shall not be less than 3/8 inch (9.5 mm).

**721.5.2.3 Structural steel trusses.** The fire resistance of structural steel trusses protected with fire-resistant materials spray applied to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section 721.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements which can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section 721.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements which directly support floor or roof construction shall be determined on the same basis as beams and girders, as specified in Section 721.5.2.1.

**FIGURE 721.5.2**  
**DETERMINATION OF THE HEATED PERIMETER**  
**OF STRUCTURAL STEEL BEAMS AND GIRDERS**

**721.6 Wood assemblies.** *The provisions of this section contain procedures by which the fire-resistance ratings of wood assemblies are established by calculations.*

**721.6.1 General.** *This section contains procedures for calculating the fire-resistance ratings of walls, floor/ceiling and roof/ceiling assemblies based in part on the standard method of testing referenced in Section 703.2.*

**721.6.1.1 Maximum fire-resistance rating.** *Fire-resistance ratings calculated using the procedures in this section shall be used only for 1-hour rated assemblies.*

**721.6.1.2 Dissimilar membranes.** *Where dissimilar membranes are used on a wall assembly, the calculation shall be made from the least fire-resistant (weaker) side.*

**721.6.2 Walls, floors and roofs.** *These procedures apply to both load-bearing and nonload-bearing assemblies.*

**721.6.2.1 Fire-resistance rating of wood frame assemblies.** *The fire-resistance rating of a wood frame assembly is equal to the sum of the time assigned to the membrane on the fire-exposed side, the time assigned to the framing members and the time assigned for additional contribution by other protective measures such as insulation. The membrane on the unexposed side shall not be included in determining the fire resistance of the assembly.*

**721.6.2.2 Time assigned to membranes.** *Table 721.6.2(1) indicates the time assigned to membranes on the fire-exposed side.*

**721.6.2.3 Exterior walls.** *For an exterior wall having more than 5 feet (1524 mm) of horizontal separation, the wall is assigned a rating dependent on the interior membrane and the framing as described in Tables 721.6.2(1) and 721.6.2(2). The membrane on the outside of the nonfire-exposed side of exterior walls having more than 5 feet (1524 mm) of horizontal separation may consist of sheathing, sheathing paper, and siding as described in Table 721.6.2(3).*

**721.6.2.4 Floors and roofs.** *In the case of a floor or roof, the standard test provides only for testing for fire exposure from below. Except as noted in Section 703.3, Item 5, floor or roof assemblies of wood framing shall have an upper membrane consisting of a subfloor and finished floor conforming to Table 721.6.2(4) or any other membrane that has a contribution to fire resistance of at least 15 minutes in Table 721.6.2(1).*

**721.6.2.5 Additional protection.** *Table 721.6.2(5) indicates the time increments to be added to the fire resistance where glass fiber, rock wool, slag mineral wool, or cellulose insulation is incorporated in the assembly.*

**721.6.2.6 Fastening.** *Fastening of wood frame assemblies and the fastening of membranes to the wood framing members shall be done in accordance with Chapter 23.*

**TABLE 721.6.2(1)**  
**TIME ASSIGNED TO WALLBOARD MEMBRANES<sup>a,b,c,d</sup>**

DESCRIPTION OF FINISH	TIME <sup>a</sup> (minutes)
<sup>3</sup> / <sub>8</sub> -inch wood structural panel bonded with exterior glue	5
<sup>15</sup> / <sub>32</sub> -inch wood structural panel bonded with exterior glue	10
<sup>19</sup> / <sub>32</sub> -inch wood structural panel bonded with exterior glue	15
<sup>3</sup> / <sub>8</sub> -inch gypsum wallboard	10
<sup>1</sup> / <sub>2</sub> -inch gypsum wallboard	15
<sup>5</sup> / <sub>8</sub> -inch gypsum wallboard	30
<sup>1</sup> / <sub>2</sub> -inch Type X gypsum wallboard	25
<sup>5</sup> / <sub>8</sub> -inch Type X gypsum wallboard	40
Double <sup>3</sup> / <sub>8</sub> -inch gypsum wallboard	25
<sup>1</sup> / <sub>2</sub> + <sup>3</sup> / <sub>8</sub> -inch gypsum wallboard	35
Double <sup>1</sup> / <sub>2</sub> -inch gypsum wallboard	40

For SI: 1 inch = 25.4 mm.

- These values apply only when membranes are installed on framing members which are spaced 16 inches o.c.
- Gypsum wallboard installed over framing or furring shall be installed so that all edges are supported, except <sup>3</sup>/<sub>8</sub>-inch Type X gypsum wallboard shall be permitted to be installed horizontally with the horizontal joints staggered 24 inches each side and unsupported but finished.
- On wood frame floor/ceiling or roof/ceiling assemblies, gypsum board shall be installed with the long dimension perpendicular to framing members and shall have all joints finished.
- The membrane on the unexposed side shall not be included in determining the fire resistance of the assembly. When dissimilar membranes are used on a wall assembly, the calculation shall be made from the least fire-resistant (weaker) side.
- The time assigned is not a finished rating.

**TABLE 721.6.2(2)**  
**TIME ASSIGNED FOR CONTRIBUTION OF WOOD FRAME<sup>a,b,c</sup>**

DESCRIPTION	TIME ASSIGNED TO FRAME (minutes)
Wood studs 16 inches o.c.	20
Wood floor and roof joists 16 inches o.c.	10

For SI: 1 inch = 25.4 mm.

- This table does not apply to studs or joists spaced more than 16 inches o.c.
- All studs shall be nominal 2 × 4 and all joists shall have a nominal thickness of at least 2 inches.
- Allowable spans for joists shall be determined in accordance with Sections 2308.8, 2308.10.2 and 2308.10.3.

**TABLE 721.6.2(3)**  
**MEMBRANE<sup>a</sup> ON EXTERIOR FACE OF WOOD STUD WALLS**

SHEATHING	PAPER	EXTERIOR FINISH
<sup>5</sup> / <sub>8</sub> -inch T & G lumber	Sheathing paper	Lumber siding
<sup>5</sup> / <sub>16</sub> -inch exterior glue plywood		Wood shingles and shakes
<sup>1</sup> / <sub>2</sub> -inch gypsum wallboard		<sup>1</sup> / <sub>4</sub> -inch wood structural panels—exterior type
<sup>5</sup> / <sub>8</sub> -inch gypsum wallboard		<sup>1</sup> / <sub>4</sub> -inch hardboard
<sup>1</sup> / <sub>2</sub> -inch fiberboard		Metal siding
		Stucco on metal lath
		Masonry veneer
None	—	<sup>3</sup> / <sub>8</sub> -inch exterior-grade wood structural panels

For SI: 1 pound/cubic feet = 16.0185 kg/m<sup>2</sup>.

- Any combination of sheathing, paper, and exterior finish is permitted.

**TABLE 721.6.2(4)  
FLOORING OR ROOFING OVER WOOD FRAMING<sup>a</sup>**

ASSEMBLY	STRUCTURAL MEMBERS	SUBFLOOR OR ROOF DECK	FINISHED FLOORING OR ROOFING
Floor	Wood	$15/32$ -inch wood structural panels or $11/16$ inch T & G softwood	Hardwood or softwood flooring on building paper resilient flooring, parquet floor felted-synthetic fiber floor coverings, carpeting, or ceramic tile on $3/8$ -inch-thick panel-type underlay  Ceramic tile on $1/4$ -inch mortar bed
Roof	Wood	$15/32$ -inch wood structural panels or $11/16$ inch T & G softwood	Finished roofing material with or without insulation

For SI: 1 inch = 25.4 mm.

a. This table applies only to wood joist construction. It is not applicable to wood truss construction.

**TABLE 721.6.2(5)  
TIME ASSIGNED FOR ADDITIONAL PROTECTION**

DESCRIPTION OF ADDITIONAL PROTECTION	FIRE RESISTANCE (minutes)
Add to the fire-resistance rating of wood stud walls if the spaces between the studs are completely filled with glass fiber mineral wool batts weighing not less than 2 pounds per cubic foot (0.6 pound per square foot of wall surface) or rockwool or slag material wool batts weighing not less than 3.3 pounds per cubic foot (1 pound per square foot of wall surface), or cellulose insulation having a nominal density not less than 2.6 pounds per cubic foot.	15

For SI: 1 pound/cubic foot = 16.0185 kg/m<sup>3</sup>.

Beams:  $2.54Zb (4 - 2(b/d))$  for beams which may be exposed to fire on four sides.  
(Equation 7-18)

$2.54Zb (4 - (b/d))$  for beams which may be exposed to fire on three sides.  
(Equation 7-19)

Columns:  $2.54Zd (3 - (d/b))$  for columns which may be exposed to fire on four sides  
(Equation 7-20)

$2.54Zd (3 - (d/2b))$  for columns which may be exposed to fire on three sides.  
(Equation 7-21)

where:

- $b$  = The breadth (width) of a beam or larger side of a column before exposure to fire (inches).
- $d$  = The depth of a beam or smaller side of a column before exposure to fire (inches).
- $Z$  = Load factor, based on Figure 720.6.3(1).

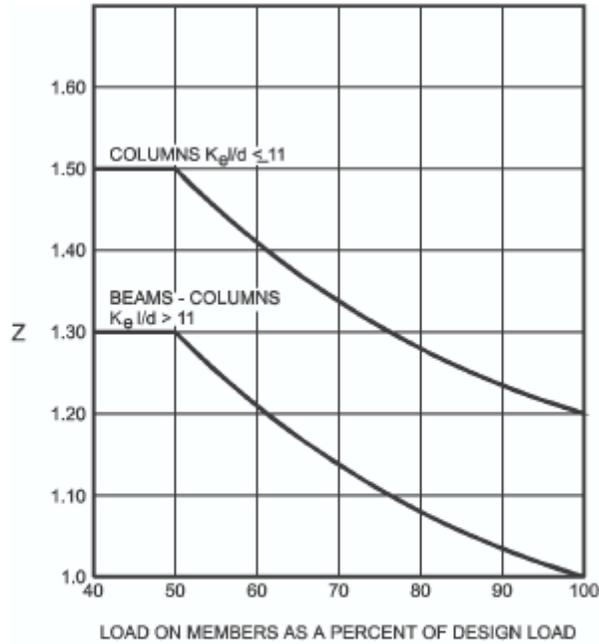

**721.6.3.1 Equation 7-21.** Equation 7-21 applies only where the unexposed face represents the smaller side of the column. If a column is recessed into a wall, its full dimension shall be used for the purpose of these calculations.

**721.6.3.2 Allowable loads.** Allowable loads on beams and columns are determined using design values given in ANSI/AF&PA NDS.

**721.6.3.3 Fastener protection.** Where minimum 1-hour fire resistance is required, connectors and fasteners shall be protected from fire exposure by 1½ inches (38 mm) of wood, or other approved covering or coating for a 1-hour rating. Typical details for commonly used fasteners and connectors are shown in AITC Technical Note 7.

**721.6.3.4 Minimum size.** Wood members are limited to dimensions of 6 inches (152 mm) nominal or greater. Glued-laminated timber beams utilize standard laminating combinations except that a core lamination is removed. The tension zone is moved inward and the equivalent of an extra nominal 2-inch-thick (51 mm) outer tension lamination is added.

**721.7 Other reference documents.** Refer to Section 703.3, Item 1, and NBS BMS 71 and NBSTRBM-44 for fire-resistance ratings of materials and assemblies.

**FIGURE 721.6.3(1)  
LOAD FIGURE**

$K_e$  = The effective length factor as noted in Figure 721.6.3(2).  
 $l$  = The unsupported length of columns (inches).

EFFECTIVE LENGTH FACTORS**

**CHAPTER 8**  
**INTERIOR FINISHES**

**SECTION BC 801**  
**GENERAL**

**801.1 Scope.** Provisions of this chapter shall govern the use of materials used as interior finishes, trim and decorative materials.

**801.1.1 Interior finishes.** These provisions shall limit the allowable flame spread and smoke development based on location and occupancy classification.

**Exceptions:**

1. Materials having a thickness less than 0.036 inch (0.91 mm) applied directly to a non-combustible, or fire-retardant treated wood, substrate.
2. Exposed portions of structural members complying with the requirements for buildings of Type IV construction in Section 602.4.

**801.1.2 Applicability in flood hazard areas.** For buildings in flood hazard areas as established in Appendix G, interior finishes, trim and decorative materials below the design flood elevation shall be flood-damage-resistant materials.

**801.2 Application.** Combustible materials complying with the requirements of this chapter shall be permitted to be used as finish for walls, ceilings, floors and other interior surfaces of buildings.

**801.2.1 Windows.** Show windows in the first story of buildings shall be permitted to be of wood or of unprotected metal framing.

**801.2.2 Foam plastics.** Foam plastics shall not be used as interior finish or trim except as provided in Section 2603.7 or 2604.

**SECTION BC 802**  
**DEFINITIONS**

**802.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**EXPANDED VINYL WALL COVERING.** *Wall covering consisting of a woven textile backing, an expanded vinyl base coat layer and a non-expanded vinyl skin coat. The expanded base coat layer is a homogeneous vinyl layer that contains a blowing agent. During processing, the blowing agent decomposes, causing this layer to expand by forming closed cells. The total thickness of the wall covering is approximately 0.055 inch to 0.070 inch (1.4 mm to 1.8 mm).*

**FLAME RESISTANCE.** *That property of materials or combinations of component materials that restricts the spread of flame in accordance with NFPA 701.*

**FLAME SPREAD.** *The propagation of flame over a surface.*

**FLAME SPREAD INDEX.** *The numerical value assigned to a material tested in accordance with ASTM E 84.*

**INTERIOR FINISH.** *Interior finish includes interior wall and ceiling finish and interior floor finish.*

**INTERIOR FLOOR FINISH.** *The exposed floor surfaces of buildings including coverings applied over a finished floor or stair, including risers.*

**INTERIOR WALL AND CEILING FINISH.** *The exposed interior surfaces of buildings including, but not limited to: fixed or movable walls and partitions; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including trim.*

**SMOKE-DEVELOPED INDEX.** *The numerical value assigned to a material tested in accordance with ASTM E 84.*

**TRIM.** *Picture molds, chair rails, baseboards, handrails, door and window frames and similar decorative or protective materials used in fixed applications.*

### **SECTION BC 803 WALL AND CEILING FINISHES**

**803.1 General.** *Interior wall and ceiling finishes shall be classified in accordance with ASTM E 84. Such*

*interior finish materials shall be grouped in the following classes in accordance with their flame spread index.*

*Class A: Flame spread 0-25.*

*Class B: Flame spread 26-75.*

*Class C: Flame spread 76-200.*

***Exception:*** *Materials, other than textiles, tested in accordance with Section 803.2.*

***803.1.1 Smoke developed index.*** *Smoke developed index shall range from 0-450 with the following restrictions:*

<i>Exits, corridors</i>	<i>25</i>
<i>Occupancy Group I</i>	<i>50</i>
<i>Rooms in which the net floor area per occupant is 10 square feet or less</i>	<i>100</i>

***Exception:*** *Materials other than textiles, tested in accordance with Section 803.2.*

***803.2. Interior wall or ceiling finishes other than textiles.*** *Interior wall or ceiling finishes, other than textiles, shall be permitted to be tested in accordance with NFPA 286. Finishes tested in accordance with NFPA 286 shall comply with Sections 803.2.1 and 803.2.2.*

***803.2.1 Acceptance criteria.*** *During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Item 3.*

- 1. During the 40 kW exposure, flames shall not spread to the ceiling.*
- 2. During the 160 kW exposure, the interior finish shall comply with the following:*
  - 2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.*
  - 2.2. Flashover, as defined in NFPA 286, shall not occur.*

3. *The total smoke released throughout the NFPA 286 test shall not exceed 1,000 m<sup>2</sup>.*

**803.2.2 Toxicity.** *Interior wall or ceiling finishes, other than textiles, upon exposure to fire, shall not produce products of decomposition or combustion that are more toxic in point of concentration than those given off by wood or paper when decomposing or burning under comparable conditions.*

**803.3 Stability.** *Interior finish materials regulated by this chapter shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 200°F (93°C) for not less than 30 minutes.*

**803.4 Application.** *Where these materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, they shall comply with the provisions of this section.*

**803.4.1 Direct attachment and furred construction.** *Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 1.75 inches (44 mm) applied directly against such surfaces. The intervening spaces between such furring strips shall be filled with inorganic or Class A material or shall be fire blocked at a maximum of 8 feet (2438 mm) in any direction in accordance with Section 717.*

**803.4.2 Set-out construction.** *Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.4.1, Class A finish materials shall be used except where interior finish materials are protected on both sides by an automatic sprinkler system or attached to noncombustible backing or furring strips installed as specified in Section 803.4.1. The hangers and assembly members of such dropped ceilings that are below the main ceiling line shall be of noncombustible materials, except that in Type III and V construction, fire-retardant-treated wood shall be permitted. The construction of each set-out wall shall be of fire-resistance-rated construction as required elsewhere in this code.*

**803.4.3 Heavy timber construction.** *Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fire blocked as specified in Section 803.4.1.*

**803.4.4 Materials.** *An interior wall or ceiling finish that is not more than 0.25 inch (6.4 mm) thick*

*shall be applied directly against a noncombustible backing.*

***Exceptions:***

1. *Class A materials.*
2. *Materials where the qualifying tests were made with the material suspended or furred from the noncombustible backing.*

***803.5 Interior finish requirements based on occupancy group.*** *Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 803.5 for the group and location designated. Interior wall and ceiling finish materials, other than textiles, tested in accordance with NFPA 286 and meeting the acceptance criteria of Sections 803.2.1 and 803.2.2, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 is required.*

**INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY<sup>k</sup>**

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m<sup>2</sup>.

- a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.4.1.
- b. In vertical exits of buildings less than three stories in height of other than Group I-3, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted.
- c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in A-1, A-2 and A-3 occupancies shall not be less than Class B materials.
- e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
- f. For churches and places of worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
- g. Class B material required where building exceeds two stories.
- h. Class C interior finish materials shall be permitted in administrative spaces.
- i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
- j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in exit access corridors.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when the vertical exits, exit passageways, exit access corridors or exitways, or rooms and spaces are protected by a sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

**803.6 Textiles.** Where used as interior wall or ceiling finish materials, textiles, including materials having woven or non-woven, napped, tufted, looped or similar surface, shall comply with the requirements of this section.

**803.6.1 Textile wall coverings.** Textile wall coverings shall have a Class A flame spread index in accordance with ASTM E 84 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2 or the covering shall meet the criteria of Section 803.6.1.1 or 803.6.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product mounting system, including adhesive.

**803.6.1.1 Method A test protocol.** During the Method A protocol, flame shall not spread to the ceiling during the 40 kW exposure. During the 150 kW exposure, the textile wall covering shall comply with all of the following:

1. Flame shall not spread to the outer extremity of the sample on the 8-foot by 12-foot (2438 mm by 3658 mm) wall.
2. The specimen shall not burn to the outer extremity of the 2-foot-wide (610 mm) samples mounted in the corner of the room.
3. Burning droplets deemed capable of igniting textile wall coverings or that burn for 30 seconds or more shall not form.
4. Flashover, as defined in NFPA 265, shall not occur.
5. The maximum net instantaneous peak heat release rate, determined by subtracting the burner output from the maximum heat release rate, does not exceed 300 kW.

**803.6.1.2 Method B test protocol.** During the Method B protocol, flames shall not spread to the ceiling at any time during the 40 kW exposure. During the 150 kW exposure, the textile wall covering shall comply with the following:

1. Flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (2438 mm by 3658 mm) walls.
2. Flashover, as described in NFPA 265, shall not occur.

**803.6.2 Textile ceiling finish.** Where used as a ceiling finish, carpet and similar textile materials shall have a Class A flame spread index in accordance with ASTM E 84 and be protected by automatic sprinklers.

**803.7 Expanded vinyl wall coverings.** Expanded vinyl wall coverings shall comply with the requirements for textile wall and ceiling materials and their use shall comply with Section 803.5.

**Exception:** Expanded vinyl wall or ceiling coverings complying with Section 803.2 shall not be required to comply with Section 803.1 or 803.5.

**803.8 Insulation.** Thermal and acoustical insulation shall comply with Section 719.

**803.9 Acoustical ceiling systems.** The quality, design, fabrication and erection of metal suspension systems for acoustical tile and lay-in panel ceilings in buildings or structures shall conform with the provisions of this chapter and other applicable requirements of this code.

**803.9.1 Materials and installation.** Acoustical materials complying with the interior finish requirements of Section 803 shall be installed in accordance with the manufacturer's recommendations and applicable provisions for applying interior finish.

**803.9.1.1 Suspended acoustical ceilings.** Acoustical ceilings that are to be suspended below floor or roof construction by means of a framing system shall consist of supporting hangers of minimum 1/4 inch (6.4 mm) diameter steel rods, carrying channels of minimum 1 1/2 inch (38 mm) deep cold-rolled steel weighing 0.457 pounds per linear foot (0.707 kg/m), and a supporting grid complying with Appendix R. Use of wire hangers shall not be permitted. Direct hung suspension systems shall not be permitted.

**Exception:** Acoustical ceiling systems in Groups R-2 and R-3 occupancies shall be permitted to be installed in accordance with ASTM C 635 and ASTM C 636 without modifications.

**803.9.1.2 Fire-resistance-rated construction.** Acoustical ceiling systems that are part of fire-resistance-rated construction shall be installed in the same manner used in the assembly tested and shall comply with the provisions of Chapter 7.

**SECTION BC 804**  
**INTERIOR FLOOR FINISH**

**804.1 General.** Interior floor finish and floor covering materials shall comply with this section

**804.2 Classification.** Interior floor finish and floor covering materials required by Section 804.5.1 to be of Class I or II materials shall be classified in accordance with NFPA 253. The classification referred to herein corresponds to the classifications determined by NFPA 253 as follows: Class I, 0.45 watts/cm<sup>2</sup> or greater; Class II, 0.22 watts/cm<sup>2</sup> or greater.

**804.3 Testing and identification.** Floor covering materials shall be tested by an approved agency in accordance with NFPA 253 and identified by a hang tag or other suitable method so as to identify the manufacturer or supplier and style, and shall indicate the interior floor finish or floor covering classification according to Section 804.2. Carpet-type floor coverings shall be tested as proposed for use, including underlayment. Test reports confirming the information provided in the manufacturer's product identification shall be furnished to the department upon request.

**804.4 Application.** Combustible materials installed in or on floors of buildings of Type I or II construction shall conform with the requirements of Sections 804.4.1 through 804.4.4.

**Exception:** Stages and platforms constructed in accordance with Sections 410.3 and 410.4, respectively.

**804.4.1 Sub-floor construction.** Floor sleepers, bucks and nailing blocks shall not be constructed of combustible materials, unless the space between the fire-resistance-rated floor construction and the flooring is either solidly filled with approved noncombustible materials or fireblocked in accordance with Section 717, and provided that such open spaces shall not extend under or through permanent partitions or walls.

**804.4.2 Wood finish flooring.** Wood finish flooring is permitted to be attached directly to the embedded or fireblocked wood sleepers and shall be permitted where cemented directly to the top surface of approved fire-resistance-rated construction or directly to a wood subfloor attached to sleepers as provided for in Section 804.4.1.

**804.4.3 Insulating boards.** Combustible insulating boards not more than 0.5-inch (12.7 mm) thick and covered with approved finished flooring are permitted, where attached directly to a noncombustible floor assembly or to wood subflooring attached to sleepers as provided for in Section 804.4.1.

**804.4.4 Carpet-type floor coverings.** Carpet-type floor coverings are permitted where cemented

*directly to the top surface of approved fire-resistance-rated construction or directly to a wood subfloor attached to sleepers as provided for in Section 804.4.1.*

**804.5 Interior floor finish limitations.** *In buildings and spaces classified in Occupancy Group H and in all exits and exit passageways of any Occupancy Group, floor finishes shall be of non-combustible materials.*

**Exception:** *Interior floor finish may be of combustible materials in the following spaces. Carpet-type materials must be able to withstand a minimum critical radiant flux as specified in Section 804.5.1.*

- 1. Buildings of Type VB Construction.*
- 2. Interior stairs in buildings of Types III, IV and V Construction in Occupancy Groups B, F, M or S-2, when the buildings are two stories in height or less.*
- 3. Interior stairs in buildings of Types III, IV and V Construction in Occupancy Group R-2 and R-3 when the buildings are three stories in height or less.*
- 4. Interior stairs in buildings of Types III, IV and V Construction in Occupancy Group R-2 when occupied by three families or less.*

**804.5.1 Minimum critical radiant flux.** *Interior floor finishes shall not be less than Class I in Occupancy Groups I-2 and I-3 and not less than Class II in Occupancy Groups A, B, E, H, I- 4, M, R-1, R-2 and S. In all other Occupancy Groups, the interior floor finish shall comply with the DOC FF-1 “pill test” (CPSC 16 CFR, Part 1630).*

## **SECTION BC 805 DECORATIONS AND TRIM**

**805.1 Decorations.** *All decorations shall comply with the requirements of the New York City Fire Code.*

**805.2 Reserved.**

**805.3 Trim.** *Material used as interior trim shall have minimum Class C flame spread as required by Section 803.1 and smoke-developed index as required by Section 803.1.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the aggregate wall or ceiling area in which it is located.*

**805.4 Foam plastic as trim.** *Foam plastic used as trim shall be permitted in Group R-3 occupancies, within individual dwelling units of Group R-1 and R-2 occupancies, and where approved in accordance with the special provisions of Section 2603.8. Foam plastics used as trim in any occupancy shall comply with the requirements of Section 2604.2.*

**805.5 Pyroxylin plastic.** *Imitation leather or other material consisting of or coated with a pyroxylin or similarly hazardous base shall not be used in Group A occupancies.*

**CHAPTER 9**  
**FIRE PROTECTION SYSTEMS**

**SECTION BC 901**  
**GENERAL**

**901.1 Scope.** *The provisions of this chapter shall specify where fire protection systems are required and shall apply to the design, installation and operation of fire protection systems.*

**901.1.1 Referenced standards.** *Where this code makes reference to the nationally recognized standards NFPA 13, NFPA 13D, NFPA 13R, NFPA 14, or NFPA 72, such standard shall be as modified for New York City in accordance with Appendix Q.*

**901.2 Fire protection systems.** *Fire protection systems shall be installed, repaired, operated and maintained in accordance with this code and the New York City Fire Code. Any fire protection system for which an exception or reduction to the provisions of this code has been granted shall be considered to be a required system.*

**Exception:** *Any fire protection system or portion thereof not required by this code shall be permitted to be installed provided that such system meets the requirements of this code.*

**901.3 Modifications.** *No person shall remove or modify any fire protection system installed or maintained under the provisions of this code or the New York City Fire Code without approval by the commissioner.*

**901.4 Threads.** *Threads provided for Fire Department connections to sprinkler systems, standpipes, yard hydrants or any other fire hose connection shall be compatible with the connections used by the Fire Department.*

**901.5 Acceptance tests.** *Fire protection systems shall be tested in accordance with the requirements of this code and the New York City Fire Code. When required, the tests shall be conducted in the presence of the department or an approved agency. Tests required by this code, the New York City Fire Code and the standards listed in this code shall be conducted at the expense of the owner or the owner's representative. It shall be unlawful to occupy portions of a structure until the required fire protection systems within that portion of the structure have been tested and approved.*

**901.6 Supervisory service.** *Where required, fire protection systems shall be monitored by an approved supervising station in accordance with NFPA 72.*

**901.6.1 Automatic sprinkler systems.** Automatic sprinkler systems shall be monitored by an approved supervising station.

**Exceptions:**

1. A supervising station is not required for automatic sprinkler systems protecting one- and two-family dwellings.
2. Limited area sprinkler systems serving fewer than 20 sprinkler heads.

**901.6.2 Fire alarm systems.** Fire alarm systems required by the provisions of Section 907.2 of this code and the New York City Fire Code shall be monitored by an approved supervising station in accordance with Section 907.14.

**Exceptions:**

1. Single- and multiple-station smoke alarms and carbon monoxide alarms required by Section 907.2.10.
2. Smoke detectors in Group I-3 occupancies.
3. Supervisory service is not required for automatic sprinkler systems in one- and two-family dwellings.

**901.6.3 Group H.** Manual fire alarm, automatic fire-extinguishing and emergency alarm systems in Group H occupancies shall be monitored by an approved supervising station.

**901.7 Fire areas.** Where buildings, or portions thereof, are divided into fire areas so as not to exceed the limits established for requiring a fire protection system in accordance with this chapter, such fire areas shall be separated by fire barriers having a fire-resistance rating of not less than that determined in accordance with Section 706.3.7.

## **SECTION BC 902**

### **DEFINITIONS**

**902.1 Definitions.** The following words and terms shall, for the purposes of this chapter, and as used

*elsewhere in this code, have the meanings shown herein.*

**ALARM NOTIFICATION APPLIANCE.** *A fire alarm system component such as a bell, horn, speaker, light or text display that provides audible, tactile or visible outputs, or any combination thereof.*

**ALARM SIGNAL.** *A signal indicating an emergency requiring immediate action, such as a signal indicative of fire.*

**ANNUNCIATOR.** *A unit containing one or more indicator lamps, alphanumeric displays or other equivalent means in which each indication provides status information about a circuit, condition or location.*

**AUDIBLE ALARM NOTIFICATION APPLIANCE.** *A notification appliance that alerts by the sense of hearing.*

**AUTOMATIC.** *As applied to fire protection devices, any device, equipment, or system that initiates a system function as a result of a predetermined temperature rise, rate of temperature rise or combustion products, without the necessity for human intervention.*

**AUTOMATIC FIRE-EXTINGUISHING SYSTEM.** *An approved system of devices and equipment that automatically detects a fire and discharges an approved fire-extinguishing agent onto or in the area of a fire.*

**AUTOMATIC SPRINKLER SYSTEM.** *An automatic fire-extinguishing system utilizing water, designed in accordance with fire protection engineering standards. The system includes a suitable water supply and a network of specially sized or hydraulically designed piping installed in a structure or area, generally overhead, to which automatic sprinklers are connected in a systematic pattern. The system is usually activated by heat from a fire and discharges water over the fire area.*

**AVERAGE AMBIENT SOUND LEVEL.** *The root mean square, A-weighted sound pressure level measured over a 24-hour period.*

**CARBON DIOXIDE EXTINGUISHING SYSTEMS.** *An automatic fire-extinguishing system supplying carbon dioxide (CO<sub>2</sub>) from a pressurized vessel through fixed pipes and nozzles. The system includes a manual- or automatic-actuating mechanism.*

**CARBON MONOXIDE ALARM.** *A single- or multiple-station alarm responsive to carbon monoxide and*

*not connected to a system.*

**CARBON MONOXIDE DETECTOR.** *A listed device that senses carbon monoxide.*

**CARBON MONOXIDE PRODUCING EQUIPMENT.** *Any furnace, boiler, water heater, fireplace, cooking appliance, gas clothes dryer, apparatus, appliance or device that burns coal, kerosene, oil, wood, fuel gases and other petroleum products including, but not limited to, methane, natural gas, liquefied natural gas and manufactured fuel gases.*

**CEILING LIMIT.** *The maximum concentration of an air-borne contaminant to which one may be exposed, as published in DOL 29 CFR Part 1910.1000.*

**CENTRAL STATION.** *A facility that receives alarm signals from a protected premise and/or retransmits such alarm signals to a Fire Department communication office.*

**CLEAN AGENT.** *Electrically nonconducting, volatile or gaseous fire extinguishant that does not leave a residue upon evaporation.*

**COMMERCIAL COOKING SYSTEM.** *A system consisting of commercial cooking equipment, exhaust hood, filters, exhaust duct system, fire suppression system and other related appurtenances designed to capture grease-laden cooking vapors and exhaust them safely to the outdoors.*

**CONSTANTLY ATTENDED LOCATION.** *A designated location at a facility staffed by trained personnel on a continuous basis where alarm or supervisory signals are monitored and facilities are provided for notification of the Fire Department or other emergency services.*

**DELUGE SPRINKLER SYSTEM.** *A sprinkler system employing open sprinklers attached to a piping system connected to a water supply through a valve that is opened by the operation of a detection system installed in the same areas as the sprinklers. When this valve opens, water flows into the piping system and discharges from all sprinklers attached thereto.*

**DETECTOR, HEAT.** *A fire detector that senses heat produced by burning substances. Heat is the energy produced by combustion that causes substances to rise in temperature.*

**DRY-CHEMICAL EXTINGUISHING SYSTEM.** *A fire extinguishing system designed to discharge a powder composed of small particles, usually of sodium bicarbonate, potassium bicarbonate, urea-potassium-based bicarbonate, potassium chloride or monoammonium phosphate, with added particulate*

material supplemented by special treatment to provide resistance to packing, resistance to moisture absorption (caking) and the proper flow capabilities.

**EMERGENCY ALARM SYSTEM.** A system to provide indication and warning of an emergency condition involving hazardous materials.

**EMERGENCY VOICE/ALARM COMMUNICATIONS.** Dedicated manual or automatic facilities for originating and distributing voice instructions, as well as alert and evacuation signals pertaining to a fire emergency, to the occupants of a building.

**FIRE ALARM BOX, MANUAL.** See “Manual Fire Alarm Box.”

**FIRE ALARM CONTROL PANEL.** A system component that receives inputs from automatic and manual fire alarm devices and is capable of supplying power to detection devices and transponder(s) or off-premises transmitter(s). The control panel is capable of providing a transfer of power to the notification appliances and transfer of condition to relays or devices.

**FIRE ALARM SIGNAL.** A signal initiated by a fire alarm-initiating device such as a manual fire alarm box, automatic fire detector, water flow switch, or other device whose activation is indicative of the presence of a fire or fire signature.

**FIRE ALARM SYSTEM.** A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals.

**FIRE COMMAND CENTER.** The principal attended or unattended location where the status of detection, alarm communications and control systems is displayed, and from which the system(s) can be manually controlled.

**FIRE DETECTOR, AUTOMATIC.** A device designed to detect the presence of a fire signature and to initiate action.

**FIRE PROTECTION SYSTEM.** Approved devices, equipment and systems or combinations of systems used to detect a fire, activate an alarm, extinguish or control a fire, control or manage smoke and products of a fire or any combination thereof.

**FIRE SAFETY FUNCTIONS.** Building and fire control functions that are intended to increase the level

*of life safety for occupants or to control the spread of harmful effects of fire.*

**FOAM-EXTINGUISHING SYSTEM.** *A fire extinguishing system designed to discharge a foam made from concentrates, either mechanically or chemically, over the area to be protected.*

**HALOGENATED EXTINGUISHING SYSTEM.** *An automatic fire-extinguishing system using one or more of the following halogen elements: fluorine, chlorine, bromine and iodine.*

**INITIATING DEVICE.** *A system component that originates transmission of a change-of-state condition, such as in a smoke detector, manual fire alarm box or supervisory switch.*

**LIMITED AREA SPRINKLER SYSTEM.** *An automatic sprinkler system serving fewer than 20 sprinkler heads on any single connection.*

**LISTED.** *See Chapter 1 of Title 28 of the Administrative Code.*

**MANUAL FIRE ALARM BOX.** *A manually operated device used to initiate an alarm signal.*

**MULTIPLE-STATION ALARM DEVICE.** *Two or more single-station alarm devices that are capable of interconnection such that actuation of one causes all integral or separate audible alarms to operate. It also can consist of one single-station alarm device having connections to other detectors or to a manual fire alarm box.*

**MULTIPLE-STATION SMOKE ALARM.** *Two or more single-station smoke alarm devices that are capable of interconnection such that actuation of one causes all integral or separate audible alarms to operate.*

**PRESIGNAL SYSTEM.** *A fire alarm system having a feature that allows initial fire alarm signals to sound in a constantly attended central location and for which a human action is subsequently required to achieve a general alarm, or a feature that allows the control equipment to delay the general alarm by more than 1 minute after the start of the alarm processing.*

**RECORD DRAWINGS.** *Drawings (“as built”) that document the location of all devices, appliances, wiring sequences, wiring methods and connections of the components of a fire alarm system as installed.*

**SINGLE-STATION SMOKE ALARM.** *An assembly incorporating the detector, the control equipment and the alarm-sounding device in one unit, operated from a power supply either in the unit or obtained at the*

*point of installation.*

**SMOKE ALARM.** *A single- or multiple-station alarm responsive to smoke and not connected to a system.*

**SMOKE DETECTOR.** *A listed device that senses visible or invisible particles of combustion.*

**SMOKEPROOF ENCLOSURE.** *An exit stairway designed and constructed so that the movement of the products of combustion produced by a fire occurring in any part of the building into the enclosure is limited.*

**STANDPIPE SYSTEM.** *Piping installed in a building or structure that serves to transfer water from a water supply to hose connections at one or more locations in a building or structure for firefighting purposes, including the following types of systems:*

**Automatic dry.** *A dry standpipe system, normally filled with pressurized air, that is arranged through the use of a device, such as dry pipe valve, to admit water into the system piping automatically upon the opening of a hose valve. The water supply for an automatic dry standpipe system shall be capable of supplying the system demand.*

**Automatic wet.** *A wet standpipe system that has a water supply that is capable of supplying the system demand automatically.*

**Manual dry.** *A dry standpipe system that does not have a permanent water supply attached to the system. Manual dry standpipe systems require water from a Fire Department pumper to be pumped into the system through the Fire Department connection in order to meet the system demand.*

**Manual wet.** *A wet standpipe system connected to a water supply for the purpose of maintaining water within the system but that does not have a water supply capable of delivering the system demand attached to the system. Manual-wet standpipe systems require water from a Fire Department pumper to be pumped into the system in order to meet the system demand.*

**Semiautomatic dry.** *A dry standpipe system that is arranged through the use of a device, such as a deluge valve, to admit water into the system piping upon activation of a remote control device located at a hose connection. A remote control activation device shall be provided at each hose connection. The water supply for a semiautomatic dry standpipe system shall be capable of supplying the system demand.*

**STANDPIPE SYSTEM, CLASSES OF.** *Standpipe classes are as follows:*

**Class I system.** *A system providing 2.5-inch (64 mm) hose connections to supply water for use by the Fire Department and those trained in handling heavy fire streams.*

**Class II system.** *A system providing 1.5-inch (38 mm) hose stations to supply water for use primarily by the building occupants or by the Fire Department during initial response.*

**Class III system.** *A system providing 1.5-inch (38 mm) hose stations to supply water for use by building occupants and 2.5-inch (64 mm) hose connections to supply a larger volume of water for use by the Fire Department and those trained in handling heavy fire streams.*

**SUPERVISING STATION.** *A facility that receives signals and at which personnel are in attendance at all times to respond to these signals.*

**SUPERVISORY SERVICE.** *The service required to monitor performance of guard tours and the operative condition of fixed suppression systems or other systems for the protection of life and property.*

**SUPERVISORY SIGNAL.** *A signal indicating the need for action in connection with the supervision of guard tours, fire suppression systems or equipment, fire alarm systems, or the maintenance features of related systems.*

**SUPERVISORY SIGNAL-INITIATING DEVICE.** *An initiation device, such as a valve supervisory switch, water-level indicator or low-air pressure switch on a dry-pipe sprinkler system, whose change of state signals an off-normal condition and its restoration to normal of a fire protection or life safety system, or a need for action in connection with the supervision of guard tours, fire suppression systems or equipment, fire alarm systems, or the maintenance features of related systems.*

**TIRES, BULK STORAGE OF.** *Storage of tires where the area available for storage exceeds 20,000 cubic feet (566 m<sup>3</sup>).*

**TROUBLE SIGNAL.** *A signal initiated by the fire alarm system or device indicative of a fault in a monitored circuit or component.*

**VISIBLE ALARM NOTIFICATION APPLIANCE.** *A notification appliance that alerts by the sense of sight.*

**WET-CHEMICAL EXTINGUISHING SYSTEM.** *A solution of water and potassium-carbonate-based chemical, potassium-acetate-based chemical or a combination thereof, forming an extinguishing agent.*

**WIRELESS PROTECTION SYSTEM.** *A system or a part of a system that can transmit and receive signals without the aid of wire.*

**ZONE.** *A defined area within the protected premises. A zone can define an area from which a signal can be received, an area to which a signal can be sent or an area in which a form of control can be executed.*

### **SECTION BC 903 AUTOMATIC SPRINKLER SYSTEMS**

**903.1 General.** *Automatic sprinkler systems shall comply with this section. Installation of automatic sprinkler systems shall comply with the special inspection requirements of Chapter 17.*

**903.1.1 Alternative protection.** *Where the discharge of water would be hazardous, alternative automatic fire-extinguishing systems complying with Section 904 shall be permitted in lieu of automatic sprinkler protection where recognized by the applicable standard and approved by the commissioner.*

**903.1.2 Construction documents.** *Construction documents for automatic sprinkler systems shall contain plans that include the following data and information:*

- 1. The location and size of water supplies and the location, spacing, number, and type of sprinkler heads to be used, with approximate location and size of all feed mains, valves and other essential features of the system. For hydraulically calculated systems, hydraulic data substantiating pipe sizes shown shall be submitted and hydraulic reference points and areas must be indicated on the plan.*
- 2. A diagram showing the proposed sprinkler system in relation to principal construction features of the building, such as its size, walls, columns, and partitions; and such other information as may be necessary for the evaluation of the system.*
- 3. The location, number, and type of any electrical or automatic devices or alarms to be used in the system.*
- 4. In buildings where a new separate fire sprinkler system is required, the available water*

*pressure at the top and bottom floors of each zone shall be shown on the riser diagram.*

5. *For street pressure-fed systems and fire pumps, a statement from the New York City Department of Environmental Protection, giving the minimum water pressure in the main serving the building.*

**903.2 Where required.** *Approved automatic sprinkler systems in new buildings and structures shall be provided in the locations described in this section.*

**Exception:** *Sprinklers shall not be required in electrical equipment rooms where all of the following conditions are met:*

1. *The room is dedicated to electrical equipment only.*
2. *Only dry-type electrical equipment is used.*
3. *Equipment is installed in a 2-hour fire-rated enclosure including protection for penetrations.*
4. *No combustible storage is permitted to be stored in the room.*

**903.2.1 Group A.** *An automatic sprinkler system shall be provided throughout buildings and portions thereof used as Group A occupancies as provided in this section. The automatic sprinkler system shall be provided throughout the floor area where the Group A occupancy is located, and in all floors between the Group A occupancy and the level of exit discharge. In all Group A occupancies providing live entertainment, dressing rooms and property rooms used in conjunction with such assembly occupancy shall be provided with an automatic sprinkler system. Stages shall comply with Section 410.6.*

**903.2.1.1 Group A-1.** *An automatic sprinkler system shall be provided for Group A-1 occupancies where any one of the following conditions exists:*

1. *The fire area exceeds 12,000 square feet (1115 m<sup>2</sup>).*
2. *The fire area has an occupant load of 300 or more.*
3. *The aggregate occupant load of all fire areas occupied by Group A, located on any*

4. *The fire area contains a multitheater complex.*

**903.2.1.2 Group A-2.** *An automatic sprinkler system shall be provided for Group A-2 occupancies where any one of the following conditions exists:*

1. *The fire area exceeds 5,000 square feet (464.5m<sup>2</sup>).*
2. *The fire area has an occupant load of 300 or more.*
3. *The aggregate occupant load of all fire areas occupied by Group A, located on any give floor other than the level of exit discharge, is 300 or more.*
4. *The A-2 occupancy is used as a cabaret.*

**903.2.1.3 Group A-3.** *An automatic sprinkler system shall be provided for Group A-3 occupancies where any one of the following conditions exists:*

1. *The fire area exceeds 12,000 square feet (1115m<sup>2</sup>).*
2. *The fire area has an occupant load of 300 or more.*
3. *The aggregate occupant load of all fire areas occupied by Group A, located on any given floor other than the level of exit discharge, is 300 or more.*

**Exception:** *Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.*

**903.2.1.4 Group A-4.** *An automatic sprinkler system shall be provided for Group A-4 occupancies where any one of the following conditions exists:*

1. *The fire area exceeds 12,000 square feet (1115m<sup>2</sup>).*
2. *The fire area has an occupant load of 300 or more.*

3. *The aggregate occupant load of all fire areas occupied by Group A, located on any given floor other than the level of exit discharge, is 300 or more.*

**Exception:** *Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.*

**903.2.1.5 Group A-5.** *An automatic sprinkler system shall be provided in all enclosed areas of the structure, including but not limited to the concession\_concourse, concession stands, retail areas, press boxes and other accessory use areas, in excess of 1,000 square feet (93 m<sup>2</sup>).*

**903.2.2 Group E.** *An automatic sprinkler system shall be provided for Group E occupancies as follows:*

1. *Throughout all Group E fire areas greater than 20,000 square feet (1858m<sup>2</sup>) in area.*
2. *Throughout every portion of educational buildings below the level of exit discharge.*

**Exception:** *An automatic sprinkler system is not required in any fire area or area below the level of exit discharge where every classroom throughout the building has at least one exterior exit door at ground level without intervening corridors, passageways, or exit enclosures.*

**903.2.3 Group F.** *An automatic sprinkler system shall be provided throughout all buildings containing a Group F occupancy where any one of the following conditions exists:*

1. *Where Group F-1 fire area exceeds 12,000 square feet (1115 m<sup>2</sup>);*
2. *Where Group F-1 fire area is located more than three stories above grade; or*
3. *Where the combined area of all Group F-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m<sup>2</sup>); or*
4. *Where required by Section 280 of the New York State Labor Law for “factory buildings” defined in Section 2 of such law.*

**903.2.3.1 Woodworking operations.** *An automatic sprinkler system shall be provided throughout any Group F-1 occupancy fire area that contains wood working operations in excess of 2,500 square feet (232 m<sup>2</sup>) in area that generate finely divided combustible waste or use finely divided combustible materials.*

**903.2.3.2 Repair garages.** *An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406, as follows:*

- 1. Buildings two or more stories in height, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m<sup>2</sup>).*
- 2. One-story buildings with a fire-area containing a repair garage exceeding 12,000 square feet (1115m<sup>2</sup>).*
- 3. Buildings with a repair service garage servicing vehicles parked in the basement.*

**903.2.3.3 Group F-1 fire areas.** *An automatic sprinkler system shall be provided throughout any Group F-1 occupancy fire area where any one of the following conditions exists:*

- 1. The fire area exceeds 7,500 square feet (697 m<sup>2</sup>).*
- 2. The fire area of any size is located more than 3 stories above grade.*

**903.2.4 Group H.** *Automatic sprinkler systems shall be provided in high-hazard occupancies as required in Sections 903.2.4.1 through 903.2.4.3 and the New York City Fire Code.*

**903.2.4.1 General.** *An automatic sprinkler system shall be installed in Group H occupancies. An automatic sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group H.*

**903.2.4.2 Group H-5.** *An automatic sprinkler system shall be installed throughout buildings containing Group H-5 occupancies. The design of the sprinkler system shall not be less than that required by this code for the occupancy hazard classifications in accordance with Table 903.2.4.2. Where the design area of the sprinkler system consists of a corridor protected by one row of*

*sprinklers, the maximum number of sprinklers required to be calculated is 13.*

[F] TABLE 903.2.4.2  
GROUP H-5 SPRINKLER DESIGN CRITERIA

LOCATION	OCCUPANCY HAZARD CLASSIFICATION
Fabrication areas	Ordinary Hazard Group 2
Service corridors	Ordinary Hazard Group 2
Storage rooms without dispensing	Ordinary Hazard Group 2
Storage rooms with dispensing	Extra Hazard Group 2
Corridors	Ordinary Hazard Group 2

**903.2.4.3 Pyroxylin plastics.** *An automatic sprinkler system shall be provided in buildings, or portions thereof, where cellulose nitrate film or pyroxylin plastics are manufactured, stored or handled in quantities exceeding 100 pounds (45 kg).*

**903.2.5 Group I.** *An automatic sprinkler system shall be provided in Group I occupancies. An automatic sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group I.*

**Exception:** *An automatic sprinkler system installed in accordance with Section 903.3.1.2 or 903.3.1.3 shall be allowed in Group I-1 facilities.*

**903.2.6 Group M.** *An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where any one of the following conditions exists:*

1. *Where a Group M fire area exceeds 12,000 square feet (1115 m<sup>2</sup>);*
2. *Where the combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m<sup>2</sup>).*

**903.2.6.1 High-piled storage.** *An automatic sprinkler system shall be provided in accordance with the New York City Fire Code in all buildings of Group M where storage of merchandise is in high-piled or rack storage arrays.*

**903.2.6.2 Group M fire areas.** *An automatic sprinkler system shall be provided throughout any Group M occupancy fire area where any one of the following conditions exists:*

1. *The fire area exceeds 7,500 square feet (697 m<sup>2</sup>).*
2. *The fire area of any size is located more than 3 stories above grade.*
3. *The fire area of any size is located in a high-rise building.*
4. *The fire area of any size contains an unenclosed stair or escalator connecting two or more floors.*

**903.2.7 Group R.** *An automatic sprinkler system shall be installed in Group R fire areas. An automatic*

sprinkler system shall be installed throughout buildings with a main use or dominant occupancy of Group R.

**Exception:** An automatic sprinkler system shall not be required in detached one- and two-family dwellings and multiple single-family dwellings (town houses), provided that such structures are not more than three stories above grade plane in height and have separate means of egress.

**903.2.8 Group S-1.** An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where any one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m<sup>2</sup>);
2. The building is greater than 1,000 square feet (92.9 m<sup>2</sup>) in area and the main use or dominant occupancy is Group S-1; or
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m<sup>2</sup>).

**903.2.8.1 Group S-1 fire areas.** An automatic sprinkler system shall be provided throughout any Group S-1 occupancy fire area where any one of the following conditions exists:

1. The fire area exceeds 500 square feet (46 m<sup>2</sup>).
2. The fire area of any size is located more than 3 stories above grade.

**903.2.8.2 Bulk storage of tires.** Buildings and structures where the area for the storage of tires exceeds 500 square feet (47 m<sup>2</sup>) or 7,500 cubic feet (212 m<sup>3</sup>) shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

**903.2.9 Group S-2.** An automatic sprinkler system shall be installed throughout buildings greater than 5,000 square feet (465 m<sup>2</sup>) in area where the main use or dominant occupancy is Group S-2.

**903.2.9.1 Commercial parking garages.** An automatic sprinkler system shall be provided throughout buildings used for storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (465 m<sup>2</sup>).

**903.2.9.2 Group S-2 fire areas.** An automatic sprinkler system shall be provided throughout any

Group S-2 occupancy fire area greater than 5,000 square feet (465 m<sup>2</sup>).

**903.2.9.3 Parking garages.** An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.4 or where an open or enclosed parking garage is located beneath other occupancy groups.

**Exception:** Parking garages located beneath Group R-3 occupancies.

**903.2.10 All occupancies.** An automatic sprinkler system shall be installed in the locations set forth in Sections 903.2.10.1 through 903.2.10.6.

**903.2.10.1 Above or below-grade stories.** An automatic sprinkler system shall be installed throughout every above or below grade story of all buildings where the floor area exceeds 1,500 square feet (139.4 m<sup>2</sup>) and where there is not provided at least one of the following types of exterior wall openings:

1. Openings below grade that lead directly to ground level by an exterior stairway complying with Section 1009 or an outside ramp complying with Section 1010. Openings shall be located in each 50 linear feet (15,240 mm), or fraction thereof, of exterior walls facing onto a street, public way or frontage space, in the story on at least one side.
2. Openings entirely above the adjoining ground level totaling at least 20 square feet (1.86 m<sup>2</sup>) in each 50 linear feet (15,240 mm), or fraction thereof, of exterior walls facing onto a street, public way or frontage space, in the story on at least one side.

**903.2.10.1.1 Opening dimensions and access.** Such openings shall have a minimum dimension of not less than 30 inches (762 mm). Such openings shall be accessible to the Fire Department from the exterior and shall not be obstructed in a manner that fire fighting or rescue cannot be accomplished from the exterior.

**903.2.10.1.2 Openings on one side only.** Where such openings in a story are provided on only one side and the opposite wall of such story is more than 100 feet (30 480 mm) from such openings, the story shall be equipped throughout with an approved automatic sprinkler system, or openings as specified above shall be provided on at least two sides of the story.

**903.2.10.1.3 Below-grade stories.** Where any portion of a below-grade story is located more

than 75 feet (22 860 mm) from openings required by Section 903.2.10.1, the below-grade story shall be equipped throughout with an approved automatic sprinkler system.

**903.2.10.2 Rubbish and linen chutes.** An automatic sprinkler system shall be installed at the top of rubbish and linen chutes, in chute access rooms, and in their terminal rooms. Chutes extending through three or more floors shall have additional sprinkler heads installed within such chutes at alternate floors. Chute sprinklers shall be accessible for servicing.

**903.2.10.3 Buildings over 55 feet in height.** An automatic sprinkler system shall be installed throughout buildings with a floor level having an occupant load of 30 or more that is located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access.

**903.2.10.4 Steel-plated and vault-like occupancies.** An automatic sprinkler system shall be installed throughout all steel-plated or similarly reinforced or secured vault-like occupancies regardless of area.

**903.2.10.5 Refuse collection and disposal areas.** An automatic sprinkler system shall be installed throughout all areas used for the storage and sorting of refuse and recyclables.

**903.2.10.6 Laundry drying areas.** An automatic sprinkler system shall be installed in spaces in which two or more clothes drying machines are installed. Sprinkler heads shall be spaced to cover the areas 5 feet (1524 mm) on all sides of the drying machines.

**903.2.11 During construction.** Automatic sprinkler systems required during construction, alteration and demolition operations shall be provided in accordance with Chapter 33 and the New York City Fire Code.

**903.2.12 Other hazards.** Automatic sprinkler protection shall be provided for the hazards indicated in Sections 903.2.12.1 and 903.2.12.2.

**903.2.12.1 Ducts conveying hazardous exhausts.** Where required by the New York City Mechanical Code, automatic sprinklers shall be provided in ducts conveying hazardous exhaust, or flammable or combustible materials.

**Exception:** Ducts in which the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).

**903.2.12.2 Commercial cooking operations.** *An automatic sprinkler system shall not be installed in a commercial kitchen exhaust hood and duct system. Fire extinguishing systems shall be installed in commercial cooking systems in accordance with Section 904.11*

**903.2.13 Other buildings, occupancies, and areas.** *In addition to the requirements of Section 903.2, the provisions indicated in Table 903.2.13 also require the installation of a suppression system for certain buildings and areas. Suppression systems shall also be required as provided for in other sections of this code, the New York City Fuel Gas Code, and the New York City Mechanical Code.*

**TABLE 903.2.13**  
**ADDITIONAL REQUIRED SUPPRESSION SYSTEMS**

<i>SECTION</i>	<i>SUBJECT</i>
402.8	<i>Covered malls</i>
403.2, 403.3	<i>High-rise buildings</i>
404.3	<i>Atriums</i>
405.3	<i>Underground structures</i>
407.5	<i>Group I-2</i>
410.6	<i>Stages</i>
411.4	<i>Special amusement buildings</i>
415.7.2.4	<i>Group H-2</i>
416.4	<i>Flammable finishes</i>
417.4	<i>Drying rooms</i>
507	<i>Unlimited area buildings</i>
NYCFC	<i>NFPA-13 as modified for NYC</i>

**903.3 Installation requirements.** Automatic sprinkler systems shall be designed and installed in accordance with Sections 903.3.1 through 903.3.7.

**903.3.1 Standards.** Sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.

**903.3.1.1 NFPA 13 sprinkler systems.** Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, sprinklers shall be installed throughout in accordance with NFPA 13 as modified in Appendix Q except as provided in Section 903.3.1.1.1.

**903.3.1.1.1 Exempt locations protected by other means.** Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion and an alternative extinguishing system in accordance with Section 904. Sprinklers shall not be omitted from any room merely because it is damp, of fire-resistance-rated construction or contains electrical equipment.

1. Any room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. Any room or space where sprinklers are considered undesirable because of the nature of the contents, when approved by the commissioner.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.

**903.3.1.2 NFPA 13R sprinkler systems.** Where allowed in buildings of Group R, up to and including six stories in height, automatic sprinkler systems shall be installed throughout in accordance with NFPA 13R as modified in Appendix Q.

**903.3.1.2.1 Balconies.** Sprinkler protection shall be provided for exterior balconies and ground-floor patios of dwelling units where the building is of Type V construction and automatic sprinkler protection is required for the Group R occupancy. Side wall sprinklers that are used to protect such areas shall be permitted to be located such that their deflectors are within 1 inch (25 mm) to 6 inches (152 mm) below the structural members, and a

*maximum distance of 14 inches (356 mm) below the deck of the exterior balconies that are constructed of open wood joist construction.*

**903.3.1.3 NFPA 13D sprinkler systems.** *Where allowed, automatic sprinkler systems in one- and two-family dwellings shall be installed throughout in accordance with NFPA 13D as modified .*

**903.3.2 Quick-response and residential sprinklers.** *Where automatic sprinkler systems are required by this code, quick-response or residential automatic sprinklers shall be installed in the following areas in accordance with Section 903.3.1 and their listings:*

- 1. Throughout all spaces within a smoke compartment containing patient dwelling units in Group I-2 in accordance with this code.*
- 2. Dwelling units in Group R and I-1 occupancies.*
- 3. Light-hazard occupancies as defined in NFPA 13.*

**903.3.3 Obstructed locations.** *Automatic sprinklers shall be installed with due regard to obstructions that will delay activation or obstruct the water distribution pattern. Automatic sprinklers shall be installed in or under covered kiosks, displays, booths, concession stands, or equipment that exceeds 4 feet (1219 mm) in width. Not less than a 3-foot (914 mm) clearance shall be maintained between automatic sprinklers and the top of piles of combustible fibers.*

**Exception:** *Kitchen equipment under exhaust hoods protected with a fire-extinguishing system in accordance with Section 904.*

**903.3.4 Actuation.** *Automatic sprinkler systems shall be automatically actuated unless otherwise specifically provided in this code.*

**903.3.5 Water supplies.** *Water supplies for automatic sprinkler systems shall comply with this section and the standards referenced in Section 903.3.1. The potable water supply shall be protected against back flow in accordance with the requirements of this section, the New York City Plumbing Code, and Rules of the New York City Department of Environmental Protection.*

**903.3.5.1 Domestic services.** *Where the domestic service provides the water supply for the automatic sprinkler system, the supply shall be in accordance with NFPA 13.*

**903.3.5.1.1 Limited area sprinkler systems.** Limited area sprinkler systems serving fewer than 20 sprinklers on any single connection are permitted to be connected to the domestic service where a wet automatic standpipe is not available. Limited area sprinkler systems connected to domestic water supplies shall comply with NFPA 13.

The domestic service shall be capable of supplying the simultaneous domestic demand and the sprinkler demand required to be hydraulically calculated by NFPA 13, NFPA 13R or NFPA 13D.

**903.3.5.1.2 Residential combination services.** A single combination water supply shall be permitted in accordance with NFPA 13R.

**903.3.5.2 Secondary water supply.** A secondary on-site water supply equal to the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings in Seismic Design Category C or D as determined by this code, and in any high-rise building greater than 300 feet (91 440 mm) in height. The secondary water supply shall have a duration not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

**903.3.6 Hose threads.** Fire hose threads used in connection with automatic sprinkler systems shall be approved and compatible with Fire Department hose threads.

**903.3.7 Fire Department connections.** The location of Fire Department connections shall be installed in accordance with Section 905 of this code.

**903.4 Sprinkler system monitoring and alarms.** All valves controlling the water supply for automatic sprinkler systems, pumps, tanks, water levels and temperatures, critical air pressures and water-flow switches on all sprinkler systems shall be electrically supervised by the fire alarm system.

**Exceptions:**

1. Automatic sprinkler systems protecting one- and two-family dwellings.
2. Automatic sprinkler systems installed in accordance with NFPA 13R where a common supply main is used to supply both domestic water and the automatic sprinkler systems and a separate shutoff valve for the automatic sprinkler system is not provided.

3. *Jockey pump control valves that are sealed or locked in the open position.*
4. *Control valves to commercial kitchen hoods, paint spray booths or dip tanks that are sealed or locked in the open position.*
5. *Valves controlling the fuel supply to fire pump engines that are sealed or locked in the open position.*
6. *Trim valves to pressure switches in dry, preaction and deluge sprinkler systems that are sealed or locked in the open position.*

**903.4.1 Signals.** *Alarm, supervisory and trouble signals shall be distinctly different and automatically transmitted to an approved central station, remote supervising station or proprietary supervising station as defined in NFPA 72 or, when approved by the commissioner, shall sound an audible signal at a constantly attended location.*

**Exceptions:**

1. *Underground key or hub valves in roadway boxes provided by the city or a public utility are not required to be monitored.*
2. *Back flow prevention device test valves, located in limited area sprinkler system supply piping, shall be locked in the open position. In occupancies required to be equipped with a fire alarm system, the back flow preventer valves shall be electrically supervised by a tamper switch installed in accordance with NFPA 72 and separately annunciated.*

**903.4.2 Alarms.** *Approved audible devices shall be connected to every automatic sprinkler system. Such sprinkler water-flow alarm devices shall be activated by water flow equivalent to the flow of a single sprinkler of the smallest orifice size installed in the system. Alarm devices shall be provided on the exterior of the building in an approved location. Where a fire alarm system is installed, actuation of the automatic sprinkler system shall actuate the building fire alarm system.*

**903.4.3 Floor control valves.** *Approved supervised indicating control valves shall be provided at the point of connection to the riser on each floor in high-rise buildings.*

**903.5 Testing and maintenance.** *Sprinkler systems shall be tested and maintained in accordance with the*

**SECTION BC 904**

**ALTERNATIVE AUTOMATIC FIRE-EXTINGUISHING SYSTEMS**

**904.1 General.** *Automatic fire-extinguishing systems, other than automatic sprinkler systems, shall be designed, installed, inspected, tested and maintained in accordance with the provisions of this section, the New York City Fire Code, and the applicable referenced standards.*

**904.1.1 Construction documents.** *Construction documents for alternative automatic fire-extinguishing systems shall be approved by the Fire Department and shall contain plans that include at least the following data and information:*

1. *Commercial kitchen suppression systems:*
  - 1.1. *Location of all surface, plenum and duct nozzles; surface dimensions and location of all cooking appliances; the location of automatic fuel shut-off and statement as to type (gas or electric); location and distance of the remote control or manual pull station;*
  - 1.2. *Identification of the grease filters to be used in any kitchen hood; the dimensions of all hoods and all related ducts, including termination of duct at the exterior of the building;*
  - 1.3. *Identification of: the fire suppression piping system; the make and model of the system; the type of extinguishing agent and number and size of the agent containers; size, length, and type of all piping that will be used; the number and location of fusible links or detectors and the temperature setting; any surface, plenum and duct nozzles.*
2. *For extinguishing agent systems, the plan should also include type and concentration of the extinguishing agent, the method of providing power supply to smoke or heat detectors, fire rating of partitions, location of all audible/visible alarms within and outside the location involved and the details of construction of the room to contain the extinguishing agent. If the area is not sprinklered, the following information is required:*
  - 2.1. *The size and location of the reserve supply, and*
3. *The plans must note whether the proposed system is connected to the building's fire alarm system.*

**Exception:** For that portion of a fire suppression piping system within an approved pre-engineered system, a schematic isometric diagram shall be acceptable in lieu of full plans, provided that the location and method of pressure relief must be indicated with areas and volumes to where said relief is taken.

**904.2 Where required.** Automatic fire-extinguishing systems installed as an alternative to the required automatic sprinkler systems of Section 903 shall be approved by the commissioner. Automatic fire-extinguishing systems shall not be considered alternatives for the purposes of exceptions or reductions permitted by other requirements of this code.

**Exception:** Automatic fire-extinguishing systems installed in Group H occupancies as an alternative to the required automatic sprinkler systems of Section 903 shall be approved by the Fire Commissioner.

**904.2.1 Hood system suppression.** Each required commercial kitchen exhaust hood and duct system required by the New York City Fire Code or the New York City Mechanical Code to have a Type I hood shall be protected with an approved automatic fire-extinguishing system installed in accordance with this code.

**904.3 Installation.** Automatic fire-extinguishing systems shall be installed in accordance with this section.

**904.3.1 Electrical wiring.** Electrical wiring shall be in accordance with the New York City Electrical Code.

**904.3.2 Actuation.** Automatic fire-extinguishing systems shall be automatically actuated and provided with a manual means of actuation in accordance with Section 904.11.1.

**904.3.3 System interlocking.** Automatic equipment interlocks with fuel shutoffs, ventilation controls, door closers, window shutters, conveyor openings, smoke and heat vents and other features necessary for proper operation of the fire-extinguishing system shall be provided as required by the design and installation standard utilized for the hazard.

**904.3.4 Alarms and warning signs.** Where alarms are required to indicate the operation of automatic fire-extinguishing systems, distinctive audible and visible alarms and warning signs shall be provided to warn of pending agent discharge. Where exposure to automatic-extinguishing agents poses a hazard to persons and a delay is required to ensure the evacuation of occupants before agent discharge, a separate warning signal shall be provided to alert occupants once agent discharge has begun. Audible signals shall be in accordance with Section 907.9.2.

**904.3.5 Monitoring.** *Where a building fire alarm system is installed, automatic fire-extinguishing systems shall be monitored by the building fire alarm system in accordance with NFPA 72.*

**904.4 Inspection and testing.** *Automatic fire-extinguishing systems shall be inspected and tested in accordance with the provisions of this section prior to acceptance.*

**904.4.1 Inspection.** *Prior to conducting final acceptance tests, the following items shall be inspected:*

- 1. Hazard specification for consistency with design hazard.*
- 2. Type, location and spacing of automatic- and manual-initiating devices.*
- 3. Size, placement and position of nozzles or discharge orifices.*
- 4. Location and identification of audible and visible alarm devices.*
- 5. Identification of devices with proper designations.*
- 6. Operating instructions.*

**904.4.2 Alarm testing.** *Notification appliances, connections to fire alarm systems and connections to approved supervising stations shall be tested in accordance with this section and Section 907 to verify proper operation.*

**904.4.2.1 Audible and visible signals.** *The audibility and visibility of notification appliances signaling agent discharge or system operation, where required, shall be verified.*

**904.4.3 Monitor testing.** *Connections to protected premises and supervising station fire alarm systems shall be tested to verify proper identification and retransmission of alarms from automatic fire-extinguishing systems.*

**904.5 Wet-chemical systems.** *Wet-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.*

**904.6 Dry-chemical systems.** *Dry-chemical extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code. New dry-chemical extinguishing systems are not permitted for the protection of kitchen equipment.*

**904.7 Foam systems.** *Foam-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.*

**904.8 Carbon dioxide systems.** *Carbon dioxide extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.*

**904.9 Halon systems.** *Halogenated extinguishing systems shall not be permitted. However, existing systems shall be maintained, periodically inspected and tested in accordance with the New York City Fire Code.*

**904.10 Clean-agent systems.** *Clean-agent fire-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.*

**904.11 Commercial cooking systems.** *The automatic fire-extinguishing system for commercial cooking systems shall be of a type recognized for protection of commercial cooking equipment and exhaust systems of the type and arrangement protected. Pre-engineered automatic wet-chemical extinguishing systems shall be approved by the Fire Commissioner, tested in accordance with UL 300, and listed and labeled for the intended application. The protected area shall include the area under the hood and over the cooking equipment, the area above or behind the filters and the opening of the hood into the branch duct. Where a pre-engineered system is installed and the size of the protected area exceeds that allowed for a single pre-engineered system, additional pre-engineered systems arranged for simultaneous operation shall be provided. Other types of automatic fire-extinguishing systems shall be listed and labeled for specific use as protection for commercial cooking operations. The system shall be installed in accordance with this code, its listing and the manufacturer's installation instructions. Automatic fire-extinguishing systems of the following types shall be installed in accordance with the New York City Fire Code and the referenced standard indicated, as shown:*

1. *Carbon dioxide extinguishing systems, in accordance with the New York City Fire Code.*
2. *Wet-chemical extinguishing systems, in accordance with the New York City Fire Code.*

**904.11.1 Manual system operation.** *A manual actuation device shall be located at or near a means of egress from the cooking areas, a minimum of 10 feet (3048 mm) and a maximum of 20 feet (6096 mm)*

from the kitchen exhaust system. The manual activation device shall be located at a minimum of 42 inches (1067 mm) and a maximum of 48 inches (1219 mm) above the floor at its center. The manual actuation device shall require a maximum force of 40 pounds (178 N) and a maximum movement of 14 inches (356 mm) to actuate the fire suppression system.

**Exception:** Automatic sprinkler systems shall not be required to be equipped with manual actuation means.

**904.11.2 System interconnection.** The actuation of the fire suppression system shall automatically shut down the fuel or electrical power supply to the cooking equipment. The fuel and electrical supply reset shall be manual.

**904.11.3 Carbon dioxide systems.** When carbon dioxide systems are used, there shall be a nozzle at the top of the ventilating duct. Additional nozzles that are symmetrically arranged to give uniform distribution shall be installed within vertical ducts exceeding 20 feet (6096 mm) and horizontal ducts exceeding 50 feet (15 240 mm). Dampers shall be installed at either the top or the bottom of the duct and shall be arranged to operate automatically upon activation of the fire-extinguishing system. Where the damper is installed at the top of the duct, the top nozzle shall be immediately below the damper. Automatic carbon dioxide fire-extinguishing systems shall be sufficiently sized to protect against all hazards venting through a common duct simultaneously.

**904.11.3.1 Ventilation system.** Commercial-type cooking equipment protected by an automatic carbon dioxide-extinguishing system shall be arranged to shut off the ventilation system upon activation.

**904.11.4 Special provisions for automatic sprinkler systems.** Automatic sprinkler systems protecting commercial-type cooking equipment shall be supplied from a separate, readily accessible, indicating-type control valve that is identified.

**904.11.4.1 Listed sprinklers.** Sprinklers used for the protection of fryers shall be listed for that application and installed in accordance with their listing.

**904.12 Water-mist systems.** Water-mist fire-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with the New York City Fire Code.

## **SECTION BC 905**

### **STANDPIPE SYSTEMS**

**905.1 General.** *Standpipe systems shall be provided in buildings and structures in accordance with this section. Fire hose threads used in connection with standpipe systems shall be approved by the Fire Commissioner. The location of Fire Department hose connections shall be approved by the Fire Commissioner. Standpipe systems in buildings used for high-piled combustible storage shall be in accordance with the New York City Fire Code. Installation of standpipe systems shall comply with the special inspection requirements of Chapter 17.*

*Any space or room that contains equipment of such nature that the use of water would be ineffective in fighting a fire therein, or would be otherwise hazardous, shall have a conspicuous sign on each door opening on such space or room stating the nature of the use and the warning: "IN CASE OF FIRE, USE NO WATER".*

**905.1.1 Construction documents.** *Construction documents for standpipe systems shall contain plans that include at least the following data and information:*

- 1. The locations and sizes of all risers, cross-connections, hose racks, valves, siamese connections, sources of water supply, piping, and other essential features of the system;*
- 2. A floor plan for each group of floors that have typical riser locations and no special features within such group of floor levels, with the indication in title block of such plan indicating clearly the floors to which the arrangement is applicable;*
- 3. A riser diagram showing the essential features of the system, including the risers, cross-connections, valves, siamese connections, tanks, pumps, sources of water supply, pipe sizes, capacities, floor heights, zone pressures, and other essential data and features of the system; and*
- 4. The available water pressure at the top and bottom floors of each zone, and at each floor where the weight pipe fittings change, shall be shown on the riser diagram.*
- 5. For street pressure-fed systems and fire pumps, a statement from the New York City Department of Environmental Protection, giving the minimum water pressure in the main serving the building.*

**905.2 Installation standards.** *Standpipe systems shall be installed in accordance with this section and NFPA 14 as modified in Appendix Q.*

**905.3 Required installations.** Standpipe systems shall be installed where required by Sections 905.3.1 through 905.3.6 and in the locations indicated in Sections 905.4, 905.5 and 905.6. Standpipe systems are permitted to be combined with automatic sprinkler systems.

**Exception:** Standpipe systems are not required in buildings occupied entirely by Group R-3.

**905.3.1 Applicability.** Class III standpipe systems shall be installed throughout the following buildings:

1. In buildings 2 stories or more in height with floor area of 10,000 square feet (929 m<sup>2</sup>) or greater on any story;
2. In buildings 3 stories or more in height with floor area of 7,500 square feet (697 m<sup>2</sup>) or greater on any story;
3. In buildings of any area with a floor level having an occupant load of 30 or more that is located 55 feet (16 764 mm) or more above the lowest level of fire department vehicle access.
4. In buildings of any area, constructed in accordance with Section 403, with occupied floors located 75 feet (22 860 mm) or more above the lowest level of fire department vehicle access.

**Exceptions:**

1. Class I standpipes are allowed in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 provided that the following additional requirements are met:
  - 1.1. A locked storage cabinet shall be provided on the main entrance floor in a location approved by the Fire Commissioner near the standpipe riser enclosure. Such cabinet shall contain at least three open nozzles, two 1.5 inch (38 mm) spanner wrenches, two 2.5 inch (64 mm) spanner wrenches, two 2.5 inch (64 mm) by 1.5 inch (38 mm) non-swivel reducing couplings, and 375 feet (114 m) of 1.5 inch (38 mm) hose. However, the hose may be omitted when serving Group R-2 occupancies.

*1.1.1. A key for unlocking the storage cabinet shall be kept in a location where it is readily available to authorized persons, but not available to the general public. A sign shall be placed on the storage cabinet indicating the location of such key.*

*1.1.2. An additional labeled key shall be kept in a locked receptacle near the storage cabinet openable by a Fire Department standard key. Such receptacle shall be labeled, "FOR FIRE DEPARTMENT USE ONLY."*

*1.1.3. A metal sign shall be placed in each stair enclosure on the main entrance floor stating clearly where the storage cabinet is located.*

*1.2. Hose valves are capped with a hose valve cap fastened to the valve with a chain.*

*2. Class I manual standpipes are allowed in open parking garages where the highest floor is located not more than 150 feet (45 720 mm) above the lowest level of fire department vehicle access.*

*3. Class I manual dry standpipes are allowed in open parking garages that are subject to freezing temperatures, provided that the hose connections are located as required for Class II standpipes in accordance with Section 905.5.*

*4. Class I standpipes are allowed in below-grade stories equipped throughout with an automatic sprinkler system.*

*5. Standpipe outlets may be omitted in portions of first floors or basements that are completely separated from the entrance hall or enclosed stairways leading to the upper floors, provided that portable fire extinguishers are installed, subject to the approval of the Fire Commissioner.*

**905.3.2 Group A.** *Class I automatic wet standpipes shall be provided in nonsprinklered Group A buildings having an occupant load exceeding 1,000 persons.*

***Exceptions:***

*1. Open-air-seating spaces without enclosed spaces.*

2. *Class I automatic dry and semiautomatic dry standpipes or manual wet standpipes are allowed in buildings where the highest floor surface used for human occupancy is 75 feet (22 860 mm) or less above the lowest level of fire department vehicle access. Dry standpipes are permitted only where subject to freezing temperatures.*

**905.3.3 Covered mall buildings.** *Covered mall buildings and buildings connected thereto shall be equipped throughout with a Class I automatic wet standpipe system, except as permitted by Section 905.3.3.1 through 905.3.3.3.*

**905.3.3.1 Covered mall building height.** *Covered mall buildings where the highest occupied floor level is located not more than 30 feet (9144 mm) above the lowest level of the fire department vehicle access shall be permitted to be provided with Class I hose connections connected to the mall sprinkler system in accordance with NFPA 13 Section 8.16.5.2 regarding Hose Connections for Fire Department Use and under the following conditions:*

1. *Any individual outlet shall be capable of delivering water flow at a rate of 250 gallons per minute (946 L/m) while concurrently supplying the mall sprinkler demand; and*
2. *Each of the two most hydraulically remote outlets shall be capable of concurrently delivering 250 gallons per minute (946 L/m) at a pressure of 100 pounds per square inch (689.4 kPa) with no mall sprinkler demand, based on a supply pressure at the system Fire Department connection of not more than 175 pounds per square inch (1207 kPa). Adequacy of the water supply available to the Fire Department to meet the hydraulic calculations shall be demonstrated by the registered design professional.*

**905.3.3.2 Location of hose connections.** *Hose connections shall be provided in accordance with Section 905.4 and at each of the following locations:*

1. *Within the mall at the entrance to each exit passageway or exit.*
2. *At each floor-level landing within enclosed stairways opening directly on the mall.*
3. *At exterior public entrances to the mall.*

**905.3.3.3 Installation standard.** Except as provided in Sections 905.3.3.1 and 905.3.3.2, the Class I hose connections and Fire Department connections shall be designed in conformance with NFPA 14.

**905.3.4 Stages.** Stages greater than 1,000 square feet in area (93 m<sup>2</sup>) shall be equipped with a Class III wet standpipe system with 1.5-inch and 2.5-inch (38 mm and 64 mm) hose connections on each side of the stage.

**Exception:** Where the building or area is equipped throughout with an automatic\_sprinkler system, the hose connections are allowed to be supplied from the automatic sprinkler system in accordance with NFPA 13 Section 8.16.5.2 and shall have a flow rate of not less than that required by NFPA 14 for Class III standpipes.

**905.3.4.1 Hose and cabinet.** The 1.5-inch (38 mm) hose connections shall be equipped with sufficient lengths of 1.5-inch (38 mm) hose to provide fire protection for the stage area. Hose connections shall be equipped with an approved adjustable fog nozzle and be mounted in a cabinet or on a rack.

**905.3.5 Underground buildings.** Underground buildings shall be equipped throughout with a Class I automatic wet or manual wet standpipe system.

**905.3.6 Helistops and heliports.** Buildings with a helistop or heliport that are equipped with a standpipe shall extend the standpipe to the roof level on which the helistop or heliport is located in accordance with the New York City Fire Code. All portions of the helistop and heliport area shall be within 150 feet (45 720 mm) of a 2.5 inch (64 mm) outlet on a Class I or III standpipe, in accordance with the New York City Fire Code.

**905.4 Location of Class I standpipe hose connections.** Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required stairway, a hose connection shall be provided for each floor level above or below grade. Hose connections shall be readily accessible and located at the riser on each floor level landing and on the entrance floor above the standpipe riser control valve. Non-required enclosed stairways are not required to have hose connections. Stairways without hose connections shall have a sign on the door to the stairway stating, "No standpipe connections in stairway".

2. *On each side of the wall adjacent to the exit opening of a horizontal exit.*
3. *In every exit passageway at the entrance from the exit passageway to the other areas of a building.*
4. *In covered mall buildings, in accordance with Section 905.3.3.2.*
5. *Where the roof has a slope of less than four units vertical in 12 units horizontal (33.3-percent slope), each standpipe shall be provided with a hose connection located either on the roof or at the highest landing of stairways with stair access to the roof. An additional hose connection shall be provided at the top of the most hydraulically remote standpipe for testing purposes.*
6. *Where the most remote portion of a floor or story is more than 150 feet (45 720 mm) from a hose connection, additional hose connections shall be provided in approved locations. For the purposes of this section, a penthouse with an occupant load greater than 10 shall be considered a story.*

**905.4.1 Protection.** *Risers and laterals of Class I standpipe systems not located within an enclosed stairway or pressurized enclosure shall be protected by a degree of fire resistance equal to that required for vertical enclosures in the building in which they are located. No standpipe riser shall be placed in any shaft containing a gas or fuel pipeline.*

**Exception:** *In buildings equipped throughout with an approved automatic sprinkler system, laterals that are not located within an enclosed stairway or pressurized enclosure are not required to be enclosed in fire-resistance-rated construction.*

**905.4.2 Interconnection.** *In buildings where more than one standpipe is provided, the standpipes shall be interconnected in accordance with NFPA 14.*

**905.5 Location of Class II standpipe hose connections.** *Class II standpipe hose connections shall be accessible and located so that all portions of the building are within 30 feet (9144 mm) of a nozzle attached to 100 feet (30 480 mm) of hose.*

**905.5.1 Groups A-1 and A-2.** *In Group A-1 and A-2 occupancies with occupant loads of more than 1,000, hose connections shall be located on each side of any stage.*

**905.5.2 Protection.** *Fire-resistance-rated protection of risers and laterals of Class II standpipe*

*systems is not required.*

**905.6 Location of Class III standpipe hose connections.** *Class III standpipe systems shall have hose connections located as required for Class I standpipes in Section 905.4 and shall have Class II hose connections as required in Section 905.5.*

**905.6.1 Protection.** *Risers and laterals of Class III standpipe systems shall be protected as required for Class I systems in accordance with Section 905.4.1.*

**905.6.2 Interconnection.** *In buildings where more than one standpipe is provided, the standpipes shall be interconnected in accordance with NFPA 14.*

**905.7 Cabinets.** *Cabinets containing fire-fighting equipment such as standpipes, fire hoses, fire extinguishers or Fire Department valves shall not be blocked from use or obscured from view.*

**905.7.1 Cabinet equipment identification.** *Cabinets shall be identified in an approved manner by a permanently attached sign with white letters not less than 2 inches (51 mm) high and a red background color, indicating the equipment contained therein.*

**Exception:** *Doors that have either an approved visual identification clear glass panel or a complete glass door panel are not required to be marked.*

**905.7.2 Locking cabinet doors.** *Cabinets shall be unlocked.*

**Exceptions:**

1. *Visual identification panels of glass or other approved transparent frangible material that is easily broken and allows access.*
2. *Approved locking arrangements.*
3. *Locking of cabinets shall be permitted in Group I-3.*

**905.8 Dry standpipes.** *Dry standpipes shall not be installed.*

**Exception:** *Where subject to freezing and in accordance with NFPA 14.*

**905.9 Valve supervision.** Valves controlling water supplies shall be supervised in the open position so that a change in the normal position of the valve will generate a supervisory signal at the supervising station required by Section 903.4. Where a fire alarm system is provided, a signal shall also be transmitted to the control unit.

**Exceptions:**

1. Valves to underground key or hub valves in roadway boxes provided by the city or public utility do not require supervision.
2. Valves locked in the normal position and inspected as provided in this code in buildings not equipped with a fire alarm system.

**905.10 During construction.** Standpipe systems required during construction, alteration and demolition operations shall be provided in accordance with Section 3303.8.

**SECTION BC 906  
PORTABLE FIRE EXTINGUISHERS**

**906.1 General.** Portable fire extinguishers shall be provided in occupancies and locations as required by the New York City Fire Code.

**SECTION BC 907  
FIRE ALARM AND DETECTION SYSTEMS**

**907.1 General.** This section covers the application, installation, performance and maintenance of fire alarm systems and their components. Systems shall be designed and installed in accordance with NFPA 72 as modified in Appendix Q and the New York City Electrical Code.

**907.1.1 Construction documents.** Construction documents for fire alarm systems shall be submitted for review and approval to the department and the Fire Department prior to system installation. Construction documents shall include, but not be limited to, all of the following:

1. A floor plan that indicates the use of all rooms.

2. *Locations of alarm-initiating and notification appliances.*
3. *Alarm control and trouble signaling equipment.*
4. *Annunciation.*
5. *Power connection.*
6. *Fire alarm riser diagram and all fire alarm devices indicated on the floor plans. Quantities of devices on the floor plans shall match the quantities indicated on the riser diagram.*
7. *Copies of any variances granted by the Fire Department.*
8. *Legend of all fire alarm symbols and abbreviations used.*
9. *Design criteria for fire alarm audibility in various occupancies indicated on plans.*
10. *Fire alarm sequence of operation for the fire alarm control panel and the central station transmitter.*
11. *The interface of fire safety control functions.*

**907.1.2 Equipment.** *Systems and their components shall be listed for the purpose for which they are installed.*

**907.2 Where required.** *An approved manual, automatic or manual and automatic fire alarm system shall be provided in accordance with Sections 907.2.1 through 907.2.21. Where automatic sprinkler protection, installed in accordance with Section 903.3.1.1 or 903.3.1.2, is provided and connected to the building fire alarm system, automatic heat detection required by this section shall not be required. An approved automatic fire detection system shall be installed in accordance with the provisions of this code, the New York City Mechanical Code, and NFPA 72. Devices, combinations of devices, appliances and equipment shall comply with Section 907.1.2. The automatic fire detectors shall be smoke detectors, except that an approved alternative type of detector shall be installed in spaces such as boiler rooms where, during normal operation, products of combustion are present in sufficient quantity to actuate a smoke detector. All initiating devices related to fire or life safety, other than smoke alarms, shall be connected to the fire*

alarm system.

*In all occupancies where an automatic fire alarm system is required by this section, selective coverage smoke detectors shall be located as follows, unless partial or total coverage automatic detection is specified.*

1. *In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms, and in elevator lobbies.*
2. *In air distribution systems in accordance with Section 606 of the New York City\_Mechanical Code.*

**907.2.1 Group A.** *A manual and automatic fire alarm system shall be installed in accordance with NFPA 72 in Group A occupancies having an occupant load of 300 or more. Portions of Group E occupancies occupied for assembly purposes shall be provided with a fire alarm system as required for the Group E occupancy.*

**Exceptions:**

1. *Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system and the notification appliances will activate upon sprinkler water flow.*
2. *A manual fire alarm system shall be installed in spaces meeting the definition for cabaret having an occupant load of 75 or more, including associated stages, dressing rooms, and property rooms.*

**907.2.1.1 System initiation in Group A occupancies.** *Activation of the fire alarm in Group A-1 occupancies with an occupant load of 300 or more, and in all other Group A occupancies with an occupant load of 1,000 or more, shall initiate a presignal system at a constantly attended location from which the Fire Department shall be notified and live voice evacuation instructions shall be initiated using an emergency voice/alarm communications system in accordance with NFPA 72.*

**907.2.1.2 Emergency power.** *Emergency voice/alarm communications systems where required by Section 907.2.1.1 shall be provided with an approved emergency power source and shall be designed and installed in accordance with NFPA 72 and the New York City Electrical Code.*

**907.2.2 Group B.** A manual and automatic fire alarm system shall be installed in Group B occupancies having an occupant load of 500 or more persons or more than 100 persons above or below the lowest level of exit discharge. Where such occupancies are not protected by an automatic sprinkler system, a manual fire alarm and partial coverage automatic smoke detection or automatic heat detection system shall be installed in accordance with NFPA 72.

**907.2.2.1 High-Rise and large area buildings.** In high-rise buildings constructed in accordance with Section 403, Group B occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access or having a total gross area exceeding 100,000 square feet (9290 m<sup>2</sup>) shall comply with the requirements of Section 907.2.12.

**907.2.3 Group E.** A manual and automatic fire alarm system shall be installed in Group E occupancies. When automatic sprinkler systems or smoke detectors are installed, such systems or detectors shall be connected to the building fire alarm system.

**907.2.4 Group F.** A manual and automatic fire alarm system shall be installed in Group F occupancies that are two or more stories in height and have an occupant load of 100 or more, or when 25 persons or more are above or below the lowest level of exit discharge.

**907.2.5 Group H.** A manual and automatic fire alarm system shall be installed in Group H-5 occupancies and in occupancies used for the manufacture of organic coatings. In addition to the automatic fire alarm system requirements of Section 907.2, an automatic smoke detection system shall be installed for highly toxic gases, organic peroxides and oxidizers in accordance with the New York City Fire Code, and shall be connected to a central station.

**Exceptions:** A smoke detection system shall not be required in detached storage buildings equipped throughout with an approved automatic fire-extinguishing system and used only to store the following:

1. Organic peroxides.
2. Liquid or solid oxidizers.

**907.2.6 Group I.** A manual and automatic fire alarm system and an automatic fire detection system shall be installed in Group I occupancies. An electrically supervised, automatic smoke detection system shall be provided in waiting areas that are open to corridors.

**907.2.6.1 Group I-2.** *Corridors in nursing homes (both intermediate-care and skilled nursing facilities), detoxification facilities and spaces open to the corridors shall be equipped with an automatic fire detection system.*

**907.2.6.2 Group I-3.** *Group I-3 occupancies shall be equipped with a manual and automatic fire alarm system installed for alerting staff.*

**907.2.6.2.1 System initiation.** *Actuation of an automatic fire-extinguishing system, a manual fire alarm box or a fire detector shall initiate an approved alarm signal that automatically notifies staff. Presignal systems shall not be used.*

**907.2.6.2.2 Manual fire alarm boxes.** *Manual fire alarm boxes are not required to be located in accordance with Section 907.3 where the fire alarm boxes are provided at staff-attended locations having direct supervision over areas where manual fire alarm boxes have been omitted. Manual fire alarm boxes shall be permitted to be locked in areas occupied by detainees, provided that staff members are present within the subject area and have keys readily available to operate the manual fire alarm boxes.*

**907.2.6.2.3 Smoke detectors.** *An approved automatic smoke detection system shall be installed throughout resident housing areas, including sleeping areas and contiguous day rooms, group activity spaces and other common spaces normally accessible to residents.*

**Exceptions:**

1. *Other approved smoke detection arrangements providing equivalent protection including, but not limited to, placing detectors in exhaust ducts from cells or behind protective guards listed for the purpose are allowed when necessary to prevent damage or tampering.*
2. *Sleeping units in Use Conditions 2 or 3.*
3. *Smoke detectors are not required in sleeping with four or fewer occupants in smoke compartments that are equipped throughout with an approved automatic sprinkler system.*

**907.2.7 Group M.** *A manual and automatic fire alarm system shall be installed in Group M*

occupancies where any one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1115 m<sup>2</sup>);
2. Where a Group M fire area is located more than three stories above grade;
3. Where the combined area of all Group M fire areas on all floors, including mezzanines, exceeds 24,000 square feet (2230 m<sup>2</sup>); or
4. Where a Group M fire area in a below-grade story exceeds 1,500 square feet (139 m<sup>2</sup>).

Where such occupancies are not protected by an automatic sprinkler system, a manual fire alarm and partial coverage automatic smoke detection or automatic heat detection system shall be installed in accordance with NFPA 72.

**907.2.8 Group R-1.** Fire alarm systems shall be installed in Group R-1 occupancies as required in Sections 907.2.8.1 through 907.2.8.3.

**907.2.8.1 Manual fire alarm system.** A manual fire alarm system shall be installed in Group R-1 occupancies.

**Exception:** A manual fire alarm system is not required in buildings not over two stories in height where all individual dwelling units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each individual dwelling unit has an exit directly to a public way, exit court or yard.

**907.2.8.2 Automatic fire alarm system.** An automatic fire alarm system shall be installed in Group R-1 occupancies. In addition to the automatic fire alarm system requirements of Section 907.2, smoke detectors shall be installed in all public corridors serving dwelling units and in accordance with Section 907.2.8.3.

**Exception:** An automatic fire detection system is not required in buildings that do not have public corridors serving dwelling units and each dwelling unit has a means of egress door opening directly to an exterior exit access that leads directly to an exit.

**907.2.8.3 Smoke detectors within dwelling units.** Smoke detectors and audible notification appliances shall be installed in dwelling units and shall be annunciated by dwelling unit at a

*constantly attended location from which the fire alarm system is capable of being manually activated. Smoke detectors are required in the following areas:*

- 1. In sleeping areas.*
- 2. In every room in the path of the means of egress from the sleeping area to the door leading from the dwelling unit.*
- 3. In each story within the unit, including below-grade stories. For dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level.*

**907.2.9 Group R-2.** *An automatic fire alarm system without alarm notification appliances shall be provided in accordance with this section in Group R-2 occupancies, other than student apartments, where such occupancy satisfies any one of the following conditions:*

- 1. Any dwelling unit is located three or more stories above the lowest level of exit discharge, including dwelling units in penthouses of any area;*
- 2. Any dwelling unit is located more than one story below the highest level of exit discharge of exits serving the dwelling unit; or*
- 3. The building contains more than 16 dwelling units.*

*Actuation of smoke detectors shall not initiate a signal to alarm notification appliances. The activation of any detector required by this section shall initiate a signal at a central station or a constantly attended location. Smoke detectors shall be located as follows:*

- 1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room, greater than 75 square feet (6.96 m<sup>2</sup>) in area.*
- 2. In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.*
- 3. In elevator machine rooms and in elevator lobbies.*

**907.2.9.1 Group R-2 student apartments.** Where the main use or dominant occupancy of a building is classified as R-2 student apartments, as defined in Section 310.2, fire alarm systems shall be installed in accordance with Section 907.2.8. Where the main use or dominant occupancy of a building is not classified as R-2 student apartments and the building is occupied partially by Group R-2 student apartments, fire alarm systems shall be installed in accordance with Sections 907.2.9.1.1 through 907.2.9.1.3.

**907.2.9.1.1 Manual fire alarm system.** A manual fire alarm system shall be installed throughout all public corridors serving student apartments and student related uses. Student related uses shall include common spaces such as recreation rooms, lounges, dining rooms, laundry rooms, and storage rooms.

**Exceptions:**

1. A manual fire alarm system is not required in buildings not over two stories in height where all individual dwelling units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each individual dwelling unit has an exit directly to a public way, exit court or yard.
2. A manual fire alarm system is not required in buildings containing fewer than 15 student apartments.

**907.2.9.1.2 Automatic fire alarm system.** An automatic fire alarm system without alarm notification appliances shall be installed in accordance with this section in Group R-2 student apartments and student related uses. The activation of any smoke detector required by this section shall initiate a signal at a central station or a constantly attended location. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms, and in elevator lobbies.
2. In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.
3. Through out all public corridors serving student apartments and student related

uses. Student related uses shall include common spaces such as recreation rooms, lounges, dining rooms, laundry rooms, and storage rooms. However, smoke detectors shall not be required in such public corridors in buildings containing fewer than 15 student apartments.

**Exception:** An automatic fire alarm system is not required in buildings not over two stories in height where all individual dwelling units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire barriers and each individual dwelling unit has an exit directly to a public way, exit court or yard.

**907.2.9.1.3 Smoke alarms.** Smoke alarms shall be installed as required by Section 907.2.10.

**907.2.10 Single- and multiple-station smoke alarms.** Listed single- and multiple-station smoke alarms shall be installed in accordance with the provisions of this code and the household fire-warning equipment provisions of NFPA72.

**907.2.10.1 Where required.** Single- or multiple-station smoke alarms shall be installed in the locations described in Sections 907.2.10.1.1.

**907.2.10.1.1 Smoke alarms in Groups R-2, R-3, and I-1.** Single- or multiple-station smoke alarms shall be installed and maintained in Groups R-2, R-3, and I-1, regardless of occupant load at all of the following locations within a dwelling unit:

1. On the ceiling or wall outside of each room used for sleeping purposes within 15 feet (4572 mm) from the door to such room.
2. In each room used for sleeping purposes.
3. In each story within a dwelling unit, including below-grade stories and penthouses of any area, but not including crawl spaces and uninhabitable attics. In dwellings or dwelling units with split levels and without an intervening door between the adjacent levels, a smoke alarm installed on the upper level shall suffice for the adjacent lower level provided that the lower level is less than one full story below the upper level.

**907.2.10.2 Power source.** Required smoke alarms shall receive their primary power from a dedicated branch circuit or the unswitched portion of a branch circuit also used for power and

lighting, and shall be equipped with a battery backup. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for over-current protection.

**907.2.10.3 Interconnection.** Where more than one smoke alarm or detector is required to be installed within an individual dwelling unit in Group R-2, R-3, or within an individual dwelling unit or sleeping unit in Group R-1, the smoke alarms or detectors shall be interconnected in such a manner that the activation of one alarm or detector will activate all of the alarms or detectors in the individual unit. The alarm or detector shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

**907.2.10.4 Acceptance testing.** When the installation of the alarm devices is complete, each detector and interconnecting wiring for multiple-station alarm devices shall be tested in accordance with the household fire warning equipment provisions of NFPA 72.

**907.2.11 Special amusement buildings.** An approved automatic smoke detection system shall be provided in special amusement buildings in accordance with this section.

**Exception:** In areas where ambient conditions will cause a smoke detection system to alarm, an approved alternative type of automatic detector shall be installed.

**907.2.11.1 Alarm.** Activation of any single smoke detector, the automatic sprinkler system or any other automatic fire detection device shall immediately sound an alarm at the building at a constantly attended location from which emergency action can be initiated, including the capability of manual initiation of requirements in Section 907.2.11.2.

**907.2.11.2 System response.** The following minimum system actuations and responses shall be required upon approval by the department and the Fire Department. The activation of two or more smoke detectors, a single smoke detector with alarm verification, the automatic sprinkler system or other approved fire detection device shall automatically:

1. Cause illumination of the means of egress with light of not less than 1 foot-candle (11 lux) at the walking surface level;
2. Stop any conflicting or confusing sounds and visual distractions; and
3. Activate an approved directional exit marking that will become apparent in an

*emergency. Such system response shall also include activation of a prerecorded message, clearly audible throughout the special amusement building, instructing patrons to proceed to the nearest exit. Alarm signals used in conjunction with the prerecorded message shall produce a sound that is distinctive from other sounds used during normal operation. The wiring to the auxiliary devices and equipment used to accomplish the above fire safety functions shall be monitored for integrity in accordance with NFPA 72.*

**907.2.11.3 Emergency voice/alarm communication system.** *An emergency voice/alarm communication system, which is also allowed to serve as a public address system, shall be installed in accordance with NFPA 72, and shall be audible throughout the entire special amusement building.*

**907.2.12 High-rise buildings.** *Buildings constructed in accordance with Section 403 and having floors used for human occupancy located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access shall be provided with automatic fire detection connected to an automatic fire alarm system in accordance with Section 907.2.12.1 and an emergency voice/alarm communication system in accordance with Section 907.2.12.2.*

**Exceptions:**

- 1. Open parking garages in accordance with Section 406.3.*
- 2. Buildings with an occupancy in Group A-5.*
- 3. Low-hazard special occupancies in accordance with Section 503.1.2.*
- 4. Buildings with an occupancy in Group H-1, H-2 or H-3 in accordance with Section 415.*

**907.2.12.1 Automatic fire detection.** *In addition to smoke detection otherwise required by this code, smoke detectors shall be provided in accordance with this section. Smoke detectors shall be connected to an automatic fire alarm system. The activation of any detector required by this section shall operate the emergency voice/alarm communication system. Smoke detectors shall be located as follows:*

- 1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room, in elevator machine rooms and in elevator lobbies.*

2. *In air distribution systems in accordance with Section 606 of the New York City Mechanical Code.*
3. *In Group R-1 occupancies a listed smoke detector is allowed to be used in each return air riser carrying not more than 5,000 cfm (2.4 m<sup>3</sup>/s) and serving not more than 10 air inlet openings.*

***Exception for Group R-2 occupancies:*** *In R-2 occupancies, the activation of smoke detectors shall initiate a signal at a central station or a constantly attended location and shall not initiate a signal to an alarm notification appliance.*

**907.2.12.2 Emergency voice/alarm communication system.** *The operation of any automatic fire detector, sprinkler water-flow device or manual fire alarm box shall automatically sound an alarm tone followed by live voice instructions giving approved information and directions on a general or selective basis to the following areas on a minimum of the alarming floor, the floor above and the floor below in accordance with the New York City Fire Code.*

1. *Elevator lobbies.*
2. *Corridors.*
3. *Rooms and tenant spaces exceeding 1,000 square feet (93 m<sup>2</sup>) in area.*
4. *Dwelling units in Group R-1 occupancies.*
5. *Areas of rescue assistance as defined in Section 1002.*

***Exceptions:***

1. *Group I-1 and I-2 occupancies. In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.*
2. *Group R-2 occupancies 125 feet or less in height. Emergency voice/alarm communication systems shall not be required in Group R-2 occupancies in buildings 125 feet (33 100 mm) or less in height.*

3. *Group R-2 occupancies greater than 125 feet in height. In Group R-2 occupied buildings greater than 125 feet (33 100 mm) in height, activation of any smoke detector or sprinkler water flow device shall initiate a signal at a central station or constantly attended location and shall not initiate a signal to an alarm notification appliance. An emergency voice/alarm communication system shall not be required. However, a one-way voice communication shall be provided between the fire command center for use by Fire Department personnel and the following terminal areas:*

3.1. *Within dwelling units. An intercom system may be utilized when provided with an override feature for use by Fire Department personnel. Such intercom system shall comply with rules promulgated by the commissioner establishing installation requirements.*

3.2. *Within required exit stairs. Annunciation devices shall be located at least on every other story. Such annunciation devices shall comply with rules promulgated by the commissioner establishing installation requirements.*

**907.2.12.2.1 Manual override.** *A manual override for emergency voice communication shall be provided for all paging zones with all-call capability and feature.*

**907.2.12.2.2 Live voice messages.** *The emergency voice/alarm communication system shall have multi-channel capability to allow live voice messages via independent audio channels to the stairs, to all or selected floors without automatic interruption of the alarm tones on the floor of incidence, floor above or floor below.*

**907.2.12.2.3 Standard.** *The emergency voice/alarm communication system shall be designed and installed in accordance with NFPA 72 as modified in Appendix Q.*

**907.2.12.3 Fire Department communication system.** *An approved two-way, fire department communication system designed and installed in accordance with NFPA 72 shall be provided for Fire Department use. It shall operate between a fire command center complying with Section 911 and elevators, elevator lobbies, emergency power rooms, fire pump rooms, areas of refuge and inside enclosed exit stairways. The Fire Department communication device shall be provided at each floor level within each enclosed stairway.*

**Exceptions:**

1. *Fire Department radio systems where approved by the Fire Department may be installed in lieu of a two-way fire department communication system.*
2. *Group R-2 occupancy.*

**907.2.13 Atriums connecting more than two stories.** *A fire alarm system shall be installed in occupancies with an atrium that connects more than two stories. The system shall be activated in accordance with Section 907.7. Such occupancies in Group A, E or M shall be provided with an emergency voice/alarm communication system complying with the requirements of Section 907.2.12.2.*

**907.2.14 High-piled combustible storage areas.** *An automatic fire detection system shall be installed throughout high-piled combustible storage areas where required by the New York City Fire Code.*

**907.2.15 Delayed egress locks.** *Where delayed egress locks are installed on means of egress doors in accordance with Section 1008.1.8.6, an automatic smoke or heat detection system shall be installed as required by that section.*

**907.2.16 Aerosol storage uses.** *Aerosol storage rooms and general-purpose warehouses containing aerosols shall be provided with an approved manual fire alarm system where required by the New York City Fire Code.*

**907.2.17 Lumber, plywood and veneer mills.** *Lumber, plywood and veneer mills shall be provided with a manual fire alarm system.*

**907.2.18 Underground buildings with smoke exhaust system.** *Where a smoke exhaust system is installed in an underground building as required by Section 405, automatic fire detectors shall be provided in accordance with this section.*

**907.2.18.1 Smoke detectors.** *A minimum of one smoke detector listed for the intended purpose shall be installed in the following areas:*

1. *Mechanical equipment, electrical, transformer, telephone equipment, elevator machine or similar rooms.*
2. *Elevator lobbies.*

3. *The main supply and return and exhaust air plenum of each air-conditioning system serving more than one story and located in a serviceable area downstream from filters on supply ducts and in return/exhaust ducts downstream of the last duct inlet.*
4. *Each connection to a vertical duct or riser serving two or more floors from return air ducts or plenums of heating, ventilating and air-conditioning systems, except that in Group R occupancies, a listed smoke detector is allowed to be used in each return air riser carrying not more than 5,000 cfm (2.4 m<sup>3</sup>/s) and serving not more than 10 air inlet openings.*

**907.2.18.2 Alarm required.** *Activation of the smoke exhaust system shall activate an audible alarm at a constantly attended location.*

**907.2.19 Underground buildings.** *In underground buildings complying with Section 405 where the lowest level of a structure is more than 30 feet (18 144 mm) below the lowest level of exit discharge, the structure shall be equipped throughout with a manual and automatic fire alarm system, including an emergency voice/alarm communication system installed in accordance with Section 907.2.12.2.*

**907.2.19.1 Public address system.** *In underground buildings complying with Section 405 where a fire alarm system is not required by Section 907.2, a public address system shall be provided that shall be capable of transmitting voice communications to the highest level of exit discharge serving the underground portions of the structure and all levels below.*

**907.2.20 Covered mall buildings.** *Covered mall buildings exceeding 50,000 square feet (4645 m<sup>2</sup>) in total floor area shall be provided with an emergency voice/alarm communication system. An emergency voice/alarm communication system serving a mall, required or otherwise, shall be accessible to the Fire Department. The system shall be provided in accordance with Section 907.2.12.2.*

**907.2.20.1 Battery rooms.** *An approved automatic smoke detection system shall be installed in areas containing stationary lead-acid battery systems having a liquid capacity of more than 50 gallons (189.3 L). The detection system shall be supervised by an approved central, proprietary or remote station service or a local alarm that will sound an audible signal at a constantly attended location.*

**907.3 Manual fire alarm boxes.** *Manual fire alarm boxes shall be installed in accordance with Sections 907.3.1 through 907.3.5.*

**907.3.1 Location.** *Manual fire alarm boxes shall be located not more than 5 feet (1524 mm) from the entrance to each exit. Additional manual fire alarm boxes shall be located so that travel distance to the nearest box does not exceed 200 feet (60 960 mm).*

**907.3.2 Height.** *The height of the manual fire alarm boxes shall be a minimum of 42 inches (1067 mm) and a maximum of 48 inches (1219 mm), measured vertically, from the floor level to the activating handle or lever of the box.*

**907.3.3 Color.** *Manual fire alarm boxes shall be red in color.*

**907.3.4 Signs.** *Where fire alarm systems are not monitored by a supervising station, an approved permanent sign that reads: WHEN ALARM SOUNDS—CALL FIRE DEPARTMENT shall be installed adjacent to each manual fire alarm box.*

**Exception:** *Where the manufacturer has permanently provided this information on the manual fire alarm box.*

**907.3.5 Protective covers.** *The Fire Department is authorized to require the installation of listed manual fire alarm box protective covers to prevent malicious false alarms or provide the manual fire alarm box with protection from physical damage. The protective cover shall be transparent or red in color with a transparent face to permit visibility of the manual fire alarm box. Each cover shall include proper operating instructions. A protective cover that emits a local alarm signal shall not be installed unless approved.*

**907.4 Power supply.** *The primary and secondary power supplies for the fire alarm system shall be provided in accordance with NFPA 72.*

**907.5 Wiring.** *Wiring shall comply with the requirements of the New York City Electrical Code and NFPA 72. Wireless protection systems utilizing radio-frequency transmitting devices shall comply with the special requirements for supervision of low-power wireless systems in NFPA 72.*

**907.6 Activation.** *Where an alarm notification system is required by another section of this code, it shall be activated by:*

1. *A required automatic fire alarm system.*
2. *Sprinkler water-flow devices.*
3. *Required manual fire alarm boxes.*
4. *Other required types of automatic fire detection devices or suppression systems.*

**907.7 Presignal system.** *Presignal systems shall not be installed unless approved by the Fire Department. Where a presignal system is installed, 24-hour personnel supervision shall be provided at a location approved by the Fire Department. Where a connection to a supervising station is required, the transmission of the alarm signal to the supervising station shall activate upon the initial alarm signal.*

**907.8 Zones.** *Each floor shall be zoned separately and a zone shall not exceed 22,500 square feet (2090 m<sup>2</sup>). The length of any zone shall not exceed 300 feet (91 440 mm) in any direction.*

**Exception:** *Automatic sprinkler system zones shall not exceed the area permitted by NFPA 13.*

**907.8.1 Zoning indicator panel.** *A zoning indicator panel and the associated controls shall be provided at the main building entrance accessible to responding Fire Department personnel and in other locations approved by the department and the Fire Department. The visual zone indication shall lock in until the system is reset and shall not be canceled by the operation of an audible alarm-silencing switch.*

**907.8.2 High-rise buildings.** *In high-rise buildings constructed in accordance with Section 403 and used for human occupancy that have occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, a separate zone by floor shall be provided for all of the following types of alarm-initiating devices where provided:*

1. *Smoke detectors.*
2. *Sprinkler water-flow devices.*
3. *Manual fire alarm boxes.*
4. *Other approved types of automatic fire detection devices or suppression systems.*

**907.9 Alarm notification appliances.** Alarm notification appliances listed for their purpose shall be provided.

**907.9.1 Visible alarms.** Visible alarm notification appliances shall be provided in accordance with Sections 907.9.1.1 through 907.9.1.3.

**Exception:** Visible alarm notification appliances shall not be required in exits.

**907.9.1.1 Public and common areas.** Visible alarm notification appliances shall be provided in public areas and common areas.

**907.9.1.2 Employee work areas.** Where employee work areas have audible alarm coverage, the wiring systems shall be designed so that visible alarm notification appliances can be integrated into the alarm system.

**907.9.1.3 Groups I-1 and R-1.** Group I-1 and R-1 dwelling units in accordance with Table 907.9.1.3 shall be provided with a visible alarm notification appliance, activated by both the in-room smoke alarm and the building fire alarm system.

**[F] TABLE 907.9.1.3**  
**VISIBLE AND AUDIBLE ALARMS**

<b>NUMBER OF DWELLING UNITS</b>	<b>DWELLING UNITS WITH VISIBLE AND AUDIBLE ALARMS</b>
<i>6 to 25</i>	<i>2</i>
<i>26 to 50</i>	<i>4</i>
<i>51 to 75</i>	<i>7</i>
<i>76 to 100</i>	<i>9</i>
<i>101 to 150</i>	<i>12</i>
<i>151 to 200</i>	<i>14</i>
<i>201 to 300</i>	<i>17</i>
<i>301 to 400</i>	<i>20</i>
<i>401 to 500</i>	<i>22</i>
<i>501 to 1,000</i>	<i>5% of total</i>
<i>1,001 and over</i>	<i>50 plus 3 for each 100 over 1,000</i>

**907.9.2 Audible alarms.** Audible alarm notification appliances shall be provided and shall sound a distinctive sound that is not to be used for any purpose other than that of a fire alarm. The audible alarm notification appliances shall provide a sound pressure level of 15 decibels (dBA) above the average ambient sound level or 5 dBA above the maximum sound level having a duration of at least 60 seconds, whichever is greater, in every occupied space within the building. The minimum sound pressure levels shall be: 70 dBA in occupancies in Groups R and I-1; 90 dBA in mechanical equipment rooms and 60 dBA in other occupancies. The maximum sound pressure level for audible alarm notification appliances shall be 120 dBA at the minimum hearing distance from the audible appliance. Where the average ambient noise is greater than 105 dBA, visible alarm notification appliances shall be provided in accordance with NFPA72 and audible alarm notification appliances shall not be required to provide a maximum sound pressure level above 120 dBA.

**Exception:** Visible alarm notification appliances shall be allowed in lieu of audible alarm notification appliances in critical-care areas of Group I-2 occupancies.

**907.10 Fire safety functions.** Where a fire alarm system is required by Section 907.2, automatic fire detectors utilized for the purpose of performing fire safety functions shall be connected to the building's fire alarm control panel. Detectors shall, upon actuation, perform the intended function and activate the alarm notification appliances or a visible and audible supervisory signal at a constantly attended location. In buildings not required to be equipped with a fire alarm system, the automatic fire detector shall be powered by normal electrical service and, upon actuation, perform the intended function. The detectors shall be located in accordance with NFPA 72.

**907.11 Duct smoke detectors.** Where a fire alarm system is provided, duct smoke detectors shall be connected to the building's fire alarm control panel. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a constantly attended location. Duct smoke detectors shall not be used as a substitute for required open-area detection.

**Exceptions:**

1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the building's alarm notification appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

**907.12 Access.** Access shall be provided to each detector for periodic inspection, maintenance and testing.

**907.13 Fire-extinguishing systems.** Where a fire alarm system is required by another section of this code or is otherwise installed, automatic fire-extinguishing systems shall be connected to the building fire alarm system.

**907.14 Monitoring.** Where required by this chapter or the New York City Fire Code, an approved supervising station in accordance with NFPA 72 shall monitor fire alarm systems.

**Exception:** Supervisory service is not required for:

1. Single- and multiple-station smoke alarms required by Section 907.2.10.
2. Smoke detectors in Group I-3 occupancies.
3. Automatic sprinkler systems in one- and two-family dwellings.

**907.15 Automatic telephone-dialing devices.** Automatic telephone-dialing devices used to transmit an emergency alarm shall not be connected to any Fire Department telephone number unless approved by the Fire Commissioner.

**907.16 Acceptance tests.** Upon completion of the installation of the fire alarm system, alarm notification appliances and circuits, alarm-initiating devices and circuits, supervisory-signal initiating devices and circuits, signaling line circuits, and primary and secondary power supplies shall be tested in accordance with NFPA 72.

**907.17 Record of completion.** A record of completion in accordance with NFPA 72 verifying that the system has been installed in accordance with the approved construction documents and specifications shall be provided.

**907.18 Instructions.** Operating, testing and maintenance instructions, and record drawings (“as built”) and equipment specifications shall be provided at an approved location.

**907.19 Inspection, testing and maintenance.** The maintenance and testing schedules and procedures for fire alarm and fire detection systems shall be in accordance with the New York City Fire Code.

**SECTION BC 908**  
**EMERGENCY ALARM SYSTEMS**

**908.1 Group H occupancies.** *Emergency alarms for the detection and notification of an emergency condition in Group H occupancies shall be provided in accordance with Section 414.7.*

**908.2 Group H-5 occupancy.** *Emergency alarms for notification of an emergency condition in an HPM facility shall be provided as required in Section 415.9.4.6. A continuous gas-detection system shall be provided for HPM gases in accordance with Section 415.9.7.*

**908.3 Highly toxic and toxic materials.** *A gas detection system shall be provided for indoor storage and use of highly toxic and toxic gases to detect the presence of gas at or below the permissible exposure limit (PEL) or ceiling limit of the gas for which detection is provided. The system shall be capable of monitoring the discharge from the treatment system at or below one-half the immediately dangerous to life and health (IDLH) limit.*

**Exception:** *A gas detection system is not required for toxic gases when the physiological warning properties are at a level below the accepted PEL for the gas.*

**908.3.1 Alarms.** *The gas detection system shall initiate a local alarm and transmit a signal to a constantly attended control station when a short-term hazard condition is detected. The alarm shall be both visible and audible and shall provide warning both inside and outside the area where gas is detected. The audible alarm shall be distinct from all other alarms.*

**Exception:** *Signal transmission to a constantly attended control station is not required when not more than one cylinder of highly toxic or toxic gas is stored.*

**908.3.2 Shutoff of gas supply.** *The gas detection system shall automatically close the shutoff valve at the source on gas supply piping and tubing related to the system being monitored for whichever gas is detected.*

**Exception:** *Automatic shutdown is not required for reactors utilized for the production of highly toxic or toxic compressed gases where such reactors are:*

1. *Operated at pressures less than 15 pounds per square inch gauge (psig) (103.4 kPa).*
2. *Constantly attended.*

3. *Provided with readily accessible emergency shutoff valves.*

**908.3.3 Valve closure.** *The automatic closure of shutoff valves shall be in accordance with the following:*

1. *When the gas-detection sampling point initiating the gas detection system alarm is within a gas cabinet or exhausted enclosure, the shutoff valve in the gas cabinet or exhausted enclosure for the specific gas detected shall automatically close.*
2. *Where the gas-detection sampling point initiating the gas detection system alarm is within a gas room and compressed gas containers are not in gas cabinets or exhausted enclosures, the shutoff valves on all gas lines for the specific gas detected shall automatically close.*
3. *Where the gas-detection sampling point initiating the gas detection system alarm is within a piping distribution manifold enclosure, the shutoff valve for the compressed container of specific gas detected supplying the manifold shall automatically close.*

**Exception:** *When the gas-detection sampling point initiating the gas-detection system alarm is at a use location or within a gas valve enclosure of a branch line downstream of a piping distribution manifold, the shutoff valve in the gas valve enclosure for the branch line located in the piping distribution manifold enclosure shall automatically close.*

**908.4 Ozone gas-generator rooms.** *Ozone gas-generator rooms shall be equipped with a continuous gas-detection system that will shut off the generator and sound a local alarm when concentrations above the PEL occur.*

**908.5 Repair garages.** *A flammable-gas detection system shall be provided in repair garages for vehicles fueled by enumerated gases in accordance with Section 406.6.6.*

**908.6 Refrigerant detector.** *Machinery rooms shall contain a refrigerant detector with an audible and visual alarm. The detector, or a sampling tube that draws air to the detector, shall be located in an area where refrigerant from a leak will concentrate. The alarm shall be actuated at a value not greater than the corresponding TLV-TWA values for the refrigerant classification indicated in the New York City Mechanical Code. Detectors and alarms shall be placed in approved locations. Refrigerant detectors shall initiate all functions as required by the New York City Mechanical Code and New York City Fire Code.*

**Exception:** Detectors are not required in ammonia system machinery rooms equipped with a vapor detector in accordance with the New York City Mechanical Code.

**908.7 Carbon monoxide alarms and detectors.** Carbon monoxide alarms and detectors shall be provided and installed in accordance with Sections 908.7.1 through 908.7.4.

**908.7.1 Group I-1 and R occupancies.** Listed carbon monoxide alarms or detectors shall be installed as follows:

1. Group R-1. Carbon monoxide detectors and audible notification appliances shall be installed in affected dwelling units as per Section 908.7.1.1 and shall be annunciated by dwelling unit at a constantly attended location from which the fire alarm system is capable of being manually activated.
2. Groups I-1, R-2 and R-3. Carbon monoxide alarms shall be installed in affected dwelling units as per Section 908.7.1.1.

**908.7.1.1 Affected dwelling units.** Carbon monoxide alarms or detectors shall be required within the following dwelling units:

1. Units on the same story where carbon monoxide producing equipment or enclosed parking is located.
2. Units on the stories above and below the floor where carbon monoxide producing equipment or enclosed parking is located.
3. Units in a building containing a carbon monoxide producing furnace, boiler, or water heater as part of a central system.
4. Units in a building served by a carbon monoxide producing furnace, boiler, or water heater as part of a central system that is located in an adjoining or attached building.

**908.7.1.1.1 Required locations within dwelling units.** Carbon monoxide alarms or detectors shall be located within dwelling units as follows:

1. Outside of any room used for sleeping purposes, within 15 feet (4572 mm) of the

*entrance to such room.*

2. *In any room used for sleeping purposes.*
3. *On any story within a dwelling unit, including below-grade stories and penthouses of any area, but not including crawl spaces and uninhabitable attics.*

**908.7.1.1.2 Installation requirements.** *Carbon monoxide alarms or detectors shall comply with the power source, interconnection, and acceptance testing requirements as required for smoke alarms in accordance with Sections 907.2.10.2 through 907.2.10.4.*

**908.7.2 Group E, I-2 and I-4 occupancies.** *Listed carbon monoxide alarms or detectors shall be installed as follows:*

1. *Carbon monoxide alarms shall be installed within any occupied space containing carbon monoxide producing equipment and in all occupied spaces above and below the story where carbon monoxide producing equipment or enclosed parking is located.*
2. *Carbon monoxide detectors and audible notification appliances shall be installed within any unoccupied space containing carbon monoxide producing equipment. Such detector shall activate an audible alarm at a constantly attended location.*

**908.7.3 Installation.** *Carbon monoxide alarms and detectors shall be listed in accordance with UL 2034 and UL 2075.*

**908.8 Medical gas.** *Medical gas pressure monitoring and alarm systems shall be provided in accordance with NFPA 99 and NFPA 99C.*

**908.9 Flammable gas.** *Areas within buildings containing flammable gas distribution piping operating at levels above 15 pounds per square inch gauge (psig) (103.4 kPa) shall be provided with an approved flammable gas detection-alarm system.*

## **SECTION BC 909 SMOKE CONTROL SYSTEMS**

**909.1 Scope and purpose.** *This section applies to mechanical or passive smoke control systems when they are required by other provisions of this code. The purpose of this section is to establish minimum*

*requirements for the design, installation and acceptance testing of smoke control systems that are intended to provide a tenable environment for the evacuation or relocation of occupants. These provisions are not intended for the preservation of contents, the timely restoration of operations or for assistance in fire suppression. Smoke control systems regulated by this section serve a different purpose than the smoke- and heat-venting provisions found in Section 910. Mechanical smoke control systems shall not be considered exhaust systems under Chapter 5 of the New York City Mechanical Code.*

**909.1.1 Definitions.** *These definitions are added for the purposes of Section 909 only.*

**POST-FIRE SMOKE PURGE SYSTEM.** *A mechanical or natural ventilation system intended to move smoke from the smoke zone to the exterior of the building.*

**PRESSURIZATION.** *Creation and maintenance of pressure levels in zones of a building, including elevator shafts and stairwells, that are higher than the pressure level at the smoke source, such pressure levels being produced by positive pressures of a supply of uncontaminated air; by exhausting air and smoke at the smoke source; or by a combination of these methods.*

**SMOKE.** *Airborne solid and liquid particulates and gases evolved when a material undergoes pyrolysis or combustion, including the quality of air that is entrained or otherwise mixed into the mass.*

**SMOKE BARRIER.** *See Section 702.1*

**SMOKE-CONTROL MODE.** *A predefined operational configuration of a system or device for the purpose of smoke control.*

**SMOKE-CONTROL SYSTEM, MECHANICAL.** *An engineered system that uses mechanical fans to produce pressure differences across smoke barriers or that establishes air flows to limit and direct smoke movement.*

**SMOKE-CONTROL SYSTEM, PASSIVE.** *A system of smoke barriers arranged to limit the migration of smoke.*

**SMOKE-CONTROL ZONE.** *A space within a building enclosed by smoke barriers.*

**SMOKE DAMPER.** *See Section 702.1.*

**STACK EFFECT.** *Vertical air flow within buildings caused by temperature differences.*

**TENABLE ENVIRONMENT.** *An environment in which the quality and location of smoke is limited or otherwise restricted to allow for ready evacuation through the space.*

**909.2 General design requirements.** *Buildings, structures or parts thereof required by this code to have a smoke control system or systems shall have such systems designed in accordance with the applicable requirements of Section 909 and the generally accepted and well-established principles of engineering relevant to the design. The construction documents shall include sufficient information and detail to adequately describe the elements of the design necessary for the proper implementation of the smoke control systems. These documents shall be accompanied by sufficient information and analysis to demonstrate compliance with these provisions.*

**909.3 Special inspection and test requirements.** *In addition to the ordinary inspection and test requirements that buildings, structures and parts thereof are required to undergo, smoke control systems subject to the provisions of Section 909 shall undergo special inspections and tests sufficient to verify the proper commissioning of the smoke control design in its final installed condition. The design submission accompanying the construction documents shall clearly detail procedures and methods to be used and the items subject to such inspections and tests. Such commissioning shall be in accordance with generally accepted engineering practice and, where possible, based on published standards for the particular testing involved. The special inspections and tests required by this section shall be conducted under the same terms in Section 1704.*

**909.3.1 Periodic testing.** *Smoke control systems shall be periodically tested to ensure proper operation. A record of each inspection and test shall be maintained on the premises by the owner or lessee, and the records for at least the last two years of operation shall be made available for inspection by the department and the Fire Commissioner.*

**909.4 Analysis.** *A rational analysis supporting the types of smoke control systems to be employed, their methods of operation, the systems supporting them and the methods of construction to be utilized shall accompany the submitted construction documents and shall include, but not be limited to, the items indicated in Sections 909.4.1 through 909.4.6. The basis of design and design analysis of the smoke control system shall be submitted to the department.*

**909.4.1 Stack effect.** *The system shall be designed such that the maximum probable normal or reverse stack effect will not adversely interfere with the system's capabilities. In determining the maximum probable stack effect, altitude, elevation, weather history and interior temperatures shall be used.*

**909.4.2 Temperature effect of fire.** Buoyancy and expansion caused by the design fire in accordance with Section 909.9 shall be analyzed. The system shall be designed such that these effects do not adversely interfere with the system's capabilities.

**909.4.3 Wind effect.** The design shall consider the adverse effects of wind. Such consideration shall be consistent with the wind-loading provisions of Chapter 16.

**909.4.4 HVAC systems.** The design shall consider the effects of the heating, ventilating and air-conditioning (HVAC) systems on both smoke and fire transport. The analysis shall include all permutations of systems status. The design shall consider the effects of the fire on the HVAC systems.

**909.4.5 Climate.** The design shall consider the effects of low temperatures on systems, property and occupants. Air inlets and exhausts shall be located so as to prevent snow or ice blockage.

**909.4.6 Duration of operation.** All portions of active or passive smoke control systems shall be capable of continued operation after detection of the fire event for not less than 20 minutes.

**909.5 Smoke barrier construction.** Smoke barriers shall comply with Section 709, and shall be constructed and sealed to limit leakage areas exclusive of protected openings. The maximum allowable leakage area shall be the aggregate area calculated using the following leakage area ratios:

1. Walls:  $A/A_w = 0.00100$
2. Exit enclosures:  $A/A_w = 0.00035$
3. All other shafts:  $A/A_w = 0.00150$
4. Floors and roofs:  $A/A_f = 0.00050$

where:

$A$  = Total leakage area, square feet ( $m^2$ ).

$A_F$  = Unit floor or roof area of barrier, square feet ( $m^2$ ).

$A_w$  = Unit wall area of barrier, square feet ( $m^2$ ).

*The leakage area ratios shown do not include openings due to doors, operable windows or similar gaps. These shall be included in calculating the total leakage area.*

**909.5.1 Leakage area.** *The total leakage area of the barrier is the product of the smoke barrier gross area monitored by the allowable leakage area ratio, plus the area of other openings such as gaps and operable windows. Compliance shall be determined by achieving the minimum air pressure difference across the barrier with the system in the smoke control mode for mechanical smoke control systems. Passive smoke control systems tested using other approved means such as door fan testing shall be approved by the department and the Fire Commissioner.*

**909.5.2 Opening protection.** *Openings in smoke barriers shall be protected by automatic-closing devices actuated by the required controls for the mechanical smoke control system. Door openings shall be protected by door assemblies complying with Section 715.3.3.*

**Exceptions:**

1. *Passive smoke control systems with automatic-closing devices actuated by spot-type smoke detectors listed for releasing service installed in accordance with Section 907.10.*
2. *Fixed openings between smoke zones that are protected utilizing the airflow method.*
3. *In Group I-2, where such doors are installed across corridors, a pair of opposite-swinging doors without a center mullion shall be installed having vision panels with approved fire-rated glazing materials in approved fire-rated frames, the area of which shall not exceed that tested. The doors shall be close fitting within operational tolerances and shall not have undercuts, louvers or grilles. The doors shall have head and jamb stops, astragals or rabbets at meeting edges, and automatic-closing devices. Positive-latching devices are not required.*
4. *Group I-3.*
5. *Openings between smoke zones with clear ceiling heights of 14 feet (4267 mm) or greater and bank-down capacity of greater than 20 minutes as determined by the design fire size.*

**909.5.2.1 Ducts and air transfer openings.** *Ducts and air transfer openings are required to be protected with a minimum Class II, 250°F (121°C) smoke damper complying with Section 716.*

**909.6 Pressurization method.** *The primary mechanical means of controlling smoke shall be by pressure differences across smoke barriers. Maintenance of a tenable environment is not required in the smoke control zone of fire origin.*

**909.6.1 Minimum pressure difference.** *The minimum pressure difference across a smoke barrier shall be 0.05-inch water gage (0.0124 kPa) in fully sprinklered buildings. In buildings permitted to be other than fully sprinklered, the smoke control system shall be designed to achieve pressure differences at least two times the maximum calculated pressure difference produced by the design fire, but in no case less than the values indicated in Table 909.6.1:*

**TABLE 909.6.1**  
**MINIMUM PRESSURE DIFFERENCES ACROSS SMOKE BARRIERS**

<i>Ceiling Height</i>	<i>Minimum Design Pressure Difference</i>
<i>Less than 15 feet (4572 mm)</i>	<i>0.10-inch water gage (0.0259 kPa)</i>
<i>Equal to or greater than 15 feet (4572 mm), but less than 21 feet (6401 mm)</i>	<i>0.14-inch water gage (0.0349 kPa)</i>
<i>Equal to or greater than 21 feet (6401mm)</i>	<i>0.18-inch water gage (0.0448 kPa)</i>

**909.6.2 Maximum pressure difference.** *The maximum air pressure difference across a smoke barrier shall be determined by required door-opening or closing forces. The actual force required to open exit doors when the system is in the smoke control mode shall be in accordance with Section 1008.1.2. Opening and closing forces for other doors shall be determined by standard engineering methods for the resolution of forces and reactions. The calculated force to set a side-hinged, swinging door in motion shall be determined by:*

$$F = F_{dc} + K(WA\Delta P)/2(W-d) \quad \text{(Equation 9-1)}$$

where:

$A$  = Door area, square feet ( $m^2$ ).

$d$  = Distance from door handle to latch edge of door, feet (m).

$F$  = Total door opening force, pounds (N).

$F_{dc}$  = Force required to overcome closing device, pounds (N).

$K$  = Coefficient 5.2 (1.0).

$W$  = Door width, feet (m).

$\Delta P$  = Design pressure difference, inches of water (Pa).

**909.7 Air flow design method.** *When approved by the department, smoke migration through openings fixed in a permanently open position, which are located between smoke control zones by the use of the airflow method, shall be permitted. The design air flow shall be in accordance with this section. Air flow shall be directed to limit smoke migration from the fire zone. The geometry of openings shall be considered to prevent flow reversal from turbulent effects.*

**909.7.1 Velocity.** *The minimum average velocity through a fixed opening shall not be less than:*

$$v = 217.2 [h(T_f - T_o)/(T_f + 460)]^{1/2} \quad \text{(Equation 9-2)}$$

For SI:  $v = 119.9 [h(T_f - T_o)/T_f]^{1/2}$

where:

$h$  = Height of opening, feet (m).

$T_f$  = Temperature of smoke, °F (°K).

$T_o$  = Temperature of ambient air, °F (°K).

$v$  = Air velocity, feet per minute (m/minute).

**909.7.2 Prohibited conditions.** *This method shall not be employed where either the quantity of air or the velocity of the airflow will adversely affect other portions of the smoke control system, unduly intensify the fire, disrupt plume dynamics or interfere with exiting. In no case shall airflow toward the fire exceed 200 feet per minute (1.02 m/s). Where the formula in Section 909.7.1 requires airflow to exceed this limit, the airflow method shall not be used.*

**909.8 Exhaust method.** *When approved by the department, mechanical smoke control for large enclosed volumes, such as in atriums or malls, shall be permitted to utilize the exhaust method. The design exhaust volumes shall be in accordance with this section.*

**909.8.1 Exhaust rate.** *The height of the lowest horizontal surface of the accumulating smoke layer shall be maintained at least 6 feet (1829 mm) above any walking surface that forms a portion of a required egress system within the smoke zone. The required exhaust rate for the zone shall be the largest of the calculated plume mass flow rates for the possible plume configurations. Provisions shall be made for natural or mechanical supply of air from outside or adjacent smoke zones to make up for the air exhausted. Makeup airflow rates, when measured at the potential fire location, shall not increase the smoke production rate beyond the capacity of the smoke control system. The temperature of the makeup air shall be such that it does not expose temperature-sensitive fire protection systems beyond their limits.*

**909.8.2 Axisymmetric plumes.** *The plume mass flow rate ( $m_p$ ), in pounds per second (kg/s), shall be determined by placing the design fire center on the axis of the space being analyzed. The limiting flame height shall be determined by:*

$$z_l = 0.533Q_c^{2/5} \quad \text{(Equation 9-3)}$$

For SI:  $z_l = 0.166Q_c^{2/5}$

where:

$m_p$  = Plume mass flow rate, pounds per second (kg/s).

$Q$  = Total heat output.

$Q_c$  = Convective heat output, British thermal units per second (kW). (The value of  $Q_c$  shall not be taken as less than  $0.70Q$ ).

$z$  = Height from top of fuel surface to bottom of smoke layer, feet (m).

$z_l$  = Limiting flame height, feet (m). The  $z_l$  value must be greater than the fuel equivalent diameter (see Section 909.9).

for  $z > z_l$

$$m_p = 0.022Q_c^{1/3}z^{5/3} + 0.0042Q_c$$

For SI:  $m_p = 0.071 Q_c^{1/3}z^{5/3} + 0.0018Q_c$

for  $z = z_l$

$$m_p = 0.011 Q_c$$

For SI:  $m_p = 0.035Q_c$

for  $z < z_l$

$$m_p = 0.0208Q_c^{3/5}z$$

For SI:  $m_p = 0.032Q_c^{3/5}z$

To convert  $m_p$  from pounds per second of mass flow to a volumetric rate, the following equation shall be used:

$$V = 60 m_p / \rho \quad \text{(Equation 9-4)}$$

where:

$V$  = Volumetric flow rate, cubic feet per minute ( $m^3/s$ ).

$\rho$  = Density of air at the temperature of the smoke layer, pounds per cubic feet ( $T$ : in °F) [ $kg/m^3$  ( $T$ : in °C)].

**909.8.3 Balcony spill plumes.** *The plume mass flow rate ( $m_p$ ) for spill plumes shall be determined using the geometrically probable width based on architectural elements and projections in the following equation:*

$$m_p = 0.124(QW^2)^{1/3}(z_b + 0.25H) \quad \text{(Equation 9-5)}$$

For SI:  $m_p = 0.36(QW^2)^{1/3}(z_b + 0.25H)$

where:

$H$  = Height above fire to underside of balcony, feet (m).

$m_p$  = Plume mass flow rate, pounds per second (kg/s).

$Q$  = Total heat output.

$W$  = Plume width at point of spill, feet (m).

$z_b$  = Height from balcony, feet (m).

**909.8.4 Window plumes.** *The plume mass flow rate ( $m_p$ ) shall be determined from:*

$$m_p = 0.077(A_w H_w^{1/2})^{1/3} (z_w + a)^{5/3} + 0.18 A_w H_w^{1/2}$$

(Equation 9-6)

For SI:  $m_p = 0.68(A_w H_w^{1/2})^{1/3} (z_w + a)^{5/3} + 1.5 A_w H_w^{1/2}$

where:

$A_w$  = Area of the opening, square feet (m<sup>2</sup>).

$H_w$  = Height of the opening, feet (m).

$m_p$  = plume mass flow rate, pounds per second (kg/s).

$z_w$  = Height from the top of the window or opening to the bottom of the smoke layer, feet (m).

$a$  =  $2.4 A_w^{2/5} H_w^{1/5} - 2.1 H_w$

**909.8.5 Plume contact with walls.** *When a plume contacts one or more of the surrounding walls, the mass flow rate shall be adjusted for the reduced entrainment resulting from the contact provided that the contact remains constant. Use of this provision requires calculation of the plume diameter, which shall be calculated by:*

$$d = 0.48 [(T_c + 460)/(T_a + 460)]^{1/2} z \quad (\text{Equation 9-7})$$

For SI:  $d = 0.48 (T_c/T_a)^{1/2} z$

where:

$d$  = Plume diameter, feet (m).

$T_a$  = Ambient air temperature, °F (°K).

$T_c$  = Plume centerline temperature, °F (°K).  
 $= 0.60 (T_a + 460) Q_c^{2/3} z^{-5/3} + T_a$

$z$  = Height at which  $T_c$  is determined, feet (m).

For SI:  $T_c = 0.08 T_a Q_c^{2/3} z^{-5/3} + T_a$

**909.9 Design fire.** *The design fire shall be based on a  $Q$  of not less than 5,000 Btu/s (5275 kW) unless a rational analysis is performed by the registered design professional and approved by the department. The design fire shall be based on the analysis in accordance with Section 909.4 and this section.*

**909.9.1 Factors considered.** *The engineering analysis shall include the characteristics of the fuel, fuel load, effects included by the fire and whether the fire is likely to be steady or unsteady.*

**909.9.2 Separation distance.** *Determination of the design fire shall include consideration of the type of fuel, fuel spacing and configuration. The ratio of the separation distance to the fuel equivalent radius shall not be less than 4. The fuel equivalent radius shall be the radius of a circle of equal area to floor area of the fuel package. The design fire shall be increased if other combustibles are within the separation distance as determined by:*

$$R = [Q / (12\pi q'')]^{1/2} \quad \text{(Equation 9-8)}$$

where:

$q''$  = Incident radiant heat flux required for nonpiloted ignition, Btu/ft<sup>2</sup> · s (W/m<sup>2</sup>).

$Q$  = Heat release from fire, Btu/s (kW).

$R$  = Separation distance from target to center of fuel package, feet (m).

**909.9.3 Heat-release assumptions.** *The analysis shall make use of best available data from approved sources and shall not be based on excessively stringent limitations of combustible material.*

**909.9.4 Sprinkler effectiveness assumptions.** *A documented engineering analysis shall be provided for conditions that assume fire growth is halted at the time of sprinkler activation.*

**909.10 Equipment.** *Equipment such as, but not limited to, fans, ducts, automatic dampers and balance dampers, shall be suitable for its intended use, suitable for the probable exposure temperatures that the rational analysis indicates, and as approved by the department.*

**909.10.1 Exhaust fans.** *Components of exhaust fans shall be rated and certified by the manufacturer for the probable temperature rise to which the components will be exposed. This temperature rise shall be computed by:*

$$T_s = (Q_c / mc) + (T_a) \quad \text{(Equation 9-9)}$$

where:

$c$  = Specific heat of smoke at smoke layer temperature, Btu/lb°F (kJ/kg · K).

$m$  = Exhaust rate, pounds per second (kg/s).

$Q_c$  = Convective heat output of fire, Btu/s (kW).

$T_a$  = Ambient temperature, °F (°K).

$T_s$  = Smoke temperature, °F (°K).

**Exception:** *Reduced  $T_s$  as calculated based on the assurance of adequate dilution<sub>air</sub>.*

**909.10.2 Ducts.** *Duct materials and joints shall be capable of withstanding the probable temperatures and pressures to which they are exposed as determined in accordance with Section 909.10.1. Ducts shall be constructed and supported in accordance with the New York City Mechanical Code. Ducts shall be leak tested to 1.5 times the maximum design pressure in accordance with nationally accepted practices. Measured leakage shall not exceed 5 percent of design flow. Results of such testing shall be a part of the documentation procedure. Ducts shall be supported directly from fire-resistance-rated structural elements of the building by substantial, noncombustible supports.*

**Exception:** *Flexible connections (for the purpose of vibration isolation) complying with the New York City Mechanical Code, that are constructed of approved fire-resistance-rated materials.*

**909.10.3 Equipment, inlets and outlets.** *Equipment shall be located so as not to expose uninvolved portions of the building to an additional fire hazard. Outside air inlets shall be located so as to minimize the potential for introducing smoke or flame into the building. Exhaust outlets shall be located so as to minimize reintroduction of smoke into the building and to limit exposure of the building or adjacent buildings to an additional fire hazard.*

**909.10.4 Automatic dampers.** *Automatic dampers, regardless of the purpose for which they are installed within the smoke control system, shall be listed for their use.*

**909.10.5 Fans.** *In addition to other requirements, belt-driven fans shall have 1.5 times the number of belts required for the design duty, but not less than two. Fans shall be selected for stable performance based on normal temperature and, where applicable, elevated temperature. Calculations and manufacturer's fan curves shall be part of the documentation procedures. Fans shall be supported and restrained by noncombustible devices in accordance with the requirements of Chapter 16. Motors driving fans shall not be operated beyond their nameplate horsepower (kilowatts), as determined from measurement of actual current draw, and shall have a minimum service factor of 1.15.*

**909.11 Power systems.** *The smoke control system shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an emergency source complying with the New York City Electrical Code. The emergency power source and its transfer switches shall be in a separate room from the normal power transformers and switch gear and shall be enclosed in a room constructed of not less than 1-hour fire-resistance-rated fire barriers ventilated directly to and from the exterior. Power distribution from the two sources shall be by independent routes. Transfer to full emergency power shall be automatic and within 60 seconds of failure of the primary power. The systems*

shall comply with the New York City Electrical Code.

**909.11.1 Power sources and power surges.** Elements of the smoke management system relying on volatile memories or similar systems shall be supplied with uninterruptable power sources of sufficient duration to span a 15-minute primary power interruption. Elements of the smoke management system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

**909.12 Detection and control systems.** Fire detection systems providing control input or output signals to mechanical smoke control systems or elements thereof shall comply with the requirements of Chapter 9 and NFPA 72. Such systems shall be equipped with a control unit complying with UL 864 and listed as smoke control equipment.

Control systems for mechanical smoke control systems shall include provisions for verification. Verification shall include positive confirmation of actuation, testing, manual override, the presence of power downstream of all disconnects and, through a preprogrammed weekly test sequence report, abnormal conditions audibly, visually and by printed report.

**909.12.1 Wiring.** In addition to meeting requirements of the New York City Electrical Code, all wiring, regardless of voltage, shall be fully enclosed within continuous raceways.

**909.12.2 Activation.** Smoke control systems shall be activated in accordance with this section.

**909.12.2.1 Pressurization, airflow or exhaust method.** Mechanical smoke control systems using the pressurization, airflow or exhaust method shall have completely automatic control.

**909.12.2.2 Passive method.** Passive smoke control systems actuated by spot-type detectors listed for releasing service shall be permitted.

**909.12.3 Automatic control.** Where completely automatic control is required or used, the automatic-control sequences shall be initiated from an appropriately zoned automatic sprinkler system complying with Section 903.3.1.1, manual controls that are readily accessible to the Fire Department and any smoke detectors required by engineering analysis. See Section 909.16 for manual control requirements.

**909.13 Control air tubing.** Control air tubing shall be of sufficient size to meet the required response times. Tubing shall be flushed clean and dry prior to final connections and shall be adequately supported and

*protected from damage. Tubing passing through concrete or masonry shall be sleeved and protected from abrasion and electrolytic action.*

**909.13.1 Materials.** *Control air tubing shall be hard drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type, in accordance with ASME B 16.18 or ASME B 16.22. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP5 brazing alloy with solidus above 1,100°F (593°C) and liquids below 1,500°F (816°C). Brazing flux shall be used on copper-to-brass joints only.*

**Exception:** *Nonmetallic tubing used within control panels and at the final connection to devices, providing all of the following conditions are met:*

1. *Tubing shall be listed by an approved agency for flame and smoke characteristics.*
2. *Tubing and connected devices shall be completely enclosed within galvanized or paint-grade steel enclosure of not less than 0.030 inch (0.76 mm) (No. 22 galvanized sheet gage) thickness. Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or Teflon or by suitable brass compression to male-barbed adapter.*
3. *Tubing shall be identified by appropriately documented coding.*
4. *Tubing shall be neatly tied and supported within enclosure. Tubing bridging cabinet and door or moveable device shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.*

**909.13.2 Isolation from other functions.** *Control tubing serving other than smoke control functions shall be isolated by automatic isolation valves or shall be an independent system.*

**909.13.3 Testing.** *Control air tubing shall be tested at three times the operating pressure for not less than 30 minutes without any noticeable loss in gauge pressure prior to final connection to devices.*

**909.14 Marking and identification.** *The detection and control systems shall be clearly marked at all junctions, accesses and terminations.*

**909.15 Control diagrams.** *Identical control diagrams showing all devices in the system and identifying their location and function shall be maintained current and kept on file with the department, the Fire Department and in the fire command center in format and manner approved by the Fire Commissioner.*

**909.16 Fire-fighter's smoke control panel.** *A fire-fighter's smoke control panel for Fire\_Department emergency response purposes only shall be provided and shall include manual control or override of automatic control for mechanical smoke control systems. The panel shall be located in a fire command center complying with Section 911, and shall comply with Sections 909.16.1 through 909.16.3. Where required in Section 912, the post-fire smoke purge system shall be manually activated from the fire-fighter's control panel.*

**909.16.1 Panel indicators.** *Fans within the building shall be shown on the fire fighter's control panel. A clear indication of the direction of airflow and the relationship of components shall be displayed. Status indicators shall be provided for all smoke control equipment, annunciated by fan and zone, and by pilot-lamp-type indicators as follows:*

1. *Fans, dampers and other operating equipment in their normal status----WHITE.*
2. *Fans, dampers and other operating equipment in their off or closed status ----RED*
3. *Fans, dampers and other operating equipment in their on or open status ---GREEN.*
4. *Fans, dampers and other operating equipment in a fault status ---YELLOW/AMBER.*

**909.16.2 Panel controls.** *The fire fighter's control panel shall provide control capability over the complete smoke-control system equipment within the building as follows:*

1. *ON-AUTO-OFF control over each individual piece of operating smoke control equipment that can also be controlled from other sources within the building. This includes stairway pressurization fans; smoke exhaust fans; supply, return and exhaust fans; elevator shaft fans and other operating equipment used or intended for smoke control purposes.*
2. *OPEN-AUTO-CLOSE control over individual dampers relating to smoke control that are also controlled from other sources within the building.*

3. *ON-OFF or OPEN-CLOSE control over smoke control and other critical equipment associated with a fire or smoke emergency and that can only be controlled from the fire-fighter's control panel. The fire-fighter's control panel shall be configured as describe in Section 911.*

**Exceptions:**

1. *Complex systems, where approved, where the controls and indicators are combined to control and indicate all elements of a single smoke zone as a unit.*
2. *Complex systems, where approved, where the control is accomplished by computer interface using approved, plain English commands.*

**909.16.3 Control action and priorities.** *The fire-fighter's control panel actions shall be as follows:*

1. *ON-OFF, OPEN-CLOSE control actions shall have the highest priority of any control point within the building. Once issued from the fire-fighter's control panel, no automatic or manual control from any other control point within the building shall contradict the control action. Where automatic means are provided to interrupt normal, nonemergency equipment operation or produce a specific result to safeguard the building or equipment (i.e., duct freezestats, duct smoke detectors, high-temperature cutouts, temperature-acutated linkage and similar devices), such means shall be capable of being overridden by the fire-fighter's control panel. The last control action as indicated by each fire-fighter's control panel switch position shall prevail. In no case shall control actions require the smoke control system to assume more than one configuration at any one time.*

**Exception:** *Power disconnects required by the New York City Electrical Code.*

2. *Only the AUTO position of each three-position fire-fighter's control panel switch shall allow automatic or manual control action from other control points within the building. The AUTO position shall be the NORMAL, nonemergency, building control position. Where a fire-fighter's control panel is in the AUTO position, the actual status of the device (on, off, open, closed) shall continue to be indicated by the status indicator described above. When directed by an automatic signal to assume emergency condition,*

*the NORMAL position shall become the emergency condition for that device or group of devices within the zone. In no case shall control actions require the smoke control system to assume more than one configuration at any one time.*

**909.17 System response time.** *Smoke-control system activation shall be initiated immediately after receipt of an appropriate automatic or manual activation command. Smoke control systems shall activate individual components (such as dampers and fans) in the sequence necessary to prevent physical damage to the fans, dampers, ducts and other equipment. For purposes of smoke control, the fire-fighter's control panel response\_time shall be the same for automatic or manual smoke control action initiated from any other building control point. The total response time, including that necessary for detection, shutdown of operating equipment and smoke control system startup, shall allow for full operational mode to be achieved before the conditions in the space exceed the design smoke condition. The system response time for each component and their sequential relationships shall be detailed in the required rational analysis and verification of their installed condition reported in the required final report.*

**909.18 Acceptance testing.** *Devices, equipment, components and sequences shall be individually tested. These tests, in addition to those required by other provisions of this code, shall consist of determination of function, sequence and, where applicable, capacity of their installed condition.*

**909.18.1 Detection devices.** *Smoke or fire detectors that are a part of a smoke control system shall be tested in accordance with Chapter 9 in their installed condition. When applicable, this testing shall include verification of airflow in both minimum and maximum conditions.*

**909.18.2 Ducts.** *Ducts that are part of a smoke control system shall be traversed using generally accepted practices to determine actual air quantities.*

**909.18.3 Dampers.** *Dampers shall be tested for function in their installed condition.*

**909.18.4 Inlets and outlets.** *Inlets and outlets shall be read using generally accepted practices to determine air quantities.*

**909.18.5 Fans.** *Fans shall be examined for correct rotation. Measurements of voltage, amperage, revolutions per minute (rpm) and belt tension shall be made.*

**909.18.6 Smoke barriers.** *Measurements using inclined manometers or other approved calibrated measuring devices shall be made of the pressure differences across smoke barriers. Such measurements shall be conducted for each possible smoke control condition.*

**909.18.7 Controls.** Each smoke zone, equipped with an automatic-initiation device, shall be put into operation by the actuation of one such device. Each additional device within the zone shall be verified to cause the same sequence without requiring the operation of fan motors in order to prevent damage. Control sequences shall be verified throughout the system, including verification of override from the fire-fighter's control panel and simulation of emergency power conditions.

**909.18.8 Special inspections for smoke control.** Smoke control systems shall be tested by a special inspector in accordance with Chapter 17.

**909.18.8.1 Scope of testing.** Special inspections shall be conducted in accordance with the following:

1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.
2. Prior to occupancy and after sufficient completion for the purposes of pressure-difference testing, flow measurements, and detection and control verification.

**909.18.8.2 Qualifications.** Special inspectors for smoke control shall have a certification as air balancers and expertise in fire protection engineering or mechanical engineering.

**909.18.8.3 Reports.** A complete report of testing shall be prepared by the special inspector or approved agency. The report shall include identification of all devices by manufacturer, nameplate data, design values, measured values and identification tag or mark. The report shall be reviewed by the responsible engineer and, when satisfied that the design intent has been achieved, the engineer shall seal, sign and date the report.

**909.18.8.3.1 Report filing.** A copy of the final report and each inspection\_report shall be filed with the department and Fire Commissioner, and an identical copy shall be maintained in an approved location at the building.

**909.18.9 Identification and documentation.** Charts, drawings and other documents identifying and locating each component of the smoke control system, and describing its proper function and maintenance requirements, shall be maintained on file at the building as an attachment to the report required by Section 909.18.8.3. Devices shall have an approved identifying tag or mark on them consistent with the other required documentation and shall be dated indicating the last time they were

*successfully tested and by whom.*

**909.18.10 Re-acceptance testing.** *The smoke control system shall require a re-acceptance test after any modifications to the system or physical changes to the building that may affect system performance.*

**909.19 System acceptance.** *Buildings, or portions thereof, required by this code to comply with this section shall not be issued a certificate of occupancy until such time that the department determines that the provisions of this section have been fully complied with, and that the Fire Department has received satisfactory instruction on the operation, both automatic and manual, of the system.*

**Exception:** *In buildings of phased construction, the department may issue a temporary certificate of occupancy provided that those portions of the building to be occupied meet the requirements of this section and that the remainder does not pose a significant hazard to the safety of the proposed occupants or adjacent buildings.*

**909.20 Smokeproof enclosures.** *Where required by Section 1019.1.8, a smoke proof enclosure shall be constructed in accordance with this section. Where access to the roof is required by the New York City Fire Code, such access shall be from the smoke proof enclosure where a smoke proof enclosure is required. Smokeproof enclosures shall consist of one of the following systems:*

1. *An enclosed interior exit stairway constructed in accordance with Section 1019.1 and accessed through an open exterior balcony.*
2. *An enclosed interior exit stairway constructed in accordance with Section 1019.1 and accessed through a naturally ventilated vestibule.*
3. *An enclosed interior exit stairway constructed in accordance with Section 1019.1 and accessed through a mechanically ventilated vestibule.*
4. *A pressurized interior exit stairway constructed in accordance with Section 1019.1*

**909.20.1 Access.** *Access to the interior exit stairway shall be by way of a vestibule or an open exterior balcony, unless such stairway is pressurized in accordance with Section 909.20.5. The minimum dimension of the vestibule or open exterior balcony shall not be less than the required width of the corridor leading to the vestibule or open exterior balcony but shall not have a width of less than 44 inches (1118 mm) and shall not have a length of less than 72 inches (1829 mm) in the direction of*

egress travel.

**909.20.2 Construction.** *The smoke proof enclosure shall be separated from the remainder of the building by not less than a 2-hour fire-resistance-rated fire barrier without openings other than the required means of egress doors. The vestibule shall be separated from the stairway by not less than a 2-hour fire-resistance-rated fire barrier. The open exterior balcony shall be constructed in accordance with the fire-resistance-rating requirements for floor construction.*

**909.20.2.1 Door closers.** *Doors in a smoke proof enclosure shall be self-closing or shall be automatic-closing by actuation of a smoke detector installed at the floor-side entrance to the smoke proof enclosure in accordance with Section 715.3.7. The actuation of the smoke detector on any door shall activate the closing devices on all doors in the smoke proof enclosure at all levels. Smoke detectors shall be installed in accordance with Section 907.10.*

**909.20.3 Natural ventilation alternative.** *The provisions of Sections 909.20.3.1 through 909.20.3.3 shall apply to ventilation of smoke proof enclosures by natural means.*

**909.20.3.1 Balcony doors.** *Where access to the stairway is by way of an open exterior balcony, the door assembly into the enclosure shall be a fire door in accordance with Section 715.3.*

**909.20.3.2 Vestibule doors.** *Where access to the stairway is by way of a vestibule, the door assembly into the vestibule shall be a fire door complying with Section 715.3. The door assembly from the vestibule to the stairway shall have not less than a 90-minute fire protection rating complying with Section 715.3.*

**909.20.3.3 Vestibule ventilation.** *Each vestibule shall have a minimum net area of 16 square feet (1.5 m<sup>2</sup>) of opening in a wall facing an outer court, yard or public way that is at least 20 feet (6096 mm) in width.*

**909.20.4 Mechanical ventilation alternative.** *The provisions of Sections 909.20.4.1 through 909.20.4.4 shall apply to ventilation of smoke proof enclosures by mechanical means.*

**909.20.4.1 Vestibule doors.** *The door assembly from the building into the vestibule shall be a fire door complying with Section 715.3. The door assembly from the vestibule to the stairway shall have not less than a 90-minute fire protection rating in accordance with Section 715.3. The door from the building into the vestibule shall be provided with gaskets or other provisions to minimize air leakage.*

**909.20.4.2 Vestibule ventilation.** *The vestibule shall be supplied with not less than one air change per minute and the exhaust shall not be less than 150 percent of supply. Supply air shall enter and exhaust air shall discharge from the vestibule through separate, tightly constructed ducts used only for that purpose. Supply air shall enter the vestibule within 6 inches (152 mm) of the floor level. The top of the exhaust register shall be located at the top of the smoke trap but not more than 6 inches (152 mm) down from the top of the trap, and shall be entirely within the smoke trap area. Doors in the open position shall not obstruct duct openings. Duct openings with controlling dampers are permitted where necessary to meet the design requirements, but dampers are not otherwise required.*

**909.20.4.2.1 Engineered ventilation system.** *Where a specially engineered system is used, the system shall exhaust a quantity of air equal to not less than 90 air changes per hour from any vestibule in the emergency operation mode and shall be sized to handle three vestibules simultaneously. Smoke detectors shall be located at the floor-side entrance to each vestibule and shall activate the system for the affected vestibule. Smoke detectors shall be installed in accordance with Section 907.10.*

**909.20.4.3 Smoke trap.** *The vestibule ceiling shall be at least 20 inches (508 mm) higher than the door opening into the vestibule to serve as a smoke and heat trap and to provide an upward-moving air column. The height shall not be decreased unless approved and justified by design and test.*

**909.20.4.4 Stair shaft air movement system.** *The stair shaft shall be provided with a dampered relief opening and supplied with sufficient air to maintain a minimum positive pressure of 0.10 inch of water (25 Pa) in the shaft relative to the vestibule with all doors closed. The system shall maintain a maximum of 0.35 inch of water (87 Pa) in the shaft relative to the building measured with all stairway doors closed under maximum anticipated stack pressures.*

**909.20.4.5 Door Opening Force.** *Door opening force shall not exceed limits in Section 1008.1.2.*

**909.20.5 Stair pressurization alternative.** *Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the vestibule is not required, provided that interior exit stairways are pressurized to a minimum of 0.15 inch of water (37 Pa) and a maximum of 0.35 inch of water (87 Pa) in the shaft relative to the building measured with all stairway doors closed under maximum anticipated stack pressures.*

**909.20.6 Ventilating equipment.** *The activation of ventilating equipment required by the alternatives in Sections 909.20.4 and 909.20.5 shall be by smoke detectors installed at each floor level at an approved location at the entrance to the smokeproof enclosure. When the closing device for the stair shaft and vestibule doors is activated by smoke detection or power failure, the mechanical equipment shall activate and operate at the required performance levels. Smoke detectors shall be installed in accordance with Section 907.10.*

**909.20.6.1 Ventilation systems.** *Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment and ductwork shall comply with one of the following:*

1. *Equipment and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by 2-hour fire-resistance-rated fire barriers.*
2. *Equipment and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by 2-hour fire-resistance-rated fire barriers.*
3. *Equipment and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by 2-hour fire-resistance-rated fire barriers.*

**909.20.6.2 Emergency power.** *Mechanical vestibule and stair shaft ventilation systems and automatic fire detection systems shall be powered by an emergency power system conforming to Section 403.11 and Chapter 27.*

**909.20.6.3 Acceptance and testing.** *Before the mechanical equipment is approved, the system shall be tested in the presence of the department or approved agency to confirm that the system is operating in compliance with these requirements.*

**909.21 Underground building smoke exhaust system.** *Where required in accordance with Section 405.5 for underground buildings, a smoke exhaust system shall be provided in accordance with this section.*

**909.21.1 Exhaust capability.** *Where compartmentation is required, each compartment shall have an independent, automatically activated smoke exhaust system capable of manual operation. The system shall have an air supply and smoke exhaust capability that will provide a minimum of six air changes*

*per hour.*

**909.21.2 Operation.** *The smoke exhaust system shall be operated in the compartment of origin by the following, independently of each other:*

1. *Two cross-zoned smoke detectors within a single protected area of a single smoke detector monitored by an alarm verification zone or an approved equivalent method.*
2. *The automatic sprinkler system.*
3. *Manual controls that are readily accessible to the Fire Department.*

**909.21.3 Alarm required.** *Activation of the smoke exhaust system shall activate an audible alarm at a constantly attended location.*

## **SECTION BC 910 SMOKE AND HEAT VENTS**

**910.1 General.** *Where required by this code or otherwise installed, smoke and heat vents or mechanical smoke exhaust systems and draft curtains shall conform to the requirements of this section.*

**Exception:** *Frozen-food warehouses used solely for storage of Class I and II commodities where protected by an automatic sprinkler system in accordance with Section 903.3.1.1.*

**910.2 Where required.** *Smoke and heat vents designed in accordance with Section 910.3 shall be installed in the roofs of buildings or portions thereof occupied for the uses set forth in Sections 910.2.1 through 910.2.3. Vents shall be installed at the top of a closed shaft in accordance with Section 910.5.*

**910.2.1 Groups F-1 and S-1.** *Buildings and portions thereof used as a Group F-1 or S-1 occupancy having more than 50,000 square feet (4645 m<sup>2</sup>) in undivided area.*

**Exception:** *Group S-1 aircraft repair hangars.*

**910.2.2 Group H.** *Buildings and portions thereof used as a Group H occupancy as shown:*

1. *In occupancies classified as Group H-2 or H-3, any of which are over 15,000 square feet (1394 m<sup>2</sup>) in undivided area or area greater in depth than 100 feet (30 480 mm) from Fire*

*Department apparatus access.*

**Exception:** *Buildings of noncombustible construction containing only noncombustible materials.*

2. *In areas of buildings in Group H used for storing Class 2, 3, and 4 liquid and solid oxidizers, Class 1 and unclassified detonable organic peroxides, Class 3 and 4 unstable (reactive) materials, or Class 2 or 3 water-reactive materials as required for a high-hazard commodity classification.*

**Exception:** *Buildings of noncombustible construction containing only noncombustible materials.*

**910.2.3 High-piled combustible storage.** *Buildings and portions thereof containing high-piled combustible stock or rack storage in any occupancy group in accordance with Section 413 and the New York City Fire Code.*

**910.3 Design and installation.** *The design and installation of smoke and heat vents and draft curtains shall be as specified in this section and Table 910.3.*

**TABLE 910.3  
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS<sup>a</sup>**

<b>OCCUPANCY GROUP AND COMMODITY CLASSIFICATION</b>	<b>DESIGNATED STORAGE HEIGHT (feet)</b>	<b>MINIMUM DRAFT CURTAIN DEPTH (feet)</b>	<b>MAXIMUM AREA FORMED BY DRAFT CURTAINS (square feet)</b>	<b>VENT AREA TO FLOOR AREA RATIO</b>	<b>MAXIMUM SPACING OF VENT CENTERS (feet)</b>	<b>MAXIMUM DISTANCE TO VENTS FROM WALL OR DRAFT CURTAINS<sup>b</sup> (feet)</b>
<i>Group F-1</i>	—	$0.2 \times H$ but $\geq 4$	50,000	1:100	120	60
<i>Group S-1</i>	$\leq 20$	6	10,000	1:100	100	60
<i>I-IV</i>	$> 20 \leq 40$	6	8,000	1:75	100	55
<i>Group S-1</i>	$\leq 20$	4	3,000	1:75	100	55
<i>I-IV (Option 2)</i>	$> 20 \leq 40$	4	3,000	1:50	100	50
<i>Group S-1</i>	$\leq 20$	6	6,000	1:50	100	50
<i>High hazard</i>	$> 20 \leq 30$	6	6,000	1:40	90	45
<i>Group S-1</i>	$\leq 20$	4	4,000	1:50	100	50
<i>High hazard</i>	$> 20 \leq 30$	4	2,000	1:30	75	40

*For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m<sup>2</sup>.*

*a. Requirements for rack storage heights in excess of those indicated shall be in accordance with the New York City Fire Code. For solid-piled storage heights in excess of those indicated, an approved engineered design shall be used.*

*b. The distance specified is the maximum distance from any vent in a particular draft curtained area to walls or draft curtains which form the perimeter of the draft curtained area.*

**910.3.1 Vent operation.** *Smoke and heat vents shall be listed and labeled and shall be capable of being operated by approved automatic and manual means. Automatic operation of smoke and heat vents shall conform to the provisions of this section.*

**910.3.1.1 Gravity-operated drop-out vents.** *Automatic smoke and heat vents containing heat-sensitive glazing designed to shrink and drop out of the vent opening when exposed to fire shall fully open within 5 minutes after the vent cavity is exposed to a simulated fire, represented by a time-temperature gradient that reaches an air temperature of 500°F (260°C) within 5 minutes.*

**910.3.1.2 Sprinklered buildings.** *Where installed in buildings provided with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke and heat vents shall be designed to operate automatically.*

**910.3.1.3 Nonsprinklered buildings.** *Where installed in buildings not provided with an automatic sprinkler system, smoke and heat vents shall operate automatically by actuation of a heat-responsive device rated at between 100°F (38°C) and 220°F (104°C) above ambient.*

**Exception:** *Gravity-operated drop-out vents complying with Section 910.3.1.1*

**910.3.2 Vent dimensions.** *The effective venting area shall not be less than 16 square feet (1.5 m<sup>2</sup>) with no dimension less than 4 feet (1219 mm), excluding ribs or gutters having a total width not exceeding 6 inches (152 mm).*

**910.3.3 Vent locations.** *Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barrier walls. Vents shall be uniformly located within the roof area above high-piled storage areas, with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.*

**910.3.4 Draft curtains.** *Where required, draft curtains shall be provided in accordance with this section.*

**Exception:** *Where areas of buildings are equipped with early suppression fast-response (ESFR) sprinklers, draft curtains need not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the conventional sprinklers.*

**910.3.4.1 Construction.** *Draft curtains shall be constructed of sheet metal, lath and plaster, gypsum board or other approved materials that provide equivalent performance to resist the*

*passage of smoke. Joints and connections shall be smoke tight.*

**910.3.4.2 Location and depth.** *The location and minimum depth of draft curtains shall be in accordance with Table 910.3.*

**910.4 Mechanical smoke exhaust.** *Where approved by the department, engineered mechanical smoke exhaust shall be an acceptable alternate to smoke and heat vents.*

**910.4.1 Location.** *Exhaust fans shall be uniformly spaced within each draft-curtained area and the maximum distance between fans shall not be greater than 100 feet (30 480 mm).*

**910.4.2 Size.** *Fans shall have a maximum individual capacity of 30,000 cfm (14.2 m<sup>3</sup>/s). The aggregate capacity of smoke exhaust fans shall be determined by the equation:*

$$C = A \times 300$$

(Equation 9-10)

where:

$C$  = Capacity of mechanical ventilation required, in cubic feet per minute ( $m^3/s$ ).

$A$  = Area of roof vents provided in square feet ( $m^2$ ) in accordance with Table 910.3.

**910.4.3 Operation.** *Mechanical smoke exhaust fans shall be automatically activated by the automatic sprinkler system or by heat detectors having operating characteristics equivalent to those described in Section 910.3.1. Individual manual controls of each fan unit shall also be provided.*

**910.4.4 Wiring and control.** *Wiring for operation and control of smoke exhaust fans shall be connected ahead of the main disconnect and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes. Controls shall be located so as to be immediately accessible to the fire service from the exterior of the building and protected against interior fire exposure by fire barriers having a fire-resistance rating not less than one hour. The location of manual controls is subject to the approval of the Fire Commissioner.*

**910.4.5 Supply air.** *Supply air for exhaust fans shall be provided at or near the floor level and shall be sized to provide a minimum of 50 percent of required exhaust. Openings for supply air shall be uniformly distributed around the periphery of the area served.*

**910.4.6 Interlocks.** *In combination comfort air-handling/smoke removal systems or independent comfort air-handling systems, fans shall be controlled to shut down in accordance with the approved smoke control sequence.*

**910.5 Smoke venting of closed shafts.** *All closed shafts having a floor area exceeding four square feet (0.37 m<sup>2</sup>) shall be provided with a smoke vent in accordance with Section 910.5.1 through 910.5.3.*

**Exception:** *Elevator and dumbwaiter shafts in accordance with Chapter 30.*

**910.5.1 Smoke vent construction.** *Smoke vents may be constructed as windows, louvers, skylights, vent ducts, or similar devices. Where a vent duct is installed, such vent ducts shall be enclosed by construction having the same fire resistance rating as required for the shaft enclosure.*

**910.5.2 Smoke vent dimensions.** *The effective venting area shall not be less than 3-½ percent of the maximum shaft area at any floor, but in no event less than 72 square inches (0.05 m<sup>2</sup>). Of the total required vent area, at least one-third shall be clear opening to the exterior in the form of fixed louvers, ridge vents, or hooded or goosenecked openings. The remaining portion of the required vent area may be a window or skylight glazed with plain glass not more than ⅛-inch (3.2 mm) thick or with plastic glazing.*

**Exception:** *The clear opening to the exterior may be constructed as a skylight or trapdoor arranged to open automatically by fusible link or other mechanical device when subjected to a*

temperature of 160°F (71°C) or to a rapid rise in temperature at a rate of 15°F (-9.4°C) to 20°F (-6.7°C) per minute.

**910.5.3 Smoke vent location.** *Smoke vents shall be located in accordance with 910.5.3.1 or 910.5.3.2 as applicable.*

**910.5.3.1 Smoke vents located above the roof line.** *Where a closed shaft or smoke vent duct penetrates through the roof of the building, the vent shall be located as follows:*

1. *The vent shall be located at least 8 inches (203 mm) above a noncombustible roof assembly or at least 36 inches (914 mm) above a combustible roof assembly.*
2. *The vent shall be located at least 10 feet (3048 mm) from any window, door, exterior stairway, or interior lot line. The vent may be located no less than 5 feet (1524 mm) from any window or door provided that the vent is located at a point higher than the top of such window or door.*
3. *Where the vent is constructed as a window or louver, the sill of the window or louver shall be located at least 36 inches (above the roof assembly).*

**910.5.3.2 Smoke vents located in an exterior wall.** *Where the exterior wall serves as part of a shaft enclosure or where a smoke vent duct penetrates the exterior wall of the building, the vent shall be located at least 30 feet above and 5 feet to the side of any other openings in the exterior wall.*

## **SECTION BC 911**

### **FIRE COMMAND CENTER**

**911.1 Features.** *Where required by other sections of this code, a fire command center for Fire Department operations shall be provided. The fire command center shall be located in the lobby of the building on the entrance floor as part of the fire alarm control panel, elevator control panel or immediately adjacent thereto. The fire command center shall comply with NFPA 72 and shall contain the following features as applicable:*

1. *The emergency voice/alarm communication system unit.*
2. *The Fire Department communications unit.*

3. *Fire detection and alarm system annunciator unit.*
4. *Annunciator visually indicating the location of the elevators and whether they are operational.*
5. *Status indicators and controls for air-handling systems.*
6. *The fire-fighter's control panel required by Section 909.16 for smoke control systems installed in the building.*
7. *Controls for unlocking stairway doors simultaneously.*
8. *Sprinkler valve and water-flow detector display panels.*
9. *Emergency power status indicators.*
10. *A telephone for Fire Department use with controlled access to the public telephone system.*
11. *Fire pump status indicators.*
12. *Generator supervision devices, manual start and transfer features.*
13. *Public address system, where specifically required by other sections of this code.*
14. *Manual controls of Post-Fire Smoke Purge system in accordance with Section 912.2.3.*

## **SECTION 912**

### **POST-FIRE SMOKE PURGE SYSTEMS**

**912.1 Scope and purpose.** *The purpose of this section is to establish minimum requirements for the design and installation of post-fire smoke purge systems, which are intended for the timely restoration of operations and overhaul activities once a fire is extinguished. Post-fire smoke purge systems are not intended or designed as life safety systems and are not required to meet the provisions of Section 909. Post-fire smoke purge systems shall be required in:*

1. *High-rise buildings subject to Section 403.*

2. *Buildings with any story exceeding 50,000 square feet (4645 m<sup>2</sup>) in floor area.*
3. *Building with spaces exceeding 100 feet (30 480 mm) from natural ventilation openings. Natural ventilation openings shall consist of operable windows and doors of at least five percent of the floor area or roof vents per Section 910.*
4. *High piled stock or rack storage in accordance with the New York City Fire Code.*

**Exceptions:** *A post-fire smoke purge system is not required in R-2 occupancies where either of the following conditions exists:*

1. *Operable windows. A post-fire smoke purge system is not required where every habitable room located in dwelling units is provided with windows complying with Chapter 12 and all of the following:*

- 1.1. *Minimum window area. Each required window shall provide at least 12 square feet (1.1 m<sup>2</sup>) of glazed area. The total area of all such windows shall not be less than 10 percent of the floor area of the room or space served.*

- 1.2. *Minimum openable area. Each required window shall provide a minimum of 6 square feet (0.56 m<sup>2</sup>) of openable area. The total area of all such openings shall not be less than five percent of the floor area of the room or space served. In addition, each required openable area shall be:*

- 1.2.1. *Located wholly at least 30 inches (762 mm) above the finished floor;  
and*

- 1.2.2. *Fully openable to the minimum 6 square feet (0.56 m<sup>2</sup>), at all times and without limiting stops or devices. Such openings may be achieved through the use of double-hung, sliding, or similar types of windows. However, in the event of the use of casement-, hopper-, pivot-, or awning-type windows, such windows shall satisfy the requirements of this section only when they open to at least 75 degrees.*

2. *Smokeproof enclosures. A post-fire smoke purge system is not required where all exits are constructed as smokeproof enclosures in accordance with Section 1019.1.8.*

**912.2 Post-fire smoke purge systems in occupancy groups other than R-2.**

**912.2.1 General design requirements.** *Post-fire smoke purge systems are permitted to use dedicated equipment, the normal building HVAC system or other openings and shall have the capability to exhaust smoke from occupied spaces. Smoke removal may be by either mechanical or natural ventilation, but shall be capable of removing cold smoke. Smoke removed from a space must be discharged to a safe location outside the building and shall not be recirculated into the building in accordance with the New York City Mechanical Code.*

**912.2.2 Exhaust capability.** *The system shall have an air supply and smoke exhaust capability that will provide a minimum of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft<sup>2</sup>) [0.00508 <sup>3</sup>/(s · m<sup>2</sup>)], whichever is greater. The system need not exhaust from all areas at the same time, but is permitted to be zoned based on the largest fire area served. For the purpose of calculating system size, the height of a compartment shall be considered to run from slab to slab and include the volume above suspended ceilings. Provisions shall be made for sufficient make-up air. The provisions may include operable windows, doors, building leakage, or mechanical systems. In buildings having occupied floors located less than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, breakable windows may be utilized.*

**912.2.3 Operation.** *The post-fire smoke purge system shall be operated by manual controls that are part of the fire command center, in accordance with Section 911, or fire alarm panel when a fire command center is not required. Such control center or panel shall display a graphic indicating the portions of the building served by each post-fire smoke purge system. When a system is zoned into areas of operation less than the entire building, each zone shall have an individual control. Fire Department manual controls of post-fire smoke purge systems shall not override the manual or automatic operation of the smoke control system. Such Fire Department manual controls shall override the fire shutdown signal from the fire alarm system.*

**912.3 Post-fire smoke purge systems in occupancy Group R-2.** *Post-fire smoke purge systems in R-2 occupancies shall comply with either Section 912.3.1 or 912.3.2. Smoke removed must be discharged to a safe location outside the building and shall not be recirculated into the building in accordance with the New York City Mechanical Code.*

**912.3.1 Stair ventilation.** *The top of all enclosed exit stairs shall be provided with a reversible fan system capable of introducing fresh air or exhausting air at a rate of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft<sup>2</sup>) [0.00508 m<sup>3</sup>/(s · m<sup>2</sup>)], whichever is greater, based on the area*

*of the largest floor. Such system shall be operated by manual controls that are part of the fire command center, as per Section 911, or fire alarm panel when a fire command center is not required. Such control center or panel shall display a graphic indicating the portions of the building served by each post-fire smoke purge system. The operation of such system shall be controlled by Fire Department personnel by manually opening stair doors at the appropriate story.*

**912.3.2 Corridor ventilation.** *The ducts and fans that provide fresh air supply to the public corridors in accordance with the New York City Mechanical Code shall be provided with reversible fans and duct sizes capable of introducing fresh air to or exhausting air from the corridor at a rate of 6 air changes per hour or 1 cubic foot per minute per square foot (cfm/ft<sup>2</sup>) [0.00508 m<sup>3</sup>/(s · m<sup>2</sup>)], whichever is greater, based on the area of the largest apartment plus the area of the public corridor. Such system shall be operated by manual controls that are part of the fire command center, as per Section 911, or fire alarm panel when a fire command center is not required. Each floor to be ventilated shall be by individual controls. Such control center or panel shall display a graphic indicating the portions of the building served by each post-fire smoke purge system.*

**912.4 Maintenance.** *The building owner shall maintain post-fire smoke exhaust systems in good operational condition. Records of testing shall be maintained on the premises for inspection by the department and Fire Department personnel.*

**CHAPTER 10**  
**MEANS OF EGRESS**

**SECTION BC 1001**  
**ADMINISTRATION**

**1001.1 General.** *Buildings or portions thereof shall be provided with a means of egress system as required by this chapter. The provisions of this chapter shall control the design, construction and arrangement of means of egress components required to provide an approved means of egress from structures and portions thereof.*

**1001.2 Minimum requirements.** *It shall be unlawful to alter a building or structure in a manner that will reduce the number of exits or the capacity of the means of egress to less than required by this code.*

**1001.3 Maintenance.** *Means of egress shall be maintained in accordance with the New York City Fire Code.*

**1001.3.1 Workplace exits.** *Except as specifically provided for in this chapter, no employer or agent of such employer shall lock the doors of or otherwise prohibit exit from any workplace, when by so doing the health or safety of any employee, independent contractor or other individual working in such workplace may become endangered by fire or other hazardous condition. Refer to Article 307 of Title 28 of the Administrative Code.*

**1001.4 Inadequate exits for existing structures.** *Every existing structure which is not provided with means of egress as required by this chapter and, in which the means of egress are, in the opinion of the commissioner inadequate for the safety of the occupants, shall be provided with means of egress or fire protection as directed by the commissioner.*

**SECTION BC 1002**  
**DEFINITIONS**

**1002.1 Definitions.** *The following words and terms shall, for the purpose of this chapter and as used elsewhere in this code, have the meaning shown herein.*

**ACCESSIBLE MEANS OF EGRESS.** *A continuous and unobstructed way of egress travel from any accessible point in a building or facility to a public way. Such way of egress travel may include an assisted*

*rescue path.*

**AISLE ACCESSWAY.** *That portion of an exit access that leads to an aisle.*

**ALTERNATING TREAD DEVICE.** *A device that has a series of steps between 50 and 70 degrees (0.87 and 1.22 rad) from horizontal, usually attached to a center support rail in an alternating manner so that the user does not have both feet on the same level at the same time.*

**AREA OF REFUGE.** *A floor area to which egress is made through a horizontal exit.*

**AREA OF RESCUE ASSISTANCE.** *An area where persons unable to use stairways can remain temporarily to await instructions or assistance during emergency evacuation.*

**ASSISTED RESCUE PATH.** *A portion of the accessible means of egress which begins at the area of rescue assistance and terminates at the public way.*

**BLEACHERS.** *Tiered seating facilities.*

**COLLECTING SAFE AREA.** *A safe area that receives occupants from the assembly space it serves, as well as from other safe areas.*

**COMMON PATH OF EGRESS TRAVEL.** *That portion of exit access which the occupants are required to traverse before two separate and distinct paths of egress travel to two exits are available. Paths that merge are common paths of travel. Common paths of egress travel shall be included within the permitted travel distance.*

**CORRIDOR.** *An enclosed exit access component that defines and provides a path of egress travel to an exit. Corridors shall be either interior or public.*

**CORRIDOR, INTERIOR.** *A corridor that serves only one tenant. In Group E occupancies, corridors serving only one institution shall be deemed as serving a single tenant.*

**CORRIDOR, PUBLIC.** *A corridor that serves more than one tenant.*

**CROSS AISLE.** *An aisle in a place of assembly usually parallel to rows of seats, connecting other aisles or connecting an aisle and an exit.*

**DEAD END.** *A portion of a corridor in which the travel to an exit is in one direction only.*

**DOOR, BALANCED.** *A door equipped with double-pivoted hardware so designed as to cause a semicounterbalanced swing action when opening.*

**EGRESS COURT.** *A court or yard which provides access to a public way for one or more exits.*

**EMERGENCY ESCAPE AND RESCUE OPENING.** *An operable window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.*

**EXIT.** *That portion of a means of egress system, which is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protective as required to provide a protected path of egress travel between the exit access and the exit discharge. Exits include vertical exits, exterior exit doors at ground level, exit enclosures, exit passageways, exterior exit stairs, exterior exit ramps and horizontal exits, but do not include access stairs, aisles, exit access doors opening to corridors or corridors.*

**EXIT ACCESS.** *That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit.*

**EXIT DISCHARGE.** *That portion of a means of egress system between the termination of an exit and a public way.*

**EXIT DISCHARGE, LEVEL OF.** *The horizontal plane located at the point at which an exit terminates and an exit discharge begins.*

**EXIT ENCLOSURE.** *An exit component that is separated from other interior spaces of a building or structure by fire-resistance-rated construction and opening protective, and provides for a protected path of egress travel in a vertical or horizontal direction to the exit discharge or the public way.*

**EXIT, HORIZONTAL.** *An exit that provides a path of egress travel from one building to an area in another building on approximately the same level, or a path of egress travel through or around a wall or partition to an area on approximately the same level in the same building, or a bridge or tunnel between two buildings, which affords safety from fire and smoke from the area of incidence and areas communicating therewith.*

**EXIT PASSAGEWAY.** *An exit component that is separated from all other interior spaces of a building or structure by fire-resistance-rated construction and opening protective, and provides for a protected path of egress travel in a horizontal direction to the exit discharge or the public way.*

**FIRE EXIT HARDWARE.** *Panic hardware that is listed for use on fire door assemblies.*

**FLOOR AREA, GROSS.** *The floor area within the inside perimeter of the exterior walls of the building under consideration, exclusive of courts, without deduction for corridors, stairways, closets, the thickness of interior walls, columns or other features. The floor area of a building, or portion thereof, not provided with surrounding exterior walls shall be the usable area under the horizontal projection of the roof or floor above. The gross floor area shall not include interior courts.*

**FLOOR AREA, NET.** *The actual occupied area not including the thickness of walls, partitions, columns, furred-in spaces, fixed cabinets, equipment, and unoccupied accessory areas such as corridors, stairways, toilet rooms, mechanical rooms and closets.*

**FOLDING AND TELESCOPIC SEATING.** *Tiered seating facilities having an overall shape and size that are capable of being reduced for purposes of moving or storing.*

**GRANDSTAND.** *Tiered seating facilities.*

**GUARD.** *A building component or a system of building components located at or near the open sides of elevated walking surfaces that minimizes the possibility of a fall from the walking surface to a lower level.*

**HANDRAIL.** *A horizontal or sloping rail intended for grasping by the hand for guidance or support.*

**MEANS OF EGRESS.** *A continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way. A means of egress consists of three separate and distinct parts: the exit access, the exit and the exit discharge.*

**NOSING.** *The leading edge of treads of stairs and of landings at the top of stairway flights.*

**OCCUPANT LOAD.** *The number of persons for which the means of egress of a building or portion thereof is designed.*

**OPEN EXTERIOR SPACE.** *A street or other public space; or a yard, court, or plaza open on one or more sides and unroofed or open on all sides, which provides egress to a street or public space.*

**PANIC HARDWARE.** *A door-latching assembly incorporating a device that releases the latch upon the application of a force in the direction of egress travel.*

**PUBLIC WAY.** *A street, alley or other parcel of land open to the outside air leading to a street, that has been deeded, dedicated or otherwise permanently appropriated to the public for public use and which has a clear width and height of not less than 10 feet (3048 mm).*

**RAMP.** *A walking surface that has a running slope steeper than one unit vertical in 20 units horizontal (5-percent slope).*

**SAFE AREA.** *An interior or exterior space that serves as a means of egress by providing a transitional area from, and that also serves as a normal means of entry to, an assembly space.*

**SCISSOR STAIR.** *Two interlocking stairways providing two separate paths of egress located within one stairwell enclosure.*

**SEATING SECTION.** *An area of seating bounded on all sides by aisles, cross aisles, walls, or partitions.*

**SMOKE-PROTECTED ASSEMBLY SEATING.** *Seating served by means of egress that is not subject to smoke accumulation within or under a structure.*

**STAIR.** *A change in elevation, consisting of two or more risers.*

**STAIRWAY.** *One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.*

**STAIRWAY, EXTERIOR.** *A stairway that is open on at least one side, except for required structural columns, beams, handrails and guards. The adjoining open areas shall be either yards, courts or public ways. The other sides of the exterior stairway need not be open.*

**STAIRWAY, INTERIOR.** *A stairway not meeting the definition of an exterior stairway.*

**STAIRWAY, SPIRAL.** *A stairway having a closed circular form in its plan view with uniform section-shaped treads attached to and radiating from a minimum-diameter-supporting column.*

**WINDER.** A stair tread with nonparallel edges.

**SECTION BC 1003**  
**GENERAL MEANS OF EGRESS**

**1003.1 Applicability.** The general requirements specified in Sections 1003 through 1012 shall apply to all three elements of the means of egress system, in addition to those specific requirements for the exit access, the exit and the exit discharge detailed elsewhere in this chapter.

**1003.2 Ceiling Height.** The means of egress shall have a ceiling height of not less than 7 feet, 6 inches (2286 mm).

**Exceptions:**

1. Ceilings that are permitted to be less than 7 feet, 6 inches (2286 mm) in accordance with Section 1208.2.
2. Ceilings of dwelling units and sleeping units within residential occupancies in accordance with Section 1208.2.
3. Allowable projections in accordance with Section 1003.3.
4. Stair headroom in accordance with Section 1009.2.
5. Door height in accordance with Section 1008.1.1.3.

**1003.3 Protruding objects.** Protruding objects shall comply with the requirements of Sections 1003.3.1 through 1003.3.4.

**1003.3.1 Headroom.** Protruding objects are permitted to extend below the minimum ceiling height required by Section 1003.2 provided a minimum headroom of 84 inches (2134 mm) shall be provided for any walking surface, including walks, corridors, aisles and passageways. Not more than 50 percent of the ceiling area of a means of egress shall be reduced in height by protruding objects.

**Exception:** Door closers and stops shall not reduce headroom to less than 78 inches (1981 mm).

*A barrier shall be provided where the vertical clearance is less than 80 inches (2032 mm) high. The leading edge of such a barrier shall be located 27 inches (686 mm) maximum above the floor.*

**1003.3.2 Free-standing objects.** *A free-standing object mounted on a post or pylon shall not overhang that post or pylon more than 12 inches (305 mm) where the lowest point of the leading edge is more than 27 inches (686 mm) and less than 80 inches (2032 mm) above the walking surface. Where a sign or other obstruction is mounted between posts or pylons and the clear distance between the posts or pylons is greater than 12 inches (305 mm), the lowest edge of such sign or obstruction shall be 27 inches (685 mm) maximum or 80 inches (2030 mm) minimum above the finish floor or ground. Free-standing objects shall not reduce the required width of the means of egress.*

**Exception:** *This requirement shall not apply to sloping portions of handrails serving stairs and ramps.*

**1003.3.3 Horizontal projections.** *Structural elements, fixtures or furnishings shall not project horizontally from either side more than 4 inches (102 mm) over any walking surface between the heights of 27 inches (686 mm) and 80 inches (2032 mm) above the walking surface.*

**Exception:** *Handrails serving stairs and ramps are permitted to protrude 4.5 inches (114 mm) from the wall.*

**1003.3.4 Clear width.** *Protruding objects shall not reduce the minimum clear width of accessible routes as required by Section 1104.*

**1003.4 Floor surface.** *Walking surfaces of the means of egress shall have a slip-resistant surface and be securely attached.*

**1003.5 Elevation change.** *Where changes in elevation of less than 12 inches (305 mm) exist in the means of egress, sloped surfaces shall be used. Where the slope is greater than one unit vertical in 20 units horizontal (5-percent slope), ramps complying with Section 1010 shall be used. Where the difference in elevation is 6 inches (152 mm) or less and the ramp is not equipped with handrails, the floor finish materials shall contrast with adjacent floor finish materials.*

**Exceptions.** *At locations that are not required to be accessible by Chapter 11:*

1. A single step with a maximum riser height of 7 inches (178 mm) is permitted for buildings with occupancies in:

1.1. Groups F, H, R-2 and R-3, and

1.2. Groups S and U at exterior doors.

2. A step with a single riser or a stair with two risers and a tread is permitted provided that the risers and treads comply with Section 1009.3, the minimum depth of the tread is 13 inches (330 mm) and at least one handrail complying with Section 1009.11 is provided within 30 inches (762 mm) of the centerline of the normal path of egress travel on the stair.

3. An aisle serving seating that has a difference in elevation less than 12 inches (305 mm) is permitted provided that the risers and treads comply with Section 1024.11 and the aisle is provided with a handrail complying with Section 1024.13.

*Any change in elevation in a corridor serving nonambulatory persons in a Group I-2 occupancy shall be by means of a ramp or sloped walkway.*

**1003.6 Means of egress continuity.** *The path of egress travel along a means of egress shall not be interrupted by any building element other than a means of egress component as specified in this chapter. Obstructions shall not be placed in the required width of a means of egress except projections permitted by this chapter. The required capacity of a means of egress system shall not be diminished along the path of egress travel.*

**1003.7 Elevators, escalators and moving walks.** *Elevators, escalators and moving walks shall not be used as a component of a required means of egress from any other part of the building.*

**Exception:** *Elevators used as a component of an accessible means of egress in accordance with Section 1007.4.*

## **SECTION BC 1004 OCCUPANT LOAD**

**1004.1 Design occupant load.** *In determining means of egress requirements, the number of occupants for whom means of egress facilities shall be provided shall be established by the largest number computed in*

accordance with Sections 1004.1.1 through 1004.1.3.

**1004.1.1 Actual number.** *The actual number of occupants for whom each occupied space, floor or building is designed.*

**1004.1.2 Number by Table 1004.1.2.** *The number of occupants computed at the rate of one occupant per unit of area as prescribed in Table 1004.1.2.*

**1004.1.3 Number by combination.** *Where occupants from accessory spaces egress through a primary area, the calculated occupant load for the primary space shall include the total occupant load of the primary space plus the number of occupants egressing through it from the accessory space.*

**1004.1.4 Modifications.** *Where the actual number of occupants of any space will be significantly lower than listed in Table 1004.1.2, the commissioner may establish a lower basis for the determination of the number of occupants.*

**1004.1.5 Unlisted occupancies.** *Where data regarding the square feet area per person for an occupancy is not listed in Table 1004.1.2, the occupant load shall be established by a registered design professional, subject to the approval of the commissioner.*

**TABLE 1004.1.2**  
**MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

<i>USE OF SPACE</i>	<i>FLOOR AREA IN SQ. FT. PER OCCUPANT</i>
<i>Agricultural building</i>	<i>300 gross</i>
<i>Aircraft hangars</i>	<i>500 gross</i>
<i>Assembly</i>	
<i>Gaming floors (keno, slots, etc.)</i>	<i>11 gross</i>
<i>Assembly with fixed seats</i>	<i>See Section 1004.7</i>
<i>Assembly without fixed seats</i>	
<i>Concentrated (chairs only—not fixed)</i>	<i>7 net</i>
<i>Dance floor</i>	<i>5 net</i>
<i>Dance floor (ballroom)</i>	<i>10 net</i>
<i>Standing space / Waiting area</i>	<i>5 net</i>
<i>Unconcentrated (tables and chairs)</i>	<i>15 net</i>
<i>Bowling centers, allow 5 persons for each lane including 15 feet of runway, and for additional areas</i>	<i>7 net</i>
<i>Business areas</i>	<i>100 gross</i>
<i>Courtrooms—other than fixed seating areas</i>	<i>40 net</i>
<i>Day Care</i>	
<i>age under 6 months</i>	<i>50 net</i>
<i>age 6 months – 2 years</i>	<i>40 net</i>
<i>age 2 years – 6 years</i>	<i>30 net</i>
<i>age above 6 years</i>	<i>50 net</i>
<i>Dormitories</i>	<i>50 gross</i>
<i>Educational</i>	
<i>Classroom area</i>	<i>20 net</i>
<i>Shops and other vocational room areas</i>	<i>50 net</i>
<i>Exercise rooms</i>	<i>50 gross</i>
<i>Gymnasiums</i>	<i>15 net</i>
<i>H-5 Fabrication and manufacturing areas</i>	<i>200 gross</i>
<i>Industrial areas</i>	<i>100 gross</i>

<i>Institutional areas</i>	
<i>Inpatient treatment areas</i>	240 gross
<i>Outpatient areas</i>	100 gross
<i>Sleeping areas</i>	120 gross
<i>Kitchens, commercial</i>	200 gross
<i>Library</i>	
<i>Reading rooms</i>	50 net
<i>Stack area</i>	100 gross
<i>Locker rooms</i>	50 gross
<i>Mercantile</i>	
<i>Areas on other floors</i>	60 gross
<i>Basement and grade floor areas</i>	30 gross
<i>Storage, stock, shipping areas</i>	300 gross
<i>Parking garages</i>	200 gross
<i>Passenger terminal</i>	
<i>Passenger terminal or platform</i>	1.5 X C*
<i>Baggage claim</i>	20 gross
<i>Baggage handling</i>	300 gross
<i>Concourse</i>	100 gross
<i>Waiting areas (Seated)</i>	15 gross
<i>Waiting area (Standing)</i>	5 net
<i>Residential</i>	200 gross within dwelling units
<i>Skating rinks, swimming pools</i>	
<i>Rink and pool</i>	50 gross
<i>Decks</i>	15 gross
<i>Stages and platforms</i>	15 net for performing area and 50 net remaining area
<i>Accessory storage areas, mechanical equipment room</i>	300 gross
<i>Warehouses</i>	500 gross

**1004.2 Increased occupant load.** *The occupant load permitted in any building or portion thereof is permitted to be increased from that number established for the occupancies in Table 1004.1.2 provided that all other requirements of the code are also met based on such modified number and the occupant load shall not exceed one occupant per 5 square feet (0.47 m<sup>2</sup>) of occupiable floor space. Where required by the commissioner, an approved aisle, seating or fixed equipment diagram substantiating any increase in occupant load shall be submitted. Where required by the commissioner, such diagram shall be posted.*

**1004.3 Posting of occupant load.** *Every room or space that is an assembly occupancy shall have the occupant load of the room or space posted in a conspicuous place, near the main exit or exit access doorway from the room or space. Posted signs shall be of an approved legible permanent design and shall be maintained by the owner or authorized agent. Such sign shall also comply with Section 1024.1.2.*

**1004.4 Exiting from multiple levels.** *Where exits serve more than one floor, only the occupant load of each floor considered individually shall be used in computing the required capacity of the exits at that floor, provided that the exit capacity shall not decrease in the direction of egress travel.*

**1004.5 Egress convergence.** *Where means of egress from floors above and below converge at an intermediate level, the capacity of the means of egress from the point of convergence shall not be less than the sum of the two floors.*

**1004.6 Mezzanine levels.** *The occupant load of a mezzanine level with egress onto a room or area below shall be added to that room or area's occupant load, and the capacity of the exits shall be designed for the total occupant load thus established.*

**1004.7 Fixed seating.** *For areas having fixed seats and aisles, the occupant load shall be determined by the number of fixed seats installed therein. For areas having fixed seating without dividing arms, the occupant load shall not be less than the number of seats based on one person for each 18 inches (457 mm) of seating length. The occupant load of seating booths shall be based on one person for each 24 inches (610 mm) of booth seat length measured at the backrest of the seating booth.*

**1004.8 Outdoor areas.** *Yards, patios, courts and similar outdoor areas accessible to and usable by the building occupants shall be provided with means of egress as required by this chapter. The occupant load of such outdoor areas shall be determined by the design professional subject to the approval of the commissioner. Where outdoor areas are to be used by persons in addition to the occupants of the building, and the path of egress travel from the outdoor areas passes through the building, means of egress requirements for the building shall be based on the sum of the occupant loads of the building plus the*

*outdoor areas.*

***Exceptions:***

1. *Outdoor areas used exclusively for service of the building need only have one means of egress.*
2. *Both outdoor areas associated with Group R-3 and individual dwelling units of Group R-2.*

***1004.9 Multiple occupancies.*** *Where a building contains two or more occupancies, the means of egress requirements shall apply to each portion of the building based on the occupancy of that space. Where two or more occupancies utilize portions of the same means of egress system, those egress components shall meet the more stringent requirements of all occupancies that are served.*

**SECTION BC 1005**

**EGRESS WIDTH**

***1005.1 Minimum required egress width.*** *The means of egress width shall not be less than that required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by the factors in Table 1005.1 and not less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress.*

***Exception:*** *Means of egress complying with Section 1024.*

**TABLE 1005.1**  
**EGRESS WIDTH PER OCCUPANT SERVED**

<b>OCCUPANCY</b>	<b>Stairways (inches per occupant)</b>	<b>Other components (inches per occupant)</b>
<i>Occupancies other than those listed below</i>	0.3	0.2
<i>Hazardous: H-1, H-2, H-3 and H-4</i>	0.7	0.4

*For SI: 1 inch = 25.4 mm*

**1005.2 Door encroachment.** Doors opening into the path of egress travel shall not reduce the required width to less than one-half during the course of the swing. When fully open, the door shall not project more than 7 inches (178 mm) into the required width.

**Exception:** The restrictions on a door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 and dwelling units of Group R-3.

## **SECTION BC 1006 MEANS OF EGRESS ILLUMINATION**

**1006.1 Illumination Required.** Exits, exit discharges and public corridors shall be illuminated at all times. Exit access components shall be illuminated at all times during occupancy.

**Exceptions:**

1. Occupancies in Group U.
2. Aisle accessways in Group A.
3. Dwelling units and sleeping units in Groups I-1, R-1, R-2 and R-3.
4. Sleeping units of Group I occupancies.

**1006.2 Illumination level.** The means of egress illumination level shall not be less than 2 foot-candles (22 lux) at the floor level in exits, at exit discharges, and in public corridors, and shall not be less than 1 foot-candle (11 lux) at the floor level in exit access components other than public corridors.

**Exceptions:**

1. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the floor level is permitted to be reduced during performances to not less than 0.5 foot-candle (5.38 lux) for aisles and cross aisles, and 0.2 foot-candle (2.15 lux) for other portions of the space, provided that the required illumination is automatically restored upon activation of a premise's fire alarm system where such system is provided. Step lights shall be provided in accordance with Section 1024.11.4.

2. *Safe areas in assembly occupancies shall be illuminated in accordance with Section 1024.17.3.2.*
3. *Open exterior spaces used to receive occupants as Class 1 or Class 2 exits in assembly occupancies shall be illuminated in accordance with Section 1024.17.4.*

**1006.3 Illumination emergency power.** *The power supply for means of egress illumination shall normally be provided by the premise's electrical supply.*

*In the event of power supply failure, an emergency electrical system shall automatically illuminate the following areas:*

1. *Exit access corridors, passageways and aisles in rooms and spaces which require two or more means of egress.*
2. *Exit access corridors, exit passageways and exit stairways located in buildings required to have two or more exits.*
3. *Exterior egress components at other than the level of exit discharge until exit discharge is accomplished for buildings required to have two or more exits.*
4. *Interior exit discharge elements, as permitted in Section 1023.1, in buildings required to have two or more exits.*
5. *The portion of the exterior exit discharge immediately adjacent to exit discharge doorways in buildings required to have two or more exits.*

**1006.3.1 Emergency power source.** *The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Section 2702.*

**1006.3.2 Performance of system.** *Emergency lighting facilities shall be arranged to provide initial illumination that is at least an average of 2 foot-candle (22 lux) and a minimum at any point of 0.2 foot-candle (2.15 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 foot-candle (6.46 lux) average and a minimum at any point of 0.06 foot-*

*candle (0.646 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.*

**1006.4** *Reserved.*

**SECTION BC 1007**  
**ACCESSIBLE MEANS OF EGRESS**

**1007.1 Accessible means of egress required.** *Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress is required by Section 1014.1 or 1018.1 from any accessible space, at least two accessible means of egress shall be provided to each accessible portion of the space.*

**Exceptions:**

- 1. Accessible means of egress are not required in alterations to existing buildings where the level of alterations does not trigger full compliance of accessibility pursuant to Section 28-101.4 of this code.*
- 2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3 or 1007.4.*
- 3. In assembly spaces with sloped floors, one accessible means of egress is required from a space where the common path of travel of the accessible route for access to the wheelchair spaces meets the requirements in Section 1024.8.*

**1007.2 Continuity and components.** *Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:*

- 1. Interior accessible routes complying with Section 1104.*
- 2. Area of rescue assistance complying with Section 1007.6.*
- 3. Stairways within vertical exit enclosures complying with Sections 1007.3 and 1019.1.*

4. *Exterior exit stairways complying with Sections 1007.3 and 1022.*
5. *Elevators complying with Section 1007.4.*
6. *Platform lifts complying with Section 1007.5.*
7. *Horizontal exits complying with Section 1021.*
8. *Ramps complying with Section 1010.*
9. *Exit discharges complying with Section 1023.*
10. *Exterior accessible routes complying with Section 1104.*
11. *Exterior areas of assisted rescue complying with Section 1007.8.*

**1007.2.1 High-rise buildings.** *In high-rise buildings subject to Section 403, at least one required accessible means of egress shall be an elevator complying with Section 1007.4.*

**Exceptions:**

1. *In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a horizontal exit located at or above the level of exit discharge.*
2. *In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a ramp conforming to the provisions of Section 1010.*
3. *In buildings of occupancy Group R-2 not subject to the requirements of emergency power in Section 403 of this code.*

**1007.2.2 Exit discharge.** *Where an exit discharge is not accessible, an exterior area for assisted rescue shall be provided in accordance with Section 1007.8. An exterior area for assisted rescue shall not be required where an exit discharge is on an assisted rescue path from a stairway or an elevator.*

**1007.2.3 Exterior exit stairway.** *Where an exit stairway is open to the exterior, the accessible means of egress shall include either an area of rescue assistance in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.8.*

**1007.3 Exit stairways.** *To be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of rescue assistance within an enlarged floor-level landing or shall be accessed from either an area of rescue assistance complying with Section 1007.6 or a horizontal exit.*

*Unenclosed exit stairways as permitted by Section 1019.1 are permitted to be considered part of an accessible means of egress.*

**Exceptions.** *The following exceptions apply to the requirements of clear width and area of rescue assistance, and do not supersede the other requirements of the accessible means of egress:*

- 1. The area of rescue assistance is not required at unenclosed stairways that are permitted by Section 1019.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.*
- 2. The clear width of 48 inches (1219 mm) between handrails and the area of rescue assistance is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.*
- 3. The clear width of 48 inches (1219 mm) between handrails is not required for enclosed exit stairways accessed from a horizontal exit.*
- 4. Areas of rescue assistance are not required at exit stairways serving open parking garages*

**1007.4 Elevators.** *To be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1 and Section 1109.6. Emergency power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from either an area of rescue assistance complying with Section 1007.6 or a horizontal exit complying with Section 1021.*

**Exceptions:**

1. Elevators are not required to be accessed from an area of rescue assistance or horizontal exit in open parking garages.
2. Elevators are not required to be accessed from an area of rescue assistance or horizontal exit in buildings and facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

**1007.5 Platform lifts.** Platform (wheelchair) lifts shall not serve as part of an accessible means of egress, except where allowed as part of a required accessible route in Section 1109.7. Platform lifts shall be installed in accordance with ASME A18.1. Emergency power shall be provided in accordance with Section 2702 for platform lifts permitted to serve as part of an accessible means of egress.

**1007.6 Areas of rescue assistance.** Every required area of rescue assistance shall be accessible from the space it serves by one or more accessible means of egress components as listed in Section 1007.2. The maximum travel distance from any accessible space to an area of rescue assistance shall not exceed the travel distance permitted for the occupancy in accordance with Section 1015.1. Every required area of rescue assistance shall have direct access to an enclosed stairway complying with Sections 1007.3 and 1019.1 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of rescue assistance, the shaft and lobby shall comply with Section 1019.1.8 for smokeproof enclosures except where the elevators are in an area of rescue assistance, such lobby shall be part of a horizontal exit or protected by smoke barrier.

**1007.6.1 Size.** Each area of rescue assistance shall be sized to accommodate one wheelchair space of 30 inches by 48 inches (762 mm by 1219 mm) for each 200 occupants or portion thereof, based on the occupant load of the area of rescue assistance and areas served by the area of rescue assistance. Such wheelchair spaces shall not reduce the required means of egress width. Access to any of the required wheelchair spaces in an area of rescue assistance shall not be obstructed by more than one adjoining wheelchair space.

**1007.6.2 Separation.** Each area of rescue assistance shall be separated from the remainder of the story by a smoke barrier complying with Section 709. Each area of rescue assistance shall be designed to minimize the intrusion of smoke.

**Exceptions.** Areas of rescue assistance need not be protected with smoke barrier where:

*1. Areas of rescue assistance is located within a stairway enclosure.*

*2. Sprinkler protection is provided in the areas of rescue assistance and all the areas it serves in accordance with Section 903.3.1.1 or 903.3.1.2.*

**1007.6.3 Two-way communication.** *Areas of rescue assistance shall be provided with a two-way communication system between the areas of rescue assistance and a central control point. If the central control point is not constantly attended, the area of rescue assistance shall also have controlled access to a public telephone system. Location of the central control point shall be approved by the Fire Department. The two-way communication system shall include both audible and visible signals.*

**1007.6.4 Instructions.** *In areas of rescue assistance that have a two-way emergency communications system, instructions on the use of the area under emergency conditions shall be posted adjoining the communications system. The instructions shall include all of the following:*

*1. Directions to find other means of egress.*

*2. Persons able to use the exit stairway do so as soon as possible, unless they are assisting others.*

*3. Information on planned availability of assistance in the use of stairs or supervised operation of elevators and how to summon such assistance.*

*4. Directions for use of the emergency communications system.*

**1007.6.5 Identification.** *Each door providing access to an area of rescue assistance from an adjacent floor area shall be identified by a sign complying with ICC A117.1, stating: AREA OF RESCUE ASSISTANCE, and including the International Symbol of Accessibility. The area of rescue assistance sign shall be illuminated in accordance with Section 1011.2. Additionally, tactile signage complying with ICC A117.1 shall be located at each door to an area of rescue assistance.*

**1007.7 Signage.** *Signage shall be installed indicating the location of an accessible means of egress at those exits and elevators serving required accessible spaces that are not accessible means of egress.*

**1007.8 Exterior area for assisted rescue.** *The exterior area for assisted rescue must be open to the outside air and meet the requirements of Section 1007.6.1. Separation walls shall comply with the requirements of*

*Section 704 for exterior walls. All walls or openings within 10 feet (3048 mm) horizontally of the perimeter of the exterior area for assisted rescue shall be constructed as required for a minimum 1-hour fire-resistance rating with ¾-hour opening protectives. Such construction shall extend 10 feet (3048 mm) vertically above the floor level of the exterior area for assisted rescue or to the roof line, whichever is lower.*

**1007.8.1 Openness.** *The exterior area for assisted rescue shall be at least 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.*

**1007.8.2 Exterior exit stairway.** *Exterior exit stairways that are part of the accessible means of egress for the exterior area for assisted rescue shall provide a clear width of 48 inches (1219 mm) between handrails.*

**1007.8.3 Identification.** *Exterior areas for assisted rescue shall have identification as required for area of rescue assistance that complies with Section 1007.6.5.*

## **SECTION BC 1008 DOORS, GATES AND TURNSTILES**

**1008.1 Doors.** *Means of egress doors shall meet the requirements of this section. Doors serving a means of egress system shall meet the requirements of this section and Section 1017.2. Doors provided for egress purposes in numbers greater than required by this code shall meet the requirements of this section.*

*Means of egress doors shall be readily distinguishable from the adjacent construction and finishes such that the doors are easily recognizable as doors. Mirrors or similar reflecting materials shall not be used on means of egress doors. Means of egress doors shall not be concealed by curtains, drapes, decorations or similar materials.*

**1008.1.1 Size of doors.** *The minimum width and height of each door opening shall be in accordance with this section.*

**1008.1.1.1 Door width.** *The minimum width of each door opening shall be sufficient for the occupant load thereof and shall provide a clear width of not less than 32 inches (813 mm). Clear openings of doorways with swinging doors shall be measured between the face of the door and the stop, with the door open 90 degrees (1.57 rad). Where this section requires a minimum clear width*

of 32 inches (813 mm) and a door opening includes two door leaves without a mullion, one leaf shall provide a clear opening width of 32 inches (813 mm). The maximum width of a swinging door leaf shall be 48 inches (1219 mm) nominal. Means of egress doors in an occupancy in Group I-2 used for the movement of beds shall provide a clear width not less than 41½ inches (1054 mm).

**Exceptions:**

1. The minimum and maximum width shall not apply to door openings that are not part of the required means of egress in occupancies in Groups R-2 and R-3.
2. Door openings to resident sleeping units in occupancies in Group I-3 shall have a clear width of not less than 28 inches (711 mm).
3. Door openings to storage closets less than 10 square feet (0.93 m<sup>2</sup>) in area shall not be limited by the minimum width.
4. Width of door leaves in revolving doors that comply with Section 1008.1.3.1 shall not be limited.
5. Interior egress doors within a dwelling unit or sleeping unit which is not required to be adaptable or accessible.
6. In Group R-3 occupancies, door openings required to be accessible within Type B dwelling units subject to Section 1107.6.3 shall have a minimum clear width of 31¾ inches (806 mm).

**1008.1.1.2 Projections into clear width.** There shall not be projections into the required clear width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

**1008.1.1.3 Height.** The height of doors shall not be less than 80 inches (2032 mm).

**Exceptions:**

1. Door openings within a dwelling unit or sleeping unit shall not be less than 78 inches

*(1981 mm) in height.*

- 2. Exterior door openings in dwelling units and sleeping units, other than the required exit door, shall not be less than 76 inches (1930 mm) in height.*

**1008.1.2 Door swing.** *Egress doors shall be installed in accordance with this section.*

**1008.1.2.1 Mounting.** *Egress doors shall be side-hinged swinging.*

**Exceptions:**

- 1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.*
- 2. Group I-3 occupancies used as a place of detention.*
- 3. Doors within or serving a single dwelling unit in Groups R-2 and R-3.*
- 4. In other than Group H occupancies, revolving doors complying with Section 1008.1.3.1.*
- 5. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.3.3 are permitted in a means of egress.*
- 6. Power-operated doors in accordance with Section 1008.1.3.2.*

**1008.1.2.2 Direction of swing.** *Doors shall swing in the direction of egress travel where serving:*

- 1. Group F or Group H occupancies.*
- 2. Rooms or spaces with an occupant load of 50 or more persons.*
- 3. Rooms or spaces requiring more than one exit door.*
- 4. Automatic teller machines in accordance with Administrative Code section 10-160.*

**Exception:** *Doors need not swing in the direction of egress travel for exterior street floor exit doors from lobbies serving only Group R-2 or R-3 occupancies.*

**1008.1.2.3 Opening force.** *The opening force for interior side-swinging doors without closers shall not exceed a 5-pound (22 N) force. For other side-swinging, sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full-open position when subjected to a 15-pound (67 N) force. Forces shall be applied to the latch side.*

**1008.1.3 Special doors.** *Special doors and security grilles shall comply with the requirements of Sections 1008.1.3.1 through 1008.1.3.5.*

**1008.1.3.1 Revolving doors.** *Revolving doors shall comply with the following:*

- 1. Each revolving door shall be capable of collapsing into a book fold position with parallel egress paths providing an aggregate width of 36 inches (914 mm).*
- 2. A revolving door shall not be located within 10 feet (3048 mm) of the foot of or top of stairs or escalators. A dispersal area shall be provided between the stairs or escalators and the revolving doors.*
- 3. The revolutions per minute (rpm) for a revolving door shall not exceed those shown in Table 1008.1.3.1.*
- 4. Each revolving door shall have a side-hinged swinging door which complies with Section 1008.1 in the same wall and within 10 feet (3048 mm) of the revolving door.*

TABLE 1008.1.3.1  
REVOLVING DOOR SPEEDS

INSIDE DIAMETER (feet-inches)	POWER-DRIVEN-TYPE SPEED CONTROL (rpm)	MANUAL-TYPE SPEED CONTROL (rpm)
6-6	11	12
7-0	10	11
7-6	9	11
8-0	9	10
8-6	8	9
9-0	8	9
9-6	7	8
10-0	7	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

**1008.1.3.1.1 Egress component.** *A revolving door used as a component of a means of egress shall comply with Section 1008.1.3.1 and the following three conditions:*

- 1. Revolving doors shall not be given credit for more than 50 percent of the required egress capacity.*
- 2. Each revolving door shall be credited with no more than a 50-person capacity.*
- 3. Each revolving door shall be capable of being collapsed when a force of not more than 130 pounds (578 N) is applied within 3 inches (76 mm) of the outer edge of a wing.*

**1008.1.3.1.2 Other than egress component.** *A revolving door used as other than a component of a means of egress shall comply with Section 1008.1.3.1. The collapsing force of a revolving door not used as a component of a means of egress shall not be more than 180 pounds (801 N).*

**Exception:** *A collapsing force in excess of 180 pounds (801 N) is permitted if the collapsing force is reduced to not more than 130 pounds (578 N) when at least one of the following conditions is satisfied:*

- 1. There is a power failure or power is removed to the device holding the door wings in position.*
- 2. There is an actuation of the automatic sprinkler system where such system is provided.*
- 3. There is an actuation of a smoke detection system which is installed in accordance with Section 907 to provide coverage in areas within the building which are within 75 feet (22 860 mm) of the revolving doors.*
- 4. There is an actuation of a manual control switch, in an approved location and clearly defined, which reduces the holding force to below the 130-pound (578 N) force level.*

**1008.1.3.2 Power-operated doors.** Where means of egress doors are operated by power, such as doors with a photoelectric-actuated mechanism to open the door upon the approach of a person, or doors with power-assisted manual operation, the design shall be such that in the event of power failure, the door is capable of being opened manually to permit means of egress travel or closed where necessary to safeguard means of egress. The forces required to open these doors manually shall not exceed those specified in Section 1008.1.2, except that the force to set the door in motion shall not exceed 50 pounds (220 N). The door shall be capable of swinging from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which egress is made. Full-power-operated doors shall comply with BHMA A156.10. Power-assisted and low-energy doors shall comply with BHMA A156.19.

**Exceptions:**

1. Power operated doors are not required to be manually operable in occupancies in Group I-3 when egress complies with Section 408.
2. Section 1008.1.3.2 does not apply to horizontal sliding doors complying with Section 1008.1.3.3.
3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 32-inch (813 mm) single-leaf requirement of Section 1008.1.1, provided a minimum 32-inch (813 mm) clear opening is provided when the two biparting leaves meeting in the center are broken out.

**1008.1.3.3 Horizontal sliding doors.** In other than Group H occupancies, horizontal sliding doors permitted to be a component of a means of egress in accordance with Exception 5 to Section 1008.1.2.1 shall comply with all of the following criteria:

1. The doors shall be power operated and shall be capable of being operated manually in the event of power failure.
2. The doors shall be openable by a simple method from both sides without special knowledge or effort.
3. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door

*in motion and 15 pounds (67 N) to close the door or open it to the minimum required width.*

- 4. The door shall be openable with a force not to exceed 15 pounds (67 N) when a force of 250 pounds (1100 N) is applied perpendicular to the door adjacent to the operating device.*
- 5. The door assembly shall comply with the applicable fire protection rating and, where rated, shall be self-closing or automatic-closing by smoke detection, shall be installed in accordance with NFPA 80 and shall comply with Section 715.*
- 6. The door assembly shall have an integrated emergency power supply.*
- 7. The door assembly power supply shall be electrically supervised.*
- 8. The door shall open to the minimum required width within 10 seconds after activation of the operating device.*

**1008.1.3.4 Access-controlled entrance doors.** *The exterior building entrance doors serving occupancies in Group A, B, E, M, R-1 or R-2 and entrance doors to tenant spaces in occupancies in Groups A, B, E, M, R-1 and R-2 are permitted to be equipped with an approved entrance and egress access control system which shall be installed in accordance with all of the following criteria:*

- 1. A sensor shall be provided on the egress side arranged to detect an occupant approaching the doors. The doors shall be arranged to unlock by a signal from or loss of power to the sensor.*
- 2. Loss of power to that part of the access control system which locks the doors shall automatically unlock the doors.*
- 3. The doors shall be arranged to unlock from a manual unlocking device located 40 inches to 48 inches (1016 mm to 1219 mm) vertically above the floor and within 5 feet (1524 mm) of the secured doors. Ready access shall be provided to the manual unlocking device and the device shall be clearly identified by a sign that reads "PUSH TO EXIT." When operated, the manual unlocking device shall result in direct interruption of power to the lock—*

*independent of the access control system electronics—and the doors shall remain unlocked for a minimum of 30 seconds.*

- 4. Activation of the building fire alarm system, if provided, shall automatically unlock the doors, and the doors shall remain unlocked until the fire alarm system has been reset.*
- 5. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically unlock the doors. The doors shall remain unlocked until the fire alarm system has been reset.*
- 6. Entrance doors in buildings with an occupancy in Group A, B, E or M shall not be secured from the egress side during periods that the building is open to the general public.*

**1008.1.3.5 Security grilles.** *In Groups B, M and S, horizontal sliding or vertical security grilles are permitted at the main entrance where the opening of such grilles are essential to the operation of the establishments. Such grilles shall be openable from the inside without the use of a key or special knowledge or effort during periods that the space is occupied. The grilles shall remain secured in the full-open position during the period of occupancy by the general public.*

**1008.1.4 Floor elevation.** *There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope).*

**Exceptions:**

- 1. Doors serving individual dwelling units in Groups R-2 and R-3 where the following apply:*
  - 1.1. A door is permitted to open at the top step of an interior flight of stairs within the dwelling unit, provided the door does not swing over the top step.*
  - 1.2. Screen doors and storm doors are permitted to swing over stairs or landings.*
- 2. Landings serving exterior doors as provided for in Section 1003.5, Exception 1, and Section 1017.2, which are not on an accessible route may be constructed a single 7-*

*inch (178 mm) step below the elevation at the door threshold.*

- 3. In Group R-3 occupancies, the landing at the exterior doorway shall not be more than 7¾ inches (197 mm) below the top of the threshold, provided the door, other than the exterior storm or screen door, does not swing over the landing.*
- 4. Variations in elevation due to differences in finish materials, but not more than 0.5 inch (12.7 mm).*
- 5. Exterior spaces of Type B units where permitted pursuant to Section 1107.4, Exceptions 1 and 2.*

**1008.1.5 Landings at doors.** *Landings shall have a width not less than the width of the stairway or the door, whichever is the greater. Doors in the fully open position shall not reduce a required dimension by more than 7 inches (178 mm). When a landing serves an occupant load of 50 or more, doors in any position shall not reduce the landing to less than 75 percent of its required width. Landings shall have a length measured in the direction of travel of not less than 44 inches (1118 mm).*

**Exception:** *Landing length in the direction of travel in Group R-3 and Group U and within individual units of Group R-2 need not exceed 36 inches (914 mm).*

**1008.1.6 Thresholds.** *Thresholds at doorways shall not exceed 0.75 inch (19.1 mm) in height for sliding doors serving dwelling units or 0.5 inch (12.7 mm) for other doors. Raised thresholds and floor level changes greater than 0.25 inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).*

**1008.1.7 Door arrangement.** *Space between two doors in series shall be 48 inches (1219 mm) minimum plus the width of a door swinging into the space. Doors in series shall swing either in the same direction or away from the space between doors.*

**Exceptions:**

- 1. The minimum distance between horizontal sliding power-operated doors in a series shall be 48 inches (1219 mm).*

2. *Storm and screen doors serving individual dwelling units in Groups R-2 and R-3 need not be spaced 48 inches (1219 mm) from the other door.*
3. *Doors within individual dwelling units in Group R-3.*
4. *Doors within individual dwelling units in Group R-2 that are not required to comply with Section 1107.*
5. *Exterior doors in vestibules in R-2 occupancies shall not be required to swing either in the same direction or away from the space between doors provided that the 48-inch (1219 mm) minimum space between door swings is maintained.*

**1008.1.8 Door operations.** *Except as specifically permitted by this section egress doors shall be readily openable from the egress side without the use of a key or special knowledge or effort.*

**1008.1.8.1 Hardware.** *Door handles, pulls, latches, locks and other operating devices on doors required to be accessible by Chapter 11 shall not require tight grasping, tight pinching or twisting of the wrist to operate.*

**1008.1.8.2 Hardware height.** *Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.*

**1008.1.8.3 Locks and latches.** *Locks and latches shall be permitted to prevent operation of doors where any of the following exists:*

1. *Places of detention or restraint.*
2. *Places where extra safeguards are required such as banks, museums, and jewelry stores subject to the approval of the commissioner and provided the locks are equipped with electrical release devices for remote control in case of emergencies. However, museums shall be subject to further special review by the commissioner and Fire Commissioner.*
3. *Main entrances in occupancy Groups B, M, and S as permitted by Section 1008.1.3.5.*

4. *Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.*
5. *Stairways leading from the top floor to a roof may be provided with locked wire mesh gates openable by key in occupancy Group E. The use of a hook and eye closing device on the inside of all doors to roofs shall be permitted.*

**1008.1.8.4 Bolt locks.** *Manually operated flush bolts or surface bolts are not permitted.*

**Exceptions:**

1. *On doors not required for egress in individual dwelling units or sleeping units.*
2. *Where a pair of doors serves a storage or equipment room, manually operated edge- or surface-mounted bolts are permitted on the inactive leaf.*

**1008.1.8.5 Unlatching.** *The unlatching of any leaf shall not require more than one operation.*

**Exception:** *More than one operation is permitted for unlatching doors in the following locations:*

1. *Places of detention or restraint.*
2. *Where manually operated bolt locks are permitted by Section 1008.1.8.4.*
3. *Doors from individual dwelling units and guestrooms of Group R occupancies as permitted by Section 1008.1.8.3, Exception 4.*

**1008.1.8.6 Delayed egress locks.** *Subject to special review and approval by the commissioner, approved, listed, delayed egress locks may be permitted on doors serving spaces where extra safeguards are required in buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an approved automatic smoke or heat detection system installed in accordance with Section 907, provided that the doors unlock in accordance*

with Items 1 through 6 below. A building occupant shall not be required to pass through more than one door equipped with a delayed egress lock before entering an exit.

1. *The doors unlock upon actuation of the automatic sprinkler system or automatic fire detection system.*
2. *The doors unlock upon loss of power controlling the lock or lock mechanism.*
3. *The door locks shall have the capability of being unlocked by a signal from the fire command center.*
4. *The initiation of an irreversible process which will release the latch in not more than 15 seconds when a force of not more than 15 pounds (67 N) is applied for 1 second to the release device. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Once the door lock has been released by the application of force to the releasing device, relocking shall be by manual means only.*

**Exception:** *Where approved, a delay of not more than 30 seconds is permitted.*

5. *A sign shall be provided on the door located above and within 12 inches (305 mm) of the release device reading: PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 SECONDS.*
6. *Emergency lighting shall be provided at the door.*

**Exceptions:**

1. *Delayed egress locks shall not be permitted in buildings or spaces in Group A, E, F and H occupancies. However, in museums, delayed egress locks may be installed on exit doors subject to special review by the commissioner and Fire Commissioner.*
2. *Places of detention or restraints in Group I-3 are permitted to install delayed egress locks without the special review by the commissioner, provided that the installation complies with all of the other requirements of this section.*

**1008.1.8.7 Stairway doors.** Interior stairway means of egress doors shall be openable from both sides without the use of a key or special knowledge or effort.

**Exceptions:**

1. Stairway discharge doors shall be openable from the egress side and shall only be locked from the opposite side.
2. This section shall not apply to doors arranged in accordance with Section 403.12.
3. In stairways serving not more than four stories, doors are permitted to be locked from the stair side, provided they are openable from the egress side.

**1008.1.9 Panic and fire exit hardware.** Each door in a means of egress from an occupancy of Group A or E having an occupant load of 75 or more and any occupancy of Group H-1, H-2, H-3 or H-5 shall be provided with panic hardware or fire exit hardware. Where panic and fire exit hardware is installed, it shall comply with the following:

1. The actuating portion of the releasing device shall extend at least one-half of the door leaf width.
2. The maximum unlatching force shall not exceed 15 pounds (67 N).
3. If balanced doors are used and panic hardware is required, the panic hardware shall be the push-pad type and the pad shall not extend more than one-half the width of the door measured from the latch side.

**1008.2 Gates.** Gates serving the means of egress system shall comply with the requirements of this section. Gates used as a component in a means of egress shall conform to the applicable requirements for doors.

**Exception:** Horizontal sliding or swinging gates exceeding the 4-foot (1219 mm) maximum leaf width limitation are permitted in fences and walls surrounding a stadium.

**1008.2.1 Stadiums.** Panic hardware is not required on gates surrounding stadiums where such gates are under constant immediate supervision while the public is present, and further provided that safe dispersal areas based on 3 square feet (0.28 m<sup>2</sup>) per occupant are located between the fence and

*enclosed space. Such required safe dispersal areas shall not be located less than 50 feet (15 240 mm) from the enclosed space. See Section 1023.6 for means of egress from safe dispersal areas.*

**1008.3 Turnstiles.** *Turnstiles or similar devices that restrict travel to one direction shall not be placed so as to obstruct any required means of egress. Where portable turnstiles are installed for ticketing purposes, such turnstiles shall be moved from the egress path for proper exiting. Turnstiles that turn freely in the direction of exit travel may be used in any occupancy where revolving doors are permitted. Each turnstile or similar device shall be credited with no more than a 50-person capacity where all of the following provisions are met:*

- 1. Each device shall turn free in the direction of egress travel when primary power is lost, and upon the manual release by an employee in the area.*
- 2. Such devices are not given credit for more than 50 percent of the required egress capacity.*
- 3. Each device is not more 39 inches (991 mm) high.*
- 4. Each device has at least 16.5 inches (419 mm) clear width at and below the height of 39 inches (991 mm) and at least 22 inches (559 mm) clear width at heights above 39 inches (991 mm).*
- 5. Where located as part of an accessible route, turnstiles shall have at least 36 inches (914 mm) clear at and below a height of 34 inches (864 mm), at least 32 inches (813 mm) clear width between 34 inches (864 mm) and 80 inches (2032 mm) and shall consist of a mechanism other than a revolving device.*

**Exception:** *Where serving an occupant load greater than 300, turnstiles shall not be credited for any of the required egress capacity.*

**1008.3.1 High turnstile.** *Turnstiles more than 39 inches (991 mm) high shall meet the requirements for revolving doors.*

**1008.3.2 Additional door.** *Where serving an occupant load greater than 300, each turnstile that is not portable shall have a side-hinged swinging door which conforms to Section 1008.1 within 50 feet (15 240 mm).*

**1008.4 Security requirements for doors and windows.** *The provisions of Section 1008.4.1 through 1008.4.4 shall apply to Group R-2 occupancies.*

**1008.4.1 Entrance doors.** *Building entrance doors and other exterior exit doors shall be equipped with heavy duty lock sets with auxiliary latch bolts to prevent the latch from being manipulated by means other than a key. Latch sets shall have stop-work in the inside cylinder controlled by a master key only. Outside cylinders of main entrance door locks shall be operated by the tenants' key, which shall not be keyed to also open the tenants' apartment door. A light or lights shall be provided at or near the outside of the front entranceway of the building providing not less than 5 foot candles (53.82 lux) intensity measured at the floor level for the full width of the entranceway.*

**1008.4.2 Doors to dwelling units.** *Doors to dwelling units shall be equipped with a heavy duty latch set and a heavy duty dead bolt operable by a key from the outside and a thumb-turn from the inside. Those doors shall also be equipped with a chain guard so as to permit partial opening of the door. Dwelling unit entrance doors shall also be equipped with a viewing device located so as to enable a person on the inside of the entrance door to view a person immediately outside.*

**1008.4.3 Windows.** *All openable windows shall be equipped with sash locks designed to be openable from the inside only. Grilles lockable from the inside only may be placed on the inside or outside of windows that are accessible from grade but that do not serve to provide access to exits.*

**1008.4.4 Intercommunication system.** *Buildings containing eight or more dwelling units shall be provided with an intercommunication system located at the door giving access to the main entrance lobby, consisting of a device or devices for voice communication between the occupant of each dwelling unit and a person outside the door to the main entrance lobby, and permitting such dwelling unit occupant to release the locking mechanism of said door from the dwelling unit. In buildings provided with a full-time lobby attendant, the intercommunication system may be between each dwelling unit and the attendant's station.*

## **SECTION BC 1009**

### **STAIRWAYS AND HANDRAILS**

**1009.1 Stairway width.** *The width of stairways shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm). See Section 1007.3 for accessible means of egress stairways.*

**Exceptions:**

1. *A width of not less than 36 inches (914 mm) shall be permitted in:*
  - 1.1. *A stairway that serves an occupant load of 50 or less cumulative for all stories; or*
  - 1.2. *A stairway that provides egress to the exit discharge solely for the use of Group R-2 occupancies, provided the building it serves is 125 feet (38 100 mm) or less in height, and provided such a stairway serves not more than 30 occupants per floor.*
2. *Spiral stairways as provided for in Section 1009.9.*
3. *Aisle stairs complying with Section 1024.*
4. *Where a stairway lift is installed on stairways serving occupancies in Group R-3, or within dwelling units in occupancies in Group R-2 a clear passage width not less than 20 inches (508 mm) shall be provided. If the seat and platform can be folded when not in use, the distance shall be measured from the folded position.*

**1009.2 Headroom.** *Stairways shall have a minimum headroom clearance of 84 inches (2134 mm) measured vertically from a line connecting the edge of the nosings. Such headroom shall be continuous above the stairway to the point where the line intersects the landing below, one tread depth beyond the bottom riser. The minimum clearance shall be maintained the full width of the stairway and landing. Projections into the required width shall not be limited above the minimum headroom height.*

**Exceptions:**

1. *In Group R-2 and R-3 occupancies stairways shall have a minimum headroom clearance of 80 inches (2032 mm).*
2. *Spiral stairways complying with Section 1009.9 are permitted a 78-inch (1981 mm) headroom clearance.*

**1009.3 Stair treads and risers.** *Stair riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. Stair tread depths shall be 11 inches (279 mm) minimum. The riser height shall be measured vertically between the leading edges of adjacent treads. The greatest riser height within any flight of stairs shall not exceed the smallest by more than 0.375 inch (9.5 mm). The tread depth shall be*

measured horizontally between the vertical planes of the foremost projection of adjacent treads and at right angle to the tread's leading edge. The greatest tread depth within any flight of stairs shall not exceed the smallest by more than 0.375 inch (9.5 mm). Winder treads shall have a minimum tread depth of 11 inches (279 mm) measured at a right angle to the tread's leading edge at a point 12 inches (305 mm) from the side where the treads are narrower and a minimum tread depth of 10 inches (254 mm). The greatest winder tread depth at the 12-inch (305 mm) walk line within any flight of stairs shall not exceed the smallest by more than 0.375 inch (9.5 mm).

**Exceptions:**

1. Circular stairways in accordance with Section 1009.7.
2. Winders in accordance with Section 1009.8.
3. Spiral stairways in accordance with Section 1009.9.
4. Aisle stairs in assembly seating areas where the stair pitch or slope is set, for sightline reasons, by the slope of the adjacent seating area in accordance with Section 1024.11.2.
5. In Group R-2 occupancies:
  - 5.1. Sum of treads and risers. The sum of two risers plus one tread exclusive of nosing shall be not less than 24 inches (610 mm) nor more than 25.5 inches (648 mm).
  - 5.2. Dimensions of treads and risers. The maximum riser height shall be 7.75 inches (197 mm) and the minimum tread depth shall be 9.5 inches (241 mm) plus nosing. Treads may be undercut a distance equal to the nosing. A nosing not less than 0.75 inch (19 mm) but not more than 1.25 inches (32 mm) shall be provided on stairways with solid risers where the tread depth is less than 11 inches (279 mm).
  - 5.3. Tolerances. The greatest riser height, tread depth, and nosing projection, within any flight of stairs shall not exceed the smallest by more than 0.375 (9.5 mm).
6. In Group R-3 occupancies; within dwelling units in Group R-2 occupancies not subject to accessibility provisions in Section 1107.2.5, Exception Item 2; and in Group U occupancies that are accessory to Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies:

- 6.1. *Sum of treads and risers. The sum of two risers plus one tread exclusive of nosing shall be not less than 24 inches (610 mm) nor more than 25.5 inches (648 mm).*
- 6.2. *Dimensions of treads and risers. The maximum riser height shall be 8.25 inches (210 mm) and the minimum tread depth shall be 9 inches (229 mm) plus nosing. Treads may be undercut a distance equal to the nosing. A 1.25-inch (32 mm) nosing shall be provided on stairways with solid risers where the tread depth is less than 11 inches (279 mm).*
- 6.3. *Tolerances. The greatest riser height, tread depth, and nosing projection, within any flight of stairs shall not exceed the smallest by more than 0.375 (9.5 mm).*
7. *In Group R-3 occupancies; and within dwelling units in Group R-2 occupancies; winders shall have a minimum tread depth of 10 inches (254 mm) measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's leading edge, when measured at a point 12 inches (305 mm) from the side where the treads are narrower. Winder treads shall have a minimum tread depth of 6 inches (152 mm) at any point. Within any flight of stairs, the greatest winder tread depth at the 12-inch (305 mm) walk line shall not exceed the smallest by more than 0.375 inch (9.5 mm).*

**1009.3.1 Dimensional uniformity.** *Stair treads and risers shall be of uniform size and shape. The tolerance between the largest and smallest riser or between the largest and smallest tread shall not exceed 0.375 inch (9.5 mm) in any flight of stairs.*

**Exceptions:**

1. *Nonuniform riser dimensions of aisle stairs complying with Section 1024.11.2.*
2. *Consistently shaped winders, complying with Section 1009.8, differing from rectangular treads in the same stairway flight.*
3. *Where the bottom or top riser adjoins a sloping public way, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of stairway width. The nosings or leading edges of treads at such*

*nonuniform height risers shall have a distinctive marking stripe, different from any other nosing marking provided on the stair flight. The distinctive marking stripe shall be visible in descent of the stair and shall have a slip-resistant surface. Marking stripes shall have a width of at least 1 inch (25 mm) but not more than 2 inches (51 mm).*

**1009.3.2 Profile.** *The radius of curvature at the leading edge of the tread shall be not greater than 0.5 inch (12.7 mm). Beveling of nosings shall not exceed 0.5 inch (12.7 mm). Risers shall be solid and vertical or sloped from the underside of the leading edge of the tread above at an angle not more than 30 degrees (0.52 rad) from the vertical. The leading edge (nosings) of treads shall project not more than 1.25 inches (32 mm) beyond the tread below and all projections of the leading edges shall be of uniform size, including the leading edge of the floor at the top of a flight. Perforated risers with openings not exceeding 0.25 inch (6.4 mm) shall be considered solid risers.*

**Exceptions:**

1. *Solid risers are not required for stairways that are not serving as means of egress or that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).*
2. *Solid risers are not required for occupancies in Group I-3.*
3. *In Group R-3 occupancies, the following shall apply:*
  - 3.1. *The radius of curvature at the leading edge of the tread shall be no greater than 0.5625 inch (14.3 mm).*
  - 3.2. *Solid risers are not required provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm). However, the opening between treads is not limited on stairways with a total rise of 30 inches (762 mm) or less.*

**1009.4 Stairway landings.** *There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run.*

**Exceptions:**

1. Aisle stairs complying with Section 1024.
2. Doors opening onto a landing shall not reduce the landing to less than 75 percent of the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing.

**1009.5 Stairway construction.** All stairways shall be built of materials consistent with the type permitted for the type of construction of the building, except that wood handrails shall be permitted for all types of construction.

**1009.5.1 Stairway walking surface.** The walking surface of treads and landings of a stairway shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Stairway treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

**Exception:** In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of 1 $\frac{1}{8}$  inches (29 mm) cannot pass through the opening.

**1009.5.2 Outdoor conditions.** Outdoor stairways and outdoor approaches to stairways shall be designed so that water will not accumulate on walking surfaces. In other than occupancies in Group R-3, and occupancies in Group U that are accessory to an occupancy in Group R-3, treads, platforms and landings that are part of exterior stairways in climates subject to snow or ice shall be protected to prevent the accumulation of same.

**1009.6 Vertical rise.** A flight of stairs shall not have a vertical rise greater than 12 feet (3658 mm) between floor levels or landings, except that the vertical rise shall not be greater than 8 feet (2438 mm) in Group A and I occupancies.

**Exception:** Aisle stairs comply with Section 1024.

**1009.7 Circular stairways.** Circular stairways shall have a minimum tread depth and a maximum riser height in accordance with Section 1009.3 and the smaller radius shall not be less than twice the width of the stairway. The minimum tread depth measured 12 inches (305 mm) from the narrower end of the tread

shall not be less than 11 inches (279 mm). The minimum tread depth at the narrow end shall not be less than 10 inches (254 mm).

**Exception:** For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2.

**1009.8 Winders.** Winders are not permitted in means of egress stairways except in R-3 occupancies or within dwelling units in Group R-2 occupancies.

**1009.9 Spiral stairways.** Spiral stairways are permitted to be used as a component in the means of egress only within dwelling units or from a space not more than 250 square feet (23 m<sup>2</sup>) in area and serving not more than five occupants, or from galleries, catwalks and gridirons in accordance with Section 1014.6. A spiral stairway shall have a 7.5-inch (191 mm) minimum clear tread depth at a point 12 inches (305 mm) from the narrow edge. The risers shall be sufficient to provide a headroom of 78 inches (1981 mm) minimum, but riser height shall not be more than 9.5 inches (241 mm). The minimum stairway width shall be 26 inches (660 mm).

**1009.10 Alternating tread devices.** Alternating tread devices are limited to an element of a means of egress in buildings of Groups F, H and S from a mezzanine not more than 250 square feet (23 m<sup>2</sup>) in area and which serves not more than five occupants; in buildings of Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m<sup>2</sup>) in area and for access to unoccupied roofs.

**1009.10.1 Handrails of alternating tread devices.** Handrails shall be provided on both sides of alternating tread devices and shall conform to Section 1009.11.

**1009.10.2 Treads of alternating tread devices.** Alternating tread devices shall have a minimum projected tread of 5 inches (127 mm), a minimum tread depth of 8.5 inches (216 mm), a minimum tread width of 7 inches (178 mm) and a maximum riser height of 9.5 inches (241 mm). The initial tread of the device shall begin at the same elevation as the platform, landing or floor surface.

**Exception:** Alternating tread devices used as an element of a means of egress in buildings from a mezzanine area not more than 250 square feet (23 m<sup>2</sup>) in an area which serves not more than five occupants shall have a minimum projected tread of 8.5 inches (216 mm) with a minimum tread depth of 10.5 inches (267 mm). The rise to the next alternating tread surface should not be more than 8 inches (203 mm).

**1009.11 Handrails.** *Stairways shall have handrails on each side. Handrails shall be adequate in strength and attachment in accordance with Section 1607.7. Handrails for ramps, where required by Section 1010.8, shall comply with this section.*

**Exceptions:**

1. *Aisle stairs complying with Section 1024 provided with a center handrail need not have additional handrails.*
2. *Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.*
3. *Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing need not have handrails.*
4. *In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.*
5. *Changes in room elevations of only one riser within dwelling units and sleeping units in Group R-02 and R-3 occupancies do not require handrails.*
6. *One handrail shall be allowed in enclosed exit stairs less than 44 inches (1118 mm) wide that do not serve as an accessible means of egress.*

**1009.11.1 Height.** *Handrail height, measured above stair tread nosings, or finish surface of ramp slope, shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965 mm).*

**1009.11.2 Intermediate handrails.** *Intermediate handrails are required so that all portions of the stairway width required for egress capacity are within 30 inches (762 mm) of a handrail. On monumental stairs, handrails shall be located along the most direct path of egress travel.*

**1009.11.3 Handrail graspability.** *Handrails with a circular cross section shall have an outside diameter of at least 1.25 inches (32 mm) and not greater than 2 inches (51 mm) or shall provide equivalent graspability. If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6.25 inches (160 mm) with a maximum cross-section dimension*

of 2.25 inches (57 mm). Edges shall have a minimum radius of 0.01 inch (0.25mm).

**1009.11.4 Continuity.** Handrail-gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

**Exceptions:**

1. Handrails within dwelling units are permitted to be interrupted by a newel post at a stair landing.
2. Within a dwelling unit, the use of volute, turnout of starting easing is allowed on the lowest tread.

**1009.11.5 Handrail extensions.** Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stair flight. Where handrails are not continuous between flights, the handrails shall extend horizontally at least 12 inches (305 mm) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser.

**Exceptions:**

1. Handrails within a dwelling unit that is not required to be an Accessible unit, or Type B unit in Group R-2 occupancies, may extend only from the top riser to the bottom riser.
2. Aisle handrails in Group A occupancies in accordance with Section 1024.13.

**1009.11.6 Clearance.** Clear space between a handrail and a wall or other surface shall be a minimum of 1.5 inches (38 mm). A handrail and a wall or other surface adjacent to the handrail shall be free of any sharp or abrasive elements.

**1009.11.7 Stairway projections.** Projections into the required width at each handrail shall not exceed 4.5 inches (114 mm).

**1009.12 Stairway to roof and roof access.** In buildings four or more stories or more than 40 feet (12 192 mm) in height above grade, one stairway shall extend to the roof surface through a stairway bulkhead complying with Section 1509.2, unless the roof has a slope steeper than 20 degrees. Access to setback roof areas may be through a door or window opening to the roof. Stairs terminating at the level of a setback

shall provide access to the setback roof areas, except where the setback is less than 4 feet (1219 mm) in width and 10 feet (3048 mm) in length, measured from the inside of the parapet wall.

**1009.12.1 Occupancy Groups I-1, R-1 and R-2.** In buildings in occupancy Groups I-1, R-1 and R-2 two stories or more in height, with roofs having a slope of 15 degrees or less, all interior stairs, except those terminating at the level of a setback roof, shall extend to the roof surface.

**Exceptions:**

1. In buildings in occupancy Groups R-1 and R-2 two stories in height and in occupancy Group R-2 three stories in height with not more than one dwelling unit per story, access to the roof shall be permitted to be a non-combustible roof hatch or trap door not less than 21 inches (533 mm) in width and 28 inches (711 mm) in length. Such hatches shall be located within the stair enclosure and be provided with a stationary, noncombustible access ladder or alternating tread device.
2. In buildings in occupancy group R-2 complying with Item 4 of Section 1018.2, roof access shall be governed by Item 4.6 of such section.

**SECTION BC 1010**

**RAMPS**

**1010.1 Scope.** The provisions of this section shall apply to ramps used as a component of a means of egress.

**Exceptions:**

1. Other than ramps that are part of the accessible routes providing access in accordance with Sections 1108.2.2 through 1108.2.4.1, ramped aisles within assembly rooms or spaces shall conform with the provisions in Section 1024.11.
2. Curb ramps shall comply with ICC A117.1.
3. Vehicle ramps in parking garages for pedestrian exit access shall not be required to comply with Sections 1010.3 through 1010.9 when they are not an accessible route serving accessible parking spaces, other required accessible elements or part of an accessible means of egress.

**1010.2 Slope.** Ramps used as part of a means of egress or part of an accessible route shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

**Exceptions:**

1. Aisle ramp slope in occupancies of Group A shall comply with Section 1024.11.
2. In garages three stories or less in height and serving not more than one level below grade, ramps with a maximum slope of one unit vertical in seven units horizontal (14-percent slope) may serve as part of a non accessible means of egress.

**1010.3 Cross slope.** The slope measured perpendicular to the direction of travel of a ramp shall not be steeper than one unit vertical in 48 units horizontal (2-percent slope).

**1010.4 Vertical rise.** The rise for any ramp run shall be 30 inches (762 mm) maximum.

**1010.5 Minimum dimensions.** The minimum dimensions of means of egress ramps shall comply with Sections 1010.5.1 through 1010.5.3.

**1010.5.1. Width.** The minimum width of a means of egress ramp shall not be less than that required for corridors by Section 1016.2. The clear width of a ramp and the clear width between handrails, if provided, shall be 36 inches (914 mm) minimum.

**1010.5.1. Headroom.** The minimum headroom in all parts of the means of egress ramp shall not be less than 84 inches (2134 mm).

**1010.5.3 Restrictions.** Means of egress ramps shall not reduce the width in the direction of egress travel. Projections into the required ramp and landing width are prohibited. Doors opening onto landing shall not reduce the clear width to less than 42 inches (1067 mm). No door shall swing over the sloping portion of a ramp.

**1010.6 Landings.** Ramps shall have landings at the bottom and top of each ramp, points of turning, entrance, exits and at doors. Landings shall comply with Sections 1010.6.1 through 1010.6.5.

**1010.6.1 Slope.** Landings shall have a slope not steeper than one unit vertical in 48 units horizontal

*(2-percent slope) in any direction. Changes in level are not permitted.*

**1010.6.2 Width.** *The landing shall be at least as wide as the widest ramp run adjoining the landing.*

**1010.6.3 Length.** *The landing length shall be 60 inches (1525 mm) minimum.*

**Exception:** *Landings in individual dwelling units, that are not Accessible units, or that are not Type B units in Group R-2 occupancies, are permitted to be 36 inches (914mm) minimum.*

**1010.6.4 Change in direction.** *Where changes in direction of travel occur at landings provided between ramp runs, the landing shall be 60 inches by 60 inches (1524 mm by 1524 mm) minimum.*

**Exception:** *Landings in individual dwelling units, that are not Accessible units, or that are not Type B units in Group R-2 occupancies, are permitted to be 36 inches by 36 inches (914 mm by 914 mm) minimum.*

**1010.6.5 Doorways.** *Where doorways are located adjacent to a ramp landing, maneuvering clearances required by ICC A117.1 are permitted to overlap the required landing area.*

**1010.7 Ramp construction.** *All ramps shall be built of materials consistent with the types permitted for the type of construction of the building; except that wood handrails shall be permitted for all types of construction. Ramps used as an exit shall conform to the applicable requirements of Sections 1019.1 and 1019.1.1 through 1019.1.3 for vertical exit enclosures.*

**1010.7.1 Ramp surface.** *The surface of ramps shall be of slip-resistant materials that are securely attached.*

**1010.7.2 Outdoor conditions.** *Outdoor ramps and outdoor approaches to ramps shall be designed so that water will not accumulate on walking surfaces. In other than occupancies in Group R-3, and occupancies in Group U that are accessory to an occupancy in Group R-3, surfaces and landings which are part of exterior ramps in climates subject to snow or ice shall be designed to minimize the accumulation of same.*

**1010.8 Handrails.** *Ramps with a rise greater than 6 inches (152 mm) shall have handrails on both sides complying with Section 1009.11.*

**1010.9 Edge protection.** Edge protection complying with Section 1010.9.1 shall be provided on each side of ramp runs and at each side of ramp landings not adjoining another ramp run or stairway.

**Exceptions:**

1. Edge protection is not required on ramps not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.
2. Edge protection is not required on the sides of ramp landings having a vertical dropoff of not more than 0.5 inch (13 mm) within 10 inches (254 mm) horizontally of the required landing area.
3. Edge protection is not required where the floor or ground surface of the ramp run or landing extends 12 inches (305 mm) minimum beyond the inside face of handrail complying with Section 1012.

**1010.9.1 Curb, rail, wall or barrier.** Edge protection shall be provided as follows:

1. Solid barriers. Solid barriers shall extend at least 4 inches (102 mm) from the floor or ground surface.
2. Other types of barriers. Other types of barriers shall prevent the passage of a 4-inch-diameter (102 mm) sphere, where any portion of the sphere is within 4 inches (102 mm) of the floor or ground surface.

**1010.10 Guards.** Guards shall be provided where required by Section 1012 and shall be constructed in accordance with Section 1012. Such guards may be used to satisfy the requirement of edge protection of Section 1010.9.

## **SECTION BC 1011**

### **EXIT SIGNS**

**1011.1 Where required.** Exits and exit access doors shall be marked by an approved exit sign readily visible from any direction of egress travel. Access to exits shall be marked by readily visible exit signs in cases where the exit or the path of egress travel is not immediately visible to the occupants. Exit sign placement shall be such that no point in an exit access corridor is more than 100 feet (30 480 mm) or the

listed viewing distance for the sign, whichever is less, from the nearest visible exit sign.

**Exceptions:**

1. Exit signs are not required in rooms or areas which require only one exit or exit access.
2. Exit signs are not required in occupancies in Group U and individual sleeping units or dwelling units in Group I-1 or R. However, in a congregate living unit where the occupancy of such unit exceeds four people, exit signs shall be provided.
3. Exit signs are not required in sleeping areas in occupancies in Group I-3.
4. In occupancies in Groups A-4 and A-5, exit signs are not required on the seating side of vomitories or openings into seating areas where exit signs provided in the concourse are readily apparent from the vomitories. Such vomitories shall be provided with emergency egress lighting to identify each vomitory or opening within the seating area.

**1011.1.1 Signs within exits.** In high-rise buildings subject to Section 403, exit signs shall be placed within exits at horizontal extensions to indicate the transition from vertical to horizontal direction and at turns along the horizontal path.

**1011.2 Illumination.** Exit signs shall be internally or externally illuminated.

**Exception:** Tactile signs required by Section 1011.3 need not be provided with illumination.

**1011.3 Tactile exit signs.** A tactile sign stating EXIT and complying with ICC A117.1 shall be provided adjacent to each door to an egress stairway, an exit passageway and the exit discharge.

**1011.4 Internally illuminated exit signs.** Internally illuminated exit signs shall be listed and labeled and shall be installed in accordance with the manufacturer's instructions and Section 2702. Exit signs shall be illuminated at all times.

**1011.4.1 Color:** The letters of exit signs shall be red.

**1011.4.2 Graphics:** The height of letters shall be not less than 6 inches (152 mm), except that in Group A and Group R-1 occupancies letters shall be not less than 8 inches (203 mm) high. Graphics shall have letter widths, strokes and spacing in proportion to their height.

**1011.5 Externally illuminated exit signs.** Externally illuminated exit signs shall comply with Sections 1011.5.1 through 1011.5.3.

**1011.5.1 Graphics.** Every exit sign and directional exit sign shall have plainly legible letters not less than 6 inches (152 mm) high with the principal strokes of the letters not less than 0.75 inch (19.1 mm) wide. The word “EXIT” shall have letters having a width not less than 2 inches (51 mm) wide except the letter “I,” and the minimum spacing between letters shall not be less than 0.375 inch (9.5 mm). In Group A and Group R-1 occupancies letters shall be not less than 8 inches (203 mm) high. Signs larger than the minimum established in this section shall have letter widths, strokes and spacing in proportion to their height.

The word “EXIT” shall be in high contrast with the background and shall be clearly discernible when the exit sign illumination means is or is not energized. The letters of exit signs shall be red. If an arrow is provided as part of the exit sign, the construction shall be such that the arrow direction cannot be readily changed.

**1011.5.2 Exit sign illumination.** The face of an exit sign illuminated from an external source shall have an intensity of not less than 25 foot-candles (269.1 lux).

**1011.5.3 Power source.** Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Section 2702.

## **SECTION BC 1012**

### **GUARDS**

**1012.1 Where required.** Guards shall be located along open-sided walking surfaces, mezzanines, industrial equipment platforms, stairways, ramps and landings which are located more than 30 inches (762 mm) above the floor or grade below. Guards shall be adequate in strength and attachment in accordance with Section 1607.7. Guards shall also be located along glazed sides of stairways, ramps and landings that are located more than 30 inches (762 mm) above the floor or grade below where the glazing provided does not meet the strength and attachment requirements in Section 1607.7.

**Exception:** Guards are not required for the following locations:

1. On the loading side of loading docks or piers.

2. *On the audience side of stages and raised platforms, including steps leading up to the stage and raised platforms.*
3. *On raised stage and platform floor areas such as runways, ramps and side stages used for entertainment or presentations.*
4. *At vertical openings in the performance area of stages and platforms.*
5. *At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.*
6. *Along vehicle service pits not accessible to the public.*
7. *In assembly seating where guards in accordance with Section 1024.14 are permitted and provided.*

**1012.2 Height.** *Guards shall form a protective barrier not less than 42 inches (1067 mm) high, measured vertically above the leading edge of the tread, adjacent walking surface or adjacent seatboard.*

**Exceptions:**

1. *For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards whose top rail also serves as a handrail shall have a height not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from the leading edge of the stair tread nosing.*
2. *The height in assembly seating areas shall be in accordance with Section 1024.14.*

**1012.3 Opening limitations.** *Open guards shall have balusters or ornamental patterns such that a 4-inch-diameter (102 mm) sphere cannot pass through any opening up to a height of 34 inches (864 mm). From a height of 34 inches (864 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, a sphere 8 inches (203 mm) in diameter shall not pass.*

**Exceptions:**

1. *The triangular openings formed by the riser, tread and bottom rail at the open side of a stairway shall be of a maximum size such that a sphere of 6 inches (152 mm) in diameter cannot pass through the opening.*
2. *At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, guards shall have balusters or be of solid materials such that a sphere with a diameter of 21 inches (533 mm) cannot pass through any opening.*
3. *In areas which are not open to the public within occupancies in Group I-3, F, H or S, balusters, horizontal intermediate rails or other construction shall not permit a sphere with a diameter of 21 inches (533 mm) to pass through any opening.*
4. *In assembly seating areas, guards at the end of aisles where they terminate at a fascia of boxes, balconies and galleries shall have balusters or ornamental patterns such that a 4-inch-diameter (102 mm) sphere cannot pass through any opening up to a height of 26 inches (660 mm). From a height of 26 inches (660 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, a sphere 8 inches (203 mm) in diameter shall not pass.*

**1012.4 Screen porches.** *Porches and decks which are enclosed with insect screening shall be provided with guards where the walking surface is located more than 30 inches (762 mm) above the floor or grade below.*

**1012.5 Mechanical equipment.** *Guards shall be provided where appliances, equipment, fans or other components that require service are located within 10 feet (3048 mm) of a roof edge or open side of a walking surface and such edge or open side is located more than 30 inches (762 mm) above the floor, roof or grade below. The guard shall be constructed so as to prevent the passage of a 21-inch-diameter (533 mm) sphere.*

## **SECTION BC 1013**

### **EXIT ACCESS**

**1013.1 General.** *The exit access arrangement shall comply with Sections 1013 through 1016 and the applicable provisions of Sections 1003 through 1012.*

**1013.2 Egress through intervening spaces.** *Egress from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas are accessory to the area served; are not a high-hazard occupancy and provide a discernible path of egress travel to an exit. Egress*

*shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes. An exit access shall not pass through a room that can be locked to prevent egress. Means of egress from dwelling units or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.*

***Exceptions:***

- 1. Means of egress are not prohibited through a kitchen area serving adjoining rooms constituting part of the same dwelling unit or sleeping unit.*
- 2. Means of egress are not prohibited through adjoining or intervening rooms or spaces in a Group H occupancy when the adjoining or intervening rooms or spaces are in the same or a lesser hazard occupancy group.*

***1013.2.1 Multiple tenants.*** *Where more than one tenant occupies any one floor of a building or structure, each tenant space, dwelling unit and sleeping unit shall be provided with access to the required exits without passing through adjacent tenant spaces, dwelling units and sleeping units.*

***1013.2.2 Group I-2.*** *Patient sleeping rooms or suites in Group I-2 occupancies shall have an exit access door leading directly to an exit access corridor.*

***Exceptions:***

- 1. Rooms with exit doors opening directly to the outside at ground level.*
- 2. Patient sleeping rooms are permitted to have one intervening room if the intervening room is not used as an exit access for more than eight patient beds.*
- 3. Special nursing suites are permitted to have one intervening room where the arrangement allows for direct and constant visual supervision by nursing personnel.*
- 4. For rooms other than patient sleeping rooms, suites of rooms are permitted to have one intervening room if the travel distance within the suite to the exit access door is not greater than 100 feet (30 480 mm) and are permitted to have two intervening rooms where the travel distance within the suite to the exit access door is not greater than 50 feet (15 240 mm).*

*Suites of sleeping rooms shall not exceed 5,000 square feet (465 m<sup>2</sup>). Suites of rooms, other than patient sleeping rooms, shall not exceed 10,000 square feet (929 m<sup>2</sup>). Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93 m<sup>2</sup>) shall have at least two exit access doors remotely located from each other. Any room or suite of rooms, other than patient sleeping rooms, of more than 2,500 square feet (232 m<sup>2</sup>) shall have at least two access doors remotely located from each other. The travel distance between any point in a Group I-2 occupancy and an exit access door in the room shall not exceed 50 feet (15 240 mm). The travel distance between any point in a suite of sleeping rooms and an exit access door of that suite shall not exceed 100 feet (30 480 mm).*

**1013.3 Common path of egress travel.** *In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In occupancies in Groups H-1, H-2, and H-3, the common path of egress travel shall not exceed 25 feet (7620 mm).*

**Exceptions:**

- 1. The length of a common path of egress travel in an occupancy in Groups B, F and S shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.*
- 2. Where a tenant space in an occupancy in Groups B, S and U has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).*
- 3. The length of a common path of egress travel in occupancies in Group I-3 shall not be more than 100 feet (30 480 mm).*

**1013.4 Aisles.** *Aisles serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles shall be provided from all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving assembly areas, other than seating at tables, shall comply with Section 1024. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1024.*

*The required width of aisles shall be unobstructed.*

**Exception:** *Doors, when fully opened, and handrails shall not reduce the required width by more than*

7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) from each side.

**1013.4.1 Groups B and M.** In Group B and M occupancies, the minimum clear aisle width shall be determined by Section 1005.1 for the occupant load served, but shall not be less than 36 inches (914 mm).

**Exception:** Nonpublic aisles serving less than 50 people, and not required to be accessible by Chapter 11 need not exceed 28 inches (711 mm) in width.

**1013.4.2 Seating at tables.** Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of the minimum aisle width shall start at a line 19 inches (483 mm) away from the table side or edge for the purpose of providing space for the seat without obstructing the aisle or aisle accessway. In the case of other side boundaries for aisle or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges, except that handrail projections are permitted.

**Exception:** Where tables or counters are served by fixed seats, the width of the aisle accessway shall be measured from the back of the seat.

**1013.4.2.1 Aisle accessway for tables and seating.** Aisle accessways serving arrangements of seating at tables or counters shall have sufficient clear width to conform to the capacity requirements of Section 1005.1.

**1013.4.2.2 Table and seating accessway width.** Aisle accessways shall provide a minimum of 12 inches (305 mm) of width plus 0.5 inch (12.7 mm) of width for each additional 1 foot (305 mm), or fraction thereof, beyond 12 feet (3658 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.

**Exception:** Portions of an aisle accessway having a length not exceeding 6 feet (1829 mm) and used by a total of not more than four persons.

**1013.4.2.3 Table and seating aisle accessway length.** The length of travel along the aisle accessway shall not exceed 30 feet (9144 mm) from any seat to the point where a person has a choice of two or more paths of egress travel to separate exits.

**1013.5 Egress balconies.** Balconies used for egress purposes shall conform to the same requirements as corridors for width, headroom, dead ends and projections. Exterior balconies shall be designed to minimize accumulation of snow or ice that impedes the means of egress.

**Exception:** Exterior balconies and concourses in outdoor stadiums shall be exempt from the design requirement to protect against the accumulation of snow or ice.

**1013.5.1 Wall separation.** Exterior egress balconies shall be separated from the interior of the building by walls and opening protectives as required for corridors.

**Exception:** Separation is not required where the exterior egress balcony is served by at least two stairs and where any dead-end portion of the balcony is separated.

**1013.5.2 Openness.** The long side of an egress balcony shall be at least 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.

**1013.6 Exit access in R-2 occupancies.** In buildings in occupancy Group R-2 exceeding three stories or more in height or occupied by more than two dwelling units on any story, a door from a dwelling unit shall open into an intervening public hall. Such public hall shall be constructed as a public corridor in accordance with Section 1016. Where two or more exits are required, such public hall shall provide access to at least two exits.

**Exception:** An intervening public hall shall not be required in buildings complying with Item 4 of Section 1018.2.

## **SECTION BC 1014**

### **EXIT AND EXIT ACCESS DOORWAYS**

**1014.1 Exit or exit access doorways required.** Two exits or exit access doorways from any space shall be provided where one of the following conditions exists:

1. The occupant load of the space exceeds the values in Table 1014.1.
2. The common path of egress travel exceeds the limitations of Section 1013.3.

3. Where required by Sections 1014.3, 1014.4 and 1014.5.

**Exception:** Group I-2 occupancies shall comply with Section 1013.2.2.

**1014.1.1 Three or more exits.** Access to three or more exits shall be provided from a floor area where required by Section 1018.1.

**TABLE 1014.1**  
**SPACES WITH ONE MEANS OF EGRESS**

<i>OCCUPANCY</i>	<i>MAXIMUM OCCUPANT LOAD</i>
<i>A, B, E, M, U</i>	<i>74</i>
<i>F</i>	<i>50</i>
<i>H-1, H-2, H-3</i>	<i>3</i>
<i>H-4, H-5, I-1, I-3, I-4</i>	<i>10</i>
<i>I-2</i>	<i>See Section 1013.2.2</i>
<i>R</i>	<i>20</i>
<i>S</i>	<i>30</i>

**1014.2 Exit or exit access doorway arrangement.** Required exits shall be located in a manner that makes their availability obvious. Exits shall be unobstructed at all times. Exit and exit access doorways shall be arranged in accordance with Sections 1014.2.1 and 1014.2.2.

**1014.2.1 Two exits or exit access doorways.** Where two exits or exit access doorways are required from any portion of the exit access, the exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the building or area to be served measured in a straight line between exit doors or exit access doorways. Stairs sharing any common wall, floors, ceilings, scissor stair assemblies, or other enclosures shall be counted as one exit stairway.

**Exceptions:**

1. *Corridor measurements.* Where exit enclosures are provided as a portion of the required exit and are interconnected by a 1-hour fire-resistance-rated corridor conforming to the requirements of Section 1016, the required exit separation shall be measured along the shortest direct line of travel within the corridor.
2. *Remote location in sprinklered buildings.* Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.
3. *R-2 occupancies.* In R-2 occupancies, where stairs are enclosed in walls having at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules:
  - 3.1. *The exit doors to such stairs shall be placed a distance apart equal to no less than 15 feet (4572 mm); and*
  - 3.2. *Such stairs shall be permitted to share common walls, floors, ceilings or scissor stairs assemblies or other enclosures provided that the construction separating the stairs is also of at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules.*

4. *B occupancies. In Group B occupancies of construction Type I or II not exceeding 60 feet (18 288 mm) in height, not exceeding 2,000 square feet (186 m<sup>2</sup>) on any story and not exceeding a travel distance of 50 feet (15 240 mm) on any story, where stairs are enclosed in walls having at least a 2-hour fire-resistance rating and constructed of masonry or masonry equivalent in accordance with department rules:*

4.1. *The exit doors to such stairs shall be placed a distance apart equal to no less than 15 feet (4572 mm); and*

4.2. *Such stairs shall be permitted to share common walls, floors, ceilings or scissor stairs assemblies.*

**1014.2.2 Three or more exits or exit access doorways.** *Where access to three or more exits is required, at least two exit doors or exit access doorways shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the area served measured in a straight line between such exit doors or exit access doorways. Additional exits or exit access doorways shall be arranged a reasonable distance apart so that if one becomes blocked, the others will be available.*

**Exception:** *Where a building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance of at least two of the exit doors or exit access doorways shall not be less than one-third of the length of the maximum overall diagonal dimension of the area served.*

**1014.3 Boiler, incinerator and furnace rooms.** *Two exit access doorways are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m<sup>2</sup>) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two exit access doorways are required, one is permitted to be a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.*

**1014.4 Refrigeration machinery rooms.** *Machinery rooms larger than 1,000 square feet (93 m<sup>2</sup>) shall have not less than two exits or exit access doors. Where two exit access doorways are required, one such doorway is permitted to be served by a fixed ladder or an alternating tread device. Exit access doorways shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of room. All portions of machinery rooms shall be within 150 feet (45 720 mm) of an exit or exit access doorway. An*

increase in travel distance is permitted in accordance with Section 1015.1. Doors shall swing in the direction of egress travel, regardless of the occupant load served. Doors shall be tight fitting and self-closing.

**1014.5 Refrigerated rooms or spaces.** Rooms or spaces having a floor area of 1,000 square feet (93 m<sup>2</sup>) or more, containing a refrigerant evaporator and maintained at a temperature below 68°F (20°C), shall have access to not less than two exits or exit access doors. Travel distance shall be determined as specified in Section 1015.1, but all portions of a refrigerated room or space shall be within 150 feet (45 720 mm) of an exit or exit access door where such rooms are not protected by an approved automatic sprinkler system. Egress is allowed through adjoining refrigerated rooms or spaces.

**Exception:** Where using refrigerants in quantities limited to the amounts based on the volume set forth in the New York City Mechanical Code.

**1014.6 Stage means of egress.** Where two means of egress are required based on the stage size or occupant load, one means of egress shall be provided on each side of the stage.

**1014.6.1 Gallery, gridiron and catwalk means of egress.** The means of egress from lighting and access catwalks, galleries and gridirons shall meet the requirements for occupancies in Group F-2.

**Exceptions:**

1. A minimum width of 22 inches (559 mm) is permitted for lighting and access catwalks.
2. Stairways required by this subsection need not be enclosed.
3. Stairways with a minimum width of 22 inches (559 mm), ladders, alternating tread devices or spiral stairs are permitted in the means of egress.
4. A second means of egress is not required from these areas where a means of escape to a floor or to a roof is provided.

**SECTION BC 1015**

**EXIT ACCESS TRAVEL DISTANCE**

**1015.1 Travel distance limitations.** Exits shall be so located on each story such that the maximum length of

*exit access travel, measured from the most remote point within a story to the entrance to an exit along the natural and unobstructed path of egress travel, shall not exceed the distances given in Table 1015.1.*

*Where the path of exit access includes unenclosed stairways or ramps within the exit access or includes unenclosed exit ramps or stairways as permitted in Section 1019.1, the distance of travel on such means of egress components shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.*

***Exceptions:***

- 1. Travel distance in open parking garages is permitted to be measured to the closest riser of open stairs.*
- 2. In outdoor facilities with open exit access components and open exterior stairs or ramps, travel distance is permitted to be measured to the closest riser of a stair or the closest slope of the ramp.*
- 3. Where an exit stair is permitted to be unenclosed in accordance with Exception 8 or 9 of Section 1019.1, the travel distance shall be measured from the most remote point within a building to an exit discharge.*

**TABLE 1015.1**  
**EXIT ACCESS TRAVEL DISTANCE<sup>a</sup>**

<b>OCCUPANCY</b>	<b>WITHOUT SPRINKLER SYSTEM (feet)</b>	<b>WITH SPRINKLER SYSTEM (feet)</b>
A	<i>See Section 1024.7</i>	
<i>E, F-1, I-1, M, R, S-1</i>	150	200 <sup>b</sup>
B	200	300 <sup>c</sup>
<i>F-2, S-2, U</i>	200	250 <sup>b</sup>
<i>H-1</i>	<i>Not permitted</i>	75 <sup>c</sup>
<i>H-2</i>	<i>Not permitted</i>	100 <sup>c</sup>
<i>H-3</i>	<i>Not permitted</i>	150 <sup>c</sup>
<i>H-4</i>	<i>Not permitted</i>	175 <sup>c</sup>
<i>H-5</i>	<i>Not permitted</i>	200 <sup>c</sup>
<i>I-2, I-3, I-4</i>	150	200 <sup>c</sup>

*For SI: 1 foot = 304.8 mm*

*a. See the following sections for modifications to exit access travel distance requirements:*

*Section 402: For the distance limitation in malls.*

*Section 404: For the distance limitation through an atrium space.*

*Section 1018.2: For buildings with one exit.*

*Chapter 31: For the limitation in temporary structures.*

- b. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where sprinkler systems according to Section 903.3.1.2 are permitted.*
- c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

**1015.2** *Reserved.*

**1015.3 Exterior egress balcony increase.** *Travel distances specified in Section 1015.1 shall be increased up to an additional 100 feet (30 480 mm) provided the last portion of the exit access leading to the exit occurs on an exterior egress balcony constructed in accordance with Section 1013.5. The length of such balcony shall not be less than the amount of the increase taken.*

**SECTION BC 1016**  
**CORRIDORS**

**1016.1 Construction.** *Corridors shall be constructed in accordance with this section. Interior corridor walls required to be fire-resistance rated shall comply with Section 708 for fire partitions. Public corridor walls shall comply with Section 706 for fire barriers.*

**1016.1.1 Interior corridors.** *Interior corridors shall be fire-resistance rated in accordance with Table 1016.1.1.*

**Exceptions:**

1. *A fire-resistance rating is not required for corridors in an occupancy in Group E where each room that is used for instruction has at least one door directly to the exterior and rooms for assembly purposes have at least one-half of the required means of egress doors opening directly to the exterior. Exterior doors specified in this exception are required to be at ground level.*
2. *A fire-resistance rating is not required for corridors contained within a dwelling or sleeping unit in an occupancy in Group R.*
3. *A fire-resistance rating is not required for corridors in open parking garages.*
4. *A fire-resistance rating is not required for corridors in an occupancy in Group B which is a space requiring only a single means of egress complying with Section 1014.1.*

**TABLE 1016.1.1  
INTERIOR CORRIDOR FIRE-RESISTANCE RATING**

<b>OCCUPANCY</b>	<b>OCCUPANT LOAD SERVED BY INTERIOR CORRIDOR</b>	<b>REQUIRED FIRE RESISTANCE RATING (hours)</b>	
		<b>Without sprinkler system</b>	<b>With sprinkler system<sup>c</sup></b>
<i>H-1, H-2, H-3</i>	<i>All</i>	<i>Not permitted</i>	<i>1</i>
<i>H-4, H-5</i>	<i>Greater than 30</i>	<i>Not permitted</i>	<i>1</i>
<i>A, B, E, F, M, S, U</i>	<i>Greater than 30</i>	<i>1</i>	<i>0</i>
<i>R</i>	<i>Greater than 30</i>	<i>1<sup>d</sup></i>	<i>0</i>
<i>I-2<sup>a</sup>, I-4</i>	<i>All</i>	<i>Not permitted</i>	<i>0</i>
<i>I-1, I-3</i>	<i>All</i>	<i>Not permitted</i>	<i>1<sup>b</sup></i>

- a. For requirements for occupancies in Group I-2, see Section 407.3.*
- b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.7.*
- c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.*
- d. Interior corridors within dwelling or sleeping units in Group R occupancies pursuant to Section 1016.1.1 Exception 2 shall not require fire-resistance rating.*

**1016.1.2 Public corridors.** *Public corridors shall be fire-resistance rated in accordance with Table 1016.1.2.*

**TABLE 1016.1.2**  
**PUBLIC CORRIDOR FIRE-RESISTANCE RATING**

<i><b>OCCUPANCY</b></i>	<i><b>REQUIRED FIRE RESISTANCE RATING (hours)</b></i>
<i>H-1, H-2, H-3</i>	<i>2</i>
<i>H-4, H-5</i>	<i>1</i>
<i>A, E, F, M, S, U</i>	<i>1</i>
<i>B</i>	<i>1<sup>a</sup></i>
<i>R (Noncombustible)</i>	<i>1</i>
<i>R (Combustible)</i>	<i>2<sup>b</sup></i>
<i>I-1, I-2, I-3, I-4</i>	<i>1</i>

- a. Public corridors need not be fire-rated in high-rise buildings in occupancy Group B equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where such building is provided with smokeproof enclosures in stairways in accordance with Section 403.13.*
- b. Public corridors in buildings not exceeding two stories in height, or that are three stories in height and occupied by not more than one family on each story, may be constructed with one hour fire-resistance rating.*

**1016.2 Corridor width.** *The minimum corridor width shall be as determined in Section 1005.1, but not less than 44 inches (1118 mm).*

**Exceptions:**

1. *Twenty-four inches (610 mm)—For access to and utilization of electrical, mechanical or plumbing systems or equipment.*
2. *Thirty-six inches (914 mm)—With a required occupant capacity of 50 or less, except as otherwise required by Chapter 11.*
3. *Thirty-six inches (914 mm)—Within a dwelling unit in occupancy Groups I-1 and R-1, except as otherwise required by Section 1107.*
4. *Thirty inches (762 mm) —Within a dwelling unit in occupancy Groups R-2 and R-3, except as otherwise required by Section 1107.*
5. *Sixty-six inches (1676 mm)—In Group E serving classrooms.*
6. *Seventy-two inches (1829 mm)—In corridors serving surgical Group I, health care centers for ambulatory patients receiving outpatient medical care, which causes the patient to be not capable of self-preservation.*
7. *Ninety-six inches (2438 mm)—In Group I-2 in areas where required for bed movement.*

**1016.3 Dead ends.** *Where more than one exit or exit access doorway is required, the exit access shall be arranged such that there are no dead ends in corridors more than 20 feet (6096 mm) in length.*

**Exceptions:**

1. *In occupancies in Group I-3 of Occupancy Condition 2, 3 or 4 (see Section 308.4), the dead end in a corridor shall not exceed 50 feet (15 240 mm).*
2. *In occupancies in Groups B and F where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the length of dead-end corridors shall not exceed 50 feet (15 240 mm).*

3. *Dead-end length not exceeding 2.5 times the least width of the dead-end corridor.*
4. *In occupancies in Group R-2, the dead end in a corridor shall not exceed 40 feet (12 192 mm). However, where the corridors are completely enclosed in construction having a 2-hour fire-resistance rating with all doors opening into the corridor being self-closing and having a fire-resistance rating of 1½ hours, the length of dead-end corridor shall not exceed 80 feet (24 384 mm).*

**1016.4 Air movement in corridors.** *Use of corridors as part of direct supply, return, or exhaust air system shall be subject to the limitations of the New York City Mechanical Code.*

**1016.4.1 Corridor ceiling.** *Use of the space between the corridor ceiling and the floor or roof structure above as a return air plenum shall be in accordance with the New York City Mechanical Code.*

**1016.5 Corridor continuity.** *Fire-resistance-rated corridors shall be continuous from the point of entry to an exit, and shall not be interrupted by intervening rooms.*

**Exception:** *Foyers, lobbies or reception rooms constructed as required for corridors shall not be construed as intervening rooms.*

## **SECTION BC 1017**

### **EXITS**

**1017.1 General.** *Exits shall comply with Sections 1017 through 1022 and the applicable requirements of Sections 1003 through 1012. An exit shall not be used for any purpose that interferes with its function as a means of egress. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the exit discharge.*

**1017.2 Exterior exit doors.** *Buildings or structures used for human occupancy shall have at least one exterior door that meets the requirements of Section 1008.1.1.*

**1017.2.1 Detailed requirements.** *Exterior exit doors shall comply with the applicable requirements of Section 1008.1.*

**1017.2.2 Arrangement.** Exterior exit doors shall lead directly to the exit discharge or the public way.

**SECTION BC 1018**  
**NUMBER OF EXITS AND CONTINUITY**

**1018.1 Minimum number of exits.** All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits as required by Table 1018.1 based on the occupant load of such story, except as modified in Section 1018.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.

**Exception:** Unless otherwise required by other provisions of this chapter, the number of exits from ground floors discharging at grade directly to the exterior shall be determined in accordance with Table 1014.1.

TABLE 1018.1  
MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD

OCCUPANT LOAD	MINIMUM NUMBER OF EXITS
1-500	2
501-1,000	3
More than 1,000	4

**1018.1.1 Open parking garages.** *Parking garages shall not have less than two exits from each parking tier. An unenclosed vehicle ramp constructed in accordance with Section 1010.2 may serve as one of the required exits when provided with pedestrian facilities along the ramp.*

**Exception:** *Where vehicles are mechanically parked, only one exit is required but such exit shall not be a vehicle ramp.*

**1018.1.2 Open or enclosed parking garages.** *In open or enclosed parking garages three stories or less in height and serving not more than one level below grade, ramps with a maximum slope of one unit vertical in seven units horizontal may serve as secondary exits.*

**1018.2 Buildings with one exit.** *Only one exit shall be required in buildings as described below:*

*1. Buildings described in Table 1018.2, provided that the building has not more than one level below the first story above grade plane.*

*2. Buildings of Group R-3 occupancy.*

*3. Single-level buildings with the occupied space at the level of exit discharge provided that the story or space complies with Section 1014.1 as a space with one means of egress.*

*4. Buildings of Group R-2 occupancy where all of the following conditions are met:*

*4.1. The building does not exceed four stories;*

*4.2. The building contains not more than three dwelling units per story;*

*4.3. The building is of construction Type I or II;*

*4.4. The building does not exceed 2,500 square feet (232 m<sup>2</sup>) per story;*

*4.5. Each dwelling unit has at least one window facing the street, or facing a lawful yard with open, unobstructed, and direct access to the street;*

*4.6. The stairway extends to the roof surface through a stairway bulkhead complying with Section 1509.2 provided the roof has a slope not steeper than 20 degrees. In lieu of the stairway*

*bulkhead, the stair may be constructed against the street wall with one window facing the street at every landing and access to the roof is provided via a scuttle with a stationary, noncombustible access ladder;*

*4.7. The stairway is enclosed in two-hour fire-rated walls with all exit doors leading into the stairway having at least 1 ½ hour fire-rating; and*

*4.8 The building shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2.*

*5. Buildings of Group R-2 occupancy of construction Type I or II not exceeding six stories and not exceeding 2,000 square feet (186 m<sup>2</sup>) per story.*

**TABLE 1018.2**  
**BUILDINGS WITH ONE EXIT**

<b>OCCUPANCY</b>	<b>MAXIMUM HEIGHT OF BUILDING ABOVE GRADE PLANE</b>	<b>MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE</b>
<i>A, B<sup>c</sup>, E, F, M U</i>	<i>1 Story</i>	<i>50 occupants and 75 feet travel distance</i>
<i>H-2, H-3</i>	<i>1 Story</i>	<i>3 occupants and 25 feet travel distance</i>
<i>H-4, H-5, I, R</i>	<i>1 Story</i>	<i>10 occupants and 75 feet travel distance</i>
<i>S<sup>a</sup></i>	<i>1 Story</i>	<i>30 occupants and 100 feet travel distance</i>
<i>B, F, M, S<sup>a</sup></i>	<i>2 Stories</i>	<i>30 occupants and 75 feet travel distance</i>
<i>R-2<sup>d, e</sup></i>	<i>2 Stories<sup>b</sup></i>	<i>4 dwelling units and 50 feet travel distance</i>

*For SI: 1 foot = 304.8 mm.*

*<sup>a</sup> For the required number of exits for open parking structures, see Section 1018.1.1*

*<sup>b</sup> Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1025 shall have a maximum height of three stories above grade.*

*<sup>c</sup> Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 with an occupancy in Group B shall have a maximum travel distance of 100 feet.*

*<sup>d</sup> Buildings classified as Group R-2 subject to Section 1018.2, item 4.*

*<sup>e</sup> Buildings classified as Group R-2 subject to Section 1018.2, item 5.*

**1018.3 Exit continuity.** Exits shall be continuous from the point of entry into the exit to the exit discharge.

**1018.4 Exit door arrangement.** Exit door arrangement shall meet the requirements of Sections 1014.2 through 1014.2.2.

**SECTION BC 1019**  
**VERTICAL EXIT ENCLOSURES**

**1019.1 Enclosures required.** Interior exit stairways and interior exit ramps shall be enclosed with fire barriers. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the shaft enclosure shall include any basements but not any mezzanines. An exit enclosure shall not be used for any purpose other than means of egress. Enclosures shall be constructed as fire barriers in accordance with Section 706.

**Exceptions:**

1. In other than Group H and I occupancies, a stairway serving an occupant load of less than 10 and not more than one story above the level of exit discharge is not required to be enclosed.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in occupancies in Group R-1, R-2 or R-3 are not required to be enclosed.
4. Stairways that are not a required means of egress element are not required to be enclosed where such stairways comply with Section 707.2.
5. Stairways in open parking structures which serve only the parking structure are not required to be enclosed.
6. Stairways in occupancies in Group I-3 shall be permitted to have glazing installed in doors and interior walls as provided for in Section 408.3.6.
7. Means of egress stairways as required by Section 410.5.4 are not required to be enclosed.

8. *In other than occupancy Groups H and I, a maximum of 50 percent of egress stairways serving one adjacent floor are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Any two such interconnected floors shall not be open to other floors.*
9. *In other than occupancy Groups H and I, interior egress stairways serving only the first and second stories of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Such interconnected stories shall not be open to other stories.*
10. *In Group R-1 and R-2 occupancies, where exit enclosures are required to have a fire-resistance rating of 2 hours, such enclosures shall be constructed of masonry or masonry equivalent. Wall assemblies constituting masonry equivalent shall be constructed in accordance with department rules.*

**1019.1.1 Openings.** *Exit enclosure opening protectives shall be in accordance with the requirements of Section 715.*

*Except as permitted in Section 402.4.6, openings in exit enclosures other than unexposed exterior openings shall be limited to those necessary for exit access to the enclosure from normally occupied spaces and for egress from the enclosure.*

*Where interior exit enclosures are extended to the exterior of a building by an exit passageway, the door assembly from the exit enclosure to the exit passageway shall be protected by a fire door conforming to the requirements in Section 715.3. Fire door assemblies in exit enclosures shall comply with Section 715.3.4.*

**1019.1.2 Penetrations.** *Penetrations into and openings through an exit enclosure are prohibited except for required exit doors, equipment and ductwork necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for Fire Department communication and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010m<sup>2</sup>). Such penetrations shall be protected in accordance with Section 712. There shall be no penetrations or communication openings, whether protected or not, between adjacent exit enclosures.*

**1019.1.3 Ventilation.** *Equipment and ductwork for exit enclosure ventilation necessary for independent pressurization shall comply with one of the following items:*

1. *Such equipment and ductwork shall be located exterior to the building and shall be directly connected to the exit enclosure by ductwork enclosed in construction as required for shafts.*
2. *Where such equipment and ductwork is located within the exit enclosure, the intake air shall be taken directly from the outdoors and the exhaust air shall be discharged directly to the outdoors, or such air shall be conveyed through ducts enclosed in construction as required for shafts.*
3. *Where located within the building, such equipment and ductwork shall be separated from the remainder of the building, including other mechanical equipment, with construction as required for shafts. In each case, openings into the fire-resistance-rated construction shall be limited to those needed for maintenance and operation and shall be protected by self-closing fire-resistance-rated devices in accordance with Chapter 7 for enclosure wall opening protectives. Exit enclosure ventilation systems shall be independent of other building ventilation systems.*

**1019.1.4 Vertical enclosure exterior walls.** *Exterior walls of a vertical exit enclosure shall comply with the requirements of Section 704 for exterior walls. Where nonrated walls or unprotected openings enclose the exterior of the stairway and the walls or openings are exposed to other parts of the building at an angle of less than 180 degrees (3.14 rad), the building exterior walls within 10 feet (3048 mm) horizontally of a nonrated wall or unprotected opening shall be constructed as required for a minimum 1-hour fire-resistance rating with ¾-hour opening protectives. This construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the topmost landing of the stairway or to the roof line, whichever is lower.*

**1019.1.5 Enclosures under stairways.** *The walls and soffits within enclosed usable spaces under enclosed and unenclosed stairways shall be protected by 1-hour fire-resistance-rated construction, or the fire-resistance rating of the stairway enclosure, whichever is greater. Access to the enclosed usable space shall not be directly from within the stair enclosure.*

**Exception:** *Spaces under stairways serving and contained within a single residential dwelling unit in Group R-2 or R-3.*

*There shall be no enclosed usable space under exterior exit stairways unless the space is*

completely enclosed in 1-hour fire-resistance-rated construction. The open space under exterior stairways shall not be used for any purpose.

**1019.1.6 Discharge identification.** A stairway in an exit enclosure shall not continue below the level of exit discharge unless an approved barrier is provided at the level of exit discharge to prevent persons from unintentionally continuing into levels below. Directional exit signs shall be provided as specified in Section 1011. An approved barrier shall consist of one-hour rated construction separating the portion of the vertical exit above grade from the portion below grade, with a three-quarter hour rated self-closing door, opening in the direction of exit travel from the floors below grade.

**Exception:** Such barrier separating the above grade portion of the vertical exit from the portion below grade shall not be required in Group E and R-3 occupancies.

**1019.1.7 Stairway floor number and identification signs.** A sign shall be provided at each floor landing in interior vertical exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the stair enclosure and the identification of the stair. The signage shall also state the story of, and the direction to the exit discharge and the availability of roof access from the stairway for the Fire Department. Each stair shall be identified by an alphabetic letter. Stairway identification signs shall be provided on both sides of each stair door. The signs shall be located 5 feet (1524 mm) above the floor landing in a position which is readily visible when the doors are in the open and closed positions.

**1019.1.8 Smokeproof enclosures.** In buildings required to comply with Section 403.13 or 405.8.2, each of the exits of a building that serves stories where the floor surface is located more than 75 feet (22 860 mm) above the lowest level of Fire Department vehicle access or more than 30 feet (9144 mm) below the level of exit discharge serving such floor levels shall be a smokeproof enclosure or pressurized stairway in accordance with Section 909.20.

**1019.1.8.1 Enclosure exit.** A smokeproof enclosure or pressurized stairway shall exit into a public way or into an exit passageway, yard or open space having direct access to a public way. The exit passageway shall be without other openings and shall be separated from the remainder of the building by 2-hour fire-resistance-rated construction.

**Exceptions:**

1. Openings in the exit passageway serving a smokeproof enclosure are permitted where

*the exit passageway is protected and pressurized in the same manner as the smokeproof enclosure, and openings are protected as required for access from other floors.*

- 2. Openings in the exit passageway serving a pressurized stairway are permitted where the exit passageway is protected and pressurized in the same manner as the pressurized stairway.*
- 3. A smokeproof enclosure or pressurized stairway shall be permitted to egress through areas on the level of discharge or vestibules as permitted by Section 1023.*

**1019.1.8.2 Enclosure access.** *Access to the stairway within a smokeproof enclosure shall be by way of a vestibule or an open exterior balcony.*

**Exceptions:** *Access is not required by way of a vestibule or exterior balcony for stairways using the pressurization alternative complying with Section 909.20.5.*

## **SECTION BC 1020 EXIT PASSAGEWAYS**

**1020.1 Exit passageway.** *Exit passageways serving as an exit component in a means of egress system shall comply with the requirements of this section. An exit passageway shall not be used for any purpose other than as a means of egress.*

**1020.2 Width.** *The width of exit passageways shall be determined as specified in Section 1005.1 but such width shall not be less than 44 inches (1118 mm), except that exit passageways serving an occupant load of less than 50 shall not be less than 36 inches (914 mm) in width.*

*The required width of exit passageways shall be unobstructed.*

**Exception:** *Doors, when fully opened, and handrails, shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) on each side.*

**1020.3 Construction.** *Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-*

hour fire-resistance rating, and not less than that required for any connecting exit enclosure. Exit passageways shall be constructed as fire barriers in accordance with Section 706.

**1020.4 Openings and penetrations.** Exit passageway opening protectives shall be in accordance with the requirements of Section 715.

Except as permitted in Section 402.4.6, openings in exit passageways other than unexposed exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for egress from the exit passageway.

Where interior exit enclosures are extended to the exterior of a building by an exit passageway, the door assembly from the exit enclosure to the exit passageway shall be protected by a fire door conforming to the requirements in Section 715.3. Fire door assemblies in exit passageways shall comply with Section 715.3.4.

Elevators shall not open into an exit passageway.

**1020.5 Penetrations.** Penetrations into and openings through an exit passageway are prohibited except for required exit doors, equipment and ductwork necessary for independent pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication and electrical raceway serving the exit passageway and terminating at a steel box not exceeding 16 square inches (0.010 m<sup>2</sup>). Such penetrations shall be protected in accordance with Section 712. There shall be no penetrations or communicating openings, whether protected or not, between adjacent exit passageways.

## **SECTION BC 1021 HORIZONTAL EXITS**

**1021.1 Horizontal exits.** Horizontal exits serving as an exit in a means of egress system shall comply with the requirements of this section. A horizontal exit shall not serve as the only exit from a portion of a building, and where two or more exits are required, not more than one-half of the total number of exits or total exit width shall be horizontal exits.

### **Exceptions:**

1. Horizontal exits are permitted to comprise two-thirds of the required exits from any building or floor area for occupancies in Group I-2.

2. *Horizontal exits are permitted to comprise 100 percent of the exits required for occupancies in Group I-3. At least 6 square feet (0.6 m<sup>2</sup>) of accessible space per occupant shall be provided on each side of the horizontal exit for the total number of people in adjoining compartments. Every fire compartment for which credit is allowed in connection with a horizontal exit shall not be required to have a stairway or door leading directly outside, provided the adjoining fire compartments have stairways or doors leading directly outside and are so arranged that egress shall not require the occupants to return through the compartment from which egress originates. The area into which a horizontal exit leads shall be provided with exits adequate to meet the occupant requirements of this chapter, but not including the added occupant capacity imposed by persons entering it through horizontal exits from another area. At least one of its exits shall lead directly to the exterior or to an exit enclosure.*

**1021.2 Separation.** *The separation between buildings or areas of refuge connected by a horizontal exit shall be provided by a fire wall complying with Section 705 or a fire barrier complying with Section 706 and having a fire-resistance rating of not less than 2 hours. Opening protectives in horizontal exit walls shall also comply with Section 715. The horizontal exit separation shall extend vertically through all levels of the building unless floor assemblies are of 2-hour fire resistance with no unprotected openings.*

**Exception:** *A fire-resistance rating is not required at horizontal exits between a building area and an above-grade pedestrian walkway constructed in accordance with Section 3104, provided that the distance between connected buildings is more than 20 feet (6096 mm). Horizontal exit walls constructed as fire barriers shall be continuous from exterior wall to exterior wall so as to divide completely the floor served by the horizontal exit.*

**1021.3 Opening protectives.** *Fire doors in horizontal exits shall be self-closing or automatic-closing when activated by a smoke detector installed in accordance with Section 907.11. Opening protectives in horizontal exits shall be consistent with the fire-resistance rating of the wall. Such doors where located in a cross-corridor condition shall be automatic-closing by activation of a smoke detector installed in accordance with Section 907.11.*

**1021.4 Capacity of area of refuge.** *The area of refuge of a horizontal exit shall be spaces occupied by the same tenant or public areas and each such area of refuge shall be adequate to house the original occupant load of the refuge space plus the occupant load anticipated from the adjoining compartment. The anticipated occupant load from the adjoining compartment shall be based on the capacity of the horizontal exit doors entering the area of refuge. The capacity of areas of refuge shall be computed on a net floor area*

allowance of 3 square feet (0.28 m<sup>2</sup>) for each occupant to be accommodated therein, not including areas of stairways, elevators and other shafts or courts.

**Exception:** The net floor area allowable per occupant shall be as follows for the indicated occupancies:

1. Six square feet (0.6 m<sup>2</sup>) per occupant for occupancies in Group I-3.
2. Fifteen square feet (1.4 m<sup>2</sup>) per occupant for ambulatory occupancies in Group I-2.
3. Thirty square feet (2.8 m<sup>2</sup>) per occupant for nonambulatory occupancies in Group I-2.

## **SECTION BC 1022**

### **EXTERIOR EXIT RAMPS AND STAIRWAYS**

**1022.1 Exterior exit ramps and stairways.** Exterior exit ramps and stairways serving as an element of a required means of egress shall comply with this section.

**Exception:** Exterior exit ramps and stairways for outdoor stadiums complying with Section 1019.1, Exception 2.

**1022.2 Use in a means of egress.** Exterior exit ramps and stairways shall not be used as an element of a required means of egress for occupancies in Group I-2. For occupancies in other than Group I-2, exterior exit ramps and stairways shall be permitted as an element of a required means of egress for buildings not exceeding six stories or 75 feet (22 860 mm) in height.

**1022.3 Open side.** Exterior exit ramps and stairways serving as an element of a required means of egress shall be open on at least one side. An open side shall have a minimum of 35 square feet (3.3 m<sup>2</sup>) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

**1022.4 Adjoining open areas.** The open areas adjoining exterior exit ramps or stairways shall be either yards, courts or public ways; the remaining sides are permitted to be enclosed by the exterior walls of the building.

**1022.5 Location.** Exterior exit ramps and stairways shall be located in accordance with Section 1023.3.

**1022.6 Exterior ramps and stairway protection.** Exterior exit ramps and stairways shall be separated from the interior of the building as required in Section 1019.1. Openings shall be limited to those necessary for egress from normally occupied spaces.

**Exceptions:**

1. In other than Group R-1 or R-2 occupancies, separation from the interior of the building is not required in buildings that are no more than two stories above grade where the level of exit discharge is the first story above grade.
2. Separation from the interior of the building is not required where the exterior ramp or stairway is served by an exterior ramp and/or balcony that connects two remote exterior stairways or other approved exits, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be a minimum of 50 percent of the height of the enclosing wall, with the top of the openings no less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the interior of the building is not required for an exterior ramp or stairway located in a building or structure that is permitted to have unenclosed interior stairways in accordance with Section 1019.1.
4. Separation from the interior of the building is not required for exterior ramps or stairways connected to open-ended corridors, provided that Items 4.1 through 4.4 are met:
  - 4.1. The building, including corridors and ramps and/or stairs, shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
  - 4.2. The open-ended corridors comply with Section 1016.
  - 4.3. The open-ended corridors are connected on each end to an exterior exit ramp or stairway complying with Section 1022.
  - 4.4. At any location in an open-ended corridor where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m<sup>2</sup>) or an exterior ramp or stairway shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

**1022.7 Fire towers.** *Fire towers may be used as exits in lieu of interior stairs provided they comply with all of the requirements for stairways as per Section 1009, except as modified below.*

**1022.7.1 Enclosure.** *The enclosing walls of fire towers shall be of noncombustible materials or assemblies having a fire-resistance rating of at least 4 hours. Such walls shall be without openings, except for doors serving as means of egress.*

**1022.7.2 Access.** *At each story served by a fire tower, access to the stairways of such fire tower shall be provided through outside balconies or fireproof vestibules. Such balconies or vestibules shall be at least 44 inches (1118 mm) in width and shall have unpierced floors of noncombustible materials and shall be provided with substantial guard railings at least 4 feet (1219 mm) high, without any openings greater than 5 inches (127 mm) in width.*

**1022.7.3 Balconies and vestibules.** *Such balconies or vestibules of fire towers shall be level with the floors of the structure and the platforms of the stairs connected by such balconies. Such balconies or vestibules shall be separated from the structure and the stairs by self-closing swinging doors with a one and one-half hour fire protection rating, capable of being opened from both sides without the use of a key or other unlocking device.*

*Balconies or vestibules of fire towers shall open on a street or yard, or on a court open vertically to the sky for its full height, having a minimum net area of 105 square feet (9.7 m<sup>2</sup>) and a minimum dimension of 7 feet (2134 mm). The opening from the vestibule to the street, yard or court shall have a minimum area of 18 square feet (1.7 m<sup>2</sup>) and a minimum dimension of 30 inches (762 mm). It shall be unlawful to leave openings in the court walls surrounding an interior fire tower, other than the openings from the vestibules, within 15 feet (4572 mm) of the balcony, except that self-closing windows with a three-quarter hour fire protection rating may be used if such windows are at least 10 feet (3048 mm) from the balcony, provided that the area of the court is at least 12 feet (3658 mm) by 24 feet (7315 mm).*

**1022.7.4 Termination.** *Fire towers shall terminate at grade level and shall exit directly to the street independently of corridors serving other stairways, except when the fire tower terminates in the ground floor corridor outside of the inner vestibule and within 10 feet (3048 mm) of the building line.*

## **SECTION BC 1023**

## ***EXIT DISCHARGE***

**1023.1 General.** Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building.

### ***Exceptions:***

1. *A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through protected areas on the level of discharge provided all of the following are met:*
  - 1.1. *Such protected area shall provide a free and unobstructed way to the exterior of the building, which way is readily visible and identifiable from the point of termination of the exit enclosure.*
  - 1.2. *The protected area shall be separated from areas below construction conforming to the fire-resistance rating for the exit enclosure.*
  - 1.3. *The protected area shall be provided with an approved automatic sprinkler system. All portions of the level of discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure exits.*
  - 1.4. *All spaces and openings communicating with the protected area shall be separated by construction conforming to the fire-resistance rating for the exit enclosure or, if the entire level of discharge in the building is sprinklered in accordance with Section 903.3.1.1 or 903.3.1.2, the separation may comprise smoke barriers complying with Section 709.*
  - 1.5. *The capacity of the protected area shall not be less than required by Section 1023.2 in addition to the occupant load of all exits serving communication spaces.*
2. *A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through a vestibule provided all of the following are met:*

- 2.1. *The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for all the exit enclosure.*
- 2.2. *The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).*
- 2.3. *The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.*
- 2.4. *The area is used only for means of egress and exits directly to the outside.*
3. *Stairways in open parking garages complying with Section 1019.1, Exception 5, are permitted to egress through the open parking garage at the level of exit discharge.*
4. *In buildings in occupancy Group R-2, up to 100 percent of the number and capacity of the exit enclosures is permitted to egress through a protected area on the level of discharge, if all of the following conditions are met:*
  - 4.1. *Egress is provided in two different directions from the discharge points of all exit enclosures to the exterior of the building that are remote from each other.*
  - 4.2. *The exit discharges are arranged and constructed so as to minimize the possibility that all exit discharges would be compromised by smoke, fire or other emergency condition, and*
  - 4.3. *Such protected areas shall comply with all requirements of Exception 1, above.*

**1023.2 Exit discharge capacity.** *The capacity of the exit discharge shall be not less than the required discharge capacity of the exits being served.*

**1023.3 Exit discharge location.** *Exterior balconies, stairways and ramps shall be located at least 10 feet (3048 mm) from adjacent lot lines and from other buildings on the same lot unless the adjacent building exterior walls and openings are protected in accordance with Section 704 based on fire separation distance.*

**Exception:** *Noncombustible stoops and ramps not exceeding one story above grade plane located at the street wall and terminating at the street are permitted to be located within 10 feet (3048 mm) of adjacent lot lines or buildings on the same lot when serving:*

- 1. Group R-2 occupancies in buildings of noncombustible construction not exceeding four stories in height and a total of four dwelling units.*
- 2. Group R-3 occupancies.*

**1023.4 Exit discharge components.** *Exit discharge components shall be sufficiently open to the exterior so as to minimize the accumulation of smoke and toxic gases.*

**1023.5 Egress courts.** *Egress courts serving as a portion of the exit discharge in the means of egress system shall comply with the requirements of Section 1023.*

**1023.5.1 Width.** *The width of egress courts shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm), except as specified herein. Egress courts serving occupancies in Group R-3 and Group U shall not be less than 36 inches (914 mm) in width. The required width of egress courts shall be unobstructed to a height of 7 feet 6 inches (2286 mm).*

*Where an egress court exceeds the minimum required width and the width of such egress court is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the egress court along the path of egress travel. In no case shall the width of the egress court be less than the required minimum.*

**1023.5.1.1 Projections.** *Doors, when fully opened, and handrails shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) from each side.*

**1023.5.2 Construction and openings.** *Where an egress court serving a building or portion thereof is less than 10 feet (3048 mm) in width, the egress court walls shall be not less than 1-hour fire-resistance-rated exterior walls complying with Section 704 for a distance of 10 feet (3048 mm) above the floor of the court, and openings therein shall be equipped with fixed or self-closing, ¾-hour opening protective assemblies.*

**Exceptions. Protection of exterior walls shall not be required where:**

1. Egress courts serving an occupant load of less than 10.
2. Egress courts serving Group R-3.

**1023.6 Access to a public way.** The exit discharge shall provide a direct and unobstructed access to a public way.

**Exception:** Where access to a public way cannot be provided, a safe dispersal area shall be provided where all of the following are met:

1. The area shall be of a size to accommodate at least 5 square feet (0.28 m<sup>2</sup>) for each person.
2. The area shall be located on the same property at least 50 feet (15 240 mm) away from the building requiring egress.
3. The area shall be permanently maintained and identified as a safe dispersal area.
4. The area shall be provided with a safe and unobstructed path of travel from the building.

### **SECTION BC 1024 ASSEMBLY**

**1024.1 General.** Occupancies in Group A shall comply with this section. No place of assembly shall be located within 250 feet (76 200 mm) of any occupancy containing explosive contents.

**1024.1.1 Place of assembly certificate of operation.** It shall be unlawful to occupy any building or space as a place of assembly unless and until a certificate of operation therefore has been issued by the department pursuant to the provisions of Chapter 1 of Title 28 of the Administrative Code.

**1024.1.2 Posted Capacity sign.** Signs shall be posted in all assembly spaces, indicating the number of persons who may legally occupy the space. Signs shall not be required where seating is fixed in place

*in accordance with an approved plan and no provision is made for standee spaces. Such signs, where required, shall read as follows:*

OCCUPANCY BY MORE THAN.....PERSONS  
IS DANGEROUS AND UNLAWFUL

Certificate of Operation No.....Commissioner,  
(where applicable)  
Dept. of Buildings, City of New York

*1024.1.2.1 Multiple occupant load sign. When a space is occupied for multiple purposes involving different occupant loads the sign shall read as follows:*

OCCUPANCY BY MORE THAN  
(number)..... PERSONS AS (type of occupancy).....  
OR BY  
(number)..... PERSONS AS (type of occupancy).....  
OR BY  
(number)..... PERSONS AS (type of occupancy).....  
IS DANGEROUS AND UNLAWFUL

Certificate of Operation No.....Commissioner,  
(where applicable)  
Dept. of Buildings, City of New York

*1024.1.2.2 Design of capacity signs. Signs shall be at least 12 inches (305 mm) wide and 16 inches (406 mm) high. The lettering shall be red on a white background. The letters shall be at least 1 inch (25 mm) high and the numerals at least 1/4 inches (32 mm) high. Signs shall be framed under a transparent protective cover, and permanently mounted in a location that is conspicuously visible to a person entering the space. Signs shall be lighted by artificial illumination at all times during occupancy to maintain at least 5 foot candles (54 lux) on the surface of the sign.*

*1024.1.3 Approved plans. In every place of assembly providing seating or other moveable furnishings, copies of approved plans and approved alternate plans shall be kept on the premises. The plans shall be readily available for inspection, and shall provide the following information:*

1. *For assembly spaces:*

1.1. *The location of each seat of each tier of seating, along with the number of occupants of each seating section.*

1.2. *The location and number of standees for each standee area.*

1.3. *The total number of occupants of each tier and of the assembly space.*

1.4. *The location and classification of all exits.*

2. *For safe areas:*

2.1. *The furniture and equipment arrangement and location.*

2.2. *The number of occupants to be accommodated.*

3. *For stage areas:*

3.1. *The maximum number of occupants, including audience seating on the stage.*

3.2. *Any conditions limiting the use of the stage area.*

3.3. *The location of all exits.*

*These plans shall not be smaller in size than required for one-eighth inch scale plans.*

**1024.2 Assembly with occupant load greater than 300.** *Buildings or spaces occupied by Group A that have an occupant load of greater than 300 shall be provided with a main exit. Such main exit shall be of sufficient width to accommodate not less than one-half of the occupant load, but such width shall not be less than the total required width of all means of egress leading to the exit. Where the main use or dominant occupancy of the building is classified as Group A, the main exit shall front on at least one street or an unoccupied space of not less than 10 feet (3048 mm) in width that adjoins a street or public way. Other additional exits shall provide an egress capacity for at least one-half of the total occupant load served by that level and comply with Section 1014.2.*

**Exception:** *In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total width of egress is not less than 100 percent of the required width.*

**1024.2.1 Exit classification.** *Where the net floor area of an assembly space, exclusive of stage area, is less than 12 square feet (1.1 m<sup>2</sup>) per person, such spaces shall also comply with Section 1024.17.*

**1024.3** *Reserved.*

**1024.4 Foyers and lobbies.** *In Group A-1 occupancies, where persons are admitted to the building at times when seats are not available and are allowed to wait in a lobby or similar space, such use of lobby or similar space shall not encroach upon the required clear width of the means of egress. Such waiting areas shall be separated from the required means of egress by substantial permanent partitions or by fixed rigid railings not less than 42 inches (1067 mm) high. Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.*

**1024.5 Interior balcony and gallery means of egress.** *For balconies or galleries having a seating capacity of over 50 located in Group A occupancies, at least two means of egress shall be provided, one from each side of every balcony or gallery, with at least one leading directly to an exit.*

**1024.5.1 Enclosure of balcony openings.** *Interior stairways and other vertical openings shall be enclosed in a vertical exit enclosure as provided in Section 1019.1, except that stairways are permitted to be open between the balcony and the main assembly floor in occupancies such as theaters, houses of worship and auditoriums. At least one accessible means of egress is required from a balcony or gallery level containing accessible seating locations in accordance with Section 1007.3 or 1007.4.*

**1024.6 Width of means of egress for assembly.** *The clear width of aisles and other means of egress shall comply with this section. The clear width shall be measured to walls, edges of seating and tread edges except for permitted projections.*

**1024.6.1 Without smoke protection.** *The clear width of aisles and other means of egress shall provide sufficient capacity in accordance with all of the following, as applicable:*

1. *At least 0.3 inch (7.6 mm) of width for each occupant served shall be provided on stairs having riser heights 7 inches (178 mm) or less and tread depths 11 inches (279 mm) or greater, measured horizontally between tread nosing.*
2. *At least 0.005 inch (0.127 mm) of additional stair width for each occupant shall be provided for each 0.10 inch (2.5 mm) of riser height above 7 inches (178 mm).*
3. *Where egress requires stair descent, at least 0.075 inch (1.9 mm) of additional width for each occupant shall be provided on those portions of stair width having no handrail within a horizontal distance of 30 inches (762 mm).*
4. *Level or ramped means of egress, where slopes are not steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have at least 0.20 inch (5.1 mm) of clear width for each occupant served. Ramped means of egress, where slopes are steeper than one unit vertical in 12 units horizontal (8-percent slope), shall have at least 0.22 inch (5.6 mm) of clear width for each occupant served.*

**1024.6.2 Smoke-protected seating.** *The clear width of aisles and other means of egress for smoke-protected assembly seating shall be not less than the occupant load served by the egress element multiplied by the appropriate factor in Table 1024.6.2. The total number of seats specified shall be those within a single assembly space and exposed to the same smoke-protected environment. Interpolation is permitted between the specific values shown. A life safety evaluation, complying with NFPA 101, shall be done for a facility utilizing the reduced width requirements of Table 1024.6.2 for smoke-protected assembly seating subject to the approval by the commissioner.*

**TABLE 1024.6.2  
WIDTH OF AISLES FOR SMOKE-PROTECTED ASSEMBLY**

TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED ASSEMBLY OCCUPANCY	INCHES OF CLEAR WIDTH PER SEAT SERVED			
	Stairs and aisle steps with handrails within 30 inches	Stairs and aisle steps without handrails within 30 inches	Passageways, doorways and ramps not steeper than 1 in 10 in slope	Ramps steeper than 1 in 10 in slope
Equal to or less than 5,000	0.200	0.250	0.150	0.165
10,000	0.130	0.163	0.100	0.110
15,000	0.096	0.120	0.070	0.077
20,000	0.076	0.095	0.056	0.062
Equal to or greater than 25,000	0.060	0.075	0.044	0.048

For SI: 1 inch = 25.4 mm.

**Exception:** For an outdoor smoke-protected assembly with an occupant load not greater than 18,000, the clear width shall be determined using the factors in Section 1024.6.3.

**1024.6.2.1 Smoke control.** Means of egress serving a smoke-protected assembly seating area shall be provided with a smoke control system complying with Section 909 or natural ventilation designed to maintain the smoke level at least 6 feet (1829 mm) above the floor of the means of egress.

**1024.6.2.2 Roof height.** A smoke-protected assembly seating area with a roof shall have the lowest portion of the roof deck not less than 15 feet (4572 mm) above the highest aisle or aisle accessway.

**Exception:** A roof canopy in an outdoor stadium shall be permitted to be less than 15 feet (4572 mm) above the highest aisle or aisle accessway provided that there are no objects less than 80 inches (2032 mm) above the highest aisle or aisle accessway.

**1024.6.2.3 Automatic sprinklers.** Enclosed areas with walls and ceilings in buildings or structures containing smoke-protected assembly seating shall be protected with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

**Exceptions:**

1. The floor area used for contests, performances or entertainment provided the roof construction is more than 50 feet (15 240 mm) above the floor level and the use is restricted to low fire hazard uses.
2. Press boxes and storage facilities less than 1,000 square feet (93 m<sup>2</sup>) in area.
3. Outdoor seating facilities where seating and the means of egress in the seating area are essentially open to the outside.

**1024.6.3 Width of means of egress for outdoor smoke-protected assembly.** The clear width in inches (mm) of aisles and other means of egress shall be not less than the total occupant load served by the egress element multiplied by 0.08 (2.0 mm) where egress is by aisles and stairs and multiplied by 0.06 (1.52 mm) where egress is by ramps, corridors, tunnels or vomitories.

**Exception:** *The clear width in inches (mm) of aisles and other means of egress shall be permitted to comply with Section 1024.6.2 for the number of seats in the outdoor smoke-protected assembly where Section 1024.6.2 permits less width.*

**1024.7 Travel distance.** *Exits and aisles shall be so located such that the travel distance to an exit door shall be provided in accordance with Table 1024.7. At least one exit opening shall be available from every attached seat or standee space in an assembly space, or from the most remote point in the space when movable seats are provided or, when no seats are provided, within the primary travel distance limitation listed in Table 1024.7. In addition, an alternate exit opening shall be available from every attached seat or standee space, or from the most remote point when attached seats are not provided within the secondary travel distance limitation listed in Table 1024.7. Such alternate exit openings may serve to satisfy the requirements for primary travel distance for other seats or locations. Exit openings satisfying the primary and secondary travel distance requirements for any one seat or location shall be separated from each other by a distance of at least 25 feet (7620 mm). Where aisles are provided for seating, the distance shall be measured along the aisles and aisle accessway without travel over or on the seats.*

**Exception:** *Smoke-protected assembly seating: The travel distance from each seat to the nearest entrance to a vomitory or concourse shall not exceed 200 feet (60 960 mm). The travel distance from the entrance to the vomitory or concourse to a stair, ramp or walk on the exterior of the building shall not exceed 200 feet (60 960 mm).*

**TABLE 1024.7**  
**TRAVEL DISTANCE**

<i>OCCUPANCY</i>	<i>NON-SPRINKLERED</i>		<i>SPRINKLERED</i>	
	<i>PRIMARY</i>	<i>SECONDARY</i>	<i>PRIMARY</i>	<i>SECONDARY</i>
<i>A-1, A-2, A-3, A-4</i>	<i>100</i>	<i>150</i>	<i>150</i>	<i>250</i>
<i>A-5</i>	<i>200</i>	<i>300</i>	<i>200</i>	<i>300</i>

**1024.8 Common path of travel.** *The common path of travel shall not exceed 30 feet (9144 mm) from any seat to a point where a person has a choice of two paths of egress travel to two exits.*

**Exceptions:**

1. *For areas such as box seats, galleries or balconies serving not more than 50 occupants, the common path of travel shall not exceed 75 feet (22 860 mm).*
2. *For smoke-protected assembly seating, the common path of travel shall not exceed 50 feet (15 240 mm).*

**1024.9 Assembly aisles are required.** *Every occupied portion of any occupancy in Group A that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this section. Aisle accessways for tables and seating shall comply with Section 1013.4.2.*

**1024.9.1 Minimum aisle width.** *The minimum clear width of aisles shall be as shown:*

1. *Forty-eight inches (1219 mm) for aisle stairs having seating on each side.*

**Exception:** *Thirty-six inches (914 mm) where the aisle does not serve more than 50 seats.*

2. *Thirty-six inches (914 mm) for aisle stairs having seating on only one side.*
3. *Twenty-three inches (584 mm) between an aisle stair handrail or guard and seating where the aisle is subdivided by a handrail.*
4. *Forty-two inches (1067 mm) for level or ramped aisles having seating on both sides.*

**Exception:** *Thirty-six inches (914 mm) where the aisle does not serve more than 50 seats.*

5. *Thirty-six inches (914 mm) for level or ramped aisles having seating on only one side.*

**1024.9.2 Aisle width.** *The aisle width shall provide sufficient egress capacity for the number of persons accommodated by the catchment area served by the aisle. The catchment area served by an aisle is*

*that portion of the total space that is served by that section of the aisle. In establishing catchment areas, the assumption shall be made that there is a balanced use of all means of egress, with the number of persons in proportion to egress capacity.*

**1024.9.3 Converging aisles.** *Where aisles converge to form a single path of egress travel, the required egress capacity of that path shall not be less than the combined required capacity of the converging aisles.*

**1024.9.4 Uniform width.** *Those portions of aisles, where egress is possible in either of two directions, shall be uniform in required width.*

**1024.9.5 Assembly aisle termination.** *Each end of an aisle shall terminate at cross aisle, foyer, doorway, vomitory or concourse having access to an exit.*

**Exceptions:**

1. *Dead-end aisles shall not be greater than 20 feet (6096 mm) in length.*
2. *For smoke-protected assembly seating, the dead-end aisle length of vertical aisles shall not exceed a distance of 50 feet (15 240 mm).*

**1024.9.6 Assembly aisle obstructions.** *There shall be no obstructions in the required width of aisles except for handrails as provided in Section 1024.13.*

**1024.10 Clear width of aisle accessways serving seating.** *Where seating rows have 14 or fewer seats, the minimum clear aisle accessway width shall not be less than 12 inches (305 mm) measured as the clear horizontal distance from the back of the row ahead and the nearest projection of the row behind. Where chairs have automatic or self-rising seats, the measurement shall be made with seats in the raised position. Where any chair in the row does not have an automatic or self-rising seat, the measurements shall be made with the seat in the down position. For seats with folding tablet arms, row spacing shall be determined with the tablet arm down.*

**1024.10.1 Dual access.** *For rows of seating served by aisles or doorways at both ends, there shall not be more than 100 seats per row. The minimum clear width of 12 inches (305 mm) between rows shall be increased by 0.3 inch (7.6 mm) for every additional seat beyond 14 seats, but the minimum clear width is not required to exceed 22 inches (559 mm).*

***Exception:*** For smoke-protected assembly seating, the row length limits for a 12-inch-wide (305 mm) aisle accessway, beyond which the aisle accessway minimum clear width shall be increased, are in Table 1024.10.1.

**TABLE 1024.10.1**  
**SMOKE-PROTECTED**  
**ASSEMBLY AISLE ACCESSWAYS**

<i>TOTAL NUMBER OF SEATS IN THE SMOKE-PROTECTED ASSEMBLY OCCUPANCY</i>	<i>MAXIMUM NUMBER OF SEATS PER ROW PERMITTED TO HAVE A MINIMUM 12-INCH CLEAR WIDTH AISLE ACCESSWAY</i>
	<i>Aisle or doorway at both ends of row</i>
<i>Less than 4,000</i>	<i>14</i>
<i>4,000</i>	<i>15</i>
<i>7,000</i>	<i>16</i>
<i>10,000</i>	<i>17</i>
<i>13,000</i>	<i>18</i>
<i>16,000</i>	<i>19</i>
<i>19,000</i>	<i>20</i>
<i>22,000 and greater</i>	<i>21</i>

*For SI: 1 inch = 25.4 mm*

**1024.10.2 Single access.** For rows of seating served by an aisle or doorway at only one end of the row, the minimum clear width of 12 inches (305 mm) between rows shall be provided. Not more than eight chairs shall be provided in such row of seating.

**1024.11 Assembly aisle walking surfaces.** Aisles with a slope not exceeding one unit vertical in eight units horizontal (12.5-percent slope) shall consist of a ramp having a slip-resistant walking surface. Aisles with a slope exceeding one unit vertical in eight units horizontal (12.5-percent slope) shall consist of a series of risers and treads that extends across the full width of aisles and complies with Sections 1024.11.1 through 1024.11.3.

**1024.11.1 Treads.** Tread depths shall be a minimum of 11 inches (279 mm) and shall have dimensional uniformity.

**Exception:** The tolerance between adjacent treads shall not exceed 0.188 inch (4.8 mm).

**1024.11.2 Risers.** Where the gradient of aisle stairs is to be the same as the gradient of adjoining seating areas, the riser height shall not be less than 4 inches (102 mm) nor more than 8 inches (203 mm) and shall be uniform within each flight.

**Exception:** Riser height nonuniformity shall be limited to the extent necessitated by changes in the gradient of the adjoining seating area to maintain adequate sightlines. Where nonuniformities exceed 0.188 inch (4.8 mm) between adjacent risers, the exact location of such nonuniformities shall be indicated with a distinctive marking stripe on each tread at the nosing or leading edge adjacent to the nonuniform risers. Such stripe shall be a minimum of 1 inch (25 mm), and a maximum of 2 inches (51 mm), wide. The edge marking stripe shall be distinctively different from the contrasting marking stripe.

**1024.11.3 Tread contrasting marking stripe.** A contrasting marking stripe shall be provided on each tread at the nosing or leading edge such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be a minimum of 1 inch (25 mm), and a maximum of 2 inches (51 mm), wide.

**Exception:** The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

**1024.11.4 Step lighting.** *Each step shall have a steplight.*

**1024.11.5 Aisle illumination.** *Aisles and cross aisles shall be illuminated in accordance with Section 1006.2.*

**1024.12 Seat stability.** *In places of assembly, the seats shall be securely fastened to the floor.*

**Exceptions:**

1. *In places of assembly or portions thereof without ramped or tiered floors for seating and with 200 or fewer seats, the seats shall not be required to be fastened to the floor, provided that the seating area has a minimum net floor area of 12 square feet (1.11 m<sup>2</sup>) per person.*
2. *In places of assembly or portions thereof with seating at tables and without ramped or tiered floors for seating, the seats shall not be required to be fastened to the floor.*
3. *In places of assembly or portions thereof without ramped or tiered floors for seating and with greater than 200 seats, the seats shall be securely fastened to the floor, or all seats in a row shall be fastened together with a maximum of 12 seats between aisles.*
4. *In places of assembly where flexibility of the seating arrangement is an integral part of the design and function of the space and seating is on tiered levels, a maximum of 200 seats shall not be required to be fastened to the floor, provided that the seating area has a minimum net floor area of 12 square feet (1.11 m<sup>2</sup>) per person.*
5. *Groups of seats within a place of assembly separated from other seating by railings, guards, partial height walls or similar barriers with level floors and having no more than 14 seats per group shall not be required to be fastened to the floor.*
6. *Seats intended for musicians or other performers and separated by railings, guards, partial height walls or similar barriers shall not be required to be fastened to the floor.*

**1024.13 Handrails.** *Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and aisle stairs shall be provided with handrails located either at the side or within the aisle width.*

**Exceptions:**

1. *Handrails are not required for ramped aisles having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and seating on both sides.*
2. *Handrails are not required if, at the side of the aisle, there is a guard that complies with the graspability requirements of handrails.*

**1024.13.1 Discontinuous handrails.** *Where there is seating on both sides of the aisle, the handrails shall be discontinuous with gaps or breaks at intervals not exceeding five rows to facilitate access to seating and to permit crossing from one side of the aisle to the other. These gaps or breaks shall have a clear width of at least 22 inches (559 mm) and not greater than 36 inches (914 mm), measured horizontally, and the handrail shall have rounded terminations or bends.*

**1024.13.2 Intermediate handrails.** *Where handrails are provided in the middle of aisle stairs, there shall be an additional intermediate handrail located approximately 12 inches (305 mm) below the main handrail.*

**1024.14 Assembly guards.** *Assembly guards shall comply with Sections 1024.14.1 through 1024.14.3.*

**1024.14.1 Cross aisles.** *Cross aisles located more than 30 inches (762 mm) above the floor or grade below shall have guards in accordance with Section 1012. Where an elevation change of 30 inches (762 mm) or less occurs between a cross aisle and the adjacent floor or grade below, guards not less than 26 inches (660 mm) above the aisle floor shall be provided.*

**Exception:** *Where the backs of seats on the front of the cross aisle project 24 inches (610 mm) or more above the adjacent floor of the aisle, a guard need not be provided.*

**1024.14.2 Sightline-constrained guard heights.** *Unless subject to the requirements of Section 1024.14.3, a fascia or railing system in accordance with the guard requirements of Section 1012 and having a minimum height of 26 inches (660 mm) shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At bleachers, a guard must be provided where the floor or footboard elevation is more than 24 inches (610 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of the immediately adjacent seating.*

**1024.14.3 Guards at the end of aisles.** A fascia or railing system complying with the guard requirements of Section 1012 shall be provided for the full width of the aisle where the foot of the aisle is more than 30 inches (762 mm) above the floor or grade below. The fascia or railing shall be a minimum of 36 inches (914 mm) high and shall provide a minimum 42 inches (1067 mm) measured diagonally between the top of the rail and the nosing of the nearest tread.

**1024.14.4 Toe guard at balconies.** An unperforated curb or toe guard at least 12 inches (305 mm) high above the level of the floor shall be provided at the fascia of all balconies.

**1024.15 Bench seating.** Where bench seating is used, the number of persons shall be based on one person for each 18 inches (457 mm) of length of the bench.

**1024.16 Standee areas.** Standee areas may be permitted within assembly spaces provide each standee has a minimum width of 22 inches (559 mm) and a minimum depth of 21 inches (533 mm). Standee areas shall not encroach on the required exit facilities and shall be separated from the space to be left clear for passage by tape, ribbon or other easily broken material, supported by lightweight posts fixed in stationary sockets.

**1024.17 Places of assembly with an occupant load of less than 12 square feet per person.** Places of assembly in which the net floor area, exclusive of stage area, is less than 12 square feet (1.11 m<sup>2</sup>) per person shall have special egress provisions in accordance with this Section.

**1024.17.1 Classification of exit openings.** For the purposes of this Section 1024.17, exit openings shall be classified as follows:

1. Class 1 - Exit openings that are used for normal entry to the assembly space, and that open directly to a safe area or to an open exterior space.
2. Class 2 - Exit openings that are not used for normal entry to the assembly space, and that open directly to a safe area or to an open exterior space.
3. Class 3 - Exit openings that open from the assembly space into corridors, exit passageways, or vertical exits.

**1024.17.2 Distribution of classes.** The required exit capacity from assembly spaces in which the net floor area, exclusive of stage area, is less than 12 square feet (1.11 m<sup>2</sup>) per person shall be distributed

*so that exit openings of each class are provided to comply with the following requirements:*

1. *For assembly spaces in which the mean floor level is not more than 15 feet (4572 mm) above or below the adjoining grade elevation, the exit capacity shall be distributed as follows:*
  - 1.1. *Class 1- not less than 40 percent.*
  - 1.2. *Class 2- not more than 60 percent.*
  - 1.3. *Class 3- not more than 40 percent.*
2. *For assembly spaces in which the mean floor level is more than 15 feet (4572 mm) above or below the adjoining grade elevation, the exit capacity shall be distributed as follows:*
  - 2.1. *Class 1 - not less than 60 percent.*
  - 2.2. *Class 3 - not more than 40 percent.*

**1024.17.3 Safe areas.** *The capacity of exits from safe areas shall be provided for all occupants of the safe area. Safe areas shall comply with the following requirements:*

1. *When provided to serve Class 1 or Class 2 exit openings, safe areas shall be separated from assembly spaces by noncombustible construction having a two hour fire-resistance rating, and shall serve as transition areas in the line and direction of exit travel. They shall serve for normal entry to the assembly space and may be used as corridors, lobbies, or lounges.*
2. *No room or space classified in occupancy Group H, S-1, F-1 or F-2 shall open upon a safe area.*
3. *Safe areas shall be at a level not more than 6 feet (1829 mm) above or below the level at which egress is made from the assembly space.*
4. *Ventilating systems for safe areas shall not be connected to systems serving any other spaces, unless separated from such systems by fire/smoke dampers actuated by smoke detectors.*
5. *Collecting safe areas. Places of assembly having more than one assembly space may have a collecting safe area that receives the occupant load discharged into it by other safe areas. Collecting safe areas shall be located within 6 feet (1829 mm) above or below the assembly space nearest to grade.*

6. *Occupant load.* The occupant load of a safe area shall be the aggregate occupant load of all exit openings discharging directly into it. The occupant load of a collecting safe area shall be the aggregate occupant load of all exit openings discharging directly into it, plus 50 percent of the occupant load of other safe areas discharging into it.
7. *Dimensions.* The clear unobstructed floor area of each safe area shall be sufficient to accommodate the total occupant load of the safe area on the basis of 3 square feet (0.28 m<sup>2</sup>) per person, not including space occupied by furniture or equipment. The minimum dimension of such unobstructed space shall be 8 feet (2438 mm). The width of the unobstructed space shall be measured at right angles to the direction of travel to an exit and shall not be less than required for the occupant load. The height of safe areas shall be at least 8 feet (2438 mm) at all points.
8. *Safe areas near grade.* When a safe area provides egress to an open exterior space, either directly or through a vestibule, the safe area need not provide the floor area required by this section when the level of discharge from the safe area to the open exterior space is not more than 4 feet (1219 mm) above or below the grade of the open exterior space.

**1024.17.3.1 Unenclosed vertical exits.** Vertical exits leading directly from one safe area to another, or leading from a safe area directly to an open exterior space, need not be enclosed.

**1024.17.3.2 Safe area lighting.** In addition to requirements of Section 1006, safe areas shall be artificially lighted by electrical means at all times during occupancy of a place of assembly so as to provide illumination of at least 5 foot-candles (54 lux) at the level of the floor and on the surface of all stairs, steps, ramps, and escalators within the safe area.

**1024.17.4 Open exterior space.** The following provisions shall apply when an open exterior space is used as an exit discharge:

1. *Capacity.* Open exterior spaces shall be adequate in width and area to accommodate the accumulated occupant load of all exits discharging into them on the basis of 2 square feet (0.19 m<sup>2</sup>) per person.
2. *Minimum dimensions.* The minimum dimension of open exterior spaces shall be 20 feet (6096 mm), except that when the principal entrance to the place of assembly is from an open exterior space, the minimum dimension of this space shall be 30 feet (9144 mm). No open exterior space shall have less than 400 square feet (37 m<sup>2</sup>) of floor area, and floor area shall be measured exclusive of the following:

- 2.1. *The area immediately outside any exit door from the place of assembly for a distance perpendicular to the exit doors of 10 feet (3048 mm) for the full width of the exit opening.*
- 2.2. *The area steps, platforms, stairs, or ramps within leading to or from the space.*
- 2.3. *The area of obstructions such as shrubs, trees, fixed furniture, signs, sculptures, pools, and similar obstructions to occupancy or exit travel.*
3. *Above or below grade. When an open exterior space is more than 15 feet (4572 mm) above or below grade of the street or public space to which it discharges, its required area shall be increased by one-third.*
4. *Egress from open exterior spaces. Exterior exit passageways, ramps, or steps leading from open exterior spaces shall not be less in width than required for the occupant load of all exits discharging into the open exterior space. The width of such exit passageways shall be based on the capacities listed in Table 1005.1, but in no case less than 10 feet (3048 mm).*
5. *Open exterior spaces. Yards or courts which serve as open exterior spaces shall be artificially lighted by electrical means at all times between sunset and sunrise during occupancy of a place of assembly so as to provide illumination of at least 5 foot-candles (54 lux) at the level of the floor over at least the required area.*

## **SECTION BC 1025**

### **EMERGENCY ESCAPE AND RESCUE**

**1025.1 General.** *In addition to the means of egress required by this chapter, provisions shall be made for emergency escape and rescue in Group R and Group I-1 occupancies. Sleeping rooms below the fourth story above grade plane and below grade stories shall have at least one exterior emergency escape and rescue opening in accordance with this section. Where below grade stories contain one or more sleeping rooms, emergency egress and rescue openings shall be required in each sleeping room, but shall not be required in adjoining areas of such below grade story. Such opening shall open directly into a public street, public alley, yard or court.*

#### **Exceptions:**

1. *Buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.*
2. *Sleeping rooms provided with a door to a fire-resistance-rated corridor having access to two remote exits in opposite directions.*
3. *The emergency escape and rescue opening is permitted to open onto a balcony within an atrium in accordance with the requirements of Section 404, provided the balcony provides access to an exit and the dwelling unit or sleeping unit has a means of egress that is not open to the atrium.*
4. *High-rise buildings in accordance with Section 403.*
5. *Emergency escape and rescue openings are not required from below grade stories or sleeping rooms which have an exit door or exit access door that opens directly into a public street, public alley, yard, egress court or to an exterior exit balcony that opens to a public street, public alley, yard or egress court.*
6. *Below grade stories without habitable spaces and having no more than 200 square feet (19 m<sup>2</sup>) in floor area shall not be required to have emergency escape windows.*

**1025.2 Minimum size.** *Emergency escape and rescue openings shall have a minimum net clear opening of 6 square feet (0.56 m<sup>2</sup>).*

**Exception:** *The minimum net clear opening for emergency escape and rescue grade-floor openings shall be 5 square feet (0.46 m<sup>2</sup>) unless such opening is required for natural ventilation in accordance with Chapter 12.*

**1025.2.1 Minimum dimensions.** *The net clear opening height dimension shall not be less than 30 inches (762 mm). The net clear opening width dimension shall not be less than 24 inches (610 mm). The final dimensions shall result in a net clear opening area as required above. The net clear opening dimensions shall be the result of normal operation of the opening.*

**1025.3 Maximum height from floor.** *Emergency escape and rescue openings shall have the bottom of the clear opening not greater than 36 inches (914 mm) measured from the floor.*

**1025.4 Operational constraints.** *Emergency escape and rescue openings shall be operational from the inside of the room without the use of keys or tools in accordance with the provisions of Chapter 10 of the New York City Fire Code.*

**1025.5 Window wells.** *An emergency escape and rescue opening with a finished sill height below the adjacent ground level shall be provided with a window well in accordance with Sections 1025.5.1 and 1025.5.2.*

**1025.5.1 Minimum size.** *The minimum horizontal area of the window well shall be 9 square feet (0.84 m<sup>2</sup>), with a minimum dimension of 36 inches (914 mm). The area of the window well shall allow the emergency escape and rescue opening to be fully opened.*

**1025.5.2 Ladders or steps.** *Window wells with a vertical depth of more than 44 inches (1118 mm) shall be equipped with an approved permanently affixed ladder or steps. Ladders or rungs shall have an inside width of at least 12 inches (305 mm), shall project at least 3 inches (76 mm) from the wall and shall be spaced not more than 18 inches (457 mm) on center (o.c.) vertically for the full height of the window well. The ladder or steps shall not encroach into the required dimensions of the window well by more than 6 inches (152 mm). The ladder or steps shall not be obstructed by the emergency escape and rescue opening. Ladders or steps required by this section are exempt from the stairway requirements of Section 1009.*

## **SECTION BC 1026**

### **SIGNAGE**

**1026.1 Signage.** *Signage shall be provided in accordance with this section.*

**1026.2 Exit signs.** *Exits signs shall be provided in accordance with Section 1011.*

**1026.3 Stairway and elevator identification signs.** *Stairway floor number and stairway identification signs shall be provided in accordance with Section 1019.1.7. Elevator identification and emergency signs shall be provided in accordance with Section 3002.3.*

**1026.4 Door signs.** *For the following buildings, signs shall be posted and maintained on exit stair doors in accordance with this section:*

1. *Buildings or portions thereof occupied by Group B or arranged to be occupied by more than 100 persons above or below the street level or more than 500 persons in the entire building.*
2. *High-rise buildings subject to Section 403*
3. *Buildings where any stair side door is locked pursuant to Section 1008.1.8.7.*

**Exception:** *Signs shall not be required on exit stair doors opening directly to dwelling or sleeping units in occupancy Group R where permitted by Section 1013.6.*

**1026.4.1 Occupied side.** *Where re-entry is not provided from a stair to every floor, a sign that reads, "NO RE-ENTRY FROM THIS STAIR" shall be posted on the occupied side of the stair door at every floor.*

**1026.4.2 Stair side.** *On the stair side, signs shall be posted and maintained at all stair doors at every floor. Such signs shall be either:*

1. *Re-entry. Where re-entry is provided, a sign shall read, "RE-ENTRY ON THIS FLOOR".*

2. *No re-entry. Where re-entry is not provided on that floor, the sign shall read:*

- 2.1. *"NO RE-ENTRY"; where re-entry is not provided on any floor;*

- 2.2. *"NO RE-ENTRY, NEAREST RE-ENTRY ON THE..... AND..... FLOORS"; where re-entry is provided on other floors; and*

- 2.3. *"NO RE-ENTRY. RE-ENTRY IS PROVIDED ONLY DURING FIRE EMERGENCIES. NEAREST TELEPHONE ON THE ..... AND..... FLOORS"; where stair side doors are locked in accordance with Section 403.12.*

**1026.4.3 Graphics.** *The lettering and numerals of the signs shall be at least ½ inch (12.7 mm) high of bold type. The lettering and background shall be contrasting colors and the signs shall be securely attached approximately 5 feet (1524 mm) above the floor. The signs may be either independent or combined with floor and stairway identification signs.*

**1026.5 Wall signs, stair side.** In high-rise buildings subject to Section 403, signs shall be posted and maintained on the wall as follows:

1. *Re-entry.* Where a re-entry door is recessed, a supplementary sign complying with Section 1026.4.3, except that the lettering and numerals shall be at least 1 inch (25 mm) high, shall be securely attached on the wall of the landing and shall be readily visible to the evacuee on the stairs indicating the location of such recessed re-entry door.
2. *No re-entry.* Where there is no re-entry from the stair, an additional sign complying with Subdivision 2 of Section 1026.4.2 and 1026.4.3, except that the lettering and numerals shall be at least 1 inch (25 mm) high, shall be securely attached at the beginning of the descent into such portion of the stair on the wall of the landing and shall be readily visible to the evacuee on the stairs.

**1026.6 Accessible means of egress signs.** Accessible means of egress shall be provided with signs in accordance with Sections 1007.6.5 and 1007.7.

**1026.7 Capacity sign.** Occupant load signs shall be provided in accordance with Sections 1004.3.

**1026.8 Access-controlled doors.** Access-controlled doors shall be provided with signs in accordance with Sections 1008.1.3.4.

**1026.9 Delayed egress locks.** Doors equipped with delayed egress shall be provided with signs in accordance with Sections 1008.1.8.6.

**1026.10 Signs in sleeping rooms.** A sign shall be posted on the inside of every door opening onto a corridor giving access to a sleeping room in all Group R-1 occupancies. The sign shall contain a diagram showing the location where it is posted and the location and letter identification of the exit stairs on the floor. The diagram shall indicate the number of doors opening onto the public corridor which must be passed to reach each exit stair. The sign shall be at least 8 inches by 10 inches (203 mm by 254 mm), located on the inside of the door and securely attached. The top of such sign shall not be more than 6 feet (1829 mm) from the floor level. Such sign shall contain such additional information as the New York City Fire Department may require.

**1026.11 Photoluminescent exit path marking.** Photoluminescent exit path markings in high-rise buildings subject to Section 403.16 shall be provided in accordance with this section. All exit path markings required

*herein shall be of an approved photoluminescent material. The markings shall be washable, non-toxic, non-radioactive, and if subjected to fire must be self extinguishing when the flame is removed. Exit path markings shall at a minimum be located:*

- 1. On all doors opening to exits, exit passageways, or horizontal exits and shall be marked with the word "EXIT".*
- 2. Within exit stairs, horizontal extensions in exit stairs, horizontal exits, and exit passageways*

***Exception:*** *Within street level lobbies where egress direction is immediately discernable.*

*Required markings for exit paths shall comply with the technical standards for installation and placement in accordance with rules promulgated by the commissioner.*

***1026.12 Materials for signs.*** *Signs required by this section shall be of metal or other durable material.*

**CHAPTER 11**  
**ACCESSIBILITY**

**SECTION BC 1101**  
**GENERAL**

**1101.1 Scope.** *The provisions of this chapter and appendices E, N and P shall control the design and construction of facilities for accessibility to persons with physical disabilities.*

**1101.2 Design.** *Buildings and facilities shall be designed and constructed to be accessible in accordance with this code and ICC A117.1 (Accessible and Usable Buildings and Facilities).*

**SECTION BC 1102**  
**DEFINITIONS**

**1102.1 Definitions.** *The following words and terms shall, for the purposes of this chapter, applicable appendices and as used elsewhere in this code, have the following meanings:*

**ACCESSIBLE.** *A site, building, facility or portion thereof that complies with this chapter.*

**ACCESSIBLE ROUTE.** *A continuous, unobstructed path that complies with this chapter.*

**ACCESSIBLE UNIT.** *A dwelling unit or sleeping unit that complies with this code and Chapter 1-Chapter 10 of ICC A117.1.*

**CIRCULATION PATH.** *An exterior or interior way of passage provided for pedestrian travel.*

**COMMON USE.** *Interior or exterior circulation paths, rooms, spaces or elements that are made available for the shared use of two or more people but are not for public use.*

**DETECTABLE WARNING.** *A standardized surface feature built in or applied to walking surfaces or other elements to warn visually impaired persons of hazards on a circulation path.*

**DWELLING UNIT (ACCESSIBILITY).** *For the purposes of Chapter 11 and applicable appendices: A single unit providing complete, independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation.*

**DWELLING UNIT OR SLEEPING UNIT, MULTI-STORY.** *A dwelling unit or sleeping unit with habitable space located on more than one story.*

**DWELLING UNIT OR SLEEPING UNIT, TYPE B.** *A dwelling unit or sleeping unit designed and constructed for accessibility in accordance with this code, Section 1004 (Type B Units) of ICC A117.1 where applicable, and Appendix P of this code where applicable, consistent with or exceeding the design and construction requirements of the federal Fair Housing Act.*

**EMPLOYEE WORK AREA.** *All or any portion of a space used only by employees and only for work. Corridors, toilet rooms, kitchenettes and break rooms are not employee work areas.*

**FACILITY.** *All or any portion of buildings, structure, site improvements, elements and pedestrian or vehicular routes located on a site.*

**INTENDED TO BE OCCUPIED AS A RESIDENCE.** *This refers to a dwelling unit or sleeping unit that can or will be used all or part of the time as the occupant's place of abode.*

**MULTILEVEL ASSEMBLY SEATING.** *Seating that is arranged in distinct levels where each level is comprised of either multiple rows, or single row of box seats accessed from a separate level.*

**PUBLIC ENTRANCE.** *An entrance that is not a service entrance.*

**PUBLIC-USE AREAS.** *Interior or exterior rooms or spaces that are made available to the general public.*

**RESTRICTED ENTRANCE.** *An entrance that is made available for public use but on a controlled basis, and that is not a service entrance.*

**SELF-SERVICE STORAGE FACILITY.** *Real property designed and used for the purpose of renting or leasing individual storage spaces to customers for the purpose of storing and removing personal property on a self-service basis.*

**SERVICES.** *Includes but is not limited to toilet rooms, drinking fountains, public telephones, and food.*

**SERVICE ENTRANCE.** *An entrance solely for delivery of goods or services.*

**SITE.** A parcel of land bounded by a property line or a designated portion of a public right-of-way.

**SLEEPING UNIT (ACCESSIBILITY).** For the purposes of Chapter 11 and applicable appendices: A room or space in which people sleep, which can also include permanent provisions for living, eating, and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a dwelling unit are not sleeping units.

**WHEELCHAIR SPACE.** A space for a single wheelchair and its occupant.

### **SECTION BC 1103 SCOPING REQUIREMENTS**

**1103.1 Where required.** Buildings and structures, temporary or permanent, including their associated sites and facilities, shall be accessible to persons with physical disabilities.

**1103.2 General exceptions.** Sites, buildings, facilities and elements shall be exempt from this chapter to the extent specified in this section.

**1103.2.1 Specific requirements.** Accessibility is not required in buildings and facilities, or portions thereof, to the extent permitted by Sections 1104 through 1110.

**1103.2.2 Existing buildings.** Existing buildings shall comply with Section 28-101.4.

**1103.2.3 Employee work areas.** All or any portion of a space used exclusively by employees and only for work shall be required to comply only with Section 1103.2.3. However, common use circulation paths, located within employee work areas shall also comply with Section 1104.3.1.

**1103.2.3.1 Employee work areas and work stations.** Spaces and elements within employee work areas shall comply with Sections 907.9.1.2, 1007 and 1104.3.1 and shall be designed and constructed so that individuals with disabilities can approach, enter and exit the work area. In addition, at least one and not less than five percent of seating, tables and/or work stations, if provided, within employee work areas shall comply with applicable sections of ICC A117.1.

**1103.2.3.2 Elevated employee work areas.** Where the elevation is critical to the proper work operations, work areas or portions of work areas that are less than 150 square feet (14 m<sup>2</sup>) in

*area and elevated 7 inches (178 mm) or more above the ground or finish floor shall be exempt from all requirements.*

**1103.2.4 Detached dwellings.** *Detached one and two-family dwellings and their accessory structures, and their associated sites and facilities are not required to be accessible.*

**1103.2.5 Utility buildings.** *Occupancies in Group U are exempt from the requirements of this chapter other than the following:*

- 1. In agricultural buildings and live stock shelters, access is required to paved work areas and areas open to the general public.*
- 2. Green houses and stables open to the public.*
- 3. Private garages or carports that contain required accessible parking.*

**1103.2.6 Construction sites.** *Structures, sites and equipment directly associated with the actual processes of construction including, but not limited to, scaffolding, bridging, materials hoists, materials storage or construction trailers are not required to be accessible.*

**1103.2.7 Raised areas.** *Raised areas used for purposes of security, life safety or fire safety including, but not limited to, observation galleries, prison guard towers, fire towers or lifeguard stands are not required to be accessible or to be on an accessible route.*

**1103.2.8 Limited access spaces.** *Nonoccupiable spaces accessed only by ladders, catwalks, crawl spaces, freight elevators that are not part of an accessible route, or very narrow passageways are not required to be accessible.*

**1103.2.9 Equipment spaces.** *Spaces frequented only by personnel for maintenance, repair or monitoring of equipment are not required to be accessible. Such spaces include, but are not limited to, elevator pits, elevator penthouses, mechanical, electrical or communications equipment rooms, piping or equipment catwalks, water or sewerage treatment pump rooms and stations, electrical substations and transformer vaults, and highway and tunnel utility facilities.*

**1103.2.10 Non-grade single-occupant structures.** *Single-occupant structures that are accessed only by passageways below grade or above grade including, but not limited to, toll booths that are accessed only by bridges or underground tunnels, are not required to be accessible.*

**1103.2.11 Residential Group R-1.** *Buildings or portions of buildings occupied by Group R-1 containing not more than five sleeping units for rent or hire that are also occupied as the residence of the proprietor are not required to be accessible.*

**1103.2.12 Detention and correctional facilities.** *In detention and correctional facilities, common use areas that are used only by inmates or detainees and security personnel, and that do not serve holding cells or housing cells required to be accessible pursuant to Section 1107.5.5, are not required to be accessible or to be on an accessible route.*

**1103.2.13 Fuel-dispensing systems.** *The operable parts on fuel-dispensing devices shall comply with Section 308.2.1 (Forward Reach Unobstructed) or 308.3.1 (Side Reach Unobstructed) of ICC A117.1.*

## **SECTION BC 1104 ACCESSIBLE ROUTE**

**1104.1 Site arrival points.** *Accessible routes within the site shall be provided from public transportation stops, accessible parking and accessible passenger loading zones, and public streets or sidewalks to the accessible building entrance served.*

**1104.2 Within a site.** *At least one accessible route shall connect accessible buildings, accessible facilities, accessible elements and accessible spaces that are on the same site and shall comply with Section 1104.5.*

**1104.3 Connected spaces.** *When a building, or portion of a building, is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way. Where only one accessible route is provided, the accessible route shall not pass through kitchens, storage rooms, restrooms, closets or similar spaces.*

### **Exceptions:**

1. *In assembly areas with seating required to be accessible, an accessible route shall not be required to serve seating where wheelchair spaces or designated aisle seats required to be on an accessible route are not provided.*
2. *Accessible routes shall not be required to mezzanines provided that the building or facility has no more than one story, or where multiple stories are not required to be connected by an accessible route as permitted by Section 1104.4.*
3. *A single accessible route is permitted to pass through a kitchen or storage room in an accessible dwelling unit.*

**1104.3.1 Circulation paths within employee work areas.** *Common use circulation paths within employee work areas shall be accessible routes.*

**Exceptions:** *The following exceptions apply only to the common use circulation paths within an employee work area and are not intended to remove the requirement of Section 1103.2.3 that employee work areas be designed and constructed so that individuals with disabilities can approach, enter and exit the employee work area.*

1. *Common use circulation paths, located within employee work areas less than 300 square feet (27.9 m<sup>2</sup>) in size, and defined by permanently installed partitions, counters, casework or furnishings not serving accessible employee work stations that are required in Section 1103.2.3.1, shall not be required to be accessible routes.*
2. *Common use circulation paths, located within employee work areas, that are an integral component of equipment, shall not be required to be accessible routes.*

**1104.3.2 Press boxes.** *Press boxes in assembly areas shall be on an accessible route.*

**Exceptions:**

1. *An accessible route shall not be required to press boxes in bleachers that have points of entry at only one level, provided that the aggregate area of all press boxes is 500 square feet (46.5 m<sup>2</sup>) maximum.*

2. *An accessible route shall not be required to free-standing press boxes that are elevated above grade 12 feet (3658 mm) minimum provided that the aggregate area of all press boxes is 500 square feet (46.5 m<sup>2</sup>) maximum.*

**1104.4 Multilevel buildings and facilities.** *At least one accessible route shall connect each accessible level, including mezzanines, in multilevel level buildings and facilities.*

**Exceptions:**

1. *An accessible route is not required to stories and mezzanines above and below accessible levels in non-residential buildings where the aggregate area of all such stories and mezzanines that are not provided with accessible routes is not more than 2,500 square feet (232.3 m<sup>2</sup>). This exception shall not apply to:*
  - 1.1. *Multiple tenant facilities of Group M occupancies containing five or more tenant spaces;*
  - 1.2. *Levels containing offices of health care providers (Group B or I);*
  - 1.3. *Passenger transportation facilities and airports (Group A-3 or B); or*
  - 1.4. *Levels frequented by the public for assembly, government, public utility or health facility purposes.*
2. *In group A, I, R and S occupancies, levels that do not contain accessible elements or other spaces required by Sections 1107 or 1108 are not required to be served by an accessible route from an accessible level.*
3. *Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.*

**1104.5 Location.** *Accessible routes shall coincide with or be located in the same area as a general circulation path. Where the circulation path is interior, the accessible route shall also be interior.*

**1104.6 Security barriers.** Security barriers including, but not limited to, security bollards and security check points shall not obstruct a required accessible route or accessible means of egress.

**Exception:** Where security barriers incorporate elements that cannot comply with these requirements, such as certain metal detectors, fluoroscopes or other similar devices, the accessible route shall be permitted to be provided adjacent to security screening devices. The accessible route shall permit persons with disabilities passing around security barriers to maintain visual contact with their personal items to the same extent provided others passing through the security barrier.

## **SECTION BC 1105 ACCESSIBLE ENTRANCES**

**1105.1 Public entrances.** In addition to accessible entrances required by Sections 1105.1.1 through 1105.1.6, all public entrances shall be accessible.

**Exceptions:**

1. An accessible entrance is not required to areas that are not required to be accessible by this chapter or Appendix E.
2. Loading and service entrances that are not the only entrance to a building or a tenant space.
3. Revolving doors, revolving gates, or turnstiles shall not be required to be accessible provided that an accessible entrance is available adjacent to such revolving doors, revolving gates or turnstiles.

**1105.1.1 Parking garage entrances.** Where provided, direct access for pedestrians from parking structures to buildings or facility entrances shall be accessible.

**1105.1.2 Entrances from tunnels or elevated walkways.** Where direct access is provided for pedestrians from a pedestrian tunnel or elevated walkway to a building or facility, entrances from such access to the building or facility shall be accessible.

**1105.1.3 Restricted entrances.** Where restricted entrances are provided to a building or facility, all such restricted entrances shall be accessible.

**1105.1.4 Entrances for inmates and detainees.** Where entrances used only by inmates or detainees and security personnel are provided at judicial facilities, detention facilities or correctional facilities, all such entrances shall be accessible.

**1105.1.5 Service entrances.** If a service entrance is the only entrance to a building or a tenant space in a facility, that entrance shall be accessible.

**1105.1.6 Tenant spaces.** All entrances to tenant spaces that are required to be accessible shall be accessible entrances.

**1105.1.6.1 Dwelling units and sleeping units.** Doors and doorways at entrance(s) to Accessible units, including hardware, shall comply with Section 404 (Doors and doorways) of ICC A117.1. Doors and doorways, including hardware, at entrance(s) to Type B units shall comply with Section 1003.5 (Doors and doorways) of ICC A117.1.

**Exceptions:**

1. An accessible entrance is not required to dwelling units and sleeping units that are not required to be Accessible units or Type B units.
2. Entrances to multi-story dwelling or sleeping units in R-2 occupancy as provided in Section 1107.2.5 that are not on the primary entry story to the unit and are not part of the accessible route required in exception 1 of Section 1107.2.5 shall not be required to be accessible.

**SECTION BC 1106**

**PARKING AND PASSENGER LOADING FACILITIES**

**1106.1 Required.** Where parking is provided, five percent of the total number of parking spaces, but not less than one parking space, shall be accessible parking spaces except as otherwise required by Sections 1106.2 through 1106.4. Van-accessible parking spaces shall be provided in accordance with Section 1106.5. Accessible parking spaces shall be designed and constructed in accordance with Section 502 (Parking Spaces) of ICC A117.1. The number of accessible parking spaces shall be determined based on the total number of parking spaces provided for the facility. Where a determination of the minimum number of parking spaces results in a number containing a decimal of 0.5 or more, the next highest integer shall be used.

**Exception:** This section does not apply to parking spaces used exclusively for buses, trucks, other delivery vehicles, law enforcement vehicles or vehicular impound where lots accessed by the public are provided with an accessible passenger loading zone.

**1106.2 Groups R-2 and R-3.** Where parking is provided for occupancies in groups R-2 and R-3, which are required to have Accessible or Type B dwelling or sleeping units, the number of accessible parking spaces shall be in compliance with Section 1106.1 and such number of accessible parking spaces shall be dispersed in accordance with Section 1106.6. Where parking is provided within or beneath a building, accessible parking spaces shall also be provided within or beneath the building.

**1106.2.1 Lease, rental, or assignment of spaces.** In a parking facility accessory to Occupancy Group R-2 or R-3 serving only the residents or employees of the management of such occupancy, or provided in compliance with Section 25-412 of the New York City Zoning Resolution, the accessible parking spaces in such facility may be leased, rented or assigned to a person without physical disabilities on a no longer than month-to-month basis. Such leases, rentals, or assignments of the accessible parking spaces to persons without physical disabilities shall be on written condition that such spaces be relinquished immediately at the end of the term of such lease, rental, or assignment to a resident or employee of the management of such occupancy who is a person with physical disabilities.

**1106.3 Hospital outpatient facilities.** Ten percent, but not less than one, of patient and visitor parking spaces provided to serve hospital outpatient facilities shall be accessible.

**1106.4 Rehabilitation facilities and outpatient physical therapy facilities.** Twenty percent, but not less than one, of the portion of patient and visitor parking spaces serving rehabilitation facilities and outpatient physical therapy facilities shall be accessible.

**1106.5 Van spaces.** For every six or fraction of six accessible parking spaces, at least one space shall be a van-accessible parking space. Van-accessible parking spaces shall be designed and constructed in accordance with ICC A117.1 including Section 502 (Parking Spaces).

**1106.6 Location.** Accessible parking spaces shall be located on the shortest accessible route of travel from adjacent parking to an accessible building entrance. Accessible parking spaces shall be dispersed among the various types of parking facilities provided. In parking facilities that do not serve a particular building, accessible parking spaces shall be located on the shortest route to an accessible pedestrian entrance to the parking facility. Where buildings have multiple accessible entrances with adjacent parking,

*accessible parking spaces shall be dispersed and located near the accessible entrances. In occupancies group R-2 and R-3, at least one of each type of parking space shall be accessible.*

***Exceptions:***

- 1. In multilevel parking structures, van-accessible parking spaces complying with Section 502 (Parking Spaces) of ICC A117.1 may be provided on one level.*
- 2. In an attended parking facility in which vehicles customarily are parked and later returned to their drivers by an attendant employed by the parking facility, accessible parking spaces need not be designated by a sign or lines if all of the following conditions are met:*
  - 2.1. Van-accessible parking spaces complying with Section 502 (Parking Spaces) of ICC A117.1 are provided,*
  - 2.2. A passenger loading zone complying with Section 1106.7 is provided where an attendant shall take control of the vehicles. A vertical clearance of 98 inches (2489 mm) shall be permitted at such loading zone,*
  - 2.3. At least one accessible parking space shall remain available unless all accessible parking spaces are occupied,*
  - 2.4. The attendant shall park and retrieve all vehicles not equipped with special controls entering the facility in which a person with disabilities is either the driver or a passenger, provided accessible parking space is available,*
  - 2.5. The attendant shall direct the drivers of vehicles equipped with special controls to accessible parking spaces. The attendant shall accompany such drivers to and from such space along an accessible route when they enter and exit the facility. If necessary, the accessible route and accessible parking space shall be created by the repositioning of vehicles parked previously by the attendant, and*
  - 2.6. Each van-accessible parking space shall have two permanently and prominently posted signs. One shall include the International Symbol of Accessibility complying with Section 703.6.3.1 of ICC A117.1. The other sign shall note that vehicles parked in such spaces are subject to being moved by an attendant of the parking*

*facility in order to accommodate a vehicle which cannot be accommodated in another accessible parking space. Such signs shall not be obstructed by a vehicle parked in the space.*

**1106.7 Passenger loading zones.** *Passenger loading zones shall be designed and constructed in accordance with ICC A117.1 including Section 503 (Passenger Loading Zones). Where there are curbs between the access aisle and the vehicle pull-up space, a curb ramp complying with ICC A117.1 including Section 406 (Curb Ramps) shall be provided.*

**1106.7.1 Continuous loading zones.** *Where passenger loading zones are provided, at least one accessible passenger loading zone shall be provided within each continuous 100 linear feet (30.4 m) of loading zone space, or fraction thereof, so that travel between accessible passenger loading zones will not exceed 100 linear feet (30.4 m).*

**1106.7.2 Medical facilities.** *A passenger loading zone shall be provided at an accessible entrance to licensed medical and long-term care facilities where people receive physical or medical treatment or care and where the period of stay exceeds 24 hours.*

**1106.7.3 Valet parking.** *A passenger loading zone shall be provided at valet parking services.*

## **SECTION BC 1107**

### **DWELLING UNITS AND SLEEPING UNITS**

**1107.1 General.** *In addition to the other requirements of this chapter, occupancies having dwelling units or sleeping units shall be provided with accessible features in accordance with this section.*

**1107.2 Design.** *Dwelling units and sleeping units which are required to be Accessible units or Type B units shall comply with this code including Appendix P where applicable, and the applicable provisions of Chapter 10 of ICC A117.1. In addition, Type B units in R-2 occupancies shall comply with Sections 1107.2.1 through 1107.2.8. Units required to be Type B units are permitted to be designed and constructed as Accessible units.*

**1107.2.1 Type B unit doors and doorways in R-2 occupancy.** *Doors and doorways at the entrance(s) to the dwelling or sleeping unit shall comply with Section 1105.1.6. All other doors and doorways within the dwelling or sleeping unit meant for human passage shall comply with Section 1003.5 (Doors*

*and Doorways) of ICC A117.1. In addition, doors and doorways serving toilet and bathing facilities that are required to comply with Appendix P shall also comply with Section P102.3.*

***Exceptions:***

- 1. Maneuvering clearance at doors. Where pull side, latch approach maneuvering clearance is required within the dwelling of sleeping unit for a door without a closer as per Fig. 404.2.3.1 (f) of ICC A117.1, the minimum maneuvering clearance perpendicular to the doorway shall be permitted to be reduced to 42 inches (1067 mm).*
- 2. Door hardware. Door hardware on doors within the dwelling or sleeping unit, except on entrance doors, shall not be required to comply with Section 404.2.6 (Door Hardware) of ICC A117.1 provided such hardware is readily replaceable without the removal or replacement of the door.*
- 3. Future reversibility for bedroom doors. Bedroom door and frames shall be permitted to be provided with mortised hinge and latch blanks to permit future reversal of the door on the same frame using common hand tools and without further alterations to the door and frame, provided such future swing of the door will not obstruct the maneuvering clearances required at the door or doorway.*
- 4. Flex-closet. Where front approach, pull side maneuvering clearance is required at a manual swinging door per Fig. 404.2.3.1(a) of ICC A117.1, such clearance space may be used for a readily removable storage closet provided that:*
  - 4.1 Such closet is so constructed that the front approach, pull side maneuvering clearance can be restored by removing the closet doors, floor tracks, and shelves using common hand tools and without alterations to the floor or flooring, walls or partitions; and*
  - 4.2. In any dwelling unit or sleeping unit containing a flex-closet, the dwelling unit or sleeping unit must contain the following additional closets:*
    - 4.2.1. An accessible non-flex-closet in each bedroom equivalent to at least one 4 feet (1219 mm) wide by 2 feet 6 inches (762 mm) deep and 5 feet (1524 mm) high or, in an efficiency apartment, at least one such closet; and*

4.2.2. *An accessible non-flex-closet equal in cubic footage to the flex closet that is located outside of bedrooms, kitchen or bathroom.*

5. *Supplemental toilet and bathing facilities. Where on Type A toilet and bathing facility is provided in a Type B unit in accordance with the exception in Section 1107.2.2, the doors and doorways to all other toilet and bathing facilities in that dwelling unit shall not be required to comply with maneuvering clearances, but shall comply with Section 1004.5.2 (User Passage Doorways) of ICC A117.1 and shall provide clear opening width of 32 inches (813 mm) minimum.*

**1107.2.2 Type B unit toilet and bathing facilities in R-2 occupancy.** *Where toilet and bathing facilities are provided in the dwelling unit or sleeping unit, all such toilet and bathing facilities shall comply with Appendix P.*

**Exception for Type A toilet and bathing facility:** *Where at least one toilet and bathing facility in the dwelling or sleeping unit is constructed in accordance with the Type A toilet and bathing facilities requirements of Section 1003.11 (Toilet and Bathing Facilities) of ICC A117.1 and is in compliance with the following:*

1. *At least one lavatory, one water closet and either a bathtub or shower within such toilet or bathing facility shall comply with Section 1003.11 of ICC A117.1. Such toilet and bathing fixtures shall be in a single toilet or bathing area, such that travel between fixtures does not require travel beyond the area in which the fixtures of such toilet or bathing facility are located.*
2. *Toilet paper dispensers within such facilities shall comply with Section 604.10.7 (Dispensers) of ICC A117.1.*
3. *Medicine cabinets, if provided, must include a storage shelf no higher than 44 inches (1118 mm) above the floor.*

*Where at least one toilet and bathing facility complying with Section 1003.11 of ICC A117.1 is provided within the dwelling or sleeping unit, other toilet and bathing facilities shall be*

required to comply only with Sections 1004.3 (Accessible route), 1004.4 (Walking Surfaces), 1004.5.2 (User Passage Doorways), 1004.9 (Operable Parts) and 1004.11.2 (Reinforcement) of ICC A117.1. Doors and doorways to such toilet and bathing facilities shall provide clear opening width of 32 inches (813 mm) minimum.

**1107.2.3 Type B unit kitchen and kitchenette in R-2 occupancy.** Where kitchens and kitchenettes are provided in the dwelling unit or sleeping unit, the primary kitchen or kitchenette shall be constructed in accordance with the kitchen requirements of Section 1003.12 (Kitchen) of ICC A117.1 and Section 1107.2.3.1 through 1107.2.3.4. Secondary kitchens and kitchenettes within the same dwelling unit or sleeping unit shall be required to comply only with Section 1004.12 (Kitchens) of ICC A117.1.

**1107.2.3.1 Kitchen counters.** A kitchen counter that is required to comply with Section 1003.12.3.2 or 1003.12.4.2 (Height) of ICC A117.1 shall be permitted to be adjustable or designed to be replaceable as a unit at variable heights between 29 inches and 36 inches in (737 mm and 914 mm), measured from the floor to the top of the work surface. The owner shall adjust or replace such countertop at the time a person with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense.

**1107.2.3.2 Appliances in kitchen and kitchenette.** Appliances shall comply with Section 1003.12.6 (Appliances) of ICC A117.1.

**Exception:** Where appliances' controls are not in compliance with Section 309.4 (Operation) of ICC A117.1, the owner shall replace such appliances with appliances in conformance with Section 309.4 of ICC A117.1 at the time a person with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense. However, the owner shall not be responsible to provide a particular model or type of appliances provided such appliances and controls complies with Sections 1003.12.6 and 309.4 of ICC A117.1.

**1107.2.3.3 Refrigerator/Freezers.** Combination refrigerators and freezers shall comply with Section 1003.12.6.6 (Refrigerator/Freezers) of ICC A117.1. In addition, where less than 100 percent of storage volume of the freezer is located within 54 inches (1372 mm) maximum above the floor, such freezer shall be a self-defrosting type.

**Exception:** Where refrigerators and freezers are not in compliance with this section, the owner shall replace such appliances with complying appliances at the time a person with physical disabilities takes occupancy of the unit, or within 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense. However, the owner shall not be responsible to provide a particular model or type of appliances provided such appliances comply with this section.

**1107.2.3.4 Kitchen and kitchenette storage.** Kitchen storage, kitchen cabinets, drawers, and shelf storage areas, within kitchen and kitchenette that are required to comply with Section 1003.12 of ICC A117.1 pursuant to Section 1107.2.3, except overhead cabinets, shall comply with Section 905 (Storage Facilities) of ICC A117.1. In addition, at least one storage shelf or cabinet, mounted above work counters at 48 inches (1219 mm) maximum above the floor, shall be provided.

**1107.2.4 Type B unit operable windows in R-2 occupancy.** All operable windows in rooms or spaces in the dwelling unit or sleeping unit shall have operable parts complying with Section 309 (Operable Parts) of ICC A117.1.

**Exception:** Compliance with Section 1107.2.4 is not required in kitchenettes less than 80 square feet (7.4 m<sup>2</sup>) in area and equipped with an accessible mechanical means of ventilation complying with the New York City Mechanical Code, and in bathrooms equipped with an accessible mechanical means of ventilation complying with the New York City Mechanical Code.

**1107.2.5 Type B multi-story units in R-2 occupancy.** Multi-story dwelling or sleeping units shall comply with the following:

1. One of the stories with an accessible entrance shall be designated as the primary entry story to the unit;
2. All rooms, spaces and doors on the primary entry story shall comply with Section 1107.2; and
3. Rooms, spaces or doors located on other than the primary entry story, and interior routes thereto, need not comply with Section 1107.2 where the primary entry story contains equivalent functional facilities.

**Exception:** Functional facilities in compliance with Section 1107.2 may be located on any story within the dwelling or sleeping unit, provided that all rooms, spaces and doors located

*on such story containing such functional facilities comply with Section 1107.2. In addition, a toilet facility complying with Section 1107.2.2 shall be provided on the primary entry story, and one of the following conditions shall be met:*

- 1. An accessible external elevator is provided to connect all such stories of the multi-story dwelling or sleeping unit; or*
- 2. A stairway complying with Section 504 (Stairways) of ICC A117.1 with a minimum clear width of 36 inches (914 mm) is provided within the multi-story dwelling or sleeping unit to connect all such stories of the unit; or*
- 3. An accessible route complying with Section 402 (accessible routes) of ICC A117.1 is provided within the dwelling or sleeping unit to connect all such stories of the unit.*

***1107.2.6 Type B unit raised or sunken floor area in R-2 occupancy.*** *Where a raised or sunken floor area in a portion of a living, dining, or sleeping room within a dwelling or sleeping unit that is permitted by Section 1004.3 (accessible route, Exception 1 and 2) of ICC A117.1 is provided, steps complying with Section 504 (Stairways) of ICC A117.1 with a minimum clear width of 36 inches (914 mm) shall connect such portion of raised or sunken floor area to an accessible route. In addition, a minimum area of 80 square feet (7.4 m<sup>2</sup>), and 8 feet (2438 mm) in one dimension, of each of such living, dining, or sleeping room shall be connected by an accessible route that is in compliance with Section 1004.3.2 (Components) of ICC A117.1.*

***1107.2.7 Type B unit storage facilities in R-2 occupancy.*** *Where storage facilities are provided within the dwelling or sleeping unit, they shall comply with Section 905 (Storage Facilities) of ICC A117.1.*

***1107.2.8 Type B unit laundry equipment in R-2 occupancy.*** *Where washing machines or clothes dryers are provided within the dwelling or sleeping unit, such equipment shall comply with Section 611 (Washing Machines and Clothes Dryers) of ICC A117.1 and shall be front loading. Laundry equipment in accessible common-use area as required in Section 1107.3 shall comply with Section E105.3.*

***Exception:*** *At the option of the owner, laundry equipment conforming to this section within the dwelling or sleeping unit may be provided at the time a person with physical disabilities takes occupancy of the unit, or within ten 10 days of the date the request is made by a person with physical disabilities, whichever is later, at the owner's expense. However, the owner shall not be*

*responsible to provide a particular model or type of equipment provided such equipment complies with this section.*

**1107.3 Accessible spaces.** *Rooms and spaces available to the general public or available for use by residents of Accessible units or Type B units shall be accessible. Accessible spaces shall include, but not be limited to, spaces for residents' use, such as laundry rooms, refuse disposal and storage locations, mailbox areas, recreational facilities, assembly and tenants' meeting rooms, storage rooms, parking areas, toilet and bathing rooms, kitchen, living and dining areas, any exterior spaces, including patios, terraces and balconies, management offices, and stores.*

**1107.4 Accessible route.** *At least one accessible route shall connect accessible building or facility entrances with the required accessible entrance(s) of each Accessible unit and Type B unit within the building or facility and with those exterior and interior spaces and facilities that serve the units.*

**Exceptions:**

- 1. Roof terraces of Type B units above residential occupancies. Roof terraces that are part of Type B units and that are not for public use or common use, located on the floor immediately above enclosed residential occupancies.*
- 2. Other exterior spaces of Type B units. All other exterior spaces, including but not limited to roof terraces, exterior decks, patios or balconies that are part of Type B units, that are not for public use or common use, that have impervious surfaces, and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the unit. Such roof terraces, decks, patios or balconies shall be designed so that accessibility can be readily provided, without modifications to the guard rail heights and structural supports, by the installation of a non-combustible ramp in compliance with Section 405 (Ramps) of ICC A117.1, or a non-combustible level platform, with removable panel for access to floor drainage, that is permeable to weather and in compliance with Section 302 (Floor Surfaces) and Section 303 (Changes in Level) of ICC A117.1.*

**1107.5 Group I.** *Occupancies in Group I shall be provided with accessible features in accordance with Sections 1107.5.1 through 1107.5.5.*

**1107.5.1 Group I-1.** *Group I-1 occupancies shall be provided with accessible features in accordance with Section 1107.5.1.1.*

**1107.5.1.1 Accessible units.** *In Group I-1 occupancies, 100 percent of the dwelling units and sleeping units shall be Accessible units.*

**1107.5.2 Group I-2 Nursing homes.** *Nursing homes of Group I-2 shall be provided with accessible features in accordance with Section 1107.5.2.1.*

**1107.5.2.1 Accessible units.** *In Nursing homes, 100 percent of the dwelling units and sleeping units shall be Accessible units.*

**1107.5.3 Group I-2 Hospitals.** *General-purpose hospitals, psychiatric facilities, detoxification facilities and residential care/assisted living facilities of Group I-2 shall be provided with accessible features in accordance with Section 1107.5.3.1.*

**1107.5.3.1 Accessible units.** *In such Group I-2 facilities, 100 percent of the dwelling units and sleeping units shall be Accessible units.*

**1107.5.4 Group I-2 Rehabilitation facilities.** *In hospitals and rehabilitation facilities of Group I-2 which specialize in treating conditions that affect mobility, or units within either which specialize in treating conditions that affect mobility, 100 percent of the dwelling units and sleeping units shall be Accessible units.*

**1107.5.5 Group I-3.** *Buildings, facilities or portions thereof with Group I-3 occupancies shall comply with Sections 1107.5.5.1 through 1107.5.5.3.*

**1107.5.5.1 Group I-3 sleeping units.** *In occupancies in Group I-3, at least two percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units.*

**1107.5.5.2 Special holding cells and special housing cells or rooms.** *In addition to the units required to be accessible by Section 1107.5.5.1, where special holding cells or special housing cells or rooms are provided, at least one serving each purpose shall be accessible. Cells or rooms subject to this requirement include, but are not limited to, those used for purposes of orientation, protective custody, administrative or disciplinary detention or segregation, detoxification and medical isolation.*

**Exception:** Cells or rooms specially designed without protrusions and that are used solely for purposes of suicide prevention shall not be required to include grab bars.

**1107.5.5.3 Medical care facilities.** Patient sleeping units or cells required to be accessible in medical care facilities shall be provided in addition to any medical isolation cells required to comply with Section 1107.5.5.2.

**1107.6 Group R.** Occupancies in Group R shall be provided with accessible features in accordance with Sections 1107.6.1 through 1107.6.3.

**1107.6.1 Group R-1.** Group R-1 occupancies shall be provided with accessible features in accordance with Sections 1107.6.1.1 through 1107.6.1.3.

**Exception:** Boarding houses, dormitories, fraternity houses and sorority houses shall comply with Section 1107.6.1.4.

**1107.6.1.1 Accessible units.** In occupancies in Group R-1, accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1. All facilities on a site shall be considered to determine the total number of Accessible units. Accessible units shall be dispersed among the various classes of units. Roll-in showers provided in Accessible units shall include a permanently mounted folding shower seat. In addition, required Accessible units in occupancies in group R-1 shall comply with the following:

Where hard wiring of audible and visual smoke detectors and/or carbon monoxide detectors is not required to be provided by Chapter 9, portable smoke and/or carbon monoxide detectors with both audible and visual features shall be available for a minimum of three percent of the total number of dwelling and sleeping units, or fraction thereof, but not fewer than one. Such detectors shall have a flash frequency range of 60 to 120 flashes per minute. Where the average illumination level with motion present is more than 20 lumens per square foot, the visible signaling appliance shall have an effective intensity rating between 100 and 1000 candela. A sign with a minimum height of 3 inches (76 mm) shall be posted at the main desk or other equivalent locations indicating the availability of such detectors.

**TABLE 1107.6.1.1**  
**ACCESSIBLE DWELLING AND SLEEPING UNITS**

<b>TOTAL NUMBER OF UNITS PROVIDED</b>	<b>MINIMUM REQUIRED NUMBER OF ACCESSIBLE UNITS ASSOCIATED WITH ROLL-IN SHOWERS</b>	<b>TOTAL NUMBER OF REQUIRED ACCESSIBLE UNITS</b>
<i>1 to 25</i>	<i>0</i>	<i>1</i>
<i>26 to 49</i>	<i>0</i>	<i>2</i>
<i>50 to 75</i>	<i>1</i>	<i>4</i>
<i>76 to 100</i>	<i>1</i>	<i>5</i>
<i>101 to 149</i>	<i>2</i>	<i>7</i>
<i>150 and over</i>	<i>1% of total*</i>	<i>5% of total*</i>

*\* Where determination by percentage results in a number containing a decimal of 0.5 or more, the next higher number shall be used.*

**1107.6.1.2 Type B units.** *In structures with four or more dwelling or sleeping units intended to be occupied as a residence, every dwelling and sleeping unit intended to be occupied as a residence shall be a Type B unit.*

**Exceptions:**

1. *The number of Type B units is permitted to be reduced in accordance with Section 1107.7.*
2. *Compliance with Sections 1107.2.1 through 1107.2.8 is not required.*

**1107.6.1.3 Doors and doorways.** *Entrances, doors, and doorways providing user passage into and within units that are not required to comply with Accessible units' requirements shall comply with Section 404.2.2 (Clear Width) of ICC A117.1.*

**1107.6.1.4 Boarding houses, dormitories, fraternity houses and sorority houses.** *Accessible units and Type B dwelling units and sleeping units shall be provided in boarding houses, dormitories, fraternity houses and sorority houses in accordance with Sections 1107.6.1.4.1 and 1107.6.1.4.2.*

**1107.6.1.4.1 Accessible units.** *Accessible dwelling units and sleeping units shall be provided in accordance with Table 1107.6.1.1.*

**1107.6.1.4.2 Type B units.** *Every dwelling unit and every sleeping unit not required to be accessible shall be a Type B unit and shall comply with Section 1107.2, and Sections 1107.2.1 through 1107.2.8, regardless of intent to occupy such unit as a residence.*

**Exception:** *The number of Type B units is permitted to be reduced in accordance with Section 1107.7.*

**1107.6.2 Group R-2.** *Accessible units and Type B units shall be provided in occupancies in Group R-2 in accordance with Section 1107.6.2.1.*

**1107.6.2.1 Apartment houses, monasteries and convents.** *Type B units shall be provided in apartment houses, monasteries and convents in accordance with Section 1107.6.2.1.1.*

**1107.6.2.1.1 Type B units.** Every dwelling unit and sleeping unit, regardless of intent to occupy such unit as a residence, shall be a Type B unit and shall comply with Section 1107.2, and Sections 1107.2.1 through 1107.2.8.

**Exception:** The number of Type B units is permitted to be reduced in accordance with Section 1107.7.

**1107.6.3 Group R-3.** In occupancies in Group R-3 where there are four or more dwelling units or sleeping units intended to be occupied as a residence in a single structure, every dwelling and sleeping unit intended to be occupied as a residence shall be a Type B unit.

**Exceptions:**

1. The number of Type B units is permitted to be reduced in accordance with Section 1107.7.
2. Compliance with Sections 1107.2.1 through 1107.2.8 is not required.

**1107.7 General exceptions.** Where specifically permitted by Section 1107.6, the required number of Type B units is permitted to be reduced in accordance with Sections 1107.7.1 through 1107.7.3.

**1107.7.1 Buildings without elevator service.** Where no elevator service is provided in a building, only the dwelling and sleeping units that are located on stories indicated in Sections 1107.7.1.1 and 1107.7.1.2 are required to be Type B units.

**1107.7.1.1 One story with Type B units required.** For occupancies in other than Group R-2, at least one story containing dwelling units or sleeping units intended to be occupied as a residence shall be provided with an accessible entrance from the exterior of the building and all units intended to be occupied as a residence on that story shall be Type B units. Occupancies in Group R-2 shall comply with the following:

1. Cellar, basement, or first story. For occupancies in Group R-2, in buildings where the lowest story containing dwelling or sleeping units is the cellar, basement, or first floor, at least one such story containing dwelling or sleeping units, regardless of intent to occupy as a residence, shall be provided with an accessible entrance and all units on that story, regardless of intent to occupy as a residence, shall be Type B units.

2. *Second story or higher. For occupancies in Group R-2, in structures where the lowest story containing dwelling or sleeping units is the second story or higher, at least one story containing dwelling or sleeping units intended to be occupied as a residence shall be provided with an accessible entrance from the exterior of the building and all units intended to be occupied as a residence on that story shall be Type B units. Notwithstanding the foregoing, Type B units shall not be required in such structures that contain only multi-story dwelling or sleeping units and shall not be required in such structures that contain fewer than four dwelling or sleeping units.*

**1107.7.1.2 Other stories with Type B units required.** *If other stories containing dwelling or sleeping units intended to be occupied as a residence are served by a building entrance that is in proximity to arrival points as indicated in Items 1 and 2, such building entrance shall be accessible and all dwelling units and sleeping units intended to be occupied as a residence served by that entrance on that story shall be Type B units.*

1. *Where the slopes of the undisturbed site measured between the planned entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less, and*
2. *Where the slopes of the planned finished grade measured between the entrance and all vehicular or pedestrian arrival points within 50 feet (15 240 mm) of the planned entrance are 10 percent or less.*

*Where no such arrival points are within 50 feet (15 240 mm) of the entrance, the closest arrival point shall be used unless that arrival point serves the story required by Section 1107.7.1.1.*

**1107.7.2 Multistory units in Occupancy Group R-3.** *A multistory dwelling or sleeping unit which is not provided with elevator service is not required to be a Type B unit. Where a multistory unit is provided with external elevator service to only one floor, the floor provided with elevator service shall be the primary entry to the unit, shall comply with the requirements for a Type B unit and a toilet facility shall be provided on that floor.*

**1107.7.3 Elevator service to the lowest story with units.** *Where elevator service in the building is provided for the sole purpose of complying with the provisions of Section 1107.7.1.1 to serve as an*

*accessible route only to the lowest story containing dwelling or sleeping units intended to be occupied as a residence, only the units intended to be occupied as a residence on the lowest story served by the elevator are required to be Type B units.*

**SECTION BC 1108**  
**SPECIAL OCCUPANCIES**

**1108.1 General.** *In addition to the other requirements of this chapter and applicable provisions of Appendices E and N, the requirements of Sections 1108.2 through 1108.4 shall apply to specific occupancies.*

**1108.2 Assembly area seating.** *Assembly areas with seating shall comply with 1108.2.1 through 1108.2.8. Dining areas shall comply with 1108.2.9.*

**1108.2.1 Services.** *Services and facilities provided in areas not required to be accessible in Section 1108.2.9 shall be provided on an accessible level and shall be accessible.*

**1108.2.2 Wheelchair spaces.** *In theaters, bleachers, grandstands, stadiums, arenas and other assembly areas, accessible wheelchair spaces, companion seats, and designated aisle seats complying with ICC A117.1 including Section 802 (Assembly Areas) shall be provided in accordance with Sections 1108.2.2.1 through 1108.2.2.3. Required accessible wheelchair spaces and their companion seats as required in Section 1108.2.5 shall be delineated on the approved seating plans. Such spaces and seats which are unsold one day (24 hours) before the event shall be permitted to be released for sale to the public, including persons without physical disabilities.*

**1108.2.2.1 General Seating.** *Wheelchair spaces shall be provided in accordance with Table 1108.2.2.1.*

**TABLE 1108.2.2.1  
ACCESSIBLE WHEELCHAIR SPACES**

<b>CAPACITY OF SEATING IN ASSEMBLY AREAS</b>	<b>MINIMUM REQUIRED NUMBER OF WHEELCHAIR SPACES</b>
4 to 25	1
26 to 50	2
51 to 100	4
101 to 300	5
301 to 500	6
501 to 5,000	6, plus 1 for each 150, or fraction thereof, between 501 through 5,000
5,001 and over	36 plus 1 for each 200, or fraction thereof, over 5,000

**1108.2.2.2 Luxury boxes, club boxes and suites.** *In each luxury box, club box, and suite within arenas, stadiums and grandstands, wheelchair spaces shall be provided in accordance with Table 1108.2.2.1.*

**1108.2.2.3 Other boxes.** *In boxes other than those required to comply with Section 1108.2.2.2, the total number of wheelchair spaces provided shall be determined in accordance with Table 1108.2.2.1. Wheelchair spaces shall be located in not less than 20 percent of all boxes provided.*

**1108.2.3 Integration.** *Wheelchair spaces shall be an integral part of the seating plan.*

**1108.2.4 Dispersion of wheelchair spaces.** *Dispersion of wheelchair spaces shall be based on the availability of accessible routes to various seating areas including seating at various levels in multilevel facilities.*

**1108.2.4.1 Multilevel assembly seating areas.** *In multilevel assembly seating areas, wheelchair spaces shall be provided on the main floor level and on each additional floor or mezzanine levels. Wheelchair spaces shall be provided in each luxury box, club box and suite within assembly facilities*

**Exceptions:**

- 1. In multilevel assembly spaces utilized for worship services, where the second floor or mezzanine level contains 25 percent or less of the total seating capacity, all wheelchair space clusters shall be permitted to be located on the main level.*
- 2. In multilevel assembly seating where the second floor or mezzanine level provides 25 percent or less of the total seating capacity and 300 or fewer seats, wheelchair space clusters shall be permitted to all be located on the main level.*

**1108.2.5 Companion seating.** *At least one companion seat complying with ICC A117.1 including Section 802.7 (Companion Seat) shall be provided for each wheelchair space required by Section 1108.2.2.*

**1108.2.6 Designated aisle seats.** *At least five percent, but not less than one, of the total number of aisle seats provided shall be designated aisle seats and shall comply with ICC A117.1 including Section 802.8 (Designated Aisle Seats).*

**1108.2.7 Assistive listening systems.** *Each assembly area where audible communications are integral to the use of the space shall have an assistive listening system in compliance with ICC A117.1 including Section 706 (Assistive Listening System) and Appendix N of this code.*

**Exception:** *Other than in courtrooms, an assistive listening system is not required where there is no audio amplification system.*

**1108.2.7.1 Receivers.** *Receivers shall be provided for assistive listening system in accordance with Table 1108.2.7.1. All receivers shall be hearing aid compatible.*

**TABLE 1108.2.7.1  
RECEIVERS FOR ASSISTIVE LISTENING SYSTEMS**

<b>CAPACITY OF SEATING IN ASSEMBLY AREAS</b>	<b>MINIMUM REQUIRED NUMBER OF RECEIVERS</b>	<b>MINIMUM NUMBER OF RECEIVERS TO BE HEARING-AID COMPATIBLE</b>
50 or less	2	2
51 to 200	2, plus 1 per 25 seats over 50 seats*	2
201 to 500	2, plus 1 per 25 seats over 50 seats.*	1 per 4 receivers*
501 to 1,000	20, plus 1 per 33 seats over 500 seats*	1 per 4 receivers*
1,001 to 2,000	35, plus 1 per 50 seats over 1,000 seats*	1 per 4 receivers*
Over 2,000	55, plus 1 per 100 seats over 2,000 seats*	1 per 4 receivers*

NOTE: \* = or fraction thereof

**1108.2.7.2 Public Address systems.** Where stadiums, arenas and grandstands provide audible public announcements, they shall also provide equivalent text information regarding events and facilities in compliance with Sections 1108.2.7.2.1 and 1108.2.7.2.2

**1108.2.7.2.1 Prerecorded text messages.** Where electronic signs are provided and have the capability to display prerecorded text messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.

**Exception:** Announcements that cannot be prerecorded in advance of the event shall not be required to be displayed.

**1108.2.7.2.2 Real-time messages.** Where electronic signs are provided and have the capability to display real-time messages containing information that is the same, or substantially equivalent, to information that is provided audibly, signs shall display text that is equivalent to audible announcements.

**1108.2.8 Performance areas.** An accessible route shall directly connect the performance area to the assembly seating area where a circulation path directly connects a performance area to an assembly seating area. An accessible route shall be provided from performance areas to ancillary areas or facilities used by performers.

**1108.2.9 Dining Areas.** In dining areas, the total floor area allotted for seating and tables shall be accessible.

**Exceptions:**

1. In buildings or facilities not required to provide an accessible route between levels as described in Section 1104.4 Exception 1, an accessible route to a mezzanine seating area is not required, provided that the mezzanine contains less than 33 percent of the total seating area and the same services are provided in the accessible area.
2. In sports facilities, tiered dining areas providing seating required to be accessible shall be required to have accessible routes serving at least 25 percent of the dining area, provided that accessible routes serve accessible seating and where each tier is provided with the same services and similar view

**1108.2.9.1 Dining surfaces.** *Where dining surfaces for the consumption of food or drink are provided, at least five percent, but not less than one, of the seating\_and standing spaces at the dining surfaces shall be accessible and be distributed throughout the facility.*

**Exception:** *Where food or drink is served at counters exceeding 34 inches (864 mm) in height, such dining surfaces shall not be required to comply with Section 1108.2.9.1 provided equivalent service is available at accessible tables or counters that are in compliance with Section 902 (Dining Surfaces and Work Surfaces) of ICC A117.1 within the same dining area.*

**1108.3 Self-service storage facilities.** *Self-service storage facilities shall provide accessible individual self-storage spaces in compliance with Section 1104 of this code and ICC A117.1 including Section 905 (Storage Facilities). The number of required self-storage spaces shall be in accordance with Table 1108.3.*

**TABLE 1108.3  
ACCESSIBLE SELF-SERVICE STORAGE FACILITIES**

<b>TOTAL SPACES IN FACILITY</b>	<b>MINIMUM NUMBER OF REQUIRED ACCESSIBLE SPACES</b>
1 to 200	5%, but not less than 1
Over 200	10, plus 2% of total number of units over 200

**1108.3.1 Dispersion.** Accessible individual self-service storage spaces shall be dispersed throughout the various classes of spaces provided. Where more classes of spaces are provided than the number of required accessible spaces, the number of accessible spaces shall not be required to exceed that required by Table 1108.3. Accessible spaces are permitted to be dispersed in a single building of a multibuilding facility.

**1108.4 Judicial facilities.** Judicial facilities shall comply with Sections 1108.4.1 through 1108.4.3.

**1108.4.1 Courtrooms.** Each courtroom shall comply with ICC A117.1 including Section 807 (Courtrooms).

**1108.4.2 Holding cells.** Where provided, central holding cells and court-floor holding cells shall comply with Sections 1108.4.2.1 and 1108.4.2.2.

**1108.4.2.1 Central holding cells.** Where separate central holding cells are provided for adult males, juvenile males, adult females or juvenile females, one of each type shall be accessible. Where central holding cells are provided and are not separated by age or sex, at least one accessible cell shall be provided.

**1108.4.2.2 Court-floor holding cells.** Where separate court-floor holding cells are provided for males, juvenile males, adult females or juvenile females, each courtroom shall be served by one accessible cell of each type. Where court-floor holding cells are provided and are not separated by age or sex, courtrooms shall be served by at least one accessible cell. Accessible cells shall be permitted to serve more than one courtroom.

**1108.4.3 Visiting areas.** Visiting areas shall comply with Sections 1108.4.3.1 and 1108.4.3.2.

**1108.4.3.1 Cubicles and counters.** At least five percent, but not fewer than one, of cubicles shall be accessible on both the visitor and detainee sides. Where counters are provided, at least one shall be accessible on both the visitor and detainee sides.

**Exception:** This requirement shall not apply to the detainee side of cubicles or counters at noncontact visiting areas not serving holding cells.

**1108.4.3.2 Partitions.** Where solid partitions or security glazing separate visitors from detainees, at least one of each type of cubical or counter partition shall be accessible.

**SECTION BC 1109**  
**OTHER FEATURES AND FACILITIES**

**1109.1 General.** Accessible building features and facilities shall be provided in accordance with 1109.2 through 1109.15.

**Exception:** Type B dwelling and sleeping units shall comply with Section 1107 and ICC A117.1.

**1109.2 Toilet and bathing facilities.** Toilet rooms and bathing facilities shall be accessible. Where a floor level is not required to be connected by an accessible route, the only toilet rooms or bathing facilities provided within the facility shall not be located on the in accessible floor. At least one of each type of fixture, element, control or dispenser in each accessible toilet room and bathing facility shall be accessible.

**Exceptions:**

1. In non-residential occupancies, for toilet rooms or bathing facilities accessed only through a private office, not for common or public use, and intended for use by a single occupant of such private office, any of the following alternatives are allowed:
  - 1.1 Doors are permitted to swing into the clear floor space provided the door swing can be reversed to meet requirements in Section 603.2.3 (Door Swing) of ICC A117.1; and
  - 1.2 The height requirements for the water closet in Section 604.4 (Height) of ICC A117.1 are not applicable; and
  - 1.3 Grab bars are not required to be installed in a toilet room, provided that the reinforcement has been installed in the walls and located so as to permit the installation of such grab bars; and
  - 1.4 The requirement for height, knee and toe clearance shall not apply to a lavatory.
2. This section is not applicable to dwelling units, sleeping units and patient toilet and bathing facilities that are not required to be accessible by Section 1107.

3. *Where multiple single-user toilet rooms or bathing facilities are clustered to be within sight of, or adjacent to one another at a single location and contain fixtures in excess of the minimum required number of plumbing fixtures, at least five percent, but not less than one room for each use at each cluster, shall be accessible.*
4. *Where no more than one urinal is provided in a toilet room or bathing facility, the urinal is not required to be accessible.*
5. *Toilet rooms that are part of critical-care or intensive-care patient sleeping rooms are not required to be accessible.*

**1109.2.1 Unisex toilet and bathing rooms.** *In assembly and mercantile occupancies, an accessible unisex toilet room shall be provided where an aggregate of six or more male and female water closets is required. In buildings of mixed occupancy, only those water closets required for the assembly or mercantile occupancy shall be used to determine the unisex toilet room requirement. In recreational facilities where separate-sex bathing rooms are provided, an accessible unisex bathing room shall be provided. Fixtures located within unisex toilet and bathing rooms may be included in determining the number of fixtures provided in an occupancy.*

**Exception:** *Where each separate-sex bathing room has only one shower or bathtub fixture, a unisex bathing room is not required.*

**1109.2.1.1 Standard.** *Unisex toilet and bathing rooms shall comply with Sections 1109.2.1.2 through 1109.2.1.7 and ICC A117.1.*

**1109.2.1.2 Unisex toilet rooms.** *Unisex toilet rooms shall include only one water closet and only one lavatory. A unisex bathing room in accordance with 1109.2.1.3 shall be considered a unisex toilet room.*

**Exception:** *A urinal is permitted to be provided in addition to the water closet in a unisex toilet room.*

**1109.2.1.3 Unisex bathing rooms.** *Unisex bathing rooms shall include only one shower or bathtub fixture. Unisex bathing rooms shall also include one water closet and one lavatory. Where*

*storage facilities are provided for separate-sex bathing rooms, accessible storage facilities complying with Section 1109.8 shall be provided for unisex bathing rooms.*

**1109.2.1.4 Location.** *Unisex toilet and bathing rooms shall be located on an accessible route. Unisex toilet rooms shall be located not more than one story above or below separate-sex toilet rooms. The accessible route from any separate-sex toilet room to a unisex toilet room shall not exceed 500 feet (152 m).*

**1109.2.1.5 Prohibited location.** *In passenger transportation facilities and airports, the accessible route from separate-sex toilet rooms to a unisex toilet room shall not pass through security checkpoints.*

**1109.2.1.6 Clear floor space.** *Where doors swing into a unisex toilet or bathing room, a clear floor space not less than 30 inches by 48 inches (762 mm by 1219 mm) shall be provided, within the room, beyond the area of the door swing.*

**1109.2.1.7 Privacy.** *Doors to unisex toilet and bathing rooms shall be securable from within the room.*

**1109.2.2 Water closet compartment.** *Where water closet compartments are provided in a toilet room or bathing facility, at least one wheelchair-accessible compartment shall be provided. Where the combined total water closet compartments and urinals provided in a toilet room or bathing facility is six or more, at least one ambulatory-accessible water closet compartment shall be provided in addition to the wheelchair-accessible compartment. Wheelchair-accessible and ambulatory-accessible compartments shall comply with ICC A117.1 including Section 604.8 (Wheelchair Accessible Compartments) and 604.9 (Ambulatory Accessible Compartments).*

**1109.3 Sinks.** *Where sinks are provided, at least five percent, but not less than one, provided in accessible spaces shall comply with ICC A117.1 including Section 606 (Lavatories and Sinks).*

**Exception:** *Mop or service sinks are not required to be accessible.*

**1109.4 Kitchens, kitchenettes and wet bars.** *Where kitchen, kitchenettes and wet bars not located within dwelling or sleeping units, are provided in accessible spaces or rooms, they shall be accessible in accordance with ICC A117.1 including Section 804 (Kitchens and Kitchenettes).*

**1109.5 Drinking Fountains.** *On floors where drinking fountains are provided, at least 50 percent, but not less than one fountain, shall be accessible.*

**1109.6 Elevators.** *Passengers elevators on an accessible route shall be accessible and comply with 3001.3.*

**1109.6.1 Limited-Use/Limited Application (LULA) elevators.** *LULA elevators shall comply with Section 408 (Limited-Use/Limited Application Elevator) of ICC A117.1 and with Part XXV of ASME A17.1 and shall be limited to a maximum rise of not more than 25 feet (7620 mm). In new construction, such LULA elevators shall be permitted to be a part of the required accessible route:*

1. *Where the total floor area of the entire building is less than 10,000 square feet (929 m<sup>2</sup>) provided such LULA elevator serves not more than three contiguous floors and elevators are not otherwise required by Chapter 30; or*
2. *Where either a wheelchair lift complying with Section 1109.7 is permitted or a private residence elevator complying with Section 409 (Private Residence Elevators) of ICC A117.1 is permitted; or*
3. *In houses of worship.*

**1109.7 Lifts.** *Platform (wheelchair) lifts shall not be a part of a required accessible route in new construction except as indicated in Items 1 through 6. Platform (wheelchair) lifts shall be installed in accordance with Chapter 30 and ASME A18.1. Platform (wheelchair) lifts are permitted to be part of a required accessible route in new construction as follows:*

1. *An accessible route to a performing area in occupancies in Group A.*
2. *An accessible route to wheelchair spaces required to comply with the wheelchair space dispersion requirements of Section 1108.2.2 through 1108.2.4.*
3. *An accessible route to spaces that are not open to the general public with an occupant load of not more than five.*
4. *An accessible route as permitted in Section 1107.2.5 within a dwelling or sleeping unit.*

5. *An interior accessible route to raised judges' benches, clerks' stations, jury boxes, witness stands and other raised or depressed areas in a court.*
6. *An accessible route where existing exterior site constraints make use of a ramp or elevator infeasible as determined by the commissioner pursuant to the rules of the department.*

**1109.8 Storage.** *Where fixed or built-in storage elements such as cabinets, shelves, medicine cabinets, closets, and drawers are provided in required accessible spaces, at least one of each type shall contain storage space complying with ICC A117.1.*

**1109.8.1 Lockers.** *Where lockers are provided in accessible spaces, at least five percent, but not less than one, of each type shall be accessible.*

**1109.8.2 Shelving and display units.** *Self-service shelves and display units shall be located on an accessible route. Such shelving and display units shall not be required to comply with reach-range provisions.*

**1109.8.3 Coat hooks and folding shelves.** *Where coat hooks and folding shelves are provided in toilet rooms, toilet compartments, or in dressing, fitting or locker rooms, at least one of each type shall be provided in accessible toilet rooms without toilet compartment, accessible toilet compartments, and accessible dressing, fitting and locker rooms.*

**1109.9 Detectable warnings.** *Detectable warnings shall be provided where required in Sections 1109.9.1 through 1109.9.5.*

**1109.9.1 Detectable warnings at passenger transit platforms.** *Passenger transit platform edges bordering a drop-off and not protected by platform screens or guards shall have a detectable warning.*

**Exception:** *Detectable warnings are not required at bus stops.*

**1109.9.2 Detectable warnings at hazardous vehicular areas.** *If a walk crosses or adjoins a vehicular way, and the walking surfaces are not separated by curbs, railings, or other elements between the pedestrian areas and vehicular areas, the boundary between the areas shall be defined by a continuous detectable warning which is 36 inches (914 mm) wide.*

**1109.9.3 Detectable warnings at pools.** *The edges of pools shall be provided with detectable warnings.*

**1109.9.4 Detectable warnings at curb ramps.** A curb ramp shall have a detectable warning. The detectable warning shall extend the full width and depth of the curb ramp.

**1109.9.5 Detectable warnings at other locations.** Detectable warnings shall be located at hazardous locations on floors, doors, and stairs. Doors that lead to areas that might prove hazardous to a person who is blind, including, but not limited to, doors to leading platforms, boiler rooms, and stages, shall be made identifiable to the touch by a textured surface on the door handle, knob, pull or other operating hardware. This textured surface may be made by knurling or roughening or by material applied to the contact surface. Such textured surfaces shall not be provided for emergency exit doors or any doors other than those too hazardous areas.

**1109.10 Assembly area seating.** Assembly areas in every occupancy shall comply with 1108.2 for accessible seating and assistive listening devices.

**1109.11 Seating at tables, counters and work surfaces.** Where seating at fixed or built-in tables, counters or work surfaces is provided in accessible spaces, at least five percent of the seating, but not less than one, shall be accessible. In Group I-3 occupancy visiting areas at least five percent, but not less than one, cubical or counter shall be accessible on both the visitor and detainee sides.

**Exceptions:**

1. Check-writing surfaces at check-out aisles not required to comply with Section 1109.12.2 are not required to be accessible.
2. In Group I-3 occupancies, the counter or cubicle on the detainee side is not required to be accessible at noncontact visiting areas or in areas not serving accessible holding cells or sleeping units.

**1109.11.1 Dispersion.** Accessible fixed or built-in seating at tables, counters or work surfaces shall be distributed throughout the space or facility containing such elements.

**1109.12 Service facilities.** Customer service facilities shall provide for accessible features in accordance with 1109.12.1 through 1109.12.5.

**1109.12.1 Dressing, fitting and locker rooms.** Where dressing rooms, fitting rooms, or locker rooms are provided, at least five percent, but not less than one, of each type of use in each cluster provided shall be accessible.

**1109.12.2 Check-out aisles.** Where check-out aisles are provided, accessible check-out aisles shall be provided in accordance with Table 1109.12.2. Where check-out aisles serve different functions, at least one accessible check-out aisle shall be provided for each function. Where check-out aisles serve different functions, accessible check-out aisles shall be provided in accordance with Table 1109.12.2 for each function. Where check-out aisles are dispersed throughout the building or facility, accessible check-out aisles shall also be dispersed. Traffic control devices, security devices and turnstiles located in accessible check-out aisles or lanes shall be accessible.

**Exception:** Where the area of the selling space is less than 5,000 square feet (465 m<sup>2</sup>), only one check-out aisle is required to be accessible.

**TABLE 1109.12.2  
ACCESSIBLE CHECK-OUT AISLES**

<b>TOTAL CHECK-OUT AISLES OF EACH FUNCTION</b>	<b>MINIMUM NUMBER OF ACCESSIBLE CHECK-OUT AISLES OF EACH FUNCTION</b>
1 to 4	1
5 to 8	2
9 to 15	3
Over 15	3, plus 20% of additional aisles

**1109.12.3 Point of sales and service counters.** Where counters are provided for sales or distribution of goods or services, at least one of each type provided shall be accessible. Where such counters are dispersed throughout the building or facility, the accessible counters shall also be dispersed.

**1109.12.4 Food service lines.** Food service lines shall be accessible. Where self-service shelves are provided, at least 50 percent, but not less than one, of each type provided shall be accessible.

**1109.12.5 Queue and waiting lines.** Queue and waiting lines servicing accessible counters or check-out aisles shall be accessible.

**1109.13 Controls, operating mechanisms and hardware.** Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation, and electrical convenience outlets, in accessible spaces, along accessible routes or as parts of accessible elements shall be accessible.

**Exceptions:**

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be accessible.
2. Electrical or communication receptacles serving a dedicated use shall not be required to be accessible.
3. Where two or more outlets are provided in a kitchen above a length of countertop that is uninterrupted by a sink or appliance, one outlet shall not be required to be accessible.
4. Floor electrical receptacles shall not be required to be accessible.
5. HVAC diffusers shall not be required to be accessible.
6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be accessible.

**1109.13.1 Operable windows.** Where operable windows are provided in rooms or spaces that are required to be accessible in accordance with 1107.5.1 through 1107.5.4 and 1107.6.1.1, at least one window in each room shall be accessible and each required operable window shall be accessible.

Where operable windows are provided in Type B units in accordance with Section 1107.6.2, such windows shall comply with Section 1107.2.4.

**Exception:** Accessible windows are not required in bathrooms or kitchens unless otherwise required in Section 1107.2.4.

**1109.14 Recreational facilities.** Recreational facilities shall be accessible.

**1109.15 Stairways.** Stairways located alongside accessible routes connecting floor levels that are not connected by an elevator shall be designed and constructed to comply with ICC A117.1 and Chapter 10.

## **SECTION BC 1110**

### **SIGNAGE**

**1110.1 Signs.** Required accessible elements shall be identified by the International Symbol of Accessibility at the following locations:

1. Accessible parking spaces required by Section 1106.1 except where the total number of parking spaces provided is no more than one.
2. Accessible passenger loading zones.
3. Accessible areas of rescue assistance required by Section 1007.6.
4. Accessible rooms where multiple single-user toilet or bathing rooms are clustered at a single location.
5. Accessible entrances where not all entrances are accessible.
6. Accessible check-out aisles where not all aisles are accessible. The sign, where provided, shall be above the check-out aisle in the same location as the check-out aisle number or type of check-out identification.
7. Unisex toilet and bathing rooms.
8. Accessible dressing, fitting and locker rooms where not all such rooms are accessible.

9. Accessible seating.

10. Accessible portable toilets.

11. Public telephones.

**1110.2 Directional signage.** Directional signage indicating the route to the nearest like accessible element shall be provided at the following locations. These directional signs shall include the International Symbol of Accessibility:

1. In accessible building entrances.

2. In accessible public toilets and bathing facilities.

3. Elevators not serving an accessible route.

4. At each separate-sex toilet and bathing room indicating the location of the nearest accessible unisex toilet or bathing room where provided in accordance with Section 1109.2.1.

5. At exits and elevators serving an accessible space, but not providing an approved accessible means of egress, signage shall be provided in accordance with Section 1007.7.

**1110.3 Other signs.** Signage indicating special accessibility provisions shall be provided as follows:

1. Each assembly area required to comply with Section 1108.2.7 shall provide a sign notifying patrons of the availability of assistive listening systems.

**Exception:** Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.

3. *At areas of rescue assistance, signage shall be provided in accordance with Sections 1007.6.3 through 1007.6.5.*
  
4. *At exterior areas for assisted rescue, signage shall be provided in accordance with Section 1007.8.3.*

**CHAPTER 12**  
**INTERIOR ENVIRONMENT**

**SECTION BC 1201**  
**GENERAL**

**1201.1 Scope.** *The provisions of this chapter shall govern ventilation, temperature control, lighting, yards and courts, sound transmission, room dimensions, surrounding materials and rodent proofing associated with the interior spaces of buildings.*

**SECTION BC 1202**  
**DEFINITIONS**

**1202.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**HABITABLE SPACE.** *All rooms and spaces within a dwelling unit in group R or I-1, including bedrooms, living rooms, studies, recreation rooms, kitchens, dining rooms, and other similar spaces.*

**Exception:** *The following spaces within a dwelling unit shall not be considered habitable spaces:*

1. *A dining space 55 square feet (5.1 m<sup>2</sup>) or less located off a living room, foyer, or kitchen;*
2. *A kitchenette;*
3. *A bathroom or toilet room;*
4. *A laundry room;*
5. *A corridor, passageway, or private hall; and a foyer used as an entrance hall in a dwelling unit: not exceeding 10 percent of the total floor area of the dwelling unit; or not exceeding 20 percent of the floor area of the dwelling unit where every habitable room is at least 20 percent larger than the required minimum room sizes established by the New York City Housing Maintenance Code.*

**KITCHEN.** *A room with 80 square feet (7.4 m<sup>2</sup>) or more of floor area which is intended, arranged, designed or used for cooking or warming of food.*

**KITCHENETTE.** A space with less than 80 square feet (7.4 m<sup>2</sup>) of floor area which is intended, arranged, designed or used for cooking or warming of food.

**OCCUPIABLE SPACE.** A room or enclosed space, other than a habitable space, designed for human occupancy or use in which individuals may remain for a period of time for rest, amusement, treatment, education, dining, shopping, employment, labor or other similar purposes.

**THERMALLY ISOLATED SUNROOM ADDITION.** A one-story addition added to an existing building with a glazed area in excess of 40 percent of the gross area of its exterior walls and roof, with a separation of conditioned spaces, between such addition and a dwelling unit, consisting of existing or new wall(s), doors and/or windows.

### **SECTION BC 1203**

#### **VENTILATION**

**1203.1 General.** Buildings shall be provided with natural ventilation in accordance with Section 1203.4, and/or mechanical ventilation in accordance with the New York City Mechanical Code. All habitable spaces shall be provided with natural ventilation in accordance with Section 1203.4.

**1203.2 Attic spaces.** Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof framing members shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain and snow. Blocking and bridging shall be arranged so as not to interfere with the movement of air. A minimum of 1 inch (25 mm) of airspace shall be provided between the insulation and the roof sheathing. The net free ventilating area shall not be less than <sup>1</sup>/<sub>150</sub> of the area of the space ventilated, with 50 percent of the required ventilating area provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above eave or cornice vents with the balance of the required ventilation provided by eave or cornice vents.

**Exception:** The minimum required net free ventilating area shall be <sup>1</sup>/<sub>300</sub> of the area of the space ventilated, provided a vapor retarder having a transmission rate not exceeding 1 perm in accordance with ASTM E 96 is installed on the warm side of the attic insulation and provided 50 percent of the required ventilating area provided by ventilators located in the upper portion of the space to be ventilated at least 3 feet (914 mm) above eave or cornice vents, with the balance of the required ventilation provided by eave or cornice vents.

**1203.2.1 Openings into attic.** Exterior openings into the attic space of any building intended for human occupancy shall be covered with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material that will prevent the entry of birds, squirrels, rodents, snakes and other similar creatures. The openings therein shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm). Where combustion air is obtained from an attic area, it shall be in accordance with Chapter 7 of the New York City Mechanical Code.

**1203.3 Under-floor ventilation.** The space between the bottom of the floor joists and the earth under any building except spaces occupied by a basement or cellar shall be provided with ventilation openings through foundation walls or exterior walls. Such openings shall be placed so as to provide cross ventilation of the under-floor space.

**1203.3.1 Openings for under-floor ventilation.** The minimum net area of ventilation openings shall not be less than 1 square foot for each 150 square feet (0.09 m<sup>2</sup> for each 13.9m<sup>2</sup>) of crawl-space area. Ventilation openings shall be covered for their height and width with any of the following materials, provided that the least dimension of the covering shall not exceed 1/4 inch (6.4 mm):

1. Perforated sheet metal plates not less than 0.070 inch (1.8 mm) thick.
2. Expanded sheet metal plates not less than 0.047 inch (1.2 mm) thick.
3. Cast-iron grills or gratings.
4. Extruded load-bearing vents.
5. Hardware cloth of 0.035 inch (0.89 mm) wire or heavier.
6. Corrosion-resistant wire mesh, with the least dimension not exceeding 1/8 inch (3.2 mm).

**1203.3.2 Exceptions.** The following are exceptions to Sections 1203.3 and 1203.3.1:

1. Where warranted by climatic conditions, ventilation openings to the outdoors are not required if ventilation openings to the interior are provided.
2. The total area of ventilation openings is permitted to be reduced to 1/1,500 of the under-floor area where the ground surface is treated with an approved vapor retarder material and the required openings are placed so as to provide cross ventilation of the space. The installation of

*operable louvers, in accordance with Section 1203.3.1, shall not be prohibited.*

3. *Ventilation openings are not required where continuously operated mechanical ventilation is provided at a rate of 1.0 cubic foot per minute (cfm) for each 50 square feet (1.02 L/s for each 10 m<sup>2</sup>) of crawl-space floor area and the ground surface is covered with an approved vapor retarder.*
4. *Ventilation openings are not required when the ground surface is covered with an approved vapor retarder, the perimeter walls are insulated and the space is conditioned in accordance with the New York State Energy Conservation Construction Code.*
5. *For buildings in areas of special flood hazard, the openings for under-floor ventilation shall comply with Appendix G.*

**1203.4 Natural ventilation.** *Natural ventilation of occupiable and habitable space shall be through openings to the outdoors. The openings shall be of a type permitted under Sections 1203.4.1.1, 1203.4.1.2, 1203.4.1.3 and 1203.4.1.4. The operating mechanism for such openings shall be provided with ready access so that the openings are readily controllable by the building occupants.*

**1203.4.1 Ventilation area required.** *Ventilation areas shall be as set forth in Sections 1203.4.1.1 through 1203.4.1.4.*

**1203.4.1.1 Occupiable spaces.** *Where occupiable spaces are not required to be provided with mechanical ventilation in accordance with the New York City Mechanical Code, natural ventilation shall be provided in accordance with Section 1203.4.1.1. Openings providing required natural ventilation to occupiable spaces shall be windows, doors, louvers, skylights, or other similar ventilating openings.*

**Exceptions:**

1. *Bathrooms and toilet rooms in R or I-1 occupancies shall comply with Section 1203.4.1.3.*
2. *Kitchenettes in R or I-1 occupancies shall comply with Section 1203.4.1.4.*

**1203.4.1.1.1 Minimum opening.** *The minimum openable area to the outdoors shall be 4 percent of the floor area of the occupiable space being ventilated.*

**1203.4.1.1.2 Adjoining spaces.** Where occupiable rooms and spaces without openings to the outdoors are ventilated through an adjoining room, the opening to the adjoining room shall be unobstructed and shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 25 square feet (2.3 m<sup>2</sup>). The minimum openable area to the outdoors shall be based on the total floor area being ventilated.

**Exception:** Exterior openings required for ventilation shall be permitted to open into a thermally isolated sunroom addition or covered patio provided that the openable area between such sunroom addition or covered patio and the interior room shall have an area of not less than 8 percent of the floor area of the interior room or space, but not less than 20 square feet (1.9 m<sup>2</sup>). The minimum openable area to the outdoors shall be based on the total floor area being ventilated.

**1203.4.1.1.3 Openings below grade.** Where openings below grade provide required natural ventilation, the outside horizontal clear space measured perpendicular to the opening shall be one and one-half times the depth of the opening. The depth of the opening shall be measured from the average adjoining ground level to the bottom of the opening.

**1203.4.1.1.4 Mezzanines.** Where an interior balcony or mezzanine opens to form part of another room or space, its area shall be added to the area of the room or space in which it is located to compute the ventilation required for both spaces.

**1203.4.1.2 Habitable spaces.** All habitable spaces shall be provided with natural ventilation in accordance with Section 1203.4.1.2. Openings providing required natural ventilation to habitable spaces shall be windows and/or glazed doors.

**Exception:** R-3 occupancies. Openable skylights, opening directly to the outer air, transparent or translucent panels, or other natural light-transmitting media may be substituted for window openings in R-3 occupancies provided that they meet the minimum dimensional requirements of Section 1203.4.1.2.1.

**1203.4.1.2.1 Minimum opening.** The minimum openable area to the outdoors shall be 5 percent of the floor area of the habitable space being ventilated. Every opening providing required natural ventilation shall be at least 12 square feet (1.1 m<sup>2</sup>) of glazed area, providing a minimum of 6 square feet (0.56 m<sup>2</sup>) of openable area.

**Exceptions:**

1. *Where fresh air is furnished in any habitable room or space by mechanical means supplying a minimum of 40 cubic feet per minute (0.02 m<sup>3</sup>/s), the free openable area of the openings may be reduced to 2 ½ percent of the floor area but each such opening shall provide not less than 5 ½ square feet (0.51 m<sup>2</sup>) of openable area*
2. *The minimum free openable area of a mullioned casement window shall be 5 ½ square feet (0.51 m<sup>2</sup>), provided that the minimum ratio of floor area to openable area is met.*

**1203.4.1.2.2 Adjoining spaces.** *An alcove or room opening off another room or space shall be considered as a separate room in determining its requirements for ventilation.*

**Exceptions:**

1. *Alcoves within R-3 dwelling units. In R-3 occupancies, where an opening between the alcove and the room or space is at least 80 percent of the area of the common wall and the floor area of the alcove does not exceed twice the area of the opening, the alcove and the room opening into the alcove may be considered as a single space.*
2. *Balconies, partially enclosed. Exterior openings required for ventilation shall be permitted to open upon a partially enclosed balcony or space above a setback when:*
  - 2.1. *Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;*
  - 2.2. *The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;*
  - 2.3. *The enclosure of the balcony or space is not more than one story in height;*

*and*

- 2.4. The front of a partially enclosed balcony or space above a setback shall be open to the outer air with an open area equal to at least 75 percent of the floor surface area of such balcony or space.*
- 3. Balconies, fully enclosed. Exterior openings required for ventilation shall be permitted to open upon a fully enclosed balcony or space above a setback, including thermally isolated sunroom additions and patio covers, when:*

  - 3.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;*
  - 3.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;*
  - 3.3. The enclosure of the balcony or space is not more than one story in height;*
  - 3.4. The building is Type I or II construction;*
  - 3.5. The outer enclosing walls of the balcony or space are glazed with an area at least 50 percent of the area of the interior enclosing walls of such balcony or space; the glazing may be clear plate glass or slow burning plastic;*
  - 3.6. At least 50 percent of the glazed area required by Exception 3.5 of this section is openable; and*
  - 3.7. No window from any bathroom, toilet room, kitchen or kitchenette shall open on such balcony or space.*
- 4. Mezzanines and split-level rooms. Where a habitable mezzanine or portion of a split-level room or space is not directly served by an opening providing natural ventilation in accordance with Section 1203.4.1.2, such mezzanine or space*

*shall open for its full width with no obstruction, except for railings, to an adjoining habitable room which is provided with natural ventilation. The floor area of such mezzanine or portion of the split level room or space shall be added to the floor area of the adjoining room to compute the required ventilation in accordance with Section 1203.4.1.2.1. The combined space shall also comply with Sections 1203.4.1.2.4 and 1203.4.5.*

**1203.4.1.2.3 Basements and cellars.** *Where openings provide natural ventilation to habitable spaces located in basements or cellars, such opening shall also comply with the applicable provisions of Section 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.*

**1203.4.1.2.4 Maximum depth of room.** *No part of any room shall be more than 30 feet (9144 mm) from a window opening onto a street or yard unless such room also opens onto a court complying with Section 1206.*

**Exception:** *In dwelling units containing more than 3 habitable rooms in group R1 or R2 occupancies in buildings of Type I or II construction, rooms may be greater than 30 feet (9144 mm) in depth provided that all other requirements of Section 1203.4.1.2 are met and that the required windows are so located as to properly light all portions of the room in accordance with Section 1205.*

**1203.4.1.3 Bathrooms and toilet rooms in R and I-1 occupancies.** *Bathrooms or toilet rooms in R or I-1 occupancies shall be provided with natural ventilation in accordance with Section 1203.4.1.3, unless provided with exhaust ventilation in accordance with the New York City Mechanical Code. Openings providing required natural ventilation shall be windows.*

**Exception:** *Openable skylights may be substituted for windows provided that the bathroom or toilet room is on the top story.*

**1203.4.1.3.1 Minimum opening.** *The minimum openable area to the outdoors shall be 5 percent of the floor area of the space being ventilated. Every window or skylight providing required natural ventilation shall be at least 3 square feet (0.28 m<sup>2</sup>) providing a minimum of 1 ½ square feet (0.14 m<sup>2</sup>) of openable area.*

**1203.4.1.3.2 Adjoining spaces.** *Natural ventilation for bathrooms and toilet rooms may not be through openings from another room or space.*

**Exception:** a bathroom or toilet room may open onto a partially enclosed balcony or space above a setback conforming with Exception 2 of Section 1203.4.1.2.2.

**1203.4.1.3.3 Basements and cellars.** Where openings provide natural ventilation to bathrooms or toilet rooms located in basements or cellars, such opening shall also comply with the applicable provisions of Section 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**1203.4.1.4. Kitchenettes in R and I-1 occupancies.** Kitchenettes in R or I-1 occupancies shall be provided with natural ventilation in accordance with Section 1203.4.1.4, unless provided with exhaust ventilation in accordance with the New York City Mechanical Code. Openings providing required natural ventilation shall be windows.

**Exception:** Openable skylights may be substituted for windows provided that:

1. The kitchenette is on the top story;
2. The skylight is 12 inches (305 mm) in its least dimensions;
3. The skylight is at least 4 square feet (0.37 m<sup>2</sup>) or 1/8 of the area of the kitchenette, whichever is greater; and
4. The skylight provides ventilating openings for at least 1/2 of its area.

**1203.4.1.4.1 Minimum opening.** The minimum openable area to the outdoors shall be 5 percent of the floor area of the space being ventilated. Every window or other opening providing required natural ventilation shall be at least 1 foot (305 mm) wide and at least 3 square feet (0.28 m<sup>2</sup>) in total area, providing a minimum of 1 1/2 square feet (0.14 m<sup>2</sup>) of openable area.

**Exception:** Skylights shall comply with the Exception of Section 1203.4.1.4.

**1203.4.1.4.2 Adjoining spaces.** Natural ventilation for kitchenettes shall not be through openings off another room or space.

**Exception:** A kitchenette may open onto a partially enclosed balcony or space above a setback conforming with Exception 2 of Section 1203.4.1.2.2.

**1203.4.1.4.3 Basements and cellars.** Where openings provide natural ventilation to kitchenettes less than 80 square feet (7.4\_m<sup>2</sup>) located in basements or cellars, such opening shall also comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**1203.4.2 Contaminants exhausted.** Contaminant sources in naturally ventilated spaces shall be removed in accordance with the New York City Mechanical Code.

**1203.4.2.1 Bathrooms.** Rooms containing bathtubs, showers, spas and similar bathing fixtures in other than R and I-1 occupancies shall be mechanically ventilated in accordance with the New York City Mechanical Code, whether or not they are also provided with natural ventilation.

**1203.4.3 Openings on yards or courts.** Natural ventilation shall be provided by openings to a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206. No such opening shall be on a recess of less than 6 feet (1829 mm) in width.

**Exceptions:**

1. Openings providing natural ventilation to habitable spaces located in basements or cellars shall also comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.
2. A kitchenette, a bathroom, or a water closet compartment may be located on a recess of less than 6 feet (1829 mm).

**1203.4.4 Measurement of openings.** Dimensions of windows and other openings shall always be taken between stop beads or, if there are no stop beads, between the sides, head, and sill of the sash opening.

**1203.4.5 Height of openings.** The top of at least one opening providing required natural ventilation to a habitable room or space shall be a minimum of 7 feet (2134\_mm) above the floor of the room or space served by the window or opening.

**Exception: Mezzanines.** Where the required natural ventilation for a habitable mezzanine level is provided by a window(s) on the lower level in accordance with Section 1203.4.1.2.2 (Exception 4), and where compliance with Section 1203.4.5 is not feasible on the mezzanine floor, Section 1203.4.5 shall not apply to such mezzanine floor provided that either:

1. Such window(s) is on the opposite wall from the mezzanine, and the top of such window is at least 12 inches (305 mm) above the floor of the mezzanine; or
2. Mechanical ventilation is provided to the mezzanine level in accordance with the New York City Mechanical Code capable of providing 2 cubic feet per minute (0.00094 m<sup>3</sup>/s) of fresh air per square foot (0.09 m<sup>2</sup>) of floor area of mezzanine.

**1203.5 Other ventilation and exhaust systems.** Ventilation and exhaust systems for occupancies and operations involving flammable or combustible hazards or other contaminant sources as covered in the New York City Mechanical Code or the New York City Fire Code shall be provided as required by both codes.

## **SECTION BC 1204**

### **TEMPERATURE AND HUMIDITY CONTROL**

**1204.1 Equipment and Systems.** Interior spaces intended for human occupancy shall be provided with active or passive space-heating systems capable of maintaining a minimum indoor temperature as indicated in Table 1204.1 at a point 3 feet (914 mm) above the finished floor. The heating capacity of heat-producing devices and equipment which are contained in the room and in constant use during occupancy may be deducted from the capacity of the heating system. Portable heating systems shall not be considered as contributing to the capacity of the heating system.

**Exception:** Where specific rooms or spaces are not listed, the temperature shall be determined by the requirements of the listed space to which they most nearly conform or as determined by the registered design professional.

**TABLE 1204.1**  
**MINIMUM SPACE TEMPERATURE REQUIREMENTS<sup>a</sup>**

<i>Rooms or Spaces</i>	<i>Minimum Temperature (degree F)</i>
<i>Habitable rooms in all buildings</i>	68
<i>Building equipment and machinery rooms</i>	50
<i>Patients' rooms, bathrooms and toilet rooms, stairs and corridors in hospitals and nursing homes</i>	<i>As per the New York State Health Code</i>
<i>Bathrooms and toilet rooms except patients bathrooms and toilet rooms in hospitals and nursing homes</i>	68
<i>Offices, waiting rooms, art galleries, museums, libraries, meeting rooms, houses of worship, classrooms, auditoriums, lecture halls, night clubs, restaurants, theatres, locker rooms, dressing rooms, and spaces where persons are engaged in sedentary activities</i>	68
<i>Laboratories, light machine work, product inspections, loft buildings, shops, stores, display rooms, show rooms, sales rooms, and spaces where persons are engaged in moderate physical activities</i>	65
<i>Gymnasias, dance halls, skating rinks, bowling alleys, heavy assembly workrooms or shops, and spaces where persons are engaged in vigorous physical activities</i> .....	60
<i>Automotive repair shops</i>	50
<i>Storage areas, garages, space where work or process requires a low temperature</i>	<i>None</i>
<i>Hospital operating rooms, and recovery, labor, delivery, and nursery rooms</i>	<i>As per the New York State Health Code</i>
<i>Swimming pools, bath houses, and shower rooms</i>	75

*a. Temperatures listed here are the minimum requirements of the department. However, other jurisdictional authorities may have more stringent requirements.*

**Exceptions:**

- 1. Heating systems are not required when occupancy is seasonal and the rooms or buildings are not occupied between November 1<sup>st</sup> and May 1<sup>st</sup> of the following year.*
- 2. Heating systems are not required when the processes or activities normally conducted in the space will generate sufficient heat to maintain the prescribed temperatures during the time of occupancy.*
- 3. Spaces where strict process requirements mandate temperatures other than those cited above shall be exempt from the minimum requirements listed in Table 1204.1.*

**1204.2 Air Conditioning.** Interior spaces intended for human occupancy that are provided with air conditioning shall be provided with active or passive systems that are capable of maintaining 78°F (26°C) at 50 percent relative humidity when the outdoor air temperature is 89°F (32°C) and the coincident wet bulb temperature is 73°F (23°C). Interior spaces without air conditioning shall be provided with mechanical or natural ventilation in compliance with other subsections of this code.

**1204.3 Freeze Protection.** All interior spaces shall be provided with active or passive systems or with methods of construction capable of preventing wet piping systems and vessels from freezing at all times, including permanently installed pipe heat tracing systems.

**1204.4 System Design.** The heating system and air conditioning system, as applicable, shall be designed to provide sufficient capacity to meet the temperature and humidity requirements of Section 1204 when considering the outdoor air ventilation requirements and all losses in the system and ancillary uses, such as domestic hot water, for which the system is used. The system shall be designed and installed to meet all other applicable provisions of this code.

## **SECTION BC 1205**

### **LIGHTING**

**1205.1 General.** Every room and space in every building shall be provided with artificial light in accordance with Section 1205.3. Every habitable room and space shall also be provided with natural light by means of exterior glazed openings in accordance with Section 1205.2.

**Exceptions.** Artificial light need not be provided in rooms or spaces:

1. Occupied exclusively during the daylight hours between one hour after sunrise and one hour before sunset, and which are provided with natural light meeting the requirements of 1205.2; or
2. With less than 40 square feet (3.7 m<sup>2</sup>) of floor area if they are used exclusively for storage purposes or for mechanical facilities containing no rotating or moving parts, no combustion equipment, or no other hazardous equipment.

**1205.2 Natural light.** Every opening providing required natural light shall be so located so as to properly light all portions of the room. Openings providing required natural light shall be windows and/or glazed doors.

**Exceptions:** *R-3 occupancies. Skylights, opening directly to the outer air, transparent or translucent panels, or other light-transmitting media, may be substituted for window openings in R-3 occupancies provided that they meet the minimum dimensional requirements of Section 1205.2.2.*

**1205.2.1 Minimum opening.** *The minimum net glazed area shall not be less than 10 percent of the floor area of the room served. Every opening providing required natural light shall be at least 12 square feet (1.1 m<sup>2</sup>) of glazed area.*

**1205.2.2 Adjoining spaces.** *An alcove or room opening off another room or space shall be considered as a separate room in determining its requirements for natural lighting.*

**Exceptions:**

1. *Alcoves within R-3 dwelling units. In R-3 occupancies, where an opening between the alcove and the room or space is at least 80 percent of the area of the common wall and the floor area of the alcove does not exceed twice the area of the opening, the alcove and the room opening into the alcove may be considered as a single space.*
2. *Balconies, partially enclosed. Exterior openings required for natural light shall be permitted to open upon a partially enclosed balcony or space above a setback when:*
  - 2.1. *Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;*
  - 2.2. *The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the exterior wall forming the partial or full enclosure of the balcony or space;*
  - 2.3. *The enclosure of the balcony or space is not more than one story in height; and*
  - 2.4. *The front of a partially enclosed balcony or space above a setback shall be open to the outer air with an open area equal to at least 75 percent of the floor surface area of such balcony or space.*
3. *Balconies, fully enclosed. Exterior openings required for natural lighting shall be permitted to open upon a fully enclosed balcony or space above a setback, including*

*thermally isolated sunroom additions and covered patios, when:*

- 3.1. Such balcony or space faces upon a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206;*
  - 3.2. The maximum depth of any habitable room is 30 feet (9144 mm) measured from the outer face of the wall forming the partial or full enclosure of the balcony or space;*
  - 3.3. The enclosure of the balcony or space is not more than one story in height;*
  - 3.4. The building is Type I or II construction;*
  - 3.5. The outer enclosing walls of the balcony or space are glazed with an area at least 50 percent of the area of the interior enclosing walls of such balcony or space; the glazing may be clear plate glass or slow burning plastic;*
  - 3.6. At least 50 percent of the glazed area required by Exception 3.5 of this section is openable; and*
  - 3.7. No window from any bathroom, toilet room, kitchen or kitchenette shall open on such balcony or space.*
- 4. Mezzanines and split-level rooms. Where a habitable mezzanine or portion of a split-level room or space is not directly served by an opening providing natural lighting in accordance with Section 1205.2, such space shall be open for its full width with no obstruction, except for railings, to an adjoining habitable room which is provided with such window or other opening. The floor area of the such mezzanine or portion of the split level room or space shall be added to the floor area of the adjoining room to compute the required lighting in accordance with Section 1205.2.1. The combined space shall also comply with Sections 1205.2.4 and 1205.2.7.*

### ***1205.2.3 Basements and cellars.***

***1205.2.3.1 Adequate adjacent space for multiple dwellings.*** *Where rooms within a dwelling unit in a multiple dwelling are located in a cellar or a basement, such rooms shall have at least ½ of their height and all of their required window surfaces above every part of an "adequate adjacent*

space". Such "adequate adjacent space" shall be open to the sky and shall be a continuous surface area not less than 30 feet (9144 mm) in its least dimension abutting at same level or directly below the exterior walls of every part of the basement and cellar portions of such dwelling unit. Such "adequate adjacent space" shall be spaces that are located on the same tax lot or plot as the building or a public street, space, alley, park, highway or right of way and the level of such areas which abut or adjoin the habitable room shall be at least 6 inches (152 mm) below the window sills of any windows.

**1205.2.3.2 Other applicable laws.** Where openings provide natural lighting to habitable spaces located in basements or cellars, such opening shall comply with the applicable provisions of Sections 27-2081 through 27-2087 of the New York City Housing Maintenance Code and Sections 26(8) and 34 of the New York State Multiple Dwelling Law.

**1205.2.4 Maximum depth of room.** No part of any room shall be more than 30 feet (9144 mm) from a window opening on a street or yard unless such room also opens onto a legal court.

**Exception:** In dwelling units containing more than 3 habitable rooms in R-1 or R-2 occupancies in buildings of Type I or II construction, rooms may be greater than 30 feet (9144 mm) in depth provided that all other requirements of Section 1205.2 are met and that the required windows are located so as to properly light all portions of the room.

**1205.2.5 Openings on yards or courts.** Exterior glazed openings shall open directly onto a public street, space, alley, park, highway, or right of way; or upon a yard, court, plaza, or space above a setback where such yard, court, plaza, or space above a setback complies with Section 1206. No such opening shall be on a recess of less than 6 feet (1829 mm) in width.

**Exception:** Spaces located in basements or cellars shall also comply with Section 1205.2.3.

**1205.2.6 Measurement of glazed areas.** Window dimensions shall always be taken between stop beads or, if there are no stop beads, between the sides, head, and sill of the sash opening.

**1205.2.7 Height of glazed areas.**

**1205.2.7.1** Only that portion of glazed areas higher than 30 inches (9144 mm) above the floor shall be considered as providing the required natural lighting.

**1205.2.7.2** The top of at least one window or other opening providing required natural lighting to

*a habitable room shall be a minimum of 7 feet (2134 mm) above the floor of the room or space served by the window or opening.*

***Exception: Mezzanines.*** *Where the required natural lighting for a habitable mezzanine level is provided by a window(s) on the lower level in accordance with Section 1205.2.2 Exception 4, and where compliance with Section 1205.2.7.2 is not feasible on the mezzanine floor, Section 1205.2.7.2 shall not apply to such mezzanine floor provided that either:*

- 1. Such window(s) is on the opposite wall from the mezzanine, and the top of such window is at least 12 inches (305 mm) above the floor of the mezzanine; or*
- 2. Mechanical ventilation is provided to the mezzanine level in accordance with the New York City Mechanical Code capable of providing 2 cubic feet per minute (0.00094 m<sup>3</sup>/s) of fresh air per square foot (0.09 m<sup>2</sup>) of floor area of mezzanine.*

### **1205.3 Artificial light.**

**1205.3.1 General.** *Artificial light shall meet the minimum illumination standards set forth in Section 1205.3. Artificial light shall not exceed maximum energy consumption requirements, if applicable, as required by Section 1301.1.1.*

**1205.3.2 Rooms and spaces.** *Artificial light shall be adequate to provide an average illumination of 10 foot-candles (107 lux) over the area of the room at a height of 30 inches (762 mm) above the floor level.*

**1205.3.3 Stairways.** *Stairways within dwelling units and exterior stairways serving a dwelling unit shall have an illumination level on tread runs of not less than 1 foot-candle (11 lux). Stairs in other occupancies shall be governed by Chapter 10.*

**1205.3.4 Means of egress.** *The means of egress shall be illuminated in accordance with Section 1006.1. Exterior lights near entranceways to multiple dwellings shall also comply with Section 27-2040 of the New York City Housing Maintenance Code.*

**1205.3.5 Places of assembly.** *Places of assembly shall be illuminated in accordance with Chapter 10.*

### **1205.4 Reserved.**

*1205.5 Reserved.*

**SECTION BC 1206**  
**YARDS AND COURTS**

*1206.1 General.* This section shall apply to yards and courts adjacent to exterior openings that provide required natural light or required natural ventilation. Such yards and courts shall be on the same zoning lot as the building. Where such yard or court is wholly or partially on a different tax lot from the exterior opening which the yard or court serves, a light and air easement or restrictive declaration acceptable to the commissioner shall be recorded against the tax lot or lots where such yard or court is located.

*1206.2 Yards.* Yards shall not be less than the dimensions prescribed by the Zoning Resolution of the City of New York and other applicable laws, rules, and regulations.

*1206.2.1 Rear yard access for multiple dwellings.* For multiple dwellings, there shall be direct access from the street to every rear yard through a noncombustible 2-hour fire-resistance-rated passage either in a direct line or through a court, except that the passage may be 1-hour fire-resistance-rated for dwellings not exceeding three stories in height and occupied by not more than 2 families on any story. Such passage shall be at least 36 inches (914 mm) in clear width and 7 feet (2134 mm) in height.

*Exceptions.* No such passage shall be required for:

1. *Buildings of Type IA or IB construction.*
2. *Buildings not exceeding three stories in height, and occupied by not more than one family on any story nor more than three families in all.*
3. *Buildings not exceeding two stories in height, and occupied by not more than two families on any story nor more than four families in all.*

*1206.3 Courts.* Courts shall not be less than the dimensions prescribed by the Zoning Resolution of the City of New York and other applicable laws, rules and regulations.

*1206.3.1 Court access.* Access shall be provided to the bottom of courts for cleaning purposes.

*1206.3.2 Air intake.* Courts more than two stories in height shall be provided with a horizontal air intake at the bottom not less than 10 square feet (0.93 m<sup>2</sup>) in area and leading to the exterior of the

*building unless abutting a yard or public way.*

**Exception:** *For multiple dwellings more than two stories in height, an air intake with a vertical cross-sectional area of 21 square feet (1.95 m<sup>2</sup>) and a least minimum dimension of 3 feet (914 mm) shall be provided at or near the lowest level of any court, in accordance with Section 26(7)(a) of the New York State Multiple Dwelling Law.*

**1206.3.3 Court drainage.** *The bottom of every court shall be properly graded and drained to a public sewer or other approved disposal system complying with the New York City Plumbing Code. For group R and I-1 occupancies, such grading and drainage shall also comply with Section 27-2027 of the New York City Housing Maintenance Code. For R-1, R-2 and I-1 occupancies, such grading and drainage shall also comply with Section 77 of the New York State Multiple Dwelling Law.*

**1206.3.4 Court walls for multiple dwellings.** *All walls enclosing courts of multiple dwellings shall be of light colored materials or shall be painted a light color.*

**Exceptions:**

1. *Outer courts that open to a street*
2. *Courts that exceed the minimum dimension set forth in the Zoning Resolution of the City of New York by at least 50 percent.*

**1206.4 Lighting in courts and yards.** *In Groups I-1, R-1 or R-2 occupancies, all yards and courts shall be artificially illuminated with a minimum intensity of not less than 1-foot-candle (11 lux) measured 30 inches (762 mm) above the floor of the lowest level of such yards or courts.*

**SECTION BC 1207**

**SOUND TRANSMISSION**

**1207.1 Scope.** *This section shall apply to common interior walls, partitions and floor/ceiling assemblies between adjacent dwelling units, between dwelling units and adjacent mechanical equipment spaces, or between dwelling units and adjacent public areas such as halls, corridors, stairs or service areas.*

**1207.2 Air-borne sound.** *Walls, partitions and floor/ceiling assemblies separating dwelling units from each other, from public or service areas, from stairs or from mechanical equipment spaces, including boiler rooms, or elevator or other shafts shall have a sound transmission class (STC) for air-borne noise of not*

*less than 50 based upon laboratory measurements made in accordance with ASTM E 90, or not less than 45 if field tested in accordance with ASTM E 336. Dwelling unit entrance doors shall be installed of assemblies having an STC of not less than 35 based upon laboratory measurements made in accordance with ASTM E 1408. Penetrations or openings in construction assemblies for piping; electrical devices; recessed cabinets; bathtubs; soffits; or heating, ventilating or exhaust ducts shall be sealed, lined, insulated or otherwise treated to maintain the required ratings.*

***1207.2.1 Machine and equipment rooms.*** *Elevator machine rooms and machinery spaces containing equipment totaling more than 75 rated h.p. shall not be located vertically or horizontally adjacent to dwelling units unless the total sound power level output of all the equipment in the machine room or space is certified not to exceed the maximum sound power levels of table 1207.2.1 in any octave band.*

**TABLE 1207.2.1**  
**MAXIMUM SOUND POWER LEVEL OUTPUTS FOR MACHINE ROOMS ADJACENT TO**  
**DWELLING UNITS**

<b>Octave Bands, Hz</b> <b>Mid-Frequency</b>	<b>Max. Sound Power Level db<sup>a</sup></b>
	<b>db re</b> <b>10<sup>-12</sup> Watts</b>
63	88
125	87
250	90
1000	87
2000	86
4000	83
8000	81

- a. *The maximum sound power levels shall be reduced five db in any octave band where the equipment data indicate pure tone generation. The presence of pure tones may be determined by means of one-third octave band analysis. The criterion for a significant pure tone component shall be an audible pure-tone sound together with an increase of the sound pressure level in the corresponding one-third octave band above the mean of the two adjacent one-third of at least:*

<b>Center frequency of one-third octave band:</b>	40/125	160/250	215/500	630/1,000	1,000/10,000
<b>Increase in sound pressure level (db):</b>	6	4	3	2	1½

**1207.3 Structure-borne sound.** *Floor/ceiling assemblies between dwelling units or between a dwelling unit and a public or service area stair, exterior mechanical equipment, or other mechanical equipment space, including boiler rooms, shall be constructed of assemblies having an impact insulation class (IIC) rating of not less than 50 based upon laboratory measurements made in accordance with ASTM E 492, or not less than 45 if field tested in accordance with ASTM E 1007 in completed construction. See Chapter 30 for additional sound control requirements for elevator machinery.*

**1207.3.1 Refuse chutes.** *Metal refuse chutes, metal chute supports, and/or metal chute bracing shall be free of direct contact with the shaft enclosure and the openings provided in the floor construction. Metal chutes shall be resiliently supported at each structural support location. Isolators shall provide a minimum static deflection of 0.3 inches (7.62 mm). All chutes shall be plumb.*

**1207.4 Field testing.** *Where conditions indicate that the installed construction or equipment does not meet the noise control prescribed in Section 1207, measurements shall be taken to determine conformance or non-conformance.*

## **SECTION BC 1208 INTERIOR SPACE DIMENSIONS**

**1208.1 Minimum room widths.** *Habitable spaces, other than a kitchen, shall not be less than 8 feet (2438 mm) in any plan dimension. Kitchens and kitchenettes shall have a clear passageway of not less than 3 feet (914 mm) between counter fronts and appliances or counter fronts and walls.*

### **Exceptions:**

1. *A room that complies with the requirements for natural light and natural ventilation and in addition has an unobstructed opening of not less than 60 square feet (5.6 m<sup>2</sup>) into an immediately adjoining room shall not be less than 7 feet (2134 mm) in any plan dimension.*
2. *A habitable dining space that complies with the requirements for natural light and natural ventilation may be less than 8 feet (2438 mm) in any plan dimension.*
3. *One-half the number of bedrooms in a dwelling unit containing 3 or more bedrooms shall not be less than 7 feet (2134 mm) in any plan dimension.*

4. *A room in a group R-1 dwelling or sleeping unit shall not be less than 6 feet (1829 mm) in any plan dimension.*

**1208.2 Minimum ceiling heights.** *Habitable rooms and spaces shall have a ceiling height of not less than 8 feet (2438 mm). Occupiable spaces and corridors shall have a ceiling height of not less than 7 feet 6 inches (2286 mm). Bathrooms, toilet rooms, kitchens in other than I-1 and R occupancies, kitchenettes in I-1 or R occupancies, storage rooms and laundry rooms shall be permitted to have a ceiling height of not less than 7 feet (2134 mm). All measurements shall be taken from the finished floor to the finished underside of the ceiling or ceiling beams.*

**Exceptions:**

1. *In one- and two-family dwellings, beams or girders spaced not less than 4 feet (1219 mm) on center may project not more than 6 inches (152 mm) below the required ceiling height, provided that a clear height of 7 feet (2134 mm) is maintained.*
2. *Habitable rooms in basements of one-family dwellings, including any projecting beams, shall have a ceiling height of not less than 7 feet (2134 mm).*
3. *Habitable rooms in basements of multiple dwellings may have as many as four beams crossing the ceiling if none of the beams exceeds 12 inches (305 mm) in width or extends below the ceiling more than 6 inches (152 mm).*
4. *Spaces above and below a mezzanine, other than habitable spaces, shall have a ceiling height of not less than 7 feet (2134 mm).*

**1208.2.1 Furred ceiling.** *Any room with a furred ceiling shall be required to have the minimum ceiling height in two-thirds of the area thereof, but in no case shall the height of the furred ceiling be less than 7 feet (2134 mm).*

**Exception:** *Minimum ceiling heights of habitable rooms and spaces shall not be less than established in Section 1208.2.*

**1208.3 Room area.** *Minimum net floor areas of rooms shall be in accordance with Sections 1208.3.1 and 1208.3.2*

**1208.3.1 Habitable rooms and spaces.** Every habitable room or space shall have not less than 80 square feet (7.4 m<sup>2</sup>) in net floor area.

**Exceptions:**

1. A room that complies with the requirements for natural light and natural ventilation and in addition has an unobstructed opening of not less than 60 square feet (5.6 m<sup>2</sup>) into an immediately adjoining room shall have not less than 70 square feet (6.5 m<sup>2</sup>) of net floor area.
2. A habitable dining space, as defined by the New York City Housing Maintenance Code, that complies with the requirements for natural light and natural ventilation may have less than 80 square feet (7.4 m<sup>2</sup>) of net floor area.
3. A room in a group R-1 dwelling unit shall have not less than 60 square feet (5.6 m<sup>2</sup>) of net floor area.

**1208.3.2 Dwelling units.** In a dwelling unit, at least one habitable room shall have not less than 150 square feet (13.9 m<sup>2</sup>) of net floor area.

**Exception:** Group R-1 dwelling or sleeping units.

**1208.3.2.1 Single room occupancy of a single room.** Where a single room within a dwelling unit is used for single room occupancy, as such term is used in Section 27-2074(e) of the New York City Housing Maintenance Code, such room shall have not less than 150 square feet (13.9 m<sup>2</sup>) of net floor area.

**1208.3.2.2 Single room occupancy of a suite of rooms.** Where two or more rooms, joined together and separated from all other rooms within a dwelling unit, are used for single room occupancy, as such term is used in Section 27-2074(e) of the New York City Housing Maintenance Code, at least one of such separated rooms shall have not less than 150 square feet (13.9 m<sup>2</sup>) of net floor area.

**1208.4 Reserved.**

**SECTION BC 1209**  
**ACCESS TO UNOCCUPIED SPACES**

**1209.1 Crawl spaces.** *Crawl spaces shall be provided with a minimum of one access opening not less than 18 inches by 24 inches (457 mm by 610 mm). All crawl spaces shall have a minimum clear height of 18 inches (457 mm).*

**1209.2 Attic spaces.** *An opening not less than 20 inches by 30 inches (508 mm by 762 mm) shall be provided to any attic area having a clear height of over 30 inches (762 mm). A 30-inch (762 mm) minimum clear headroom in the attic space shall be provided at or above the access opening.*

**1209.3 Mechanical appliances.** *Access to mechanical appliances installed in under-floor areas, in attic spaces and on roofs or elevated structures shall be in accordance with the New York City Mechanical Code.*

**SECTION BC 1210**  
**SURROUNDING MATERIALS**

**1210.1 Floors.** *Toilet and bathing room floors shall have a smooth, hard, nonabsorbent surface that extends upward onto the walls at least 6 inches (152 mm).*

**1210.2 Walls.** *Walls within 2 feet (610 mm) of urinals and water closets shall have a smooth, hard, nonabsorbent surface, to a height of 4 feet (1219 mm) above the floor, and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture.*

**Exceptions:**

1. *Dwelling units.*
2. *Toilet rooms that are not accessible to the public and which have not more than one water closet.*

*Accessories such as grab bars, towel bars, paper dispensers and soap dishes, provided on or within walls, shall be installed and sealed to protect structural elements from moisture.*

**1210.3 Showers.** Shower compartments and walls above bathtubs with installed shower heads shall be finished with a smooth, nonabsorbent surface to a height not less than 70 inches (1778 mm) above the drain inlet.

**1210.4 Waterproof joints.** Built-in tubs with showers shall have waterproof joints between the tub and adjacent wall.

**1210.5 Toilet rooms.** Toilet rooms shall not open directly into a room used for the preparation of food for service to the public. In multiple dwellings no toilet room or bathroom shall open onto any kitchen or kitchenette.

### **SECTION BC 1211**

#### **KITCHENS AND KITCHENETTES**

**1211.1 Sleeping.** No kitchen or kitchenette shall be occupied for sleeping purposes.

**1211.2 Kitchenettes in multiple dwellings.** Except at entrances thereto, every kitchenette in a multiple dwelling shall be surrounded by partitions extending from floor to ceiling, and/or by a soffit dropped 1 foot (305 mm) from the ceiling.

### **SECTION BC 1212**

#### **RODENT PROOFING**

**Section 1212.1 General.** Rodent proofing shall be in accordance with Appendix F.

### **SECTION BC 1213**

#### **REFUSE AND RECYCLABLE STORAGE**

**1213.1 General.** Multiple dwellings shall comply with Section 81 of the New York State Multiple Dwelling Law and Section 27-2021 of the New York City Housing Maintenance Code. Where a room is provided for the storage of refuse and recyclables in a building, such room shall be completely enclosed by construction that has a fire-resistance rating of not less than 2 hours, with self-closing opening protectives having a fire protection rating of not less than 1 ½ hour. The location of such refuse storage room shall be identified on the construction documents.

**1213.2 Compactor.** A refuse compacting system shall be provided in multiple dwellings in Groups I-1 or R-2 occupancy that are four or more stories in height and contain 12 or more dwelling units, and in

*buildings of any size occupied as a Group R-1 multiple dwelling. Such system shall be located within a refuse storage room constructed in accordance with Section 1213.1 or in a in refuse chute termination room constructed in accordance with Section 707.13.4.*

**1213.3 Refuse chute.** *A multiple dwelling that is five or more stories in height and that contains more than 12 dwelling units shall be provided with a refuse chute, refuse chute access rooms, and refuse chute termination room constructed in accordance with Section 707.13.*

**CHAPTER 13**  
**ENERGY EFFICIENCY**

**SECTION BC 1301**  
**GENERAL**

*1301.1 Scope. This chapter governs the design and construction of buildings for energy efficiency.*

*1301.1.1 Criteria. Buildings shall be designed and constructed in accordance with the Energy Conservation Construction Code of New York State.*

**CHAPTER 14**  
**EXTERIOR WALLS**

**SECTION BC 1401**  
**GENERAL**

**1401.1 Scope.** *The provisions of this chapter shall establish the minimum requirements for exterior walls, exterior wall coverings, exterior wall openings, exterior windows and doors, architectural trim, exterior balconies, bay windows, and other exterior appendages subject to this chapter.*

**SECTION BC 1402**  
**DEFINITIONS**

**1402.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**ADHERED MASONRY VENEER.** *Veneer secured and supported through the adhesion of an approved bonding material applied to an approved backing.*

**ANCHORED MASONRY VENEER.** *Veneer secured with approved mechanical fasteners to an approved backing.*

**BACKING.** *The wall or surface to which the veneer is secured.*

**CURTAIN WALL.** *A curtain wall or panel wall system is a non-load bearing building wall, in skeleton frame construction attached and supported to the structure at every floor or other periodic locations. Assemblies may include glass, metal, precast concrete or masonry elements arranged so as not to exert common action underload and to move independently of each other and the supporting structure.*

**EXTERIOR INSULATION FINISH SYSTEM (EIFS).** *Non-load bearing, barrier wall, exterior cladding systems, generally consisting of the following components:*

1. *Insulation board.*
2. *Adhesive and/or mechanical fasteners that attach the insulation board to the substrate.*
3. *Fiberglass reinforcing mesh.*

4. *Base coat on the face of the insulation board.*
5. *A textured protective finish coat.*
6. *Joint and seam treatments.*

**EXTERIOR WALL.** *A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.*

**EXTERIOR WALL COVERING.** *A material or assembly of materials applied on the exterior side of exterior walls for the purpose of providing a weather-resisting barrier, insulation or for aesthetics, including but not limited to, veneers, siding exterior insulation and finish systems, architectural trim and embellishments such as cornices, soffits, fascias, gutters and leaders.*

**EXTERIOR WALL ENVELOPE.** *A system or assembly of exterior wall components, including exterior wall finish materials, that provides protection of the building structural members, including framing and sheathing materials, and conditioned interior space, from the detrimental effects of the exterior environment.*

**FIBER CEMENT SIDING.** *A manufactured, fiber-reinforcing product made with an inorganic hydraulic or calcium silicate binder formed by chemical reaction and reinforced with organic or inorganic nonasbestos fibers, or both. Additives that enhance manufacturing or product performance are permitted. Fiber cement siding products have either smooth or textured faces and are intended for exterior wall and related applications.*

**METAL COMPOSITE MATERIAL (MCM).** *A factory-manufactured panel consisting of metal skins bonded to both faces of a plastic core.*

**METAL COMPOSITE MATERIAL (MCM) SYSTEM.** *An exterior wall finish system fabricated using MCM in a specific assembly including joints, seams, attachments, substrate, framing and other details as appropriate to a particular design.*

**VENEER.** *A facing attached to a wall for the purpose of providing ornamentation, protection or insulation, but not counted as adding strength to the wall. Veneers are nonstructural in that they do not carry any load other than their own weight.*

**SECTION BC 1403**  
**PERFORMANCE REQUIREMENTS**

**1403.1 General.** *The provisions of this section shall apply to exterior walls, exterior wall coverings and components thereof.*

**1403.2 Weather protection.** *Exterior walls shall provide the building with a weather-resistant exterior wall envelope. The exterior wall envelope shall include flashing, as described in Section 1405.3. The exterior wall envelope and its drainage system shall be designed and constructed in such a manner as to prevent the accumulation of water within the wall assembly by providing a water-resistive barrier behind the exterior veneer, as described in Section 1404.2 and a means for draining water that enters the assembly to the exterior of the veneer, unless it is determined that penetration of water behind the veneer shall not be detrimental to the building performance. Protection against condensation in the exterior wall assembly shall be provided in accordance with the New York State Energy Conservation Construction Code.*

**Exceptions:**

1. *A weather-resistant exterior wall envelope shall not be required over concrete and masonry walls, designed to resist water penetration and detrimental effects from freeze/thaw cycling and in accordance with Chapters 19 and 21, as applicable.*
2. *Compliance with the requirements for a means of drainage, and the requirements of Sections 1405.2 and 1405.3, shall not be required for an exterior wall envelope that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E 331 under the following conditions:*
  - 2.1. *Exterior wall envelope test assemblies shall include at least one opening, one control joint, and where required one wall/eave interface and one wall sill. All tested openings and penetrations shall be representative of the intended end-use configuration.*
  - 2.2. *Exterior wall envelope test assemblies shall be at least 4 feet by 8 feet (1219 mm by 2438 mm) in size.*
  - 2.3. *Exterior wall envelope assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (psf) (0.297 kN/m<sup>2</sup>).*
  - 2.4. *Exterior wall envelope assemblies shall be subjected to a minimum test exposure duration of 2 hours. The exterior wall envelope design shall be considered to resist wind-driven rain where the results of testing indicate that water did not penetrate control joints in the exterior wall envelope, joints at the perimeter of openings, or intersections of terminations with dissimilar materials.*

**1403.3 Vapor retarder.** *An approved vapor retarder shall be provided.*

**Exceptions:**

1. *Where other approved means to avoid condensation and leakage of moisture are provided.*
2. *Plain and reinforced concrete or masonry exterior walls designed and constructed in accordance with Chapter 19 or 21, as applicable.*

**1403.4 Structural.** *Exterior walls, and the associated openings, shall be designed and constructed to resist safely the superimposed loads required by Chapter 16.*

**1403.5 Fire resistance.** *Exterior walls shall be fire-resistance rated as required by other sections of this code with opening protection as required by Chapter 7.*

**1403.6 Flood resistance.** *For buildings in areas of special flood hazard, exterior walls extending below the design flood elevation shall be resistant to water damage and shall comply with Appendix G.*

**1403.7 Reserved.**

## **SECTION BC 1404**

### **MATERIALS**

**1404.1 General.** *Materials used for the construction of exterior walls shall comply with the provisions of this section. Materials not prescribed herein shall be permitted, provided that any such alternative has been approved.*

**1404.2 Water-resistive barrier.** *Where required by Section 1403.2, an approved continuous water-resistive barrier shall be provided behind the exterior wall covering, or a secondary drainage system shall be provided to divert water out of the wall system to the building exterior. Where asphaltic felt is used, it shall be a minimum of one layer of No. 15 asphalt felt, complying with ASTM D 226 for Type 1 felt, and shall be attached to the sheathing, with flashing as described in Section 1405.3, in such a manner as to provide a continuous water-resistive barrier behind the exterior wall veneer.*

**1404.3 Wood.** *Exterior walls of wood construction shall be designed and constructed in accordance with Chapter 23.*

**1404.3.1 Basic hardboard.** Basic hardboard shall conform to the requirements of AHA A135.4.

**1404.3.2 Hardboard siding.** Hardboard siding shall conform to the requirements of AHA A135.6 and, where used structurally, shall be so identified by the label of an approved agency.

**1404.4 Masonry.** Exterior walls of masonry construction shall be designed and constructed in accordance with this chapter and Chapter 21. Masonry units, mortar and metal accessories used in anchored and adhered veneer shall meet the physical requirements of Chapter 21. The backing of anchored and adhered veneer shall be of concrete, masonry, steel framing or wood framing.

**1404.5 Metal.** Exterior walls of formed steel construction, structural steel or lightweight metal alloys shall be designed in accordance with Chapters 22 and 20, as applicable.

**1404.5.1 Aluminum siding.** Aluminum siding shall conform to the requirements of AAMA 1402.

**1404.6 Concrete.** Exterior walls of concrete construction shall be designed and constructed in accordance with Chapter 19.

**1404.7 Glass-unit masonry.** Exterior walls of glass-unit masonry shall be designed and constructed in accordance with Chapter 21.

**1404.8 Plastics.** Plastic panel, apron or spandrel walls as defined in this code shall not be limited in thickness, provided that such plastics and their assemblies conform to the requirements of Chapter 26 and are constructed of approved weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16.

**1404.9 Vinyl siding.** Vinyl siding shall conform to the requirements of ASTM D 3679.

**1404.10 Fiber cement siding.** Fiber cement siding shall conform to the requirements of ASTM C 1186 and shall be so identified on labeling listing an approved quality control agency.

**1404.11 Exterior Insulation Finish System (EIFS).** EIFS shall be designed and constructed in accordance with Chapter 25, Section 1405.8 and Section 2603. EIFS shall conform to the requirements of ANSI/EIMA 99A and shall be so labeled. Such label shall indicate the approved quality control agency.

**SECTION BC 1405**  
**INSTALLATION OF WALL COVERINGS**

**1405.1 General.** *Exterior wall coverings shall be designed and constructed in accordance with the applicable provisions of this section. Installations of exterior wall coverings shall comply with the special inspection requirements of Chapter 17.*

**1405.2 Weather protection.** *Exterior walls shall provide weather protection for the building. The materials of the minimum nominal thickness specified in Table 1405.2 shall be acceptable as approved weather coverings.*

**TABLE 1405.2**

**MINIMUM THICKNESS OF WEATHER COVERINGS**

<b>COVERING TYPE</b>	<b>MINIMUM THICKNESS</b> (inches)
<i>Adhered masonry veneer*</i>	0.25
<i>Anchored masonry veneer</i>	2.625
<i>Aluminum siding</i>	0.019
<i>Cold-rolled copper<sup>d</sup></i>	0.0216 nominal
<i>Copper shingles<sup>d</sup></i>	0.0162 nominal
<i>Exterior plywood (with sheathing)</i>	0.313
<i>Exterior plywood (without sheathing)</i>	See Section 2304.6
<i>Fiberboard siding</i>	0.5
<i>Fiber cement lap siding</i>	0.25 <sup>c</sup>
<i>Fiber cement panel siding</i>	0.25 <sup>c</sup>
<i>Glass-fiber reinforced concrete panels</i>	0.375
<i>Hardboard siding<sup>c</sup></i>	0.25
<i>High-yield copper<sup>d</sup></i>	0.0162 nominal
<i>Lead-coated copper<sup>d</sup></i>	0.0216 nominal
<i>Lead-coated high-yield copper</i>	0.0162 nominal
<i>Marble slabs</i>	1
<i>Particleboard (with sheathing)</i>	See Section 2304.6
<i>Particleboard (without sheathing)</i>	See Section 2304.6
<i>Precast stone facing</i>	0.625
<i>Steel (approved corrosion resistant)</i>	0.0149
<i>Stone (cast artificial)</i>	1.5
<i>Stone (natural)</i>	2
<i>Structural glass</i>	0.344
<i>Stucco or exterior portland cement plaster</i>	
<i>Three-coat work over:</i>	
<i>Metal plaster base</i>	0.875 <sup>b</sup>
<i>Unit masonry</i>	0.625 <sup>b</sup>
<i>Cast-in-place or precast concrete</i>	0.625 <sup>b</sup>
<i>Two-coat work over:</i>	
<i>Unit masonry</i>	0.5 <sup>b</sup>
<i>Cast-in-place or precast concrete</i>	0.375 <sup>b</sup>
<i>Terra cotta (anchored)</i>	1

<i>Terra cotta (adhered)</i>	0.25
<i>Vinyl siding</i>	0.035
<i>Wood shingles</i>	0.375
<i>Wood siding (without sheathing)<sup>a</sup></i>	0.5

*For SI: 1 inch = 25.4 mm.*

*a. Wood siding of thicknesses less than 0.5 inch shall be placed over sheathing that conforms to Section 2304.6.*

*b. Exclusive of texture.*

*c. As measured at the bottom of decorative grooves.*

*d. 16 ounces per square foot for cold-rolled copper and lead-coated copper, 12 ounces per square foot for copper shingles, high-yield copper and lead-coated high-yield copper.*

*\*Veneer units in this group shall be approved type and not be greater than 2 inches in thickness.*

**1405.3 Flashing.** Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect it to the exterior. Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of exterior wall assemblies, exterior wall intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting trim.

**1405.3.1 Exterior wall pockets.** In exterior walls of buildings or structures, wall pockets or crevices in which moisture can accumulate shall be avoided or protected with caps or drips, or other approved means shall be provided to prevent water damage.

**1405.3.2 Masonry.** Flashing and weepholes shall be located in the first course of masonry above finished ground level above the foundation wall or slab, and other points of support, including structural floors, shelf angles and lintels where anchored veneers are designed in accordance with Section 1405.5.

**1405.4 Wood veneers.** Wood veneers on exterior walls of buildings of Type I, II, III and IV construction shall be not less than 1-inch (25 mm) nominal thickness, 0.438-inch (11.1 mm) exterior hardboard siding or 0.375-inch (9.5 mm) exterior-type wood structural panels or particleboard and shall conform to the following:

1. The veneer does not exceed three stories in height, measured from grade, except where fire-retardant-treated wood is used, the height shall not exceed four stories.
2. The veneer is attached to or furred from a noncombustible backing that is fire-resistance rated as required by other provisions of this code.
3. Where open or spaced wood veneers (without concealed spaces) are used, they shall not project more than 24 inches (610 mm) from the building wall.

**1405.5 Anchored masonry veneer.** Anchored masonry veneer shall comply with the provisions of Sections 1405.5, 1405.6, 1405.7 and 1405.8 and Sections 6.1 and 6.2 of ACI 530/ASCE 5/TMS 402.

**1405.5.1 Tolerances.** Anchored masonry veneers in accordance with Chapter 14 are not required to meet the tolerances in Article 3.3 G1 of ACI 530.1/ASCE 6/TMS 602.

**1405.5.2 Seismic requirements.** Anchored masonry veneer located in Seismic Design Category C, D, E or F shall conform to the requirements of Section 6.2.2.10 of ACI 530/ASCE 5/TMS 402.

**1405.6 Stone veneer.** Stone veneer units not exceeding 10 inches (254 mm) in thickness shall be anchored directly to masonry, concrete or to stud construction by one of the following methods:

1. With concrete or masonry backing, anchor ties shall be not less than 0.1055-inch (2.55 mm) corrosion-resistant wire, or approved equal, formed beyond the base of the backing. The legs of the loops shall be not less than 6 inches (152 mm) in length bent at right angles and laid in the mortar joint, and spaced so that the eyes or loops are 12 inches (305 mm) maximum on center (o.c.) in both directions. There shall be provided not less than a 0.1055-inch (2.55 mm) corrosion-resistant wire tie, or approved equal, threaded through the exposed loops for every 2 square feet (0.2 m<sup>2</sup>) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length bent so that it will lie in the stone veneer mortar joint. The last 2 inches (51 mm) of each wire leg shall have a right-angle bend. One-inch (25 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer.
2. With stud backing, a 2-inch by 2-inch (51 by 51 mm) 0.0625-inch (1.59 mm) corrosion-resistant wire mesh with two layers of waterproofed paper backing in accordance with Section 1403.3 shall be applied directly to wood studs spaced a maximum of 16 inches (406 mm) o.c. On studs, the mesh shall be attached with 2-inch-long (51 mm) corrosion-resistant steel wire furring nails at 4 inches (102 mm) o.c. providing a minimum 1.125-inch (29 mm) penetration into each stud and with 8d common nails at 8 inches (203 mm) o.c. into top and bottom plates or with equivalent wire ties. There shall be not less than a 0.1055-inch (2.68 mm) corrosion-resistant wire, or approved equal, looped through the mesh for every 2 square feet (0.2 m<sup>2</sup>) of stone veneer. This tie shall be a loop having legs not less than 15 inches (381 mm) in length, so bent that it will lie in the stone veneer mortar joint. The last 2 inches (51 mm) of each wire leg shall have a right-angle bend. One-inch (25 mm) minimum thickness of cement grout shall be placed between the backing and the stone veneer.

**1405.7 Slab-type veneer.** Slab-type veneer units not exceeding 2 inches (51 mm) in thickness shall be anchored directly to masonry, concrete or stud construction. For veneer units of marble, travertine, granite or other stone units of slab form ties of corrosion-resistant dowels in drilled holes located in the middle third of the edge of the units spaced a maximum of 24 inches (610 mm) apart around the periphery of each unit with not less than four ties per veneer unit. Units shall not exceed 20 square feet (1.9 m<sup>2</sup>) in area. If the dowels are not tight fitting, the holes shall be drilled not more than 0.063 inch (1.6 mm) larger in diameter than the dowel, with the hole countersunk to a diameter and depth equal to twice the diameter of the dowel in order to provide a tight-fitting key of cement mortar at the dowel locations when the mortar in the joint has set. Veneer ties shall be corrosion-resistant metal capable of resisting, in tension or compression, a force equal to two times the weight of the attached veneer. If made of sheet metal, veneer ties shall be not smaller in area than 0.0336 by 1 inch (0.853 by 25 mm) or, if made of wire, not smaller in diameter than 0.1483-inch (3.76 mm) wire.

**1405.8 Terra cotta.** Anchored terra cotta or ceramic units not less than 1.625 inches (41 mm) thick shall be anchored directly to masonry, concrete or stud construction. Tied terra cotta or ceramic veneer units shall be not less than 1.625 inches (41 mm) thick with projecting dovetail webs on the back surface spaced approximately 8 inches (203 mm) o.c. The facing shall be tied to the backing wall with corrosion-resistant metal anchors of not less than No. 8 gage wire installed at the top of each piece in horizontal bed joints not less than 12 inches (305 mm) nor more than 18 inches (457 mm) o.c.; these anchors shall be secured to 0.25-inch (6.4 mm) corrosion-resistant pencil rods that pass through the vertical aligned loop anchors in the backing wall. The veneer ties shall have sufficient strength to support the full weight of the veneer in tension. The facing shall be set with not less than a 2-inch (51 mm) space from the backing wall and the space shall be filled solidly with portland cement grout and pea gravel. Immediately prior to setting, the backing wall and the facing shall be drenched with clean water and shall be distinctly damp when the grout is poured.

**1405.9 Adhered masonry veneer.** Adhered masonry veneer shall comply with the applicable requirements in Section 1405.9.1 and Sections 6.1 and 6.3 of ACI 530/ASCE 5/TMS 402.

**1405.9.1 Interior adhered masonry veneers.** Interior adhered masonry veneers shall have a maximum weight of 20 psf (0.958 kg/m<sup>2</sup>) and shall be installed in accordance with Section 1405.9. Where the interior adhered masonry veneer is supported by wood construction, the supporting members shall be designed to limit deflection to <sup>1</sup>/600 of the span of the supporting members.

**1405.10 Metal veneers.** Veneers of metal shall be fabricated from approved corrosion-resistant materials or shall be protected front and back with porcelain enamel, or otherwise be treated to render the metal resistant to corrosion. Such veneers shall not be less than 0.0149-inch (0.378 mm) nominal thickness sheet steel mounted on wood or metal furring strips or approved sheathing on the wood construction.

**1405.10.1 Attachment.** Exterior metal veneer shall be securely attached to the supporting masonry or framing members with corrosion-resistant fastenings, metal ties or by other approved devices or methods. The spacing of the fastenings or ties shall not exceed 24 inches (610 mm) either vertically or horizontally, but where units exceed 4 square feet (0.4 m<sup>2</sup>) in area there shall be not less than four attachments per unit. The metal attachments shall have a cross-sectional area not less than provided by W 1.7 wire. Such attachments and their supports shall be capable of resisting a horizontal force in accordance with the wind loads specified in Section 1609, but in no case less than 20 psf (0.958 kg/m<sup>2</sup>).

**1405.10.2 Weather protection.** Metal supports for exterior metal veneer shall be protected by painting, galvanizing or by other equivalent coating or treatment. Wood studs, furring strips or other wood supports for exterior metal veneer shall be approved pressure-treated wood or protected as required in Section 1403.2.

*Joints and edges exposed to the weather shall be caulked with approved durable waterproofing material or by other approved means to prevent penetration of moisture.*

**1405.10.3 Backup.** *Masonry backup shall not be required for metal veneer except as is necessary to meet the fire-resistance requirements of this code.*

**1405.10.4 Grounding.** *Grounding of metal veneers on buildings shall comply with the requirements of Chapter 27 and the New York City Electrical Code.*

**1405.11 Glass veneer.** *The area of a single section of thin exterior structural glass veneer shall not exceed 10 square feet (0.93 m<sup>2</sup>) where it is not more than 15 feet (4572 mm) above the level of the sidewalk or grade level directly below, and shall not exceed 6 square feet (0.56 m<sup>2</sup>) where it is more than 15 feet (4572 mm) above that level. In no event shall thin exterior structural glass veneer be installed more than 35 feet (10 668 mm) above the level of the sidewalk or grade level directly below.*

**1405.11.1 Length and height.** *The length or height of any section of thin exterior structural glass veneer shall not exceed 48 inches (1219 mm).*

**1405.11.2 Thickness.** *The thickness of thin exterior structural glass veneer shall be not less than 0.344 inch (8.7 mm).*

**1405.11.3 Application.** *Thin exterior structural glass veneer shall be set only after backing is thoroughly dry and after application of an approved bond coat uniformly over the entire surface of the backing so as to effectively seal the surface. Glass shall be set in place with an approved mastic cement in sufficient quantity so that at least 50 percent of the area of each glass unit is directly bonded to the backing by mastic not less than 0.25 inch (6.4 mm) thick and not more than 0.625 inch (15.9 mm) thick. The bond coat and mastic shall be evaluated for compatibility and shall bond firmly together.*

**1405.11.4 Installation at sidewalk level.** *Where glass extends to a sidewalk surface, each section shall rest in an approved metal molding, and be set at least 0.25 inch (6.4 mm) above the highest point of the sidewalk. The space between the molding and the sidewalk shall be thoroughly caulked and made water tight.*

**1405.11.4.1 Installation above sidewalk level.** *Where thin exterior structural glass veneer is installed above the level of the top of a bulkhead facing, or at a level more than 36 inches (914 mm) above the sidewalk level, the mastic cement binding shall be supplemented with approved nonferrous metal shelf angles located in the horizontal joints in every course. Such shelf angles shall be not less than 0.0478-inch (1.21 mm) thick and not less than 2 inches (51 mm) long and shall be spaced at approved intervals, with*

*not less than two angles for each glass unit. Shelf angles shall be secured to the wall or backing with expansion bolts, toggle bolts or by other approved methods.*

**1405.11.5 Joints.** *Unless otherwise specifically approved by the commissioner, abutting edges of thin exterior structural glass veneer shall be ground square. Mitered joints shall not be used except where specifically approved for wide angles. Joints shall be uniformly buttered with an approved jointing compound and horizontal joints shall be held to not less than 0.063 inch (1.6 mm) by an approved nonrigid substance or device. Where thin exterior structural glass veneer abuts nonresilient material at sides or top, expansion joints not less than 0.25 inch (6.4 mm) wide shall be provided.*

**1405.11.6 Mechanical fastenings.** *Thin exterior structural glass veneer installed above the level of the heads of show windows and veneer installed more than 12 feet (3658 mm) above sidewalk level shall, in addition to the mastic cement and shelf angles, be held in place by the use of fastenings at each vertical or horizontal edge, or at the four corners of each glass unit. Fastenings shall be secured to the wall or backing with expansion bolts, toggle bolts or by other methods. Fastenings shall be so designed as to hold the glass veneer in a vertical plane independent of the mastic cement. Shelf angles providing both support and fastenings shall be permitted.*

**1405.11.7 Flashing.** *Exposed edges of thin exterior structural glass veneer shall be flashed with overlapping corrosion-resistant metal flashing or equivalent and caulked with a waterproof compound in a manner to effectively prevent the entrance of moisture between the glass veneer and the backing.*

**1405.12 Exterior windows and doors.** *Windows and doors installed in exterior walls shall conform to the testing and performance requirements of Section 1714.5.*

**1405.12.1 Installation.** *Windows and doors shall be installed in accordance with approved manufacturer's instructions. Fastener size and spacing shall be provided in such instructions and shall be calculated based on maximum loads and spacing used in the tests.*

**1405.13 Vinyl siding.** *Vinyl siding conforming to the requirements of this section and complying with ASTM D 3679 shall be permitted on exterior walls of buildings of Type V construction located in areas where the basic wind speed specified in Chapter 16 does not exceed 100 miles per hour (161 km/h) and the building height is less than 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the basic wind speed exceeds 100 miles per hour (161 km/h), or building heights are in excess of 40 feet (12 192 mm), tests or calculations indicating compliance with Chapter 16 shall be submitted. Vinyl siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.*

**1405.13.1 Application.** *The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding*

*shall be applied to conform with the weather-resistant barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions. Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding and accessories shall have a minimum 0.313-inch (7.9 mm) head diameter and 0.125-inch (3.18 mm) shank diameter. The nails shall be corrosion resistant and shall be long enough to penetrate the studs or nailing strip at least 0.75 inch (19 mm). Where the siding is installed horizontally, the fastener spacing shall not exceed 16 inches (406 mm) horizontally and 12 inches (305 mm) vertically. Where the siding is installed vertically, the fastener spacing shall not exceed 12 inches (305 mm) horizontally and 12 inches (305 mm) vertically.*

**1405.14 Cement plaster.** *Cement plaster applied to exterior walls shall conform to the requirements specified in Chapter 25.*

**1405.15 Fiber cement siding.** *Fiber cement siding complying with Section 1404.10 shall be permitted on exterior walls of Type I, II, III, IV and V construction for wind pressure resistance or wind speed exposures as indicated in the manufacturer's compliance report and approved installation instructions. Where specified, the siding shall be installed over sheathing or materials listed in Section 2304.6 and shall be installed to conform to the weather-resistant barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions. Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding to wood studs shall be corrosion-resistant round head smooth shank and shall be long enough to penetrate the studs at least 1 inch (25 mm). For metal framing, all-weather screws shall be used and shall penetrate the metal framing at least three full threads.*

**1405.15.1 Panel siding.** *Panels shall be installed with the long dimension parallel to framing. Vertical joints shall occur over framing members and shall be sealed with caulking or covered with battens. Horizontal joints shall be flashed with Z-flashing and blocked with solid wood framing.*

**1405.15.2 Horizontal lap siding.** *Lap siding shall be lapped a minimum of 1¼ inches (32 mm) and shall have the ends sealed with caulking, covered with an H-section joint cover or located over a strip of flashing. Lap siding courses shall be permitted to be installed with the fastener heads exposed or concealed, according to approved manufacturers' instructions.*

**1405.16 Fastening.** *Weather boarding and wall coverings shall be securely fastened with aluminum, copper, zinc, zinc-coated or other approved corrosion-resistant fasteners in accordance with the nailing schedule in Table 2304.9.1 or the approved manufacturer's installation instructions. Shingles and other weather covering shall be attached with appropriate standard shingle nails to furring strips securely nailed to studs, or with approved mechanically bonding nails, except where sheathing is of wood not less than 1-inch (25 mm) nominal thickness or of wood structural panels as specified in Table 2308.9.3(3).*

**1405.17** *Reserved.*

**1405.18 Exterior Insulation Finish System (EIFS).** *EIFS cladding conforming to the requirements of this section and tested in accordance with ASTM E 330 shall be permitted on exterior walls of buildings provided that the foam plastic insulation meets the requirements of Chapter 26, the substrate assembly is constructed of approved weather-resistant materials of adequate strength to resist the wind loads for cladding specified in Chapter 16, and the building height is 40 feet (12 192 mm) or less. EIFS may be permitted on the exterior walls of heights in excess of 40 feet (12 192 mm), provided that tests or calculations indicating compliance with Chapter 16 are submitted to the commissioner. EIFS installations on buildings of any height shall comply with the special inspection requirements of Chapter 17.*

**1405.18.1 Application.** *The EIFS cladding shall be applied over a substrate that is constructed in accordance with the appropriate section of this code depending on its type of construction. EIFS cladding shall be applied in accordance with ANSI/EIMA 99 A.*

**1405.18.2 Installation at grade level.** *Where EIFS cladding is within 10 feet (3048 mm) of grade the installation must conform to the requirements of ANSI/EIMA 99 A impact resistance LEVEL 4.*

**1405.18.3 Installation on Type I, II, III, or IV construction.** *EIFS cladding on the exterior walls of buildings of Type I, II, III and IV construction shall comply with the appropriate provisions of Chapter 26 and Sections 1405.18.3.1 through 1405.18.3.8.*

**1405.18.3.1 Separation from lot lines.** *Reserved.*

**1405.18.3.2 Expansion joints.** *Expansion joints shall be provided in EIFS in the following locations:*

1. *Where EIFS adjoin dissimilar construction.*
2. *Where building expansion joints occur.*
3. *Where prefabricated panels abut one another.*
4. *Where the substrate changes.*
5. *Where significant structural movement occurs, as determined by the design professional.*

**1405.18.3.3 EIFS approval.** *EIFS systems shall be approved based on test data.*

**1405.18.3.4 Fire-rated assembly.** *The inclusion of an EIFS over a listed fire-rated assembly shall not be deemed to reduce the tested or listed rating.*

**1405.18.3.5 Flame spread.** *The EIFS insulation board shall comply with the requirements of Chapter 26 and the assembly of fiberglass reinforcing mesh, base coat on the face of the insulation board and textured protective finish coat shall be tested in accordance with ASTM E 84, and shall have a flame spread rating of 25 or less and a smoke-developed rating of 50 or less. Materials shall be tested in the thickness intended to be used.*

**1405.18.3.6 Labeling.** *Foam insulation shall be listed by an approved testing laboratory and shall be labeled with all of the following information:*

1. *Inspection agency name.*
2. *Specific manufacturer's product for which the insulation is listed.*
3. *Identification of the insulation manufacturer.*
4. *Flame spread and smoke-developed classifications.*

**1405.18.3.7 Contractor.** *The installing contractor shall have a certificate of instruction from the respective EIFS manufacturer's applicator training program.*

**1405.18.3.8 Fastening for multistory buildings.** *The system materials shall be fastened to each other and the overall assembly shall be attached to the building frame so as to prevent failure due to elevated temperatures that occur in a building fire, wind loads, wetting or other environmental conditions. Installations over two stories shall be secured with either full bed of adhesive or corrosion-resistant mechanical fasteners.*

## **SECTION BC 1406**

### **COMBUSTIBLE MATERIALS ON THE EXTERIOR SIDE OF EXTERIOR WALLS**

**1406.1 General.** *This section shall apply to exterior wall coverings, exterior balconies and similar appendages, bay and oriel windows, decks, porches, porticos, entranceways, and storm enclosures constructed of combustible materials.*

**1406.2 Combustible exterior wall coverings.** Combustible exterior wall coverings, including architectural trim, shall comply with this section.

**Exceptions:**

1. Plastics complying with Chapter 26.
2. EIFS complying with Section 1405.18.

**1406.2.1 Ignition resistance.** Combustible exterior wall coverings shall be tested in accordance with NFPA 268.

**Exceptions:** The following materials are not required to be tested in accordance with NFPA 268. However, such materials shall comply with all other provisions of Section 1406.

1. Wood or wood-based products.
2. Other combustible materials covered with an exterior covering other than vinyl sidings listed in Table 1405.2.
3. Aluminum having a minimum thickness of 0.019 inch (0.48 mm).
4. Exterior wall coverings on exterior walls of Type V construction.

**1406.2.1.1 Fire separation 5 feet or less.** Where installed on exterior walls having a fire separation distance of 5 feet (1524 mm) or less, combustible exterior wall coverings shall not exhibit sustained flaming as defined in NFPA 268.

**1406.2.1.2 Fire separation greater than 5 feet.** For fire separation distances greater than 5 feet (1524 mm), an assembly shall be permitted that has been exposed to a reduced level of incident radiant heat flux in accordance with the NFPA 268 test method without exhibiting sustained flaming. The minimum fire separation distance required for the assembly shall be determined from Table 1406.2.1.2 based on the maximum tolerable level of incident radiant heat flux that does not cause sustained flaming of the assembly.

**TABLE 1406.2.1.2  
MINIMUM FIRE SEPARATION FOR COMBUSTIBLE VENEERS**

FIRE SEPARATION DISTANCE (feet)	TOLERABLE LEVEL INCIDENT RADIANT HEAT ENERGY(kW/m <sup>2</sup> )	FIRE SEPARATION DISTANCE (feet)	TOLERABLE LEVEL INCIDENT RADIANT HEAT ENERGY(kW/m <sup>2</sup> )
5	12.5	16	5.9
6	11.8	17	5.5
7	11.0	18	5.2
8	10.3	19	4.9
9	9.6	20	4.6
10	8.9	21	4.4
11	8.3	22	4.1
12	7.7	23	3.9
13	7.2	24	3.7
14	6.7	25	3.5
15	6.3		

For SI: 1 foot = 304.8 mm, 1 Btu/H<sup>2</sup> × °F = .0057 kW/m<sup>2</sup> × K.

**1406.2.2 Area limitations.** *In buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of combustible materials in accordance with Section 1406.2.1. Combustible exterior wall coverings shall not exceed 10 percent of an exterior wall surface area on any given story nor exceed 40 feet (12 192 mm) in height above grade plane. Such combustible exterior wall coverings shall not be permitted on exterior walls where the fire separation distance is 5 feet (1524 mm) or less. Exterior wall coverings that exceed 40 feet (12 192 mm) in height above grade plane shall be constructed of approved noncombustible materials and shall be secured to the wall with metal or other approved noncombustible brackets.*

**1406.2.3 Location.** *Where combustible exterior wall covering is located along the top of exterior walls, such trim shall be completely backed up by the exterior wall and shall not extend over or above the top of exterior walls.*

**1406.2.4 Fireblocking.** *Where the combustible exterior wall covering is furred from the wall and forms a solid surface, the distance between the back of the covering and the wall shall not exceed 1.625 inches (41 mm) and the space thereby created shall be fireblocked in accordance with Section 717 so that there will be no open space exceeding 100 square feet (9.3 m<sup>2</sup>). Where wood furring strips are used, they shall be of approved wood of natural decay resistance or preservative-treated wood.*

**Exceptions:**

1. *Fireblocking of cornices is not required in single-family dwellings.*
2. *Fireblocking shall not be required where installed on noncombustible framing and the face of the exterior wall finish exposed to the concealed space is covered by one of the following materials:*
  - 2.1. *Aluminum having a minimum thickness of 0.019 inch (0.5 mm);*
  - 2.2. *Corrosion-resistant steel having a base metal thickness not less than 0.016 inch (0.4 mm) at any point; or*
  - 2.3. *Other approved noncombustible materials.*

**1406.3 Exterior balconies and similar projections.** *Exterior balconies and similar projections shall be permitted to be constructed of combustible materials provided that the exterior balcony or similar projection affords the fire-resistance rating required by Table 601 for floor construction.*

**Exceptions:**

1. *Balconies or similar projections serving as a required exit shall not be constructed of combustible materials.*
2. *Balconies or similar projections on the exterior of buildings of Type I or II construction shall not be constructed of combustible materials.*

**1406.4 Bay and oriel windows, decks, porches, porticos, entranceways, and storm enclosures.** *Bay and oriel windows, decks, porches, porticos, entranceways, and storm enclosures shall conform to the type of construction required for the building to which they are attached, including required fire-rating, unless otherwise modified by the requirements of this Section. For the purposes of this Section, such structures shall be referred to as, "appendages".*

**Exception:** *Plastic complying with Chapter 26.*

**1406.4.1 Appendages on Type I and II construction.** *Appendages on buildings of Type I or II construction shall be constructed of non-combustible materials. However, on buildings not more than three stories or 40 feet (12 192 mm) in height, whichever is less, fire-retardant-treated wood shall be permitted.*

**1406.4.2 Appendages on Type III, IV and VA construction.** *Appendages on buildings of Type III, IV, and VA construction may be constructed of combustible materials, provided that all the following conditions are met:*

1. *Such building does not exceed 3 stories or 40 feet (12 192 mm) in height, whichever is less.*
2. *The main use or dominant occupancy of such building is classified in Occupancy Group R-2 or R-3.*
3. *The appendage has an exterior separation on all exposed sides of at least 15 feet (4572 mm), measured from the outermost surface of the appendage, except that appendages with exposed sides protected by minimum 1-hour fire-rated construction extending at least 36 inches (914 mm) above the highest combustible horizontal surface may be located up to a minimum distance of 36 inches (914 mm) from any property line.*
4. *The appendage is so constructed that its removal or destruction will not reduce the structural stability or fire resistive integrity of the building.*
5. *The appendage has a superficial area not exceeding 150 square feet (13.9 m<sup>2</sup>) when viewed from directly above and is included in the area limitations of Table 503 for the entire building.*

6. *The appendage is not higher than the sills of the second story windows.*
7. *The vertical surface area of the combustible portions of the appendage does not exceed 10 percent of the total wall area (windows excluded) of the building.*
8. *For enclosed appendages, the roof of the appendage has a class A roof covering, and the soffit or ceiling covering the combustible roof framing shall have a minimum 1-hour fire-resistance rating.*

**Exception:** *Appendages constructed of fire-retardant-treated wood, on buildings not exceeding 3 stories or 40 feet (12 192 mm) in height, whichever is less, need not comply with Items 2 through 8.*

**1406.4.3 Appendages on Type VB construction.** *Appendages may be constructed of combustible materials on buildings of construction Type VB.*

## **SECTION BC 1407**

### **METAL COMPOSITE MATERIALS (MCM)**

**1407.1 General.** *The provisions of this section shall govern the materials, construction and quality of metal composite materials (MCM) for use as exterior wall coverings in addition to other applicable requirements of Chapters 14 and 16.*

**1407.2 Exterior wall finish.** *MCM used as exterior wall finish or as elements of balconies and similar appendages and bay and oriel windows to provide cladding or weather resistance shall comply with Sections 1407.4 through 1407.13.*

**1407.3 Architectural trim and embellishments.** *MCM used as architectural trim or embellishments shall comply with Sections 1407.7 through 1407.13.*

**1407.4 Structural design.** *MCM systems shall be designed and constructed to resist wind loads as required by Chapter 16 for components and cladding.*

**1407.5 Approval.** *Results of approved tests or an engineering analysis shall be submitted to the commissioner to verify compliance with the requirements of Chapter 16 for wind loads.*

**1407.6 Weather resistance.** *MCM systems shall comply with Section 1403 and shall be designed and constructed to resist wind and rain in accordance with this section and the manufacturer's installation instructions.*

**1407.7 Durability.** *MCM systems shall be constructed of approved materials that maintain the performance characteristics required in Section 1407 for the duration of use.*

**1407.8 Fire-resistance rating.** *Where MCM systems are used on exterior walls required to have a fire-resistance rating in accordance with Section 704, evidence shall be submitted to the commissioner that the required fire-resistance rating is maintained.*

**1407.9 Surface-burning characteristics.** *Unless otherwise specified, MCM shall have a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84.*

**1407.10 Type I, II, III and IV construction.** *Where installed on buildings of Type I, II, III and IV construction, MCM systems shall comply with Sections 1407.10.1 through 1407.10.4, or 1407.11.*

**1407.10.1 Surface-burning characteristics.** *MCM shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84.*

**1407.10.2 Thermal barriers.** *MCM shall be separated from the interior of a building by an approved thermal barrier consisting of 0.5-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 15 minutes of fire exposure in accordance with the standard time-temperature curve of ASTM E 119. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance with UL 1715.*

**Exceptions:**

- 1. The thermal barrier is not required where the MCM system is specifically approved based on tests conducted in accordance with UL 1040 or UL 1715. Such testing shall be performed with the MCM in the maximum thickness intended for use. The MCM system shall include seams, joints and other typical details used in the installation and shall be tested in the manner intended for use.*
- 2. The thermal barrier is not required where the MCM is used as elements of balconies and similar appendages, architectural trim or embellishments.*

**1407.10.3 Full-scale tests.** *The MCM exterior wall assembly shall be tested in accordance with, and comply with, the acceptance criteria of NFPA 285. Such testing shall be performed on the MCM system with the MCM in the maximum thickness intended for use.*

**1407.11 Alternate conditions.** *MCM and MCM systems shall not be required to comply with Sections 1407.10.1 through 1407.10.4 provided such systems comply with Section 1407.11.1 or 1407.11.2.*

**1407.11.1 Installations up to 40 feet in height.** *MCM shall not be installed more than 40 feet (12 190 mm) in height above the grade plane where installed in accordance with Sections 1407.11.1.1 and 1407.11.1.2.*

**1407.11.1.1 Fire separation distance of 5 feet or less.** *Where the fire separation distance is 5 feet (1524 mm) or less, the area of MCM shall not exceed 10 percent of the exterior wall surface.*

**1407.11.1.2 Fire separation distance greater than 5 feet.** *Where the fire separation distance is greater than 5 feet (1524 mm), there shall be no limit on the area of exterior wall surface coverage using MCM.*

**1407.11.2 Installations up to 50 feet in height.** *MCM shall not be installed more than 50 feet (15 240 mm) in height above the grade plane where installed in accordance with Sections 1407.11.2.1 and 1407.11.2.2.*

**1407.11.2.1 Self ignition temperature.** *MCM shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929.*

**1407.11.2.2 Limitations.** *Sections of MCM shall not exceed 300 square feet (27.9 m<sup>2</sup>) in area and shall be separated by a minimum of 4 feet (1219 mm) vertically.*

**1407.12 Type V construction.** *MCM shall be permitted to be installed on buildings of Type V construction.*

**1407.13 Labeling.** *MCM shall be labeled in accordance with Chapter 17.*

**CHAPTER 15**  
**ROOF ASSEMBLIES AND ROOFTOP STRUCTURES**

**SECTION BC 1501**  
**GENERAL**

**1501.1 Scope.** *The provisions of this chapter shall govern the design, materials, construction and quality of roof assemblies, and rooftop structures.*

**SECTION BC 1502**  
**DEFINITIONS**

**1502.1 General.** *The following terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**BULKHEAD.** *An enclosed rooftop structure enclosing a shaft, stairway, tank or service equipment, or other space not designed or used for human occupancy.*

**BUILT-UP ROOF COVERING.** *Two or more layers of felt cemented together and surfaced with a cap sheet, mineral aggregate, smooth coating or similar surfacing material.*

**GREEN ROOF.** *A roofing assembly consisting of a roof covering and additional landscape material components, including growing media, filter fabric, drainage, and roof surface.*

**INTERLAYMENT.** *A layer of felt or nonbituminous saturated felt not less than 18 inches (457 mm) wide, shingled between each course of a wood-shake roof covering.*

**MECHANICAL EQUIPMENT SCREEN.** *A partially enclosed rooftop structure used to aesthetically conceal heating, ventilating and air conditioning (HVAC) electrical or mechanical equipment from view.*

**METAL ROOF PANEL.** *An interlocking metal sheet having a minimum installed weather exposure of 3 square feet (.279 m<sup>2</sup>) per sheet.*

**METAL ROOF SHINGLE.** *An interlocking metal sheet having an installed weather exposure less than 3 square feet (.279 m<sup>2</sup>) per sheet.*

**MODIFIED BITUMEN ROOF COVERING.** *One or more layers of polymer-modified asphalt sheets. The*

*sheet materials shall be fully adhered or mechanically attached to the substrate or held in place with an approved ballast layer.*

**PENTHOUSE.** *An enclosed rooftop structure which is designed or used for human occupancy.*

**POSITIVE ROOF DRAINAGE.** *The drainage condition in which consideration has been made for all loading deflections of the roof deck, including ponding instability, and additional slope has been provided to ensure drainage of the roof within 48 hours of precipitation.*

**REROOFING.** *The process of recovering or replacing an existing roof covering. See “Roof recover” and “Roof replacement.”*

**ROOF ASSEMBLY.** *A system designed to provide weather protection and resistance to design loads. The system consists of a roof covering and roof deck or a single component serving as both the roof covering and the roof deck. A roof assembly includes the roof deck, vapor retarder, substrate or thermal barrier, insulation, vapor retarder and roof covering.*

**ROOF COVERING.** *The covering applied to the roof deck for weather resistance, fire classification or appearance.*

**ROOF COVERING SYSTEM.** *See “Roof assembly.”*

**ROOF DECK.** *The flat or sloped surface not including its supporting members or vertical supports.*

**ROOF RECOVER.** *The process of installing an additional roof covering over a prepared existing roof covering without removing the existing roof covering.*

**ROOF REPLACEMENT.** *The process of removing the existing roof covering, repairing any damaged substrate and installing a new roof covering.*

**ROOF VENTILATION.** *The natural or mechanical process of supplying conditioned or unconditioned air to, or removing such air from, attics, cathedral ceilings or other enclosed spaces over which a roof assembly is installed.*

**ROOFTOP STRUCTURE.** *An enclosed or unenclosed structure on or above the roof of any part of a building.*

**SINGLE-PLY MEMBRANE.** A roofing membrane that is field applied using one layer of membrane material (either homogeneous or composite) rather than multiple layers.

**UNDERLAYMENT.** One or more layers of felt, sheathing paper, nonbituminous saturated felt or other approved material over which a steep-slope roof covering is applied.

### **SECTION BC 1503 WEATHER PROTECTION**

**1503.1 General.** Roof decks shall be covered with approved roof coverings secured to the building or structure in accordance with the provisions of this chapter. Roof coverings shall be designed, installed and maintained in accordance with this code and the approved manufacturer's instructions such that the roof covering shall serve to protect the building or structure.

**1503.2 Flashing.** Flashing shall be installed in such a manner so as to prevent moisture entering the wall and roof through joints in copings, through moisture-permeable materials and at intersections with parapet walls and other penetrations through the roof plane.

**1503.2.1 Locations.** Flashing shall be installed at wall and roof intersections, at gutters, wherever there is a change in roof slope or direction and around roof openings. Where flashing is of metal, the metal shall be corrosion resistant with a thickness of not less than 0.019 inch (.483 mm) (No. 26 galvanized sheet).

**1503.3 Coping.** Parapet walls shall be properly coped with noncombustible, weatherproof materials of a width no less than the thickness of the parapet wall.

**1503.4 Roof drainage.** Design and installation of roof drainage systems shall comply with the New York City Plumbing Code.

**1503.4.1 Gutters.** Gutters and leaders placed on the outside of buildings shall be of noncombustible, corrosion-resistant material, or a minimum of Schedule 40 plastic pipe.

**1503.4.1.1 Height limitations.** Vertical sections of exterior leaders made from galvanized steel, galvanized wrought iron, cast iron, brass, or similar heavy material shall be permitted only for the first 15 feet (4572 mm) of leader extending up from grade, provided that the leader is securely anchored with offset clamps to the face of the building at no fewer than 2 points along the vertical section of the leader. Horizontal sections of exterior gutter made from such heavy materials shall

*not be permitted higher than 15 feet (4572 mm) above grade.*

**1503.5 Roof ventilation.** *Intake and exhaust vents shall be provided in accordance with Section 1203.2 and the manufacturer's installation instructions.*

## **SECTION BC 1504 PERFORMANCE REQUIREMENTS**

**1504.1 Wind resistance of roofs.** *Roof decks and roof coverings shall be designed for wind loads in accordance with Chapter 16 and Sections 1504.2, 1504.3 and 1504.4.*

**1504.1.1 Wind resistance of asphalt shingles.** *Asphalt shingles shall be designed for wind speeds in accordance with Section 1507.2.7.*

**1504.2 Wind resistance of clay and concrete tile.** *Clay and concrete tile roof coverings shall be connected to the roof deck in accordance with Chapter 16.*

**1504.3 Wind resistance of nonballasted roofs.** *Roof coverings installed on roofs in accordance with Section 1507 that are mechanically attached or adhered to the roof deck shall be designed to resist the design wind load pressures for cladding in Chapter 16.*

**1504.3.1 Other roof systems.** *Roof systems with built-up, modified bitumen, fully adhered or mechanically attached single-ply through fastened metal panel roof systems, and other types of membrane roof coverings shall also be tested in accordance with FM 4450, FM 4470, UL 580 or UL 1897.*

**1504.3.2 Metal panel roof systems.** *Metal panel roof systems through fastened or standing seam shall be tested in accordance with UL 580 or ASTM E 1592.*

**1504.4 Ballasted low-slope roof systems.** *Ballasted low-slope (roof slope < 2:12) single-ply roof system coverings installed in accordance with Section 1507 shall be designed in accordance with ANSI/SPRI RP-4.*

**1504.5 Edge securement for low-slope roofs.** *Low-slope membrane roof systems metal edge securement, except gutters, installed in accordance with Section 1507, shall be designed in accordance with ANSI/SPRI ES-1, except the basic wind speed shall be determined in accordance with Chapter 16.*

**1504.6 Physical properties.** Roof coverings installed on low-slope roofs (roof slope < 2:12) in accordance with Section 1507 shall demonstrate physical integrity over the working life of the roof based upon 2,000 hours of exposure to accelerated weathering tests conducted in accordance with ASTM G 152, ASTM G 155 or ASTM G 154. Those roof coverings that are subject to cyclical flexural response due to wind loads shall not demonstrate any significant loss of tensile strength for unreinforced membranes or breaking strength for reinforced membranes when tested as herein required.

**1504.7 Impact resistance.** Roof coverings installed on low-slope roofs (roof slope < 2:12) in accordance with Section 1507 shall resist impact damage based on the results of tests conducted in accordance with ASTM D 3746, ASTM D 4272, CGSB 37-GP-52M or FM 4470.

**1504.8 Reflectance.** Roof coverings on roofs or setbacks with slope less than three units vertical in 12 units horizontal (25 percent) shall be white in color or EnergyStar rated as highly reflective for at least 75 percent of the area of the roof or setback surface.

**Exceptions:**

1. Terraces on setbacks comprising less than 25 percent of the area of the largest floor plate in the building.
2. Green roofs in compliance with Section 1507.16 shall be permitted to comprise part or all of the 75 percent required area coverage.
3. Roofs used as outdoor recreation space by the occupants of the building shall be permitted to be either landscaped or covered with a walking surface or other protective surface with an albedo of 30 percent or greater.

**SECTION BC 1505**

**FIRE CLASSIFICATION**

**1505.1 General.** Roof assemblies shall be divided into the classes defined below. Class A, B and C roof assemblies and roof coverings required to be listed by this section shall be tested in accordance with ASTM E 108 or UL 790. In addition, fire-retardant-treated wood roof coverings shall be tested in accordance with ASTM D 2898. The minimum roof coverings installed on buildings shall comply with Table 1505.1 based on the type of construction of the building.

**TABLE 1505.1<sup>a,b</sup>**

**MINIMUM ROOF COVERING CLASSIFICATION FOR TYPES OF CONSTRUCTION**

<b>IA</b>	<b>IB</b>	<b>IIA</b>	<b>IIB</b>	<b>IIIA</b>	<b>IIIB</b>	<b>IV</b>	<b>VA</b>	<b>VB</b>
<i>B</i>	<i>B</i>	<i>B</i>	<i>B</i>	<i>B</i>	<i>B</i>	<i>B</i>	<i>B</i>	<i>C<sup>b</sup></i>

*For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m<sup>2</sup>*

- a. Unless otherwise required due to the location of the building within a fire district in accordance with Section D102.2.3 in Appendix D.*
- b. Buildings that are not more than two stories in height and having not more than 6,000 square feet of projected roof area and where there is a minimum 10-foot fire-separation distance from the leading edge of the roof to a lot line on all sides of the building, except for street fronts or public ways, shall be permitted to have roofs of No. 1 cedar or redwood shakes and No. 1 shingles in accordance with Section 1505.6.*

**1505.2 Class A roof assemblies.** *Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by an approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.*

**Exception:** *Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, exposed concrete roof deck, ferrous or copper shingles or sheets.*

**1505.3 Class B roof assemblies.** *Class B roof assemblies are those that are effective against moderate fire-test exposure. Class B roof assemblies and roof coverings shall be listed and identified as Class B by an approved testing agency.*

**Exception:** *Class B roof assemblies include those with coverings of metal sheets and shingles.*

**1505.4 Class C roof assemblies.** *Class C roof assemblies are those that are effective against light fire-test exposure. Class C roof assemblies and roof coverings shall be listed and identified as Class C by an approved testing agency.*

**1505.5 Construction of sloping roofs.** *Roofs having a slope of more than 60 degrees (1.05 rad) to the horizontal shall be constructed of material having the same fire-resistance-rating as required for an exterior non-bearing wall of the building of which it is a part. When the slope is 60 degrees (1.05 rad) or less to the horizontal, the sloping roof shall be constructed as required for the roof of the building. Where the back of a false mansard is exposed to the outdoors, the back shall be covered with noncombustible material or with roof covering as required for the roof of the building.*

**1505.6 Fire-retardant-treated wood shingles and shakes.** *Fire-retardant-treated wood shakes and shingles shall be treated by impregnation with chemicals by the full-cell vacuum-pressure process, in accordance with AWWA C1. Each bundle shall be marked to identify the manufactured unit and the manufacturer, and shall also be labeled to identify the classification of the material in accordance with the testing required in Section 1505.1, the treating company and the quality control agency.*

**1505.7 Special purpose roofs.** *Special purpose wood shingle or wood shake roofing shall conform with the grading and application requirements of Section 1507.8 or Section 1507.9. In addition, an underlayment of 0.625 inch (15.9 mm) Type X water-resistant gypsum backing board or gypsum sheathing shall be placed under minimum nominal 0.5-inch-thick (12.7 mm) wood structural panel solid sheathing or 1-inch (25 mm) nominal spaced sheathing.*

## **SECTION BC 1506**

### **MATERIALS**

**1506.1 Scope.** *The requirements set forth in this section shall apply to the application of roof-covering materials specified herein. Roof coverings shall be applied in accordance with this chapter and the manufacturer's installation instructions. Installation of roof coverings shall comply with the applicable provisions of Section 1507.*

**1506.2 Compatibility of materials.** *Roofs and roof coverings shall be of materials that are compatible with each other and with the building or structure to which the materials are applied.*

**1506.3 Material specifications and physical characteristics.** *Roof-covering materials shall conform to the applicable standards listed in this chapter. In the absence of applicable standards or where materials are of questionable suitability, testing by an approved agency shall be required by the commissioner to determine the character, quality and limitations of application of the materials.*

**1506.4 Product identification.** *Roof-covering materials shall be delivered in packages bearing the manufacturer's identifying marks and approved testing agency labels required in accordance with Section 1505. Bulk shipments of materials shall be accompanied with the same information issued in the form of a certificate or on a bill of lading by the manufacturer.*

## **SECTION BC 1507**

### **REQUIREMENTS FOR ROOF COVERINGS**

**1507.1 Scope.** *Roof coverings shall be applied in accordance with the applicable provisions of this section and the manufacturer's installation instructions.*

**1507.2 Asphalt shingles.** *The installation of asphalt shingles shall comply with the provisions of this section and Table 1507.2.*

**1507.2.1 Deck requirements.** *Asphalt shingles shall be fastened to solidly sheathed decks.*

**1507.2.2 Slope.** *Asphalt shingles shall only be used on roof slopes of two units vertical in 12 units horizontal (17-percent slope) or greater. For roof slopes from two units vertical in 12 units horizontal (17-percent slope) up to four units vertical in 12 units horizontal (33-percent slope), double underlayment application is required in accordance with Section 1507.2.8.*

**1507.2.3 Underlayment.** Unless otherwise noted, required underlayment shall conform to ASTM D 226, Type I, or ASTM D 4869, Type I.

**1507.2.4 Self-adhering polymer modified bitumen sheet.** Self-adhering polymer modified bitumen sheet shall comply with ASTM D 1970.

**1507.2.5 Asphalt shingles.** Asphalt shingles shall have self-seal strips or be interlocking, and comply with ASTM D 225 or ASTM D 3462.

**1507.2.6 Fasteners.** Fasteners for asphalt shingles shall be galvanized, stainless steel, aluminum or copper roofing nails, minimum 12 gage shank with a minimum 0.375 inch-diameter (9.5 mm) head, of a length to penetrate through the roofing materials and a minimum of 0.75 inch (19.1 mm) into the roof sheathing. Where the roof sheathing is less than 0.75 inch (19.1 mm) thick, the nails shall penetrate through the sheathing. Fasteners shall comply with ASTM F 1667.

**1507.2.7 Attachment.** Asphalt shingles shall have the minimum number of fasteners required by the manufacturer and Section 1504.1. Asphalt shingles shall be secured to the roof with not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 20 units vertical in 12 units horizontal (166 percent slope), special methods of fastening are required. For roofs located where the basic wind speed in accordance with Figure 1609 is 110 mph or greater, special methods of fastening are required. Special fastening methods shall be tested in accordance with ASTM D 3161, modified to use a wind speed of 110 mph.

**1507.2.8 Underlayment application.** For roof slopes from two units vertical in 12 units horizontal (17-percent slope), up to four units vertical in 12 units horizontal (33-percent slope), underlayment shall be two layers applied in the following manner. Apply a minimum 19-inch-wide (483 mm) strip of underlayment felt parallel with and starting at the eaves, fastened sufficiently to hold in place. Starting at the eave, apply 36-inch-wide (914 mm) sheets of underlayment overlapping successive sheets 19 inches (483 mm) and fastened sufficiently to hold in place. For roof slopes of four units vertical in 12 units horizontal (33-percent slope) or greater, underlayment shall be one layer applied in the following manner. Underlayment shall be applied shingle fashion, parallel to and starting from the eave and lapped 2 inches (51 mm), fastened only as necessary to hold in place.

**1507.2.8.1 Ice dam membrane.** Where there is a possibility of ice forming along the eaves causing a backup of water, a membrane that consists of at least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet shall be used in lieu of normal underlayment and extend from the eave's edge to a point at least 24 inches (610 mm) inside the

*exterior wall line of the building.*

**Exception:** *Detached accessory structures that contain no conditioned floor area.*

**1507.2.9 Flashings.** *Flashing for asphalt shingles shall comply with this section. Flashing shall be applied in accordance with this section and the asphalt shingle manufacturer's printed instructions.*

**1507.2.9.1 Base and cap flashing.** *Base and cap flashing shall be installed in accordance with the manufacturer's instructions. Base flashing shall be of either corrosion-resistant metal of minimum nominal 0.019-inch (0.483 mm) thickness or mineral-surfaced roll roofing weighing a minimum of 77 pounds per 100 square feet (3.76 kg/m<sup>2</sup>). Cap flashing shall be corrosion-resistant metal of minimum nominal 0.019-inch (0.483 mm) thickness.*

**1507.2.9.2 Valleys.** *Valley linings shall be installed in accordance with the manufacturer's instructions before applying shingles. Valley linings of the following types shall be permitted:*

- 1. For open valleys (valley lining exposed) lined with metal, the valley lining shall be at least 16 inches (406 mm) wide and of any of the corrosion-resistant metals in Table 1507.2.9.2.*
- 2. For open valleys, valley lining of two plies of mineral-surfaced roll roofing shall be permitted. The bottom layer shall be 18 inches (457 mm) and the top layer a minimum of 36 inches (914 mm) wide.*
- 3. For closed valleys (valleys covered with shingles), valley lining of one ply of smooth roll roofing complying with ASTM D 224 and at least 36 inches (914 mm) wide or types as described in Items 1 and 2 above shall be permitted. Specialty underlayment shall comply with ASTM D 1970.*

**TABLE 1507.2  
ASPHALT SHINGLE APPLICATION**

COMPONENT	INSTALLATION REQUIREMENT
1. Roof slope	Asphalt shingles shall only be used on roof slopes of two units vertical in 12 units horizontal (2:12) or greater. For roof slopes from two units vertical in 12 units horizontal (2:12) up to four units vertical in 12 units horizontal (4:12), double underlayment application is required in accordance with Section 1507.2.8.
2. Deck requirement	Asphalt shingles shall be fastened to solidly sheathed roofs.
3. Underlayment	Underlayment shall conform with ASTM D 226, Type 1, or ASTM D 4869, Type 1.
For roof slopes from two units vertical in 12 units horizontal (2:12), up to four units vertical in 12 units horizontal (4:12)	Underlayment shall be two layers applied in the following manner. Apply a minimum 19-inch strip or underlayment felt parallel to and starting at the eaves, fastened sufficiently to hold in place. Starting at the eave, apply 35-inch-wide sheets of underlayment overlapping successive sheets 19 inches and fastened sufficiently to hold in place.
For roof slopes from four units vertical in 12 units horizontal (4:12) or greater	Underlayment shall be one layer applied in the following manner. Underlayment shall be applied shingle fashion, parallel to and starting from the eave and lapped 2 inches, fastened only as necessary to hold in place.
In areas where the average daily temperature in January is 25°F or less or where there is a possibility of ice forming along the eaves causing a backup of water	A membrane that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the eave's edge to a point at least 24 inches inside the exterior wall line of the building.
4. Application	—
Attachment	Asphalt shingles shall have the minimum number of fasteners required by the manufacturer and Section 1504.1. Asphalt shingles shall be secured to the roof with not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 20 units vertical in 12 units horizontal (20:12), special methods of fastening are required.
Fasteners	Galvanized, stainless steel, aluminum or copper roofing nails, minimum 12-gage (0.015 inch) shank with a minimum 3/8-inch diameter head. Fasteners shall be long enough to penetrate into the sheathing 3/4 inch or through the thickness of the sheathing.
Flashings	In accordance with Section 1507.2.9.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, °C = [(°F) - 32]/1.8, 1 mile per hour = 1.609 km/h.

**TABLE 1507.2.9.2  
VALLEY LINING MATERIAL**

MATERIAL	MINIMUM THICKNESS	GAGE	WEIGHT
Copper	—	—	16 oz
Aluminum	0.024 in.	—	—
Stainless steel	—	28	—
Galvanized steel	0.0179 in.	26 (zinc-coated G90)	—
Zinc alloy	0.027 in.	—	—
Lead	—	—	2.5 pounds
Painted terne	—	—	20 pounds

For SI: 1 inch = 25.4 mm, 1 pound = 0.454 kg, 1 ounce = 28.35 g.

**1507.2.9.3 Drip edge.** Provide drip edge at eaves and gables of shingle roofs. Overlap to be a minimum of 2 inches (51 mm). Eave drip edges shall extend 0.25 inch (6.4 mm) below sheathing and extend back on the roof a minimum of 2 inches (51 mm). Drip edge shall be mechanically fastened a maximum of 12 inches (305 mm) o.c. A cricket or saddle shall be installed on the ridge side of any chimney greater than 30 inches (762 mm) wide. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

**1507.3 Clay and concrete tile.** The installation of clay and concrete tile shall comply with the provisions of this section.

**1507.3.1 Deck requirements.** Concrete and clay tile shall be installed only over solid sheathing or spaced structural sheathing boards.

**1507.3.2 Deck slope.** Clay and concrete roof tile shall be installed on roof slopes of 2½ units vertical in 12 units horizontal (21-percent slope) or greater. For roof slopes from 2½ units vertical in 12 units horizontal (21-percent slope) to four units vertical in 12 units horizontal (33-percent slope), double underlayment application is required in accordance with Section 1507.3.3.

**1507.3.3 Underlayment.** Unless otherwise noted, required underlayment shall conform to: ASTM D 226, Type II; ASTM D 2626 or ASTM D 249 Type I mineral-surfaced roll roofing.

**1507.3.3.1 Low-slope roofs.** For roof slopes from 2½ units vertical in 12 units horizontal (21-percent slope), up to four units vertical in 12 units horizontal (33-percent slope), underlayment shall be a minimum of two layers applied as follows:

1. Starting at the eave, a 19-inch (483 mm) strip of underlayment shall be applied parallel with the eave and fastened sufficiently in place.
2. Starting at the eave, 36-inch-wide (914 mm) strips of underlayment felt shall be applied overlapping successive sheets 19 inches (483 mm) and fastened sufficiently in place.

**1507.3.3.2 High-slope roofs.** For roof slopes of four units vertical in 12 units horizontal (33-percent slope) or greater, underlayment shall be a minimum of one layer of underlayment felt applied shingle fashion, parallel to, and starting from the eaves and lapped 2 inches (51 mm), fastened only as necessary to hold in place.

**1507.3.4 Clay tile.** Clay roof tile shall comply with ASTM C 1167.

**1507.3.5 Concrete tile.** *Concrete roof tiles shall be in accordance with the physical test requirements as follows:*

- 1. The transverse strength of tiles shall be determined according to Section 6.3 of ASTM C 1167 and in accordance with Table 1507.3.5.*
- 2. The absorption of concrete roof tiles shall be according to Section 8 of ASTM C 140. Roof tiles shall absorb not more than 15 percent of the dry weight of the tile during a 24-hour immersion test.*
- 3. Roof tiles shall be tested for freeze/thaw resistance according to Section 8 of ASTM C67. Roof tiles shall show no breakage and not have more than 1 percent loss in dry weight of any individual concrete roof tile.*

**TABLE 1507.3.5  
TRANSVERSE BREAKING STRENGTH  
OF CONCRETE ROOF TILE (lbs.)**

TILE PROFILE	DRY	
	Average of five tiles	Individual tile
High profile	400	350
Medium profile	300	250
Flat profile	300	250

For SI: 1 pound = 4.45 N.

**1507.3.6 Fasteners.** *Tile fasteners shall be corrosion resistant and not less than 11 gage, <sup>5</sup>/<sub>16</sub>-inch (8.0 mm) head, and of sufficient length to penetrate the deck a minimum of 0.75 inch (19.1 mm) or through the thickness of the deck, whichever is less. Attaching wire for clay or concrete tile shall not be smaller than 0.083 inch (2.1 mm). Perimeter fastening areas include three tile courses but not less than 36 inches (914 mm) from either side of hips or ridges and edges of eaves and gable rakes.*

**1507.3.7 Attachment.** *Clay and concrete roof tiles shall be fastened in accordance with Table 1507.3.7.*

**TABLE 1507.3.7  
CLAY AND CONCRETE TILE ATTACHMENT<sup>a, b, c</sup>**

GENERAL — CLAY OR CONCRETE ROOF TILE				
Maximum basic wind speed (mph)	Mean roof height (feet)	Roof slope		
		up to < 3:12	3:12 and over	
85	0-60	One fastener per tile. Flat tile without vertical laps, two fasteners per tile.	Two fasteners per tile. Only one fastener on slopes of 7:12 and less for tiles with installed weight exceeding 7.5 lbs./sq. ft. having a width no greater than 16 inches.	
100	0-40			
100	> 40-60	The head of all tiles shall be nailed. The nose of all eave tiles shall be fastened with approved clips. All rake tiles shall be nailed with two nails. The nose of all ridge, hip and rake tiles shall be set in a bead of roofer's mastic.		
110	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
120	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
130	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
All	> 60	The fastening system shall resist the wind forces in Section 1609.7.2.		
INTERLOCKING CLAY OR CONCRETE ROOF TILE WITH PROJECTING ANCHOR LUGS <sup>d, e</sup> (Installations on spaced/solid sheathing with battens or spaced sheathing)				
Maximum basic wind speed (mph)	Mean roof height (feet)	Roof slope		
		up to < 5:12	5:12 < 12:12	12:12 and over
85	0-60	Fasteners are not required. Tiles with installed weight less than 9 lbs./sq. ft. require a minimum of one fastener per tile.	One fastener per tile every other row. All perimeter tiles require one fastener. Tiles with installed weight less than 9 lbs./sq. ft. require a minimum of one fastener per tile.	One fastener required for every tile. Tiles with installed weight less than 9 lbs./sq. ft. require a minimum of one fastener per tile.
100	0-40			
100	> 40-60	The head of all tiles shall be nailed. The nose of all eave tiles shall be fastened with approved clips. All rake tiles shall be nailed with two nails. The nose of all ridge, hip and rake tiles shall be set in a bead of roofers's mastic.		
110	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
120	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
130	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
All	> 60	The fastening system shall resist the wind forces in Section 1609.7.2.		
INTERLOCKING CLAY OR CONCRETE ROOF TILE WITH PROJECTING ANCHOR LUGS (Installations on solid sheathing without battens)				
Maximum basic wind speed (mph)	Mean roof height (feet)	All roof slopes		
85	0-60	One fastener per tile.		
100	0-40	One fastener per tile.		
100	> 40-60	The head of all tiles shall be nailed. The nose of all eave tiles shall be fastened with approved clips. All rake tiles shall be nailed with two nails. The nose of all ridge, hip and rake tiles shall be set in a bead of roofers's mastic.		
110	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
120	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
130	0-60	The fastening system shall resist the wind forces in Section 1609.7.2.		
All	> 60	The fastening system shall resist the wind forces in Section 1609.7.2.		

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 1.609 km/h, 1 pound per square foot = 0.0478 kN/m<sup>2</sup>.

- Minimum fastener size. Corrosion-resistant nails not less than No. 11 gage with <sup>3</sup>/<sub>16</sub>-inch head. Fasteners shall be long enough to penetrate into the sheathing 0.75 inch or through the thickness of the sheathing, whichever is less. Attaching wire for clay and concrete tile shall not be smaller than 0.083 inch.
- Snow areas. A minimum of two fasteners per tile are required on battens and one fastener.
- Roof slopes greater than 24:12. The nose of all tiles shall be securely fastened.
- Horizontal battens. Battens shall be not less than 1 inch by 2 inch nominal. Provisions shall be made for drainage by a minimum of <sup>1</sup>/<sub>8</sub>-inch riser at each nail or by 4-foot-long battens with at least a 0.5-inch separation between battens. Horizontal battens are required for slopes over 7:12.
- Perimeter fastening areas include three tile courses but not less than 36 inches from either side of hips or ridges and edges of eaves and gable rakes.

**1507.3.8 Application.** *Tile shall be applied according to the manufacturer's installation instructions, based on the following:*

1. *Climatic conditions.*
2. *Roof slope.*
3. *Underlayment system.*
4. *Type of tile being installed.*

**1507.3.9 Flashing.** *At the juncture of the roof vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer's installation instructions, and where of metal, shall not be less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) underlayment of one layer of Type I underlayment running the full length of the valley, in addition to other required underlayment. Where there is a possibility of ice forming along the eaves causing a backup of water, the metal valley flashing underlayment shall be solid cemented to the roofing underlayment for slopes under seven units vertical in 12 units horizontal (58-percent slope) or of self-adhering polymer modified bitumen sheet.*

**1507.4 Metal roof panels.** *The installation of metal roof panels shall comply with the provisions of this section.*

**1507.4.1 Deck requirements.** *Metal roof panel roof coverings shall be applied to a solid or closely fitted deck, except where the roof covering is specifically designed to be applied to spaced supports.*

**1507.4.2 Deck slope.** *The minimum slope for lapped, nonsoldered seam metal roofs without applied lap sealant shall be three units vertical in 12 units horizontal (25-percent slope). The minimum slope for lapped, nonsoldered seam metal roofs with applied lap sealant shall be one-half vertical unit in 12 units horizontal (4-percent slope). The minimum slope for standing seam of roof systems shall be one-quarter unit vertical in 12 units horizontal (2-percent slope).*

**1507.4.3 Material standards.** *Metal-sheet roof covering systems that incorporate supporting structural*

*members shall be designed in accordance with Chapter 22. Metal-sheet roof coverings installed over structural decking shall comply with Table 1507.4.3.*

***1507.4.4 Attachment.*** *Metal roofing fastened directly to steel framing shall be attached by approved manufacturers' fasteners. In the absence of manufacturer recommendations, all of the following fasteners shall be used:*

- 1. Galvanized fasteners shall be used for galvanized roofs.*
- 2. 300 series stainless-steel fasteners shall be used for copper roofs.*
- 3. Stainless-steel fasteners are acceptable for all types of metal roofs.*

**TABLE 1507.4.3  
METAL ROOF COVERINGS**

ROOF COVERING TYPE	STANDARD APPLICATION RATE/THICKNESS
Aluminum	ASTM B 209, 0.024 inch minimum thickness for roll-formed panels and 0.019 inch minimum thickness for press-formed shingles.
Aluminum-zinc alloy coated steel	ASTM A 792 AZ 50
Copper	16 oz./sq. ft. for metal-sheet roof-covering systems; 12 oz./sq. ft. for preformed metal shingle systems.
Galvanized steel	ASTM A 653 G-90 zinc-coated, 0.013-inch-thick minimum
Lead-coated copper	ASTM B 101
Hard lead	2 lbs./sq. ft.
Soft lead	3 lbs./sq. ft.
Prepainted steel	ASTM A 755
Terne (tin) and terne-coated stainless	Terne coating of 40 lbs. per double base box, field painted where applicable in accordance with manufacturer's installation instructions.

For SI: 1 ounce per square foot = 0.0026 kg/m<sup>2</sup>,  
1 pound per square foot = 4.882 kg/m<sup>2</sup>,  
1 inch = 25.4 mm, 1 pound = 0.454 kg.

**1507.5 Metal roof shingles.** *The installation of metal roof shingles shall comply with the provisions of this section.*

**1507.5.1 Deck requirements.** *Metal roof shingles shall be applied to a solid or closely fitted deck, except where the roof covering is specifically designed to be applied to spaced sheathing.*

**1507.5.2 Deck slope.** *Metal roof shingles shall not be installed on roof slopes below three units vertical in 12 units horizontal (25-percent slope).*

**1507.5.3 Underlayment.** *Underlayment shall conform to ASTM D 226, Type I. Where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall be used in lieu of normal underlayment and extend from the eave's edge to a point at least 24 inches (610 mm) inside the exterior wall line of the building.*

**Exception:** *Detached accessory structures that contain no conditioned floor area.*

**1507.5.4 Material standards.** *Metal roof shingle roof coverings shall comply with Table 1507.4.3.*

**1507.5.5 Attachment.** *Metal roof shingles shall be secured to the roof in accordance with the approved manufacturer's installation instructions.*

**1507.5.6 Flashing.** *Roof valley flashing shall be of corrosion-resistant metal of the same material as the roof covering or shall comply with the standards in Table 1507.4.3. The valley flashing shall extend at least 8 inches (203 mm) from the centerline each way and shall have a splash diverter rib not less than 0.75 inch (19.1 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). Where there is a possibility of ice forming along the eaves causing a backup of water, the metal valley flashing shall have a 36-inch-wide (914 mm) underlayment directly under it consisting of one layer of underlayment running the full length of the valley, in addition to underlayment required for metal roof shingles. The metal valley flashing underlayment shall be solid cemented to the roofing underlayment for roof slopes under seven units vertical in 12 units horizontal (58-percent slope) or of self-adhering polymer-modified bitumen sheet.*

**1507.6 Mineral-surfaced roll roofing.** *The installation of mineral-surfaced roll roofing shall comply with this section.*

**1507.6.1 Deck requirements.** *Mineral-surfaced roll roofing shall be fastened to solidly sheathed roofs.*

**1507.6.2 Deck slope.** Mineral-surfaced roll roofing shall not be applied on roof slopes below one unit vertical in 12 units horizontal (8-percent slope).

**1507.6.3 Underlayment.** Underlayment shall conform to ASTM D 226, Type I. Where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall extend from the eave's edge to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

**Exception:** Detached accessory structures that contain no conditioned floor area.

**1507.6.4 Material standards.** Mineral-surfaced roll roofing shall conform to ASTM D 224, ASTM D 249, ASTM D 371 or ASTM D 3909.

**1507.7 Slate shingles.** The installation of slate shingles shall comply with the provisions of this section.

**1507.7.1 Deck requirements.** Slate shingles shall be fastened to solidly sheathed roofs.

**1507.7.2 Deck slope.** Slate shingles shall only be used on slopes of four units vertical in 12 units horizontal (4:12) or greater.

**1507.7.3 Underlayment.** Underlayment shall comply with ASTM D 226, Type II. Where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet, shall extend from the eave's edge to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

**Exception:** Detached accessory structures that contain no conditioned floor area.

**1507.7.4 Material standards.** Slate shingles shall comply with ASTM C 406.

**1507.7.5 Application.** Minimum headlap for slate shingles shall be in accordance with Table 1507.7.5. Slate shingles shall be secured to the roof with two fasteners per slate.

**TABLE 1507.7.5  
SLATE SHINGLE HEADLAP**

<b>SLOPE</b>	<b>HEADLAP (inches)</b>
4:12 < slope < 8:12	4
8:12 < slope < 20:12	3
slope $\geq$ 20:12	2

For SI: 1 inch = 25.4 mm.

**1507.7.6 Flashing.** Flashing and counterflashing shall be made with sheet metal. Valley flashing shall be a minimum of 15 inches (381 mm) wide. Valley and flashing metal shall be a minimum uncoated thickness of 0.0179-inch (0.455 mm) zinc-coated G90. Chimneys, stucco or brick walls shall have a minimum of two plies of felt for a cap flashing consisting of a 4-inch-wide (102 mm) strip of felt set in plastic cement and extending 1 inch (25 mm) above the first felt and a top coating of plastic cement. The felt shall extend over the base flashing 2 inches (51 mm).

**1507.8 Wood shingles.** The installation of wood shingles shall comply with the provisions of this section and Table 1507.8.

**1507.8.1 Deck requirements.** Wood shingles shall be installed on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall not be less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners.

**1507.8.1.1 Solid sheathing required.** Solid sheathing is required where there is a possibility of ice forming along the eaves causing a backup of water.

**1507.8.2 Deck slope.** Wood shingles shall be installed on slopes of three units vertical in 12 units horizontal (25-percent slope) or greater.

**1507.8.3 Underlayment.** Underlayment shall comply with ASTM D 226, Type I. Where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the eave's edge to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

**Exception:** Detached accessory structures that contain no conditioned floor area.

**TABLE 1507.8  
WOOD SHINGLE AND SHAKE INSTALLATION**

ROOF ITEM	WOOD SHINGLES	WOOD SHAKES
1. Roof slope	Wood shingles shall be installed on slopes of three units vertical in 12 units horizontal (3:12) or greater.	Wood shakes shall be installed on slopes of four units vertical in 12 units horizontal (4:12) or greater.
2. Deck requirement	—	—
Temperate climate	Shingles shall be applied to roofs with solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall not be less than 1" x 4" nominal dimensions and shall be spaced on center equal to the weather exposure to coincide with the placement of fasteners.	Shakes shall be applied to roofs with solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall not be less than 1" x 4" nominal dimensions and shall be spaced on center equal to the weather exposure to coincide with the placement of fasteners. When 1" x 4" spaced sheathing is installed at 10 inches, boards must be installed between the sheathing boards.
In areas where the average daily temperature in January is 25°F or less or where there is a possibility of ice forming along the eaves causing a backup of water.	Solid sheathing required.	Solid sheathing is required.
3. Interlayment	No requirements.	Interlayment shall comply with ASTM D 226, Type 1.
4. Underlayment	—	—
Temperate climate	Underlayment shall comply with ASTM D 226, Type 1.	Underlayment shall comply with ASTM D 226, Type 1.
In areas where the average daily temperature in January is 25°F or less or where there is a possibility of ice forming along the eaves causing a backup of water.	An ice shield that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the eave's edge to a point at least 24 inches inside the exterior wall line of the building.	An ice shield that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the eave's edge to a point at least 24 inches inside the exterior wall line of the building.
5. Application	—	—
Attachment	Fasteners for wood shingles shall be corrosion resistant with a minimum penetration of 0.75 inch into the sheathing. For sheathing less than 0.5 inch thick, the fasteners shall extend through the sheathing.	Fasteners for wood shakes shall be corrosion resistant with a minimum penetration of 0.75 inch into the sheathing. For sheathing less than 0.5 inch thick, the fasteners shall extend through the sheathing.
No. of fasteners	Two per shingle.	Two per shake.
Exposure	Weather exposures shall not exceed those set forth in Table 1507.8.6	Weather exposures shall not exceed those set forth in Table 1507.9.7
Method	Shingles shall be laid with a side lap of not less than 1.5 inches between joints in courses, and no two joints in any three adjacent courses shall be in direct alignment. Spacing between shingles shall be 0.25 to 0.375 inch.	Shakes shall be laid with a side lap of not less than 1.5 inches between joints in adjacent courses. Spacing between shakes shall not be less than 0.375 inch or more than 0.625 inch for shakes and tapersawn shakes of naturally durable wood and shall be 0.25 to 0.375 inch for preservative taper sawn shakes.
Flashing	In accordance with Section 1507.8.7.	In accordance with Section 1507.9.8.

For SI: 1 inch = 25.4 mm, °C = [(°F) - 32]/1.8.

**1507.8.4 Material standards.** *Wood shingles shall be of naturally durable wood and comply with the requirements of Table 1507.8.4.*

**TABLE 1507.8.4  
WOOD SHINGLE MATERIAL REQUIREMENTS**

<b>MATERIAL</b>	<b>APPLICABLE MINIMUM GRADES</b>	<b>GRADING RULES</b>
Wood shingles of naturally durable wood	1, 2 or 3	CSSB

CSSB = Cedar Shake and Shingle Bureau

**1507.8.5 Attachment.** Fasteners for wood shingles shall be corrosion resistant with a minimum penetration of 0.75 inch (19.1 mm) into the sheathing. For sheathing less than 0.5 inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Each shingle shall be attached with a minimum of two fasteners.

**1507.8.6 Application.** Wood shingles shall be laid with a side lap not less than 1.5 inches (38 mm) between joints in adjacent courses, and not be in direct alignment in alternate courses. Spacing between shingles shall be 0.25 to 0.375 inches (6.4 to 9.5 mm). Weather exposure for wood shingles shall not exceed that set in Table 1507.8.6.

**TABLE 1507.8.6  
WOOD SHINGLE WEATHER EXPOSURE AND ROOF SLOPE**

ROOFING MATERIAL	LENGTH(inches)	GRADE	EXPOSURE (inches)	
			3:12 pitch to < 4:12	4:12 pitch or steeper
Shingles of naturally durable wood	16	No. 1	3.75	5
		No. 2	3.5	4
		No. 3	3	3.5
	18	No. 1	4.25	5.5
		No. 2	4	4.5
		No. 3	3.5	4
	24	No. 1	5.75	7.5
		No. 2	5.5	6.5
		No. 3	5	5.5

For SI: 1 inch = 25.4 mm.

**1507.8.7 Flashing.** *At the juncture of the roof and vertical surfaces, flashing and counterflashing shall be provided in accordance with the manufacturer's installation instructions, and where of metal, shall not be less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of three units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) underlayment of one layer of Type I underlayment running the full length of the valley, in addition to other required underlayment. Where there is a possibility of ice forming along the eaves causing a backup of water, the metal valley flashing underlayment shall be solid cemented to the roofing underlayment for slopes under seven units vertical in 12 units horizontal (58-percent slope).*

**1507.9 Wood shakes.** *The installation of wood shakes shall comply with the provisions of this section and Table 1507.8.*

**1507.9.1 Deck requirements.** *Wood shakes shall only be used on solid or spaced sheathing. Where spaced sheathing is used, sheathing boards shall not be less than 1-inch by 4-inch (25 mm by 102 mm) nominal dimensions and shall be spaced on centers equal to the weather exposure to coincide with the placement of fasteners. Where 1-inch by 4-inch (25 mm by 102 mm) spaced sheathing is installed at 10 inches (254 mm) o.c., additional 1-inch by 4-inch (25 mm by 102 mm) boards shall be installed between the sheathing boards.*

**1507.9.1.1 Solid sheathing required.** *Solid sheathing is required in areas where the average daily temperature in January is 25°F (-4°C) or less or where there is a possibility of ice forming along the eaves causing a backup of water.*

**1507.9.2 Deck slope.** *Wood shakes shall only be used on slopes of four units vertical in 12 units horizontal (33-percent slope) or greater.*

**1507.9.3 Underlayment.** *Underlayment shall comply with ASTM D 226, Type I. Where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or a self-adhering polymer-modified bitumen sheet shall extend from the edge of the eave to a point at least 24 inches (610 mm) inside the exterior wall line of the building.*

**Exception:** *Detached accessory structures that contain no conditioned floor area.*

**1507.9.4 Interlayment.** *Interlayment shall comply with ASTM D 226, Type I.*

**1507.9.5 Material standards.** *Wood shakes shall comply with the requirements of Table 1507.9.5.*

**TABLE 1507.9.5  
WOOD SHAKE MATERIAL REQUIREMENTS**

MATERIAL	MINIMUM GRADES	APPLICABLE GRADING RULES
Wood shakes of naturally durable wood	1	CSSB
Taper sawn shakes of naturally durable wood	1 or 2	CSSB
Preservative-treated shakes and shingles of naturally durable wood	1	CSSB
Fire-retardant-treated shakes and shingles of naturally durable wood	1	CSSB
Preservative-treated taper sawn shakes of Southern yellow pine treated in accordance with AWPAs Standard C2	1 or 2	TFS

CSSB = Cedar Shake and Shingle Bureau.

TFS = Forest Products Laboratory of the Texas Forest Services.

**1507.9.6 Attachment.** Fasteners for wood shakes shall be corrosion resistant with a minimum penetration of 0.75 inch (19.1 mm) into the sheathing. For sheathing less than 0.5 inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Each shake shall be attached with a minimum of two fasteners.

**1507.9.7 Application.** Wood shakes shall be laid with a side lap not less than 1.5 inches (38 mm) between joints in adjacent courses. Spacing between shakes in the same course shall be 0.375 to 0.625 inches (9.5 to 15.9 mm) for shakes and taper sawn shakes of naturally durable wood and shall be 0.25 to 0.375 inch (6.4 to 9.5 mm) for preservative taper sawn shakes. Weather exposure for wood shakes shall not exceed those set in Table 1507.9.7.

**TABLE 1507.9.7  
WOOD SHAKE WEATHER EXPOSURE  
AND ROOF SLOPE**

ROOFING MATERIAL	LENGTH (inches)	GRADE	EXPOSURE (inches) 4:12 PITCH OR STEEPER
Shakes of naturally durable wood	18	No. 1	7.5
	24	No. 1	10a
Preservative-treated taper sawn shakes of Southern yellow pine	18	No. 1	7.5
	24	No. 1	10
	18	No. 2	5.5
	24	No. 2	7.5
Taper sawn shakes of naturally durable wood	18	No. 1	7.5
	24	No. 1	10
	18	No. 2	5.5
	24	No. 2	7.5

For SI: 1 inch = 25.4 mm.

- a. For 24-inch by 0.375-inch handsplit shakes, the maximum exposure is 7.5 inches.

**1507.9.8 Flashing.** *At the juncture of the roof and vertical surfaces, flashing and counter-flashing shall be provided in accordance with the manufacturer's installation instructions, and where of metal, shall not be less than 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal. The valley flashing shall extend at least 11 inches (279 mm) from the centerline each way and have a splash diverter rib not less than 1 inch (25 mm) high at the flow line formed as part of the flashing. Sections of flashing shall have an end lap of not less than 4 inches (102 mm). For roof slopes of 3 units vertical in 12 units horizontal (25-percent slope) and over, the valley flashing shall have a 36-inch-wide (914 mm) underlayment of one layer of Type I underlayment running the full length of the valley, in addition to other required underlayment. Where there is a possibility of ice forming along the eaves causing a backup of water, the metal valley flashing underlayment shall be solid cemented to the roofing underlayment for slopes under seven units vertical in 12 units horizontal (58-percent slope).*

**1507.10 Built-up roofs.** *The installation of built-up roofs shall comply with the provisions of this section.*

**1507.10.1 Slope.** *Built-up roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.10.2 Material standards.** *Built-up roof covering materials shall comply with the standards in Table 1507.10.2.*

**TABLE 1507.10.2  
BUILT-UP ROOFING MATERIAL STANDARDS**

<b>MATERIAL STANDARD</b>	<b>STANDARD</b>
Acrylic coatings used in roofing	ASTM D 6083
Aggregate surfacing	ASTM D 1863
Asphalt adhesive used in roofing	ASTM D 3747
Asphalt cements used in roofing	ASTM D 3019; D 2822; D 4586
Asphalt-coated glass fiber base sheet	ASTM D 4601
Asphalt coatings used in roofing	ASTM D1227; D 2823; D 4479
Asphalt glass felt	ASTM D 2178
Asphalt primer used in roofing	ASTM D 41
Asphalt-saturated and asphalt-coated organic felt base sheet	ASTM D 2626
Asphalt-saturated organic felt (perforated)	ASTM D 226
Asphalt used in roofing	ASTM D 312
Coal-tar cements used in roofing	ASTM D 4022; D 5643
Coal-tar saturated organic felt	ASTM D 227
Coal-tar pitch used in roofing	ASTM D 450; Type I or II
Coal-tar primer used in roofing, damproofing and waterproofing	ASTM D 43
Glass mat, coal tar	ASTM D 4990
Glass mat, venting type	ASTM D 4897
Mineral-surfaced inorganic cap sheet	ASTM D 3909
Thermoplastic fabrics used in roofing	ASTM D 5665, D 5726

**1507.11 Modified bitumen roofing.** *The installation of modified bitumen roofing shall comply with the provisions of this section.*

**1507.11.1 Slope.** *Modified bitumen membrane roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.11.2 Material standards.** *Modified bitumen roof coverings shall comply with CGSB 37-GP-56M, ASTM D 6162, ASTM D 6163, ASTM D 6164, ASTM D 6222, ASTM D 6223 and ASTM D 6298.*

**1507.12 Thermoset single-ply roofing.** *The installation of thermoset single-ply roofing shall comply with the provisions of this section.*

**1507.12.1 Slope.** *Thermoset single-ply membrane roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.12.2 Material standards.** *Thermoset single-ply roof coverings shall comply with RMA RP-1, RP-2 or RP-3, or ASTM D 4637, ASTM D 5019 or CGSB 37-GP-52M.*

**1507.13 Thermoplastic single-ply roofing.** *The installation of thermoplastic single-ply roofing shall comply with the provisions of this section.*

**1507.13.1 Slope.** *Thermoplastic single-ply membrane roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.13.2 Material standards.** *Thermoplastic single-ply roof coverings shall comply with ASTM D 4434 or CGSB 37-GP-54M.*

**1507.14 Sprayed polyurethane foam roofing.** *The installation of sprayed polyurethane foam roofing shall comply with the provisions of this section.*

**1507.14.1 Slope.** *Sprayed polyurethane foam roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.14.2 Material standards.** *Spray-applied polyurethane foam insulation shall comply with ASTM C 1029.*

**1507.14.3 Application.** *Foamed-in-place roof insulation shall be installed in accordance with the*

*manufacturer's instructions. A liquid-applied protective coating that complies with Section 1507.15 shall be applied no less than 2 hours nor more than 72 hours following the application of the foam.*

**1507.14.4 Foamplastics.** *Foam plastic materials and installation shall comply with Chapter 26.*

**1507.15 Liquid-applied coatings.** *The installation of liquid-applied coatings shall comply with the provisions of this section.*

**1507.15.1 Slope.** *Liquid-applied roofs shall have a slope designed and built to provide positive roof drainage.*

**1507.15.2 Material standards.** *Liquid-applied roof coatings shall comply with ASTM C 836, ASTM C 957, ASTM D 6083, ASTM D 1227 or ASTM D 3468.*

**1507.16 Green roof System.** *The installation of a green roof system shall comply with this section.*

**1507.16.1 Roof covering.** *Roof covering shall conform with Sections 1507.10, 1507.11, 1507.12, 1507.13, or 1507.15.*

**1507.16.2 Slope.** *Green roof systems shall have a design slope in accordance with the roof covering utilized.*

**1507.16.3 Material Standards.** *Green roof systems shall comply with required standards for the roof covering and good practice standards for the landscape material components. Either an affidavit from the roof covering manufacturer, stating review and acceptance of the final work, shall be provided prior to sign-off of construction or a controlled inspection by the professional architect or engineer shall be performed.*

## **SECTION BC 1508**

### **ROOF INSULATION**

**1508.1 General.** *The use of above-deck thermal insulation shall be permitted provided such insulation is covered with an approved roof covering and passes the tests of FM 4450 or UL 1256 when tested as an assembly.*

**Exception:** *Foam plastic roof insulation shall conform to the material and installation requirements of Chapter 26.*

**1508.1.1 Cellulosic fiberboard.** Cellulosic fiberboard roof insulation shall conform to the material and installation requirements of Chapter 23.

**SECTION BC 1509**  
**ROOFTOP STRUCTURES**

**1509.1 General.** The provisions of this section shall govern the construction of rooftop structures. All rooftop structures shall be subject to the roof area coverage limitations and building height requirements of Chapter 5. Rooftop structures shall be constructed with materials as required for the building, except as provided for in this section.

**1509.2 Bulkheads and Penthouses.** Bulkheads and penthouses shall comply with the construction requirements of Section 1509.2.

**1509.2.1 Type of construction.** Bulkheads and penthouses shall be constructed with walls, floors and roof as required for the building.

**Exceptions:** Where the total aggregate area of all rooftop structures does not exceed 33 ⅓ percent of the area of the roof of the building upon which they are erected; the following shall apply:

1. Bulkheads on buildings of Type I and II construction. The exterior walls and roofs of such bulkheads with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible construction. Walls and roofs with a fire separation distance of 20 feet (6096 mm) or greater shall be of noncombustible construction. Interior framing and walls shall be of noncombustible construction.
2. Bulkheads on buildings of Type III, IV and V construction. The exterior walls of such bulkheads with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be at least 1-hour fire-resistance-rated construction. Walls with a fire separation distance of 20 feet (6096 mm) or greater from a common property line shall be of Type IV or noncombustible construction. Roofs shall be constructed of materials and fire-resistance rated as required in Table 601. Interior framing and walls shall be Type IV or noncombustible construction.
3. Unprotected noncombustible enclosures housing only mechanical equipment and located

*with a minimum fire separation distance of 20 feet (6096 mm) shall be permitted.*

4. *On one-story buildings, combustible unroofed mechanical equipment screens, fences or similar enclosures are permitted where located with a fire separation distance of at least 20 feet (6096 mm) from adjacent property lines and where not exceeding 4 feet (1219 mm) in height above the roof surface.*

**1509.2.2 Penthouses.** *Enclosed walls of penthouses shall comply with the requirements for exterior walls as per Table 601 and 602 for the construction class of the building on which they are erected. Roofs of penthouses shall comply with the requirements for roof construction of Table 601 and Chapter 15 of this code.*

**1509.2.3 Bulkheads.** *An enclosed rooftop structure not intended for human occupancy shall not be used for purposes other than shelter of mechanical equipment or shelter of vertical shaft openings in the roof. Provisions such as louvers, louver blades or flashing shall be made to protect the mechanical equipment and the building interior from the elements.*

**1509.3 Tank supports.** *Tanks having a capacity of more than 500 gallons (2 m<sup>3</sup>) placed in or on a building shall be supported on masonry, reinforced concrete, steel or Type IV construction provided that, where such supports are located in the building above the lowest story, the support shall be fire-resistance rated as required for Type IA construction.*

**1509.3.1 Valve.** *Such tanks shall have in the bottom or on the side near the bottom, a pipe or outlet, fitted with a suitable quick opening valve for discharging the contents in an emergency through an adequate drain.*

**1509.3.2 Location.** *Such tanks shall not be placed over or near a line of stairs or an elevator shaft, unless there is a solid roof or floor underneath the tank.*

**1509.3.3 Tank cover.** *Unenclosed roof tanks shall have covers sloping toward the outer edges.*

**1509.4 Cooling towers.** *Cooling towers in excess of 250 square feet (23.2 m<sup>2</sup>) in base area or in excess of 15 feet (4572 mm) high where located on buildings more than 50 feet (15 240 mm) high shall be of noncombustible construction.*

**Exceptions:**

1. *Drip boards and the enclosing construction of wood not less than 1 inch (25 mm) nominal thickness, provided the wood is covered on the exterior of the tower with noncombustible material.*
2. *Filling and drift eliminators may be of combustible material if the towers are provided with automatic sprinkler protection complying with Section 903 of this code.*

**1509.5 Steeple, minarets, spires, domes and cupolas.** *Any steeple, minaret, spire, dome or cupola shall be of a type of construction not less in fire-resistance rating than required for the building to which it is attached except that any such steeple, minaret, spire, dome or cupola that exceeds 85 feet (25 908 mm) in height above grade, or exceeds 200 square feet (18.6 m<sup>2</sup>) in horizontal area or is used for any purpose other than a belfry or an architectural embellishment shall be constructed of and supported on Type I or II construction.*

**1509.5.1 Noncombustible construction required.** *Any steeple, minaret, spire, dome or cupola that exceeds 60 feet (18 288 mm) in height above the highest point at which it comes in contact with the roof, or that exceeds 200 square feet (18.6 m<sup>2</sup>) in area at any horizontal section, or which is intended to be used for any purpose other than a belfry or architectural embellishment, shall be entirely constructed of and supported by noncombustible materials. Such structures shall be separated from the building below by construction having a fire-resistance rating of not less than 1.5 hours with openings protected with a minimum 1.5-hour fire-protection rating. Such structures placed above the roof of any building more than 50 feet (15 240 mm) in height, shall be of noncombustible material and shall be supported by construction of noncombustible material.*

**1509.5.2 Steeple, minarets and spires.** *Steeple, minarets, and spires where enclosed shall have exterior walls as required for the building to which they are attached. The roof covering of spires shall be of a class of roof covering as required for the main roof of the rest of the structure.*

**1509.6 Dormers.** *Dormers shall have exterior walls as required for the building to which they are attached. The roof covering of dormers shall be of a class of roof covering as required for the main roof of the rest of the structure.*

**1509.7 Greenhouses.** *Greenhouses used for the cultivation of plants, on the roofs of buildings other than buildings of Type V construction, shall be constructed of noncombustible framework and shall be glazed with plain or wire glass, or light transmitting plastic glazing complying with the requirements of Section 2606. The floors of greenhouses shall be constructed to be at least equal to the requirements for roof construction on Table 601 for the construction class of the building on which it is located.*

**1509.8 Protective guards.** Buildings greater than 22 feet (6706 mm) in height with roof slopes less than 2.4 units vertical in 12 units horizontal (20 percent slope) shall be provided with a parapet, railing, fence, or combination thereof, not less than 42 inches (1067 mm) in height. Railings or fences may be located inward from the face of the exterior wall a distance not exceeding 6 feet (1829 mm). Railings or fences shall be of noncombustible material, except on buildings of Type V construction. Railings shall be constructed to comply with the requirements of Sections 1012 and 1607.7.

**1509.8.1 Fences on roofs used for recreational purposes.** Rooftops used for recreational purposes shall be provided with wire fencing at least 10 feet (3048 mm) in height. Openings in the fence shall not permit the passage of a 4-inch diameter (102 mm) sphere. Where ball games are played on rooftops the wire fencing shall be extended to provide an overhead closure.

**1509.9 Miscellaneous combustible roof structures.** The following roof structures may be constructed of combustible material if less than 12 feet (1658 mm) high above the roof: antenna supports; flagpoles; clothes drying frames; duckboarding, decking or platforms that do not cover more than 20 percent of the contiguous roof area at that level.

## **SECTION BC 1510 REROOFING**

**1510.1 General.** Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15.

**1510.2 Structural and construction loads.** Structural roof components shall be capable of supporting the roof-covering system and the material and equipment loads that will be encountered during installation of the system.

**1510.3 Recovering versus replacement.** New roof coverings shall not be installed without first removing all existing layers of roof coverings where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

***Exceptions:***

- 1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.*
- 2. Metal panel, metal shingle, and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.*

***1510.4 Roof recovering.*** *Where the application of a new roof covering over wood shingle or shake roofs creates a combustible concealed space, the entire existing surface shall be covered with gypsum board, mineral fiber, glass fiber or other approved materials securely fastened in place.*

***1510.5 Reinstallation of materials.*** *Existing slate, clay or cement tile shall be permitted for reinstallation, except that damaged, cracked or broken slate or tile shall not be reinstalled. Existing vent flashing, metal edgings, drain outlets, collars and metal counterflashings shall not be reinstalled where rusted, damaged or deteriorated. Aggregate surfacing materials shall not be reinstalled.*

***1510.6 Flashings.*** *Flashings shall be reconstructed in accordance with approved manufacturer's installation instructions. Metal flashing to which bituminous materials are to be adhered shall be primed prior to installation.*

**CHAPTER 16**  
**STRUCTURAL DESIGN**

**SECTION BC 1601**  
**GENERAL**

**1601.1 Scope.** *The provisions of this chapter shall govern the structural design of buildings, structures and portions thereof regulated by this code.*

**SECTION BC 1602**  
**DEFINITIONS**

**1602.1 Definitions.** *The following words and terms shall, for the purposes of this code, have the meanings shown herein.*

**ALLOWABLE STRESS DESIGN.** *A method of proportioning structural members, such that elastically computed stresses produced in the members by nominal loads do not exceed specified allowable stresses (also called “working stress design”).*

**BALCONY, EXTERIOR.** *An exterior floor projecting from and supported by a structure without additional independent supports.*

**BASE SHEAR.** *Total design lateral force or shear at the base.*

**BASIC SEISMIC-FORCE-RESISTING SYSTEMS.**

**Bearing wall system.** *A structural system without a complete vertical load-carrying space frame. Bearing walls or bracing elements provide support for substantial vertical loads. Seismic lateral force resistance is provided by shear walls or braced frames.*

**Building frame system.** *A structural system with an essentially complete space frame providing support for vertical loads. Seismic lateral force resistance is provided by shear walls or braced frames.*

**Dual system.** *A structural system with an essentially complete space frame providing support for vertical loads. Seismic lateral force resistance is provided by a moment frame and shear walls or braced frames.*

***Inverted pendulum system.*** A structure with a large portion of its mass concentrated at the top; therefore, having essentially one degree of freedom in horizontal translation. Seismic lateral force resistance is provided by the columns acting as cantilevers.

***Moment-resisting frame system.*** A structural system with an essentially complete space frame providing support for vertical loads. Seismic lateral force resistance is provided by moment frames.

***Shear wall-frame interactive system.*** A structural system which uses combinations of shear walls and frames designed to resist seismic lateral forces in proportion to their rigidities, considering interaction between shear walls and frames on all levels. Support of vertical loads is provided by the same shear walls and frames.

***BOUNDARY MEMBERS.*** Strengthened portions along shear wall and diaphragm edges (also called “boundary elements”).

***Boundary element.*** In light-frame construction, diaphragms and shear wall boundary members to which sheathing transfers forces. Boundary elements include chords and drag struts at diaphragm and shear wall perimeters, interior openings, discontinuities and reentrant corners.

***CANTILEVERED COLUMN SYSTEM.*** A structural system relying on column elements that cantilever from a fixed base and have minimal rotational resistance capacity at the top with lateral forces applied essentially at the top and are used for lateral resistance.

***COLLECTOR ELEMENTS.*** Members that serve to transfer forces between floor diaphragms and members of the lateral-force-resisting system.

***CONFINED REGION.*** The portion of a reinforced concrete component in which the concrete is confined by closely spaced special transverse reinforcement restraining the concrete in directions perpendicular to the applied stress.

***DEAD LOADS.*** The weight of materials of construction incorporated into the building, including but not limited to walls, floors, roofs, ceilings, stairways, built-in partitions, finishes, cladding and other similarly incorporated architectural and structural items, and fixed service equipment, including the weight of cranes. All dead loads are considered permanent loads.

***DECK.*** An exterior floor supported on at least two opposing sides by an adjacent structure, and/or posts, piers

or other independent supports.

**DEFORMABILITY.** *The ratio of the ultimate deformation to the limit deformation.*

**High deformability element.** *An element whose deformability is not less than 3.5 when subjected to four fully reversed cycles at the limit deformation.*

**Limited deformability element.** *An element that is neither a low deformability or a high deformability element.*

**Low deformability element.** *An element whose deformability is 1.5 or less.*

**DEFORMATION.**

**Limited deformation.** *Two times the initial deformation that occurs at a load equal to 40 percent of the maximum strength.*

**Ultimate deformation.** *The deformation at which failure occurs and which shall be deemed to occur if the sustainable load reduces to 80 percent or less of the maximum strength.*

**DESIGN STRENGTH.** *The product of the nominal strength and a resistance factor (or strength reduction factor).*

**DIAPHRAGM.** *A horizontal or sloped system acting to transmit lateral forces to the vertical-resisting elements. When the term “diaphragm” is used, it shall include horizontal bracing systems.*

**Diaphragm, blocked.** *In light-frame construction, a diaphragm in which all sheathing edges not occurring on a framing member are supported on and fastened to blocking.*

**Diaphragm boundary.** *In light-frame construction, a location where shear is transferred into or out of the diaphragm sheathing. Transfer is either to a boundary element or to another force-resisting element.*

**Diaphragm chord.** *A diaphragm boundary element perpendicular to the applied load that is assumed to take axial stresses due to the diaphragm moment.*

**Diaphragm, flexible.** *A diaphragm is flexible for the purpose of distribution of story shear and torsional*

*moment when the computed maximum in-plane deflection of the diaphragm itself under lateral load is more than two times the average drift of adjoining vertical elements of the lateral-force-resisting system of the associated story under equivalent tributary lateral load (see Section 1617.5.3).*

**Diaphragm, rigid.** *A diaphragm is rigid for the purpose of distribution of story shear and torsional moment when the lateral deformation of the diaphragm is less than or equal to two times the average story drift.*

**DURATION OF LOAD.** *The period of continuous application of a given load, or the aggregate of periods of intermittent applications of the same load.*

**ELEMENT.**

**Ductile element.** *An element capable of sustaining large cyclic deformations beyond the attainment of its nominal strength without any significant loss of strength.*

**Limited ductile element.** *An element that is capable of sustaining moderate cyclic deformations beyond the attainment of nominal strength without significant loss of strength.*

**Nonductile element.** *An element having a mode of failure that results in an abrupt loss of resistance when the element is deformed beyond the deformation corresponding to the development of its nominal strength. Nonductile elements cannot reliably sustain significant deformation beyond that attained at their nominal strength.*

**EQUIPMENT SUPPORT.** *Those structural members or assemblies of members or manufactured elements, including braces, frames, lugs, snuggers, hangers or saddles, that transmit gravity load and operating load between the equipment and the structure.*

**ESSENTIAL FACILITIES.** *Buildings and other structures that are intended to remain operational in the event of extreme environmental loading from flood, wind, snow or earthquakes.*

**FACTORED LOAD.** *The product of a nominal load and a load factor.*

**FLEXIBLE EQUIPMENT CONNECTIONS.** *Those connections between equipment components that permit rotational and/or translational movement without degradation of performance.*

**FRAME.**

**Braced frame.** An essentially vertical truss, or its equivalent, of the concentric or eccentric type that is provided in a building frame system or dual system to resist lateral forces.

**Concentrically braced frame (CBF).** A braced frame in which the members are subjected primarily to axial forces.

**Eccentrically braced frame (EBF).** A diagonally braced frame in which at least one end of each brace frames into a beam a short distance from a beam-column or from another diagonal brace.

**Ordinary concentrically braced frame (OCBF).** A steel concentrically braced frame in which members and connections are designed in accordance with the provisions of AISC Seismic without modification.

**Special concentrically braced frame (SCBF).** A steel or composite steel and concrete concentrically braced frame in which members and connections are designed for ductile behavior.

**Moment frame.** A frame in which members and joints resist lateral forces by flexure as well as along the axis of the members. Moment frames are categorized as “intermediate moment frames” (IMF), “ordinary moment frames” (OMF), and “special moment frames” (SMF).

**GUARD.** See Section 1002.1.

**IMPACT LOAD.** The load resulting from moving machinery, elevators, craneways, vehicles and other similar forces and kinetic loads, pressure and possible surcharge from fixed or moving loads.

**JOINT.** A portion of a column bounded by the highest and lowest surfaces of the other members framing into it.

**LIMIT STATE.** A condition beyond which a structure or member becomes unfit for service and is judged to be no longer useful for its intended function (serviceability limit state) or to be unsafe (strength limit state).

**LIVE LOADS.** Those loads produced by the use and occupancy of the building or other structure and do not include construction or environmental loads such as wind load, snow load, rain load, earthquake load, flood load or dead load.

**LIVE LOADS (ROOF).** Those loads produced (1) during maintenance by workers, equipment and materials; and (2) during the life of the structure by movable objects such as planters and by people.

**LOAD AND RESISTANCE FACTOR DESIGN (LRFD).** A method of proportioning structural members and their connections using load and resistance factors such that no applicable limit state is reached when the structure is subjected to appropriate load combinations. The term “LRFD” is used in the design of steel and wood structures.

**LOAD FACTOR.** A factor that accounts for deviations of the actual load from the nominal load, for uncertainties in the analysis that transforms the load into a load effect, and for the probability that more than one extreme load will occur simultaneously.

**LOADS.** Forces or other actions that result from the weight of building materials, occupants and their possessions, environmental effects, differential movement and restrained dimensional changes. Permanent loads are those loads in which variations over time are rare or of small magnitude, such as dead loads. All other loads are variable loads (see also “Nominal loads”).

**LOADS EFFECTS.** Forces and deformations produced in structural members by the applied loads.

**NOMINAL LOADS.** The magnitudes of the loads specified in this chapter (dead, live, soil, wind, snow, rain, flood and earthquake).

**NOTATIONS.**

$D$  = Dead load.

$E$  = Combined effect of horizontal and vertical earthquake-induced forces as defined in Section 1617.1.

$E_m$  = Maximum seismic load effect of horizontal and vertical seismic forces as set forth in Section 1617.1.

$F$  = Load due to fluids.

$F_a$  = Flood load.

$H$  = Load due to lateral pressure of soil and water in soil.

$L$  = Live load, except roof live load, including any permitted live load reduction.

$L_r$  = Roof live load including any permitted live load reduction.

$P$  = Ponding load.

$R$  = Rain load.

$S$  = Snow load.

$T$  = Self-straining force arising from contraction or expansion resulting from temperature change, shrinkage, moisture change, creep in component materials, movement due to differential settlement or combinations thereof.

$W$  = Load due to wind pressure.

**OTHER STRUCTURES.** Structures, other than buildings, for which loads are specified in this chapter.

**P-DELTA EFFECT.** The second order effect on shears, axial forces and moments of frame members induced by axial loads on a laterally displaced building frame.

**PANEL (PART OF A STRUCTURE).** The section of a floor, wall or roof comprised between the supporting frame of two adjacent rows of columns and girders or column bands of floor or roof construction.

**RESISTANCE FACTOR.** A factor that accounts for deviations of the actual strength from the nominal strength and the manner and consequences of failure (also called “strength reduction factor”).

**SHEAR PANEL.** A floor, roof or wall component sheathed to act as a shear wall or diaphragm.

**SHEAR WALL.** A wall designed to resist lateral forces parallel to the plane of the wall.

**SPACE FRAME.** A structure composed of interconnected members, other than bearing walls, that is capable of supporting vertical loads and that also may provide resistance to seismic lateral forces.

**SPECIAL TRANSVERSE REINFORCEMENT.** Reinforcement composed of spirals, closed stirrups or hoops and supplementary cross ties provided to restrain the concrete and qualify the portion of the component, where used, as a confined region.

**STRENGTH, NOMINAL.** *The capacity of a structure or member to resist the effects of loads, as determined by computations using specified material strengths and dimensions and equations derived from accepted principles of structural mechanics or by field tests or laboratory tests of scaled models, allowing for modeling effects and differences between laboratory and field conditions.*

**STRENGTH, REQUIRED.** *Strength of a member, cross section or connection required to resist factored loads or related internal moments and forces in such combinations as stipulated by these provisions.*

**STRENGTH DESIGN.** *A method of proportioning structural members such that the computed forces produced in the members by factored loads do not exceed the member design strength. The term “strength design” is used in the design of concrete and masonry structural elements.*

**WALL, LOAD BEARING.** *Any wall meeting either of the following classifications:*

- 1. Any metal or wood stud wall that supports more than 100 pounds per linear foot (plf) (1459 N/m) of vertical load in addition to its own weight.*
- 2. Any masonry or concrete wall that supports more than 200 plf (2919 N/m) of vertical load in addition to its own weight.*

**WALL, NONLOAD BEARING.** *Any wall that is not a load-bearing wall.*

### **SECTION BC 1603**

#### **CONSTRUCTION DOCUMENTS**

**1603.1 General.** *Construction documents shall show the size, section and relative locations of structural members with floor levels, column centers and offsets fully dimensioned. The design loads and other information pertinent to the structural design required by Sections 1603.1.1 through 1603.1.7 shall be clearly indicated on the construction documents for parts of the building or structure.*

**Exception:** *Construction documents for buildings constructed in accordance with the conventional light-frame construction provisions of Section 2308 shall indicate the following structural design information:*

- 1. Floor and roof live loads.*

2. Ground snow load,  $P_g$ .

3. Basic wind speed (3-second gust), miles per hour (mph) (km/hr) and wind exposure.

4. Seismic design category and site class.

**1603.1.1 Floor live load.** The uniformly distributed, concentrated and impact floor live load used in the design shall be indicated for floor areas. Live load reduction of the uniformly distributed floor live loads, if used in the design, shall be indicated.

**1603.1.2 Roof live load.** The roof live load used in the design shall be indicated for roof areas (Section 1607.11).

**1603.1.3 Roof snow load.** The ground snow load,  $P_g$ , shall be indicated. The following additional information shall also be provided, regardless of whether snow loads govern the design of the roof:

1. Flat-roof snow load,  $P_f$ .

2. Snow exposure factor,  $C_e$ .

3. Snow load importance factor,  $I_s$ .

4. Thermal factor,  $C_t$ .

**1603.1.4 Wind design data.** The following information related to wind loads shall be shown, regardless of whether wind loads govern the design of the lateral-force-resisting system of the building:

1. Basic wind speed (3-second gust), miles per hour (km/hr).

2. Wind importance factor,  $I_w$ , and building category.

3. Wind exposure, if more than one wind exposure is utilized, the wind exposure and applicable wind direction shall be indicated.

4. The applicable internal pressure coefficient.

5. *Components and cladding. The design wind pressures in terms of psf ( $\text{kN}/\text{m}^2$ ) to be used for the design of exterior component and cladding materials not specifically designed by the registered design professional.*

**1603.1.5 Earthquake design data.** *The following information related to seismic loads shall be shown, regardless of whether seismic loads govern the design of the lateral-force-resisting system of the building:*

1. *Seismic importance factor,  $I_E$ , and seismic use group.*
2. *Mapped spectral response accelerations  $S_S$  and  $S_1$ .*
3. *Site class.*
4. *Spectral response coefficients  $S_{DS}$  and  $S_{D1}$ .*
5. *Seismic design category.*
6. *Basic seismic-force-resisting system(s).*
7. *Design base shear.*
8. *Seismic response coefficient(s),  $C_S$ .*
9. *Response modification factor(s),  $R$ .*
10. *Analysis procedure used.*

**1603.1.6 Flood load.** *For buildings located in areas of special flood hazard, construction documents shall comply with Appendix G.*

**1603.1.7 Special loads.** *Special loads that are applicable to the design of the building, structure or portions thereof shall be indicated along with the specified section of this code that addresses the special loading condition.*

**1603.2 Restrictions on loading.** *It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by these requirements.*

**1603.3 Live loads posted.** Where the live loads for which each floor or portion thereof of a building are or have been designed to exceed 50 psf (2.40 kN/m<sup>2</sup>), such design live loads shall be conspicuously posted by the owner in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.

**Exceptions:** Residential occupancies.

**1603.3.1 Data required.** The following floor load data shall be shown on drawings:

1. The uniform distributed design live load for each floor or part thereof.
2. The weight of any piece of machinery or equipment weighing more than 1,000 pounds (4,400 N), and its identifying description and location. When this equipment includes oscillating or rotating components the description shall indicate the frequency of such movement.
3. The maximum design wheel load and total maximum weight of any vehicle that may be brought into the building.
4. The equivalent uniform partition loads or, in lieu of these, a statement to the effect that the design was predicated on actual partition loads.

**1603.4 Occupancy permits for changed loads.** Construction documents for other than residential buildings filed with the commissioner with applications for permits shall show on each drawing the live loads per square foot (m<sup>2</sup>) of area covered for which the building is designed. Occupancy permits for buildings hereafter erected shall not be issued until the floor load signs, required by Section 1603.3, have been installed.

## **SECTION 1604**

### **GENERAL DESIGN REQUIREMENTS**

**1604.1 General.** Building, structures and parts thereof shall be designed and constructed in accordance with strength design, load and resistance factor design, allowable stress design, empirical design or conventional construction methods, as permitted by the applicable material chapters.

**1604.2 Strength.** Buildings and other structures, and parts thereof, shall be designed and constructed to support safely the factored loads in load combinations defined in this code without exceeding the appropriate

*strength limit states for the materials of construction. Alternatively, buildings and other structures, and parts thereof, shall be designed and constructed to support safely the nominal loads in load combinations defined in this code without exceeding the appropriate specified allowable stresses for the materials of construction. Loads and forces for occupancies or uses not covered in this chapter shall be subject to the approval of the commissioner.*

**1604.3 Serviceability.** *Structural systems and members thereof shall be designed to have adequate stiffness to limit deflections and lateral drift. See Section 1617.3 for drift limits applicable to earthquake loading.*

**1604.3.1 Deflections.** *The deflections of structural members shall not exceed the more restrictive of the limitations of Sections 1604.3.2 through 1604.3.5 or that permitted by Table 1604.3.*

**1604.3.2 Reinforced concrete.** *The deflection of reinforced concrete structural members shall not exceed that permitted by ACI 318.*

**1604.3.3 Steel.** *The deflection of steel structural members shall not exceed that permitted by AISC LRFD, AISC HSS, AISC 335, AISI-NASPEC, AISI-General, AISI-Truss, ASCE 3, ASCE 8-SSD-LRFD/ASD, and the standard specifications of SJI Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders as applicable.*

**1604.3.4 Masonry.** *The deflection of masonry structural members shall not exceed that permitted by ACI 530/ASCE 5/TMS 402.*

**1604.3.5 Aluminum.** *The deflection of aluminum structural members shall not exceed that permitted by AA-94.*

**1604.3.6 Limits.** *For limits on the deflection of structural members, refer to the relevant material design standards. Should a design standard not provide for deflection limits, deflection of structural members over span,  $l$ , shall not exceed that permitted by Table 1604.3.*

**TABLE 1604.3**  
**DEFLECTION LIMITS<sup>a, b, c, h, i</sup>**

CONSTRUCTION	<i>L</i>	<i>S</i> or <i>W</i> <sup>f</sup>	<i>D</i> + <i>L</i> <sup>d, g</sup>
Roof members: <sup>e</sup>			
Supporting plaster ceiling	<i>l</i> /360	<i>l</i> /360	<i>l</i> /240
Supporting nonplaster ceiling	<i>l</i> /240	<i>l</i> /240	<i>l</i> /180
Not supporting ceiling	<i>l</i> /180	<i>l</i> /180	<i>l</i> /120
Floor members	<i>l</i> /360	—	<i>l</i> /240
Exterior walls and interior partitions:			
With brittle finishes	—	<i>l</i> /240	—
With flexible finishes	—	<i>l</i> /120	—
Farm buildings	—	—	<i>l</i> /180
Greenhouses	—	—	<i>l</i> /120

For SI: 1 foot = 304.8 mm.

- a. For structural roofing and siding made of formed metal sheets, the total load deflection shall not exceed *l*/60. For secondary roof structural members supporting formed metal roofing, the live load deflection shall not exceed *l*/150. For secondary wall members supporting formed metal siding, the design wind load deflection shall not exceed *l*/90. For roofs, this exception only applies when the metal sheets have no roof covering.
- b. Interior partitions not exceeding 6 feet in height and flexible, folding and portable partitions are not governed by the provisions of this section. The deflection criterion for interior partitions is based on the horizontal load defined in Section 1607.13.
- c. See Section 2403 for glass supports.
- d. For wood structural members having a moisture content of less than 16 percent at time of installation and used under dry conditions, the deflection resulting from *L* + 0.5*D* is permitted to be substituted for the deflection resulting from *L* + *D*.
- e. The above deflections do not ensure against ponding. Roofs that do not have sufficient slope or camber to assure adequate drainage shall be investigated for ponding. See Section 1611 for rain and ponding requirements and Section 1503.4 for roof drainage requirements.
- f. The wind load is permitted to be taken as 0.7 times the "component and cladding" loads for the purpose of determining deflection limits herein.
- g. For steel structural members, the dead load shall be taken as zero.
- h. For aluminum structural members or aluminum panels used in roofs or walls of sunroom additions or patio covers, not supporting edge of glass or aluminum sandwich panels, the total load deflection shall not exceed *l*/60. For aluminum sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed *l*/120.
- i. For cantilever members, *l* shall be taken as twice the length of the cantilever.

**1604.4 Analysis.** *Load effects on structural members and their connections shall be determined by methods of structural analysis that take into account equilibrium, general stability, geometric compatibility and both short- and long-term material properties.*

*Members that tend to accumulate residual deformations under repeated service loads shall have included in their analysis the added eccentricities expected to occur during their service life. Secondary stresses in trusses shall be considered and, where of significant magnitude, their effects shall be provided for in the design.*

*Any system or method of construction to be used shall be based on a rational analysis in accordance with well-established principles of mechanics. Such analysis shall result in a system that provides a complete load path capable of transferring loads from their point of origin to the load-resisting elements.*

*The total lateral force shall be distributed to the various vertical elements of the lateral-force-resisting system in proportion to their rigidities considering the rigidity of the horizontal bracing system or diaphragm. Rigid elements that are assumed not to be a part of the lateral-force-resisting system shall be permitted to be incorporated into buildings provided that their effect on the action of the system is considered and provided for in design. Provisions shall be made for the increased forces induced on resisting elements of the structural system resulting from torsion due to eccentricity between the center of application of the lateral forces and the center of rigidity of the lateral-force-resisting system.*

*Every structure shall be designed to resist the overturning effects caused by the lateral forces specified in this chapter. See Section 1609 for wind, Section 1610 for lateral soil loads and Sections 1613 through 1623 for earthquake.*

**1604.5 Importance factors.** *The value for snow load, wind load and seismic load importance factors shall be determined in accordance with Table 1604.5.*

**TABLE 1604.5**

**CLASSIFICATION OF BUILDINGS AND OTHER STRUCTURES FOR IMPORTANCE FACTORS**

<b>CATEGORY<sup>a</sup></b>	<b>NATURE OF OCCUPANCY</b>	<b>SEISMIC FACTOR I<sub>E</sub></b>	<b>SNOW FACTOR I<sub>S</sub></b>	<b>WIND FACTOR I<sub>W</sub></b>
<i>I</i>	<p><i>Buildings and other structures that represent a low hazard to human life in the event of failure including, but not limited to:</i></p> <ul style="list-style-type: none"> <li>• <i>Agricultural facilities</i></li> <li>• <i>Certain temporary facilities</i></li> <li>• <i>Minor storage facilities</i></li> </ul>	<i>1.00</i>	<i>0.8</i>	<i>0.87</i>
<i>II</i>	<i>Buildings and other structures except those listed in Categories I, III and IV</i>	<i>1.00</i>	<i>1.0</i>	<i>1.00</i>
<i>III</i>	<p><i>Buildings and other structures that represent a substantial hazard to human life in the event of failure including, but not limited to:</i></p> <ul style="list-style-type: none"> <li>• <i>Buildings and other structures where more than 300 people congregate in one area</i></li> <li>• <i>Buildings and other structures with elementary school, secondary school or day care facilities with an occupant load greater than 250</i></li> <li>• <i>Buildings and other structures with an occupant load greater than 500 for colleges or adult education facilities</i></li> <li>• <i>Health care facilities with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities</i></li> <li>• <i>Jails and detention facilities</i></li> <li>• <i>Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Category IV</i></li> <li>• <i>Buildings and other structures not included in Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released</i></li> </ul>	<i>1.25</i>	<i>1.1</i>	<i>1.15</i>
<i>IV</i>	<i>Buildings and other structures designed as essential facilities including, but not</i>	<i>1.50</i>	<i>1.2</i>	<i>1.15</i>

	<p><i>limited to:</i></p> <ul style="list-style-type: none"> <li>• <i>Hospitals and other health care facilities having surgery or emergency treatment facilities</i></li> <li>• <i>Fire, rescue and police stations and emergency vehicle garages</i></li> <li>• <i>Designated earthquake, hurricane or other emergency shelters</i></li> <li>• <i>Designated emergency preparedness, communication, and operation centers and other facilities required for emergency response</i></li> <li>• <i>Power-generating stations and other public utility facilities required as emergency backup facilities for Category IV structures</i></li> <li>• <i>Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.7(2)</i></li> <li>• <i>Aviation control towers, air traffic control centers and emergency aircraft hangars</i></li> <li>• <i>Buildings and other structures having critical national defense functions</i></li> <li>• <i>Water treatment facilities required to maintain water pressure for fire suppression</i></li> </ul>			
--	---	--	--	--

*a. For the purpose of Section 1616.2, Categories I and II are considered Seismic Use Group I, Category III is considered Seismic Use Group II and Category IV is equivalent to Seismic Use Group III.*

**1604.6 In-situ load tests.** *The commissioner is authorized to require an engineering analysis or a load test, or both, of any construction whenever there is reason to question the safety of the construction for the intended occupancy. Engineering analysis and load tests shall be conducted in accordance with Section 1713.*

**1604.7 Preconstruction load tests.** *Materials and methods of construction that are not capable of being designed by recognized engineering analysis or that do not comply with the applicable material design standards listed in Chapter 35, or alternative test procedures in accordance with Section 1711, shall be load tested in accordance with Section 1714.3.*

**1604.8 Anchorage.**

**1604.8.1 General.** *Anchorage of the roof to walls and columns, and of walls and columns to foundations, shall be provided to resist the uplift and sliding forces that result from the application of the prescribed loads.*

**1604.8.2 Concrete and masonry walls.** *Concrete and masonry walls shall be anchored to floors, roofs and other structural elements that provide lateral support for the wall. Such anchorage shall provide a positive direct connection capable of resisting the horizontal forces specified in this chapter but not less than a minimum strength design horizontal force of 280 plf (4.10 kN/m) of wall, substituted for “E” in the load combinations of Section 1605.2 or 1605.3. Walls shall be designed to resist bending between anchors where the anchor spacing exceeds 4 feet (1219 mm). Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Sections 1609.6.2.2 and 1620 for wind and earthquake design requirements.*

**1604.8.3 Decks.** *Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. For decks with cantilevered framing members, connections to exterior walls or other framing members shall be designed and constructed to resist uplift resulting from the full live load specified in Table 1607.1 acting on the cantilevered portion of the deck.*

**SECTION BC 1605**  
**LOAD COMBINATIONS**

**1605.1 General.** *Buildings and other structures and portions thereof shall be designed to resist the load*

*combinations specified in Section 1605.2 or 1605.3 and Chapters 18 through 23, and the special seismic load combinations of Section 1605.4. Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.*

***1605.2 Load combinations using strength design or load and resistance factor design.***

***1605.2.1 Basic load combinations.*** *Where strength design or load and resistance factor design is used, structures and portions thereof shall resist the most critical effects from the following combinations of factored loads:*

$$1.4D \quad \text{(Equation 16-1)}$$

$$1.2D + 1.6L + 0.5(L_r \text{ or } S \text{ or } R) \quad \text{(Equation 16-2)}$$

$$1.2D + 1.6(L_r \text{ or } S \text{ or } R) + (f_1L \text{ or } 0.8W) \quad \text{(Equation 16-3)}$$

$$1.2D + 1.6W + f_1L + 0.5(L_r \text{ or } S \text{ or } R) \quad \text{(Equation 16-4)}$$

$$1.2D + 1.0E + f_1L + f_2S \quad \text{(Equation 16-5)}$$

$$0.9D + (1.0E \text{ or } 1.6W) \quad \text{(Equation 16-6)}$$

where:

$f_1$  = 1.0 for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m<sup>2</sup>), and for parking garage live load.

$f_1$  = 0.5 for other live loads.

$f_2$  = 0.7 for roof configurations (such as saw tooth) that do not shed snow off the structure.

$f_2$  = 0.2 for other roof configurations.

**Exception:** Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

where:

$f_1 = 1.0$  for floors in places of public assembly, for live loads in excess of 100 pounds per square foot (4.79 kN/m<sup>2</sup>), and for parking garage live load.

$f_1 = 0.5$  for other live loads.

$f_2 = 0.7$  for roof configurations (such as saw tooth) that do not shed snow off the structure.

$f_2 = 0.2$  for other roof configurations.

**Exception:** Where other factored load combinations are specifically required by the provisions of this code, such combinations shall take precedence.

**1605.2.2 Other loads.** Where  $F$ ,  $H$ ,  $P$  or  $T$  is to be considered in design, each applicable load shall be added to the above combinations in accordance with Section 2.3.2 of ASCE 7. Where  $F_a$  is to be considered in design, the load combinations of Section 2.3.3 of ASCE 7 shall be used. Where ice loads are to be considered in design, the load combinations of Section 2.3.4 of ASCE 7 shall be used. Refer to the following sections for other loads:

Soil lateral loads	Section 1610
Rain loads	Section 1611
Flood loads	Appendix G
Snow and Thermal loads	Section 1608

**1605.3 Load combinations using allowable stress design.**

**1605.3.1 Basic load combinations.** Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$$D \quad \text{(Equation 16-7)}$$

$$D+L \quad \text{(Equation 16-8)}$$

$$D+L+(L_r \text{ or } S \text{ or } R) \quad \text{(Equation 16-9)}$$

$$D+(W \text{ or } 0.7E)+L+(L_r \text{ or } S \text{ or } R) \quad \text{(Equation 16-10)}$$

$$0.6D+W \quad \text{(Equation 16-11)}$$

$$0.6D+0.7E \quad \text{(Equation 16-12)}$$

**Exceptions:**

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m<sup>2</sup>) or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m<sup>2</sup>), 20 percent shall be combined with seismic loads.
3. Where allowable stress design is used to design foundations, refer to Chapter 18 of this code for combinations of load effects.

**1605.3.1.1 Load reduction.** It is permitted to multiply the combined effect of two or more variable loads by 0.75 and add to the effect of dead load. The combined load used in design shall not be less than the sum of the effects of dead load and any one of the variable loads. The 0.7 factor on E does not apply for this provision. Increases in allowable stresses specified in the appropriate materials section of this code or referenced standard shall not be used with the load combinations of Section 1605.3.1 except that a duration of load increase shall be permitted in accordance with Chapter 23.

**1605.3.1.2 Other loads.** Where F, H, P or T are to be considered in design, the load combinations of Section 2.4.1 of ASCE 7 shall be used. Where F<sub>a</sub> is to be considered in design, the load combinations of Section 2.4.2 of ASCE 7 shall be used. Where ice loads are to be considered in design, the load combinations of Section 2.4.3-of ASCE 7 shall be used. Refer to the following sections for other loads:

Soil lateral loads	Section 1610
Rain loads	Section 1611
Flood loads	Appendix G
Snow and Thermal loads	Section 1608

**1605.4 Special seismic load combinations.** For both allowable stress design and strength design methods, where specifically required by Sections 1613 through 1622 or by Chapters 18 through 23, elements and components shall be designed to resist the forces calculated using Equation 16-19 when the effects of the seismic ground motion are additive to gravity forces and those calculated using Equation 16-20 when the effects of the seismic ground motion counteract gravity forces.

$$1.2D + f_y L + E_m$$

(Equation 16-19)

$$0.9D + E_m$$

(Equation 16-20)

where:

$E_m$  = The maximum effect of horizontal and vertical forces as set forth in Section 1617.1.

$f_1$  = 1.0 for floors in places of public assembly, for live loads in excess of 100 psf (4.79 kN/m<sup>2</sup>) and for parking garage live load.

$f_1$  = 0.5 for other live loads.

**1605.5 Heliports and helistops.** Heliport and helistop landing or touchdown areas shall be designed for the following loads, combined in accordance with Section 1605:

1. Dead load,  $D$ , plus the gross weight of the helicopter,  $D_h$ , plus snow load,  $S$ .
2. Dead load,  $D$ , plus two single concentrated impact loads,  $L$ , approximately 8 feet (2438 mm) apart applied anywhere on the touchdown pad (representing each of the helicopter's two main landing gear, whether skid type or wheeled type), having a magnitude of 0.75 times the gross weight of the helicopter. Both loads acting together total 1.5 times the gross weight of the helicopter.
3. Dead load,  $D$ , plus a uniform live load,  $L$ , of 100 psf (4.79 kN/m<sup>2</sup>).

**1605.6 Structural integrity load combinations – alternate load path method.** Where specifically required by Sections 1624 through 1629, elements and components shall be designed to resist the forces calculated using the following combination of factored loads:

$$D + f_1L + f_2W \quad (\text{Equation 16-65})$$

Where:

$f_1$  = 0.25 for buildings in Category II.

$f_1$  = 0.5 for buildings in Category III or IV.

$f_2$  = 0 for buildings in Category II.

$f_2$  = 0.33 for buildings in Category III or IV.

*The live load component  $f_1L$  need not be greater than the reduced live load.*

***1605.7 Structural integrity load combinations – vehicular impact and gas explosions.*** *Where specifically required by Sections 1625.5 and 1625.6, elements and components shall be designed to resist the forces calculated using the following combination of factored loads:*

$$1.2D + A_k + (0.5L \text{ or } 0.2S) \quad (\text{Equation 16-66})$$

$$0.9D + A_k + 0.2W \quad (\text{Equation 16-67})$$

Where  $A_k$  is the load effect of the vehicular impact or gas explosion.

**1605.8 Structural integrity load combinations – specific local resistance method.** *Where the specific local resistance method is used in a key element analysis, the specified local loads shall be used as specified in Section 1626.7.*

#### **SECTION BC 1606**

##### **DEAD LOADS**

**1606.1 Weights of materials and construction.** *In determining dead loads for purposes of design, the actual weights of materials and construction shall be used. In the absence of definite information, values used shall be subject to the approval of the commissioner.*

**1606.2 Weights of fixed service equipment.** *In determining dead loads for purposes of design, the weight of fixed service equipment, such as plumbing stacks and risers, electrical feeders, heating, ventilating and air-conditioning systems (HVAC) and fire sprinkler systems, shall be included.*

#### **SECTION BC 1607**

##### **LIVE LOADS**

**1607.1 General.** *Live loads are those defined in Section 1602.1*

**TABLE 1607.1**  
**MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS AND MINIMUM CONCENTRATED LIVE**

*For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm<sup>2</sup>, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>, 1 pound = 0.004448 kN.*

*1 pound per cubic foot = 16 kg/m<sup>3</sup>*

*a. Floors in garages or portions of buildings used for the storage of motor vehicles shall be designed for the uniformly distributed live loads of Table*

*1607.1 or the following concentrated loads: (1) for garages restricted to vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of 4.5 inches by 4.5 inches; (2) for mechanical parking structures without slab or deck which are used for storing passenger vehicles only, 2,250 pounds per wheel.*

*b. The loading applies to stack room floors that support nonmobile, double-faced library bookstacks, subject to the following limitations:*

*1. The nominal bookstack unit height shall not exceed 90 inches;*

*2. The nominal shelf depth shall not exceed 12 inches for each face; and*

*3. Parallel rows of double-faced bookstacks shall be separated by aisles not less than 36 inches wide.*

*c. Design in accordance with the ICC Standard on Bleachers, Folding and Telescopic Seating and Grandstands .*

*d. Other uniform loads in accordance with a recognized method acceptable to the commissioner which contains*

*provisions for truck loadings shall also be considered where appropriate.*

*e. The concentrated wheel load shall be applied on an area of 20 square inches.*

*f. Minimum concentrated load on stair treads (on area of 4 square inches) is 300 pounds.*

*g. Where snow loads occur that are in excess of the design conditions, the structure shall be designed to support the loads due to the increased loads caused by drift buildup or a greater snow design determined by the commissioner (see Section 1608). For special-purpose roofs, see Section 1607.11.2.2.*

*h. See Section 1604.8.3 for decks attached to exterior walls.*

*i. Live loads for assembly spaces other than those described in this table shall be determined from the occupant load requirements as established by Section 1004 of this code using the formula 1000/(net floor area per occupant) but shall not be less than 50 psf nor more than 100 psf.*

*j. For establishing live loads for occupancies not specifically listed herein, refer to Reference Standard ASCE 7 for guidance.*

**1607.2 Loads not specified.** For occupancies or uses not designated in Table 1607.1, the live load shall be determined in accordance with a method approved by the commissioner.

**1607.2.1 Stage areas using scenery or scenic elements.** Scenery battens and suspension systems shall be designed for a load of 30 pounds per linear foot (437.7 N/m) of batten length. Loft block and head block beams shall be designed to support vertical and horizontal loads corresponding to a 4 inch (102 mm) spacing of battens for the entire depth of the gridiron. Direction and magnitude of total forces shall be determined from the geometry of the rigging system including load concentrations from spot line rigging. Locking rails shall be designed for a uniform uplift of 500 psf (3447 kN/m<sup>2</sup>) with a 1,000 pound (454 kg) concentration. Impact factor for batten design shall be 75 percent and for loft and head block beams shall be 25 percent. A plan drawn to a scale not less than ¼ inch (6.4 mm) equals one foot (305 mm) shall be displayed in the stage area indicating the framing plan of the rigging loft and the design loads for all members used to support scenery or rigging. Gridirons over stages shall be designed to support a uniformly distributed live load of 50 psf (2.40 kN/m<sup>2</sup>) in addition to the rigging loads indicated.

**1607.3 Uniform live loads.** The live loads used in the design of buildings and other structures shall be the maximum loads expected by the intended use or occupancy but shall in no case be less than the minimum uniformly distributed unit loads required by Table 1607.1.

**1607.4 Concentrated loads.** Floors and other similar surfaces shall be designed to support the uniformly distributed live loads prescribed in Section 1607.3 or the concentrated load, in pounds (kilonewtons), given in Table 1607.1, whichever produces the greater load effects. Unless otherwise specified, the indicated concentration shall be assumed to be uniformly distributed over an area 2.5 feet by 2.5 feet [6.25 ft<sup>2</sup> (0.58 m<sup>2</sup>)] and shall be located so as to produce the maximum load effects in the structural members.

**1607.5 Partition loads.** Weights of all partitions shall be considered, using either actual weights at locations shown on the plans or the equivalent uniform load given in Section 1607.5.2. Partition loads shall be taken as superimposed dead loads.

**1607.5.1 Actual loads.** Where actual partition weights are used, the uniform design live load may be omitted from the strip of floor area under each partition.

**1607.5.2 Equivalent uniform load.** The equivalent uniform partition loads in Table 1607.5 may be used in lieu of actual partition weights except for bearing partitions or partitions in toilet room areas (other than in one- and two-family dwellings), at stairs and elevators, and similar areas where partitions are concentrated. In such cases, actual partition weights shall be used in design. Except as

*otherwise exempted, equivalent uniform partition loads shall be used in areas where partitions are not definitely located on the plans, or in areas where partitions are subject to rearrangement or relocation*

**Table 1607.5**  
**EQUIVALENT UNIFORM PARTITION LOADS**

<i>Partition Weight (plf)</i>	<i>Equivalent Uniform Load (psf)</i> <i>(To be added to floor dead and live loads)</i>
<i>50 or less</i>	<i>0</i>
<i>51 to 100</i>	<i>6</i>
<i>101 to 200</i>	<i>12</i>
<i>201 to 350</i>	<i>20</i>
<i>Greater than 350</i>	<i>20 plus a concentrated live load of the weight in excess of 350 plf.</i>

## **1607.6 Garages.**

**1607.6.1 Passenger vehicle garages.** *Areas used for, and restricted by physical limitations of clearance to, the transit or parking of passenger vehicles shall be designed for the uniformly distributed and concentrated loads for parking areas for such vehicles as provided in Table 1607.1 applied without impact. An exception is made for members or constructions which, because of physical limitations, cannot be subjected to direct load from the vehicle or from a jack or hoist used to raise or suspend the vehicle. Such members or constructions shall be designed for the loads corresponding to the actual usage.*

**1607.6.2 Truck and bus garages.** *Minimum live loads for garages having trucks or buses shall be as specified in Table 1607.6, but shall not be less than 50 psf (2.40 kN/m<sup>2</sup>), unless other loads are specifically justified and approved by the commissioner. Actual loads shall be used where they are greater than the loads specified in the table.*

**TABLE 1607.6  
UNIFORM AND CONCENTRATED LOADS**

LOADING CLASS <sup>a</sup>	UNIFORM LOAD (pounds/linear foot of lane)	CONCENTRATED LOAD (pounds) <sup>b</sup>	
		For moment design	For shear design
H20-44 and HS20-44	640	18,000	26,000
H15-44 and HS15-44	480	13,500	19,500

For SI: 1 pound per linear foot = 0.01459 kN/m, 1 pound = 0.004448 kN, 1 ton = 8.90 kN.

- a. An H loading class designates a two-axle truck with a semitrailer. An HS loading class designates a tractor truck with a semitrailer. The numbers following the letter classification indicate the gross weight in tons of the standard truck and the year the loadings were instituted.
- b. See Section 1607.6.1 for the loading of multiple spans.

**1607.6.2.1 Truck and bus garage live load application.** *The concentrated load and uniform load shall be uniformly distributed over a 10 foot (3048 mm) width on a line normal to the centerline of the lane placed within a 12-foot-wide (3658 mm) lane. The loads shall be placed within their individual lanes so as to produce the maximum stress in each structural member. Vertical impact shall be taken as 10 percent of the vertical load. Single spans shall be designed for the uniform load in Table 1607.6 and one simultaneous concentrated load positioned to produce the maximum effect. Multiple spans shall be designed for the uniform load in Table 1607.6 on the spans and two simultaneous concentrated loads in two spans positioned to produce the maximum negative moment effect. Multiple span design loads, for other effects, shall be the same as for single spans.*

**1607.7 Loads on handrails, guards, grab bars and vehicle barriers.** *Handrails, guards, grab bars designed in accordance with Chapter 11, and vehicle barriers shall be designed and constructed to the structural loading conditions set forth in this section.*

**1607.7.1 Handrails and guards.** *Handrail assemblies and guards shall be designed to resist a load of 50 plf (0.73 kN/m) applied in any direction at the top and to transfer this load through the supports to the structure.*

**Exceptions:**

1. *For one- and two-family dwellings, only the single, concentrated load required by Section 1607.7.1.1 shall be applied.*
2. *In Group I-3, F, H, and S occupancies, for areas that are not accessible to the general public and that have an occupant load no greater than 50, the minimum load shall be 20 pounds per foot (0.29 kN/m).*

**1607.7.1.1 Concentrated load.** *Handrail assemblies and guards shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building. This load need not be assumed to act concurrently with the loads specified in the preceding paragraph.*

**1607.7.1.2 Components.** *Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to withstand a horizontally applied normal load of 50 pounds (0.22 kN) on an area equal to 1 square foot (0.09 m<sup>2</sup>), including openings and space between rails. Reactions due to this loading are not required to be superimposed with those of Section 1607.7.1*

or 1607.7.1.1.

**1607.7.1.3 Stress increase.** Where handrails and guards are designed in accordance with the provisions for allowable stress design (working stress design) exclusively for the loads specified in Section 1607.7.1, the allowable stress for the members and their attachments are permitted to be increased by one-third.

**1607.7.2 Grab bars, shower seats and dressing room bench seats.** Grab bars, shower seats and dressing room bench seat systems shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point.

**1607.7.3 Vehicle barriers.** Vehicle barrier systems for passenger cars shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, the load shall be assumed to act at a minimum height of 1 foot, 6 inches (457 mm) above the floor or ramp surface on an area not to exceed 1 square foot (0.09 m<sup>2</sup>), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in the preceding paragraphs of Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with a recognized method acceptable to the commissioner that contains provision for traffic railings.

**1607.7.3.1 Columns in parking areas.** Unless specially protected, columns in parking areas subject to impact of moving vehicles shall be designed to resist the lateral load due to impact and this load shall be considered a variable load. For passenger vehicles, this lateral load shall be taken as a minimum of 6,000 pounds (26.70 kN) applied at least 1 foot 6 inches (457 mm); above the roadway, and acting simultaneously with other design loads.

**1607.8 Impact loads.** The live loads specified in Section 1607.2 include allowance for impact conditions. Provisions shall be made in the structural design for uses and loads that involve unusual vibration and impact forces.

**1607.8.1 Elevators.** Elevator loads shall be increased by 100 percent for impact and the structural supports shall be designed within the limits of stress and deflection prescribed by ASME A17.1.

**1607.8.2 Machinery.** For the purpose of design, the weight of machinery and moving loads shall be increased as follows to allow for impact: (1) elevator machinery, 100 percent; (2) light machinery, shaft- or motor-driven, 20 percent; (3) reciprocating machinery or power-driven units, 50 percent; (4)

*hangers for floors or balconies, 33 percent. Percentages shall be increased where specified by the manufacturer.*

**1607.8.3 Railroad equipment.** *Minimum loads (including vertical, lateral, longitudinal, and impact) and the distribution thereof shall meet the applicable requirements of the AREMA Manual for Railway Engineering Chapter 15, Steel Structures.*

**1607.8.4 Assembly structures.** *Seating areas in grandstands, stadiums, and similar assembly structures shall be designed to resist the simultaneous application of a horizontal swaying load of at least 24 plf (36 kg/m) of seats applied in a direction parallel to the row of the seats, and of at least 10 plf (15 kg/m) of seats in a direction perpendicular to the row of the seats. When this load is used in combination with wind for outdoor structures, the wind load shall be one-half of the design wind load.*

**1607.9 Reduction in live loads.** *The minimum uniformly distributed live loads,  $L_o$ , in Table 1607.1 are permitted to be reduced according to the following provisions.*

**1607.9.1 General.** *Subject to the limitations of Sections 1607.9.1.1 through 1607.9.1.4, members for which a value of  $K_{LL} A_T$  is 400 square feet (37.16 m<sup>2</sup>) or more are permitted to be designed for a reduced live load in accordance with the following equation:*

$$L = L_o \left( 0.25 + \frac{15}{\sqrt{K_{LL} A_T}} \right) \quad (\text{Equation 16-21})$$

$$\text{For SI: } L = L_o \left( 0.25 + \frac{4.57}{\sqrt{K_{LL} A_T}} \right)$$

where:

$L$  = Reduced design live load per square foot (meter) of area supported by the member.

$L_o$  = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607.1).

$K_{LL}$  = Live load element factor (see Table 1607.9.1).

$A_T$  = Tributary area, in square feet (square meters).  $L$  shall not be less than  $0.50L_o$  for members supporting one floor and  $L$  shall not be less than  $0.40L_o$  for members supporting two or more floors.

where:

$L$  = Reduced design live load per square foot (meter) of area supported by the member.

$L_o$  = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607.1).

$K_{LL}$  = Live load element factor (see Table 1607.9.1).

$A_T$  = Tributary area, in square feet (square meters).  $L$  shall not be less than  $0.50L_o$  for members supporting one floor and  $L$  shall not be less than  $0.40L_o$  for members supporting two or more floors.

**TABLE 1607.9.1  
LIVE LOAD ELEMENT FACTOR,  $K_{LL}$**

ELEMENT	$K_{LL}$
Interior columns	4
Exterior columns without cantilever slabs	4
Edge columns with cantilever slabs	3
Corner columns with cantilever slabs	2
Edge beams without cantilever slabs	2
Interior beams	2
All other members not identified above including: Edge beams with cantilever slabs Cantilever beams Two-way slabs Members without provisions for continuous shear transfer normal to their span	1

**1607.9.1.1 Heavy live loads.** Live loads that exceed 100 psf (4.79 kN/m<sup>2</sup>) shall not be reduced except the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.

**1607.9.1.2 Passenger vehicle garages.** The live loads shall not be reduced in passenger vehicle garages except the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.

**1607.9.1.3 Special occupancies.** Live loads of 100 psf (4.79 kN/m<sup>2</sup>) or less shall not be reduced in public assembly occupancies or in areas used for retail or wholesale sales.

**1607.9.1.4 Special structural elements.** Live loads shall not be reduced for one-way slabs except as permitted in Section 1607.9.1.1. Live loads shall not be reduced for calculating shear stresses at the heads of columns in flat slab or flat plate construction. Live loads of 100 psf (4.79 kN/m<sup>2</sup>) or less shall not be reduced for roof members except as specified in Section 1607.11.2.

**1607.9.2 Alternate floor live load reduction.** As an alternative to Section 1607.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.
2. A reduction shall not be permitted when the live load exceeds 100 psf (4.79 kN/m<sup>2</sup>) except that the design live load for columns may be reduced by 20 percent.
3. For live loads not exceeding 100 psf (4.79 kN/m<sup>2</sup>), the design live load for any structural member supporting 150 square feet (13.94 m<sup>2</sup>) or more is permitted to be reduced in accordance with the following equation:

$$R = r(A - 150)$$

(Equation 16-22)

For SI:  $R = r(A - 13.94)$

*Such reduction shall not exceed 40 percent for horizontal members, 60 percent for vertical members, nor R as determined by the following equation:*

Such reduction shall not exceed 40 percent for horizontal members, 60 percent for vertical members, nor  $R$  as determined by the following equation:

$$R = 23.1(1 + D/L_o) \quad (\text{Equation 16-23})$$

where:

$A$  = Area of floor or roof supported by the member, square feet ( $m^2$ ).

$D$  = Dead load per square foot ( $m^2$ ) of area supported.

$L_o$  = Unreduced live load per square foot ( $m^2$ ) of area supported.

$R$  = Reduction in percent.

$r$  = Rate of reduction equal to 0.08 percent for floors.

**1607.10 Distribution of floor loads.** Where uniform floor live loads are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full dead loads on all spans in combination with the floor live loads on spans selected to produce the greatest effect at each location under consideration. It shall be permitted to reduce floor live loads in accordance with Section 1607.9.

**1607.11 Roof loads.** The structural supports of roofs and marquees shall be designed to resist wind and, where applicable, snow and earthquake loads, in addition to the dead load of construction and the appropriate live loads as prescribed in this section, or as set forth in Table 1607.1. The live loads acting on a sloping surface shall be assumed to act vertically on the horizontal projection of that surface.

**1607.11.1 Distribution of roof loads.** Where uniform roof live loads are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full dead loads on all spans in combination with the roof live loads on adjacent spans or on alternate spans, whichever produces the greatest effect. See Section 1607.11.2 for minimum roof live loads and Section 1608.5 for partial snow loading.

**1607.11.1.1 Arches and gabled frames.** The following simplification is permissible:

1. Live load placed on  $\frac{1}{2}$  of the span adjacent to one support.
2. Live load placed on the center  $\frac{1}{4}$  of the span.
3. Live load placed on  $\frac{3}{8}$  of the span adjacent to each support.

**1607.11.2 Minimum roof live loads.** Minimum roof loads shall be determined for the specific conditions in accordance with Sections 1607.11.2.1 through 1607.11.2.4.

**1607.11.2.1 Flat, pitched and curved roofs.** Ordinary flat, pitched and curved roofs shall be designed for the live loads specified in the following equation or other controlling combinations of loads in Section 1605, whichever produces the greater load. In structures where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equation shall not be used unless approved by the commissioner. Greenhouses shall be designed for a minimum roof live load of 10 psf (0.479 kN/m<sup>2</sup>).

$$L_r = 20R_1R_2 \qquad \text{(Equation 16-24)}$$

where:  $12 \leq L_r \leq 20$

For SI:  $L_r = 0.96 R_1 R_2$

where:  $0.58 \leq L_r \leq 0.96$

$L_r$  = Roof live load per square foot ( $m^2$ ) of horizontal projection in pounds per square foot ( $kN/m^2$ ).

For SI:  $L_r = 0.96 R_1 R_2$

where:  $0.58 \leq L_r \leq 0.96$

$L_r$  = Roof live load per square foot ( $\text{m}^2$ ) of horizontal projection in pounds per square foot ( $\text{kN}/\text{m}^2$ ).

The reduction factors  $R_1$  and  $R_2$  shall be determined as follows:

$$R_1 = 1 \quad \text{for } A_t \leq 200 \text{ square feet} \\ \text{(18.58 m}^2\text{)} \quad \text{(Equation 16-25)}$$

$$R_1 = 1.2 - 0.001A_t \quad \text{for } 200 \text{ square feet} < A_t < \\ 600 \text{ square feet} \quad \text{(Equation 16-26)}$$

$$\text{For SI: } 1.2 - 0.011A_t \quad \text{for } 18.58 \text{ square meters} < A_t < \\ 55.74 \text{ square meters} \\ R_1 = 0.6 \quad \text{for } A_t \geq 600 \text{ square feet} \\ \text{(55.74 m}^2\text{)} \quad \text{(Equation 16-27)}$$

where:

$A_t$  = Tributary area (span length multiplied by effective width) in square feet ( $m^2$ ) supported by any structural member, and

$F$  = for a sloped roof, the number of inches of rise per foot (for SI:  $F = 0.12 \times$  slope, with slope expressed in percentage points), and

$F$  = for an arch or dome, rise-to-span ratio multiplied by 32, and

$$R_2 = 1 \quad \text{for } F \leq 4 \quad (\text{Equation 16-28})$$

$$R_2 = 1.2 - 0.05 F \quad \text{for } 4 < F < 12 \quad (\text{Equation 16-29})$$

$$R_2 = 0.6 \quad \text{for } F \geq 12 \quad (\text{Equation 16-30})$$

**1607.11.2.2 Special-purpose roofs.** Roofs used for promenade purposes shall be designed for a minimum live load of 60 psf (2.87 kN/m<sup>2</sup>). Roofs used for roof gardens or assembly purposes shall be designed for a minimum live load of 100 psf (4.79 kN/m<sup>2</sup>). Roofs used for other special purposes shall be designed for appropriate loads, as directed or approved by the commissioner.

**1607.11.2.3 Green roofs.** Where roofs utilize a green roof system and are not intended for human occupancy, the uniform design live load in the area covered by the green roof shall be 20 psf (0.958 kN/m<sup>2</sup>). The weight of the landscaping materials shall be considered as dead load and shall be computed on the basis of saturation of the soil. Where roofs utilize a green roof system and are used for human occupancy, the minimum live load shall be as specified in Table 1607.1 or Section 1607.11.2.2, whichever is greater.

**1607.11.2.4 Awnings and canopies.** Awnings and canopies shall be designed for a uniform live load of 5 psf (0.240 kN/m<sup>2</sup>) as well as for snow loads and wind loads as specified in Sections 1608 and 1609.

**1607.11.2.5 Hanging loads.** Girders and roof trusses (other than joists) over garage areas regularly utilized for the repair of vehicles and over manufacturing floors or storage floors used for commercial purposes shall be capable of supporting, in addition to the specified live and wind loads, a concentrated live load of 2,000 pounds (908 kg) applied at any lower chord panel point for trusses, and at any point of the lower flange for girders.

**1607.12 Crane loads.** The crane live load shall be the rated capacity of the crane. Design loads for the runway beams, including connections and support brackets, of moving bridge cranes and monorail cranes shall include the maximum wheel loads of the crane and the vertical impact, lateral and longitudinal forces induced by the moving crane.

**1607.12.1 Maximum wheel load.** The maximum wheel loads shall be the wheel loads produced by the weight of the bridge, as applicable, plus the sum of the rated capacity and the weight of the trolley with the trolley positioned on its runway at the location where the resulting load effect is maximum.

**1607.12.2 Vertical impact force.** The maximum wheel loads of the crane shall be increased by the percentages shown below to determine the induced vertical impact or vibration force:

<i>Monorail cranes (powered).....</i>	<i>25 percent</i>
<i>Cab-operated or remotely operated bridge cranes (powered).....</i>	<i>25 percent</i>
<i>Pendant-operated bridge cranes (powered).....</i>	<i>10 percent</i>
<i>Bridge cranes or monorail cranes with hand-gearred bridge, trolley and hoist percent.....</i>	<i>0 percent</i>

**1607.12.3 Lateral force.** *The lateral force on crane runway beams with electrically powered trolleys shall be calculated as 20 percent of the sum of the rated capacity of the crane and the weight of the hoist and trolley. The lateral force shall be assumed to act horizontally at the traction surface of a runway beam, in either direction perpendicular to the beam, and shall be distributed according to the lateral stiffness of the runway beam and supporting structure.*

**1607.12.4 Longitudinal force.** *The longitudinal force on crane runway beams, except for bridge cranes with hand-gearred bridges, shall be calculated as 10 percent of the maximum wheel loads of the crane. The longitudinal force shall be assumed to act horizontally at the traction surface of a runway beam, in either direction parallel to the beam.*

**1607.13 Interior walls and partitions.** *Interior walls and partitions that exceed 6 feet (1829 mm) in height, including their finish materials, shall have adequate strength to resist the loads to which they are subjected but not less than a horizontal load of 5 psf (0.240 kN/m<sup>2</sup>).*

**SECTION BC 1608  
SNOW LOADS AND THERMAL LOADS**

**1608.1 General.** *Design snow loads shall be determined in accordance with Section 7 of ASCE 7, but the design roof load shall not be less than that determined by Section 1607.*

**1608.2 Ground snow loads.** *The ground snow load,  $P_g$ , to be used in determining the design snow loads for roofs is 25 psf (1.2 kN/m<sup>2</sup>).*

**1608.3 Flat roof snow loads.** *The flat roof snow load,  $\rho_f$ , on a roof with a slope equal to or less than 5 degrees (0.09 rad) (1 inch per foot = 4.76 degrees) shall be calculated in accordance with Section 7.3 of ASCE 7.*

**1608.3.1 Exposure factor.** *The value for the snow exposure factor,  $C_e$ , used in the calculation of  $\rho_f$  shall be determined from Table 1608.3.1.*

**TABLE 1608.3.1**  
**SNOW EXPOSURE FACTOR  $C_e$**

<b>TERRAIN CATEGORY<sup>a</sup></b>	<b>EXPOSURE OF ROOF<sup>a,b</sup></b>		
	<b>Fully exposed<sup>c</sup></b>	<b>Partially exposed</b>	<b>Sheltered</b>
<i>A (see Section 1609.4)</i>	<i>N/A</i>	<i>1.1</i>	<i>1.3</i>
<i>B (see Section 1609.4)</i>	<i>0.9</i>	<i>1.0</i>	<i>1.2</i>
<i>C (see Section 1609.4)</i>	<i>0.9</i>	<i>1.0</i>	<i>1.1</i>

*For SI: 1 mile=1609m.*

- a. The terrain category and roof exposure condition chosen shall be representative of the anticipated conditions during the life of the structure. An exposure factor shall be determined for each roof of a structure.*
- b. Definitions of roof exposure are as follows:*
  - 1. Fully exposed shall mean roofs exposed on all sides with no shelter afforded by terrain, higher structures or trees. Roofs that contain several large pieces of mechanical equipment, parapets which extend above the height of the balanced snow load,  $h_b$ , or other obstructions are not in this category.*
  - 2. Partially exposed shall include all roofs except those designated as “fully exposed” or “sheltered”*
  - 3. Sheltered roofs shall mean those roofs located tight in among conifers that qualify as ‘obstructions’*
- c. Obstructions within a distance of  $10 h_o$  provide “shelter”, where  $h_o$  is the height of the obstruction above the roof level. If the only obstructions are a few deciduous trees that are leafless in winter, the “fully exposed” category shall be used except for terrain category “A.” Note that these are heights above the roof. Heights used to establish the terrain category in Section 1609.4 are heights above the ground.*

**1608.3.2 Thermal factor.** *The value for the thermal factor,  $C_t$ , used in the calculation of  $\rho_f$  shall be determined from Table 1608.3.2.*

**TABLE 1608.3.2  
THERMAL FACTOR,  $C_t$**

THERMAL CONDITION <sup>a</sup>	$C_t$
All structures except as indicated below	1.0
Structures kept just above freezing and others with cold, ventilated roofs in which the thermal resistance ( <i>R</i> -value) between the ventilated space and the heated space exceeds $25\text{h} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$	1.1
Unheated structures	1.2
Continuously heated greenhouses <sup>b</sup> with a roof having a thermal resistance ( <i>R</i> -value) less than $2.0\text{h} \cdot \text{ft}^2 \cdot ^\circ\text{F}/\text{Btu}$	0.85

For SI:  $^\circ\text{C} = [^\circ\text{F} - 32] / 1.8$ , 1 British thermal unit per hour = 0.2931 W.

a. The thermal condition shall be representative of the anticipated conditions during winters for the life of the structure.

b. A continuously heated greenhouse shall mean a greenhouse with a constantly maintained interior temperature of 50°F or more during winter months. Such greenhouse shall also have a maintenance attendant on duty at all times or a temperature alarm system to provide warning in the event of a heating system failure.

**1608.3.3 Snow load importance factor.** The value for the snow load importance factor,  $I_s$ , used in the calculation of  $p_f$  shall be determined in accordance with Table 1604.5. Greenhouses that are occupied for growing plants on production or research basis, without public access, shall be included in Importance Category I.

**1608.3.4 Rain-on-snow surcharge load.** Roofs with a slope less than  $\frac{1}{2}$  inch per foot (2.38 degrees) shall be designed for a rain-on-snow surcharge load determined in accordance with Section 7.10 of ASCE 7.

**1608.3.5 Ponding instability.** For roofs with a slope less than  $\frac{1}{4}$  inch per foot (1.19 degrees), the design calculations shall include verification of the prevention of ponding instability in accordance with Section 7.11 of ASCE 7.

**1608.3.6 Ice.** For ice loads to be used in the design of ice sensitive structures such as open framed or guyed towers refer to ASCE 7.

**1608.4 Sloped roof snow loads.** The snow load,  $p_s$ , on a roof with a slope greater than 5 degrees (0.09 rad) (1 inch per foot = 4.76 degrees) shall be calculated in accordance with Section 7.4 of ASCE 7.

**1608.5 Partial loading.** The effect of not having the balanced snow load over the entire loaded roof area shall be analyzed in accordance with Section 7.5 of ASCE 7.

**1608.6 Unbalanced snow loads.** Unbalanced roof snow loads shall be determined in accordance with Section 7.6 of ASCE 7. Winds from all directions shall be accounted for when establishing unbalanced snow loads.

**1608.7 Drifts on lower roofs.** In areas where the ground snow load,  $p_g$ , as determined by Section 1608.2, is equal to or greater than 5 psf (0.240 kN/ m<sup>2</sup>), roofs shall be designed to sustain localized loads from snowdrifts in accordance with Section 7.7 of ASCE 7.

**1608.8 Roof projections.** Drift loads due to mechanical equipment, penthouses, parapets and other projections above the roof shall be determined in accordance with Section 7.8 of ASCE 7.

**1608.9 Sliding snow.** The extra load caused by snow sliding off a sloped roof onto a lower roof shall be determined in accordance with Section 7.9 of ASCE 7.

**1608.10 Thermal forces.** The design of enclosed buildings more than 250 feet (76 200 mm) in plan

*dimension shall provide for the forces and/or movements resulting from an assumed expansion corresponding to a change in temperature of 40°F (4.44°C). For exterior exposed frames, arches, or shells regardless of plan dimensions, the design shall provide for the forces and/or movements resulting from an assumed expansion and contraction corresponding to an increase or decrease in temperature of 40°F (4.44°C) for concrete or masonry construction and 60°F (15.55°C) for metal construction. For determination of the required anchorage for piping, the forces shall be determined on the basis of temperature variations for the specific service conditions. Friction forces in expansion bearings shall be considered.*

## **SECTION BC 1609**

### **WIND LOADS**

**1609.1 Applications.** *Buildings, structures and parts thereof shall be designed to withstand the minimum wind loads prescribed herein. Decreases in wind loads shall not be made for the effect of shielding by other structures.*

**1609.1.1 Determination of wind loads.** *Wind loads on every building or structure shall be determined in accordance with Section 6 of ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered. Exposure-A as defined in section 1609.4 can be considered using ASCE 7 where applicable.*

#### **Exceptions:**

1. *Wind loads determined by the provisions of Section 1609.6.*
2. *Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 Standard for Hurricane Resistant Residential Construction shall be permitted for applicable Group R-2 and R-3 buildings.*
3. *Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA Wood Frame Construction Manual for One-and Two-Family Dwellings.*
4. *Designs using NAAMM FP 1001 Guide Specification for Design of Metal Flagpoles.*
5. *Designs using TIA/EIA-222 for antenna-supporting structures and antennas.*

**1609.1.1.1 Applicability.** *The provisions of SSTD10 are applicable only to buildings located within Exposure, B or C as defined in Section 1609.4. The provisions of SSTD 10 and the AF&PA Wood Frame construction Manual for One- and Two-Family Dwellings shall not apply to buildings sited on the upper half of an isolated hill, ridge or escarpment meeting the following conditions:*

- 1. The hill, ridge or escarpment is 60 feet (18 288 mm) or higher if located in Exposure B or 30 feet (9144 mm) or higher if located in Exposure C;*
- 2. The maximum average slope of the hill exceeds 10 percent; and*
- 3. The hill, ridge or escarpment is unobstructed upwind by other such topographic features for a distance from the high point of 50 times the height of the hill or 1 mile (1.61 km), whichever is greater.*

**1609.1.2 Minimum wind loads.** *The wind loads used in the design of the main wind-force-resisting system shall not be less than 20 psf (0.958 kN/m<sup>2</sup>) multiplied by the area of the building or structure projected on a vertical plane normal to the wind direction. In the calculation of design wind loads for components and cladding for buildings, the algebraic sum of the pressures acting on opposite faces shall be taken into account. The design pressure for components and cladding of buildings shall not be less than 20 psf (0.958 kN/m<sup>2</sup>) acting in either direction normal to the surface. The design force for open buildings and other structures shall not be less than 10 psf (0.479 kN/ m<sup>2</sup>) multiplied by the area  $A_f$ .*

**1609.1.3 Anchorage against overturning, uplift and sliding.** *Structural members and systems and components and cladding in a building or structure shall be anchored to resist wind-induced overturning, uplift and sliding and to provide continuous load paths for these forces to the foundation. Where a portion of the resistance to these forces is provided by dead load, the dead load, including the weight of soils and foundations, shall be taken as the minimum dead load likely to be in place during a design wind event. Where the alternate basic load combinations of Section 1605.3.2 are used, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used.*

**1609.1.4 Wind and seismic detailing.** *Lateral-force-resisting systems shall meet seismic detailing requirements and limitations prescribed in this code, even when wind code prescribed load effects are greater than seismic load effects.*

**1609.2 Definitions.** *The following words and terms shall, for the purposes of Section 1609.6, have the*

*meanings shown herein.*

***BUILDINGS AND OTHER STRUCTURES, FLEXIBLE.*** *Buildings and other structures that have a fundamental natural frequency less than 1 Hz.*

***BUILDING, ENCLOSED.*** *A building that does not comply with the requirements for open or partially enclosed buildings.*

***BUILDING, LOW-RISE.*** *Enclosed or partially enclosed buildings that comply with the following conditions:*

- 1. Mean roof height, h, less than or equal to 60 feet (18 288 mm).*
- 2. Mean roof height, h, does not exceed least horizontal dimension.*

***BUILDING, OPEN.*** *A building having each wall at least 80 percent open. This condition is expressed for each wall by the equation:*

$$A_o \geq 0.8A_g \quad \text{(Equation 16-31)}$$

where:

$A_o$  = Total area of openings in a wall that receives positive external pressure, in square feet ( $m^2$ ).

$A_g$  = The gross area of that wall in which  $A_o$  is identified, in square feet ( $m^2$ ).

***BUILDING, PARTIALLY ENCLOSED.*** A building that complies with both of the following conditions:

1. *The total area of openings in a wall that receives positive external pressure exceeds the sum of the areas of openings in the balance of the building envelope (walls and roof) by more than 10 percent; and*
2. *The total area of openings in a wall that receives positive external pressure exceeds 4 square feet (0.37 m<sup>2</sup>) or 1 percent of the area of that wall, whichever is smaller, and the percentage of openings in the balance of the building envelope does not exceed 20 percent. These conditions are expressed by the following equations:*

$$A_o > 1.10A_{oi} \quad (\text{Equation 16-32})$$

$$A_o > 4 \text{ square feet (0.37 m}^2\text{) or } > 0.01A_g, \text{ whichever is smaller,} \\ \text{and } A_{oi}/A_{gi} \leq 0.20 \quad (\text{Equation 16-33})$$

where:

$A_o$ ,  $A_g$  are as defined for an open building.

$A_{oi}$  = The sum of the areas of openings in the building envelope (walls and roof) not including  $A_o$ , in square feet ( $m^2$ ).

$A_{gi}$  = The sum of the gross surface areas of the building envelope (walls and roof) not including  $A_g$ , in square feet ( $m^2$ ).

**BUILDING, SIMPLE DIAPHRAGM.** A building in which wind loads are transmitted through floor and roof diaphragms to the vertical lateral-force-resisting systems.

**COMPONENTS AND CLADDING.** Elements of the building envelope that do not qualify as part of the main wind force-resisting system.

**EFFECTIVE WIND AREA.** The area used to determine  $G C_p$ . For component and cladding elements, the effective wind area in Tables 1609.6.2.1(2) and 1609.6.2.1(3) is the span length multiplied by an effective width that need not be less than one-third the span length. For cladding fasteners, the effective wind area shall not be greater than the area that is tributary to an individual fastener.

**HURRICANE-PRONE REGIONS.** New York City is within the hurricane prone region.

**IMPORTANCE FACTOR, I.** A factor that accounts for the degree of hazard to human life and damage to property.

**MAIN WIND FORCE-RESISTING SYSTEM.** An assemblage of structural elements assigned to provide support and stability for the overall structure. The system generally receives wind loading from more than one surface.

**MEAN ROOF HEIGHT.** The average of the roof eave height and the height to the highest point on the roof surface, except that eave height shall be used for roof angle of less than or equal to 10 degrees (0.1745 rad).

**WIND-BORNE DEBRIS REGION.** New York City is not in the Wind-Borne Debris Region.

**1609.3 Basic wind speed.** The basic wind speed for New York City which is measured at 33 feet (10 058

mm) above ground as 3-second gust speed is 98 mph (43.8 m/s). This wind speed is based on local wind climate with annual probability of 0.02 (50-year mean recurrence interval).

**1609.3.1 Wind speed conversion.** When required, the 3-second gust wind velocity of 98 mph (43.12 m/s) can be converted to 79 mph (35.2 m/s) fastest mile wind velocity.

**1609.4 Exposure category.** For each wind direction considered, an exposure category that adequately reflects the characteristics of ground surface irregularities shall be determined for the site at which the building or structure is to be constructed. For a site located in the transition zone between categories, the category resulting in the largest wind forces shall apply. Account shall be taken of variations in ground surface roughness that arise from natural topography and vegetation as well as from constructed features. For any given wind direction, the exposure in which a specific building or other structure is sited shall be assessed as being one of the following categories. When applying the simplified wind load method of Section 1609.6, a single exposure category shall be used based upon the most restrictive for any given wind direction.

1. *Exposure A. Large city centers with at least 50 percent of the buildings having a height in excess of 70 feet (21 366 mm). Use of this exposure category shall be limited to those areas for which terrain representative of Exposure A prevails in the upwind direction for a distance of at least 2,500 feet (762 m) or 10 times the height of the building or structure, whichever is greater. Possible channeling effects or increased velocity pressures due to the building or structure being located in the wake of adjacent buildings shall be taken into account. See Table 1609.4.1-a and Table 1609.4.1-b for terrain and pressure coefficients related to Exposure-A.*

**Table- 1609.6.4.1-a**  
**Terrain Exposure Constants**

Exposure	$\alpha$	$z_g$ (ft)	$\hat{a}$	$\hat{b}$	$\bar{\alpha}$	$\bar{b}$	c	$\ell$ (ft)	$\bar{\epsilon}$	$z_{min}$ (ft)*
<b>A</b>	5.0	1500	1/5	0.64	1/3.0	0.30	0.45	180	1/2.0	60

\* $z_{min}$  = minimum height used to ensure that the equivalent height  $\bar{z}$  is greater of  $0.6h$  or  $z_{min}$ .  
For buildings with  $h \leq z_{min}$ ,  $\bar{z}$  shall be taken as  $z_{min}$ .

2. *Exposure B. Urban and suburban areas, wooded areas or other terrain with numerous closely spaced obstructions having the size of single-family dwellings or larger. Exposure B shall be assumed unless the site meets the definition of another type of exposure.*
3. *Exposure C. Open terrain with scattered obstructions, including surface undulations or other irregularities, having heights generally less than 30 feet (9144 mm) extending more than 1,500 feet (457.2 m) from the building site in any quadrant. This exposure shall also apply to any building located within Exposure B-type terrain where the building is directly adjacent to open areas of Exposure C-type terrain in any quadrant for a distance of more than 600 feet (182.9 m). This category includes flat open country, grasslands and shorelines in hurricane-prone regions.*
4. *Exposure D. Not applicable in New York City.*

**1609.5 Importance factor.** *Buildings and other structures shall be assigned a wind load importance factor,  $I_w$ , in accordance with Table 1604.5.*

**1609.6 Simplified wind load methods.**

**1609.6.1 Scope.** *The procedures in Section 1609.6 shall be permitted to be used for determining and applying wind pressures in the design of enclosed buildings as listed below:*

1. *For buildings with flat, gabled or hipped roofs having a mean roof height not exceeding the least horizontal dimension or 60 feet (18 288 mm), whichever is less, the use of Section 1609.6.2, Simplified Procedure-I, is permitted.*
2. *For buildings with a mean roof height of not more than 200 feet (60 960 mm) and located not closer than 2,000 feet (609.6 m) to the river, bay, or ocean shore line in any Borough other than Manhattan, the use of Section 1609.6.3, Simplified Procedure-II, is permitted.*
3. *For buildings with a mean roof height of not more than 300 feet (91 440 mm) within the Borough of Manhattan and located not closer than 2,000 feet (609.6 m) to the river, bay or ocean shore line, the use of Section 1609.6.3, Simplified Procedure-II, is permitted.*

**1609.6.1.1 Reduction of loads.** *The design wind pressures determined in accordance with Sections 1609.6.2 and 1609.6.3 may be reduced by one of the following methods:*

1. Application of the directionality factor ( $K_d$ ) as specified in Table 6-4 of ASCE 7 to the design wind pressures.
2. Reduction of the load factor for the wind load ( $W$ ) from 1.6 to 1.3 for the load combinations specified in Section 1605.2.

**1609.6.2 Simplified design procedure-I (for low-rise buildings).**

1. The wind shall be assumed to come from any horizontal direction.
2. An importance factor  $I_w$  shall be determined in accordance with Section 1609.5.
3. An exposure category shall be determined in accordance with Section 1609.4.
4. A height and exposure adjustment coefficient,  $\lambda$ , shall be determined from Table 1609.6.2.1(4).

**1609.6.2.1 Main wind force-resisting system.** Simplified design wind pressures,  $p_s$ , for the main wind force-resisting systems represent the net pressures (sum of internal and external) to be applied to the horizontal and vertical projections of building surfaces as shown in Figure 1609.6.2.1. For the horizontal pressures (Zones A, B, C, D),  $p_s$  is the combination of the windward and leeward net pressures.  $p_s$  shall be determined from Equation 16-34).

$$P_3 = \lambda I_w P_{z30}$$

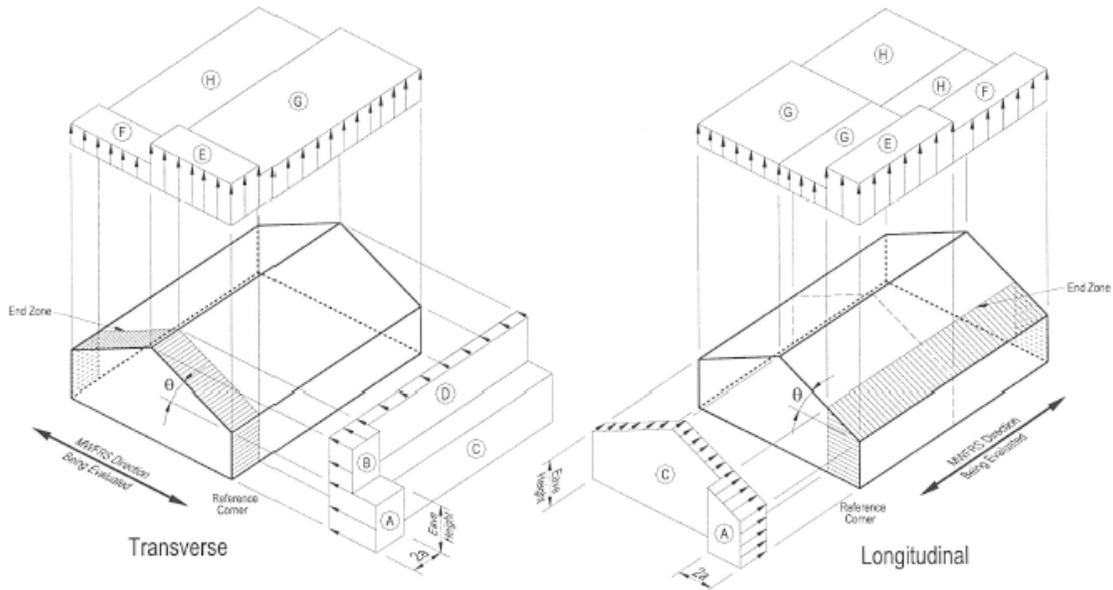

(Equation 16-34)

where:

$\lambda$  = Adjustments factor for building height and exposure from Table 1609.6.2.1(4).

$I_w$  = Importance factor as defined in Section 1609.5.

$P_{s30}$  = Simplified design wind pressure for Exposure B, at  $h= 30$  feet (9144 mm), and for  $I_w = 1.0$ , from Table 1609.6.2.1(1).

**FIGURE 1609.6.2.1**  
**MAIN WINDFORCE LOADING DIAGRAM**

For SI: 1 foot = 304.8 mm, 1 degree = 0.0174 rad.

**Notes:**

1. Pressures are applied to the horizontal and vertical projections for Exposure B, at  $h = 30$  feet, for  $I_w = 1.0$ . Adjust to other exposures and heights with adjustment factor  $\lambda$ .
2. The load patterns shown shall be applied to each corner of the building in turn as the reference corner.
3. For the design of the longitudinal MWFRS, use  $\theta = 0^\circ$ , and locate the Zone E/F, G/H boundary at the mid-length of the building.
4. Load Cases 1 and 2 must be checked for  $25^\circ < \theta \leq 45^\circ$ . Load Case 2 at  $25^\circ$  is provided only for interpolation between  $25^\circ$  to  $30^\circ$ .
5. Plus and minus signs signify pressures acting toward and away from the projected surfaces, respectively.
6. For roof slopes other than those shown, linear interpolation is permitted.
7. The total horizontal load shall not be less than that determined by assuming  $p_s = 0$  in Zones B and D.
8. The zone pressures represent the following:
  - Horizontal pressure zones — Sum of the windward and leeward net (sum of internal and external) pressures on vertical projection of:
    - A — End zone of wall
    - B — End zone of roof
    - C — Interior zone of wall
    - D — Interior zone of roof
  - Vertical pressure zones — Net (sum of internal and external) pressures on horizontal projection of:
    - E — End zone of windward roof
    - F — End zone of leeward roof
    - G — Interior zone of windward roof
    - H — Interior zone of leeward roof
9. Where Zone E or G falls on a roof overhang on the windward side of the building, use  $E_{OH}$  and  $G_{OH}$  for the pressure on the horizontal projection of the overhang. Overhangs on the leeward and side edges shall have the basic zone pressure applied.
10. Notation:
  - a: 10 percent of least horizontal dimension or  $0.4h$ , whichever is smaller, but not less than either 4 percent of least horizontal dimension or 3 feet.
  - h: Mean roof height, in feet (meters), except that eave height shall be used for roof angles  $< 10^\circ$ .
  - $\theta$ : Angle of plane of roof from horizontal, in degrees.

**Interior Zones**  
Roofs - Zone 1 / Walls - Zone 4

**End Zones**  
Roofs - Zone 2 / Walls - Zone 5

**Corner Zones**  
Roofs - Zone 3

**TABLE 1609.6.2.1(1)**

**SIMPLIFIED DESIGN WIND PRESURE (MAIN WINDFORCE-RESISTING SYSTEM),  $p_{s30}$**

**(Exposure B at  $h = 30$  feet with  $I_w = 1.0$ ) (psf)**

	3	10	-36.9
	3	20	-35.8
	3	50	-34.3
	3	100	-33.2

For SI: 1 foot = 304.8 mm, 1 degree = 0.0174 rad, 1 mile per hour = 0.45 m/s, 1 pound per square foot = 47.9 N/m<sup>2</sup>.

Note: For effective areas between those given above, the load is permitted to be interpolated, otherwise use the load associated with the lower effective area.

**TABLE 1609.6.2.1(4)**

**ADJUSTMENT FACTOR FOR BUILDING HEIGHT AND EXPOSURE, (2)**

MEAN ROOF HEIGHT (feet)	EXPOSURE		A
	B	C	
15	1.00	1.21	.7
20	1.00	1.29	.7
25	1.00	1.35	.7
30	1.00	1.40	.7
35	1.05	1.45	.7
40	1.09	1.49	.8
45	1.12	1.53	.8
50	1.16	1.56	.8
55	1.19	1.59	.8
60	1.22	1.62	.8

For SI: 1 foot = 304.8 mm.

a. All table values shall be adjusted for other exposures and heights by multiplying by the above coefficients.

**1609.6.2.1.1 Minimum pressures.** *The load effects of the design wind pressures from Section 1609.6.2.1 shall not be less than assuming the pressures,  $p_s$ , for Zones A, B, C and D all equal to + 20 psf (0.96 kN/m<sup>2</sup>), while assuming Zones E, F, G, and H all equal to 0 psf.*

**1609.6.2.2 Components and cladding.** *Net design wind pressures,  $p_{net}$ , for the components and cladding of buildings represent the net pressures (sum of internal and external) to be applied normal to each building surface as shown in Figure 1609.6.2.2. The net design wind pressure,  $p_{net}$ , shall be determined from Equation 16-35:*

$$P_{net} = \lambda I_w P_{net30}$$

(Equation 16-35)

where:

$\lambda$  = Adjustments factor for building height and exposure from Table 1609.6.2.1(4).

$I_w$  = Importance factor as defined in Section 1609.5.

$P_{net30}$  = Net design wind pressure for Exposure B, at  $h = 30$  feet (9144 mm), and for  $I_w = 1.0$ , from Tables 1609.6.2.1(2) and 1609.6.2.1(3).

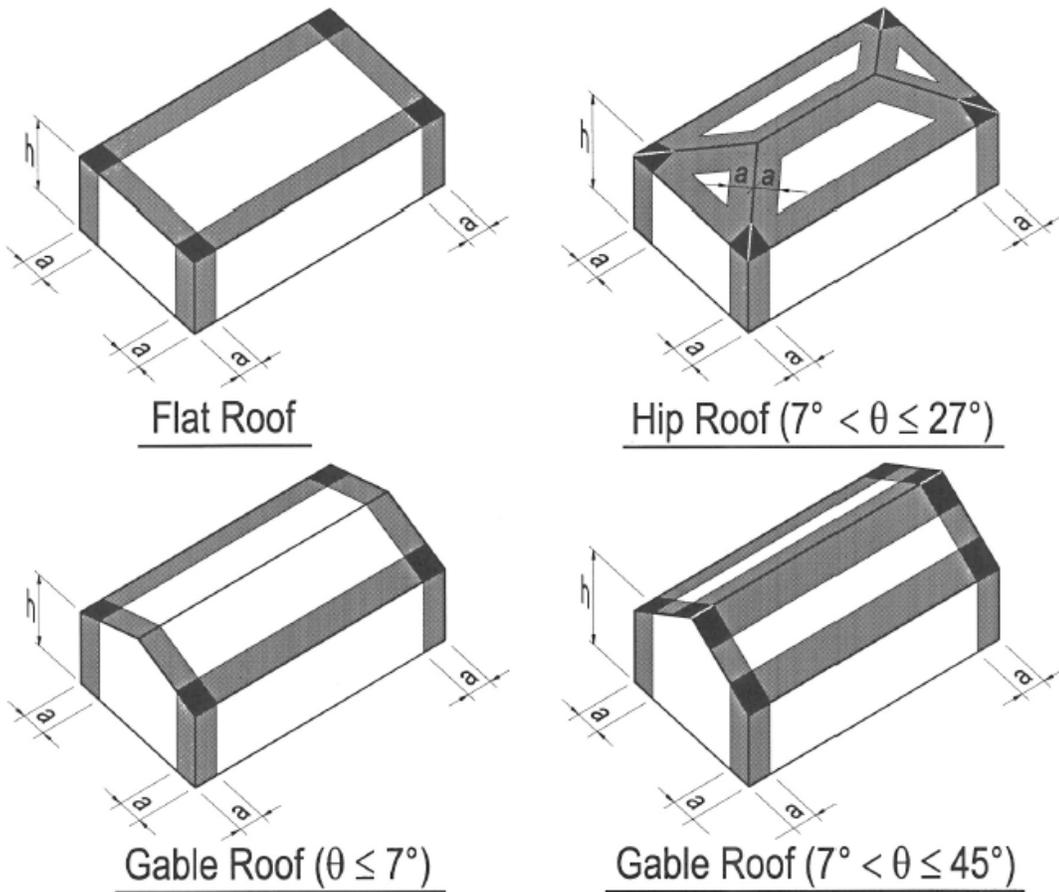

FIGURE 1609.6.2.2  
COMPONENT AND CLADDING PRESSURE

For SI: 1 foot = 304.8 mm, 1 degree = 0.0174 rad.

**Notes:**

1. Pressures are applied normal to the surface for Exposure B, at  $h = 30$  feet, for  $I_w = 1.0$ . Adjust to other exposures and heights with adjustment factor  $\lambda$ .
2. Plus and minus signs signify pressures acting toward and away from the surfaces, respectively.
3. For hip roofs with  $\theta \leq 25^\circ$ , Zone 3 shall be treated as Zone 2.
4. For effective areas between those given, the value is permitted to be interpolated, otherwise use the value associated with the lower effective area.
5. Notation:
  - $a$ : 10 percent of least horizontal dimension or  $0.4h$ , whichever is smaller, but not less than either 4 percent of least horizontal dimension or 3 feet.
  - $h$ : Mean roof height, in feet (meters), except that eave height shall be used for roof angles  $< 10^\circ$ .
  - $\theta$ : Angle of plane of roof from horizontal, in degrees.

**1609.6.2.2.1 Minimum pressures.** The positive design wind pressures,  $p_{net}$ , from Section 1609.6.2.2 shall not be less than + 30 psf (1.44 kN/m<sup>2</sup>), and the negative design wind pressures,  $p_{net}$ , from Section 1609.6.2.2 shall not be less than – 30 psf (-1.44 kN/m<sup>2</sup>).

**1609.6.2.3 Load case.** Members that act as both part of the main wind force-resisting system and as components and cladding shall be designed for each separate load case.

### **1609.6.3 Simplified design procedure-II.**

**1609.6.3.1 Main wind force-resisting system.** Main wind force-resisting systems shall comply with the following:

1. The building shall be designed for the following net lateral wind pressure to be applied to the horizontal projection of the building surfaces:

1.1. From 0 to 100 feet elevation 20 psf (0.96 kN/m<sup>2</sup>).

From 100 to 300 feet elevation 25 psf (1.2 kN/m<sup>2</sup>).

2. An importance factor  $I_w$  shall be determined in accordance with Section 2.1.1. 1609.5. and shall be applied to the pressures indicated above.

**1609.6.3.2 Design wind load cases.** The main wind force-resisting system of buildings of all heights, whose wind loads have been determined pursuant to Section 1609.6.3, shall be designed for wind load cases as defined below:

**Case-1.** Full design wind pressure acting on the projected area perpendicular to each principal axis of the structure, considered separately along each principal axis.

**Case-2.** 75 percent of the design wind pressure acting on the projected area perpendicular to each principal axis of the structure to be applied eccentric to the center of the exposure with eccentricity equal to 15 percent of the exposure width, considered separately for each principal direction.

**Case-3.** Wind loading as defined in case-1, but considered to act simultaneously at 75 percent of the specified value.

**1609.6.3.3 Components and cladding.** Net design wind positive and negative pressures, (pressure and suction) for the components and cladding of buildings represent the net pressures (sum of internal and external) to be applied normal to each building surface. The net design wind pressure and suction shall be 30 psf (1.44 kN/m<sup>2</sup>).

**1609.6.3.4 Roof.** The design pressure and suction acting over the entire roof including purlins, roofing, and other roof elements (including their fastenings) shall be per values given in Section 1609.6.3.1.

**1609.6.3.5 Other building elements.** The following building elements of buildings whose wind loads have been determined under the provisions of Section 1609.6.3 shall be designed for wind pressures shown in Section 1609.6.3.1 multiplied by the following shape factors given in Table 1609.6.3.5.

**TABLE 1609.6.3.5**  
**OTHER BUILDING ELEMENTS**

***Construction Shape Factor***

---

<i>Signs (and their supports), or portions thereof, having 70 percent or more of solid surface</i>	<i>1.5</i>
<i>Signs (and their supports), or portions thereof, having less than 70 percent of solid surface</i>	<i>2.0</i>
<i>Tanks, cooling towers, and similar constructions</i>	<i>1.5</i>
<i>Square and rectangular chimneys</i>	<i>1.5</i>

---

**1609.6.3.5.1 Eaves and cornices.** *Eaves, cornices, and overhanging elements of the buildings shall be designed for upward pressures twice the values given in Section 1609.6.3.1.*

**1609.7 Roof systems.**

**1609.7.1 Roof deck.** *The roof deck shall be designed to withstand the wind pressures determined under either the provisions of Section 1609.6 for buildings satisfying the height and other requirements of the simplified methods or Section 1609.1.1 for buildings of any height.*

**1609.8 Runback structures.** *Runback structures shall be designed in compliance with the rules of the department.*

**SECTION BC 1610  
SOIL LATERAL LOAD**

**1610.1 General.** *Basement, foundation and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless specified otherwise in a soil investigation report approved by the commissioner. Basement walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top are permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils with expansion potential are present at the site.*

**Exception:** *Basement walls extending not more than 8 feet (2438 mm) below grade and supporting flexible floor systems shall be permitted to be designed for active pressure.*

**TABLE 1610.1  
SOIL LATERAL LOAD**

DESCRIPTION OF BACKFILL MATERIAL <sup>c</sup>	UNIFIED SOIL CLASSIFICATION	DESIGN LATERAL SOIL LOAD <sup>a</sup> (pound per square foot per foot of depth)	
		Active pressure	At-rest pressure
Well-graded, clean gravels; gravel-sand mixes	GW	30	60
Poorly graded clean gravels; gravel-sand mixes	GP	30	60
Silty gravels, poorly graded gravel-sand mixes	GM	40	60
Clayey gravels, poorly graded gravel-and-clay mixes	GC	45	60
Well-graded, clean sands; gravelly sand mixes	SW	30	60
Poorly graded clean sands; sand-gravel mixes	SP	30	60
Silty sands, poorly graded sand-silt mixes	SM	45	60
Sand-silt clay mix with plastic fines	SM-SC	45	100
Clayey sands, poorly graded sand-clay mixes	SC	60	100
Inorganic silts and clayey silts	ML	45	100
Mixture of inorganic silt and clay	ML-CL	60	100
Inorganic clays of low to medium plasticity	CL	60	100
Organic silts and silt clays, low plasticity	OL	Note b	Note b
Inorganic clayey silts, elastic silts	MH	Note b	Note b
Inorganic clays of high plasticity	CH	Note b	Note b
Organic clays and silty clays	OH	Note b	Note b

For SI: 1 pound per square foot per foot of depth = 0.157 kPa/m, 1 foot = 304.8 mm.

a. Design lateral soil loads are given for moist conditions for the specified soils at their optimum densities. Actual field conditions shall govern. Submerged or saturated soil pressures shall include the weight of the buoyant soil plus the hydrostatic loads.

b. Unsuitable as backfill material.

c. The definition and classification of soil materials shall be in accordance with ASTM D 2487.

**SECTION BC 1611**

**RAIN LOADS**

*1611.1 Design rain loads. Each portion of a roof shall be designed to sustain the load of rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow.*

$$R = 5.2(d_s + d_h)$$

(Equation 16-37)

For SI:  $R = 0.0098$  ( $d_s = d_h$ )

where:

$d_h$  = Additional depth of water on the undeflected roof above the inlet of secondary drainage system at its design flow (i.e., the hydraulic head), in inches (mm).

$d_s$  = Depth of water on the undeflected roof up to the inlet of secondary drainage system when the primary drainage system is blocked (i.e., the static head), in inches (mm).

$R$  = Rain load on the undeflected roof, in psf (kN/m<sup>2</sup>). When the phrase “undeflected roof” is used, deflections from loads (including dead loads) shall not be considered when determining the amount of rain on the roof.

**1611.2 Ponding instability.** Ponding refers to the retention of water due solely to the deflection of relatively flat roofs. Roofs with a slope less than one-fourth unit vertical in 12 units horizontal (2-percent slope) shall be investigated by structural analysis to ensure that they possess adequate stiffness to preclude progressive deflection (i.e., instability) as rain falls on them or melt water is created from snow on them. The larger of snow load or rain load shall be used in this analysis. The primary drainage system within an area subjected to ponding shall be considered to be blocked in this analysis.

**1611.3 Controlled drainage.** Roofs equipped with hardware to control the rate of drainage shall be equipped with a secondary drainage system at a higher elevation that limits accumulation of water on the roof above that elevation. Such roofs shall be designed to sustain the load of rainwater that will accumulate on them to the elevation of the secondary drainage system plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow determined from Section 1611.1. Such roofs shall also be checked for ponding instability in accordance with Section 1611.2.

## **SECTION BC 1612**

### **FLOOD LOADS**

**1612.1 General.** The requirements for flood loads shall be as specified in Appendix G of this code.

**1612.2 Reserved.**

**1612.3 Reserved.**

*1612.4 Reserved.*

*1612.5 Reserved.*

**SECTION BC 1613**  
**EARTHQUAKE LOADS DEFINITIONS**

**1613.1 Definitions.** *The following words and terms shall, for the purposes of this section, have the meanings shown herein.*

**ACTIVE FAULT/ACTIVE FAULT TRACE.** *A fault for which there is an average historic slip rate of 1 mm per year or more and geologic evidence of seismic activity within Holocene (past 11,000 years) times. Active fault traces are designated by the appropriate regulatory agency and/or registered design professional subject to identification by a geologic report.*

**ATTACHMENTS, SEISMIC.** *Means by which components and their supports are secured or connected to the seismic-force-resisting system of the structure. Such attachments include anchor bolts, welded connections and mechanical fasteners.*

**BASE.** *The level at which the horizontal seismic ground motions are considered to be imparted to the structure.*

**BOUNDARY ELEMENTS.** *Chords and collectors at diaphragm and shearwall edges, interior openings, discontinuities and reentrant corners.*

**BRITTLE.** *Systems, members, materials and connections that do not exhibit significant energy dissipation capacity in the inelastic range.*

**COLLECTOR.** *A diaphragm or shear wall element parallel to the applied load that collects and transfers shear forces to the vertical-force-resisting elements or distributes forces within a diaphragm or shear wall.*

**COMPONENT.** *A part or element of an architectural, electrical, mechanical or structural system.*

**Component, equipment.** *A mechanical or electrical component or element that is part of a mechanical and/or electrical system within or without a building system.*

**Component, flexible.** *Component, including its attachments, having a fundamental period greater than*

0.06 second.

**Component, rigid.** Component, including its attachments, having a fundamental period less than or equal to 0.06 second.

**DESIGN EARTHQUAKE.** The earthquake effects that buildings and structures are specifically proportioned to resist in Sections 1613 through 1622.

**DISPLACEMENT.**

**Design displacement.** The design earthquake lateral displacement, excluding additional displacement due to actual and accidental torsion, required for design of the isolation system.

**Total design displacement.** The design earthquake lateral displacement, including additional displacement due to actual and accidental torsion, required for design of the isolation system.

**Total maximum displacement.** The maximum considered earthquake lateral displacement, including additional displacement due to actual and accidental torsion, required for verification of the stability of the isolation system or elements thereof, design of building separations and vertical load testing of isolator unit prototype.

**DISPLACEMENT RESTRAINT SYSTEM.** A collection of structural elements that limits lateral displacement of seismically isolated structures due to the maximum considered earthquake.

**EFFECTIVE DAMPING.** The value of equivalent viscous damping corresponding to energy dissipated during cyclic response of the isolation system.

**EFFECTIVE STIFFNESS.** The value of the lateral force in the isolation system, or an element thereof, divided by the corresponding lateral displacement.

**HAZARDOUS CONTENTS.** A material that is highly toxic or potentially explosive and in sufficient quantity to pose a significant life-safety threat to the general public if an uncontrolled release were to occur.

**INVERTED PENDULUM-TYPE STRUCTURES.** Structures that have a large portion of their mass concentrated near the top, and thus have essentially one degree of freedom in horizontal translation. The structures are usually T-shaped with a single column supporting the beams or framing at the top.

**ISOLATION INTERFACE.** *The boundary between the upper portion of the structure, which is isolated, and the lower portion of the structure, which moves rigidly with the ground.*

**ISOLATION SYSTEM.** *The collection of structural elements that includes individual isolator units, structural elements that transfer force between elements of the isolation system and connections to other structural elements.*

**ISOLATOR UNIT.** *A horizontally flexible and vertically stiff structural element of the isolation system that permits large lateral deformations under design seismic load. An isolator unit is permitted to be used either as part of or in addition to the weight-supporting system of the building.*

**LOAD.**

**Gravity load (W).** *The total dead load and applicable portions of other loads as defined in Sections 1613 through 1622.*

**MAXIMUM CONSIDERED EARTHQUAKE.** *The most severe earthquake effects considered by this code.*

**NONBUILDING STRUCTURE.** *A structure, other than a building, constructed of a type included in Section 1622.*

**OCCUPANCY IMPORTANCE FACTOR.** *A factor assigned to each structure according to its seismic use group as prescribed in Table 1604.5.*

**SEISMIC DESIGN CATEGORY.** *A classification assigned to a structure based on its seismic use group and the severity of the design earthquake ground motion at the site.*

**SEISMIC-FORCE-RESISTING SYSTEM.** *The part of the structural system that has been considered in the design to provide the required resistance to the seismic forces prescribed herein.*

**SEISMIC FORCES.** *The assumed forces prescribed herein, related to the response of the structure to earthquake motions, to be used in the design of the structure and its components.*

**SEISMIC USE GROUP.** *A classification assigned to a building based on its use as defined in Section 1616.2.*

***SHEAR WALL.*** A wall designed to resist lateral forces parallel to the plane of the wall.

***SHEAR WALL-FRAME INTERACTIVE SYSTEM.*** A structural system that uses combinations of shear walls and frames designed to resist lateral forces in proportion to their rigidities, considering interaction between shear walls and frames on all levels.

***SITE CLASS.*** A classification assigned to a site based on the types of soils present and their engineering properties as defined in Section 1615.1.5.

***SITE COEFFICIENTS.*** The values of,  $F_w$ , and,  $F_v$ , indicated in Tables 1615.1.2(1) and 1615.1.2(2), respectively.

***STORY DRIFT RATIO.*** The story drift divided by the story height.

***TORSIONAL FORCE DISTRIBUTION.*** The distribution of horizontal seismic forces through a rigid diaphragm when the center of mass of the structure at the level under consideration does not coincide with the center of rigidity (sometimes referred to as a “diaphragm rotation”).

***TOUGHNESS.*** The ability of a material to absorb energy without losing significant strength.

***WIND-RESTRAINT SEISMIC SYSTEM.*** The collection of structural elements that provides restraint of the seismic-isolated structure for wind loads. The wind-restraint system may be either an integral part of isolator units or a separate device.

## **SECTION BC 1614**

### **EARTHQUAKE LOADS—GENERAL**

**1614.1 Scope.** Every structure, and portion thereof, shall at a minimum, be designed and constructed to resist the effects of earthquake motions and assigned a seismic design category as set forth in Section 1616.3.

#### **Exceptions:**

1. Structures designed in accordance with the provisions of Sections 9.1 through 9.6, 9.13 and 9.14 of ASCE 7 shall be permitted.

2. *One- and two-family dwellings not more than three stories in height are exempt from the requirements of Sections 1613 through 1622.*
3. *The seismic-force-resisting system of wood frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in Section 1616.1.*
4. *Agricultural storage structures intended only for incidental human occupancy are exempt from the requirements of Sections 1613 through 1623.*

**1614.1.1** *Reserved.*

**1614.2** *Reserved.*

**1614.3** *Reserved.*

**1614.4** *Quality assurance.* A quality assurance plan shall be provided where required by Chapter 17.

**1614.5** *Seismic and wind.* When the code-prescribed wind design produces greater effects, the wind design shall govern, but detailing requirements and limitations prescribed in this and referenced sections shall be followed.

## **SECTION BC 1615**

### **EARTHQUAKE LOADS—SITE GROUND MOTION**

**1615.1** *General procedure for determining maximum considered earthquake and design spectral response accelerations.* Ground motion accelerations, represented by response spectra and coefficients derived from these spectra, shall be determined in accordance with the general procedure of Section 1615.1, or the site-specific procedure of Section 1615.2. The site-specific procedure of Section 1615.2 shall be used for structures on sites classified as Site Class F, in accordance with Section 1615.1.1.

*The mapped maximum considered earthquake spectral response acceleration at short periods ( $S_S$ ) shall be 0.365g and at 1-second period ( $S_1$ ) shall be 0.071g.*

*The site class shall be determined in accordance with Section 1615.1.1. The maximum considered earthquake spectral response accelerations at short period and 1-second period adjusted for site class effects,  $S_{MS}$  and  $S_{M1}$ , shall be determined in accordance with Section 1615.1.2. The design spectral response accelerations at short period,  $S_{DS}$ , and at 1-second period,  $S_{D1}$ , shall be determined in accordance with*

*Section 1615.1.3. The general response spectrum shall be determined in accordance with Section 1615.1.4.*

**1615.1.1 Site class definitions.** *The site shall be classified as one of the site classes defined in Table 1615.1.1. Where the soil shear wave velocity,  $v_s$ , is not known, site class shall be determined, as permitted in Table 1615.1.1, from standard penetration resistance,  $N$ , or from soil undrained shear strength,  $s_u$ , calculated in accordance with Section 1615.1.5. Where site-specific data are not available to a depth of 100 feet (30 480 mm), appropriate soil properties are permitted to be estimated by the registered design professional preparing the soils report based on known geologic conditions. When the soil properties are not known in sufficient detail to determine the site class, Site Class D shall be used unless the commissioner determines that Site Class E or F soil is likely to be present at the site.*

**TABLE 1615.1.1  
SITE CLASS DEFINITIONS**

SITE CLASS	SOIL PROFILE NAME	AVERAGE PROPERTIES IN TOP 100 feet, AS PER SECTION 1615.1.5		
		Soil shear wave velocity, $\bar{v}_s$ , (ft/s)	Standard penetration resistance, $\bar{N}$	Soil undrained shear strength, $\bar{s}_u$ , (psf)
A	Hard rock	$\bar{v}_s > 5,000$	N/A	N/A
B	Rock	$2,500 < \bar{v}_s \leq 5,000$	N/A	N/A
C	Very dense soil and soft rock	$1,200 < \bar{v}_s \leq 2,500$	$\bar{N} > 50$	$\bar{s}_u \geq 2,000$
D	Stiff soil profile	$600 \leq \bar{v}_s \leq 1,200$	$15 \leq \bar{N} \leq 50$	$1,000 \leq \bar{s}_u \leq 2,000$
E	Soft soil profile	$\bar{v}_s < 600$	$\bar{N} < 15$	$\bar{s}_u < 1,000$
E	—	Any profile with more than 10 feet of soil having the following characteristics: 1. Plasticity index $PI > 20$ , 2. Moisture content $w \geq 40\%$ , and 3. Undrained shear strength $\bar{s}_u < 500$ psf		
F	—	Any profile containing soils having one or more of the following characteristics: 1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. 2. Peats and/or highly organic clays ( $H > 10$ feet of peat and/or highly organic clay where $H$ = thickness of soil) 3. Very high plasticity clays ( $H > 25$ feet with plasticity index $PI > 75$ ) 4. Very thick soft/medium stiff clays ( $H > 120$ feet)		

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m<sup>2</sup>, 1 pound per square foot = 0.0479 kPa. N/A = Not applicable

**1615.1.2 Site coefficients and adjusted maximum considered earthquake spectral response acceleration parameters.** *The maximum considered earthquake spectral response acceleration for short periods,  $S_{MS}$ , and at 1-second period,  $S_{M1}$ , adjusted for site class effects, shall be determined by Equations 16-38 and 16-39, respectively:*

$$S_{M5} = F_c S_5 \quad (\text{Equation 16-38})$$

$$S_{M1} = F_v S_1 \quad (\text{Equation 16-39})$$

*where:*

$F_a$  = Site coefficient defined in Table 1615.1.2(1).

$F_v$  = Site coefficient defined in Table 1615.1.2(2).

$S_s$  = The mapped spectral accelerations for short periods as determined in Section 1615.1.

$S_1$  = The mapped spectral accelerations for a 1-second period as determined in Section 1615.1.

**TABLE 1615.1.2 (1)**  
**VALUES OF SITE COEFFICIENT  $F_a$  AS A FUNCTION OF SITE CLASS AND MAPPED**  
**SPECTRAL RESPONSE ACCELERATION AT SHORT PERIODS ( $S_S$ )<sup>a</sup>**

<b>SITE CLASS</b>	<b><math>F_a</math></b>
<b>A</b>	0.80
<b>B</b>	1.00
<b>C</b>	1.20
<b>D</b>	1.51
<b>E</b>	2.13
<b>F</b>	Note a

- a. Site-specific geotechnical investigation and dynamic site response analyses shall be performed to determine appropriate values, except that for structures with periods of vibration equal or less than 0.5 second, values of  $F_a$  for liquefiable soils are permitted to be taken equal to the values for the site class determined without regard to liquefaction in Section 1615.1.5.1.

**TABLE 1615.1.2 (2)**  
**VALUES OF SITE COEFFICIENT  $F_v$  AS A FUNCTION OF SITE CLASS AND MAPPED**  
**SPECTRAL RESPONSE ACCELERATION AT 1-SECOND PERIOD ( $S_1$ )<sup>a</sup>**

<b>SITE CLASS</b>	<b><math>F_v</math></b>
<b>A</b>	0.80
<b>B</b>	1.00
<b>C</b>	1.70
<b>D</b>	2.4
<b>E</b>	3.5
<b>F</b>	Note a

- a. Site-specific geotechnical investigation and dynamic site response analyses shall be performed to determine appropriate values, except that for structures with periods of vibration equal or less than 0.5 second, values of  $F_v$  for liquefiable soils are permitted to be taken equal to the values for the site class determined without regard to liquefaction in Section 1615.1.5.1.

**1615.1.3 Design spectral response acceleration parameters.** Five-percent damped design spectral response acceleration at short periods,  $S_{DS}$ , and at 1-second period,  $S_{D1}$ , shall be determined from Equations 16-40 and 16-41, respectively:

$$S_{DS} = \frac{2}{3} S_{MS} \quad (\text{Equation 16-40})$$

$$S_{DI} = \frac{2}{3} S_{M1} \quad (\text{Equation 16-41})$$

where:

$S_{MS}$  = The maximum considered earthquake spectral response accelerations for short period as determined in Section 1615.1.2.

$S_{MI}$  = The maximum considered earthquake spectral response accelerations for 1 second period as determined in Section 1615.1.2.

**1615.1.4 General procedure response spectrum.** The general design response spectrum curve shall be developed as indicated in Figure 1615.1.4 and as follows:

1. For periods less than or equal to  $T_O$ , the design spectral response acceleration,  $S_a$ , shall be determined by Equation 16-42.
2. For periods greater than or equal to  $T_O$  and less than or equal to  $T_S$ , the design spectral response acceleration,  $S_a$ , shall be taken equal to  $S_{DS}$ .
3. For periods greater than  $T_S$ , the design spectral response acceleration,  $S_a$ , shall be determined by Equation 16-43.

$$S_a = 0.6 \frac{S_{DS}}{T_o} T + 0.4 S_{DS} \quad (\text{Equation 16-42})$$

$$S_a = \frac{S_{DI}}{T} \quad (\text{Equation 16-43})$$

where:

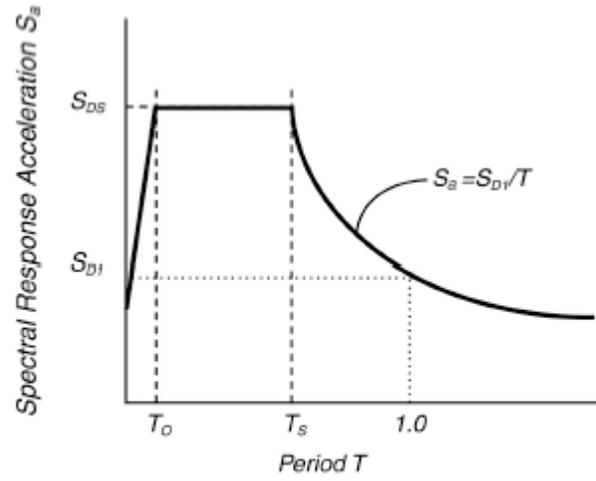

$S_{DS}$  = The design spectral response acceleration at short periods as determined in Section 1615.1.3.

$S_{D1}$  = The design spectral response acceleration at 1-second period as determined in Section 1615.1.3.

$T$  = Fundamental period (in seconds) of the structure (see Section 9.5.5.3 of ASCE 7).

$$T_o = 0.2 S_{D1}/S_{DS}$$

$$T_s = S_{D1}/S_{DS}$$

**FIGURE 1615.1.4**  
**DESIGN RESPONSE SPECTRUM**

**1615.1.5 Site classification for seismic design.** Site classification for Site Class C, D or E shall be determined from Table 1615.1.5.

The notations presented below apply to the upper 100 feet (30 480 mm) of the site profile. Profiles containing distinctly different soil layers shall be subdivided into those layers designated by a number that ranges from 1 to n at the bottom where there is a total of n distinct layers in the upper 100 feet (30 480 mm). The symbol, i, then refers to any one of the layers between 1 and n.

where:

$v_{si}$  = The shear wave velocity in feet per second (m/s).

$d_i$  = The thickness of any layer between 0 and 100 feet (30 480 mm).

$$\bar{v}_s = \frac{\sum_{i=1}^n d_i}{\sum_{i=1}^n \frac{d_i}{v_i}} \quad \text{(Equation 16-44)}$$

$$\sum_{i=1}^n d_i = 100 \text{ feet (30 480 mm)}$$

*$N_i$  is the Standard Penetration Resistance (ASTM D1586) not to exceed 100 blow/foot (mm) as directly measured in the field without corrections.*

$$\bar{N} = \frac{\sum_{i=1}^n d_i}{\sum_{i=1}^n \frac{d_i}{N_i}} \quad \text{(Equation 16-45)}$$

$$\bar{N}_{cb} = \frac{d_s}{\sum_{i=1}^m \frac{d_i}{N_i}} \quad \text{(Equation 16-46)}$$

where:

$m$

$$\sum_{i=1}^m d_i = d_s$$

$i=1$

Use only  $d_i$  and  $N_i$  for cohesionless soils.

$d_s$  = The total thickness of cohesionless soil layers in the top 100 feet (30 480 mm).

$S_{ui}$  = The undrained shear strength in psg (kPa), not to exceed 5,000 psg (240 kPa), ASTM D 2166 or D 2850.

$$\bar{s}_a = \frac{d_c}{\sum_{i=1}^k \frac{d_i}{s_i}} \quad (\text{Equation 16-47})$$

where:

$k$

$$\sum_{i=1} d_i = d_c$$

$i=1$

$d_c$  = The total thickness (100- $d_s$ ) (For SI:30480- $d_s$ ) of cohesive soil layers in the top 100 feet (30480 mm).

$PI$  = The plasticity index, ASTM D 4318.

$W$  = The moisture content in percent, ASTM D 2216.

*The shear wave velocity for rock, Site Class B, shall be either measured on site or estimated by a geotechnical engineer or engineering geologist/seismologist for competent rock with moderate fracturing and weathering. Softer and more highly fractured and weathered rock shall either be measured on site for shear wave velocity or classified as Site Class C.*

*The hard rock, Site Class A, category shall be supported by shear wave velocity measurements either on site or on profiles of the same rock type in the same formation with an equal or greater degree of weathering and fracturing. Where hard rock conditions are known to be continuous to a depth of 100 feet (30 480 mm), surficial shear wave velocity measurements are permitted to be extrapolated to assess  $v_s$ .*

*The rock categories, Site Classes A and B, shall not be used if there is more than 10 feet (3048 mm) of soil between the rock surface and the bottom of the spread footing or mat foundation.*

**TABLE 1615.1.5  
SITE CLASSIFICATION<sup>a</sup>**

SITE CLASS	$\bar{v}_s$	$\bar{N}$ or $\bar{N}_{60}$	$\bar{s}_v$
E	< 600 ft/s	< 15	< 1,000 psf
D	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
C	1,200 to 2,500 ft/s	> 50	> 2,000

For SI: 1 foot per second = 304.8 mm per second, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>.

a. If the  $\bar{s}_v$  method is used and the  $\bar{N}_{60}$  and  $\bar{v}_s$  criteria differ, select the category with the softer soils (for example, use Site Class E instead of D).

#### **1615.1.5.1 Steps for classifying a site.**

1. Check for the four categories of Site Class F requiring site-specific evaluation. If the site corresponds to any of these categories, classify the site as Site Class F and conduct a site-specific evaluation.
2. Check for the existence of a total thickness of soft clay > 10 feet (3048 mm) where a soft clay layer is defined by:  $s_u < 500$  psf (25 kPa),  $w \geq 40$  percent, and  $PI > 20$ . If these criteria are satisfied, classify the site as Site Class E.
3. Categorize the site using one of the following three methods with  $v_s$ ,  $N$ , and  $s_u$  computed in all cases as specified.
  - 3.1  $v_s$  for the top 100 feet (30 480 mm) ( $v_s$  method).
  - 3.2  $N$  for the top 100 feet (30 480 mm) ( $N$  method).
  - 3.3  $N_{ch}$  for cohesionless soil layers ( $PI < 20$ ) in the top 100 feet (30 480 mm) and average,  $s_w$  for cohesive soil layers ( $PI > 20$ ) in the top 100 feet (30 480 mm) ( $s_u$  method).

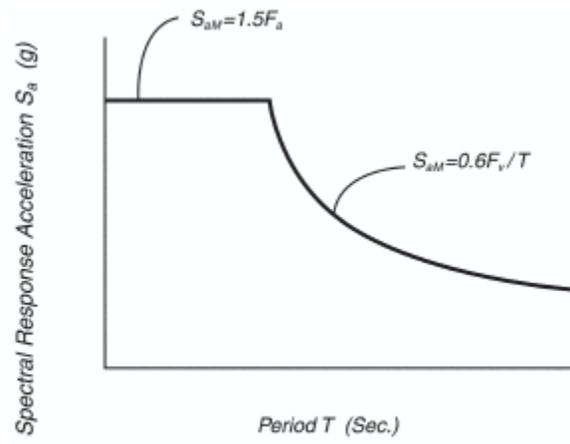

**1615.2 Site-specific procedure for determining ground motion accelerations.** A site-specific study shall account for the regional seismicity and geology; the expected recurrence rates and maximum magnitudes of events on known faults and source zones; the location of the site with respect to these; near source effects if any and the characteristics of subsurface site conditions.

**1615.2.1 Probabilistic maximum considered earthquake.** Where site-specific procedures are used as required or permitted by Section 1615, the maximum considered earthquake ground motion shall be taken as that motion represented by an acceleration response spectrum having a 2-percent probability of exceedance within a 50-year period. The maximum considered earthquake spectral response acceleration at any period,  $S_{aM}$ , shall be taken from the 2-percent probability of exceedance within a 50-year period spectrum.

**Exception:** Where the spectral response ordinates at 0.2 second or 1 second for a 5-percent damped spectrum having a 2-percent probability of exceedance within a 50-year period exceed the corresponding ordinates of the deterministic limit of Section 1615.2.2, the maximum considered earthquake ground motion spectrum shall be taken as the lesser of the probabilistic maximum considered earthquake ground motion or the deterministic maximum considered

*earthquake ground motion spectrum of Section 1615.2.3, but shall not be taken as less than the deterministic limit ground motion of Section 1615.2.2.*

***1615.2.2 Deterministic limit on maximum considered earthquake ground motion.*** *The deterministic limit for the maximum considered earthquake ground motion shall be the response spectrum determined in accordance with Figure 1615.2.2, where site coefficients,  $F_a$  and  $F_v$ , are determined in accordance with Section 1615.1.2, with the value of the mapped short-period spectral response acceleration,  $S_s$ , taken as 1.5g and the value of the mapped spectral response acceleration at 1 second,  $S_1$ , taken as 0.6g.*

**FIGURE 1615.2.2**  
**DETERMINISTIC LIMIT ON MAXIMUM CONSIDERED**  
**EARTHQUAKE RESPONSE SPECTRUM**

**1615.2.3 Deterministic maximum considered earthquake ground motion.** *The deterministic maximum considered earthquake ground motion response spectrum shall be calculated as 150 percent of the median spectral response accelerations,  $S_{aM}$ , at all periods resulting from a characteristic earthquake on any known active fault within the region.*

**1615.2.4 Site-specific design ground motion.** *Where site-specific procedures are used to determine the maximum considered earthquake ground motion response spectrum, the design spectral response acceleration,  $S_a$ , at any period shall be determined from Equation 16-48:*

$$S_a = \frac{2}{3} S_{aM}$$

(Equation 16-48)

and shall be greater than or equal to 80 percent of the design spectral response acceleration,  $S_a$ , determined by the general response spectrum in Section 1615.1.4.

**1615.2.5 Design spectral response coefficients.** Where the site-specific procedure is used to determine the design ground motion in accordance with Section 1615.2.4, the parameter  $S_{DS}$  shall be taken as the spectral acceleration,  $S_a$ , obtained from the site-specific spectra at a period of 0.2 second, except that it shall not be taken as less than 90 percent of the peak spectral acceleration,  $S_a$ , at any period. The parameter  $S_{DI}$  shall be taken as the greater of the spectral acceleration,  $S_a$ , at a period of 1 second or two times the spectral acceleration,  $S_a$ , at a period of 2 seconds. The parameters  $S_{MS}$  and  $S_{MI}$  shall be taken as 1.5 times  $S_{DS}$  and  $S_{DI}$ , respectively. The values so obtained shall not be taken as less than 80 percent of the values obtained from the general procedures of Section 1615.1.

## **SECTION BC 1616**

### **EARTHQUAKE LOADS—CRITERIA SELECTION**

**1616.1 Structural design criteria.** Each structure shall be assigned to a seismic design category in accordance with Section 1616.3. Seismic design categories are used in this code to determine permissible structural systems, limitations on height and irregularity, those components of the structure that must be designed for seismic resistance and the types of lateral force analysis that must be performed. Each structure shall be provided with complete lateral- and vertical-force-resisting systems capable of providing adequate strength, stiffness and energy dissipation capacity to withstand the design earthquake ground motions determined in accordance with Section 1615 within the prescribed deformation limits of Section 1617.3. The design ground motions shall be assumed to occur along any horizontal direction of a structure. A continuous load path, or paths, with adequate strength and stiffness to transfer forces induced by the design earthquake ground motions from the points of application to the final point of resistance shall be provided.

Allowable stress design is permitted to be used to evaluate sliding, overturning and soil bearing at the soil-structure interface regardless of the approach used in the design of the structure, provided load combinations of Section 1605.3 are utilized. When using allowable stress design for proportioning foundations, the value of  $0.2 S_{DS}D$  in Equations 16-50, 16-51, 16-52 and 16-53 or Equations 9.5.2.7-1, 9.5.2.7-2, 9.5.2.7.1-1 and 9.5.2.7.1-2 of ASCE 7 is permitted to be taken equal to zero. When the load combinations of Section 1605.3.2 are utilized, a one-third increase in soil allowable stresses is permitted for all load combinations that include  $W$  or  $E$ .

**1616.2 Seismic use groups and occupancy importance factors.** Each structure shall be assigned a seismic use group and a corresponding occupancy importance factor ( $IE$ ) as indicated in Table 1604.5.

**1616.2.1 Seismic Use Group I.** *Seismic Use Group I structures are those not assigned to either Seismic Use Group II or III.*

**1616.2.2 Seismic Use Group II.** *Seismic Use Group II structures are those, the failure of which would result in a substantial public hazard due to occupancy or use as indicated by Table 1604.5, or as designated by the commissioner.*

**1616.2.3 Seismic Use Group III.** *Seismic Use Group III structures are those having essential facilities that are required for post earthquake recovery and those containing substantial quantities of hazardous substances, as indicated in Table 1604.5, or as designated by the commissioner. Where operational access to a Seismic Use Group III structure is required through an adjacent structure, the adjacent structure shall conform to the requirements for Seismic Use Group III structures. Where operational access is less than 10 feet (3048 mm) from an interior lot line or less than 10 feet (3048 mm) from another structure, access protection from potential falling debris shall be provided by the owner of the Seismic Use Group III structure.*

**1616.2.4 Multiple occupancies.** *Where a structure is occupied for two or more occupancies not included in the same seismic use group, the structure shall be assigned the classification of the highest seismic use group corresponding to the various occupancies. Where structures have two or more portions that are structurally separated in accordance with Section 1620, each portion shall be separately classified. Where a structurally separated portion of a structure provides required access to, required egress from or shares life safety components with another portion having a higher seismic use group, both portions shall be assigned the higher seismic use group.*

**1616.3 Determination of seismic design category.** *All structures shall be assigned to a seismic design category based on their seismic use group and the design spectral response acceleration coefficients,  $S_{DS}$  and  $S_{DI}$ , determined in accordance with Section 1615.1.3 or 1615.2.5. Each building and structure shall be assigned to the most severe seismic design category in accordance with Table 1616.3(1) or 1616.3(2), irrespective of the fundamental period of vibration of the structure,  $T$ . Seismic Design Category B is the minimum design category allowed.*

**Exception:** *The seismic design category is permitted to be determined from Table 1616.3(1) alone when all of the following apply:*

1. *The approximate fundamental period of the structure,  $T_w$ , in each of the two orthogonal directions determined in accordance with Section 9.5.5.3.2 of ASCE 7, is less than  $0.8 T_s$*

*determined in accordance with Section 1615.1.4,*

- 2. Equation 9.5.5.2.1-1 of ASCE 7 is used to determine the seismic response coefficient,  $C_s$ , and*
- 3. The diaphragms are rigid as defined in Section 1602.*

**TABLE 1616.3 (1)**  
**SEISMIC DESIGN CATEGORY BASED ON**  
**SHORT-PERIOD RESPONSE ACCELERATIONS**

VALUE OF $S_{DS}$	SEISMIC USE GROUP		
	I	II	III
$S_{DS} < 0.167g$	A	A	A
$0.167g < S_{DS} < 0.33g$	B	B	C
$0.33g < S_{DS} < 0.50g$	C	C	D
$0.50g < S_{DS}$	$D^a$	$D^a$	D

a. Building structures in Seismic Use Groups I or II and on Site Class E may be designed in Seismic Design Category C if their Fundamental Period of Vibration is not between 1 and 2 seconds or a dynamic structural analysis based on a site specific spectrum is performed.

**TABLE 1616.3 (2)**  
**SEISMIC DESIGN CATEGORY BASED ON**  
**1-SECOND PERIOD RESPONSE ACCELERATIONS**

VALUE OF $S_{D1}$	SEISMIC USE GROUP		
	I	II	III
$S_{D1} < 0.067g$	A	A	A
$0.067g < S_{D1} < 0.133g$	B	B	C
$0.133g < S_{D1} < 0.20g$	C	C	D
$0.20g < S_{D1}$	D	D	D

**1616.3.1 Seismic Design Category A, E or F.** Requirements for Seismic Design Categories A, E and F have been eliminated from the New York City Building Code as such categories do not apply in New York City. References to these categories can be found in ASCE 7.

**1616.4** Reserved.

**1616.5 Building configuration.** Buildings shall be classified as regular or irregular based on the criteria in Section 9.5.2.3 of ASCE 7.

**Exception:** Buildings designed using the simplified analysis procedure in Section 1617.5 shall be classified in accordance with Section 1616.5.1.

**1616.5.1 Building configuration (for use in the simplified analysis procedure of Section 1617.5).** Buildings designed using the simplified analysis procedure in Section 1617.5 shall be classified as regular or irregular based on the criteria in this section. Such classification shall be based on the plan and vertical configuration. Buildings shall not exceed the limitations of Section 1616.6.1.

**1616.5.1.1 Plan irregularity.** Buildings having one or more of the features listed in Table 1616.5.1.1 shall be designated as having plan structural irregularity and shall comply with the requirements in the sections referenced in that table.

**TABLE 1616.5.1.1**  
**PLAN STRUCTURAL IRREGULARITIES**

<b>IRREGULARITY TYPE AND DESCRIPTION</b>		<b>REFERENCE SECTION</b>	<b>SEISMIC DESIGN CATEGORY<sup>a</sup> APPLICATION</b>
1a	<i>Torsional Irregularity - to be considered when diaphragms are not flexible as determined in Section 1602.1.1</i>	9.5.5.5.2 of ASCE 7 1620.4.1	C and D, D, D, C and D
	<i>Torsional irregularity shall be considered to exist when the maximum story drift, computed including accidental torsion, at one end of the structure transverse to an axis is more than 1.2 times the average of the story drifts at the two ends of the structure.</i>	9.5.2.1 of ASCE 7 9.5.5.7.1 of ASCE 7	
1b	<i>Extreme Torsional Irregularity - to be considered when diaphragms are not flexible as determined in Section 1602.1.</i>	9.5.5.5.2 of ASCE 7 1620.4.1	C and D, D D, C and D
	<i>Extreme Torsional irregularity shall be considered to exist when the maximum story drift</i>	9.5.2.5.1 of ASCE 7 9.5.5.7.1 of ASCE 7	
2	<i>Reentrant Corners</i> <i>Plan configurations of a structure and its lateral-force-resisting system contain reentrant corners where both projections of the structure beyond a reentrant corner are greater than 15 percent of the plan dimension of the structure in the given direction.</i>	1620.4.1	D
3	<i>Diaphragm Discontinuity</i> <i>Diaphragms with abrupt discontinuities or variations in stiffness, including those having cutout or open areas greater than 50 percent of the gross enclosed diaphragm area, or changes in effective diaphragm stiffness of more than 50 percent from one story to the next.</i>	1620.4.1	D
4	<i>Out-of Plane Offsets</i> <i>Discontinuities in a lateral-force-resistance path, such as</i>	1620.4.1 9.5.2.5.1 of ASCE	D, D,

	<i>out of plane offset of the vertical elements.</i>	7 1620.2.9	<i>B, C and D</i>
5	<i>Nonparallel Systems</i> <i>The vertical lateral-force-resisting elements are not parallel to or symmetric about the major orthogonal axes of the lateral-force-resisting system.</i>	1620.3.2	<i>C and D</i>

a. *Seismic Design Category is determined in accordance with Section 1616.*

)

**1616.5.1.2 Vertical irregularity.** Buildings having one or more of the features listed in Table 1616.5.1.2 shall be designated as having vertical irregularity and shall comply with the requirements in the sections referenced in that table.

**Exceptions:**

1. Structural irregularities of Type 1a, 1b or 2 in Table 1616.5.1.2 do not apply where no story drift ratio under design lateral load is greater than 130 percent of the story drift ratio of the next story above. Torsional effects need not be considered in the calculation of story drifts for the purpose of this determination. The story drift ratio relationship for the top two stories of the building is not required to be evaluated.
2. Irregularities of Types 1a, 1b and 2 of Table 1616.5.1.2 are not required to be considered for one-story buildings in any seismic design category or for two-story buildings in Seismic Design Category B, C or D.

**TABLE 1616.5.1.2**  
**VERTICAL STRUCTURAL IRREGULARITIES**

<b>IRREGULARITY TYPE AND DESCRIPTION</b>		<b>REFERENCE SECTION</b>	<b>SEISMIC DESIGN CATEGORY<sup>a</sup> APPLICATION</b>
1a	<p><i>Stiffness Irregularity - Soft Story</i></p> <p><i>A soft story is one in which lateral stiffness is less than 70 percent of that in the story above or less than 80 percent for the average stiffness of the three stories above.</i></p>	<p>9.5.2.5.1 of ASCE</p> <p>7</p>	D
1b	<p><i>Stiffness Irregularity - Extreme Soft Story</i></p> <p><i>An extreme soft story is one in which the lateral stiffness is less than 60 percent of that in the story above or less than 70 percent of the average stiffness of the three stories above.</i></p>	<p>9.5.2.5.1 of ASCE</p> <p>7</p>	D
2	<p><i>Weight (Mass) Irregularity</i></p> <p><i>Mass irregularity shall be considered to exist where the effective mass of any story is more than 150 percent of the effective mass of an adjacent story. *a. Seismic Design Category is determined in accordance with Section 1616.*

**1616.6 Analysis procedures.** A structural analysis conforming to one of the types permitted in Section 9.5.2.5.1 of ASCE7 or to the simplified procedure in Section 1617.5 shall be made for all structures. The analysis shall form the basis for determining the seismic forces,  $E$  and  $E_m$ , to be applied in the load combinations of Section 1605 and shall form the basis for determining the design drift as required by Section 9.5.2.8 of ASCE 7 or Section 1617.3.

**Exception:** Design drift need not be evaluated in accordance with Section 1617.3 when the simplified analysis method of Section 1617.5 is used.

**1616.6.1 Simplified analysis.** A simplified analysis, in accordance with Section 1617.5, shall be permitted to be used for any structure in Seismic Use Group I, subject to the following limitations, or a more rigorous analysis shall be made:

1. Buildings of light-framed construction not exceeding three stories in height, excluding basements.
2. Buildings of any construction other than light-framed construction, not exceeding two stories in height, excluding basements, with flexible diaphragms at every level as defined in Section 1602.

## **SECTION BC 1617**

### **EARTHQUAKE LOADS—MINIMUM DESIGN LATERAL FORCE AND RELATED EFFECTS**

**1617.1 Seismic load effect  $E$  and  $E_m$ .** The seismic load effect,  $E$ , for use in the basic load combinations of Sections 1605.2 and 1605.3 shall be determined from Section 9.5.2.7 of ASCE 7. The maximum seismic load effect,  $E_m$ , for use in the special seismic load combination of Section 1605.4 shall be the special seismic load determined from Section 9.5.2.7.1 of ASCE 7.

**Exception:** For structures designed using the simplified analysis procedure in Section 1617.5, the seismic load effects,  $E$  and  $E_m$ , shall be determined from Section 1617.1.1.

**1617.1.1 Seismic load effects,  $E$  and  $E_m$  (for use in the simplified analysis procedure of Section 1617.5).** Seismic load effects,  $E$  and  $E_m$ , for use in the load combinations of Section 1605 for structures designed using the simplified analysis procedure in Section 1617.5 shall be determined as follows.

**1617.1.1.1 Seismic load effect,  $E$ .** Where the effects of gravity and the seismic ground motion are additive, seismic load,  $E$ , for use in Equations 16-5, 16-10 and 16-17, shall be defined by Equation

16-50:

$$E = \rho Q_E + 0.2 S_{DS} D$$

(Equation 16-50)

where:

$D$  = The effect of dead load.

$E$  = The combined effect of horizontal and vertical earthquake-induced forces.

$\rho$  = A redundancy coefficient obtained in accordance with Section 1617.2.

$Q_E$  = The effect of horizontal seismic forces.

$S_{DS}$  = The design spectral response acceleration at short periods obtained from Section 1615.1.3 or 1615.2.5.

Where the effects of gravity and seismic ground motion counteract, the seismic load,  $E$ , for use in Equations 16-6, 16-12 and 16-18 shall be defined by Equation 16-51.

$$E = \rho Q_E - 0.2S_{DS}D$$

(Equation 16-51)

*Design shall use the load combinations prescribed in Section 1605.2 for strength or load and resistance factor design methodologies or Section 1605.3 for allowable stress design methods.*

**1617.1.1.2 Maximum seismic load effect,  $E_m$ .** *The maximum seismic load effect,  $E_m$ , shall be used in the special seismic load combinations in Section 1605.4.*

*Where the effects of the seismic ground motion and gravity loads are additive, seismic load,  $E_m$ , for use in Equation 16-19, shall be defined by Equation 16-52.*

$$E_m = \Omega_0 Q_E + 0.2 S_{DS} D \quad (\text{Equation 16-52})$$

*Where the effects of the seismic ground and gravity loads counteract, seismic load,  $E_m$ , for use in Equation 16-20, shall be defined by Equation 16-53.*

$$E_m = \Omega_\theta Q_E - 0.2S_{D\theta}D \quad (\text{Equation 16-53})$$

Where  $E$ ,  $Q_E$ ,  $S_{DS}$  are as defined above and  $Q_0$  is the system overstrength factor as given in Table 1617.6.2.

The term  $Q_0 Q_E$  need not exceed the maximum force that can be transferred to the element by the other elements of the lateral-force-resisting system.

Where allowable stress design methodologies are used with the special load combinations of Section 1605.4, design strengths are permitted to be determined using an allowable stress increase of 1.7 and a resistance factor,  $\phi$ , of 1.0. This increase shall not be combined with increases in allowable stresses or load combination reductions otherwise permitted by this code or the material reference standard except that combination with the duration of load increases in Chapter 23 is permitted.

**1617.2 Redundancy.** The provisions given in Section 9.5.2.4 of ASCE 7 shall be used.

**Exception:** Structures designed using the simplified analysis procedure in Section 1617.5 shall use the redundancy provisions in Sections 1617.2.2.

**1617.2.1 ASCE7, Section 9.5.2.4.2.** Modify Section 9.5.2.4.2 as follows:

9.5.2.4.2 Seismic Design Category D: For structures in Seismic Design Category D,  $\rho$  shall be taken as the largest of the values of  $\rho_x$  calculated at each story “x” of the structure in accordance with Equation 9.5.2.4.2-1 as follows:

$$\rho_x = 2 - \frac{20}{r_{maxx} \sqrt{A_x}}$$

where:

$r_{maxx}$  = The ratio of the design story shear resisted by the single element carrying the most shear force in the story to the total story shear, for a given direction of loading. For braced frames, the value of  $r_{maxx}$  is equal to the lateral force component in the most heavily loaded brace element divided by the story shear. For moment frames,  $r_{maxx}$  shall be taken as the maximum of the sum of the shears in any two adjacent columns in the plane of a moment frame divided by the story shear. For columns common to two bays with moment-resisting connections on opposite sides at the level under consideration, 70 percent of the shear in that column is permitted to be used in the column shear summation. For shear walls,  $r_{maxx}$  shall be taken equal to shear in

*the most heavily loaded wall or wall pier multiplied by 10/l<sub>w</sub> (the metric coefficient is 3.3/l<sub>w</sub>), divided by the story shear, where l<sub>w</sub> is the wall or wall pier length in feet (m). The value of the ratio of 10/l<sub>w</sub> need not be greater than 1.0 for buildings of light-framed construction. For dual systems, r<sub>maxx</sub> shall be taken as the maximum value defined above, considering all lateral-load-resisting elements in the story. The lateral loads shall be distributed to elements based on relative rigidities considering the interaction of the dual system. For dual systems, the value of n̄ need not exceed 80 percent of the value calculated above.*

*A<sub>x</sub> = The floor area in square feet of the diaphragm level immediately above the story.*

*Calculation of r<sub>maxx</sub> need not consider the effects of accidental torsion and any dynamic amplification of torsion required by Section 9.5.5.5.2.*

*For a story with a flexible diaphragm immediately above, r<sub>maxx</sub> shall be permitted to be calculated from an analysis that assumes rigid diaphragm behavior and ρ<sub>x</sub> need not exceed 1.25.*

*The value of ρ need not exceed 1.5, which is permitted to be used for any structure. The value of ρ shall not be taken as less than 1.0.*

**Exception:** *For structures with seismic-force-resisting systems in any direction comprised solely of special moment frames, the seismic-force-resisting system shall be configured such that the value of ρ calculated in accordance with this section does not exceed 1.25. The calculated value of ρ is permitted to exceed this limit when the design story drift, Δ, as determined in Section 9.5.5.7, does not exceed Δ<sub>a</sub>/ρ for any story where a is the allowable story drift from Table 9.5.2.8.*

*The metric equivalent of Equation 9.5.2.4.2-1 is:*

$$\rho_x = 2 - \frac{6.1}{r_{maxx} \sqrt{A_x}}$$

*Where: A<sub>x</sub> is in square meters.*

*The value ρ shall be permitted to be taken equal to 1.0 in the following circumstances:*

- 1. When calculating displacements for dynamic amplification of torsion in Section 9.5.5.5.2.*
- 2. When calculating deflections, drifts and seismic shear forces related to Sections 9.5.5.7.1 and*

9.5.5.7.2.

3. For design calculations required by Section 9.5.2.6, 9.6 or 9.14.

For structures with vertical combinations of seismic-force-resisting systems, the value of  $\tilde{n}$  shall be determined independently for each seismic-force-resisting system. The redundancy coefficient of the lower portion shall not be less than the following:

$$\rho_L = \frac{R_L \rho_u}{R_u}$$

where:

$\rho_L = \rho$  of lower portion.

$R_L = R$  of lower portion.

$\rho_u = \rho$  of upper portion.

$R_u = R$  of upper portion.

**1617.2.2 Redundancy (for use in the simplified analysis procedure of Section 1617.5).** A redundancy coefficient,  $\rho$ , shall be assigned to each structure designed using the simplified analysis procedure in Section 1617.5 in accordance with this section. Buildings shall not exceed the limitations of Section 1616.6.1.

**1617.2.2.1 Seismic Design Category B or C.** For structures assigned to Seismic Design Category B or C (see Section 1616), the value of the redundancy coefficient  $\rho$  is 1.0.

**1617.2.2.2 Seismic Design Category D.** For structures in Seismic Design Category D (see Section 1616), the redundancy coefficient,  $\rho$ , shall be taken as the largest of the values of,  $\rho_i$ , calculated at each story “i” of the structure in accordance with Equation 16-54, as follows:

$$\rho_i = 2 - \frac{20}{r_{\max_i} \sqrt{A_i}} \quad \text{(Equation 16-54)}$$

For SI:

$$\rho_i = 2 - \frac{6.1}{r_{\max_i} \sqrt{A_i}}$$

where:

$r_{maxi}$  = The ratio of the design story shear resisted by the most heavily loaded single element in the story to the total story shear, for a given direction of loading.

$r_{maxi}$  = For braced frames, the value  $r_{maxi}$  is equal to the horizontal force component in the most heavily loaded brace element divided by the story shear.

$r_{maxi}$  = For moment frames,  $r_{maxi}$  shall be taken as the maximum of the sum of the shears in any two adjacent columns in a moment frame divided by the story shear. For columns common to two bays with moment-resisting connections on opposite sides at the level under consideration, it is permitted to use 70 percent of the shear in that column in the column shear summation.

$r_{maxi}$  = For shear walls,  $r_{maxi}$  shall be taken as the maximum value of the product of the shear in the wall or wall pier and  $10/lw$  ( $3.3/lw$  for SI), divided by the story shear, where  $lw$  is the length of the wall or wall pier in feet (m). In light-framed construction, the value of the ratio of  $10/lw$  need not be greater than 1.0.

$r_{maxi}$  = For dual systems,  $r_{maxi}$  shall be taken as the maximum value defined above, considering all lateral-load-resisting elements in the story. The lateral loads shall be distributed to elements based on relative rigidities considering the interaction of the dual system. For dual systems, the value of  $\rho$  need not exceed 80 percent of the value calculated above.

$A_i$  = The floor area in square feet of the diaphragm level immediately above the story.

For a story with a flexible diaphragm immediately above,  $r_{maxi}$  shall be permitted to be calculated from an analysis that assumes rigid diaphragm behavior and  $\rho$  need not exceed 1.25.

The value,  $\rho$ , shall not be less than 1.0, and need not exceed 1.5.

Calculation of  $r_{maxi}$  need not consider the effects of accidental torsion and any dynamic amplification of torsion required by Section 9.5.5.5.2 of ASCE 7.

For structures with seismic-force-resisting systems in any direction comprised solely of special moment frames, the seismic-force-resisting system shall be configured such that the value of  $\rho$  calculated in accordance with this section does not exceed 1.25 for structures assigned to

*Seismic Design Category D, and does not exceed 1.1 for structures assigned to Seismic Design Category E or F.*

**Exception:** *The calculated value of  $\rho$  is permitted to exceed these limits when the design story drift,  $\Delta$ , as determined in Section 1617.5.4, does not exceed  $\Delta_a/\rho$  for any story where  $a$  is the allowable story drift from Table 1617.3.1.*

*The value  $\rho$  shall be permitted to be taken equal to 1.0 in the following circumstances:*

- 1. When calculating displacements for dynamic amplification of torsion in Section 9.5.5.5.2 of ASCE 7.*
- 2. When calculating deflections, drifts and seismic shear forces related to Sections 9.5.5.7.1 and 9.5.5.7.2 of ASCE 7.*
- 3. For design calculations required by Section 1620, 1621 or 1622.*

*For structures with vertical combinations of seismic-force-resisting systems, the value,  $\rho$ , shall be determined independently for each seismic-force-resisting system. The redundancy coefficient of the lower portion shall not be less than the following:*

---

$$\rho_L = \frac{R_L \rho_a}{R_a}$$

(Equation 16-55)

where:

$\rho_L$  =  $\rho$  of lower portion.

$R_L$  =  $R$  of lower portion.

$\rho_u$  =  $\rho$  of upper portion.

$R_u$  =  $R$  of upper portion.

**1617.3 Deflection and drift limits.** *The provisions given in Section 9.5.2.8 of ASCE 7 shall be used.*

**Exception:** *Structures designed using the simplified analysis procedure in Section 1617.5 shall meet the provisions in Section 1617.3.1.*

**1617.3.1 Deflection and drift limits (for use in the simplified analysis procedure of Section 1617.5).** *The design story drift  $\Delta$ , as determined in Section 1617.5.4, shall not exceed the allowable story drift  $\Delta_w$ , as obtained from Table 1617.3.1 for any story. All portions of the building shall be designed to act as an integral unit in resisting seismic forces unless separated structurally by a distance sufficient to avoid damaging contact under total deflection as determined in Section 1617.5.4. Buildings shall not exceed the limitations of Section 1616.6.1.*

**TABLE 1617.3.1  
ALLOWABLE STORY DRIFT,  $\Delta_x$  (inches)<sup>a</sup>**

BUILDING	SEISMIC USE GROUP		
	I	II	III
Buildings, other than masonry shear wall or masonry wall frame buildings, four stories or less in height with interior walls, partitions, ceilings and exterior wall systems that have been designed to accommodate the story drifts	0.025 $h_{sx}$ <sup>b</sup>	0.020 $h_{sx}$	0.015 $h_{sx}$
Masonry cantilever shear wall buildings <sup>c</sup>	0.010 $h_{sx}$	0.010 $h_{sx}$	0.010 $h_{sx}$
Other masonry shear wall buildings	0.007 $h_{sx}$	0.007 $h_{sx}$	0.007 $h_{sx}$
Masonry wall frame buildings	0.013 $h_{sx}$	0.013 $h_{sx}$	0.010 $h_{sx}$
All other buildings	0.020 $h_{sx}$	0.015 $h_{sx}$	0.010 $h_{sx}$

For SI: 1 inch = 25.4 mm.

- a. There shall be no drift limit for single-story buildings with interior walls, partitions, ceilings and exterior wall systems that have been designed to accommodate the story drifts.
- b.  $h_{sx}$  is the story height below Level  $x$ .
- c. Buildings in which the basic structural system consists of masonry shear walls designed as vertical elements cantilevered from their base or foundation support which are so constructed that moment transfer between shear walls (coupling) is negligible.

**1617.3.2 Structural separations.** All structures shall be separated from adjacent structures. When a structure adjoins a property line not common to a public way (typically side or rear lot lines), that structure shall also be set back from the property line by at least 1 inch (25 mm) for each 50 feet (15 240) of height. For structures in Seismic Design Category D , refer to Section 1620.4.5 for additional requirements.

**Exception:** Smaller separations or property line setbacks shall be permitted when justified by rational analysis based on maximum expected ground motions.

**1617.4 Equivalent lateral force procedure for seismic design of buildings.** The provisions given in Section 9.5.5 of ASCE 7 shall be used with modifications. Modify Table 9.5.5.3.2 "Values of Approximate Period Parameters  $C_i$  and  $x$ " to include the following:

Structure Type	$C_i$	$x$
Dual systems where the building height exceeds 400 feet (122 m)	0.03 (0.07) <sup>a</sup>	0.75
Dual systems where the building height ( $h$ ) exceeds 160 feet (48 768 mm) but is less than 400 feet (122 m)	$0.02 + 0.01 \times [h-160]/240$ $(0.055 + 0.015 \times [h-48.8]/73.2)$ <sup>a</sup>	0.75

<sup>a</sup> Metric equivalents are shown in parenthesis.

**1617.5 Simplified analysis procedure for seismic design of buildings.** See Section 1616.6.1 for limitations on the use of this procedure. For purposes of this analytical procedure, a building is considered to be fixed at the base.

**1617.5.1 Seismic base shear.** The seismic base shear,  $V$ , in a given direction shall be determined in accordance with the following equation:

$$V = \frac{1.2S_{DS}}{R}W$$

(Equation 16-56)

where:

$S_{DS}$  = The design elastic response acceleration at short period as determined in accordance with Section 1615.1.3.

$R$  = The response modification factor from Table 1617.6.2.

$W$  = The effective seismic weight of the structure, including the total dead load and other loads listed below:

1. In areas used for storage, a minimum of 25 percent of the reduced floor live load (floor live load in public garages and open parking structures need not be included).
2. Where an allowance for partition load is included in the floor load design, the actual partition weight or a minimum weight of 10 psf of floor area, whichever is greater (0.48 kN/m<sup>2</sup>).
3. Total weight of permanent operating equipment.
4. 20 percent of flat roof snow load where flat snow load exceeds 30 psf (1.44 kN/m<sup>2</sup>).

**1617.5.2 Vertical distribution.** The forces at each level shall be calculated using the following equation:

$$F_x = \frac{1.2S_{DS}}{R} w_x$$

(Equation 16-57)

where:

$w_x$  = The portion of the effective seismic weight of the structure,  $W$ , at Level  $x$ .

**1617.5.3 Horizontal distribution.** Diaphragms constructed of untopped steel decking or wood structural panels or similar light-framed construction are permitted to be considered as flexible.

**1617.5.4 Design drift.** For the purposes of Sections 1617.3.1 and 1620.4.6, the design story drift,  $\Delta$ , shall be taken as 1 percent of the story height unless a more exact analysis is provided.

**1617.6 Seismic-force-resisting systems.** The provisions given in Section 9.5.2.2 of ASCE 7 shall be used except as modified in Section 1617.6.1.

**Exception:** For structures designed using the simplified analysis procedure in Section 1617.5, the provisions of Section 1617.6.2 shall be used.

**1617.6.1 Modifications to ASCE 7, Section 9.5.2.2.**

**1617.6.1.1 ASCE 7, Table 9.5.2.2.** Delete ASCE Table 9.5.2.2 and replace with Table 1617.6.2.

**1617.6.1.2 ASCE 7, Section 9.5.2.2.2.1.** Modify Section 9.5.2.2.2.1 by adding Exception 3 as follows:

3. The following two-stage static analysis procedure is permitted to be used for structures having a flexible upper portion supported on a rigid lower portion where both portions of the structure considered separately can be classified as being regular, the average story stiffness of the lower portion is at least 10 times the average story stiffness of the upper portion and the period of the entire structure is not greater than 1.1 times the period of the upper portion considered as a separate structure fixed at the base:

3.1 The flexible upper portion shall be designed as a separate structure using the appropriate values of  $R$  and  $\rho$ .

3.2 The rigid lower portion shall be designed as a separate structure using the appropriate values of  $R$  and  $\rho$ . The reactions from the upper portion shall be those determined from the analysis of the upper portion amplified by the ratio of the  $R/\rho$  of the upper portion over  $R/\rho$  of the lower portion. This ratio shall not be less than 1.0.

**1617.6.1.3 ASCE 7, Section 9.5.2.2.4.3.** *Modify Section 9.5.2.2.4.3 by changing exception to read as follows:*

**Exception:** *Reinforced concrete frame members not designed as part of the seismic-force-resisting system and slabs shall comply with Section 21.11 of Ref. 9.9-1.*

**1617.6.2 Seismic-force-resisting systems (for use in the Simplified analysis procedure of Section 1617.5).** *The basic lateral and vertical seismic-force-resisting systems shall conform to one of the types indicated in Table 1617.6.2 subject to the limitations on height indicated in the table based on seismic design category as determined in Section 1616. The appropriate response modification coefficient,  $R$ , system over-strength factor,  $\Omega_0$ , and deflection amplification factor,  $C_d$ , indicated in Table 1617.6.2 shall be used in determining the base shear, element design forces and design story drift. For seismic-force-resisting systems not listed in Table 1617.6.2, analytical and test data shall be submitted that establish the dynamic characteristics and demonstrate the lateral-force resistance and energy dissipation capacity to be equivalent to the structural systems listed in Table 1617.6.2 for equivalent response modification coefficient,  $R$ , system over-strength coefficient,  $\Omega_0$ , and deflection amplification factor,  $C_d$ , values. Buildings shall not exceed the limitations of Section 1616.6.1.*

2. <i>Special steel moment frames</i>	2 ½	2	2 ½	NL	NL	NL
3. <i>Ordinary steel moment frames</i>	1 ¼	2	2 ½	NL	NL	NP
4. <i>Special reinforced concrete moment frames</i>	2 ½	2	1 ¼	NL	NL	NL
<b>H.</b> <i>Structural Steel Systems Not Specifically Detailed for Seismic Resistance</i>	3	3	3	NL	NL	NP

Notes:

- a.** Response modification coefficient,  $R$ , for use throughout the standard. Note  $R$  reduces forces to a strength level not an allowable stress level.
- b.** Deflection amplification factor,  $C_d$ , for use in Sections 9.5.3.7.1 and 9.5.3.7.2
- c.** NL = Not Limited and NP = Not Permitted. For metric units use 30 m for 100 ft and use 50 m for 160 ft. Heights are measured for the base of the structure as defined in section 9.2.1.
- d.** See section 9.5.2.2.4.1 for a description of building systems limited to buildings with a height of 240 ft (75 m) or less.

- e.** *Ordinary moment frame is permitted to be used in lieu of intermediate moment frame in Seismic Design Categories B and C.*
- f.** *The tabulated value of the overstrength factor,  $\Omega_o$ , may be reduced by subtracting  $\frac{1}{2}$  for structures with flexible diaphragms but shall not be taken as less than 2.0 for any structure.*
- g.** *Steel ordinary moment frames and intermediate moment frames are permitted in single-story buildings up to a height of 60 ft, when the moment joints of field connections are constructed of bolted end plates and the dead load of the roof does not exceed 15 psf.*
- h.** *Steel ordinary moment frames are permitted in buildings up to a height of 35 ft when the dead load of the walls, floors, and roofs does not exceed 15 psf.*
- i.** *Steel ordinary concentrically braced frames are permitted in single-story buildings up to a height of 60 ft when the dead load of the roof does not exceed 15 psf and in penthouse structures.*

**1617.6.2.1 Dual systems.** For a dual system, the moment frame shall be capable of resisting at least 25 percent of the design forces. The total seismic force resistance is to be provided by the combination of the moment frame and the shear walls or braced frames in proportion to their stiffness.

**1617.6.2.2 Combination along the same axis.** For other than dual systems and shear wall-frame interactive systems, where a combination of different structural systems is utilized to resist lateral forces in the same direction, the value,  $R$ , used for design in that direction shall not be greater than the least value for any of the systems utilized in that same direction.

**Exception:** For light-framed, flexible diaphragm buildings, of Seismic Use Group I and two stories or less in height: Resisting elements are permitted to be designed using the least value of  $R$  for the different structural systems found on each independent line of resistance. The value of  $R$  used for design of diaphragms in such structures shall not be greater than the least value for any of the systems utilized in that same direction.

**1617.6.2.3 Combinations of framing systems.** Where different seismic-force-resisting systems are used along the two orthogonal axes of the structure, the appropriate response modification coefficient,  $R$ , system over-strength factor,  $\Omega_0$ , and deflection amplification factor,  $C_d$ , indicated in Table 1617.6.2 for each system shall be used.

**1617.6.2.3.1 Combination framing factor.** The response modification coefficient,  $R$ , in the direction under consideration at any story shall not exceed the lowest response modification coefficient,  $R$ , for the seismic-force-resisting system in the same direction considered above that story, excluding penthouses. The system over-strength factor,  $\Omega_0$ , in the direction under consideration at any story, shall not be less than the largest value of this factor for the seismic-force-resisting system in the same direction considered above that story. In structures assigned to Seismic Design Category D, if a system with a response modification coefficient,  $R$ , with a value less than five is used as part of the seismic-force-resisting system in any direction of the structure, the lowest such value shall be used for the entire structure.

**Exceptions:**

1. Detached one- and two-family dwellings constructed of light framing.
2. The response modification coefficient,  $R$ , and system over-strength factor,  $\Omega_0$ , for

*supported structural systems with a weight equal to or less than 10 percent of the weight of the structure are permitted to be determined independent of the values of these parameters for the structure as a whole.*

*3. The following two-stage static analysis procedure is permitted to be used for structures having a flexible upper portion supported on a rigid lower portion where both portions of the structure considered separately can be classified as being regular, the average story stiffness of the lower portion is at least 10 times the average story stiffness of the upper portion and the period of the entire structure is not greater than 1.1 times the period of the upper portion considered as a separate structure fixed at the base:*

*3.1. The flexible upper portion shall be designed as a separate structure using the appropriate values of  $R$  and  $\rho$ .*

*3.2. The rigid lower portion shall be designed as a separate structure using the appropriate values of  $R$  and  $\rho$ . The reactions from the upper portion shall be those determined from the analysis of the upper portion amplified by the ratio of,  $R/\rho$ , of the upper portion over,  $R/\rho$ , of the lower portion. This ratio shall not be less than 1.0.*

**1617.6.2.3.2 Combination framing detailing requirements.** *The detailing requirements of Section 1620 required by the higher response modification coefficient,  $R$ , shall be used for structural components common to systems having different response modification coefficients.*

**1617.6.2.4 System limitations for Seismic Design Category D.** *In addition to the system limitation indicated in Table 1617.6.2, structures assigned to Seismic Design Category D shall be subject to the following.*

**1617.6.2.4.1 Interaction effects.** *Moment-resisting frames that are enclosed or adjoined by stiffer elements not considered to be part of the seismic-force-resisting system shall be designed so that the action or failure of those elements will not impair the vertical load and seismic-force-resisting capability of the frame. The design shall consider and provide for the effect of these rigid elements on the structural system at deformations corresponding to the design story drift,  $\Delta$ , as determined in Section 1617.5.4. In addition, the effects of these elements shall be considered when determining whether a structure has one or more of the irregularities defined in Section 1616.5.1.*

**1617.6.2.4.2 Deformational compatibility.** Every structural component not included in the seismic-force-resisting system in the direction under consideration shall be designed to be adequate for vertical load-carrying capacity and the induced moments and shears resulting from the design story drift,  $\Delta$ , as determined in accordance with Section 1617.5.4. Where allowable stress design is used,  $\Delta$  shall be computed without dividing the earthquake force by 1.4. The moments and shears induced in components that are not included in the seismic-force-resisting system in the direction under consideration shall be calculated including the stiffening effects of adjoining rigid structural and nonstructural elements.

**Exception:** Reinforced concrete frame members not designed as part of the seismic-force-resisting system shall comply with Section 21.11 of ACI 318.

**1617.6.2.4.3 Special moment frames.** A special moment frame that is used but not required by Table 1617.6.2 is permitted to be discontinued and supported by a stiffer system with a lower response modification coefficient,  $R$ , provided the requirements of Sections 1620.2.3 and 1620.4.1 are met. Where a special moment frame is required by Table 1617.6.2, the frame shall be continuous to the foundation.

## **SECTION BC 1618**

### **DYNAMIC ANALYSIS PROCEDURE FOR THE SEISMIC DESIGN OF BUILDINGS**

**1618.1 Dynamic analysis procedures.** The following dynamic analysis procedures are permitted to be used in lieu of the equivalent lateral force procedure of Section 1617.4:

1. Modal Response Spectral Analysis.
2. Linear Time-history Analysis.
3. Nonlinear Time-history Analysis. The dynamic analysis procedures listed above shall be performed in accordance with the requirements of Sections 9.5.6, 9.5.7 and 9.5.8, respectively, of ASCE 7.

## **SECTION BC 1619**

### **EARTHQUAKE LOADS SOIL-STRUCTURE INTERACTION EFFECTS**

**1619.1 Analysis procedure.** If soil-structure interaction is considered in the determination of seismic design forces and corresponding displacements in the structure, the procedure given in Section 9.5.9 of

ASCE 7 shall be used.

**SECTION BC 1620**  
**EARTHQUAKE LOADS—DESIGN, DETAILING REQUIREMENTS AND STRUCTURAL**  
**COMPONENT LOAD EFFECTS**

**1620.1 Structural component design and detailing.** *The design and detailing of the components of the seismic-force-resisting system shall comply with the requirements of Section 9.5.2.6 of ASCE 7 in addition to the nonseismic requirements of this code except as modified in Sections 1620.1.1, 1620.1.2 and 1620.1.3.*

**Exception:** *For structures designed using the simplified analysis procedure in Section 1617.5, the provisions of Sections 1620.2 through 1620.5 shall be used.*

**1620.1.1 ASCE 7, Section 9.5.2.6.2.5.** *Section 9.5.2.6.2.5 of ASCE 7 shall not apply.*

**1620.1.2 ASCE 7, Section 9.5.2.6.2.11.** *Modify ASCE 7, Section 9.5.2.6.2.11, to read as follows:*

*9.5.2.6.2.11 Elements supporting discontinuous walls or frames. Columns, beams, trusses or slabs supporting discontinuous walls or frames of structures and the connections of the discontinuous element to the supporting member having plan irregularity Type 4 of Table 9.5.2.3.2 or vertical irregularity Type 4 of Table 9.5.2.3.3 shall have the design strength to resist the maximum axial force that can develop in accordance with the special seismic loads of Section 9.5.2.7.1.*

**Exceptions:**

- 1. The quantity  $E$  in Section 9.5.2.7.1 need not exceed the maximum force that can be transmitted to the element by the lateral-force-resisting system at yield.*
- 2. Concrete slabs supporting light-framed walls.*

**1620.1.3 ASCE 7, Section 9.5.2.6.3.** *Modify ASCE 7, Section 9.5.2.6.3, to read as follows:*

*9.5.2.6.3 Seismic Design Category C. Structures assigned to Category C shall conform to the requirements of Section 9.5.2.6.2 for Category B and to the requirements of this section. Structures that have plan structural irregularity Type 1a or 1b of Table 9.5.2.3.2 along both principal plan axes, or plan structural irregularity Type 5 of Table 9.5.2.3.2, shall be analyzed for seismic forces in compliance with Section 9.5.2.5.2.2. When the square root of the sum of the squares method of*

combining directional effects is used, each term computed shall be assigned the sign that will yield the most conservative result.

The orthogonal combination procedure of Section 9.5.2.5.2.2, Item a, shall be required for any column or wall that forms part of two or more intersecting seismic-force-resisting systems and is subjected to axial load due to seismic forces acting along either principal plan axis equaling or exceeding 20 percent of the axial load design strength of the column or wall.

**1620.2 Structural component design and detailing (for use in the simplified analysis procedure of Section 1617.5).** The design and detailing of the components of the seismic-force-resisting system for structures designed using the simplified analysis procedure in Section 1617.5 shall comply with the requirements of this section in addition to the nonseismic requirements of this code. Buildings shall not exceed the limitations of Section 1616.6.1.

**Exception:** Structures assigned to Seismic Design Category B (see Section 1616) shall conform to Sections 1620.2.1 through 1620.2.10.

**1620.2.1 Second-order load effects.** Where  $\theta$  exceeds 0.10 as determined in Section 9.5.5.7.2 in ASCE 7, second-order load effects shall be included in the evaluation of component and connection strengths.

**1620.2.2 Openings.** Where openings occur in shear walls, diaphragms or other plate-type elements, reinforcement at the edges of the openings shall be designed to transfer the stresses into the structure. The edge reinforcement shall extend into the body of the wall or diaphragm a distance sufficient to develop the force in the reinforcement.

**1620.2.3 Discontinuities in vertical system.** Structures with a discontinuity in lateral capacity, vertical irregularity Type 5, as defined in Table 1616.5.1.2, shall not be over two stories or 30 feet (9144 mm) in height where the “weak” story has a calculated strength of less than 65 percent of the story above.

**Exception:** Where the “weak” story is capable of resisting a total seismic force equal to the over-strength factor,  $\Omega_o$ , as given in Table 1617.6.2, multiplied by the design force prescribed in Section 1617.5, the height limitation does not apply.

**1620.2.4 Connections.** All parts of the structure, except at separation joints, shall be interconnected and the connections shall be designed to resist the seismic force,  $F_p$ , induced by the parts being connected. Any smaller portion of the structure shall be tied to the remainder of the structure for the

*greater of:*

$$F_p = 0.133 S_{DS} w_p \quad (\text{Equation 16-58})$$

or

$$F_p = 0.05 w_p \quad (\text{Equation 16-59})$$

$S_{DS}$  = The design, 5-percent damped, spectral response acceleration at short periods as defined in Section 1615.

$w_p$  = The weight of the smaller portion.

A positive connection for resisting a horizontal force acting parallel to the member shall be provided for each beam, girder or truss to its support for a force not less than 5 percent of the dead plus live load reaction.

**1620.2.5 Diaphragms.** Permissible deflection shall be that deflection up to which the diaphragm and any attached distributing or resisting element will maintain its structural integrity under design load conditions, such that the resisting element will continue to support design loads without danger to occupants of the structure.

Floor and roof diaphragms shall be designed to resist  $F_p$  as follows:

$$F_p = 0.2 I_E S_{DS} w_p + V_{px}$$

(Equation 16-60)

where:

$F_p$  = The seismic force induced by the parts.

$I_E$  = Occupancy importance factor (Table 1604.5).

$S_{DS}$  = The short-period site design spectral response acceleration coefficient (Section 1615).

$w_p$  = The weight of the diaphragm and other elements of the structure attached to the diaphragm.

$V_{px}$  = The portion of the seismic shear force at the level of the diaphragm, required to be transferred to the components of the vertical seismic-force-resisting system because of the offsets or changes in stiffness of the vertical components above or below the diaphragm.

Diaphragms shall provide for both shear and bending stresses resulting from these forces. Diaphragms shall have ties or struts to distribute the wall anchorage forces into the diaphragm. Diaphragm connections shall be positive, mechanical or welded-type connections.

**1620.2.6 Collector elements.** Collector elements shall be provided that are capable of transferring the seismic forces originating in other portions of the structure to the element providing the resistance to those forces. Collector elements, splices and their connections to resisting elements shall have the design strength to resist the special load combinations of Section 1605.4.

**Exception:** In structures or portions thereof braced entirely by light-framed shear walls, collector elements, splices and connections to resisting elements need only have the strength to resist the load combinations of Section 1605.2 or 1605.3.

**1620.2.7 Bearing walls and shear walls.** Bearing walls and shear walls and their anchorage shall be designed for an out-of-plane force,  $F_p$ , that is the greater of 10 percent of the weight of the wall, or the quantity given by Equation 16-61:

$$F_p = 0.40 I_E S_{DS} w_w$$

(Equation 16-61)

where:

$I_E$  = Occupancy importance factor (Table 1604.5).

$S_{DS}$  = The short-period site design spectral response acceleration coefficient (Section 1615.1.3 or 1615.2.5).

$w_w$  = The weight of the wall.

In addition, concrete and masonry walls shall be anchored to the roof and floors and members that provide lateral support for the wall or that are supported by the wall. The anchorage shall provide a direct connection between the wall and the supporting construction capable of resisting the greater of the force,  $F_p$ , as given by Equation 16-61 or  $(400 S_{DS} I_E)$  pounds per linear foot of wall. For SI:  $5838 S_{DS} I_E$  N/m. Walls shall be designed to resist bending between anchors where the anchor spacing exceeds 4 feet (1219 mm). Parapets shall conform to the requirements of Section 9.6.2.2 of ASCE 7.

**1620.2.8 Inverted pendulum-type structures.** Supporting columns or piers of inverted pendulum-type structures shall be designed for the bending moment calculated at the base determined using the procedures given in Section 1617.4 and varying uniformly to a moment at the top equal to one-half the calculated bending moment at the base.

**1620.2.9 Elements supporting discontinuous walls or frames.** Columns or other elements subject to vertical reactions from discontinuous walls or frames of structures having plan irregularity Type 4 of Table 1616.5.1.1 or vertical irregularity Type 4 of Table 1616.5.1.2 shall have the design strength to resist special seismic load combinations of Section 1605.4. The connections from the discontinuous walls or frames to the supporting elements need not have the design strength to resist the special seismic load combinations of Section 1605.4.

**Exceptions:**

1. The quantity,  $E_m$ , in Section 1617.1.1.2 need not exceed the maximum force that can be transmitted to the element by the lateral-force-resisting system at yield.
2. Concrete slabs supporting light-framed walls.

**1620.2.10 Direction of seismic load.** The direction of application of seismic forces used in design shall be that which will produce the most critical load effect in each component. The requirement will be

*deemed satisfied if the design seismic forces are applied separately and independently in each of the two orthogonal directions.*

**1620.3 Seismic Design Category C.** *Structures assigned to Seismic Design Category C (see Section 1616) shall conform to the requirements of Section 1620.2 for Seismic Design Category B and to Sections 1620.3.1 through 1620.3.2.*

**1620.3.1 Anchorage of concrete or masonry walls.** *Concrete or masonry walls shall be anchored to floors and roofs and members that provide out-of-plane lateral support for the wall or that are supported by the all. The anchorage shall provide a positive direct connection between the wall and floor or roof capable of resisting the horizontal forces specified in Equation 16-62 for structures with flexible diaphragms or in Section 9.6.1.3 of ASCE 7 (using  $a_p$  of 1.0 and  $R_p$  of 2.5) for structures with diaphragms that are not flexible.*

$$F_p = 0.8 S_{DS} I_E w_w$$

(Equation 16-62)

where:

$F_p$  = The design force in the individual anchors.

$I_E$  = Occupancy importance factor in accordance with Section 1616.2.

$S_{DS}$  = The design earthquake spectral response acceleration at short period in accordance with Section 1615.1.3.

$w_w$  = The weight of the wall tributary to the anchor.

*Diaphragms shall be provided with continuous ties or struts between diaphragm chords to distribute these anchorage forces into the diaphragms. Where added chords are used to form subdiaphragms, such chords shall transmit the anchorage forces to the main cross ties. The maximum length-to-width ratio of the structural subdiaphragm shall be 2½ to 1. Connections and anchorages capable of resisting the prescribed forces shall be provided between the diaphragm and the attached components. Connections shall extend into the diaphragms a sufficient distance to develop the force transferred into the diaphragm.*

*The strength design forces for steel elements of the wall anchorage system shall be 1.4 times the force otherwise required by this section.*

*In wood diaphragms, the continuous ties shall be in addition to the diaphragm sheathing. Anchorage shall not be accomplished by use of toenails or nails subject to withdrawal, nor shall wood ledgers or framing be used in cross-grain bending or cross-grain tension. The diaphragm sheathing shall not be considered effective as providing the ties or struts required by this section.*

*In metal deck diaphragms, the metal deck shall not be used as the continuous ties required by this section in the direction perpendicular to the deck span.*

*Diaphragm-to-wall anchorage using embedded straps shall be attached to or hooked around the reinforcing steel or otherwise terminated so as to directly transfer force to the reinforcing steel.*

**1620.3.2 Direction of seismic load.** *For structures that have plan structural irregularity Type 1a or 1b of Table 1616.5.1.1 along both principal plan axes, or plan structural irregularity Type 5 in Table 1616.5.1.1, the critical direction requirement of Section 1620.2.10 shall be deemed satisfied if components and their foundations are designed for the following orthogonal combination of*

*prescribed loads.*

*One hundred percent of the forces for one direction plus 30 percent of the forces for the perpendicular direction. The combination requiring the maximum component strength shall be used. Alternatively, the effects of the two orthogonal directions are permitted to be combined on a square root of the sum of the squares (SRSS) basis. When the SRSS method of combining directional effects is used, each term computed shall be assigned the sign that will result in the most conservative result.*

*The orthogonal combination procedure above shall be required for any column or wall that forms part of two or more intersecting seismic-force-resisting systems and is subjected to axial load due to seismic forces acting along either principal plan axis equaling or exceeding 20 percent of the axial load design strength of the column or wall.*

**1620.4 Seismic Design Category D.** *Structures assigned to Seismic Design Category D shall conform to the requirements of Section 1620.3 for Seismic Design Category C and to Sections 1620.4.1 through 1620.4.6.*

**1620.4.1 Plan or vertical irregularities.** *For buildings having a plan structural irregularity of Type 1a, 1b, 2, 3 or 4 in Table 1616.5.1.1 or a vertical structural irregularity of Type 4 in Table 1616.5.1.2, the design forces determined from Section 1617.5 shall be increased 25 percent for connections of diaphragms to vertical elements and to collectors, and for connections of collectors to the vertical elements.*

**Exception:** *When connection design forces are determined using the special seismic load combinations of Section 1605.4*

**1620.4.2 Vertical seismic forces.** *In addition to the applicable load combinations of Section 1605, horizontal cantilever and horizontal prestressed components shall be designed to resist a minimum net upward force of 0.2 times the dead load.*

**1620.4.3 Diaphragms.** *Floor and roof diaphragms shall be designed to resist design seismic forces determined in accordance with Equation 16-63 as follows:*

$$F_{\mu} = \frac{\sum_{i=x}^n F_i}{\sum_{i=x}^n w_i} w_{\mu} \quad (\text{Equation 16-63})$$

where:

$F_i$  = The design force applied to Level  $i$ .

$F_{px}$  = The diaphragm design force.

$w_i$  = The weight tributary to Level  $i$ .

$w_{px}$  = The weight tributary to the diaphragm at Level  $x$ .

The force determined from Equation 16-63 need not exceed  $0.4S_{DS}I_Ew_{px}$  but shall not be less than  $0.2S_{DS}I_Ew_{px}$  where  $S_{DS}$  is the design spectral response acceleration at short period determined in Section 1615.1.3 and  $I_E$  is the occupancy importance factor determined in Section 1616.2. When the diaphragm is required to transfer design seismic force from the vertical-resisting elements above the diaphragm to other vertical-resisting elements below the diaphragm due to offsets in the placement of the elements or to changes in relative lateral stiffness in the vertical elements, these forces shall be added to those determined from Equation 16-63 and to the upper and lower limits on that equation.

**1620.4.4 Collector elements.** Collector elements shall be provided that are capable of transferring the seismic forces originating in other portions of the structure to the element providing resistance to those forces.

Collector elements, splices and their connections to resisting elements shall resist the forces determined in accordance with Equation 16-63. In addition, collector elements, splices and their connections to resisting elements shall have the design strength to resist the earthquake loads as defined in the special load combinations of Section 1605.4.

**Exception:** In structures, or portions thereof, braced entirely by light-framed shear walls, collector elements, splices and their connections to resisting elements need only be designed to resist forces in accordance with Equation 16-63.

**1620.4.5 Building separations.** All structures shall be separated from adjoining structures. Separations shall allow for the displacement  $\delta_M$ . Adjacent buildings on the same property shall be separated by at least  $\delta_{MT}$  where

$$\delta_{MT} = \sqrt{(\delta_{M1})^2 + (\delta_{M2})^2} \quad \text{(Equation 16-64)}$$

and  $\delta_{M1}$  and  $\delta_{M2}$  are the displacements of the adjacent buildings.

When a structure adjoins a property line not common to a public way, that structure shall also be set back from the property line by at least the displacement,  $\delta_M$ , of that structure.

**Exception:** Smaller separations or property line setbacks shall be permitted when justified by rational analyses based on maximum expected ground motions.

**1620.4.6 Anchorage of concrete or masonry walls to flexible diaphragms.** In addition to the requirements of Section 1620.3.1, concrete and masonry walls shall be anchored to flexible diaphragms based on the following:

1. When elements of the wall anchorage system are not loaded concentrically or are not perpendicular to the wall, the system shall be designed to resist all components of the forces induced by the eccentricity.
2. When pilasters are present in the wall, the anchorage force at the pilasters shall be calculated considering the additional load transferred from the wall panels to the pilasters. The minimum anchorage at a floor or roof shall not be less than that specified in Item 1.

**1620.5 Reserved.**

**SECTION BC 1621**  
**ARCHITECTURAL, MECHANICAL AND ELECTRICAL COMPONENT SEISMIC DESIGN**  
**REQUIREMENTS**

**1621.1 Component design.** Architectural, mechanical, electrical and nonstructural systems, components and elements permanently attached to structures, including supporting structures and attachments (hereinafter referred to as “components”), and nonbuilding structures that are supported by other structures, shall meet the requirements of Section 9.6 of ASCE 7 except as modified in Sections 1621.1.1, 1621.1.2 and 1621.1.3, excluding Section 9.6.3.11.2, of ASCE 7, as amended in this section.

**1621.1.1 ASCE 7, Section 9.6.3.11.2:** Section 9.6.3.11.2 of ASCE 7 shall not apply.

**1621.1.2 ASCE 7, Section 9.6.2.8.1.** Modify ASCE 7, Section 9.6.2.8.1, to read as follows:

9.6.2.8.1 *General. Partitions that are tied to the ceiling and all partitions greater than 6 feet (1829 mm) in height shall be laterally braced to the building structure. Such bracing shall be independent of any ceiling splay bracing. Bracing shall be spaced to limit horizontal deflection at the partition head to be compatible with ceiling deflection requirements as determined in Section 9.6.2.6 for suspended ceilings and Section 9.6.2.6 for other systems.*

**Exception:** *Partitions not taller than 9 feet (2743 mm) when the horizontal seismic load does not exceed 5 psf (0.240 KN/m<sup>2</sup>) required in Section 1607.13.*

**1621.1.3 ASCE 7, Section 9.6.3.13.** *Modify ASCE 7, Section 9.6.3.13, to read as follows:*

*9.6.3.13 Mechanical equipment, attachments and supports. Attachments and supports for mechanical equipment not covered in Sections 9.6.3.8 through 9.6.3.12 or Section 9.6.3.16 shall be designed to meet the force and displacement provisions of Section 9.6.1.3 and 9.6.1.4 and the additional provisions of this section. In addition to their attachments and supports, such mechanical equipment designated as having an  $I_p = 1.5$ , which contains hazardous or flammable materials in quantities that exceed the maximum allowable quantities for an open system listed in Section 307, shall, itself, be designed to meet the force and displacement provisions of Sections 9.6.1.3 and 9.6.1.4 and the additional provisions of this section. The seismic design of mechanical equipment, attachments and their supports shall include analysis of the following: the dynamic effects of the equipment, its contents and, when appropriate, its supports. The interaction between the equipment and the supporting structures, including other mechanical and electrical equipment, shall also be considered.*

## **SECTION BC 1622**

### **NONBUILDING STRUCTURES SEISMIC DESIGN REQUIREMENTS**

**1622.1 Nonbuilding structures.** *The requirements of Section 9.14 of ASCE 7 shall apply to nonbuilding structures except as modified by Sections 1622.1.1, 1622.1.2 and 1622.1.3.*

**1622.1.1 ASCE 7, Section 9.14.5.1.** *Modify Section 9.14.5.1, Item 9, to read as follows:*

*9. Where an approved national standard provides a basis for the earthquake-resistant design of a particular type of nonbuilding structure covered by Section 9.14, such a standard shall not be used unless the following limitations are met:*

- 1. The seismic force shall not be taken as less than 80 percent of that given by the*

*remainder of Section 9.14.5.1.*

2. *The seismic ground acceleration, and seismic coefficient, shall be in conformance with the requirements of Sections 9.4.1 and 9.4.1.2.5, respectively.*
3. *The values for total lateral force and total base overturning moment used in design shall not be less than 80 percent of the base shear value and overturning moment, each adjusted for the effects of soil structure interaction that is obtained by using this standard.*

**1622.1.2 ASCE 7, Section 9.14.7.2.1.** *Modify Section 9.14.7.2.1 to read as follows:*

*9.14.7.2.1 General. This section applies to all earth-retaining walls. The applied seismic forces shall be determined in accordance with Section 9.7.5.1 with a geotechnical analysis prepared by a registered design professional.*

*The seismic use group shall be determined by the proximity of the retaining wall to other nonbuilding structures or buildings. If failure of the retaining wall would affect an adjacent structure, the seismic use group shall not be less than that of the adjacent structure, as determined in Section 9.1.3. Earth-retaining walls are permitted to be designed for seismic loads as either yielding or nonyielding walls. Cantilevered reinforced concrete retaining walls shall be assumed to be yielding walls and shall be designed as simple flexural wall elements.*

**1622.1.3 ASCE 7, Section 9.14.7.9.** *Add a new Section 9.14.7.9 to read as follows:*

*9.14.7.9 Buried structures. As used in this section, the term “buried structures” means subgrade structures such as tanks, tunnels and pipes. Buried structures that are designated as Seismic Use Group II or III, as determined in Section 9.1.3, or are of such a size or length as to warrant special seismic design as determined by the registered design professional, shall be identified in the geotechnical report. Buried structures shall be designed to resist seismic lateral forces determined from a substantiated analysis using standards approved by the commissioner. Flexible couplings shall be provided for buried structures where changes in the support system, configurations or soil condition occur.*

**SECTION BC 1623**  
**SEISMICALLY ISOLATED STRUCTURES**

**1623.1 Design requirements.** Every seismically isolated structure and every portion thereof shall be designed and constructed in accordance with the requirements of Section 9.13 of ASCE 7, except as modified in Section 1623.1.1.

**1623.1.1 ASCE 7, Section 9.13.6.2.3.** Modify ASCE 7, Section 9.13.6.2.3, to read as follows:

9.13.6.2.3 Fire resistance. Fire-resistance ratings for the isolation system shall comply with Section 714.7 of the New York City Building Code.

## **SECTION BC 1624 STRUCTURAL INTEGRITY DEFINITIONS**

**1624.1 Definitions.** The following words and terms shall, for the purposes of this section, have the meanings shown herein.

**ALTERNATE LOAD PATH.** A secondary or redundant load path capable of transferring the load from one structural element to other structural elements.

**ALTERNATE LOAD PATH METHOD.** A design approach that accounts for an extreme event by providing alternate load paths for elements that are no longer able to carry load. In an alternate load path design, key elements are considered notionally removed, one at a time, and the structure is designed to transfer the loads from the removed element to other structural elements, as required by Section 1626.

**ASPECT RATIO.** The height of any portion of a building divided by its least dimension at the elevation from which the height is being measured.

**COLLAPSE.** Failure of a structural element to the extent that it can no longer support any load.

**ELEMENT.** A structural member or structural assembly.

**KEY ELEMENT.** An element of the structural system, including its connections, that meets one or more of the following criteria:

1. An element which when lost, results in more than local collapse.
2. An element that braces a key element, the failure of which results in failure of the key element (further secondary elements need not be considered key elements).

**LOCAL COLLAPSE.** Failure of a structural element that results in the collapse of areas being directly supported by that element and not extending vertically more than three stories.

**RESPONSE RATIO.** The ratio of an ultimate response quantity (e.g., deflection) to its value at yield.

**ROTATION.** The angle, measured at the ends of a member, whose tangent is equal to the deflection of the member at mid-span divided by half the length of the member.

**SPECIFIC LOCAL LOAD.** A load applied to a structural element or structural system as specified in Section 1626.7.

**SPECIFIC LOCAL RESISTANCE METHOD.** A design approach that accounts for extreme event loads by providing sufficient strength for elements that may fail. In a specific local resistance design, key elements are designed for specific local loads as required by Section 1626.

## **SECTION BC 1625**

### **STRUCTURAL INTEGRITY—PRESCRIPTIVE REQUIREMENTS**

**1625.1 Scope.** The intent of these provisions is to enhance structural performance under extreme event scenarios by providing additional overall system redundancy and local robustness. All structures shall be designed to satisfy the prescriptive requirements of this Section.

**Exception:** Structures in Category I of Table 1604.5 and structures in occupancy group R-3 are exempt from the requirements of Sections 1624 through 1626.

**1625.2 Continuity and ties.** All structural elements shall have a minimum degree of continuity and shall be tied together horizontally and vertically as specified in Chapters 19, 21, and 22 for concrete, masonry and steel, respectively.

**1625.3 Lateral bracing.** Floor and roof diaphragms or other horizontal elements shall be tied to the lateral load resisting system.

**1625.4 Reserved.**

**1625.5 Vehicular impact.** Structural columns that are directly exposed to vehicular traffic shall be designed for vehicular impact. Structural columns that are adequately protected by bollards, guard walls,

*vehicle arrest devices or other elements need not be designed for vehicular impact. The load combinations for vehicular impact shall be as specified in Section 1605.7.*

*Specific loads for vehicular impact shall be as follows:*

- 1. Exterior corner columns shall be designed for a concentrated load of 40 kips applied horizontally in any direction from which a vehicle can approach at a height of either 18 inches (457 mm) or 36 inches (914 mm) above the finished driving surface, whichever creates the worst effect.*
- 2. All other exterior columns exposed to vehicular traffic, and columns within loading docks, and columns in parking garages along the driving lane shall be designed for a concentrated load of 20 kips applied horizontally in any direction from which a vehicle can approach at a height of either 18 inches (457 mm) or 36 inches (914 mm) above the finished driving surface, whichever creates the worst effect.*

**1625.6 Gas explosions.** *In buildings with gas piping operating at pressures in excess of 15 psig (103 kPa gauge), all key elements and their connections within 15 feet (4572 mm) of such piping shall be designed to resist a potential gas explosion. The structure shall be designed to account for the potential loss of the affected key elements one at a time by the Alternate Load Path Method. Load combinations for the Alternate Load Path shall be as specified in Section 1605.6. In lieu of the Alternate Load Path Method, the affected key elements shall be designed to withstand a load of 430 psf (20.6 kPa) applied using the load combinations specified in Section 1605.7. The load shall be applied along the entire length of the element, and shall be applied in the manner and direction that produces the most damaging effect.*

**Exceptions:**

- 1. If a structural enclosure designed to resist the specified pressure is provided around the high-pressure gas piping, only the key elements within the structural enclosure need to comply with this section.*
- 2. A reduced pressure for gas explosions can be used based on an engineering analysis approved by the commissioner.*

**1625.7 Design criteria.** *Alternate load path design and/or specific local resistance design shall conform to the appropriate design criteria as determined from Sections 1626.9, 1626.10 and 1626.11. Load combinations for the alternate load path shall be as specified in Section 1605.6.*

**SECTION BC 1626**  
**STRUCTURAL INTEGRITY — KEY ELEMENT ANALYSIS**

**1626.1 Scope.** *A Key Element Analysis shall be performed for the following buildings:*

1. *Buildings with Importance Factor Category of IV as defined in this chapter and more than 50,000 square feet (4645 m<sup>2</sup>) of framed area.*
2. *Buildings with the aspect ratios of seven or greater.*
3. *Buildings greater than 600 feet (183 m) in height or more than 1,000,000 square feet (92 903 m<sup>2</sup>) in gross floor area.*
4. *In Buildings taller than seven stories for any element which supports in aggregate more than 15 percent of the building area a Key Element Analysis shall be performed.*
5. *Buildings designed using non-linear time history analysis or with special seismic energy dissipation systems.*
6. *Buildings where a structural peer review is requested by the commissioner.*

**1626.2 Load combination.** *Where specifically required by Sections 1626.1, elements and components shall be designed to resist the forces calculated using the combination specified in Section 1605.6.*

**1626.3 Multiple occupancies.** *Where a structure is used for two or more occupancies not included in the same category of Table 1604.5, the structure shall be assigned the classification of the highest category corresponding to the various occupancies.*

**1626.4 Seismic and wind.** *When the code-prescribed seismic or wind design produces greater effects, the seismic or wind design shall govern, but the detailing requirements and limitations prescribed in this and referenced sections shall also be followed*

**1626.5 Joints.** *Where a structure is divided by joints that allow for movement, each portion of the structure between joints shall be considered as a separate structure.*

**1626.6 Key Element Analysis.** Where key elements are present in a structure, the structure shall be designed to account for their potential loss one at a time by the Alternate Load Path Method or by the Specific Local Resistance Method as specified in Section 1626.7.

**1626.7 The Specific Local Resistance Method.** Where the specific local resistance method is used key elements shall be designed using specific local loads as follows:

1. Each compression element shall be designed for a concentrated load equal to 2 percent of its axial load but not less than 15 kips, applied at mid-span in any direction, perpendicular to its longitudinal axis. This load shall be applied in combination with the full dead load and 50 percent of the live load in the compression element.
2. Each bending element shall be designed for the combination of the principal acting moments plus an additional moment, equal to 10 percent of the principal acting moment applied in the perpendicular plane.
3. Connections of each tension element shall be designed to develop the smaller of the ultimate tension capacity of the member or 3 times the force in the member.
4. All structural elements shall be designed for a reversal of load. The reversed load shall be equal to 10 percent of the design load used in sizing the member.

**1626.8 Design criteria.** Alternate load path method and/or specific local resistance method for key elements shall conform to the appropriate design criteria as determined from Sections 1626.9, 1626.10 and 1626.11. Load combinations shall be as specified in Section 1605.6.

**1626.9 Analysis procedures.** All structural analysis for specific local loads and/or key elements shall be made by one of the following methods:

**1626.9.1 Static elastic analysis.** For analysis of this type, dynamic effects of member loss or dynamic effects of specific local loads need not be considered. The structure shall be assumed to remain elastic; however, structural elements may reach yield across their entire cross-section. The response ratio of structural elements so designed shall be limited to one.

**1626.9.2 Dynamic inelastic analysis.** For analysis of this type, dynamic effects of member loss or specific local loads shall be considered. The structure need not remain elastic; however, the response ratio and rotation limits obtained from Table 1626.9.3 shall not be exceeded.

**1626.9.3 Energy methods.** *Static inelastic analysis using energy equilibrium may also be used. The structure need not remain elastic; however, the response ratio and rotation limits obtained from Table 1626.9.3 shall not be exceeded.*

**TABLE 1626.9.3**  
**RESPONSE RATIO AND ROTATION LIMITS**

<i>ELEMENT</i>	<i>RESPONSE</i>	
	<i>RATIO</i>	<i>ROTATION</i>
<i>Concrete Slabs</i>	$\mu < 10$	$\theta < 4^\circ$
<i>Post-Tensioned Beams</i>	$\mu < 2$	$\theta < 1.5^\circ$
<i>Concrete Beams</i>	$\mu < 20$	$\theta < 6^\circ$
<i>Concrete Columns</i>	$\mu < 2$	$\theta < 6^\circ$
<i>Long Span Acoustical Deck</i>	$\mu < 2$	$\theta < 3^\circ$
<i>Open Web Steel Joists</i>	$\mu < 2$	$\theta < 6^\circ$
<i>Steel Beams</i>	$\mu < 20$	$\theta < 10^\circ$
<i>Steel Columns</i>	$\mu < 5$	$\theta < 6^\circ$

*Table 1624.2 is intended for SDOF and simplified MDOF response calculations and a low level of protection. Table 1624.2 does not apply for explicit finite element methods that calculate the performance of the structural elements in response to the specified loading intensity. Steel Joists: downward loading 6-degrees, upward loading ductility of 2.*

**1626.10 Minimum response.** *Structural response of elements determined using a dynamic inelastic analysis shall not be less than 80 percent of the structural response determined using a static elastic analysis.*

**1626.11 Strength reduction factors.** *For structural design for specific local loads and/or key elements, all strength reduction factors may be taken as one.*

## **SECTION BC 1627 STRUCTURAL PEER REVIEW**

**1627.1 General.** *The provisions of this section specify where structural peer review is required, how and by whom it is to be performed.*

**1627.2 Where required.** *A structural peer review of the primary structure shall be performed and a report provided for the following buildings:*

- 1. Buildings with Importance Factor Category of IV as defined in this chapter and more than 50,000 square feet (4645 m<sup>2</sup>) of framed area.*
- 2. Buildings with aspect ratios of seven or greater.*
- 3. Buildings greater than 600 feet (183 m) in height or more than 1,000,000 square feet (92 903 m<sup>2</sup>) in gross floor area.*
- 4. Buildings taller than seven stories where any element supports in aggregate more than 15 percent of the building area.*
- 5. Buildings designed using non-linear time history analysis or with special seismic energy dissipation systems.*
- 6. Buildings where a structural peer review is requested by the commissioner.*

**1627.3 Structural design review.** *It shall be verified that the structural design of the primary structure is in general conformance with the requirements of this code.*

**1627.4 Structural peer reviewer.** *The structural peer review shall be performed by a qualified independent structural engineer who has been retained by or on behalf of the owner. A structural peer reviewer shall meet the requirements of the rules of the department.*

**1627.5 Definitions.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**PRIMARY STRUCTURE.** *The structural frame and the load supporting parts of floors, roofs, and walls, and the foundations. Cladding, cladding framing, stairs, equipment\_supports, ceiling supports, non-load bearing partitions, and railings and other secondary structural items are excluded from this definition of primary structure.*

**1627.6 Extent of the structural peer review.**

**1627.6.1 Scope.** *The reviewing engineer shall review the plans and specifications submitted with the permit application for general compliance with the structural and foundation design provisions of this code. The reviewing engineer shall perform the following tasks at a minimum:*

1. *Confirm that the design loads conform to this code.*
2. *Confirm that other structural design criteria, and design assumptions, conform to this code and are in accordance with generally accepted engineering practice.*
3. *Review geotechnical and other engineering investigations that are related to the foundation and structural design and confirm that the design properly\_incorporates the results and recommendations of the investigations.*
4. *Confirm that the structure has a complete load path.*
5. *Perform independent calculations for a representative fraction of systems, members, and details to check their adequacy. The number of representative systems, members, and details verified shall be sufficient to form a basis for the reviewer's conclusions.*
6. *Verify that performance-specified structural components (such as certain precast concrete elements) have been appropriately specified and coordinated with the primary building structure.*

7. *Confirm that the structural integrity provisions of the code are being followed.*
8. *Review the structural and architectural plans for the building. Confirm that the structural plans are in general conformance with the architectural plans regarding loads and other conditions that may affect the structural design.*
9. *Confirm that major mechanical items are accommodated in the structural plans.*
10. *Attest to the general completeness of the structural plans and specifications.*

**1627.6.2 Structural calculations.** *The structural calculations prepared by the structural engineer of record shall be submitted to the reviewing engineer, upon the reviewing engineer's request, for reference only. The reviewing engineer shall not be obliged to review or check these calculations. If the design criteria and design assumptions are not shown on the drawings or in the computations, the structural engineer of record shall provide a statement of these criteria and assumptions for the reviewer.*

**1627.7 Structural peer review report.**

**1627.7.1 General.** *The reviewing engineer shall submit a report to the department stating whether or not the structural design shown on the plans and specifications generally conforms to the structural and foundation requirements of this code.*

**1627.7.2 Contents.** *The report shall demonstrate at a minimum compliance with items 1 through 10 of section 1630.6.1. In addition, the report shall also include the following:*

1. *The codes and standards used in the structural design of the project.*
2. *The structural design criteria, including loads and performance requirements.*
3. *The basis for design criteria that are not specified directly in applicable codes and standards. This should include reports by specialty consultants such as wind tunnel study reports and geotechnical reports. Generally, the report should confirm that existing conditions at the site have been investigated as appropriate and that the design of the proposed structure is in general conformance with these conditions.*

**1627.7.3 Phased submission.** *If an application is submitted for a permit for the construction of foundations or any other part of a building before the construction documents for the whole building have been submitted, then the structural peer review and report shall be phased. The structural peer reviewer shall be provided with sufficient information on which to make a structural peer review of the phased submission.*

**1627.8 Responsibility.**

**1627.8.1 Structural engineer of record.** *The structural engineer of record shall retain sole responsibility for the structural design. The activities and reports of the structural peer reviewer shall not relieve the structural engineer of record of this responsibility.*

**1627.8.2 Structural peer reviewer.** *The structural peer reviewer's report states his or her opinion regarding the design by the engineer of record. The standard of care to which the structural peer reviewer shall be held in the performance of the structural peer review and report is that level of skill and care consistent with structural peer review services performed by professional engineers licensed in the State of New York for similar types of projects.*

**CHAPTER 17**  
**STRUCTURAL TESTS AND SPECIAL INSPECTIONS**

**SECTION BC 1701**  
**GENERAL**

**1701.1 Scope.** *The provisions of this chapter shall govern the inspection of quality, workmanship and requirements for construction. Materials, inspection and testing shall conform to the applicable standards listed in this code or in the rules of the department. See Chapter 1 of Title 28 of the Administrative Code for additional provisions relating to materials, testing and inspections.*

**1701.2 New materials.** *See Chapter 1 of Title 28 of the Administrative Code for additional provisions.*

**1701.3 Used materials.** *See Chapter 1 of Title 28 of the Administrative Code.*

**SECTION BC 1702**  
**DEFINITIONS**

**1702.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**APPROVED AGENCY.** *See Chapter 1 of Title 28 of the Administrative Code.*

**APPROVED FABRICATOR.** *An established and qualified person, firm or corporation approved by the commissioner.*

**CERTIFICATE OF COMPLIANCE.** *A certificate stating that materials meet specified standards or that work was done in compliance with approved construction documents and other applicable provisions of law and with respect to specified service equipment, a certificate issued by the department authorizing the operation of such equipment.*

**FABRICATED ITEM.** *Products and assemblies regulated by this code that are custom manufactured, or built prior to their incorporation into the work at the job site. Fabricated items shall not include listed, labeled or approved products or assemblies.*

**INSPECTION CERTIFICATE.** *An identification applied on a product by an approved agency containing*

*the name of the manufacturer, the function and performance characteristics, and the name and identification of the approved agency that indicates that the product or material has been inspected and evaluated by such approved agency. An inspection certificate shall also mean a certificate issued by the department upon satisfactory completion of an inspection or test.*

***LABEL.*** *An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an approved agency and that indicates that a representative sample of the product or material has been tested and evaluated by an approved agency for compliance with nationally recognized standards or tests to determine suitable usage in a specified manner.*

***MANUFACTURER'S DESIGNATION.*** *An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules.*

***MARK.*** *An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material.*

***SPECIAL INSPECTION.*** *Inspection of selected materials, equipment, installation, fabrication, erection or placement of components and connections, to ensure compliance with approved construction documents and referenced standards as required by this chapter or elsewhere in this code or its referenced standards.*

***SPECIAL INSPECTION, CONTINUOUS.*** *The full-time observation of work requiring special inspection by a special inspector who is continuously present in the area where the work is being performed.*

***SPECIAL INSPECTION, PERIODIC.*** *The intermittent observation of work requiring special inspection by a special inspector who is present in the area where the work has been or is being performed and at the completion of the work. All work requiring special inspection shall remain accessible and exposed until approved by the special inspector.*

***SPECIAL INSPECTOR.*** *See Chapter 1 of title 28 of the Administrative Code.*

***SPRAYED FIRE-RESISTANT MATERIALS.*** *Cementitious or fibrous materials that are spray applied to provide fire-resistant protection of the substrates.*

***SUPERINTENDENT OF CONSTRUCTION.*** *See Chapter 1 of Title 28 of the Administrative Code.*

**SECTION BC 1703**

**APPROVALS**

*See Chapter 1 of Title 28 of the Administrative Code.*

**SECTION BC 1704**

**SPECIAL INSPECTIONS**

**1704.1 General.** *Where application is made for construction as described in this section, one or more special inspectors shall be employed by the owner to provide inspections during construction on the types of work listed under Section 1704 and elsewhere in this code. The special inspector shall be acceptable to the registered design professional of record.*

**Exception:** *Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by the Education Law of the State of New York and applicable regulations governing the professional registration and certification of engineers or architects.*

**1704.1.1 Building permit requirement.** *The permit applicant shall submit a statement of special inspections as a condition for permit issuance on forms supplied by the department. This statement shall include a complete list of materials and work requiring special inspections by this section, the inspections to be performed and a list of the individuals or approved agencies to be retained for conducting the special inspections listed on the approved plans. Within each category of work, multiple special inspectors may be employed.*

**1704.1.1.1 Identification of design professionals providing design documents for certain construction operations.** *The registered design professionals responsible for the production of design, sequence of construction operations or shop drawings for projects that require design as defined in Chapter 33, shall file documentation of their intent to perform those duties on forms supplied by the department.*

**1704.1.2 Report requirement.** *Special inspectors shall keep records of inspections for the period of six years from the date of project sign-off. Such records shall be supplied to the commissioner upon request. The commissioner may require that special inspection reports be filed with the department and/or that such reports be otherwise made accessible for review. Reports shall indicate that work inspected was done in conformance with approved construction documents. Discrepancies shall be*

brought to the immediate attention of the contractor and, when applicable, to the superintendent of construction, for correction. If the discrepancies are not corrected, the discrepancies shall be brought to the attention of the owner, and the registered design professional of record prior to the completion of that phase of the work. Special inspection reports and records of special inspections shall be in the form and format supplied by the commissioner.

**1704.1.2.1 Hazardous conditions.** The special inspector shall report conditions noted as hazardous to life, safety or health, to the immediate attention of the commissioner.

**1704.1.2.2 Approval of partially completed work.** Reports of partially completed work shall be accepted when such reports indicate the code compliant status of completed work and the condition of the remaining work.

**1704.2 Inspection of fabricators.** Where fabrication of structural members, and other regulated products is performed on the premises of a fabricator's shop, special inspection of the fabricated items shall be required as provided in Sections 1704.2.1 through 1704.2.2 and in Chapter 1 of Title 28 of the Administrative Code.

**1704.2.1 Fabrication and implementation procedures.** The special inspector shall verify that the fabricator maintains detailed fabrication and quality control procedures that provide a basis for inspection control of the workmanship and the fabricator's ability to conform to approved construction documents and referenced standards. The special inspector shall review the procedures for completeness and adequacy relative to the code requirements for the fabricator's scope of work.

**Exception:** Special inspections as required by Section 1704.2 shall not be required where the fabricator is approved in accordance with Section 1704.2.2 and with Chapter 1 of Title 28 of the Administrative Code.

**1704.2.2 Fabricator approval.** Special inspections required by this code are not required where the work is done on the premises of a fabricator registered and approved to perform such work without special inspection. Approval of fabricators shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an approved agency.

**1704.2.2.1 Fabricator's certificate of compliance.** For all fabricated items, the approved fabricator shall submit a certificate of compliance to the department stating that the work was

*performed in accordance with the approved construction documents, referenced standards and applicable provisions of law.*

**1704.3 Steel construction.** *The special inspections for steel elements of buildings and structures shall be as required by Section 1704.3 and Table 1704.3. Where required, special inspection of steel shall also comply with Section 1715.*

**Exceptions:**

1. *Special inspection of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and mill test reports for the main stress-carrying elements are capable of being determined.*
2. *The special inspector need not be continuously present during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.*
  - 2.1. *Single-pass fillet welds not exceeding  $5/16$  inch (7.9 mm) in size.*
  - 2.2. *Floor and roof deck welding.*
  - 2.3. *Welded studs when used for structural diaphragm.*
  - 2.4. *Welded sheet steel for cold-formed steel framing members such as studs and joists.*
  - 2.5. *Welding of stairs and railing systems.*

**TABLE 1704.3**  
**REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION**

<i>Verification and Inspection</i>	<i>Continuous</i>	<i>Periodic</i>	<i>Referenced Standard</i>	<i>BC Reference</i>
<i>1. Material verification of high-strength bolts, nuts and washers:</i>				
<i>A. Identification markings to conform to ASTM standards specified in the approved construction documents.</i>	—	X	<i>Applicable ASTM material specification; AISC 335, Section A3.4; AISC LRFD, Section A3.3</i>	—
<i>B. Manufacturer's certificate of compliance required.</i>	—	X	—	—
<i>2. Inspection of high-strength bolting:</i>				
<i>A. Bearing-type connections</i>	—	X <i>Note b</i>	<i>AISC LRFD Section M2.5</i>	<i>1704.3.3</i>
<i>B. Slip-critical connections.</i>	X	X		
<i>3. Material verification of structural steel:</i>				
<i>A. Identification markings to conform to ASTM standards specified in the approved construction documents.</i>	—	—	<i>ASTM A 6 or ASTM A 568</i>	<i>1708.4</i>
<i>B. Manufacturers' certified mill test reports.</i>	—	—	<i>ASTM A 6 or ASTM A 568</i>	
<i>4. Material Verification of weld filler materials</i>				
<i>A. Identification markings</i>	—	—	<i>AISC, ASD, Section A3.6;</i>	—

<i>to conform to AWS specification in the approved construction documents.</i>			<i>AISC LRFD, Section A3.5</i>	
<i>B. Manufacturer's certificate of compliance required.</i>	—	—	—	—
<i>5. Inspection of welding:</i>				
<i>A. Structural Steel:</i>				
<i>1) Complete and partial penetration groove welds.</i>	X	—	<i>AWS D1.1</i>	<i>1704.3.1</i>
<i>2) Multipass fillet welds</i>	X	—		
<i>3) Single-pass fillet welds &gt; 5/16"</i>	X	—		
<i>4) Single-pass fillet welds ≤ 5/16"</i>	—	X		
<i>5) Floor and deck welds</i>	—	X	<i>AWS D1.3</i>	—
<i>B. Reinforcing Steel:</i>	—	—	<i>AWS d1.4 ACI 318: 3.5.2</i>	<i>1903.5.2</i>
<i>1) Verification of weldability of reinforcing steel other than ASTM A 706.</i>	—	X		

2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced concrete shear walls and shear reinforcement.	X	—		
3) Shear reinforcement	X Note a	—		
4) Other reinforcing steel.	—	X		
6. Inspection of steel frame joint details for compliance with approved construction documents: a) Details such as bracing and stiffening. b) member locations. c) Application of joint details at each connection.	— — —	X — —	—	1704.3.2

a) A minimum of 10% of shear studs shall be verified for strength of welded connection. If failure is evident on one or more then the strength of all shear studs shall be verified.

b) Turn of the nut bolting shall be continuously inspected. Exception: Periodic inspection shall be acceptable when the contractor's procedures have been established and verified for compliance by the special inspector.

**1704.3.1 Welding.** *Welding inspection shall be in compliance with AWS D1.1.*

**1704.3.2 Details.** *The special inspector shall perform an inspection of the steel frame to verify compliance with the details shown on the approved construction documents, such as bracing, stiffening, member locations and proper application of joint details at each connection, including connections designed for seismic effects.*

**1704.3.3 High-strength bolts.** *Installation of high-strength bolts shall be inspected in accordance with this section.*

**1704.3.3.1 General.** *While the work is in progress, the special inspector shall determine that the requirements for bolts, nuts, washers and paint; bolted parts and installation and tightening in such standards are met. For bolts requiring pretensioning, the special inspector shall observe the preinstallation testing and calibration procedures when such procedures are required by the installation method or by project plans or specifications; determine that all plies of connected materials have been drawn together and properly snugged and monitor the installation of bolts to verify that the selected procedure for installation is properly used to tighten bolts. For joints required to be tightened only to the snug-tight condition, the special inspector need only verify that the connected materials have been drawn together and properly snugged.*

**1704.3.3.2 Periodic monitoring.** *Monitoring of bolt installation for pretensioning is permitted to be performed on a periodic basis when using the turn-of-nut method with matchmarking techniques, the direct tension indicator method or the alternate design fastener (twist-off bolt) method. Joints designated as snug tight need be inspected only on a periodic basis.*

**1704.3.3.3 Continuous monitoring.** *Monitoring of bolt installation for pretensioning using the calibrated wrench method or the turn-of-nut method without matchmarking shall be performed on a continuous basis.*

**1704.4 Concrete construction.** *The special inspections and verifications for concrete construction shall be as required by this section and Table 1704.4.*

**Exception:** *Special inspections shall not be required for the following when specifically exempted on the approved construction documents:*

1. *Concrete placement of less than 50 cubic yards provided that the concrete is non-structural*

*and is not subject to the durability requirements of Section 1904. In such case, testing may be waived by the registered design professional who prepared the structural construction documents.*

- 2. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 Mpa).*
- 3. Concrete foundation(s) for lightweight fences and recreational equipment.*
- 4. Concrete patios, site furnishings, garden walls, driveways, sidewalks, and similar construction.*

**TABLE 1704.4**  
**REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION**

<i>Verification and Inspection</i>	<i>Continuous</i>	<i>Periodic</i>	<i>Referenced Standard</i>	<i>BC Reference</i>
<i>1. Inspection of reinforcing steel, including prestressing tendons, and placement.</i>	—	X	<i>ACI 318:3.5, 7.1 – 7.7</i>	<i>1903.5, 1907.1, 1907.7, 1914.4</i>
<i>2. Inspection of reinforcing steel welding in accordance with table 1704.3, Item 5B.</i>	—	—	<i>AWS D1.4 ACI 318:3.5.2</i>	<i>1903.5.2</i>
<i>3. Inspect bolts to be installed in concrete prior to and during placement of concrete where allowable loads have been increased.</i>	X	—	—	<i>1912.5</i>
<i>4. Verifying use of required design mix.</i>	—	X	<i>ACI 318: Ch. 4, 5.2-5.4</i>	<i>1904, 1905.2-1905.4, 1914.2, 1914.3</i>
<i>5. At the time fresh concrete is sampled to fabricate specimens for strength tests, perform slump and air content tests, and determine the temperature of the concrete.</i>	X	—	<i>ASTM C 172 ASTM C 31 ACI 318: 5.6, 5.8 (Note a, b, c)</i>	<i>1905.6, 1914.10</i>
<i>6. Inspection of concrete and shotcrete placement for proper application techniques.</i>	X	—	<i>ACI 318: 5.9, 5.10</i>	<i>1905.9, 1905.10, 1914.6, 1914.7, 1914.8</i>
<i>7. Inspection for maintenance of specified curing temperature and techniques.</i>	—	X	<i>ACI 318: 5.11-5.13</i>	<i>1905.11, 1905.13, 1914.9</i>
<i>8. Inspection of prestressed concrete:</i> <i>A. Application of prestressing forces</i> <i>B. Grouting of bonded prestressing tendons in the seismic-force-resisting system.</i>	X  X	—	<i>ACI 318: 18.20 ACI 318:18.18.4</i>	—
<i>9. Erection of precast concrete members.</i>	—	X	<i>ACI 318: Ch. 16</i>	—
<i>10. Verification of in-situ concrete strength, prior to stressing of tendons in posttensioned concrete and prior to removal of shores and forms from beams and structural slabs.</i>	—	X	<i>ACI 318: 6.2</i>	<i>1906.2</i>

- a) *Standard sampling rate shall be in accordance with Section 1905.6.2.*
- b) *4"x8" cylinders may be accepted in lieu of 6"x12" cylinders at the option of the engineer of record.*

**1704.4.1 Materials.** *In the absence of sufficient data or documentation providing evidence of conformance to quality standards for materials in Chapter 3 of ACI 318, the commissioner shall require testing of materials in accordance with the appropriate standards and criteria for the material in Chapter 3 of ACI 318. Weldability of reinforcement, except that which conforms to ASTM A 706, shall be determined in accordance with the requirements of Section 1903.5.2.*

**1704.4.2 Concrete construction.** *When the specified compressive strength of concrete in a column is greater than 1.4 times that specified for a floor system, the special inspections for concrete construction shall also comply with the requirements of section 1908.2.1.*

**1704.5 Masonry construction.** *Masonry construction shall be inspected and evaluated in accordance with the requirements of this section, depending on the classification of the building or structure or nature of occupancy, as defined by this code (see Table 1604.5 and Section 1616.2).*

**Exception:** *Special inspections shall not be required for:*

1. *Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or ACI 530/ASCE 5/TMS 402, Chapters 5, 6 or 7, when they are part of nonessential buildings (see Table 1604.5 and Section 1616.2).*
2. *Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4).*

**1704.5.1 Empirically designed masonry, glass unit masonry and masonry veneer in essential facilities.** *The minimum inspection program for masonry designed by Chapter 14, Section 2109 or 2110, or by Chapter 5, 6 or 7 of ACI 530/ASCE 5/TMS 402, in essential facilities listed in Table 1604.5 and Section 1616.2, shall comply with Table 1704.5.1.*

**TABLE 1704.5.1  
LEVEL 1 SPECIAL INSPECTION**

<b>INSPECTION TASK</b>	<b>FREQUENCY OF INSPECTION</b>		<b>REFERENCE FOR CRITERIA</b>		
	<i>Continuous during task listed</i>	<i>Periodically during task listed</i>	<i>BC section</i>	<i>ACI 530/ASCE 5/TMS 402a</i>	<i>ACI 530.1/ASCE 6/TMS 602a</i>
<i>1. As masonry construction begins, the following shall be verified to ensure compliance:</i>					
<i>a. Proportions of site-prepared mortar.</i>	—	X	—	—	Art. 2.6A
<i>b. Construction of mortar joints.</i>		X			Art. 3.3B
<i>c. Location of reinforcement and connectors.</i>		X			Art. 3.4, 3.6A
<i>d. Prestressing technique.</i>	—	X	—	—	Art. 3.6B
<i>e. Grade and size of prestressing tendons and anchorages.</i>	—	X	—	—	Art. 2.4B 2.4H
<i>2. The inspection program shall verify:</i>					
<i>a. Size and location of structural elements.</i>	—	X	—	—	Art. 3.3G
<i>b. Type, size and location of anchors, including other details of anchorage of masonry to structural members, frames or other construction.</i>	—	X	—	Sec. 4, 3.1.6 2.1.4, 3.1.6	—
<i>c. Specified size, grade and type of reinforcement.</i>	—	X	—	Sec. 1.12	Art. 2.4, 3.4
<i>d. Welding of reinforcing bars.</i>	X	—	—	Sec. 2.1.10.6.2, 3.2.3.4(b)	—
<i>e. Protection of masonry during cold weather (temperature below 40°F) or hot weather (temperature above 90°F).</i>	—	X	Sec. 2104.3, 2104.4	—	Art. 1.8C, 1.8D
<i>f. Application and measurement of prestressing force.</i>	—	X	—	—	Art. 3.6B
<i>3. Prior to grouting, the following shall be verified to ensure compliance:</i>					
<i>a. Grout space is clean.</i>	~	X	~	—	Art. 3.2D
<i>b. Placement of reinforcement and connectors and prestressing tendons and anchorages.</i>		X		Sec. 1.12	Art. 3.4
<i>c. Proportions of site-prepared grout and prestressing grout for bonded tendons.</i>		X		—	Art. 2.6B
<i>d. Construction of mortar joints.</i>		X		—	Art. 3.3B
<i>4. Grout placement shall be verified to ensure compliance with code and construction document provisions.</i>	X	~	~	~	Art 3.5

<i>a. Grouting of prestressing bonded tendons.</i>	X	—	—	—	<i>Art. 3.6C</i>
<i>5. Preparation of any required grout specimens, mortar specimens and/or prisms shall be observed.</i>	X	—	<i>Sec. 2105.2.2, 2105.3</i>	-	<i>Art. 1.4</i>
<i>6. Compliance with required inspection provisions of the construction documents and the approved submittals shall be verified.</i>	-	X	-	-	<i>Art. 1.5</i>

*For SI: °C = (°F - 32)/1.8.*

*a. The specific standards referenced are those listed in Chapter 35.*

**1704.5.2 Masonry facilities less than three stories in height and engineered masonry in nonessential facilities.** The minimum special inspection program for masonry designed by Section 2106, 2107 or 2108, or by chapters other than Chapters 5, 6 or 7 of ACI 530/ASCE 5/TMS 402, in nonessential facilities (see Table 1604.5 and Section 1616.2), shall comply with Table 1704.5.1.

**1704.5.3 Structural and veneer masonry in facilities three stories or more in height and engineered masonry in essential facilities.** The minimum special inspection program for masonry designed by Section 2106, 2107 or 2108, or by chapters other than Chapters 5, 6 or 7 of ACI 530/ASCE 5/TMS 402, in essential facilities (see Table 1604.5 and Section 1616.2), shall comply with Table 1704.5.3.

**TABLE 1704.5.3**  
**LEVEL 2 SPECIAL INSPECTION**

	<i>Frequency of Inspection</i>		<i>Reference for Criteria</i>		
	<u>Continuous during task listed</u>	<i>Periodically during task listed</i>	<i>BC Section</i>	<i>ACI 530/ASC 5/TMS 402<sup>a</sup></i>	<i>ACI 530.1/ASCE 6/TMS 602<sup>a</sup></i>
<i>1. From the beginning of masonry construction, the following shall be verified to ensure compliance.</i>					
<i>a. Proportions of site-prepared mortar, grout and prestressing grout for bonded tendons.</i>	—	X	—	—	<i>Art. 2.6A</i>
<i>b. Placement of masonry units and construction of mortar joints.</i>	—	X	—	—	<i>Art. 3.3B</i>
<i>c. Placement of reinforcement, connectors, and prestressing tendons and anchorages.</i>	—	X	—	<i>Sec. 1.12</i>	<i>Art. 3.4, 3.6A</i>
<i>d. Grout space prior to grouting.</i>	X	—	—	—	<i>Art. 3.2D</i>
<i>e. Placement of grout.</i>	X	—	—	—	<i>Art. 3.5</i>
<i>f. Placement of prestressing frou.</i>	X	—	—	—	<i>Art. 3.6C</i>
<i>2. The inspection program shall verify:</i>					
<i>a. Size and location of structural elements.</i>	—	X	—	—	<i>Art. 3.3G</i>
<i>b. Type, size, and location of anchors, including other details of anchorage of masonry to structural members, frames or other construction.</i>	X	—	—	<i>Sec. 1.2.2(e), 2.1.4, 3.1.6</i>	—

<i>c. Specified size, grade and type of reinforcement.</i>	—	X	—	<i>Sec.1.12</i>	<i>Art. 2.4, 3.4</i>
<i>d. welding reinforcement.</i>	X	—	—	<i>Sec. 2.1.10.6.2 3.2.3.4(b)</i>	—
<i>e. Protection of masonry during cold weather (temp. below 40°F) or hot weather (temp. above 90°F).</i>	—	X	<i>Sec. 2104.3, 2104.4</i>	—	<i>Art. 1.8C, 1.8D</i>
<i>f. Application and measurement of prestressing force.</i>	X	—	—	—	<i>Art. 3.6B</i>
<i>3. Preparation of any required grout specimens, mortar specimens and/or prisms shall be observed.</i>	X	—	<i>Sec. 2105.2.2, 2105.3</i>	—	<i>Art. 1.4</i>
<i>4. Compliance with required inspection provisions of the construction documents and the approved submittals shall be verified.</i>	—	X	—	—	<i>Art. 1.5</i>

**1704.6 Wood construction.** *Special inspections of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with Section 1704.2. Special inspections of site-built assemblies shall be in accordance with Section 1704.1.*

**1704.6.1 Fabrication of high-load diaphragms.** *High-load diaphragms using values from Table 2306.3.2 shall be installed with special inspections as indicated in Section 1704.1. The special inspector shall inspect the wood structural panel sheathing to ascertain whether it is of the grade and thickness shown on the approved construction documents. Additionally, the special inspector must verify the nominal size of framing members at adjoining panel edges, the nail or staple diameter and length, the number of fastener lines and that spacing between fasteners in each line and at edge margins agrees with the approved construction documents.*

**1704.6.2 Other structural wood construction.** *Special inspection of structural wood construction shall be performed in accordance with Chapter 1.*

**1704.7 Soils.** *The special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be performed in accordance with Sections 1704.7.1 through 1704.7.3. The approved soils report, required by Section 1802.2, shall be used to determine compliance.*

**1704.7.1 Site preparation.** *Immediately prior to placement of the footings, foundations, fill or other supporting materials the special inspector shall determine that the site has been prepared in accordance with the approved soils report.*

**1704.7.2 During fill placement.** *During placement and compaction of the fill material, the special inspector shall determine that the material being used and the maximum lift thickness comply with the approved report, as specified in Section 1803.5.*

**1704.7.3 Evaluation of in-place density.** *The special inspector shall determine, at the approved frequency, that the in-place dry density of the compacted fill complies with the approved report.*

**1704.7.4 Special inspection of soils investigations, borings and test pits.** *Boring operations shall be subject to continuous special inspection to verify compliance with Section 1802. Soil sample recovery operations for test pits shall be subject to continuous special inspection to verify compliance with Section 1802.*

**Exception:** *Existing boring, test pit and soil investigation records that have been deemed*

acceptable to the commissioner in accordance with Section 1802.4.2 are not subject to special inspection.

**1704.7.4.1 Boring and /or test pit report.** *The special inspector's report shall include statements attesting to the following: that borings were performed in accordance with the procedures established in Section 1802.5, that 50 percent or more of the borings were witnessed directly by the registered design professional designated for this special inspection, the identification of those borings, the name and address of the individual(s) that witnessed any other borings, the borings and/or test pits so inspected were made and carried to the depths indicated; that to the best of the special inspector's knowledge and belief, the description and classification of the soils are a true description of the samples recovered from the respective borings and/or test pits: that such samples were recovered at the levels indicated; and that the boring and/or test pit work progressed in such manner that the samples recovered are reasonably representative of the subsurface conditions.*

**1704.8 Pile foundations.** *A special inspector shall be present when pile foundations are being installed and during tests. The special inspector shall make and submit to the commissioner records of the installation of each pile and results of load tests. Records shall include the cutoff and tip elevation of each pile relative to a permanent reference. A special inspector shall verify that pile installation procedures are in accordance with Section 1808.*

**1704.9 Pier foundations.** *Special inspection is required for all pier foundations designed in accordance with Section 1802.2.4.*

**Exception:** *Piers for support of lightweight fences, recreational equipment, site furnishings and similar construction, unless special inspection is specifically noted as required on the approved construction documents.*

**1704.9.1 Underpinning operations.** *Special inspection is required for underpinning operations in accordance with Section 3301.3. See Section 1704.21.*

**1704.10 Wall panels, curtain walls and veneers.** *Special inspection is required for exterior architectural wall panels and the anchoring of veneers designed for installation on buildings above a height of 40 feet (12 192 mm). Special inspection of masonry veneer on such structures shall be in accordance with Section 1704.5.*

**1704.10.1 Special Inspection for wall panels, curtain walls and veneers.** *The special inspector shall become familiar with and retain a copy of the construction documents, shop drawings, instructions for the sequence of component installation, samples and/or mock-ups, if supplied. The special inspector shall field check the site conditions at the time the structure is prepared for component installation to verify: that the supporting structure is properly aligned and within design tolerances, that required inserts are properly installed, that framing components are properly sized, aligned, and without structural defects or weakness, that anchors are properly placed, welded, bolted and finished as applicable, that weeps, flashings and tubes are in place and properly drained, that joinery and end dams are properly sealed per plans, that sealing materials with sufficient elongation capability are provided, that gaskets meet specifications, that materials are installed to compensate for horizontal and vertical movement in accordance with the design and the manufacturers guidelines and that any other observations pertinent to safety of performance of the wall system have been performed.*

**1704.10.2 Unsafe wall conditions.** *The special inspector shall report any immediate hazards to the department.*

**1704.11 Sprayed fire-resistant materials.** *Special inspections for sprayed fire-resistant materials applied to structural elements and decks shall be in accordance with Sections 1704.11.1 through 1704.11.5. Special inspections shall be based on the fire-resistance design as designated in the approved construction documents.*

**1704.11.1 Structural member surface conditions.** *The surfaces shall be prepared in accordance with the approved fire-resistance design and the approved manufacturer's written instructions. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.*

**1704.11.2 Application.** *The substrate shall have a minimum ambient temperature before and after application as specified in the approved manufacturer's written instructions. The area for application shall be ventilated during and after application as required by the manufacturer's written instructions.*

**1704.11.3 Thickness.** *The average thickness of the sprayed fire-resistant materials applied to structural elements shall not be less than the thickness required by the approved fire-resistant design. Individual measured thickness, which exceeds the thickness specified in a design by ¼ inch (6.4mm) or more, shall be recorded as the thickness specified in the design plus ¼ inch (6.4 mm). For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus ¼ inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum*

allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections 1704.11.3.1 and 1704.11.3.2.

**1704.11.3.1 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, taking the average of not less than four measurements for each 1,000 square feet (93 m<sup>2</sup>) of the sprayed area on each floor or part thereof.

**1704.11.3.2 Structural framing members.** The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

**1704.11.4 Density.** The density of the sprayed fire-resistant material shall not be less than the density specified in the approved fire-resistant design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605.

**1704.11.5 Bond strength.** The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to structural elements shall not be less than 150 pounds per square foot (psf) (7.18 kN/m<sup>2</sup>). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections 1704.11.5.1 and 1704.11.5.2.

**1704.11.5.1 Floor, roof and wall assemblies.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 10,000 square feet (929 m<sup>2</sup>) or part thereof of the sprayed area in each story.

**1704.11.5.2 Structural framing members.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, joists, trusses and columns at the rate of not less than one sample for each type of structural framing member for each 10,000 square feet (929 m<sup>2</sup>) of floor area or part thereof in each story.

**1704.11.6 Inspection of existing sprayed fire-resistant materials during alterations in office spaces and spaces classified in occupancy Group B.** In office spaces and spaces classified in occupancy Group B, where an alteration exposes any required sprayed fire-resistant materials on structural

*members or where, pursuant to an alteration, persons are required to enter or access areas in which such sprayed fire-resistant materials are capable of being observed, the existing required sprayed fire-resistant materials shall be subject to special inspection. Such inspection shall require a determination, based on visual inspection (i) that the existing sprayed fire-resistant materials as originally applied or installed comply with the applicable requirements of this code, including those for installation methods, materials, thickness and coverage; and (ii) that, since their original application, the integrity of the existing sprayed fire-resistant materials has not been compromised, damaged or displaced by the current alteration or by any prior alteration or other event.*

**1704.12 Exterior insulation and finish systems (EIFS).** *Special inspections shall be required for all EIFS applications installed more than fifteen feet above adjacent finished grades.*

**1704.12.1** *The special inspection shall include verification of: compliance with approved construction documents for attachment to structure, installation of waterproofing membranes, weeps, drains, mold prevention features and conformance with the manufacturers installation guidelines.*

**1704.13 Special cases.** *Special inspections shall be required for proposed work that is, in the opinion of the commissioner, unusual in its nature, such as, but not limited to, the following examples:*

- 1. Construction materials and systems that are alternatives to materials and systems prescribed by this code.*
- 2. Unusual design applications of materials described in this code.*
- 3. Materials and systems required to be installed in accordance with additional manufacturer's instructions that prescribe requirements not contained in this code or in standards referenced by this code.*

**1704.14 Special inspection for smoke control.** *Smoke control systems shall be tested by a special inspector in accordance with Section 1704.14.1 and 909.*

**1704.14.1 Testing scope.** *The test scope shall be as follows:*

- 1. During erection of ductwork and prior to concealment for the purposes of leakage testing and recording of device location.*

2. *Prior to occupancy and after sufficient completion for the purposes of pressure difference testing, flow measurements and detection and control verification.*

**1704.15 Special inspection for mechanical systems.** *Mechanical systems regulated by the New York City Mechanical Code Sections 107 and 507 and Chapters 10, 11, and 12 shall be inspected for conformance with the approved construction documents.*

**1704.15.1 Tests for mechanical systems.** *Tests of mechanical systems shall be performed in accordance with New York City Mechanical Code Sections 507.16, 1011, 1108 and 1208.*

**Exception:** *Listed and labeled self contained factory built equipment and appliances deemed to meet the design, manufacture and factory test requirements of this code shall be field tested in accordance with their manufacturers installation and operational test standards.*

**1704.15.2 Special Inspection of Mechanical Systems.** *Inspections of mechanical systems shall include the following as applicable to the system:*

1. *Visual certification that required components of such systems are complete in accordance with the manufacturers installation guidelines and the approved construction documents,*
2. *Supports, hangers, seismic bracing, and vibration isolation equipment are properly spaced and anchored to supporting structure,*
3. *Installation of required signage and safety instructions,*
4. *Electrical components are installed and electrical sign-off issued,*
5. *Ventilation balancing report is complete and in accordance with design documents,*
6. *Required labeling, operational instructions and safety signage properly posted,*
7. *All related special inspections for such systems are complete,*
8. *Noise producing mechanical equipment located within 100 feet (30 480 mm) of habitable room windows shall be tested at the equipment for compliance with the design STC rating of the equipment,*

9. *Required fire and smoke dampers are installed and functioning properly.*

**Exception:** *Systems and equipment exempt from service equipment certificate of compliance in accordance with Section 109.3.8.2.1.*

**1704.16 Special inspection for fuel storage and fuel piping systems.** *Fuel oil storage equipment including tanks, pumps, valves, including transfer, return, fill and vent piping, hangers and bracing, fill and vent terminals, and related systems regulated by the New York City Mechanical Code Sections 1308, shall be inspected for conformance with the approved construction documents and the manufacturer's installation standards. Testing of fuel storage tanks and piping shall be performed in accordance with New York City Mechanical Code Section 1308.1.*

**Exceptions:**

1. *Testing for listed fuel oil storage tanks 660 gallons (2498 L) or less in capacity, supplied with a label or manufacturer's certification attesting that the tank was factory tested to a testing standard indicated in New York City Mechanical Code Section 1308.1.*
2. *Systems and equipment exempt from service equipment certificate of compliance in accordance with Section 109.3.8.2.3.*

**1704.17 High pressure steam piping.** *High pressure steam piping regulated by New York City Mechanical Code Section 1210, shall be subject to special inspection in accordance with this section.*

**1704.17.1 Welding.** *The special inspector shall verify the qualifications of the welder and the quality of the welding materials and equipment prior to welding operations. The special inspector shall review the proposed welding procedures for compliance with applicable standards listed in the New York City Mechanical Code Section 1210.4.*

**1704.17.2 Welding operations.** *The special inspector shall perform periodic inspection of the pipe joining and welding operations in accordance with the above. Radiographic testing shall be applied to connections as indicated in New York City Mechanical Code Section 1210.4.9. Unacceptable connections and installations shall be rejected.*

**1704.17.3 Testing of high pressure steam piping.** *Hydrostatic testing shall be performed on the*

completed installation of new and altered systems in accordance with New York City Mechanical Code Section 1210.4.10.

**Exception:** Testing requirements shall not apply to alteration or repairs to existing high pressure steam piping systems in which the integrity of the piping is not affected. Such alterations shall be visually inspected for compliance with the approved construction documents.

**1704.18 High pressure gas piping.** High pressure gas piping regulated in New York City Fuel Gas Code Section 406 shall be subject to periodic special inspection in accordance with this section.

**1704.18.1 Welding.** The special inspector shall verify the qualifications of the welder, the quality of the welding materials and equipment prior to welding operations. The special inspector shall review the proposed welding procedures for compliance with applicable standards listed in New York City Fuel Gas Code Section 406.

**1704.18.2 Welding operations.** The special inspector shall perform periodic special inspection for the pipe joining and welding operations in accordance with the above, Radiographic testing shall be performed to the connections as indicated in New York City Fuel Gas Code Section 406.4.

**1704.18.3 Testing of high pressure gas piping.** Pressure testing shall be performed on the completed installation of new and altered systems in accordance with New York City Fuel Gas Code Section 406.4.

**1704.19 Structural safety during construction operations.** Construction work consisting of structural alterations, excavation, underpinning, and demolition work that requires “design” as defined in Chapter 33, including: earth shoring, underpinning, protection of adjacent structures and buildings, shall be subject to special inspection in accordance with this section. All alterations to existing structures in which loads are transferred from one structural system of structural elements to another, such as installation of columns or girders, replacement of existing bearing walls, the creation of openings or slots in existing walls, girders or floors, alteration of arches, rigid frames, trusses in frame buildings, or where the stability or integrity of a structural system is to be temporarily diminished shall be subject to special inspections in accordance with this section.

**Exception:** Construction operations not requiring “design” as defined in Chapter 33.

**1704.19.1 General.** Prior to commencement of work, the special inspector shall review the

contractor's proposed sequence of operations and determine the areas of work that require design. A written statement shall be prepared, mutually acceptable to the contractor and the special inspector, indicating:

1. *The portions of work requiring design as defined in Chapter 33.*
2. *The names and addresses of the licensed professionals that have been engaged to supply design documents for applicable work.*
3. *The approximate dates for delivery of design documents.*
4. *A schedule of periodic special inspections, at agreed intervals, including adequate frequency to assure the contractor's continued compliance with the proposed designs and sequence of construction operations.*

**1704.19.2 Site structural safety design documents.** *Design documents including: shop drawings, sketches and written descriptions of proposed work regarding site structural safety in construction operations shall be prepared by a registered design professional in the employ of the owner or the contractor. Such designs may be revised at any time by the registered design professional. Copies of the special inspection log book, the design documents and revisions thereof, shall be maintained at the jobsite, and at the office of the special inspector, available for use and review at all reasonable times, until the structural work is complete. In the case of alteration to existing structures, the design documents shall be reviewed by the registered design professional of record.*

**1704.19.3 Inspection for structural safety in construction operations.** *The special inspector shall visit the jobsite at agreed intervals, assess the ongoing work and verify that operations conform with the design documents. Deficiencies shall be reported as required by Section 1704.2. In the event unsafe conditions are discovered, the commissioner and the registered design professional employed by the contractor shall be immediately notified.*

**1704.19.4 Records of structural safety inspections in construction operations.** *The special inspection logbook shall be maintained at the special inspector's office and shall contain the following information:*

1. *Project identification, application number and address.*

2. *Date and time of each inspection.*
3. *Names of personnel who performed each inspection.*
4. *Dates of off-site meetings, names of the participants and a summary of the conversations.*
5. *Any significant observations or instructions given related to any of the following:*
  - 5.1. *Deviations from the design documents.*
  - 5.2. *Anticipated field conditions.*
  - 5.3. *Proper execution of the work.*
  - 5.4. *Safe jobsite conditions.*
  - 5.5. *Precautions taken to maintain safe conditions, if work is stopped for any reason.*

**1704.19.5 Special requirements for work in occupied multiple dwellings.** *When alteration or construction operations are performed at occupied multiple dwellings, the special inspector shall periodically verify compliance with a Tenant Protection Plan as provided for in Chapter 1 of Title 28 of the Administrative Code.*

**1704.20 Site storm drainage disposal and detention facilities.** *Storm water detention facilities, roof retention facilities and dry-well systems shall be inspected for conformance with the approved construction documents. Minor variations, based on actual site conditions shall be acceptable at the discretion of the registered design professional of record. Verification shall include:*

1. *Materials of construction.*
2. *Bedding of pipe and facilities.*
3. *Placement and installation of fill materials.*
4. *Volume of drywell and detention facilities.*

5. *Installation of volume flow control devices.*
6. *Workmanship and quality of installation.*
7. *Overall conformance with the approved construction documents. Hydrostatic testing of the detention system shall be required when the system is designed as watertight.*

**1704.20.1 Soil percolation tests.** *Soil percolation tests shall be performed at the site of a proposed individual on-site private sewage disposal system installation to determine the suitability of the soil and site. Such test shall be performed under the supervision of a special inspector. The results of the percolation tests shall be filed on forms provided by the department, stating the suitability of the site and the capacity of the subsoil for the proposed use. The registered design professional of record for the dry-well system shall be notified immediately if the results of the percolation test demonstrate that the approved system may not function as designed.*

**1704.21 Sprinkler system special inspection.** *New and altered sprinkler system shall be inspected in accordance with Section 903. The permit holder responsible for the sprinkler work shall perform all required acceptance tests, complete and sign the appropriate contractor's material and test certifications. The special inspector shall witness all required tests, and shall verify that all installations of all materials, fittings, hangers, assemblies and signage are in accordance with the approved construction documents and that the contractor has transmitted required maintenance literature and instruction to the owner. The special inspector shall verify that the material and test certification forms have been transmitted to the Fire Department and the department.*

**Exception:** *Special inspection of the hydrostatic test shall not be required when such test is witnessed by the department.*

**1704.22 Standpipe system special inspection.** *New and altered standpipe systems shall be inspected in accordance with Section 905. The permit holder responsible for the standpipe work shall perform all required acceptance tests, complete and sign the appropriate contractor's material and test certifications. The special inspector shall witness all required tests, verify that installation of all materials, fittings, hangers, assemblies and signage are in accordance with the approved construction documents and that the contractor has transmitted required maintenance literature and instruction to the owner. The special inspector shall verify that the material and test certification forms have been transmitted to the Fire Department and the department.*

**Exception:** *Special inspection of the hydrostatic test shall not be required when such test is witnessed by the department.*

**1704.23 Heating systems.** *Special Inspection shall be required for new and altered boilers and heating systems. All boilers and heating systems, including chimney connectors, shall be inspected for compliance with the approved construction documents. New heating systems shall be tested in accordance with New York City Mechanical Code Section 1011. Alterations to heating systems shall be subjected to applicable tests for the altered portions of the system and to verification of its satisfactory operation within the existing system.*

**Exception:** *Tests and inspections need not duplicate any tests or inspections previously certified by the commissioner or a duly authorized insurance company.*

**1704.24 Chimneys.** *New and altered chimneys shall be subject to special inspection. The chimney shall be inspected to verify compliance with the approved construction documents, and proper clearance or isolation from adjacent combustible construction. Testing of the chimney shall be performed in accordance with Section 810 of the New York City Mechanical Code.*

**Exception:** *A pressurized smoke test need not be performed on an existing negative pressure chimney if the lining of such chimney is not affected by alterations and the registered design professional specifies on the approved construction documents that such test need not be performed on such chimney.*

**1704.25 Through-penetration firestop systems, concealed draftstop and fireblock systems.** *All through-penetration firestopping, draftstopping and fireblocking shall be subject to periodic special inspection prior to concealment to determine compliance with the approved construction documents. Listed systems shall be inspected for compliance with their listing.*

**Exception:** *Through-penetration firestop systems may be inspected in accordance with ASTM E2174-04 when authorized by the registered design professional of record and when the contractor applies the procedures established in that standard.*

**1704.26 Aluminum Construction.** *The special inspections for structural aluminum elements of buildings and structures shall be as required by section 1704.28.1.*

**1704.26.1 Welding Operations.** All welding operations of aluminum elements shall be subject to special inspection for compliance with this code, AA ASM-35, Parts 1A and 1B of the Aluminum Design Manual, and AWS D1.2.

**Exception:** Welding operations in connections where the calculated stresses in the welds are less than fifty percent of the basic allowable values.

**SECTION BC 1705**

**RESERVED**

**SECTION BC 1706**

**RESERVED**

**SECTION BC 1707**

**SPECIAL INSPECTIONS FOR SEISMIC RESISTANCE**

**1707.1** Reserved.

**1707.2** Reserved.

**1707.3** Reserved.

**1707.4** Reserved.

**1707.5** Reserved.

**1707.6** Reserved.

**1707.7 Mechanical and electrical components.** Periodic special inspection is required during the anchorage of electrical equipment for emergency power systems in structures assigned to Seismic Design Category C, or D. Periodic special inspection is required during the installation of piping systems intended to carry flammable, combustible or highly toxic contents and their associated mechanical units in structures assigned to Seismic Design Category C, or D. Periodic special inspection is required during the installation of HVAC ductwork that will contain hazardous materials in structures assigned to Seismic Design Category C, or D.

*1707.8 Seismic isolation system. There shall be periodic special inspection during the fabrication and installation of isolator units and energy dissipation devices if used as part of the seismic isolation system.*

**SECTION BC 1708**

**RESERVED**

**SECTION BC 1709**

**RESERVED**

**SECTION BC 1710**

**DESIGN STRENGTHS OF MATERIALS**

*1710.1 Conformance to standards. The design strengths and permissible stresses of any structural material that are identified by a manufacturer's designation as to manufacture and grade by mill tests, or the strength and stress grade is otherwise confirmed to the satisfaction of the commissioner shall conform to the specifications and methods of design of accepted engineering practice or the rules of the department in the absence of applicable standards.*

*1710.2 New materials. For materials that are not specifically provided for in this code, the design strengths and permissible stresses shall be established by tests as provided for in Section 1711.*

**SECTION BC 1711**

**ALTERNATIVE TEST PROCEDURE**

*1711.1 General. In the absence of rules or other approved standards, and upon special application by a registered design professional the commissioner shall make, or cause to be made, the necessary tests and investigations; or the commissioner shall accept duly authenticated reports from approved agencies in respect to the quality and manner of use of new materials or assemblies as provided for in Section 113. The cost of all tests and other investigations required under the provisions of this code shall be borne by the permit applicant.*

**SECTION BC 1712**

**TEST SAFE LOAD**

*1712.1 Where required. Where proposed construction is not capable of being designed by approved engineering analysis, or where proposed construction design method does not comply with the applicable*

*material design standard, the system of construction or the structural unit and the connections shall be subjected to the tests prescribed in Section 1714. The commissioner shall accept certified reports of such tests conducted by an approved testing agency, provided that such tests meet the requirements of this code and approved procedures.*

**SECTION BC 1713  
IN-SITU LOAD TESTS**

**1713.1 General.** *Whenever there is a reasonable doubt as to the stability or load-bearing capacity of a completed building, structure or portion thereof for the expected loads, an engineering assessment shall be required. The engineering assessment shall involve either a structural analysis or an in-situ load test, or both. The structural analysis shall be based on actual material properties and other as-built conditions that affect stability or load-bearing capacity, and shall be conducted in accordance with the applicable design standard. If the structural assessment determines that the load-bearing capacity is less than that required by the code, load tests shall be conducted in accordance with Section 1713.2. If the building, structure or portion thereof is found to have inadequate stability or load-bearing capacity for the expected loads, modifications to ensure structural adequacy or the removal of the inadequate construction shall be required.*

**1713.2 Test standards.** *Structural components and assemblies shall be tested in accordance with the appropriate material standards listed in Chapter 35. In the absence of a standard that contains an applicable load test procedure, the test procedure shall be developed by a registered design professional and approved. The test procedure shall simulate loads and conditions of application that the completed structure or portion thereof will be subjected to in normal use.*

**1713.3 In-situ load tests.** *In-situ load tests shall be conducted in accordance with Section 1713.3.1 or 1713.3.2 and shall be supervised by a registered design professional. The test shall simulate the applicable loading conditions specified in Chapter 16 as necessary to address the concerns regarding structural stability of the building, structure or portion thereof.*

**1713.3.1 Load test procedure specified.** *Where a standard listed in Chapter 35 contains an applicable load test procedure and acceptance criteria, the test procedure and acceptance criteria in the standard shall apply. In the absence of specific load factors or acceptance criteria, the load factors and acceptance criteria in Section 1713.3.2 shall apply.*

**1713.3.2 Load test procedure not specified.** *In the absence of applicable load test procedures*

*contained within a standard referenced by this code or acceptance criteria for a specific material or method of construction, such existing structure shall be subjected to a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components that are not a part of the seismic-load-resisting system, the test load shall be equal to two times the unfactored design loads. The test load shall be left in place for a period of 24 hours. The structure shall be considered to have successfully met the test requirements where the following criteria are satisfied:*

- 1. Under the design load, the deflection shall not exceed the limitations specified in Section 1604.3.*
- 2. Within 24 hours after removal of the test load, the structure shall have recovered not less than 75 percent of the maximum deflection.*
- 3. During and immediately after the test, the structure shall not show evidence of failure.*

#### **SECTION BC 1714 PRECONSTRUCTION LOAD TESTS**

**1714.1 General.** *In evaluating the physical properties of materials and methods of construction that are not capable of being designed by approved engineering analysis or do not comply with applicable material design standards listed in Chapter 35, the structural adequacy shall be predetermined based on the load test criteria established in this section.*

**1714.2 Load test procedures specified.** *Where specific load test procedures, load factors and acceptance criteria are included in the applicable design standards listed in Chapter 35, such test procedures, load factors and acceptance criteria shall apply. In the absence of specific test procedures, load factors or acceptance criteria, the corresponding provisions in Section 1714.3 shall apply.*

**1714.3 Load test procedures not specified.** *Where load test procedures are not specified in the applicable design standards listed in Chapter 35, the load-bearing and deformation capacity of structural components and assemblies shall be determined on the basis of a test procedure developed by a registered design professional that simulates applicable loading and deformation conditions. For components and assemblies that are not a part of the seismic-load-resisting system, the test shall be as specified in Section 1714.3.1. Load tests shall simulate the applicable loading conditions specified in Chapter 16.*

**1714.3.1 Test procedure.** *The test assembly shall be subjected to an increasing superimposed load equal to not less than two times the superimposed design load. The test load shall be left in place for a period of 24 hours. The tested assembly shall be considered to have successfully met the test requirements if the assembly recovers not less than 75 percent of the maximum deflection within 24 hours after the removal of the test load. The test assembly shall then be reloaded and subjected to an increasing superimposed load until either structural failure occurs or the superimposed load is equal to two and one-half times the load at which the deflection limitations specified in Section 1714.3.2 were reached, or the load is equal to two and one-half times the superimposed design load. In the case of structural components and assemblies for which deflection limitations are not specified in Section 1714.3.2, the test specimen shall be subjected to an increasing superimposed load until structural failure occurs or the load is equal to two and one-half times the desired superimposed design load. The allowable superimposed design load shall be taken as the lesser of:*

1. *The load at the deflection limitation given in Section 1714.3.2.*
2. *The failure load divided by 2.5.*
3. *The maximum load applied divided by 2.5.*

**1714.3.2 Deflection.** *The deflection of structural members under the design load shall not exceed the limitations in Section 1604.3.*

**1714.4 Wall and partition assemblies.** *Load-bearing wall and partition assemblies shall sustain the test load both with and without window framing. The test load shall include all design load components. Wall and partition assemblies shall be tested both with and without door and window framing.*

**1714.5 Exterior window and door assemblies.** *The design pressure rating of exterior windows and doors in buildings shall be determined in accordance with Section 1714.5.1 or 1714.5.2.*

**Exception:** *Structural wind load design pressures for window units smaller than the size tested in accordance with Section 1714.5.1 or 1714.5.2 shall be permitted to be higher than the design value of the tested unit provided such higher pressures are determined by accepted engineering analysis. All components of the small unit shall be the same as the tested unit. Where such calculated design pressures are used, they shall be validated by an additional test of the window unit having the highest allowable design pressure.*

**1714.5.1 Aluminum, vinyl and wood exterior windows and glass doors.** *Aluminum, vinyl and wood exterior windows and glass doors shall be labeled as conforming to AAMA/NWWDA 101/I.S.2 or 101/I.S.2/NAFS. The label shall state the name of the manufacturer, the approved labeling agency and the product designation as specified in AAMA/NWWDA 101/I.S.2 or 101/I.S.2/NAFS. Products tested and labeled as conforming to AAMA/NWWDA 101/I.S.2 or 101/I.S.2/NAFS shall not be subject to the requirements of Sections 2403.2 and 2403.3.*

**1714.5.2 Exterior windows and door assemblies not provided for in Section 1714.5.1.** *Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.*

**1714.6 Test specimens.** *Test specimens and construction shall be representative of the materials, workmanship and details normally used in practice. The properties of the materials used to construct the test assembly shall be determined on the basis of tests on samples taken from the load assembly or on representative samples of the materials used to construct the load test assembly. Required tests shall be conducted or witnessed by an approved agency.*

## **SECTION BC 1715**

### **MATERIAL AND TEST STANDARDS**

**1715.1 Test standards for joist hangers and connectors.**

**1715.1.1 Test standards for joist hangers.** *The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with ASTM D 1761, using lumber having a specific gravity of 0.49 or greater, but not greater than 0.55, as determined in accordance with AFPA NDS for the joist and hangers.*

**1715.1.2 Vertical load capacity for joist hangers.** *The vertical load capacity for the joist hanger shall be determined by testing three joist hanger assemblies as specified in ASTM D 1761. If the ultimate vertical load for any one of the tests varies more than 20 percent from the average ultimate vertical load, at least three additional tests shall be conducted. The allowable vertical load for a normal duration of loading of the joist hanger shall be the lowest value determined from the following:*

1. *The lowest ultimate vertical load from any test divided by three (where three tests are*

*conducted and each ultimate vertical load does not vary more than 20 percent from the average ultimate vertical load).*

- 2. The average ultimate vertical load for all tests divided by six (where six or more tests are conducted).*
- 3. The vertical load at which the vertical movement of the joist with respect to the header is 0.125 inch (3.2 mm) in any test.*
- 4. The allowable design load for nails or other fasteners utilized to secure the joist hanger to the wood members.*
- 5. The allowable design load for the wood members forming the connection.*

***1715.1.3 Torsional moment capacity for joist hangers.*** *The torsional moment capacity for the joist hanger shall be determined by testing at least three joist hanger assemblies as specified in ASTM D 1761. The allowable torsional moment for normal duration of loading of the joist hanger shall be the average torsional moment at which the lateral movement of the top or bottom of the joist with respect to the original position of the joist is 0.125 inch (3.2 mm).*

***1715.1.4 Design value modifications for joist hangers.*** *Allowable design values for joist hangers that are determined by Item 4 or 5 in Section 1715.1.2 shall be permitted to be modified by the appropriate duration of loading factors as specified in AFPA NDS but shall not exceed the direct loads as determined by Item 1, 2 or 3 in Section 1715.1.2. Allowable design values determined by Item 1, 2 or 3 in Sections 1715.1.2 and 2305.1 shall not be modified by duration of loading factors.*

## ***1715.2 Concrete and clay roof tiles.***

***1715.2.1 Overturning resistance.*** *Concrete and clay roof tiles shall be tested to determine their resistance to overturning due to wind in accordance with SBCCI SSTD 11 and Chapter 15.*

***1715.2.2 Wind tunnel testing.*** *When roof tiles do not satisfy the limitations in Chapter 16 for rigid tile, a wind tunnel test shall be used to determine the wind characteristics of the concrete or clay tile roof covering in accordance with SBCCI SSTD 11 and Chapter 15.*

**CHAPTER 18**  
**SOILS AND FOUNDATIONS**

**SECTION BC 1801**  
**GENERAL**

**1801.1 Scope.** *The provisions of this chapter shall apply to building and foundation systems in those areas not subject to scour or water pressure by wind and wave action. Buildings and foundations subject to such scour or water pressure loads shall be designed in accordance with Chapter 16 and Appendix G of this code.*

**1801.2 Design.** *Allowable bearing pressures, allowable stresses and design formulas provided in this chapter shall be used with the allowable stress design load combinations specified in Section 1605.3.*

*The quality and design of materials used structurally in excavations, footings and foundations shall conform to the requirements specified in Chapters 16, 19, 21, 22 and 23 of this code. Excavations and fills shall also comply with Chapter 33.*

*Members shall have adequate capacity to resist all applicable combinations of the loads listed in Chapter 16, in accordance with the following:*

*Where the structural design of soil or foundation members is based on allowable working stresses, the load reductions as described in Section 1605.3.1.1 shall be modified to use the following factors and the design shall be based on the resulting load values:*

- 1. For the design of temporary structures (defined for this chapter as a structure, that will be in place 180 days or less) load combinations in Equations 16-8, 16-9 can be multiplied by a factor of 0.75.*
- 2. For the design of temporary structures the Equations 16-10, 16-11, 16-12 can be multiplied by a factor of 0.67.*
- 3. For any combination of dead loads with three or more variable loads, these variable loads can be multiplied by a factor of 0.67.*

4. *For the combinations of loads to be used in the design of permanent structures, the load due to lateral earth and ground water pressure shall be multiplied by a factor of 1.*

**1801.2.1 Foundation design for seismic overturning.** *Where the foundation is proportioned using the strength design load combinations of Section 1605.2, the seismic overturning moment need not exceed 75 percent of the value computed from Section 9.5.5.6 of ASCE 7 for the equivalent lateral force method, or Section 1618 for the modal analysis method.*

## **SECTION BC 1802**

### **FOUNDATION AND SOILS INVESTIGATIONS**

**1802.1 General.** *Foundation and soils investigations shall be subject to special inspections in accordance with Sections 1704.7, 1704.8 and 1704.9 and be conducted in conformance with Sections 1802.2 through 1802.6. An Engineer shall scope, supervise and approve the classification and subsurface investigation of soil.*

**1802.2 Where required.** *The owner or applicant shall submit a foundation and soils investigation to the commissioner where required in Sections 1802.2.1 through 1802.2.3.*

**1802.2.1 Questionable soil.** *Where the safe load-bearing capacity of the soil is in doubt, or where a load-bearing value superior to that specified in this code is claimed, the commissioner shall require that the necessary investigation be made. Such investigation shall comply with the provisions of Sections 1802.4 through 1802.6.*

**1802.2.2 Seismic design category C.** *Where a structure is determined to be in Seismic Design Category C in accordance with Section 1616, an investigation shall be conducted, and shall include an evaluation of the following potential hazards resulting from earthquake motions: slope instability, liquefaction and surface rupture due to faulting or lateral spreading.*

**1802.2.3 Seismic design category D.** *Where the structure is determined to be in Seismic Design Category D in accordance with Section 1616, the soils investigation requirements for Seismic Design Category C, given in Section 1802.2.6, shall be met, in addition to the following:*

1. *A site-specific analysis in accordance with Sections 1813.2, 1813.3, and 1813.4. Site specific response shall be evaluated for site peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions.*

2. A determination of lateral pressures on basement, cellar, and retaining walls due to earthquake motions.
3. An assessment of potential consequences of any liquefaction and soil strength loss, including estimation of differential settlement, lateral movement or reduction in foundation soil-bearing capacity, and shall address mitigation measures. Such measures shall be given consideration in the design of the structure and shall include, but are not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements or any combination of these measures. Peak ground acceleration shall be determined from a site-specific study taking into account soil amplification effects, as specified in Section 1615.2.

**Exception:** A site-specific study need not be performed provided that peak ground acceleration equal to  $S_{DS}/2.5$  is used, where  $S_{DS}$  is determined in accordance with Section 1615.

**1802.3 Material classification.** Soil and rock classification shall be based on materials disclosed by borings, test pits or other subsurface exploration methods and shall be determined in accordance with Tables 1804.1 and 1804.2 and Section 1804.2. Additional laboratory tests shall be conducted to ascertain these classifications where deemed necessary by the engineer responsible for the investigation or the commissioner.

**1802.3.1 General.** For the purposes of this chapter, the definition and classification of soil materials for use in Table 1804.2 and Section 1804.2 shall be in accordance with ASTM D 2487.

**1802.4 Investigation.** Soil classification shall be based on observation and any necessary tests of the materials disclosed by borings, test pits or other subsurface exploration made in appropriate locations. Additional studies shall be made as necessary to evaluate stratigraphy, slope stability, soil strength, adequacy of load-bearing soils, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction and expansiveness.

**1802.4.1 Scope of investigation.** The scope of the soil investigation, including the number, types and depths of borings or test pits; the equipment used to drill and sample; the in-situ testing; and the laboratory testing program shall be determined by the engineer responsible for the investigation. Borings shall be uniformly distributed under the structure or distributed in accordance with load patterns imposed by the structure. As a minimum, investigations shall include two exploratory borings

for built-over areas up to 5,000 square feet (465 m<sup>2</sup>), and at least one additional boring for each additional 2,500 square feet (233 m<sup>2</sup>), or part thereof, of built-over areas up to 20,000 square feet (1860 m<sup>2</sup>). For built-over areas in excess of 20,000 square feet (1860 m<sup>2</sup>), there shall be at least one boring for each additional 5,000 square feet (465 m<sup>2</sup>), or part thereof. Borings shall be taken into bedrock, or to an adequate depth below the top of the load bearing strata to demonstrate that the foundation loads have been sufficiently dissipated. For structures having an average area load (dead plus live) of 1,000 pounds per square foot (47.9 kN/m<sup>2</sup>) or more, at least one boring for every 10,000 square feet (930 m<sup>2</sup>) of footprint area shall penetrate at least 100 feet (30 480 mm) below the curb grade or 5 feet (1524 mm) into bedrock of Class 1c or better, whichever is less. At least one-half of the borings satisfying this requirement shall be located within the limits of the built-up area and the remainder shall be within 25 feet (7620 mm) of the built-up area limits. For structures to be supported on pile foundations the required number of borings shall be increased by 30 percent.

The engineer responsible for the investigation shall have a qualified representative on the site inspecting all boring, sampling, and in-situ testing operations.

**Exception:** Test pits may be substituted for borings for one- and two-story structures, and may be used to establish the top of rock, where practical, for taller structures. In such case, there shall be prepared a test pit observation report that shall be submitted to the commissioner.

**1802.4.2 Existing data.** Suitable borings, test pits, probings, and the logs and records that were obtained as part of earlier exploration programs and that meet the requirements of this section may be used as partial fulfillment of the requirements of this section, subject to the approval of the commissioner. Additional borings shall be made at the direction of the engineer responsible for the investigation when uncertainty exists as to the accuracy of the available information or specific new project or loading conditions indicate the need for additional information.

**1802.4.3 Ground-water table.** The subsurface soil investigation shall determine the existing ground-water table.

**1802.4.4 Compressible soils.** In areas that have compressible soils, the investigation shall determine the extent of these soils in the plan area of the building and shall determine the pre-consolidation pressure and consolidation parameters of the deposit using appropriate laboratory tests. The information shall be used in the building's foundation design.

**1802.5 Soil and rock sampling.** The soil boring and sampling procedures and apparatus shall be in

accordance with ASTM D 1586 and D 1587 and generally accepted engineering practice. Where liquefaction assessment is performed, the investigation shall be in accordance with ASTM D 6066. The rock coring, sampling procedure and apparatus shall be in accordance with ASTM D 2113 and generally accepted engineering practice. Rock cores shall be obtained with a double-tube core barrel with a minimum outside diameter of  $2\frac{7}{8}$  inches (73 mm). With the approval of the engineer responsible for the investigation, smaller diameter double-tube core barrels may be used under special circumstances such as telescoping casing to penetrate boulders, or space limitations requiring the use of drill rigs incapable of obtaining large diameter cores.

**1802.5.1 Bedrock support.** Where the foundation design relies on rock to support footings, piles or caisson sockets, a sufficient number of rock corings shall extend at least 10 feet (3 3048 mm) below the lowest level of bearing to provide assurance of the rock soundness. Where foundations are to rest on bedrock and such rock is exposed over a part or all of the area of the building, borings are not required in those areas where rock is exposed, provided the following requirements are met:

1. The presence of defects or the inclination of bedding planes in the rock are of such size and location so as not to affect stability of the foundation.
2. The foundation is not designed for bearing pressures exceeding those permitted in Table 1804.2.

**1802.5.2 Alternative investigative methods.** The engineer responsible for the investigation may engage specialized technicians to conduct alternative investigative methods such as cone penetrometer probing. Data from these investigations may be used to: 1) supplement soil boring and rock coring information, provided there is a demonstrated correlation between the findings, and 2) determine material properties for static and seismic or liquefaction analyses. Subject to the approval of the commissioner, alternate exploration methods may replace borings on a two for one basis, but in no case shall there be less than two standard borings for every 10,000 square feet (930 m<sup>2</sup>) of footprint area. All the borings shall penetrate at least 100 feet (30 480 mm) below the curb grade or 5 feet (1524 mm) into rock when the average area load equals or exceeds one thousand pounds per square foot (48 kPa).

Other in-situ testing methods, such as geophysical, vane shear, and pressure meter may be used to determine engineering design parameters, but may not be used as a substitute for the required number of borings.

**1802.5.3 Material disposition.** *Soil and rock samples shall be maintained in an accessible location, by the permit holder or owner and made available to the engineer responsible for the investigation and to the department, until the foundation work has been completed and accepted, or until one year after the investigation is complete, whichever is longer.*

**1802.6 Reports.** *The soil classification and design load-bearing capacity shall be shown on the construction documents. Where required by the commissioner, the engineer responsible for the investigation shall sign, seal and submit a written report of the investigation that includes, but need not be limited to, the following information:*

1. *A description of the planned structure*
2. *A plot showing the location of test borings and/or excavations.*
3. *A complete record of the soil sample descriptions.*
4. *A record of the soil profile.*
5. *Elevation of the water table, if encountered.*
6. *Results of in-situ or geophysical testing*
7. *Results of laboratory testing.*
8. *Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil, mitigation of the effects of liquefaction (if applicable), differential settlement and varying soil strength; and the effects of adjacent loads.*
9. *Expected total and differential settlement.*
10. *Pile and pier foundation recommendations and installed capacities*
11. *Special design and construction provisions for footings or foundations founded on expansive soils, as necessary.*

12. *Compacted fill material properties and testing in accordance with Section 1803.5.*

*For pile or pier foundations, the report shall also include:*

1. *Special installation procedures.*
2. *Pier and pile load test requirements.*

**SECTION BC 1803**  
**EXCAVATION, GRADING AND FILL**

**1803.1 Excavations near footings or foundations.** *Excavations for any purpose shall not remove lateral support from any footing or foundation without first underpinning or protecting the footing or foundation against settlement or lateral translation.*

**1803.2 Placement of backfill.** *The excavation outside the foundation shall be backfilled with soil that is free of organic material, construction debris, cobbles and boulders or a controlled low-strength material (CLSM). The backfill shall be placed in lifts and compacted, in a manner that does not damage the foundation or the waterproofing or damp proofing material.*

**Exception:** *Controlled low-strength material need not be compacted.*

**1803.3 Site grading.** *The ground immediately adjacent to the foundation shall be sloped away from the building as needed, or an approved alternate method of diverting water away from the foundation shall be used, where surface water would detrimentally affect the foundation bearing soils.*

**1803.3.1 Seepage.** *In an excavation where soil and ground water conditions are such that an inward or upward seepage might be produced in materials intended to provide vertical or lateral support for foundation elements or for adjacent foundations, excavating methods shall control or prevent the inflow of ground water to prevent disturbance of the soil material in the excavation or beneath existing buildings. No foundation shall be placed on soil that has been disturbed by seepage unless remedial measures have been taken.*

**1803.4 Grading and fill in floodways.** *Any floodway encroachment in areas of special flood hazard shall comply with Appendix G.*

**1803.5 Compacted fill material.** Where footings will bear on compacted fill material, the compacted fill shall comply with the provisions of a geotechnical report, prepared by, signed and sealed by the engineer, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.
2. Specifications for material to be used as compacted fill.
3. Test method to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.
4. Maximum allowable thickness of each lift of compacted fill material.
5. Field test method for determining the in-place dry density of the compacted fill.
6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.
7. Number and frequency of field tests required to determine compliance with Item 6.
8. Acceptable types of compaction equipment for the specified fill materials.

**1803.6 Controlled low-strength material (CLSM).** Where footings will bear on controlled low-strength material (CLSM), the CLSM shall comply with the provisions of a geotechnical report prepared by, signed and sealed by the engineer, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of the CLSM.
2. Specifications for the CLSM.
3. Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.
4. Test methods for determining the acceptance of the CLSM in the field.
5. Number and frequency of field tests required to determine compliance with Item 4.

*1803.7 Artificially treated soils.* After the treatment procedure, a minimum of one boring shall be made for every 1,600 square feet (149 m<sup>2</sup>) of that portion of the building that is supported on treated soil, and a sufficient number of samples shall be recovered from the treated soil to demonstrate the efficacy of the treatment.

#### **SECTION BC 1804**

#### **ALLOWABLE LOAD-BEARING VALUES OF SOILS**

*1804.1 Design.* The presumptive load-bearing values provided in Table 1804.1 shall be used with the allowable stress design load combinations specified in Section 1605.3 and Section 1801.2.

**TABLE 1804.1**  
**ALLOWABLE BEARING PRESSURES**

<b>CLASS OF MATERIALS</b> <i>(Notes 1 and 3)</i>	<b>MAXIMUM ALLOWABLE</b> <b>FOUNDATION</b> <b>PRESSURE (TSF)</b>	<b>MAXIMUM ALLOWABLE</b> <b>FOUNDATION</b> <b>PRESSURE (kPa)</b>
<i>1. Bedrock (Notes 2 and 7)</i>		
<i>1.a Hard sound rock-gneiss, diabase, schist</i>	60	5,746
<i>1.b Medium Hard Rock-marble, serpentine</i>	40	3,830
<i>1.c Intermediate Rock-shale, sandstone</i>	20	1,915
<i>1.d Soft Rock-weathered rock</i>	8	766
<i>2. Sandy Gravel and Gravel (GW, GP) (Notes 3, 4, 8, and 9)</i>		
<i>2.a Dense</i>	10	958
<i>2.b Medium</i>	6	575
<i>3. Granular Soils (GC, GM, SW, SP, SM, and SC) (Notes 4, 5, 8, and 9)</i>		
<i>3.a Dense</i>	6	575
<i>3.b Medium</i>	3	287
<i>4. Clays (SC, CL, and CH) (Notes 4, 6, 8, and 9)</i>		
<i>4.a Hard</i>	5	479
<i>4.b Stiff</i>	3	287
<i>4.c Medium</i>	2	192
<i>5. Silts and Silty Soils (ML and MH) (Notes 4, 8, and 9)</i>		
<i>5.a Dense</i>	3	287
<i>5.b Medium</i>	1.5	144
<i>6. Organic silts, organic clays, peats, soft clays, loose granular soils and varved silts.</i>	<i>See 1804.2.1</i>	<i>See 1804.2.1</i>
<i>7. Controlled and Uncontrolled Fills.</i>	<i>See 1804.2.2 or 1804.2.3</i>	<i>See 1804.2.2 or 1804.2.3</i>

**Notes:**

1. *Where there is doubt as to the applicable classification of a soil stratum, the allowable bearing pressure applicable to the lower Class of material to which the given stratum might conform shall apply.*
2. *The tabulated values of allowable bearing pressures apply only for massive rocks or for sedimentary or foliated rocks, where the strata are level or nearly so, and, then only if the area has ample lateral support. Tilted strata and their relation to nearby slopes or excavations shall receive special consideration. The tabulated values for Class 1a materials (Hard sound rock) may be increased by 25 percent provided the geotechnical engineer performs additional tests and/or analyses substantiating the increase.*
3. *For intermediate conditions, values of allowable bearing pressure shall be estimated by interpolation between indicated extremes.*
4. *Footing embedment in soils shall be in accordance with section 1805.2 and the width of the loaded area not less than 2 feet (610 mm), unless analysis demonstrates that the proposed construction will have a minimum factor of safety of 2.0 against shear failure of the soil.*
5. *Estimates of settlements shall govern the allowable bearing value, subject to the maximums given in this table, and as provided in Section 1804.2.*
6. *The bearing capacity of clay soils shall be established on the basis of the strength of such soils as determined by field or laboratory tests and shall provide a factor of safety against failure of the soil of not less than 2.0 computed on the basis of a recognized procedure of soils analysis, shall account for probable settlements of the building and shall not exceed the tabulated maximum values.*
7. *Increases in allowable bearing pressure due to embedment of the foundation: The allowable bearing values for intermediate to hard rock shall apply where the loaded area is on the surface of sound rock. Where the loaded area is below the adjacent rock surface and is fully confined by the adjacent rock mass and provided that the rock mass has not been shattered by blasting or otherwise is or has been rendered unsound, these values may be increased ten percent of the base value for each one foot (0.3 meters) of embedment below the surface of the adjacent rock surface in excess of one foot (0.3 meters), but shall not exceed 200 percent of the values.*

8. *The allowable bearing values for soils of Classes 2, 3, 4, and 5 determined in accordance with notes three, four and five above, shall apply where the loaded area is embedded 4 feet (1219 mm) or less in the bearing stratum. Where the loaded area is embedded more than 4 feet (1219 mm) below the adjacent surface of the bearing stratum, and is fully confined by the weight of the adjacent soil, these values may be increased five percent of the base value for each 1-foot (305) of additional embedment, but shall not exceed twice the values. Increases in allowable bearing pressure due to embedment shall not apply to soft rock, clays, silts and soils of classes 6 and 7.*
  
9. *The allowable bearing values for soils of Classes 2, 3, 4, and 5 determined in accordance with this table and the notes thereto, may be increased up to one third where the density of the bearing stratum below the bottom of the footings increases with depth and is not underlain by materials of a lower allowable bearing pressure. Such allowable bearing values shall be demonstrated by a recognized means of analysis that the probable settlement of the foundation due to compression, and/or consolidation does not exceed acceptable limits for the proposed building.*
  
10. *The maximum toe pressure for eccentrically loaded footings may exceed the allowable bearing value by up to 25 per cent if it is demonstrated that the heel of the footing is not subjected to tension.*

**1804.2 Allowable foundation pressure.** *The allowable foundation pressure for supporting soils at or near the surface shall not exceed the values specified in Table 1804.1, unless data to substantiate the use of a higher value are developed and contained in the engineer's geotechnical report and subject to the commissioner's approval. Allowable bearing pressure shall be considered to be the pressure at the base of a foundation in excess of the stabilized overburden pressure existing at the same level prior to construction operations.*

**TABLE 1804.2 UNIFIED SOIL CLASSIFICATION**

(Including Identification and Description)

Major Divisions		Group Symbols	Typical Names	Field Identification Procedures (Excluding particles larger than 3 in. and basing fractions on estimated weights)	Information Required for Describing Soils	Laboratory Classification Criteria	
1	2	3	4	5	6	7	
<b>Coarse-grained Soils</b>  More than half of material is larger than No. 200 sieve size. The No. 200 sieve size is about the smallest visible to the naked eye.	<b>Gravels</b>  More than half of coarse fraction is larger than No. 4 sieve size. (For visual classification, the 1/4-in. size may be used as equivalent to the No. 4 sieve size.)	GW	Well-graded gravels, gravel-sand mixture, little or no fines.	Wide range in grain size and substantial amounts of all intermediate particle sizes.	For undisturbed soils add information on stratification, degree of compactness, cementation, moisture condition, and drainage characteristics.	$C_u = \frac{D_6}{D_{10}} \text{ Greater than } 4$ $C_e = \frac{(D_{30})^2}{D_{10} \times D_{60}} \text{ Between } 1 \text{ and } 3$	
		GP	Poorly graded gravels or gravel-sand mixture, little or no fines.	Predominantly one size or a range of sizes with some intermediate sizes missing.		Give typical name; indicate approximate percentages of sand and gravel, maximum size; angularity, surface condition, and hardness of the coarse grains; local or geologic name and other pertinent descriptive information; and symbol in parentheses.	Not meeting all gradation requirements for GW
		GM	Silty gravels, gravel-and-silt mixtures.	Nonplastic fines or fines with low plasticity (for identification procedures see ML below).	Atterberg limits below "A" line or PI less than 4		Above "A" line with PI between 4 and 7 are borderline cases requiring use of dual symbols.
					Atterberg limits above "A" line with PI greater than 7		
		GC	Clayey gravels, gravel-and-clay mixtures.	Plastic fines (for identification procedures see CL below).	$C_u = \frac{D_6}{D_{10}} \text{ Greater than } 6$		
SW	Well-graded sands, gravelly	Wide range in grain size and substantial amounts					

Use grain-size curve in identifying the fractions as given under field identification.

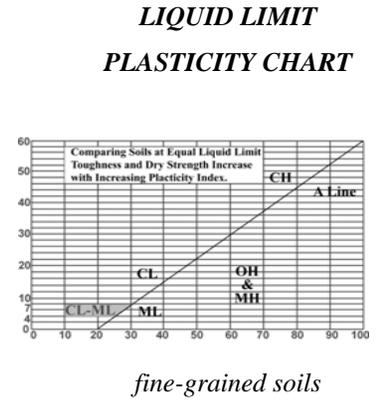

soils are classified as follows:

Less than 5% GW, GP, SW, SP,

More than 12% GM, GC, SM, SC.

	<p style="text-align: center;"><i>Silts and Clays Liquid limit is less than 50</i></p>	<p style="text-align: center;"><i>ML</i></p>	<p><i>Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity</i></p>	<p><i>None to slight</i></p>	<p><i>Quick to slow</i></p>	<p><i>None</i></p>	<p><i>For undisturbed soils add information on structure, stratification, consistency in undisturbed and remolded states, moisture and drainage conditions</i></p>	<p><i>Plasticity Index</i></p>
		<p style="text-align: center;"><i>CL</i></p>	<p><i>Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.</i></p>	<p><i>Medium to high</i></p>	<p><i>None to very slow</i></p>	<p><i>Medium</i></p>		
	<p style="text-align: center;"><i>Silts and Clays Liquid limit is greater than 50</i></p>	<p style="text-align: center;"><i>OL</i></p>	<p><i>Organic silts and organic silty clays of low plasticity.</i></p>	<p><i>Slight to medium</i></p>	<p><i>Slow</i></p>	<p><i>Slight</i></p>	<p><i>Give typical name; indicate degree and character of plasticity; amount and maximum size of coarse grains; color in wet condition; odor, if any; local or geologic name and other pertinent descriptive information; and symbol in parentheses.</i></p> <p><i>Example: Clayey silt, brown; slightly plastic; small percentage of fine sand; numerous vertical</i></p>	
		<p style="text-align: center;"><i>MH</i></p>	<p><i>Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.</i></p>	<p><i>Slight to medium</i></p>	<p><i>Slow to none</i></p>	<p><i>Slight to medium</i></p>		
		<p style="text-align: center;"><i>CH</i></p>	<p><i>Inorganic clays of high plasticity, fat clays.</i></p>	<p><i>High to very high</i></p>	<p><i>None</i></p>	<p><i>High</i></p>		
		<p style="text-align: center;"><i>OH</i></p>	<p><i>Organic clays of medium to high plasticity, organic silts.</i></p>	<p><i>Medium to high</i></p>	<p><i>None to very slow</i></p>	<p><i>Slight to medium</i></p>		

<i>Highly Organic Soils</i>	<i>Pt</i>	<i>Peat and other highly organic soils.</i>	<i>Readily identified by color, odor, spongy feel and frequently by fibrous texture</i>	<i>root holes; firm and dry in place; loess; (ML)</i>			
<p><i>(1) Boundary classifications: Soils possessing characteristics of two groups are designed by combinations of group symbols. For example GM-GC, well-graded gravel-sand mixture with clay binder.</i></p> <p><i>(2) All sieve sizes on this chart are U.S. standard.</i></p> <p><i>(3) Adopted by Corps of Engineers and Bureau of Reclamation, January 1952</i></p>							
							<i>032058C</i>

**1804.2.1 Classification of materials.** Soil materials shall be classified and identified in accordance with Table 1804.2. In addition, refer to Sections 1804.2.1 through 1804.2.4 for supplementary definitions.

## **BEDROCK.**

**Hard sound rock (Class 1a).** Includes crystalline rocks such as gneiss, granite, diabase, and schist. Characteristics are: the rock rings when struck with pick or bar; the rock do not disintegrate after exposure to air or water; the rock break with sharp fresh fracture; cracks are unweathered and less than 1/8-inch (3.2 mm) wide, generally no closer than 3 feet (914 mm) apart; the RQD (Rock Quality Designation) with a double tube, NX-size diamond core barrel is generally 85 percent or greater for each 5 foot (1524 mm) run, or core recovery with BX-size core is generally 85 percent or greater for each 5 foot (1524 mm) run.

**Medium hard rock (Class 1b).** Includes crystalline rocks of paragraph (a) of this subdivision, plus marble and serpentinite. Characteristics are: all those listed in paragraph (a) of this subdivision, except that cracks may be 1/4-inch (6.4 mm) wide and slightly weathered, generally spaced no closer than 2 feet (610 mm) apart; the RQD with a double tube, NX-size diamond core barrel is generally between 50 and 85 percent for each 5 foot (1524 mm) run, or core recovery with BX-size core is generally fifty to eighty-five percent for each 5 foot (1524 mm) run.

**Intermediate rock (Class 1c).** Includes rocks described in paragraphs (a) and (b) of this subdivision, plus cemented shales and sandstone. Characteristics are: the rock gives dull sound when struck with pick or bar; does not disintegrate after exposure to air or water; broken pieces may show weathered surfaces; may contain fracture and weathered zones up to 1 inch (25 mm) wide spaced as close as 1 foot (305 mm); the RQD with a double tube, NX size diamond core barrel is generally 35 to 50 percent for each 5 foot (1524 mm) run, or a core recovery with BX-size core of generally 35 to 50 percent for each 5 foot (1524 mm) run.

**Soft rock (Class 1d).** Includes rocks described in paragraphs (a), (b) and (c) of this subdivision in partially weathered condition, plus poorly cemented shales and sandstones. Characteristics are: rock may soften on exposure to air or water; may contain thoroughly weathered zones up to 3 inches (76 mm) wide but filled with stiff soil; the RQD with a double tube, NX-size diamond core barrel is less than 35 percent for each 5 foot (1524 mm) run, or core recovery with BX-size core of generally less than thirty-five percent for each 5 foot (1524 mm) run and a standard penetration resistance more than 50 blows per foot (0.3 meters).

**SANDY GRAVEL AND GRAVELS.** Consists of coarse-grained material with more than half of the coarse fraction larger than the # 4 size sieve and containing little or no fines (GW and GP). The density of these materials shall be determined in accordance with the following:

**Dense (Class 2a).** Those materials having a Standard Penetration Test N-value greater than 30 blows per one foot (0.3 meter).

**Medium (Class 2b).** Those materials having a Standard Penetration Test N-value between 10 and 30 blows per one foot (0.3 meter).

**Loose (Class 6).** Those materials having a Standard Penetration Test N-value less than 10 blows per one foot (0.3 meter).

**GRANULAR SOILS.** These materials are coarse-grained soils consisting of gravel and/or sand with appreciable amounts of fines, and gravel (GM, GC, SW, SP, SM, and SC). The density of granular materials shall be determined in accordance with the following:

**Dense (Class 3a).** Those materials having a Standard Penetration Test N-value greater than 30 blows per one foot (0.3 meter).

**Medium (Class 3b).** Those materials having a Standard Penetration Test N-value between 10 and 30 blows per one foot (0.3 meter).

**Loose (Class 6).** Those materials having Standard Penetration Test N-value less than 10 blows per one foot (0.3 meter).

**CLAYS.** In the absence of sufficient laboratory data, the consistency of clay materials (SC, CL, and CH) shall be determined in accordance with the following:

**Hard (Class 4a).** Clay requiring picking for removal, a fresh sample of which cannot be molded by pressure of the fingers, or having an unconfined compressive strength in excess of 4 TSF (383 kPa), or Standard Penetration Test N-values greater than 30 blows per one foot (0.3 meter).

**Stiff (Class 4b).** Clay that can be removed by spading, a fresh sample of which requires substantial pressure of the fingers to create an indentation, or having an unconfined compressive strength between 1 TSF (96 kPa) and 4TSF (383 kPa), or Standard Penetration Test N-values between 8 and 30 blows per one foot (0.3 meter).

**Medium (Class 4c).** Clay that can be removed by spading, a fresh sample of which can be molded by substantial pressure of the fingers, or having an unconfined compressive strength between 0.5 TSF (48 kPa) and 1 TSF (96 kPa), or Standard Penetration Test N-values between 4 and 8 blows per one foot (0.3 meter).

**Soft (Class 6).** Clay, a fresh sample of which can be molded with slight pressure of the fingers, or having an unconfined compressive strength less than 0.5 TSF (48 kPa), or Standard Penetration Test N-values less than 4 blows per one foot (0.3 meter).

**SILTS AND CLAYEY SILTS.** In the absence of sufficient laboratory data, the consistency of silt materials (ML and MH) shall be determined in accordance with the following:

**Dense (Class 5a).** Silt with a Standard Penetration Test N-values greater than 30 blows per one foot (0.3 meter).

**Medium (Class 5b).** Silt with a Standard Penetration Test N-values between 10 and 30 blows per one foot (0.3 meter).

**Loose (Class 6).** Silt with a Standard Penetration Test N-values less than 10 blows per one foot (0.3 meters).

**Organic silts, organic clays, peats, soft clays, loose granular soils and varved silts.** The allowable bearing pressure shall be determined independently of Table 1804.1 subject to the following:

1. For varved silts, the soil bearing pressure produced by the proposed building shall not exceed two tons per square foot (192 kPa), except that for desiccated or over consolidated soils, higher bearing pressures are allowed subject to approval by the commissioner.
2. For organic silts or clays, soft clays, or for loose granular soils, the engineer responsible for the investigation shall establish the allowable soil bearing pressure based upon the soil's specific engineering properties. This may require that the soils be preconsolidated, artificially treated, or compacted.

3. *A report prepared, signed and sealed by the engineer is required to be filed to substantiate the design soil pressures to be used on soil materials and it shall contain, at a minimum:*

3.1 *Sufficient laboratory test data on the compressible material to indicate the soil strength and the preconsolidation pressure, coefficient of consolidation, coefficient of compressibility, permeability, secondary compression characteristics, and Atterberg limits.*

3.2 *Where the design contemplates improvement of the natural bearing capacity and/or reduction in settlements by virtue of preloading: cross sections showing the amount of fill and surcharge to be placed, design details showing the required time for surcharging, and computations showing the amount of settlement to be expected during surcharging and the estimated amount and rate of settlement expected to occur after the structure has been completed, including the influence of dead and live loads of the structure.*

3.3 *A detailed analysis showing that the anticipated future settlement will not adversely affect the performance of the structure.*

3.4 *Where strip drains, sand drains, or stone columns are to be used, computations showing the diameter, spacing, and anticipated method of installation of such drains.*

3.5 *Records of settlement plate elevations and pore pressure readings, before, during, and after surcharging.*

**1804.2.2 Controlled fills.** *Fills shall be considered as satisfactory bearing material of the applicable class when placed in accordance with the following procedures and subject to the special inspection provisions of Chapter 17:*

1. *Area to be filled shall be stripped of all organic materials, rubbish and debris.*
2. *Fill shall not be placed when frozen or on frozen or saturated subgrade.*
3. *The engineer, or the engineer's representative, shall approve the subgrade prior to fill placement.*

4. *Fill material shall consist of well graded sand, gravel, crushed rock, recycled concrete aggregate, or a mixture of these, or equivalent materials with a maximum of 10 percent passing the #200 sieve, as determined from the percent passing the #4 sieve.*
5. *Fill shall be placed and compacted in lifts, not exceeding 12 inches (305 millimeters), at its optimum moisture content, plus or minus two percent, and to not less than a density of ninety-five percent of the optimum density as determined by ASTM D 1557.*
6. *Fill density shall be verified by in-place tests made on each lift.*
7. *The allowable bearing value of controlled fill shall be limited to 3 tons per square foot (383 kPa) providing the underlying soil is not weaker than the controlled fill.*

**1804.2.3 Uncontrolled fills.** *Fills other than controlled fill may be considered as satisfactory bearing material of applicable class, subject to the following:*

1. *The soil within the building area shall be explored using test pits at every column. All test pits shall extend to depths equal to the smaller width of the footing and at least one test pit shall penetrate at least 8 feet (2438 mm) below the level of the bottom of the proposed footings. All test pits shall be backfilled with properly compacted fill. Borings may be used in lieu of test pits, provided that continuous samples of at least 3 inches (76 mm) in diameter are recovered.*
2. *The building area shall be additionally explored using one standard boring for every twenty-five hundred square foot (232.3 m<sup>2</sup>) of building footprint area. These borings shall be carried to a depth sufficient to penetrate into natural ground, but not less than 20 feet (6096 mm) below grade.*
3. *The fill shall be composed of material that is free of voids and free of extensive inclusions of mud, organic materials such as paper, wood, garbage, cans, or metallic objects, and debris.*
4. *The allowable soil bearing pressure on satisfactory uncontrolled fill material shall not exceed two tons per square foot (192 kPa). One- and two-family dwellings may be founded on satisfactory uncontrolled fill provided the dwelling site has been explored using at least one test pit, penetrating at least 8 feet (2438 mm) below the level of the bottom of the proposed footings, and that the fill has been found to be composed of material that is free of voids and generally free of mud, organic materials such as paper, garbage, cans, or metallic objects, and debris. Test pits shall be backfilled with properly compacted fill.*

**1804.2.4 Artificially treated soils.** *Nominally unsatisfactory soil materials that are artificially compacted, cemented, or preconsolidated may be used for the support of buildings, and nominally satisfactory soil materials that are similarly treated may be used to resist soil bearing pressures in excess of those indicated in Table 1804.1. The engineer shall develop treatment plans and procedures and post-treatment performance and testing requirements and submit such plans, procedures, and requirements to the commissioner for approval. After treatment, a sufficient amount of sampling and/or in-situ tests shall be performed in the treated soil to demonstrate the efficacy of the treatment for the increased bearing pressure.*

**1804.3** *Reserved.*

## **SECTION BC 1805 FOOTINGS AND FOUNDATIONS**

**1805.1 General.** *Footings and foundations shall be designed and constructed in accordance with Sections 1805.1 through 1805.9. Footings and foundations shall be built on undisturbed soil, compacted fill material or CLSM. Compacted fill material shall be placed in accordance with Section 1803.5. CLSM shall be placed in accordance with Section 1803.6.*

*The top surface of footings shall be level. The bottom surface of footings is permitted to have a slope not exceeding one unit vertical in 10 units horizontal (10-percent slope). Footings shall be stepped where it is necessary to change the elevation of the top surface of the footing or where the surface of the ground slopes more than one unit vertical in 10 units horizontal (10-percent slope).*

**1805.2 Depth of footings.** *The minimum depth of footings below the undisturbed ground surface shall be 12 inches (305 mm). Where applicable, the depth of footings shall also conform to Sections 1805.2.1 through 1805.2.3.*

**1805.2.1 Frost protection.** *Except where otherwise protected from frost, foundation walls, piers and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:*

- 1. Extending a minimum of 4 feet (1219 mm) below grade;*
- 2. Constructing in accordance with ASCE-32; or*

3. Erecting on solid rock.

**Exception:** Free-standing buildings meeting all of the following conditions are shall not required to be protected:

1. Classified in Importance Category I (See Table 1604.5);
2. Area of 400 square feet (37 m<sup>2</sup>) or less; and
3. Eave height of 10 feet (3048 mm) or less.

*Footings shall not bear on frozen soil unless such frozen condition is of a permanent character.*

**1805.3 Foundations at different levels.** Where footings are supported at different levels, or are at different levels from the footings of adjacent structures, the influence of the pressures under the higher footings on the stability of the lower footings shall be considered in the design. The design shall consider the requirements for lateral support of the material supporting the higher footing, the additional load imposed on the lower footings, and assessment of the effects of dragdown on adjacent pile-supported buildings.

**1805.4 Footings.** Footings shall be designed and constructed in accordance with Sections 1805.4.1 through 1805.4.6.

**1805.4.1 Design.** Footings shall be so designed that the allowable bearing capacity of the soil is not exceeded, and that differential settlement is minimized. The minimum width of footings shall be 18 inches (457 mm).

**1805.4.1.1 Design loads.** Footings shall be designed for the most unfavorable effects due to the combinations of loads specified in Section 1605.3 and Section 1801.2. The dead load shall include the weight of foundations, footings and overlying fill. Reduced live loads, as specified in Section 1607.9, are permitted to be used in the design of footings.

**1805.4.1.2 Vibratory loads.** Where machinery operations or other vibrations are transmitted through the foundation, consideration shall be given in the footing design to prevent detrimental disturbances of the soil.

**1805.4.2 Concrete footings.** The design, materials and construction of concrete footings shall comply with Sections 1805.4.2.1 through 1805.4.2.6 and the provisions of Chapter 19.

**1805.4.2.1 Concrete strength.** Concrete in footings shall have a specified compressive strength ( $f'_c$ ) of not less than 2,500 pounds per square inch (psi) (17 237 kPa) at 28 days.

**1805.4.2.2 Footing seismic ties.** Where a structure is assigned to Seismic Design Category D in accordance with Section 1616, individual spread footings founded on soil defined in Section 1615.1.1 as Site Class E or F shall be interconnected by ties. Ties shall be capable of carrying, in tension or compression, a force equal to the product of the larger footing load times the seismic coefficient  $S_{DS}$  divided by 10 unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade.

**1805.4.2.3 Plain concrete footings.** The edge thickness of plain concrete footings supporting walls of other than light-frame construction shall not be less than 8 inches (203 mm) where placed on soil.

**Exception:** For plain concrete footings supporting Group R-3 occupancies, the edge thickness is permitted to be 6 inches (152 mm), provided that the footing does not extend beyond a distance greater than the thickness of the footing on either side of the supported wall.

**1805.4.2.4 Placement of concrete.** Concrete footings shall not be placed through water unless a tremie or other method approved by the commissioner is used. Where placed under or in the presence of water, the concrete shall be deposited by approved means to ensure minimum segregation of the mix and negligible turbulence of the water.

**1805.4.2.5 Protection of concrete.** No foundation shall be placed on frozen soil. No foundation shall be placed in freezing weather unless provision is made to maintain the underlying soil free of frost. Concrete footings shall be protected from freezing during depositing and for a period of not less than five days thereafter. Water shall not be allowed to flow through the deposited concrete.

**1805.4.3 Masonry-unit footings.** The design, materials and construction of masonry-unit footings shall comply with the provisions of Chapter 21.

**1805.4.4 Steel grillage footings.** Grillage footings of structural steel shapes shall be separated with approved steel spacers and be entirely encased in concrete with at least 6 inches (152 mm) on the bottom and at least 4 inches (102 mm) at all other points. The spaces between the shapes shall be completely filled with concrete or cement grout.

**1805.4.5 Timber footings.** Refer to Chapter 23.

**1805.4.6 Wood foundations.** Refer to Chapter 23.

**1805.5 Foundation walls.** Concrete and masonry foundation walls shall be designed in accordance with Chapter 19 or 21, respectively.

**1805.5.1 Foundation wall thickness.** The minimum thickness of concrete and masonry foundation walls shall comply with Section 1805.5.1.1.

**1805.5.1.1 Thickness based on walls supported.** The thickness of foundation walls shall not be less than the thickness of the wall supported, except that foundation walls of at least 8-inch (203 mm) nominal width are permitted to support brick-veneered frame walls and 10-inch-wide (254 mm) cavity walls.

**1805.5.2 Foundation wall drainage.** Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.] Foundation walls shall be designed to support the earth pressures due to the backfill including full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.

**1805.5.3 Pier and curtain wall foundations.** Except in Seismic Design Category D, pier and curtain wall foundations are permitted to be used to support light-frame construction not more than two stories in height, provided the following requirements are met:

1. All load-bearing walls shall be placed on continuous concrete footings bonded integrally with the exterior wall footings.
2. The minimum actual thickness of a load-bearing masonry wall shall not be less than 4 inches (102 mm) nominal or  $3 \frac{5}{8}$  inches (92 mm) actual thickness, and shall be bonded integrally with piers spaced 6 feet (1829 mm) on center (o.c.).
3. Piers shall be constructed in accordance with Chapter 21 and the following:
  - 3.1. The unsupported height of the masonry piers shall not exceed 10 times their least dimension.

3.2. Where structural clay tile or hollow concrete masonry units are used for piers supporting beams and girders, the cellular spaces shall be filled solidly with concrete or Type M or S mortar.

**Exception:** Unfilled hollow piers are permitted where the unsupported height of the pier is not more than four times its least dimension.

4. The maximum height of a 4-inch (102mm) load-bearing masonry foundation wall supporting wood frame walls and floors shall not be more than 4 feet (1219 mm) in height.

5. The unbalanced fill for 4-inch (102 mm) foundation walls shall not exceed 24 inches (610 mm) for solid masonry, nor 12 inches (305mm) for hollow masonry.

**1805.6 Reserved.**

**1805.7 Reserved.**

**1805.8 Reserved.**

**1805.9 Seismic requirements.** See Section 1910 for additional requirements for footings and foundations of structures assigned to Seismic Design Category C or D. For structures assigned to Seismic Design Category D, provisions of ACI 318, Sections 21.10.1 to 21.10.3 shall apply when not in conflict with the provisions of Section 1805. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

**Exceptions:**

1. Group R or U occupancies of light-framed construction and two stories or less in height are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.

2. One- and two-family dwellings not more than three stories in height are not required to comply with the provisions of ACI 318, Sections 21.10.1 to 21.10.3.

**SECTION BC 1806**

## **RETAINING WALLS AND OTHER RETAINING STRUCTURES**

**1806.1 General.** Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning.

**1806.2 Seismic loads on retaining walls and other retaining structures.** Seismic foundation design shall comply with the requirements of ASCE 7, Section 9.7. The geotechnical analysis and design shall take into consideration the yielding characteristics of the retaining walls or other retaining structures.

### **SECTION BC 1807**

#### **DAMPPROOFING AND WATERPROOFING**

**1807.1 Where required.** Walls or portions thereof that retain earth and enclose interior spaces and floors below grade shall be waterproofed and dampproofed in accordance with this section, with the exception of those spaces containing occupancy groups other than residential and institutional where such omission is not detrimental to the building or occupancy. Ventilation for crawl spaces shall comply with Section 1203.3.

**1807.1.1 Story above grade.** Where a basement or cellar is considered a story above grade and the finished ground level adjacent to the basement or cellar wall is below the basement or cellar floor elevation for 25 percent or more of the perimeter, the floor and walls shall be dampproofed in accordance with Section 1807.2 and a foundation drain shall be installed in accordance with Section 1807.4.2. The foundation drain shall be installed around the portion of the perimeter where the basement or cellar floor is belowground level. The provisions of Sections 1807.3 and 1807.4.1 shall not apply in this case.

**1807.1.2 Under-floor space.** The finished ground level of an under-floor space such as a crawl space shall not be located below the bottom of the footings. Where there is evidence that the ground-water table rises to within 6 inches (152 mm) of the ground level at the outside building perimeter, or that the surface water does not readily drain from the building site, the ground level of the under-floor space shall be as high as the outside finished ground level, unless an approved drainage system is provided. The provisions of Sections 1802.2.3, 1807.2, 1807.3 and 1807.4 shall not apply in this case.

**1807.1.2.1 Flood hazard areas.** For buildings and structures in areas of special flood hazard, the finished ground level of an under-floor space such as a crawl space shall comply with Appendix G.

**1807.1.3 Ground-water control.** Where the ground-water table is lowered and maintained at an elevation not less than 6 inches (152 mm) below the bottom of the lowest floor, the floor and walls shall be dampproofed in accordance with Section 1807.2. The design of the system to lower the ground-water table shall be based on accepted principles of engineering that shall consider, but not necessarily be limited to, permeability of the soil, rate at which water enters the drainage system, rated capacity of pumps, head against which pumps are to operate and the rated capacity of the disposal area of the system.

**1807.2 Dampproofing required.** Where hydrostatic pressure will not occur as determined by Section 1802, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AFPA TR7.

**1807.2.1 Floors.** Dampproofing materials for floors shall be installed between the floor and the base course required by Section 1807.4.1, except where a separate floor is provided above a concrete slab. Where installed beneath the slab, dampproofing shall consist of not less than 6-mil (0.006 inch; 0.152 mm) polyethylene with joints lapped not less than 6 inches (152 mm), or other approved methods or materials. Where permitted to be installed on top of the slab, dampproofing shall consist of mopped-on bitumen, not less than 4-mil (0.004 inch; 0.102 mm) polyethylene, or other approved methods or materials. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

**1807.2.2 Walls.** Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level. Dampproofing shall consist of a bituminous material, 3 pounds per square yard (16 N/m<sup>2</sup>) of acrylic modified cement, 1/8-inch (3.2 mm) coat of surface-bonding mortar complying with ASTM C 887, any of the materials permitted for waterproofing by Section 1807.3.2 or other approved methods or materials.

**1807.2.2.1 Surface preparation of walls.** Prior to application of dampproofing materials on concrete walls, holes and recesses resulting from the removal of form ties shall be sealed with a bituminous material or other approved methods or materials. Unit masonry walls shall be parged on the exterior surface below ground level with not less than 3/8 inch (9.5 mm) of portland cement mortar. The parging shall be covered at the footing.

**Exception:** Parging of unit masonry walls is not required where a material is approved for direct application to the masonry.

**1807.3 Waterproofing required.** Where the investigation required by Section 1802 indicates that a hydrostatic pressure condition exists, and the design does not include a ground-water control system as described in Section 1807.1.3, walls and floors shall be waterproofed in accordance with this section.

**1807.3.1 Floors.** Floors required to be waterproofed shall be of concrete, designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected. Waterproofing shall be accomplished by placing a membrane of rubberized asphalt, butyl rubber, or not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride with joints lapped not less than 6 inches (152 mm) or other approved materials under the slab. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

**1807.3.2 Walls.** Walls required to be waterproofed shall be of concrete or masonry and shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected. Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section 1807.2.2. Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene or other approved methods or materials capable of bridging nonstructural cracks. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

**1807.3.2.1 Surface preparation of walls.** Prior to the application of waterproofing materials on concrete or masonry walls, the walls shall be prepared in accordance with Section 1807.2.2.1.

**1807.3.3 Joints and penetrations.** Joints in walls and floors, joints between the wall and floor and penetrations of the wall and floor shall be made water-tight utilizing approved methods and materials.

**1807.4 Subsoil drainage system.** Where a hydrostatic pressure is to be controlled by a subsoil drainage system, dampproofing, a floor base course, and subdrains around the foundation perimeter and under the floor shall be provided. A subsoil drainage system designed and constructed in accordance with Section 1807.1.3 shall be deemed adequate for lowering the ground-water table.

**1807.4.1 Floor base course.** Floors of basements or cellars, except as provided for in Section 1807.1.1, shall be placed over a floor base course not less than 4 inches (102 mm) in thickness that consists of gravel or crushed stone containing not more than 10 percent of material that passes through a No. 4 (4.75 mm) sieve.

**Exception:** Where a site is located in well-drained gravel or sand/gravel mixture soils, a floor base course is not required.

**1807.4.2 Foundation drain.** A drain that consists of gravel or crushed stone containing not more than 10-percent material that passes through a No. 4 (4.75 mm) sieve shall be placed around the perimeter of a foundation. The drain shall extend a minimum of 12 inches (305 mm) beyond the outside edge of the footing. The thickness shall be such that the bottom of the drain is not higher than the bottom of the base under the floor, and that the top of the drain is not less than 6 inches (152 mm) above the top of the footing. The top of the drain shall be covered with an approved filter membrane material. Where a drain tile or perforated pipe is used, the invert of the pipe or tile shall not be higher than the floor elevation. The top of joints or the top of perforations shall be protected with an approved filter membrane material. The pipe or tile shall be placed on not less than 2 inches (51 mm) of gravel or crushed stone complying with Section 1807.4.1, and shall be covered with not less than 6 inches (152 mm) of the same material.

**1807.4.3 Drainage discharge.** The floor base and foundation perimeter drain shall discharge by gravity or mechanical means into an approved drainage system that complies with the New York City Plumbing Code.

**Exception:** Where a site is located in well-drained gravel or sand/gravel mixture soils, a dedicated drainage system is not required.

**1807.5 In-situ walls.** Applied waterproofing or damp-proofing need not be applied to slurry walls, or walls constructed below the water table. In-situ walls shall be constructed with watertight joints between individual elements and sealed by grouting to achieve a uniform watertight surface. External drains and waterproofing are not required. In-situ walls constructed using tangent pile or secant pile may require waterproofing systems, because their joints cannot be sealed. For both instances, an under floor seepage collection system or pressure slab shall be provided.

## **SECTION BC 1808**

### **PIER AND PILE FOUNDATIONS**

**1808.1 Definitions.** The following words and terms shall, for the purposes of this section, have the meanings shown herein.

**FLEXURAL LENGTH.** Flexural length is the length of the pile from the first point of zero lateral deflection

to the underside of the pile cap or grade beam.

**PIER FOUNDATIONS.** Pier foundations consist of isolated masonry or cast-in-place concrete structural elements extending into firm materials. Piers are relatively short in comparison to their width, with lengths less than or equal to 12 times the least horizontal dimension of the pier. Piers derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.

**Belled piers.** Belled piers are cast-in-place concrete piers constructed with a base that is larger than the diameter of the remainder of the pier. The belled base is designed to increase the load-bearing area of the pier in end bearing.

**PILE FOUNDATIONS.** Pile foundations consist of concrete, wood or steel structural elements either driven into the ground or cast in place. Piles are relatively slender in comparison to their length, with lengths exceeding 12 times the least horizontal dimension. Piles derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.

**Augered-cast-in-place piles.** Augered-cast-in-place piles are constructed by pumping grout into an augered hole during the withdrawal of the auger. The pile is reinforced with a single reinforcing bar, a reinforcing steel cage or a structural steel section.

**Caisson piles.** Steel cased piles are constructed by driving a steel shell to a watertight seal at the top of rock and drilling of an uncased socket within the rock. The shell and socket is filled with a steel core section and concrete or grout.

**Compacted Concrete Piles.** Compacted concrete piles are constructed by filling a shaft with low strength concrete as the casing is withdrawn.

**Concrete-filled steel pipe and tube piles.** Concrete-filled steel pipe and tube piles are constructed by driving a steel pipe or tube section into the soil and filling the pipe or tube section with concrete. The steel pipe or tube section is left in place during and after the deposition of the concrete.

**Driven uncased piles.** Driven uncased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole that is later filled with concrete. The steel casing is lifted out of the hole during the deposition of the concrete. These piles are allowed only if the concrete is placed under pressure.

**Enlarged base piles.** Enlarged base piles are cast-in-place concrete piles constructed with a base that

is larger than the diameter of the remainder of the pile. The enlarged base is designed to increase the load-bearing area of the pile in end bearing. Enlarged base piles include piles installed by driving a pre-cast concrete tip or by compacting concrete into the base of the pile to form an enlarged base.

**H-Piles.** Steel H-piles are constructed by driving a steel H shaped section into the ground.

**Steel-cased piles.** Steel-cased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole. The steel casing is left permanently in place and filled with concrete.

**Jacked Piles.** Steel pipe piles installed by hydraulically jacking the pile into the ground against a dead weight reaction. Piles installed by other static forces shall be considered in this category.

**Micro-piles / mini-piles.** Small diameter drilled steel cased piles, driven uncased piles or caisson piles.

**Open End Pipe Pile.** Steel pipe driven open ended that may or may not be filled with concrete or soil.

#### **1808.2 Piers and piles—general requirements.**

**1808.2.1 Design.** Piles are permitted to be designed in accordance with provisions for piers in Section 1808 and Sections 1812.3 through 1812.11 where either of the following conditions exists, subject to the approval of the commissioner:

1. Group R-3 and U occupancies not exceeding two stories of light-frame construction, or
2. Where the surrounding foundation materials furnish adequate lateral support for the pile.

**1808.2.2 General.** Pier and pile foundations shall be designed and installed on the basis of a foundation investigation as defined in Section 1802.

The investigation and report provisions of Section 1802 shall be expanded to include, but not be limited to, the following:

1. Recommended pier or pile types and installed capacities.
2. Recommended center-to-center spacing of piers or piles.

3. *Driving criteria.*
4. *Installation procedures.*
5. *Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).*
6. *Pier or pile load test requirements.*
7. *Durability of pier or pile materials.*
8. *Designation of bearing stratum or strata.*
9. *Reductions for group action, where necessary.*

*Pier and pile foundations shall be designed and installed under the direct control of an engineer knowledgeable in the field of geotechnical engineering and pier and pile foundations and shall be subject to special inspection performed under the direct control of such engineer. The engineer shall certify to the commissioner that the piers or piles as installed satisfy the design criteria.*

**1808.2.3 Special types of piles.** *The use of types of piles not specifically mentioned herein is permitted, subject to the approval of the commissioner, upon the submission of acceptable test data, calculations and other information relating to the structural properties and load capacity of such piles. The allowable stresses shall not in any case exceed the limitations specified herein.*

**1808.2.4 Pile caps.** *Pile caps shall be of reinforced concrete, and shall include all elements to which piles are connected, including grade beams and mats. The soil immediately below the pile cap shall not be considered as carrying any vertical load. The tops of piles shall be embedded not less than 3 inches (76 mm) into pile caps and the caps shall extend at least 4 inches (102 mm) beyond the edges of piles. The tops of piles shall be cut back to sound material before capping.*

**1808.2.5 Stability.** *Piers or piles shall be braced to provide lateral stability in all directions. Three or more piles connected by a rigid cap shall be considered braced, provided that the piles are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-pile group in a rigid cap shall be considered to be braced along the axis connecting the two piles. Methods used to brace piers or piles shall be subject to the approval of the commissioner. Piles supporting walls shall be driven alternately in lines spaced at least 1 foot (305 mm) apart and located*

*symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the wall piles are adequately braced to provide for lateral stability. A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories or 35 feet (10 668 mm) in height, provided the centers of the piles are located within the width of the foundation wall.*

**1808.2.6 Structural integrity.** *Piers or piles shall be installed in such a manner and sequence as to prevent distortion or damage to piles being installed or already in place to the extent that such distortion or damage affects the structural integrity of the piles.*

**1808.2.6.1 Minimum spacing of piles.** *Piles shall be spaced to meet the following requirements:*

- 1. Spacing of piles shall provide for adequate distribution of the load on the pile group to the supporting soil. In no case shall the minimum center-to-center spacing of piles be less than 24 inches (610 mm) nor less than the following for the specific types of piling indicated in this chapter.*
- 2. Minimum spacing between enlarged base concrete piles shall be 4 feet 6 inches (1372 mm), center to center except that where the shafts of such piles are cased for their full length, this spacing may be reduced to 3 feet 6 inches (1067 mm). Where a question exists as to possible damage to adjacent previously driven piles, these minimums shall be increased. Minimum center-to-center spacing of piles at the bearing level shall be at least two and one half times the outside diameter of the shell.*
- 3. Unless special measures are taken to assure that piles will penetrate sufficiently to meet the requirements of 1808.2.8 without interfering with or intersecting each other, the minimum center to center spacing of piles shall be twice the average diameter of the butt for round piles, one and three quarters times the diagonal for rectangular piles; or, for taper piles, twice the diameter at a level two thirds of the pile length measured up from the tip.*
- 4. In cases of practical difficulty, the spacing of new piles from existing piles under an adjacent building may be less than the above values provided that the requirements relating to minimum embedment and pile interference are satisfied and that the soil under the proposed and existing buildings is not overloaded by the closer pile grouping.*

**1808.2.6.2 Piles located near a lot line.** *Piles located near a lot line shall be designed on the*

*assumption that the adjacent lot will be excavated to a depth of 10 feet (3048 mm) below the nearest legally established curb level. Where such excavation would reduce the embedded length of the pile, the portion of the pile exposed shall be deemed to provide no lateral or vertical support, and the load carrying determination shall be made the resistance offered by the soil that is subject to potential excavation has been discounted.*

**1808.2.7 Splices.** *Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the pile during installation and subsequent thereto and shall be of adequate strength to transmit the vertical and lateral loads (including tensions) and the moments occurring in the pile section at the location of the splice without exceeding the allowable stresses for such materials as established in Section 1809. In all cases splices shall develop at least 50 percent of the capacity of the pile in bending. In all cases pile splices situated in the upper 10 feet (3048 mm) of the pile shall be capable of resisting (at allowable working stresses) the applied moments and shears or the moment and shear that would result from an assumed eccentricity of the pile load of 3 inches (76 mm), whichever is greater. For piles located near a lot line, the embedded length of such piles shall be determined on the basis that the adjacent site will be excavated to a depth of 10 feet (3048 mm) below the nearest established curb level as required in Section 1808.2.6.2.*

**1808.2.8 Allowable pier or pile loads.** *Allowable pier or pile loads shall be determined in accordance with Section 1808.2.8.1 through 1808.2.8.9.*

**1808.2.8.1 Determination of allowable loads.** *The allowable axial and lateral loads on piers or piles shall be determined by load tests or a recognized method of analysis. The allowable load shall be determined by a licensed engineer experienced in geotechnical engineering and shall be approved by the commissioner.*

*The allowable axial load on a pile shall be the least value permitted by consideration of the following factors (for battered piles, the axial load shall be computed from the resultant of all vertical loads and lateral forces occurring simultaneously):*

- 1. The capacity of the pile as a structural member.*
- 2. The allowable bearing pressure on soil strata underlying the pile tips.*
- 3. The resistance to penetration of the piles, including resistance to driving, resistance to jacking, the rate of penetration, or other equivalent criteria.*

4. *The capacity as indicated by load test, where load tests are required.*
5. *The maximum loads prescribed in Section 1808.2.8.1.3.*

**1808.2.8.1.1 Bearing capacity.** *The allowable pile load shall be limited by the provision that the pressures in materials at and below the pile tips, produced by the loads on individual piles and by the aggregate of all piles in a group or foundation, shall not exceed the allowable bearing values established in Table 1804.1. The transfer of load from piles to soil shall be determined by a recognized method of analysis. As an alternative, for purposes of this section, piles or pile groups may be assumed to transfer their loads to the underlying materials by spreading the load uniformly at an angle of sixty degrees with the horizontal, starting at a polygon circumscribing the piles, located as follows:*

1. *For piles embedded entirely in decomposed rock or granular soils, or in controlled fill materials, the polygon shall be circumscribed at a level located two-thirds of the embedded length of the pile, measured up from the tip.*
2. *For piles penetrating through silts and clays into bearing in decomposed rock or granular soils, the polygon shall be circumscribed at the bottom of the strata of silts or clays.*

**1808.2.8.1.2 Bearing stratum.** *The plans for the proposed work shall establish, in accordance with the requirements relating to allowable bearing pressure, the bearing stratum to which the piles in the various sections of the building must penetrate and the approximate elevations of the top of such bearing stratum. Where penetration of a given distance into the bearing strata is required for adequate distribution of the loads, such penetration shall be shown on the plans. The indicated elevations of the top of the bearing strata shall be modified by such additional data as may be obtained during construction. All piles shall penetrate to or into the designated bearing stratum.*

**1808.2.8.1.3 Maximum loads.** *Except as permitted by the provisions of Section 1808.2.8.3.1.6, the maximum allowable pile load shall not exceed the values specified in Table 1808.2.8.1.3.*

**TABLE 1808.2.8.1.3**  
**MAXIMUM ALLOWABLE PILE LOADS**

<i><b>TYPE OF PILE</b></i>	<i><b>MAXIMUM ALLOWABLE PILE LOAD (TONS)</b></i>
<i>Caisson Piles</i>	<i>No upper limit</i>
<i>Open-end pipe (or tube) piles bearing on rock of classes 1a, 1b, or 1c</i>	<i>18-in O.D. and greater - 250</i>
	<i>14-in to 18-in O.D. - 200</i>
	<i>12-in to 14-in - 150</i>
	<i>10-in to 12-in - 100</i>
	<i>8-in to 10-in - 60</i>
<i>Closed-end pipe (or tube) piles, H-piles, cast-in-place concrete, enlarged base piles, and precast concrete piles bearing on rock of Classes 1a, 1b, or 1c</i>	<i>150</i>
<i>Piles (other than timber piles) bearing on soft rock of Class 1d.</i>	<i>80</i>
<i>Piles (other than timber piles) that receive their principal support other than by direct bearing on rock of Class 1a. through 1d.</i>	<i>75</i>
<i>Timber piles bearing on rock of Class 1a. through 1d.</i>	<i>25</i>
<i>Timber piles bearing in suitable soils</i>	<i>40 tons maximum permissible with load test, 30 tons maximum without load test.</i>

**1808.2.8.1.4 Minimum pile penetrations.** Piles shall penetrate the minimum distance required to develop the required load capacity of the pile as established by the required penetration resistance and load tests as applicable.

**1808.2.8.1.5 Capacity as indicated by resistance to penetration.** Where subsurface investigation and general experience in the area indicate that the soil that must be penetrated by the pile consists of glacial deposits containing boulders, or fills containing riprap, excavated detritus, masonry, concrete or other obstructions in sufficient numbers to present a hazard to the installation of the piles, the selection of type of pile and penetration criteria shall be subject to the approval of the commissioner but in no case shall the minimum penetration resistance be less than that stated in Tables 1808.2.8.1.5A and 1802.8.2.8.1.5B.

**TABLE 1808.2.8.1.5A**

	32,000		1/4 inch (Minimum Hammer energy of 19,000 ft. lbs.)	
--	--------	--	--	--

**Notes:**

- a. *Final driving resistance shall be the sum of tabulated values plus resistance exerted by non-bearing materials. The driving resistance of non-bearing materials shall be taken as the resistance experienced by the pile during driving, but which will be dissipated with time and may be approximated as described in Section 1808.2.8.1.5.1.*
- b. *The hammer energy indicated is the rated energy.*
- c. *Sustained driving resistance. Where piles are to bear in Soft Rock, the minimum driving resistance shall be maintained for the last six inches, unless a higher sustained driving resistance requirement is established by load test. Where piles are to bear in soil classes 2 through 5, the minimum driving resistance shall be maintained for the last twelve inches unless load testing demonstrates a requirement for higher sustained driving resistance. No pile need be driven to a resistance to penetration (in blows per inch [blows per 25 mm] ) more than twice the resistance indicated in this table, nor beyond the point at which there is no measurable net penetration under the hammer blow.*
- d. *The tabulated values assume that the ratio of total weight of pile to weight of striking part of the hammer does not exceed 3.5. If a larger ratio is to be used, or for other conditions for which no values are tabulated, the driving resistance shall be as approved by the commissioner.*
- e. *For intermediate values of pile capacity, minimum requirements for driving resistance may be determined by straight line interpolation.*

**TABLE 1808.2.8.1.5B**  
**MINIMUM DRIVING RESISTANCE AND**  
**HAMMER ENERGY FOR TIMBER PILES**

<i>Pile Capacity (tons)</i>	<i>Minimum Driving Resistance (blows-in.) to be added to driving resistance exerted by non-bearing materials<sup>1,3,4</sup></i>	<i>Hammer Energy (ft.-lbs.)<sup>2</sup></i>
<i>Up to 20</i>	<i>Formula in Note 4 shall apply</i>	<i>7,500-12,000</i>
<i>Over 20 to 25</i>		<i>9,000-12,000</i>
<i>Over 25 to 30</i>		<i>14,000-16,000</i>
<i>Greater than 30</i>		<i>12,000-16,000</i> <i>(single-acting hammers)</i>
<i>Greater than 30</i>		<i>15,000-20,000</i> <i>(double-acting hammers)</i>

**Notes:**

1. The driving resistance exerted by non-bearing materials is the resistance experienced by the pile during driving, but which will be dissipated with time and may be approximated as described in Section 1808.2.8.1.5.1.
2. The hammer energy indicated is the rated energy.
3. Sustained driving resistance. Where piles are to bear in soil classes Soft Rock, the minimum driving resistance shall be maintained for the last six inches, unless a higher sustained driving resistance requirement is established by load test. Where piles are to bear in soil classes 2 thru 5, the minimum driving resistance measured in blows per inch [blows per 25 mm] shall be maintained for the last twelve inches unless load testing demonstrates a requirement for higher sustained driving resistance. No pile need be driven to a resistance to penetration in blows per inch [blows per 25 mm] more than twice the resistance indicated in this table nor beyond the point at which there is no measurable net penetration under the hammer blow.

4. *The minimum driving resistance shall be determined by the following formula:*

$$P = \frac{2WhH}{(S + 0.1)} \quad \text{or} \quad P = \frac{2E}{(S+0.1)}$$

*Where: P = Allowable pile load in pounds.*

*Wp = Weight of pile in pounds.*

*Wh = Weight of striking part of hammer in pounds.*

*H = Actual height of fall of striking part of hammer in feet.*

*E = Rated energy delivered by the hammer per blow in foot lbs.*

*S = Penetration of pile per blow, in inches, after the pile has been driven to a depth where successive blows produce approximately equal net penetration.*

*The value Wp shall not exceed three times Wh.*

**1808.2.8.1.5.1 Piles installed by use of steam-powered, air-powered, diesel-powered or hydraulic impact hammers.**

1. *The minimum required driving resistance and the requirements for hammer energies for various types and capacities of piles are given in Tables 1808.2.8.1.5A and 1808.2.8.1.5.B. To obtain the required total driving resistance, the indicated driving resistances shall be added to any driving resistance experienced by the pile during installation, but which will be dissipated with time (resistance exerted by non-bearing materials or by materials which are to be excavated). For the purposes of this section, the resistance exerted by non-bearing materials may be approximated as the resistance to penetration of the pile recorded when the pile has penetrated to the bottom of the lowest stratum of nominally unsatisfactory bearing material (class 6 and uncontrolled fills, but not controlled fill) or to the bottom of the lowest stratum of soft or loose deposits of soils of class 4 or 5 but only where such strata are completely penetrated by the pile.*
  
2. *Alternate for similitude method - The requirement for installation of piling to the penetration resistances given in tables 1808.2.8.1.5A and 1808.2.8.1.5B may be waived where the following six conditions are satisfied:*
  - 2.1. *The piles bear on, or in, soil of class 2 through class 5.*
  
  - 2.2. *The stratigraphy, as defined by not less than one boring for every 1600 square feet (149 m<sup>2</sup>) of building area, shall be reasonably uniform or divisible into areas of uniform conditions.*
  
  - 2.3. *Regardless of pile type or capacity, one load test, as described in Section 1808.2.8.1.5.3, shall be conducted in each area of uniform conditions, but not less than two typical piles for the entire foundation installation of the building or group of buildings on the site, nor less than one pile for every 15,000 square feet (1394 m<sup>2</sup>) of pile foundation area shall be load tested.*
  
  - 2.4. *Except as permitted by the provisions of paragraph 6 below, all building piles within the area of influence of a given load-tested pile of satisfactory performance shall be installed to the same or greater driving resistance as the successful load-tested pile. The same or heavier equipment of the same type that was used to install the load-tested pile*

*shall be used to install all other building piles, and the equipment shall be operated identically. Also, all other piles shall be of the same type, shape, external dimension, and equal or greater cross-section as the load-tested pile. All building piles within the area of influence represented by a given satisfactory load-tested pile shall bear in, or on the same bearing stratum as the load test pile.*

*2.5. A report by an engineer shall be submitted to the commissioner for review and approval establishing that the soil bearing pressures do not exceed the values permitted by Table 1804.1 and that the probable differential settlements will not cause stress conditions in the building in excess of those permitted by the provisions of this code.*

*2.6. Where the structure of the building or the spacing and length of the piling is such as to cause the building and its foundation to act as an essentially rigid body, the building piles may be driven to length and/or penetration into the bearing stratum without regard to penetration resistance, subject to the requirement of paragraph 5 above, relating to the submission and approval of a report.*

***1808.2.8.1.5.2 Piles installed by jacking or other static forces.*** *The carrying capacity of a pile installed by jacking or other static forces shall be not more than 50 percent of the load or force used to install the pile to the required penetration, except for piles jacked into position for underpinning. The working load of each permanent underpinning pile shall not exceed the larger of the following values: two-thirds of the total jacking force used to obtain the required penetration if the load is held constant for seven hours without measurable settlement; or one-half of the total jacking force at final penetration if the load is held for a period of one hour without measurable settlement. The jacking resistance used to determine the working load shall not include the resistance offered by non-bearing materials which will be dissipated with time.*

***1808.2.8.1.5.3 Piles installed by use of vibratory hammer.*** *The capacity of piles installed by vibratory hammer shall not exceed the value established on the principle of similitude, as follows:*

- 1. Comparison piles, as required by the provisions of Item 4 below, shall be installed using an impact hammer and driving resistances corresponding to the*

*proposed pile capacities as determined in paragraph (c) below or to tip elevations and driving resistances as determined by the engineer.*

- 2. For each comparison pile, an identical index pile shall be installed by use of the vibratory hammer at a location at least 4 feet (1219 mm), but not more than 6 feet (1829 mm), from each comparison pile. The index piles shall be installed to the same tip elevation as the comparison pile, except that where the comparison piles bear on rock, the index piles shall bear in or on similar material. All driving data for the index pile shall be recorded.*
- 3. The index piles shall be load tested in accordance with the provisions of Item 4 of this section. Should the specified load test criteria indicate inadequate capacity of the index piles, steps a, b, and c shall be repeated using longer, larger, or other types of piles.*
- 4. All building piles within the area of influence of a given, satisfactorily tested index pile shall be installed to the same or lesser rate of penetration (inches per minute [mm per minute]) as the successful index pile. The same equipment that was used to install the index pile, identically operated in all aspects, shall be used to install the building piles. All building piles shall be of the same type size and shape as the index pile. All building piles within the area of influence as represented by a given satisfactorily tested index pile shall bear in, or on, the same bearing stratum as the index pile.*

**1808.2.8.2 Driving criteria.** *The allowable compressive load on steel and concrete piles, where determined solely by the application of an approved wave equation analyses, shall not exceed 40 tons (356 kN). The allowable compressive loads on timber piles, where determined solely by the wave equation analysis shall not exceed 30 tons. For allowable loads greater than these values, the wave equation method of analysis may be used to establish initial driving criteria, but final driving criteria and the allowable load shall be verified by load tests. The delivered energy of the hammer to be used shall be the maximum consistent with the size, strength and weight of the driven piles. The use of a follower is permitted only with the approval of the engineer of record. The introduction of fresh hammer cushion or pile cushion material just prior to final penetration is not permitted.*

**1808.2.8.3 Load tests.** *Where design compressive loads per pier or pile are greater than 40 tons, (30 tons for timber piles) or where drilled or jacked piles are not installed in Class 1.a, 1.b or 1.c*

material, or where final penetration is by a vibratory hammer, or where the design load for any pier or pile foundation is in doubt, piers or piles shall be load tested in accordance with this section. At least one pier or pile shall be test loaded in each area of uniform subsoil conditions.

**1808.2.8.3.1 Load test evaluation.** It shall be permitted to evaluate pile load tests with any of the following methods:

1. *Davisson Offset Limit.*
2. *Brinch-Hansen 90 percent Criterion.*
3. *Chin-Konder Extrapolation.*
4. *Other methods approved by the commissioner.*

**1808.2.8.3.1.1 Additional load tests.** Where required by the commissioner, additional piers or piles shall be load tested where necessary to establish the allowable capacity. The load capacity shall be determined by an engineer in accordance with 1808.2.8.3. For friction piles where the actual production pile lengths vary more than twenty five per cent from that of the test pile, the engineer shall require an investigation to determine the adequacy of the piles.

**1808.2.8.3.1.2 Load test requirements.** Before any load test is made, the proposed apparatus and structure to be used in making the load test shall be satisfactory to the commissioner. The test shall be made under the responsible engineer's surveillance. A complete record of such tests shall be filed with the commissioner. Areas of the foundation site within which the subsurface soil conditions are substantially similar in character shall be established by the engineer. For piles installed by impact hammer, one load test shall be conducted in each area of substantially similar conditions, but not less than one typical pile for the entire foundation installation of the building or group of buildings on the site occupying a total area of 5,000 square feet (465 m<sup>2</sup>) or less; and not less than two load tests for a site having a footprint between 5,000 (465 m<sup>2</sup>) and 30,000 (2787 m<sup>2</sup>) square feet and one additional load test for each 20,000 (1860 m<sup>2</sup>) square feet of added footprint area.

**1808.2.8.3.1.3 Load test procedures.** Load tests shall be conducted in accordance with ASTM D 1143 standard procedures and the following conditions:

1. *Dial extensometer gages shall provide readings to the nearest 0.001 inch (0.025 mm) Electrical transducers may be used to make settlement observations provided that backup measurements are made utilizing dial extensometers as described herein at sufficient times to validate the transducer readings. The total test load shall remain in place until the rate of settlement does not exceed 0.012 inches (0.305 mm) over a time period of twelve hours. The total load shall be removed in decrements not exceeding twenty five per cent of the total load at one hour intervals or longer. In addition to observations required by ASTM D 1143, settlement observations shall be performed at one-half minute, one minute, two minute and four minute intervals after application of each load increment, and twenty four hours after the entire test load has been removed.*
2. *Any temporary supporting capacity that the soil might provide to the pile during a load test, but which would be dissipated with time, shall be eliminated by casing off or by other suitable means, such as increasing the total test load to account for such temporary capacity.*

**1808.2.8.3.1.4 Alternative test methods.** *Load test methods other than those described in Section 1808.2.8.3 may be used subject to the approval of the commissioner where three or more load tests are required. In such case, at least one alternative test shall be performed as a calibration on a static load tested pile or nearby pile driven to comparable resistance. No more than one half the required number of load tests may be performed by alternative methods. Alternative tests shall be performed under the supervision of an engineer experienced in the methods used. The number of alternative tests shall be at least twice the number of replaced static load tests.*

**1808.2.8.3.1.5 Acceptance criteria.** *The allowable pile load shall be the lesser of the two values computed as follows:*

1. *Fifty percent of the applied load causing a net settlement of the pile of not more than one  $\frac{1}{100}$  of an inch per ton (0.25 mm per 8.9 kN) of applied load. Net settlement in this paragraph is defined as gross settlement due to the total test load minus the rebound after removing one hundred per cent of the test load.*
2. *Fifty percent of the applied load causing a net settlement of the pile of  $\frac{3}{4}$  of an inch (19 mm). Net settlement in this paragraph is defined as the gross settlement*

*due to the total test load less the amount of elastic shortening in the pile section due to total test load. The elastic shortening shall be calculated as if the pile is designed as an end-bearing pile or as a friction pile. Alternatively, the net settlement may be measured directly using a telltale or other suitable instrumentation.*

**1808.2.8.3.1.6 Substantiation of higher allowable loads.** *The pile capacities tabulated in Table 1808.2.8.1.3 may be exceeded where a higher value can be substantiated on the basis of load tests and analysis. The provisions of paragraphs 1808.2.8.3.1.2 and 1808.2.8.3.1.3 shall be supplemented, as follows:*

*The final load increment shall remain in place for a total of not less than twenty-four hours; single test piles shall be subjected to cyclical loading or suitably instrumented with telltales and strain gauges so that the movements of the pile tip and butt may be independently determined and load transfer to the soil evaluated. A complete record demonstrating satisfactory performance of the test shall be submitted to the commissioner.*

**1808.2.8.4 Allowable frictional resistance.** *The assumed frictional resistance developed by any pier or uncased cast-in-place pile shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1804.1, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the commissioner after a soil investigation as specified in Section 1802 is submitted. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless recommended by a soil investigation as specified in Section 1802.*

**1808.2.8.5 Uplift capacity.** *Where required by the design, the uplift capacity of a single pier or pile shall be determined in accordance with accepted engineering practice based on a minimum factor of safety of three or by uplift load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity divided by a factor of safety of two. The design uplift capacities of a pile group shall not exceed the sum of the design uplift capacities of the individual piles in the group, nor the uplift capacity calculating the group action of the pile in accordance with accepted engineering practice where the calculated ultimate group capacity is divided by a safety factor of 2.5.*

**1808.2.8.6 Load-bearing capacity.** *Piers, individual piles and groups of piles shall develop ultimate load capacities of at least twice the design working loads in the designated load-bearing layers. Analysis shall show that no soil layer underlying the designated load-bearing layers*

*causes the load-bearing capacity safety factor to be less than two and that settlements of strata within the influence of the pile groups and the average area load of the supported structure are tolerable for the structure.*

**1808.2.8.7 Bent piers or piles.** *The load-bearing capacity of piers or piles discovered to have a sharp or sweeping bend shall be determined by an approved method of analysis in accordance with accepted engineering practice or by load testing a representative pier or pile.*

**1808.2.8.8 Overloads on piers or piles.** *The maximum compressive load on any pier or pile due to mislocation shall not exceed 110 percent of the allowable design load. If the total load on any pile, so determined, is in excess of one hundred ten percent of the allowable load bearing capacity, correction shall be made by installing additional piles or by other methods of load distribution as required to reduce the maximum pile load to one hundred ten percent of the capacity.*

**1808.2.8.9 More than one pile type, pile capacity, or method of pile installation.** *In the conditions described below, the several parts of the building supported on the different types, capacities, or modes of piling shall be separated by suitable joints providing for differential movement, or analysis shall be prepared by the engineer, establishing to the satisfaction of the commissioner that the proposed construction is adequate and safe, and showing that the probable settlements and differential settlements to be expected will be tolerable to the structure and not result in instability of the building. The load test requirements of 1808.2.8.3 shall apply separately and distinctly to each different type or capacity of piling, method of installation, or type or capacity of equipment used, except where analysis of the probable, comparative behavior of the different types or capacities of the piles or the methods of installation indicates that data on one type or capacity of pile permit a reliable extrapolation of the probable behavior of the piles of other types and capacities. The requirements of this section apply to the following proposed conditions:*

- 1. Construction of a foundation for a building utilizing piles of more than one type or capacity; or*
- 2. Modification of an existing foundation by the addition of piles of a type or capacity other than those of the existing piling; or*
- 3. Construction or modification of a foundation utilizing different methods or more than one method of installation, or using different types or capacities of equipment (such as different types of hammers having markedly different*

*striking energies or speeds); or*

4. *Support of part of a building on piles and part on footings.*

#### **1808.2.9 Lateral support.**

**1808.2.9.1 General.** *Any soil other than fluid soil shall be deemed to afford sufficient lateral support to the pier or pile to prevent buckling and to permit the design of the pier or pile in accordance with accepted engineering practice and the applicable provisions of this code.*

**1808.2.9.2 Unbraced piles.** *Piles standing unbraced in air, water or in fluid soils shall be designed as columns in accordance with the provisions of this code. Such piles driven into firm ground can be considered fixed and laterally supported at 5 feet (1524 mm) below the ground surface and in soft material at 10 feet (3048 mm) below the ground surface unless otherwise prescribed by the engineer.*

**1808.2.9.3 Allowable lateral load.** *Where required by the design, the lateral load capacity of a pier, a single pile or a pile group shall be determined by an approved method of analysis in accordance with accepted engineering practice or by lateral load tests in accordance with ASTM D 3966 to at least twice the proposed design working load. The resulting allowable load shall not be more than one-half of that test load that produces a gross lateral movement of 1 inch (25mm) at the ground surface.*

*In the absence of specific project requirements as determined by the engineer, the resulting allowable load shall not be more than one-half of that test load that produces a gross lateral movement of 1 inch (25 mm) at the ground surface. The maximum allowable lateral load of a pile shall be 1 ton (8.9 kN), unless verified by load test. Lateral capacities for pile groups shall be modified to account for group effects in accordance with accepted engineering practice.*

**1808.2.10 Allowable stresses in piles and use of higher allowable pier or pile stresses.** *Allowable stresses for designing piles shall be as specified in Section 1809, 1810, and 1811. Allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are permitted where supporting data justifying such higher stresses are filed and approved by the commissioner. Such substantiating data shall include:*

1. *A soils investigation in accordance with Section 1802.*

2. *Pier or pile load tests in accordance with Section 1808.2.8.3, regardless of the load supported by the pier or pile. The design and installation of the pier or pile foundation shall be under the direct supervision of an engineer knowledgeable in the field of soil mechanics and pier or pile foundations who shall certify to the commissioner that the piers or piles as installed satisfy the design criteria.*

**1808.2.11 Piles in subsiding areas.** *Where piles are driven through subsiding fills or other subsiding strata and derive support from underlying firmer materials, consideration shall be given to the downward frictional forces that may be imposed on the piles by the subsiding upper strata.*

**1808.2.12 Settlement analysis.** *The settlement of piers, individual piles or groups of piles shall be estimated based on approved methods of analysis. The predicted settlement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any stresses to exceed allowable values.*

**1808.2.13 Preexcavation.** *The use of jetting, augering or other methods of preexcavation shall be subject to the approval of the commissioner. Where permitted, preexcavation shall be carried out in the same manner as used for piers or piles subject to load tests and in such a manner that will not impair the carrying capacity of the piers or piles already in place or damage adjacent structures. Pile tips shall be driven below the preexcavated depth until the required resistance or penetration is obtained.*

**1808.2.14 Installation sequence.** *Piles shall be installed in such sequence so as to avoid compacting the surrounding soil to the extent that other piles cannot be installed properly, and to prevent ground movements that are capable of damaging adjacent structures.*

**1808.2.14.1 Protection of adjacent property.** *Piles and piers shall be installed with adequate provision for the protection of adjacent buildings and property.*

**1808.2.15 Use of vibratory drivers.** *Vibratory drivers shall only be used to install piles where the pile is subsequently seated by an impact hammer to the final driving criteria established in accordance with Section 1808.2.8.2.*

**1808.2.16 Pile driveability.** *Pile cross sections shall be of sufficient size and strength to withstand driving stresses without damage to the pile, and to provide sufficient stiffness to transmit the required driving forces.*

**1808.2.17 Protection of pile materials.** *Where boring records or site conditions indicate possible*

*deleterious action on pier or pile materials because of soil constituents, changing water levels or other factors, the pier or pile materials shall be adequately protected by materials, methods or processes approved by the engineer. Protective materials shall be applied to the piles so as not to be rendered ineffective by driving. The effectiveness of such protective measures for the particular purpose shall have been thoroughly established by satisfactory service records or other evidence. The following specific provisions shall apply:*

- 1. Untreated timber piles shall not be used unless the top level of the pile is below the permanent water table. The permanent water table level shall not be assumed higher than the invert level of sewer, drain, or subsurface structure in the adjacent streets, nor higher than the water level at the site resulting from the lowest drawdown of wells or sumps, but in no case shall untreated timber piles be used where the cut-off level is less than 10 feet (3048 mm) below the adjacent legal grade. Where treated piles are required, preservative treatment shall consist of impregnation with creosote or a creosote solution or CCA treatment. For piles entirely embedded below grade, a pentachlorophenol solution may be used. Treatment shall be in accordance with all requirements of the AWWA standards and as specified in Section 1809.1.2.*
- 2. Piles installed in ash or garbage fills, cinder fills, and piles that are free-standing in or near a seawater environment, or that are used for the support of chemical plants, coal piles and piles under similar conditions of chemical seepage or aggressive action, or that are used for support of electrical generating plants, shall be investigated regarding the need for special protective treatment. Where special protective treatment is indicated by the engineer, such piles shall be protected against deterioration by encasement, coating, or other device acceptable to the engineer.*

***1808.2.17.1 Protection of piles during installation.*** *Piling shall be handled and installed to the required penetration and resistance by methods that leave the piles' strength unimpaired and that develop and retain their required load bearing resistance. Any damaged pile shall be satisfactorily repaired or the pile shall be rejected. As an alternative and subject to the approval by the commissioner, damaged or misaligned piles or piles not reaching design tip elevation may be used at a reduced fraction of the design load based on an analysis by the engineer.*

***1808.2.17.2 Equipment.*** *Equipment and methods of installation shall be such that piles are installed in their proper position and alignment, without damage. Equipment shall be maintained*

*in good working order. The pile-driving hammer shall travel freely in the leads. The hammer shall deliver its rated energy and measurements shall be made of the fall of the ram or other suitable data shall be obtained at intervals necessary to verify the actual energy delivered during the final twenty blows of the hammer.*

**1808.2.17.3 Cushion or cap block.** *The cushion or cap block shall be a solid block of hardwood with its grains parallel to the axis of the pile and enclosed in a tight-fitting steel housing, or other accepted equivalent assembly. If laminated materials are used, their type and construction shall be such that their strength is equal to or greater than hardwood. Wood chips, pieces of rope, hose, shavings, automobile tires or similar materials shall not be used. Cap block cushions shall be replaced if burned, crushed, or otherwise damaged. Other cushion materials may be used subject to the approval of the engineer.*

**1808.2.17.4 Followers.** *Followers shall not be used unless permitted in writing by the engineer responsible for the pile driving operation. The required driving resistance shall account for the losses of driving energy transmitted to the pile because of the follower. The follower shall be a single length section, shall be provided with a socket or hood carefully fitted to the top of the pile to minimize loss of energy and to prevent damage to the pile, and shall have sufficient rigidity to prevent “whip” during driving.*

**1808.2.18 Use of existing piers or piles.** *Piers or piles left in place where a structure has been demolished shall not be used for the support of new construction unless the piles are load tested, original installation and testing records are available, or the new loads are no more than half the calculated previous loads on the piles. The engineer shall determine and certify that the piers or piles are sound and meet the requirements of this code. The design load applied to such piers or piles shall be the lowest allowable load as determined by tests, redriving data or calculations.*

**1808.2.19 Heaved piles.** *Piles that have heaved during the driving of adjacent piles shall be redriven as necessary to develop the required capacity and penetration, or the capacity of the pile shall be verified by load tests in accordance with Section 1808.2.8.3.*

**1808.2.20 Identification.** *All pier or pile materials shipped or delivered to the job site shall be identified for conformity to the specified grade and this identification shall be maintained continuously from the point of manufacture to the point of installation. Such shipment or delivery shall be accompanied by a certification from the material supplier or manufacturer indicating conformance with the construction documents. Such certification shall be made available to the engineer of record and the department. In the absence of adequate data, pier or pile materials shall be tested by an*

approved agency to determine conformity to the specified grade. The approved agency shall furnish a certification of compliance to the engineer of record, or upon request to the commissioner.

**1808.2.21 Pier or pile location plan.** A plan showing the location and designation of piers or piles by an identification system shall be filed with the commissioner prior to installation of such piers or piles. Detailed records for piers or individual piles shall bear an identification corresponding to that shown on the plan.

**1808.2.21.1 Tolerance in alignment of the pile axis.** If the axis of any pile is installed out of plumb or deviates from the specified batter by more than four percent of the pile length, the design of the foundation shall be modified to resist the resulting vertical and lateral forces. In types of piles for which subsurface inspection is not possible, this determination shall be made on the exposed section of the pile, which section, at the time of checking axial alignment, shall not be less than 2 feet (610 mm) in length. In piles that can be checked for axial alignment below the ground surface, the sweep of the pile axis shall not exceed four percent of the embedded length.

**1808.2.21.2 Tolerance in the location of the head of the pile.** A tolerance of 3 inches (76 mm) from the designed location shall be permitted in the installation of each pile, without reduction in load capacity of the pile group. Where piles are installed out of position in excess of this amount, the true loading on such piles shall be analytically determined from a survey that defines the actual location of the piles as driven, and using the actual eccentricity in the pile group with respect to the line of action of the applied load.

**1808.2.22 Special inspection.** Special inspections in accordance with Sections 1704.8 and 1704.9 shall be provided for piles and piers, respectively.

**1808.2.23 Seismic design of piers or piles.** Seismic design of piers and piles shall be done in accordance with Section 1808.2.23.1 through 1808.2.23.2.

**1808.2.23.1 Seismic design category C.** Where a structure is assigned to Seismic Design Category C in accordance with Section 1616, individual pile caps, piers or piles shall be interconnected by ties. Ties shall be capable of carrying, in tension and compression, a force equal to the product of the larger pile cap or column load times the seismic coefficient,  $S_{DS}$ , divided by 10 unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils.

**Exception:** *Piers supporting foundation walls, isolated interior posts detailed so the pier is not subject to lateral loads, and lightly loaded exterior decks and patios of Group R-3 and U occupancies not exceeding two stories of light-frame construction, are not subject to interconnection if it can be shown that the soils are of adequate stiffness, subject to the approval of the commissioner.*

**1808.2.23.1.1 Connection to pile cap.** *Concrete piles and concrete-filled steel pipe piles shall be connected to the pile cap by embedding the pile reinforcement or field-placed dowels anchored in the concrete pile and the pile cap for a distance equal to the development length. For deformed bars, the development length is the full development length for compression or tension, in the case of uplift, without reduction in length for excess area. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the pile are permitted provided the design is such that any hinging occurs in the confined region.*

*Ends of hoops, spirals and ties shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318, turned into the confined concrete core. The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.*

*For resistance to uplift forces, anchorage of steel pipe (round HSS sections), concrete-filled steel pipe or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section.*

**Exception:** *Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile.*

*Splices of pile segments shall develop the full strength of the pile, but the splice need not develop the nominal strength of the pile in tension, shear and bending when it has been designed to resist axial and shear forces and moments from the load combinations of Section 1605.4.*

**1808.2.23.1.2 Design details.** *Pier or pile moments, shears and lateral deflections used for design shall be established considering the nonlinear interaction of the shaft and soil, as recommended by the engineer. Where the ratio of the depth of embedment of the pile-to-pile diameter or width is less than or equal to six, the pile may be assumed to be rigid.*

*Pile group effects from soil on lateral pile nominal strength shall be included where pile*

*center-to-center spacing in the direction of lateral force is less than eight pile diameters. Pile group effects on vertical nominal strength shall be included where pile center-to-center spacing is less than three pile diameters. The pile uplift soil nominal strength shall be taken as the pile uplift strength as limited by the frictional force developed between the soil and the pile.*

*Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of the pier or pile, provisions shall be made so that those specified lengths or extents are maintained after pier or pile cutoff.*

**1808.2.23.2 Seismic design category D.** *Where a structure is assigned to Seismic Design Category D in accordance with Section 1616, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met. Provisions of ACI 318, Section 21.10.4, shall also apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.*

**Exceptions:**

- 1. Group R or U occupancies of light-framed construction and two stories or less in height are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.*
- 2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.*
- 3. Section 21.10.4.4(a) of ACI 318 shall not apply to concrete piles.*

**1808.2.23.2.1 Design details for piers, piles and grade beams.** *Piers or piles shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile-structure interaction coupled with pier or pile deformations induced by lateral pier or pile resistance to structure seismic forces. Concrete piers or piles on Site Class E or F sites, as determined in Section 1615.1.1, shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and the interfaces of soft to medium stiff clay or liquefiable strata. For precast prestressed concrete piles, detailing provisions as given in Sections 1809.2.3.2.1 and 1809.2.3.2.2 shall*

apply.

*Grade beams shall be designed as beams in accordance with ACI 318, Chapter 21. When grade beams have the capacity to resist the forces from the load combinations in Section 1605.4, they need not conform to ACI 318, Chapter 21.*

**1808.2.23.2.2 Connection to pile cap.** *For piles required to resist uplift forces or provide rotational restraint, design of anchorage of piles into the pile cap shall be provided considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop a minimum of 25 percent of the strength of the pile in tension. Anchorage into the pile cap shall be capable of developing the following:*

- 1. In the case of uplift, the lesser of the nominal tensile strength of the longitudinal reinforcement in a concrete pile, or the nominal tensile strength of a steel pile, or the pile uplift soil nominal strength factored by 1.3 or the axial tension force resulting from the load combinations of Section 1605.4.*
- 2. In the case of rotational restraint, the lesser of the axial and shear forces, and moments resulting from the load combinations of Section 1605.4 or development of the full axial, bending and shear nominal strength of the pile.*

**1808.2.23.2.3 Flexural strength.** *Where the vertical, lateral-force-resisting elements are columns, the grade beam or pile cap flexural strengths shall exceed the column flexural strength.*

*The connection between batter piles and grade beams or pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connections shall be capable of resisting forces and moments from the load combinations of Section 1605.4.*

## **SECTION BC 1809 DRIVEN PILE FOUNDATIONS**

**1809.1 Timber piles.** *Timber piles shall be designed in accordance with the AF & PA NDS.*

**1809.1.1 Materials.** *Round timber piles shall conform to ASTM D 25. Sawn timber piles shall conform to DOC PS-20.*

**1809.1.2 Preservative treatment.** *Timber piles used to support permanent structures shall be treated in accordance with this section unless it is established that the tops of the untreated timber piles will be below the lowest ground-water level assumed to exist during the life of the structure as specified in Section 1808.2.17. Preservative and minimum final retention shall be in accordance with AWP A C3 for round timber piles and AWP A C24 for sawn timber piles. Preservative-treated timber piles shall be subject to a quality control program administered by an approved agency. Pile cutoffs shall be treated in accordance with AWP A M4.*

**1809.1.3 End-supported piles.** *Any sudden decrease in driving resistance of an end-supported timber pile shall be investigated with regard to the possibility of damage. If the sudden decrease in driving resistance cannot be correlated to load-bearing data, the pile shall be removed for inspection or rejected.*

**1809.1.4 Sizes of piles.** *Piles shall be of adequate size to resist the applied loads without creating stresses in the pile material in excess of twelve hundred psi (8.27 MPa) for piles of southern pine, Douglas fir, oak, or other wood of comparable strength; or eight hundred psi (5.52 MPa) for piles of cedar, Norway pine, spruce or other wood of comparable strength. Piles of twenty-five tons (222.5 kN) capacity or more shall have a minimum 8-inch tip (203 mm) with uniform taper. Piles of less than 25 tons (222.5 kN) capacity shall have a minimum 6-inch (152 mm) tip with uniform taper. All piles, regardless of capacity, driven to end bearing on bedrock of classes 1a to 1d and compact gravels and sands of class 2a shall have a minimum 8-inch (203 mm) tip and a uniform taper. Any species of wood may be used that conforms to ASTM D 25 and that will stand the driving stresses.*

**1809.1.5 Lagged or inverted piles.** *The use of lagged or inverted piles is permitted. Double lagging shall be adequately connected to the basic pile material to transfer the full pile load from the basic pile material to the lagging without exceeding values of allowable stress as established in Chapter 23. The connection for single lagging shall be proportioned for half the pile load. The diameter of any inverted pile at any section shall be adequate to resist the applied load without exceeding the stresses specified in Section 1809.1.4, but in no case shall it be less than 8 inches (203 mm).*

## **1809.2 Precast concrete piles.**

**1809.2.1 General.** *The materials, reinforcement and installation of precast concrete piles shall conform to Sections 1809.2.1.1 through 1809.2.1.4.*

**1809.2.1.1 Design and manufacture.** *Piles shall be designed and manufactured in accordance*

with accepted engineering practice to resist all stresses induced by handling, driving and service loads.

**1809.2.1.2 Minimum dimension.** The minimum lateral dimension shall be 8 inches (203 mm). Corners of square piles shall be chamfered.

**1809.2.1.3 Reinforcement.** Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced not more than 4 inches (102 mm) apart, center to center, for a distance of 2 feet (610 mm) from the ends of the pile; and not more than 6 inches (152 mm) elsewhere except that at the ends of each pile, the first five ties or spirals shall be spaced 1 inch (25mm) center to center. The gage of ties and spirals shall be as follows:

1. For piles having a diameter of 16 inches (406 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage).
2. For piles having a diameter of more than 16 inches (406 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage).
3. For piles having a diameter of 20 inches (508 mm) and larger, wire shall not be smaller than ¼ inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage).

**1809.2.1.4 Installation.** Piles shall be handled and driven so as not to cause injury or overstressing in a manner that affects durability or strength.

**1809.2.2 Precast nonprestressed piles.** Precast nonprestressed concrete piles shall conform to Sections 1809.2.2.1 through 1809.2.2.5.

**1809.2.2.1 Materials.** Concrete shall have a 28-day specified compressive strength ( $f'_c$ ) of not less than 3,000 psi (20.68 MPa).

**1809.2.2.2 Minimum reinforcement.** The minimum amount of longitudinal reinforcement shall be 0.8 percent of the concrete section and shall consist of at least four bars.

**1809.2.2.2.1 Seismic reinforcement in seismic design category C.** Where a structure is assigned to Seismic Design Category C in accordance with Section 1616, longitudinal reinforcement with a minimum steel ratio of 0.01 shall be provided throughout the length of precast concrete piles. Within three pile diameters of the bottom of the pile cap, the

*longitudinal reinforcement shall be confined with closed ties or spirals of a minimum 3/8-inch (9.5 mm) diameter. Ties or spirals shall be provided at a maximum spacing of eight times the diameter of the smallest longitudinal bar, not to exceed 6 inches (152 mm). Throughout the remainder of the pile, the closed ties or spirals shall have a maximum spacing of 16 times the smallest longitudinal-bar diameter, not to exceed 8 inches (203 mm).*

**1809.2.2.2.2 Seismic reinforcement in seismic design category D.** *Where a structure is assigned to Seismic Design Category D in accordance with Section 1616, the requirements for Seismic Design Category C in Section 1809.2.2.2.1 shall apply except as modified by this section. Transverse confinement reinforcement consisting of closed ties or equivalent spirals shall be provided in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three pile diameters of the bottom of the pile cap. For other than Site Class E or F, or liquefiable sites and where spirals are used as the transverse reinforcement, it shall be permitted to use a volumetric ratio of spiral reinforcement of not less than one-half that required by Section 21.4.4.1(a) of ACI 318.*

**1809.2.2.3 Allowable stresses.** *The allowable compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength ( $f'_c$ ) applied to the gross cross-sectional area of the pile. The allowable compressive stress in the reinforcing steel shall not exceed 40 percent of the yield strength of the steel ( $f_y$ ) or a maximum of 30,000 psi (207 MPa). The allowable tensile stress in the reinforcing steel shall not exceed 50 percent of the yield strength of the steel ( $f_y$ ) or a maximum of 24,000 psi (165 MPa).*

**1809.2.2.4 Installation.** *A precast concrete pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength ( $f'_c$ ), but not less than the strength sufficient to withstand handling and driving forces.*

**1809.2.2.5 Concrete cover.** *Reinforcement for piles that are not manufactured under plant conditions shall have a concrete cover of not less than 2 inches (51 mm). Reinforcement for piles manufactured under plant control conditions shall have a concrete cover of not less than 1 1/4 inches (32 mm) for No. 5 bars and smaller, and not less than 1 1/2 inches (38 mm) for No. 6 through No. 11 bars except that longitudinal bars spaced less than 1 1/2 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars. Reinforcement for piles exposed to seawater shall have a concrete cover of not less than 3 inches (76 mm).*

**1809.2.3 Precast prestressed piles.** *Precast prestressed concrete piles shall conform to the*

requirements of Sections 1809.2.3.1 through 1809.2.3.5.

**1809.2.3.1 Materials.** *Prestressing steel shall conform to ASTM A 416. Concrete shall have a 28-day specified compressive strength ( $f'_c$ ) of not less than 5,000 psi (34.48 MPa).*

**1809.2.3.2 Design.** *Precast prestressed piles shall be designed to resist stresses induced by handling and driving as well as by loads. The effective prestress in the pile shall not be less than 400 psi (2.76MPa) for piles up to 30 feet (9144 mm) in length, 550 psi (3.79MPa) for piles up to 50 feet (15 240 mm) in length and 700 psi (4.83 MPa) for piles greater than 50 feet (15 240 mm) in length. Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.*

**1809.2.3.2.1 Design in seismic design category C.** *Where a structure is assigned to Seismic Design Category C in accordance with Section 1616, the minimum volumetric ratio of spiral reinforcement shall not be less than 0.007 or the amount required by the following formula for the upper 20 feet (6096 mm) of the pile.*

$$\rho_s = 0.12 f'_c / f_{yh} \quad \text{(Equation 18-4)}$$

where:

$f'_c$  = Specified compressive strength of concrete,  
psi (MPa)

$f_{yh}$  = Yield strength of spiral reinforcement  $\leq$   
85,000 psi (586 MPa).

$\rho_s$  = Spiral reinforcement index (vol. spiral/vol.  
core).

---

*At least one-half the volumetric ratio required by Equation 18-4 shall be provided below the upper 20 feet (6096 mm) of the pile.*

*The pile cap connection by means of dowels as indicated in Section 1808.2.23.1 is permitted. Pile cap connection by means of developing pile reinforcing strand is permitted provided that the pile reinforcing strand results in a ductile connection.*

**1809.2.3.2.2 Design in seismic design category D.** *Where a structure is assigned to Seismic Design Category D in accordance with Section 1616, the requirements for Seismic Design Category C in Section 1809.2.3.2.1 shall be met, in addition to the following:*

- 1. Requirements in ACI 318, Chapter 21, do not apply, unless specifically referenced.*
- 2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.*
- 3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand, or 8 inches (203 mm), whichever is smaller.*
- 4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of the spiral to a 90-degree hook or by use of a mechanical or welded splice complying with Sec. 12.14.3 of ACI 318.*
- 5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:*

$$\rho_s = 0.25(f'_c/f_{yh})(A_g/A_{ch} - 1.0)[0.5 + 1.4P/(f'_c A_g)]$$

(Equation 18-5)

but not less than:

$$\rho_s = 0.12(f'_c/f_{yh})[0.5 + 1.4P/(f'_c A_g)]$$

(Equation 18-6)

and need not exceed:

$$\rho_s = 0.021 \quad \text{(Equation 18-7)}$$

where:

$A_g$  = Pile cross-sectional area, square inches  
(mm<sup>2</sup>).

---

6. *When transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacings, and perpendicular to dimension,  $h_v$ , shall conform to:*

$$A_{sh} = 0.3sh_c (f'_c / f_{yh})(A_g / A_{ch} - 1.0)[0.5 + 1.4P / (f'_c A_g)]$$

**(Equation 18-8)**

but not less than:

$$A_{sh} = 0.12sh_c (f'_c / f_{yh})[0.5 + 1.4P / (f'_c A_g)]$$

**(Equation 18-9)**

where:

$f_{yh}$  =  $\leq 70,000$  psi (483 MPa).

$h_c$  = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).

$s$  = Spacing of transverse reinforcement measured along length of pile, inch (mm).

$A_{sh}$  = Cross-sectional area of transverse reinforcement, square inches (mm<sup>2</sup>)

$f'_c$  = Specified compressive strength of concrete, psi (MPa) ■

---

*The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks.*

*Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.*

**1809.2.3.3 Allowable stresses.** *The maximum allowable design compressive stress,  $f_c$ , in concrete shall be determined as follows:*

$$f_c = 0.33 f'_c - 0.27 f_{pc} \quad \text{(Equation 18-10)}$$

---

**1809.2.3.4 Installation.** A prestressed pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength ( $f'_c$ ), but not less than the strength sufficient to withstand handling and driving forces.

**1809.2.3.5 Concrete cover.** Prestressing steel and pile reinforcement shall have a concrete cover of not less than 1 ¼ inches (32 mm) for square piles of 12 inches (305 mm) or smaller size and 1 ½ inches (38 mm) for larger piles, except that for piles exposed to seawater, the minimum protective concrete cover shall not be less than 2 ½ inches (64 mm).

**1809.3 Structural steel piles.** Structural steel piles shall conform to the requirements of Sections 1809.3.1 through 1809.3.4.

**1809.3.1 Materials.** Structural steel piles, steel pipe and fully welded steel piles fabricated from plates shall conform to ASTM A36, ASTM A252, ASTM A283, ASTM A572, ASTM A 588 or ASTM A 913.

**1809.3.2 Allowable stresses.** The allowable axial stresses shall not exceed 35 percent of the minimum specified yield strength ( $F_y$ ).

**Exception:** Where justified in accordance with Section 1808.2.10.1, the allowable axial stress is permitted to be increased above  $0.35F_y$ , but shall not exceed  $0.5F_y$ .

**1809.3.3 Dimensions of H-piles.** Sections of H-piles shall comply with the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall not be less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of  $\frac{3}{8}$  inch (9.5 mm).

**1809.3.4 Dimensions of steel pipe piles.** Steel pipe piles driven open ended shall have a nominal outside diameter of not less than 8 inches (203 mm). The pipe shall have a minimum of 0.34 square inch (219 mm<sup>2</sup>) of steel in cross section to resist each 1,000 foot-pounds (1356 N×m) of pile hammer energy or the equivalent strength for steels having a yield strength greater than 35,000 psi (241 MPa). Where pipe wall thickness less than 0.188 inch (4.8 mm) is driven open ended, a suitable cutting shoe

shall be provided.

**SECTION 1810**  
**CAST-IN-PLACE CONCRETE PILE FOUNDATIONS**

**1810.1 General.** *The materials, reinforcement and installation of cast-in-place concrete piles shall conform to Sections 1810.1.1 through 1810.1.3.*

**1810.1.1 Materials.** *Concrete shall have a 28-day specified compressive strength ( $f'_c$ ) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pile, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.*

**1810.1.2 Reinforcement.** *Except for steel dowels embedded 5 feet (1524 mm) or less in the pile, reinforcement where required shall be placed in accordance with Section 1810.3.4 and shall be assembled and tied together and placed in the pile as a unit before the reinforced portion of the pile is filled with concrete except in augered uncased cast-in-place piles. Tied reinforcement in augered uncased cast-in-place piles shall be placed after piles are filled, while the grout is still in a semifluid state.*

**1810.1.2.1 Reinforcement in seismic design category C.** *Where a structure is assigned to Seismic Design Category C in accordance with Section 1616, a minimum longitudinal reinforcement ratio of 0.0025 shall be provided for uncased cast-in-place concrete drilled or augered piles, piers or caissons in the top one-third of the pile length, a minimum length of 10 feet (3048 mm) below the ground or that required by analysis, whichever length is greatest. The minimum reinforcement ratio, but no less than that ratio required by rational analysis, shall be continued throughout the flexural length of the pile. There shall be a minimum of four longitudinal bars with closed ties (or equivalent spirals) of a minimum  $\frac{3}{8}$ -inch (9 mm) diameter provided at 16-longitudinal-bar diameter maximum spacing. Transverse confinement reinforcing with a maximum spacing of the lesser of 6 inches (152 mm) or 8-longitudinal-bar diameters shall be provided within a distance equal to three times the least pile dimension of the bottom of the pile cap.*

**1810.1.2.2 Reinforcement in seismic design category D.** *Where a structure is assigned to Seismic Design Category D in accordance with Section 1616, the requirements for Seismic Design Category C given above shall be met. In addition, a minimum longitudinal reinforcement ratio of 0.005 shall be provided for uncased cast-in-place drilled or augered concrete piles, piers or*

caissons in the top one-half of the pile length, a minimum length of 10 feet (3048 mm) below ground or throughout the flexural length of the pile, whichever length is greatest. The flexural length shall be taken as the length of the pile to a point where the concrete section cracking moment strength multiplied by 0.4 exceeds the required moment strength at that point. There shall be a minimum of four longitudinal bars with transverse confinement reinforcing provided in the pile in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three times the least pile dimension of the bottom of the pile cap. Use of a transverse spiral reinforcing ratio of not less than one-half of that required in Section 21.4.4.1(a) of ACI 318 for other than Class E, F or liquefiable sites is allowed. Tie spacing throughout the remainder of the concrete section shall not exceed 12-longitudinal-bar diameters, one-half the least dimension of the section, nor 12 inches (305 mm). Ties shall be a minimum of No. 3 bars for piles with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger piles.

**1810.1.3 Concrete placement.** Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pile, the concrete shall not be chuted directly into the pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pile. Grout for auger cast pile shall be pumped through a hollow stem auger and shall be maintained throughout placement.

**1810.2 Enlarged base piles.** Enlarged base piles shall conform to the requirements of Sections 1810.2.1 through 1810.2.5.

**1810.2.1 Materials.** The maximum size for coarse aggregate for concrete shall be  $\frac{3}{4}$  inch (19.1 mm). Concrete to be compacted shall have a zero slump.

**1810.2.2 Allowable stresses.** The maximum allowable design compressive stress for concrete not placed in a permanent steel casing shall be 25 percent of the 28-day specified compressive strength ( $f'_c$ ). Where the concrete is placed in a permanent steel casing, the maximum allowable concrete stress shall be 33 percent of the 28-day specified compressive strength ( $f'_c$ ).

**1810.2.3 Installation.** Enlarged bases formed either by compacting concrete or driving a precast base shall be formed in or driven into granular soils. Piles shall be constructed in the same manner as successful prototype test piles driven for the project. Pile shafts extending through peat or other organic soil shall be encased in a permanent steel casing. Where a cased shaft is used, the shaft shall be adequately reinforced to resist column action or the annular space around the pile shaft shall be filled sufficiently to re-establish lateral support by the soil. Where pile heave occurs, the pile shall be

*replaced unless it is demonstrated that the pile is undamaged and capable of carrying twice its design load.*

**1810.2.4 Load-bearing capacity.** *Pile load-bearing capacity shall be verified by load tests in accordance with Section 1808.2.8.3.*

**1810.2.5 Concrete cover.** *The minimum concrete cover shall be 2 ½ inches (64 mm) for uncased shafts and 1 inch (25 mm) for cased shafts.*

**1810.3 Drilled or augered uncased piles.** *Drilled or augered uncased piles shall conform to Sections 1810.3.1 through 1810.3.5.*

**1810.3.1 Allowable stresses.** *The allowable design stress in the concrete of drilled uncased piles shall not exceed 33 percent of the 28-day specified compressive strength ( $f'_c$ ). The allowable design stress in the concrete of augered cast-in-place piles shall not exceed 25 percent of the 28-day specified compressive strength ( $f'_c$ ). The allowable compressive stress of reinforcement shall not exceed 34 percent of the yield strength of the steel or 25,500 psi (175.8 Mpa).*

**1810.3.2 Dimensions.** *The minimum diameter of drilled or augered uncased piles shall be 12 inches (305 mm).*

**1810.3.3 Installation.** *Where pile shafts are formed through unstable soils and concrete is placed in an open-drilled hole, a steel liner shall be inserted in the hole prior to placing the concrete. Where the steel liner is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the liner at a sufficient height to offset any hydrostatic or lateral soil pressure. Where grout is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. An initial head of grout shall be established and maintained on the auger flights before withdrawal. The auger shall be withdrawn in a continuous manner in increments of about 12 inches (305 mm) each. Grout pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Grout volumes shall be measured to ensure that the volume of grout placed in each pile is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any pile is interrupted or a loss of grout pressure occurs, the pile shall be re-drilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or grout pressure was lost and reformed. Augered cast-in-place piles shall not be installed within six pile diameters center to center of a pile filled with concrete or grout less than 12 hours old, unless approved by the engineer. The level at which return of the grout occurs during withdrawal shall be recorded. If the grout level in any completed pile drops*

during installation of an adjacent pile, the pile shall be replaced. The installation shall be performed under the direct supervision of the engineer. The engineer shall certify to the commissioner that the piles were installed in compliance with the approved construction documents.

**1810.3.4 Reinforcement.** For piles installed with a hollow-stem auger, where full-length longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed through ducts in the auger prior to filling the pile with concrete. All pile reinforcement shall have a concrete cover of not less than 2 ½ inches (64 mm).

**Exception:** Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the piles are completely concreted but while concrete is still in a semifluid state.

**1810.3.5 Reinforcement in seismic design category C or D.** Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1616, the corresponding requirements of Sections 1810.1.2.1 and 1810.1.2.2 shall be met.

**1810.4 Driven uncased piles.** Driven uncased piles shall conform to Sections 1810.4.1 through 1810.4.4.

**1810.4.1 Allowable stresses.** The allowable design stress in the concrete shall not exceed 25 percent of the 28-day specified compressive strength ( $f'_c$ ) applied to a cross-sectional area not greater than the inside area of the drive casing or mandrel.

**1810.4.2 Dimensions.** The minimum diameter of the driven uncased pile shall be 12 inches (305 mm).

**1810.4.3 Installation.** Piles shall not be driven within six pile diameters center to center in granular soils or within one-half the pile length in cohesive soils of a pile filled with concrete less than 48 hours old unless approved by the commissioner. If the concrete surface in any completed pile rises or drops, the pile shall be replaced. Piles shall not be installed in soils that could cause pile heave. The installation shall be performed under the direct supervision of the engineer, who shall certify to the commissioner that the piles were installed in compliance with the approved design

**1810.4.4 Concrete cover.** Pile reinforcement shall have a concrete cover of not less than 2 ½ inches (64 mm), measured from the inside face of the drive casing or mandrel.

**1810.5 Steel-cased piles.** Steel-cased piles shall comply with the requirements of Sections 1810.5.1 through

1810.5.4.

**1810.5.1 Materials.** *Pile shells or casings shall be of steel and shall be sufficiently strong to resist collapse and sufficiently water tight to exclude any foreign materials during the placing of concrete. Steel shells shall have a sealed tip with a diameter of not less than 8 inches (203 mm).*

**1810.5.2 Allowable stresses.** *The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength ( $f'_c$ ). The allowable concrete compressive stress shall be 0.40 ( $f'_c$ ) for that portion of the pile meeting the conditions specified in Sections 1810.5.2.1 through 1810.5.2.4.*

**1810.5.2.1 Shell thickness.** *The thickness of the steel shell shall not be less than manufacturer's standard gage No. 14 gage (0.068 inch) (1.75 mm) minimum.*

**1810.5.2.2 Shell type.** *The shell shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.*

**1810.5.2.3 Strength.** *The ratio of steel yield strength ( $f_y$ ) to 28-day specified compressive strength ( $f'_c$ ) shall not be less than six.*

**1810.5.2.4 Diameter.** *The nominal pile diameter shall not be greater than 16 inches (406 mm).*

**1810.5.3 Installation.** *Steel shells shall be mandrel driven their full length in contact with the surrounding soil. The steel shells shall be driven in such order and with such pacing as to ensure against distortion of or injury to piles already in place. A pile shall not be driven within four and one-half average pile diameters of a pile filled with concrete less than 24 hours old unless approved by the commissioner. Concrete shall not be placed in steel shells within heave range of driving.*

**1810.5.4 Reinforcement.** *Reinforcement shall not be placed within 1 inch (25 mm) of the steel shell. Reinforcing shall be required for unsupported pile lengths or where the pile is designed to resist uplift or unbalanced lateral loads.*

**1810.5.4.1 Seismic reinforcement.** *Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1616, the reinforcement requirements for drilled or augered uncased piles in Section 1810.3.5 shall be met.*

**Exception:** A spiral-welded metal casing of a thickness not less than manufacturer's standard gage No. 14 (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or equivalent spirals required in an uncased concrete pile. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

**1810.6 Concrete-filled steel pipe and tube piles.** Concrete-filled steel pipe and tube piles shall conform to the requirements of Sections 1810.6.1 through 1810.6.5.

**1810.6.1 Materials.** Steel pipe and tube sections used for piles shall conform to ASTM A 252 or ASTM A 283. Concrete shall conform to Section 1810.1.1. The maximum coarse aggregate size shall be  $\frac{3}{4}$  inch (19.1 mm).

**1810.6.2 Allowable stresses.** The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength ( $f'_c$ ). The allowable design compressive stress in the steel shall not exceed 35 percent of the minimum specified yield strength of the steel ( $F_y$ ), provided  $F_y$  shall not be assumed greater than 36,000 psi (248 MPa) for computational purposes.

**Exception:** Where justified in accordance with Section 1808.2.10, the allowable stresses are permitted to be increased to 0.50  $F_y$ .

**1810.6.3 Minimum dimensions.** Piles shall have a nominal outside diameter of not less than 8 inches (203 mm) and a minimum wall thickness in accordance with Section 1809.3.4. For mandrel-driven pipe piles, the minimum wall thickness shall be  $\frac{1}{10}$  inch (2.5 mm).

**1810.6.4 Reinforcement.** Reinforcement steel shall conform to Section 1810.1.2. Reinforcement shall not be placed within 1 inch (25 mm) of the steel casing.

**1810.6.4.1 Seismic reinforcement.** Where a structure is assigned to Seismic Design Category C or D in accordance with Section 1616, minimum reinforcement no less than 0.01 times the cross-sectional area of the pile concrete shall be provided in the top of the pile with a length equal to two times the required cap embedment anchorage into the pile cap, but not less than the tension development length of the reinforcement. The wall thickness of the steel pipe shall not be less than  $\frac{3}{16}$  inch (5 mm).

**1810.6.5 Placing concrete.** The placement of concrete shall conform to Section 1810.1.3.

**1810.7 Caisson piles.** Caisson piles shall conform to the requirements of Sections 1810.7.1 through 1810.7.9.

**1810.7.1 Construction.** Caisson piles shall consist of a shaft section of concrete-filled pipe extending to bedrock with an uncased socket drilled into the bedrock and filled with concrete. The caisson pile shall have a full-length structural steel core or a stub core installed in the rock socket and extending into the pipe portion a distance equal to the socket depth.

**1810.7.2 Materials.** Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of  $\frac{3}{8}$  inch (9.5 mm) and shall be fitted with a suitable steel-driving shoe welded to the bottom of the pipe. Concrete shall have a 28-day specified compressive strength ( $f'_c$ ) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).

**1810.7.3 Design.** The depth of the rock socket shall be sufficient to develop the full load-bearing capacity of the caisson pile with a minimum safety factor of two, but the depth of the socket in class 1c rock or better below the shoe shall not be less than 3 feet of the outside diameter of the pipe. The minimum outside diameter of the caisson pile shall be 7 inches (194 mm), and the diameter of the rock socket shall be approximately equal to the inside diameter of the pile.

**1810.7.4 Structural core.** The gross cross-sectional area of the structural steel core shall not exceed 30 percent of the gross area of the caisson. The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm). Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

**1810.7.5 Allowable stresses.** The allowable design compressive stresses shall not exceed the following: concrete,  $0.33 f'_c$ ; steel pipe,  $0.35 F_y$  and structural steel core,  $0.50 F_y$ .

**1810.7.6 Installation.** The rock socket and pile shall be thoroughly cleaned of foreign materials before filling with concrete. Steel cores shall be set 1 inch above the base of the rock socket. Concrete shall not be placed through water except where a tremie or other method approved by the commissioner is used.

**1810.7.7 Dimensions of caisson piles.** Caisson piles shall consist of concrete pipe piles that are socketed into rock and constructed with steel reinforcement, and in which the socket is observed before the concrete is poured. Steel reinforcement shall be covered with at least  $1\frac{1}{2}$  inches (38 mm) of

concrete. The minimum diameter of caisson piles shall be 7 inches (178 mm). A suitable steel driving shoe shall be welded to the bottom of each caisson pile. The center-to-center spacing of caisson sockets shall be at least two and one-half times the outside diameter of the shell but not less than 4 feet (1219 mm).

**1810.7.8 Inspection.** All rock sockets shall be inspected to verify rock quality. Inspection may be accomplished by direct observation or by video methods or by a core boring performed prior to the drilling of the socket. Load tests performed in accordance with 1808.2.8.3 may be substituted for inspection of rock sockets.

**1810.7.9 Caisson piles in soil.** Caisson piles as described in Sections 1810.7 may be installed in soil provided that the socket is formed entirely in soil of class 4 or better and the concrete is placed under pressure exceeding 1.5 times the existing total overburden pressure. The socket shall be formed by extending the casing to the bottom of the socket and withdrawing the casing while the concrete is being pumped under pressure. Piles shall be installed in accordance with the provisions of Section 1810.3 and 1810.7. For diameters less than 12 inches (305 mm), the casing above the socket shall remain in place permanently. Reinforcing to the socket shall be placed in the casing to the depth of the socket prior to placing concrete.

## **SECTION BC 1811 COMPOSITE PILES**

**1811.1 General.** Composite piles shall conform to the requirements of Sections 1811.2 through 1811.5.

**1811.2 Design.** Composite piles consisting of two or more approved pile types shall be designed to meet the conditions of installation.

**1811.3 Limitation of load.** The maximum allowable load shall be limited by the capacity of the weakest section incorporated in the pile.

**1811.4 Splices.** Splices between concrete and steel or wood sections shall be designed to prevent separation both before and after the concrete portion has set, and to ensure the alignment and transmission of the total pile load. Splices shall be designed to resist uplift caused by upheaval during driving of adjacent piles, and shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section.

**1811.5 Seismic reinforcement.** Where a structure is assigned to Seismic Design Category C or D, in

accordance with Section 1616 and where concrete and steel are used as part of the pile assembly, the concrete reinforcement shall comply with Sections 1810.1.2.1 and 1810.1.2.2 and the steel section shall comply with Section 1809.3.45 or 1810.6.4.1.

**SECTION BC 1812**  
**PIER FOUNDATIONS**

**1812.1 General.** Isolated and multiple piers used as foundations shall conform to the requirements of Sections 1812.2 through 1812.11, as well as the applicable provisions of Section 1808.2.

**1812.2 Lateral dimensions and height.** The minimum dimension of isolated piers used as foundations shall be 2 feet (610 mm), and the height shall not exceed 12 times the least horizontal dimension.

**1812.3 Materials.** Concrete shall have a 28-day specified compressive strength ( $f'_c$ ) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

**1812.4 Reinforcement.** Except for steel dowels embedded 5 feet (1524 mm) or less in the pier, reinforcement where required shall be assembled and tied together and shall be placed in the pier hole as a unit before the reinforced portion of the pier is filled with concrete.

**Exception:** Reinforcement is permitted to be wet set and the 2½ inch (64 mm) concrete cover requirement permitted to be reduced to 2 inches (51 mm) for Group R-3 and U occupancies not exceeding two stories of light-frame construction, provided the construction method is approved by the commissioner.

Reinforcement shall conform to the requirements of Sections 1810.1.2.1 and 1810.1.2.2.

**Exceptions:**

1. Isolated piers supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than a minimum of one No. 4 bar, without ties or spirals, when detailed so the pier is not subject to lateral loads and the soil is determined to be of adequate stiffness.

2. *Isolated piers supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than one No. 4 bar, without ties or spirals, when the lateral load,  $E$ , to the top of the pier does not exceed 200 pounds (890 N) and the soil is determined to be of adequate stiffness.*
3. *Piers supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction are permitted to be reinforced as required by rational analysis but not less than two No. 4 bars, without ties or spirals, when it can be shown the concrete pier will not rupture when designed for the maximum seismic load,  $E_m$ , and the soil is determined to be of adequate stiffness.*
4. *Closed ties or spirals where required by Section 1810.1.2.2 are permitted to be limited to the top 3 feet (914 mm) of the piers 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of Seismic Design Category D, not exceeding two stories of light-frame construction.*

**1812.5 Concrete placement.** *Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.*

**1812.6 Belled bottoms.** *Where pier foundations are belled at the bottom, the edge thickness of the bell shall not be less than that required for the edge of footings. Where the sides of the bell slope at an angle less than 60 degrees (1 rad) from the horizontal, the effects of vertical shear shall be considered.*

**1812.7 Reserved.**

**1812.8 Concrete.** *Where adequate lateral support is not provided, and the ratio of unsupported height to least lateral dimension does not exceed three, piers of plain concrete shall be designed and constructed as pilasters in accordance with ACI 318. Where the unsupported height to least lateral dimension exceeds three, piers shall be constructed of reinforced concrete, and shall conform to the requirements for columns in ACI 318.*

**Exception:** Where adequate lateral support is furnished by the surrounding materials as defined in Section 1808.2.9, piers are permitted to be constructed of plain or reinforced concrete. The requirements of ACI 318 for bearing on concrete shall apply.

**1812.9 Steel shell.** Where concrete piers are entirely encased with a circular steel shell, and the area of the shell steel is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1808.2.17. Horizontal joints in the shell shall be spliced to comply with Section 1808.2.7.

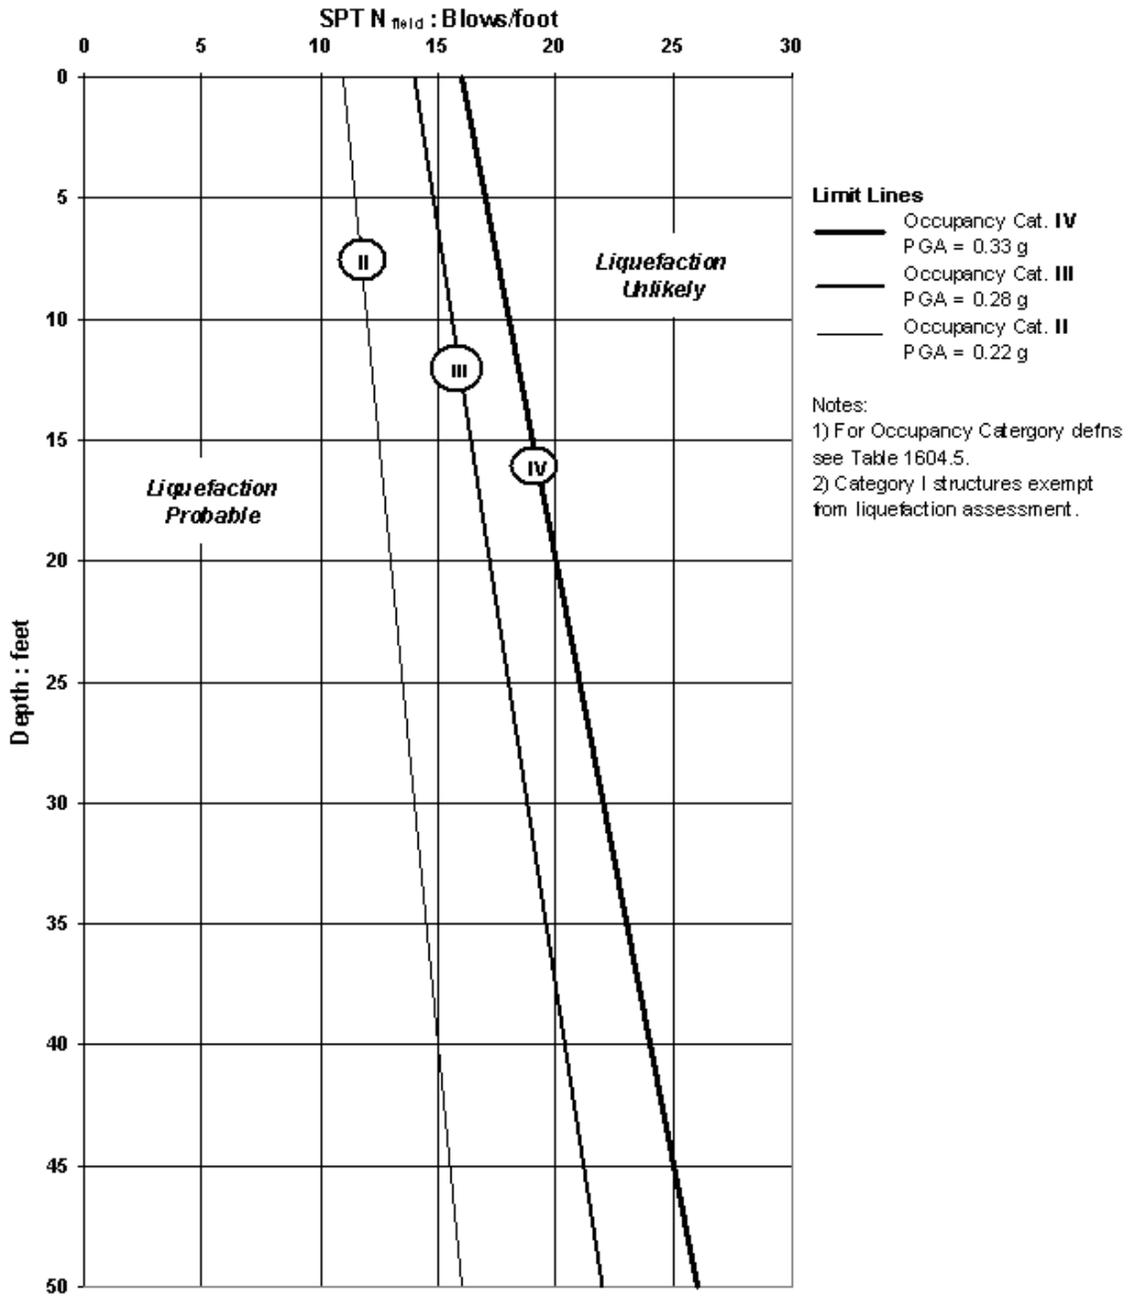

**1812.10 Dewatering.** Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom in dry conditions.

**1812.11 Method of construction.** Methods of construction shall conform to ACI 336.1 “Standard Specification for the Construction of Drilled Piers.”

### **SECTION BC 1813 LIQUEFACTION ANALYSIS**

**1813.1 General.** An assessment of the liquefaction potential shall be determined for each building site. The evaluation of liquefaction potential shall include the following considerations:

1. Non-cohesive soils below ground water table and less than 50 feet (15 240 mm) below the ground surface shall be considered to have potential for liquefaction.
2. The potential for liquefaction on level ground shall be determined on the basis of the Occupancy Categories associated with the uncorrected Standard Penetration Resistance ( $N$ ) at the site, as defined in Figure 1813.1, or a site specific analysis performed by an engineer with specific expertise in the evaluation of liquefaction.

**FIGURE 1813.1**  
**LIQUEFACTION ASSESSMENT DIAGRAM**

**1813.2 Site-specific analyses.** *In evaluating liquefaction potential, the analysis shall consider the following parameters: ground surface acceleration, earthquake magnitude, magnitude scaling factor, effective overburden pressure, hammer energy, cone penetration resistance (where applicable), and fines content. If a site response analysis is conducted, bedrock acceleration time histories and a shear wave velocity profile based on in-situ measurements may be utilized. These analyses may consider the results of laboratory cyclic shear tests.*

**1813.3 Foundation design analysis.** *The foundation design analysis shall consider an assessment of potential consequences of any liquefaction and soil strength loss including estimation of differential settlement, lateral movement or reduction in foundation soil bearing capacity, and may incorporate the potential benefits of any proposed mitigation measures. Such measures may be given consideration in the design of the structure and can include, but are not limited to, ground improvement, pore pressure dissipation, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements, or any combination of these measures.*

*In evaluating the potential for liquefaction, the effect of settlements induced by seismic motions and loss of soil strength shall be considered. The analysis performed shall incorporate the effects of peak ground acceleration, appropriate earthquake magnitudes and duration consistent with the design earthquake ground motions as well as uncertainty and variability of soil properties across the site. Peak ground acceleration, seismically induced cyclic stress ratios and pore pressure development may be determined from a site-specific study taking into account soil amplification effects and ground motions appropriate for the seismic hazard. Other recognized methods of analysis may be used in the evaluation process subject to the approval of the commissioner. Effects of pore water pressure buildup shall be considered in the design except for the following conditions:*

- 1. The calculated cyclic shear demand is equal to or less than 75 percent of the calculated cyclic shear strength for Category I, II, and III structures.*
- 2. The calculated cyclic shear demand is equal to or less than 85 percent of the calculated cyclic shear strength for Category IV structures.*

**1813.4 Design considerations.** *At sites where liquefaction is determined to be probable, the following considerations shall be in the design:*

- 1. Liquefiable soils shall be considered to have no passive (lateral) resistance or bearing capacity value during an earthquake, unless shown otherwise by accepted methods of analysis. The engineer shall submit an analysis for review*

*and approval by the commissioner, demonstrating that the proposed construction is safe against the effects of soil liquefaction.*

2. *Where liquefiable soils are present in sloped ground or over sloped non-liquefiable substrata and where lateral displacement is possible, the engineer shall submit a stability analysis for review and approval by the commissioner, demonstrating that the proposed construction is safe against failure of the soil and that the effect of potential lateral displacements are acceptable.*

#### **SECTION BC 1814 UNDERPINNING**

**1814.1 General.** *Where the protection and/or support of adjacent structures is required, an engineer shall prepare a preconstruction report summarizing the condition of the structure as determined from examination of the structure, the review of available design documents and if necessary, the excavation of test pits. The engineer shall determine the requirements for underpinning and protection and prepare site-specific plans, details, and sequence of work for submission to the commissioner. Such support may be provided by underpinning, sheeting, and bracing, or by other means acceptable to the commissioner. Underpinning piers, walls, piles, and footings shall be designed and installed in accordance with provisions of this chapter and Chapter 33 and shall be inspected in accordance with provisions of Chapter 17.*

**1814.1.1 Underpinning and bracing.** *Where underpinning is used for the support of adjacent structures, the piers, wall piles or footings shall be installed in such manner so as to prevent the lateral or vertical displacement of the adjacent structure, to prevent deterioration of the foundations or other effects that would disrupt the adjacent structure. The sequence of installation and the requirements for sheeting, preloading, wedging with steel wedges, jacking or dry packing shall be identified in the design.*

**1814.2 Use of rock support in lieu of underpinning.** *Existing structures founded at a level above the level of adjacent new construction may be supported on Class 1a and 1b rock in lieu of underpinning, sheeting and bracing or retaining walls, provided that a report by the engineer substantiates the safety of the proposed construction. The engineer shall also certify that he or she has inspected the exposed rock and the jointing therein and has determined whether supplemental support of the rock face is required.*

**1814.3 Monitoring of influenced structures.** *A land surveyor or engineer shall monitor the behavior of influenced structures during construction and for as long as necessary after construction concludes, as determined by the commissioner.*

**CHAPTER 19**  
**CONCRETE**

**SECTION BC 1901**  
**GENERAL**

**1901.1 Scope.** *The provisions of this chapter shall govern the materials, quality control, design and construction of concrete used in structures.*

**1901.2 Plain and reinforced concrete.** *Structural concrete shall be designed and constructed in accordance with the requirements of this chapter and ACI 318 as amended in Section 1908 of this code. Except for the provisions of Sections 1904 and 1911, the design and construction of slabs on grade shall not be governed by this chapter unless they transmit vertical loads or lateral forces from other parts of the structure to the soil.*

**1901.3 Source and applicability.** *Sections 1902 through 1907 of this chapter are derived from the provisions for structural concrete in ACI 318. Where sections within Chapters 2 through 7 of ACI 318 are referenced in other chapters and appendices of ACI 318, the provisions of Sections 1902 through 1907 of this code shall apply.*

**1901.4 Construction documents.** *The construction documents for structural concrete construction shall include:*

- 1. Specified compressive strength of concrete at the stated ages or stages of construction for which each concrete element is designed.*
- 2. Specified strength or grade of reinforcement.*
- 3. Size and location of structural elements, reinforcement, and anchors.*
- 4. Provision for dimensional changes resulting from creep, shrinkage and temperature.*
- 5. Magnitude and location of prestressing forces.*
- 6. Anchorage length of reinforcement and location and length of lap splices.*

7. *Type and location of mechanical and welded splices of reinforcement.*
8. *Details and location of contraction or isolation joints specified for plain concrete.*
9. *Minimum concrete compressive strength at time of posttensioning.*
10. *Stressing sequence for posttensioning tendons.*
11. *For structures assigned to Seismic Design Category D, a statement if slab on grade is designed as a structural diaphragm (see Section 21.10.3.4 of ACI 318).*
12. *Freezing and thawing and deicing chemical exposure classifications (see Section 1904.2).*
13. *Sulfate exposure classification (see Section 1904.3).*
14. *Maximum water soluble chloride ion (Cl) concentrations (see Section 1904.4).*

**1901.5 Special inspection.** *The special inspection of concrete elements of buildings and structures and concreting operations shall be in accordance with Chapter 17.*

## **SECTION BC 1902**

### **DEFINITIONS**

**1902.1 General.** *The following words and terms shall have the meanings shown herein.*

**ADMIXTURE.** *Material other than water, aggregate or hydraulic cement, used as an ingredient of concrete and added to concrete before or during its mixing to modify its properties.*

**AGGREGATE.** *Granular material, such as sand, gravel, crushed stone and iron blast-furnace slag, used with a cementing medium to form a hydraulic cement concrete or mortar.*

**AGGREGATE, LIGHTWEIGHT.** *Aggregate with a dry, loose weight of 70 pounds per cubic foot (pcf) ( $1120 \text{ kg/m}^3$ ) or less.*

**CEMENTITIOUS MATERIALS.** *Materials as specified in Section 1903 that have cementing value when*

*used in concrete either by themselves, such as portland cement, blended hydraulic cements and expansive cement, or such materials in combination with fly ash, other raw or calcined natural pozzolans, silica fume, and/or ground granulated blast-furnace slag.*

**COLUMN.** *A member with a ratio of height-to-least-lateral dimension exceeding three, used primarily to support axial compressive load.*

**CONCRETE.** *A mixture of portland cement or any other hydraulic cement, fine aggregate, coarse aggregate and water, with or without admixtures.*

**CONCRETE, SPECIFIED COMPRESSIVE STRENGTH OF, ( $f'_c$ ).** *The compressive strength of concrete used in design and evaluated in accordance with the provisions of Section 1905, expressed in pounds per square inch (psi) (MPa). Whenever the quantity  $f'_c$  is under a radical sign, the square root of the numerical value only is intended, and the result has units of psi (MPa).*

**CONTRACTION JOINT.** *Formed, sawed or tooled groove in a concrete structure to create a weakened plane and regulate the location of cracking resulting from the dimensional change of different parts of the structure.*

**DEFORMED REINFORCEMENT.** *Deformed reinforcing bars, bar mats, deformed wire, welded plain wire fabric and welded deformed wire fabric conforming to ACI 318, Section 3.5.3.*

**DUCT.** *A conduit (plain or corrugated) to accommodate prestressing steel for postensioned installation.*

**EFFECTIVE DEPTH OF SECTION ( $d$ ).** *The distance measured from extreme compression fiber to the centroid of tension reinforcement.*

**ISOLATION JOINT.** *A separation between adjoining parts of a concrete structure, usually a vertical plane, at a designed location such as to interfere least with performance of the structure, yet to allow relative movement in three directions and avoid formation of cracks elsewhere in the concrete and through which all or part of the bonded reinforcement is interrupted.*

**PEDESTAL.** *An upright compression member with a ratio of unsupported height-to-average-least-lateral dimension of three or less.*

**PLAIN CONCRETE.** *Structural concrete with no reinforcement or with less reinforcement than the*

*minimum amount specified for reinforced concrete.*

**PLAIN REINFORCEMENT.** *Reinforcement that does not conform to the definition of “Deformed reinforcement” (see ACI 318, Section 3.5.4).*

**POSTTENSIONING.** *Method of prestressing in which prestressing steel is tensioned after concrete has hardened.*

**PRECAST CONCRETE.** *A structural concrete element cast elsewhere than its final position in the structure.*

**PRESTRESSED CONCRETE.** *Structural concrete in which internal stresses have been introduced to reduce potential tensile stresses in concrete resulting from loads.*

**PRESTRESSING STEEL.** *High-strength steel element such as wire, bar or strand, or a bundle of such elements, used to impart prestress forces to concrete.*

**PRETENSIONING.** *Method of prestressing in which prestressing steel is tensioned before concrete is placed.*

**REINFORCED CONCRETE.** *Structural concrete reinforced with no less than the minimum amounts of prestressing steel or nonprestressed reinforcement specified in ACI\_318, Chapters 1 through 21 and ACI 318 Appendices A through C.*

**REINFORCEMENT.** *Material that conforms to Section 1903.5, excluding prestressing steel unless specifically included.*

**RESHORES.** *Shores placed snugly under a concrete slab or other structural member after the original forms and shores have been removed from a larger area, thus requiring the new slab or structural member to deflect and support its own weight and existing construction loads applied prior to the installation of the reshores.*

**SHORES.** *Vertical or inclined support members designed to carry the weight of the formwork, concrete and construction loads above.*

**SPIRAL REINFORCEMENT.** *Continuously wound reinforcement in the form of a cylindrical helix.*

**STRIPPING OPERATIONS.** Removal on the floor of any parts of the concrete formwork including shoring, bracing and other supports.

**STIRRUP.** Reinforcement used to resist shear and torsion stresses in a structural member; typically bars, wires or welded wire fabric (plain or deformed) either single leg or bent into L, U or rectangular shapes and located perpendicular, or at an angle to, longitudinal reinforcement. (The term “stirrups” is usually applied to lateral reinforcement in flexural members and the term “ties” to those in compression members.)

**STRUCTURAL CONCRETE.** Concrete used for structural purposes, including plain and reinforced concrete.

**TENDON.** In pretensioning applications, the tendon is the prestressing steel. In posttensioned applications, the tendon is a complete assembly consisting of anchorages, prestressing steel and sheathing with coating for unbonded applications or ducts with grout for bonded applications.

### **SECTION BC 1903 SPECIFICATIONS FOR TESTS AND MATERIALS**

**1903.1 General.** Materials used to produce concrete and testing thereof shall comply with the applicable standards listed in ACI 318 and this section. Tests of concrete and the materials used in concrete shall be in accordance with ACI 318, Section 3.8. Where required, special inspections and tests shall be in accordance with Chapter 17.

**1903.2 Cement.** Cement used to produce concrete shall comply with ACI 318, Section 3.2.

**1903.3 Aggregates.** Aggregates used in concrete shall comply with ACI 318, Section 3.3.

**1903.4 Water.** Water used in mixing concrete shall be clean and free from injurious amounts of oils, acids, alkalis, salts, organic materials or other substances that are deleterious to concrete or steel reinforcement and shall comply with ACI 318, Section 3.4.

**1903.5 Steel reinforcement.** Reinforcement and welding of reinforcement to be placed in concrete construction shall conform to the requirements of this section.

**1903.5.1 Reinforcement type.** Reinforcement shall be deformed reinforcement, except plain reinforcement is permitted for spirals or prestressing steel, and reinforcement consisting of structural steel, steel pipe or steel tubing is permitted where specified in ACI 318. Reinforcement shall comply with ACI 318, Section 3.5.

**1903.5.2 Welding.** Welding of reinforcing bars shall conform to AWS D1.4. Type and location of welded splices and other required welding of reinforcing bars shall be indicated on the construction documents or in the project specifications. The ASTM reinforcing bar specifications, except for ASTM A 706, shall be supplemented to require a report of material properties necessary to conform to the requirements in AWS D1.4. A written welding procedure shall be provided to the registered design professional of record for approval prior to any welding. All welding shall be subject to special inspection by an approved agency.

**1903.6 Admixtures.** Admixtures to be used in concrete shall be subject to prior approval by the registered design professional of record and shall comply with ACI 318, Section 3.6.

**1903.7 Storage of materials.** The storage of materials for use in concrete shall comply with the provisions of Sections 1903.7.1 and 1903.7.2.

**1903.7.1 Manner of storage.** Cementitious materials and aggregates shall be stored in such a manner as to prevent deterioration or intrusion of foreign matter.

**1903.7.2 Unacceptable material.** Any material that has deteriorated or has been contaminated shall not be used for concrete.

**1903.8 Glass fiber reinforced concrete.** Glass fiber reinforced concrete (GFRC) and the materials used in such concrete shall be in accordance with the PCI MNL 128 standard.

## **SECTION BC 1904 DURABILITY REQUIREMENTS**

**1904.1 Water-cementitious materials ratio.** The water-cementitious materials ratios specified in Tables 1904.2.2 and 1904.3 shall be calculated using the weight of cement meeting ASTM C 150, ASTM C 595, ASTM C 845 or ASTM C 1157, plus the weight of fly ash and other pozzolans meeting ASTM C 618, slag meeting ASTM C 989 and silica fume meeting ASTM C 1240, if any, except that where concrete is exposed to deicing chemicals, Section 1904.2.3 further limits the amount of fly ash, pozzolans, silica fume, slag or

*the combination of these materials.*

**1904.2 Freezing and thawing exposures.** *Concrete that will be exposed to freezing and thawing or deicing chemicals shall comply with Sections 1904.2.1 through 1904.2.3.*

**1904.2.1 Air entrainment.** *Normal-weight and lightweight concrete exposed to freezing and thawing or deicing chemicals shall be air entrained in accordance with Table 1904.2.1. Tolerance of air content as delivered shall be  $\pm 1.5$  percent. For specified compressive strength ( $f'_c$ ) greater than 5,000 psi (34.47 MPa), reduction of air content indicated in Table 1904.2.1 by 1.0 percent is permitted.*

**TABLE 1904.2.1  
TOTAL AIR CONTENT FOR FROST-RESISTANT CONCRETE**

NOMINAL MAXIMUM AGGREGATE SIZE <sup>a</sup> (inches)	AIR CONTENT (percent)	
	Severe exposure <sup>b</sup>	Moderate exposure <sup>b</sup>
$\frac{3}{8}$	$7\frac{1}{2}$	6
$\frac{1}{2}$	7	$5\frac{1}{2}$
$\frac{3}{4}$	6	5
1	6	$4\frac{1}{2}$
$1\frac{1}{2}$	$5\frac{1}{2}$	$4\frac{1}{2}$
2 <sup>c</sup>	5	4
3 <sup>c</sup>	$4\frac{1}{2}$	$3\frac{1}{2}$

For SI: 1 inch = 25.4 mm.

- a. See ASTM C 33 for tolerance on oversize for various nominal maximum size designations.
- b. The severe and moderate exposures referenced in this table are not based on the weathering regions shown in Figure 1904.2.2. For the purposes of this section, severe and moderate exposures shall be defined as follows:
  1. Severe exposure occurs where concrete will be in almost continuous contact with moisture prior to freezing, or where deicing salts are used. Examples are pavements, bridge decks, sidewalks, parking garages and water tanks.
  2. Moderate exposure occurs where concrete will be only occasionally exposed to moisture prior to freezing, and where deicing salts are not used. Examples are certain exterior walls, beams, girders and slabs not in direct contact with soil.
- c. These air contents apply to total mix, as for the preceding aggregate sizes. When testing these concretes, however, aggregate larger than  $1\frac{1}{2}$  inches is removed by hand picking or sieving and air content is determined on the minus  $1\frac{1}{2}$ -inch fraction of the mix (tolerance on air content as delivered applies to this value). Air content of total mix is computed from value determined on the minus  $1\frac{1}{2}$ -inch fraction.

**1904.2.2 Concrete properties.** Concrete that will be subject to the exposures given in Table 1904.2.2(1) shall conform to the corresponding maximum water-cementitious materials ratios and minimum specified concrete compressive strength requirements of that table. In addition, concrete that will be exposed to deicing chemicals shall conform to Section 1904.2.3.

**Exception:** For Group R and accessory occupancies that are in buildings less than four stories in height, normal-weight aggregate concrete that is subject to freezing and thawing or deicer chemicals shall comply with the requirements of Table 1904.2.2(2).

**TABLE 1904.2.2(1)**  
**REQUIREMENTS FOR SPECIAL EXPOSURE CONDITIONS**

EXPOSURE CONDITION	MAXIMUM WATER-CEMENTITIOUS MATERIALS RATIO, BY WEIGHT, NORMAL-WEIGHT AGGREGATE CONCRETE	MINIMUM $f'_c$ , NORMAL-WEIGHT AND LIGHTWEIGHT AGGREGATE CONCRETE (psi)
Concrete intended to have low permeability when exposed to water	0.50	4,000
Concrete exposed to freezing and thawing in a moist condition or to deicing chemicals	0.45	4,500
For corrosion protection of reinforcement in concrete exposed to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources	0.40	5,000

For SI: 1 pound per square inch = 0.00689 MPa.

**TABLE 1904.2.2(2)**  
**MINIMUM SPECIFIED COMPRESSIVE STRENGTH (f 'c)**  
**(AS REVISED)**

<b>TYPE OR LOCATION OF CONCRETE CONSTRUCTION</b>	<b>MINIMUM SPECIFIED COMPRESSIVE STRENGTH (f'c at 28 days, psi)</b>
<i>Basement walls<sup>c</sup> and foundations not exposed to the weather</i>	2,500 <sup>a</sup>
<i>Basement slabs and interior slabs on grade, except garage floor slabs</i>	2,500 <sup>a</sup>
<i>Basement walls<sup>c</sup>, foundation walls, exterior walls and other vertical concrete surfaces exposed to the weather</i>	3,000 <sup>b</sup>
<i>Driveways, curbs, walks, patios, porches, carport slabs, steps and other flatwork exposed to the weather, and garage floor slabs</i>	3,500 <sup>b</sup>

*For SI: 1 pound per square inch = 0.00689 MPa.*

- a. Concrete in these locations that can be subjected to freezing and thawing during construction shall be of air-entrained concrete in accordance with Table 1904.2.1.*
- b. Concrete shall be air entrained in accordance with Table 1904.2.1.*
- c. Structural plain concrete basement walls are exempt from the requirements for special exposure conditions of Section 1904.2.2 (see Section 1909.1.1).*

**1904.2.3 Deicing chemicals.** *For concrete exposed to deicing chemicals, the maximum weight of fly ash, other pozzolans, silica fume or slag that is included in the concrete shall not exceed the percentages of the total weight of cementitious materials given in Table 1904.2.3.*

**TABLE 1904.2.3  
REQUIREMENTS FOR CONCRETE EXPOSED TO DEICING CHEMICALS**

CEMENTITIOUS MATERIALS	MAXIMUM PERCENT OF TOTAL CEMENTITIOUS MATERIALS BY WEIGHT <sup>a, b</sup>
Fly ash or other pozzolans conforming to ASTM C 618	25
Slag conforming to ASTM C 989	50
Silica fume conforming to ASTM C 1240	10
Total of fly ash or other pozzolans, slag and silica fume	50 <sup>c</sup>
Total of fly ash or other pozzolans and silica fume	35 <sup>c</sup>

a. The total cementitious material also includes ASTM C 150, ASTM C 595, ASTM C 845 and ASTM C 1157 cement.

b. The maximum percentages shall include:

1. Fly ash or other pozzolans present in Type IP or I (PM) blended cement, ASTM C 595, or ASTM C 1157.
2. Slag used in the manufacture of an IS or I (SM) blended cement, ASTM C 595, or ASTM C 1157.
3. Silica fume, ASTM C 1240, present in a blended cement.

c. Fly ash or other pozzolans and silica fume shall constitute no more than 25 and 10 percent, respectively, of the total weight of the cementitious materials.

**1904.3 Sulfate exposures.** Where concrete will be exposed to sulfate-containing solutions, it shall comply with the provisions of Sections 1904.3.1 and 1904.3.2.

**1904.3.1 Concrete quality.** Concrete to be exposed to sulfate-containing solutions or soils shall conform to the requirements of Table 1904.3 or shall be concrete made with a cement that provides sulfate resistance and that has a maximum water-cementitious materials ratio and minimum compressive strength as set forth in Table 1904.3.

**1904.3.2 Calcium chloride.** Calcium chloride as an admixture shall not be used in concrete to be exposed to those severe or very severe sulfate-containing solutions defined in Table 1904.3.

**TABLE 1904.3  
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS**

SULFATE EXPOSURE	WATER SOLUBLE SULFATE (SO <sub>4</sub> ) IN SOIL, PERCENT BY WEIGHT	SULFATE (SO <sub>4</sub> ) IN WATER (ppm)	CEMENT TYPE			MAXIMUM WATER-CEMENTITIOUS MATERIALS RATIO, BY WEIGHT, NORMAL-WEIGHT AGGREGATE CONCRETE <sup>a</sup>	MINIMUM $f'_c$ , NORMAL-WEIGHT AND LIGHTWEIGHT AGGREGATE CONCRETE (psi) <sup>a</sup>
			ASTM C 150	ASTM C 595	ASTM C 1157		
Negligible	0.00 - 0.10	0 - 150	—	—	—	—	—
Moderate <sup>b</sup>	0.10 - 0.20	150 - 1,500	II	II, IP (MS), IS (MS), P (MS), I (PM)(MS), I (SM)(MS)	MS	0.50	4,000
Severe	0.20 - 2.00	1,500 - 10,000	V	—	HS	0.45	4,500
Very severe	Over 2.00	Over 10,000	V plus pozzolan <sup>c</sup>	—	HS plus pozzolan <sup>d</sup>	0.45	4,500

For SI: 1 pound per square inch = 0.00689 MPa.

a. A lower water-cementitious materials ratio or higher strength may be required for low permeability or for protection against corrosion of embedded items or freezing and thawing (see Table 1904.2.2).

b. Seawater.

c. Pozzolan that has been determined by test or service record to improve sulfate resistance when used in concrete containing Type V cement.

d. Pozzolan that has been determined by test or service record to improve sulfate resistance when used in concrete containing Type HS blended cement.

**1904.4 Corrosion protection of reinforcement.** Reinforcement in concrete shall be protected from corrosion and exposure to chlorides as provided by Sections 1904.4.1 and 1904.4.2.

**1904.4.1 General.** For corrosion protection of reinforcement in concrete, the maximum water-soluble chloride ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials and admixtures shall not exceed the limits of Table 1904.4.1. When testing is performed to determine water-soluble chloride ion content, test procedures shall conform to ASTM C 1218.

TABLE 1904.4.1  
 MAXIMUM CHLORIDE ION CONTENT FOR CORROSION PROTECTION OF REINFORCEMENT

TYPE OF MEMBER	MAXIMUM WATER SOLUBLE CHLORIDE ION (Cl) IN CONCRETE, PERCENT BY WEIGHT OF CEMENT
Prestressed concrete	0.06
Reinforced concrete exposed to chloride in service	0.15
Reinforced concrete that will be dry or protected from moisture in service	1.00
Other reinforced concrete construction	0.30

**1904.4.2 Exposure to chlorides.** Where concrete with reinforcement will be exposed to chlorides from deicing chemicals, salt, saltwater, brackish water, seawater or spray from these sources, the requirements of Table 1904.2.2(1) for water-cementitious materials ratio and concrete strength, and the minimum concrete cover requirements of Section 1907.7, shall be satisfied. For corrosion protection of unbonded tendons compliance with ACI 318, Section 18.16 shall be required. The limits on acid-soluble and water-soluble chlorides in fresh concrete that contains reinforcing steel or other metals shall conform to the requirements of ACI 222, Section 3.2.

## **SECTION BC 1905 CONCRETE QUALITY, MIXING AND PLACING**

**1905.1 General.** The required strength and durability of concrete shall be governed by compliance with the proportioning, testing, mixing and placing provisions of Sections 1905.1.1 through 1905.13.

**1905.1.1 Strength.** Concrete shall be proportioned to provide an average compressive strength in accordance with Section 1905.3, and shall satisfy the durability criteria of Section 1904. Concrete shall be produced to minimize the frequency of strengths below  $f'_c$  in compliance with Section 1905.6.3.3. For concrete designed and constructed in accordance with this chapter,  $f'_c$  shall not be less than 2,500 psi (17.22 MPa). No maximum specified compressive strength shall apply unless restricted by a specific provision of this code or ACI 318.

**1905.1.2 Cylinder tests.** Requirements for  $f'_c$  shall be based on tests of cylinders made and tested in accordance with Section 1905.6.3.

**1905.1.3 Basis of  $f'_c$ .** Unless otherwise specified,  $f'_c$  shall be based on 28-day tests. If other than 28 days, test age for  $f'_c$  shall be as indicated in construction documents. If at any time during the concrete operations, the concrete is not in conformance with ASTM C 94 or is otherwise compromised, it shall be rejected. If it is placed, the location of the load shall be recorded and a pair of cylinders shall be molded from the load per ASTM C 31 and included in the average  $f'_c$ .

**1905.1.4 Lightweight aggregate concrete.** Where design criteria in ACI 318, Sections 9.5.2.3, 11.2 and 12.2.4, provide for use of a splitting tensile strength value of concrete ( $f_{ct}$ ), laboratory tests shall be made in accordance with ASTM C 330 to establish the value of  $f_{ct}$  corresponding to the specified value of  $f'_c$ .

**1905.1.5 Field acceptance.** Splitting tensile strength tests shall not be used as a basis for field

*acceptance of concrete.*

**1905.2 Selection of concrete proportions.** *Concrete proportions shall be determined in accordance with the provisions of Sections 1905.2.1 through 1905.2.3.*

**1905.2.1 General.** *Proportions of materials for concrete shall be established to provide:*

- 1. Workability and consistency to permit concrete to be worked readily into forms and around reinforcement under the conditions of placement to be employed, without segregation or excessive bleeding.*
- 2. Resistance to special exposures as required by Section 1904.*
- 3. Conformance with the strength test requirements of Section 1905.6.*

**1905.2.2 Different materials.** *Where different materials are to be used for different portions of proposed work, each combination shall be evaluated.*

**1905.2.3 Basis of proportions.** *Concrete proportions shall be established in accordance with Section 1905.3 or Section 1905.4, and shall comply with the applicable requirements of Section 1904.*

**1905.3 Proportioning on the basis of field experience and/or trial mixtures.** *Concrete proportioning determined on the basis of field experience or trial mixtures shall be done in accordance with ACI 318, Section 5.3. If the required  $f'_c$  is obtained for trial batch mixes prior to the date specified, the trial mix design may be approved. All mixes shall be approved by the registered design professional of record, prior to construction.*

**1905.4 Proportioning without field experience or trial mixtures.** *Concrete proportioning determined without field experience or trial mixtures shall be done in accordance with ACI 318, Section 5.4. This method of proportioning shall not be permitted for load carrying structural concrete or concrete mix proportions that are required to conform with Section 1904.*

**1905.5 Average strength reduction.** *As data become available during construction, it is permissible to reduce the amount by which the average compressive strength ( $f'_c$ ) is required to exceed the specified value of  $f'_c$  in accordance with ACI 318, Section 5.5.*

**1905.6 Evaluation and acceptance of concrete.** *The criteria for evaluation and acceptance of concrete shall be as specified in Sections 1905.6.2 through 1905.6.5.5.*

**1905.6.1 Qualified technicians.** *Concrete shall be tested in accordance with the requirements in Sections 1905.6.2 through 1905.6.5. An approved agency shall perform tests on fresh concrete at the job site, prepare specimens required for curing under field conditions, prepare specimens required for testing in the laboratory and record the temperature of the fresh concrete when preparing specimens for strength tests. All field sampling and testing, including the testing of aggregates, concrete mixes, and strength testing of specimens, shall be subject to special inspection by an approved agency. All testing laboratories shall be approved testing agencies and shall employ qualified special inspectors to perform all required laboratory tests. Test results shall be promptly distributed by the testing laboratory to the registered design professional of record, concrete producer, owner, and contractor.*

**1905.6.2 Frequency of testing.** *The frequency of conducting strength tests of concrete shall be as specified in Sections 1905.6.2.1 through 1905.6.2.4.*

**1905.6.2.1 Minimum frequency.** *Samples for strength tests of each class of concrete placed each day shall be taken not less than once a day, nor less than once for each 50 cubic yards (38 m<sup>3</sup>) of concrete nor less than once for each 5,000 square feet (465 m<sup>2</sup>) of surface area for slabs or walls. For concrete mixes proportioned for durability requirements specified in Section 1904, the registered design professional of record shall specify additional field testing of the concrete for unit weight, air, and water content. At the discretion of the registered design professional of record, the frequency of testing may be reduced, but not less than once for each 150 cubic yards (115 m<sup>3</sup>).*

**1905.6.2.2 Minimum number.** *On a given project, if the total volume of concrete is such that the frequency of testing required by Section 1905.6.2.1 would provide less than five strength tests for a given class of concrete, tests shall be made from at least five randomly selected batches or from each batch if fewer than five batches are used.*

**1905.6.2.3 Small volume.** *When the total volume of a given class of concrete is less than 50 cubic yards (38 m<sup>3</sup>), and the concrete is non-structural and is not subject to the durability requirements of Section 1904, testing may be waived by the registered design professional of record.*

**1905.6.2.4 Strength test.** *A strength test shall be the average of the strengths of two cylinders made from the same sample of concrete and tested at 28 days or at the test age designated for the*

determination of  $f'_c$ . Consideration shall be given specifying an  $f'_c$  at 56 days or later for concrete utilizing pozzolans in the mix proportions. At the discretion of the registered design professional of record or the approved agency performing the testing, additional pairs of test cylinders may be taken at the time of sampling for testing at a later date. The additional cylinders may be tested at a later date should the strength at the specified date not meet the required  $f'_c$ .

**1905.6.3 Laboratory-cured specimens.** Laboratory-cured specimens shall comply with the provisions of Sections 1905.6.3.1 through 1905.6.3.4.

**1905.6.3.1 Sampling.** Samples for strength tests shall be taken in accordance with ASTM C 172.

**1905.6.3.2 Cylinders.** Cylinders for strength tests shall be molded and laboratory-cured in accordance with ASTM C 31. The Contractor shall be responsible for providing the specified field storage curing facility and for monitoring the temperature as defined in ASTM C 31. The cylinders shall be tested in accordance with ASTM C 39.

**1905.6.3.3 Acceptance of results.** The strength level of an individual class of concrete shall be considered satisfactory if both of the following requirements are met:

1. Every arithmetic average of any three consecutive strength tests equals or exceeds  $f'_c$ .
2. No individual strength test (average of two cylinders) falls below  $f'_c$  by more than 500 psi (3.45 MPa) when  $f'_c$  is 5,000 psi (34.50 MPa) or less, or by more than  $0.10 f'_c$  when  $f'_c$  is more than 5,000 psi (34.50 MPa).

**1905.6.3.4 Correction.** If either of the requirements of Section 1905.6.3.3 is not met, steps shall be taken to increase the average of subsequent strength test results. The requirements of Section 1905.6.5 shall govern if the requirement of Section 1905.6.3.3, subsection 2 is not met.

**1905.6.4 Field-cured specimens.** Field-cured specimens shall comply with the provisions of Sections 1905.6.4.1 through 1905.6.4.4.

**1905.6.4.1 When required.** Where required by the commissioner, the results of strength tests of cylinders cured under field conditions shall be provided to the department.

**1905.6.4.2 Curing.** Field-cured cylinders shall be cured under field conditions in accordance with

ASTM C 31.

**1905.6.4.3 Sampling.** *Field-cured test cylinders shall be molded at the same time and from the same samples as laboratory-cured test cylinders.*

**1905.6.4.4 Correction.** *Procedures for protecting and curing concrete shall be improved when the strength of field-cured cylinders at the test age designated for determination of  $f'_c$  is less than 85 percent of that of companion laboratory-cured cylinders. The 85-percent limitation shall not apply if the field-cured strength exceeds  $f'_c$  by more than 500 psi (3.45 MPa).*

**1905.6.5 Low-strength test results.** *The investigation of low-strength test results shall be in accordance with the provisions of Sections 1905.6.5.1 through 1905.6.5.5.*

**1905.6.5.1 Precaution.** *If any strength test of laboratory-cured cylinders performed in accordance with Section 1905.6.2.4 falls below the specified value of  $f'_c$  by more than the values given in Section 1905.6.3.3, subsection 2, or if tests of field-cured cylinders performed in accordance with Section 1905.6.4.4 indicate deficiencies in protection and curing, steps shall be taken to assure that the load-carrying capacity of the structure is not jeopardized.*

**1905.6.5.2 Core tests.** *Where calculations indicate that load-carrying capacity is significantly reduced, tests of cores drilled from the area in question in accordance with ASTM C 42 shall be permitted. In such cases, three cores shall be taken for each strength test that falls below the values given in Section 1905.6.3.3, subsection 2.*

**1905.6.5.3 Condition of cores.** *Cores shall be prepared for transport and storage by wiping drilling water from their surfaces and placing the cores in water-tight bags or containers immediately after drilling. Cores shall be tested not earlier than 48 hours nor later than seven days after coring unless approved by the registered design professional of record.*

**1905.6.5.4 Test results.** *Concrete in an area represented by core tests shall be considered structurally adequate if the average of three cores is equal to at least 85 percent of  $f'_c$  and if no single core is less than 75 percent of  $f'_c$ . Additional testing of cores extracted from locations represented by erratic core strength results is permitted.*

**1905.6.5.5 Strength evaluation.** *If the criteria of Section 1905.6.5.4 are not met and the structural adequacy remains in doubt, the commissioner may order a strength evaluation in accordance with*

*ACI 318, Chapter 20, for the questionable portion of the structure, or take other appropriate action. The registered design professional of record shall present to the commissioner a complete analysis showing the final safe load-carrying capacity of the questionable portion of the structure including any proposed remedial actions necessary for review and approval.*

**1905.7 Preparation of equipment and place of deposit.** *Preparation before concrete placement shall include the following:*

- 1. Equipment for mixing and transporting concrete shall be clean.*
- 2. Debris and ice shall be removed from spaces to be occupied by concrete.*
- 3. Forms shall be properly coated.*
- 4. Masonry filler units that will be in contact with concrete shall be well drenched.*
- 5. Reinforcement shall be thoroughly clean of ice or other deleterious coatings.*
- 6. Water shall be removed from the place of deposit before concrete is placed unless a tremie is to be used or unless otherwise permitted by the commissioner.*
- 7. Laitance and other unsound material shall be removed before additional concrete is placed against hardened concrete.*

**1905.8 Mixing.** *Mixing of concrete shall be performed in accordance with Sections 1905.8.1 through 1905.8.3.*

**1905.8.1 General.** *Concrete shall be mixed until there is a uniform distribution of materials and shall be discharged completely before the mixer is recharged.*

**1905.8.2 Ready-mixed concrete.** *Ready-mixed concrete shall be mixed and delivered in accordance with the requirements of ASTM C 94 or ASTM C 685. Concrete plants shall be certified by the National Ready Mixed Concrete Association (NRMCA) and shall comply with the rules of the department. Concrete producers shall have their plants inspected quarterly and have their scales and trucks certified. In fulfilling this certification requirement, the concrete producer may present certification by either a New York City government agency, or by the New York State Department of*

*Transportation subject to the approval of the commissioner. Concrete ready-mix truck drivers shall be certified by the NRMCA and shall comply with the rules of the department.*

*If required by the registered design professional of record, batch tickets shall accompany every load of concrete delivered to a site. The batch ticket shall contain the information given below:*

- 1. Plant Name and Location;*
- 2. Contract Number and Project;*
- 3. Mix Designation as to Type and Strength;*
- 4. Each material in the load along with quantities of each by weight; and*
- 5. The total amount of mix proportion water approved, quantity of water added at the plant and in transit, and the remaining water that can be added on site.*

***1905.8.3 Job-mixed concrete.*** *Job-mixed concrete shall comply with ACI 318, Section 5.8.3.*

***1905.9 Conveying.*** *The method and equipment for conveying concrete to the place of deposit shall comply with Sections 1905.9.1 and 1905.9.2.*

***1905.9.1 Method of conveyance.*** *Concrete shall be conveyed from the mixer to the place of final deposit by methods that will prevent separation or loss of materials that may alter the properties of the concrete delivered. Cylinders shall be made at the truck to determine the quality of concrete delivered to the site. Cylinders shall be made at the point of placement to determine the quality of concrete in-place.*

***1905.9.2 Conveying equipment.*** *The conveying equipment shall be capable of providing a supply of concrete at the site of placement without separation of ingredients and without interruptions sufficient to permit the loss of plasticity between successive increments.*

***1905.10 Depositing.*** *The depositing of concrete shall comply with the provisions of Sections 1905.10.1 through 1905.10.8.*

***1905.10.1 Segregation.*** *Concrete shall be deposited as nearly as practicable to its final position to*

*avoid segregation due to rehandling or flowing.*

**1905.10.2 Placement timing.** *Concreting operations shall be carried on at such a rate that the concrete is at all times plastic and flows readily into spaces between reinforcement.*

**1905.10.3 Unacceptable concrete.** *Concrete that has partially hardened or been contaminated by foreign materials shall not be deposited in the structure.*

**1905.10.4 Retempering.** *Retempered concrete or concrete that has been remixed after initial set shall not be used unless approved by the registered design professional.*

**1905.10.5 Continuous operation.** *After concreting has started, it shall be carried on as a continuous operation until placing of a panel or section, as defined by its boundaries or predetermined joints, is completed, except as permitted or prohibited by Section 1906.8.*

**1905.10.6 Placement in vertical lifts.** *The top surfaces of vertically formed lifts shall be generally level.*

**1905.10.7 Construction joints.** *When construction joints are required, they shall be made in accordance with Section 1906.8.*

**1905.10.8 Consolidation.** *Concrete shall be thoroughly consolidated by suitable means during placement and shall be thoroughly worked around reinforcement and embedded fixtures and into corners of the forms.*

**1905.11 Curing.** *The curing of concrete shall be in accordance with Sections 1905.11.1 through 1905.11.3.*

**1905.11.1 Regular.** *Concrete (other than high early strength) shall be maintained above 50°F (10°C) and in a moist condition for at least the first seven days after placement, except when cured in accordance with Section 1905.11.3.*

**1905.11.2 High-early-strength.** *High-early-strength concrete shall be maintained above 50°F (10°C) and in a moist condition for at least the first three days, except when cured in accordance with Section 1905.11.3.*

**1905.11.3 Accelerated curing.** *Accelerated curing of concrete shall comply with ACI 318, Section*

5.11.3.

**1905.12 Cold weather requirements.** Concrete that is to be placed during freezing or near-freezing weather shall comply with the following:

1. Adequate equipment shall be provided for heating concrete materials and protecting concrete during freezing or near-freezing weather.
2. Concrete materials and reinforcement, forms, fillers and ground with which concrete is to in contact shall be free from frost.
3. Frozen materials or materials containing ice shall not be used.

**1905.13 Hot weather requirements.** During hot weather, proper attention shall be given to ingredients, production methods, handling, placing, protection and curing to prevent excessive concrete temperatures or water evaporation that could impair the required strength or serviceability of the member or structure.

## **SECTION BC 1906**

### **FORMWORK, EMBEDDED PIPES AND CONSTRUCTION JOINTS**

**1906.1 General requirements.** The design, fabrication and erection of forms shall comply with the requirements of section 1906.1.1 through 1906.1.6.

**1906.1.1 Safe support of loads.** Formwork, including all related braces, shoring, framing, and auxiliary construction shall be proportioned, erected, supported, braced, and maintained so that it will safely support all vertical and lateral loads that might be applied until such loads can be supported by the permanent construction.

**1906.1.2 Vertical and lateral loads.** Vertical and lateral loads shall be carried to the ground by the formwork system, by the new construction after it has attained adequate strength for that purpose, or by existing structures. Forms and their supports shall be designed so as not to damage previously placed structures.

**1906.1.3 Bracing.** Forms shall be properly braced or tied together so as to maintain position and shape, and shall conform to the sizes and shapes of members as shown on the design drawings.

**1906.1.4 Ramps, runways, and platforms.** Ramps, runways, and platforms shall meet the requirements of Section 3315.

**1906.1.5 Design.** Design of formwork shall comply with ACI 318, Section 6.1.5.

**1906.1.6 Forms for pre-stressed and post-tensioned concrete.** Forms for pre-stressed and post-tensioned concrete members shall be designed and constructed to permit movement of the member without damage during application of the pre-stressing force.

**1906.2 Inspection.** Formwork, including shores, reshores, braces, and other supports, shall be inspected prior to placement of reinforcing steel to verify that the sizes of the concrete members that are being formed conform to the construction documents and form design drawings. Such inspections shall be performed by a qualified person designated by the contractor. Subsequently, inspections shall be performed by such person periodically during the placement of concrete. During and after concreting, the elevations, camber, and vertical alignment of formwork systems shall be inspected using tell-tale devices. A record of all such inspections shall be kept at the site available to the commissioner. The names of the persons responsible for such inspections and the foreman in charge of the formwork shall be posted in the field office.

**1906.3 Design of concrete formwork.** Wherever the shore height exceeds 14 feet (4267 mm) or the total load on the forms exceeds 150 pounds per square foot (732 kg/m<sup>2</sup>), or wherever power buggies or two-stage shores are used, the forms, including shoring foundation, shall be designed by a registered design professional and shall be constructed in conformance with such design. A copy of the design drawings and any construction drawings and specifications shall be kept on the job site available to the commissioner.

**1906.3.1 Vertical loads.** Vertical loads shall include the total dead and live loads. Dead load shall include the weight of the formwork plus the weight of the reinforcement and fresh concrete. Live load shall allow for the weight of the workers and equipment, with allowance for impact, but in no case shall be less than 20 pounds per square foot (98 kg/m<sup>2</sup>).

**1906.3.2 Lateral concrete pressure.** Design of forms, ties, and bracing shall satisfy the minimum lateral pressures of fresh concrete specified in Table 1906.3.2.

**TABLE 1906.3.2**  
**MINIMUM LATERAL PRESSURES TO BE ASSUMED FOR FRESH CONCRETE WEIGHING 150**  
**POUNDS PER CUBIC FOOT**

Type of Work	Minimum Lateral Pressure Assumed (psf)	Limitations
Columns: Ordinary work with normal internal vibration	$p = 150 + \frac{9000R}{T}$	Maximum 3,000 psf or 150h, whichever is less
Walls: Rate of placement at 7 ft. per hr. or less	$p = 150 + \frac{9000R}{T}$	Maximum 2,000 psf or 150h, whichever is less
Walls: Rate of placement at greater than 7 feet per hr.	$p = 150 + \frac{43400}{T} + \frac{2800R}{T}$	Maximum 2,000 psf or 150h, whichever is less
Slabs	$p = 150h$	None

Where:

*R* = rate of placement, feet per hour

*T* = temperature of concrete in the forms, degrees F.

*h* = height of fresh concrete above point considered, feet.

- a. Allowances for change in lateral pressure shall be made for concrete weighing other than one hundred fifty pcf; for concrete containing pozzolanic additions or cements other than type I, for concrete having slumps greater than six inches, or for concrete consolidated by revibration or external vibration of forms.
- b. Where retarding admixtures are employed under hot weather conditions an effective value of temperature less than that of the concrete in the forms shall be used in the above formulae.
- c. If retarding admixtures are used in cold weather, the lateral pressure may be assumed as that exerted by a fluid weighing one hundred fifty pcf.

**1906.3.3 External lateral loads.** Braces and shores shall be designed to resist all external lateral loads including but not limited to wind, cable tensions, inclined supports, dumping of concrete, and starting and stopping of equipment. In no case shall the assumed value of lateral load due to wind, dumping of concrete, and equipment acting in any direction at each floorline be less than 100 plf edge or 2 percent of total dead load of the floor, whichever is greater. Except for foundation walls that are poured against a rigid backing, wall forms shall be designed for a minimum lateral load of 10 pounds per square foot (49 kg/m<sup>2</sup>), and bracing for wall forms shall be designed for a lateral load of at least 100 plf of wall, applied at the top. The lateral load acting on walls greater than 14 feet (4267 mm) high shall be determined by analysis of conditions applicable to the site and building.

**1906.3.4 Special loads.** The formwork shall be designed for any special conditions of construction likely to occur, such as unsymmetrical placement of concrete, impact of machine-delivered concrete, uplift, and concentrated loads.

**1906.3.5 Shoring and bracing.** Shoring and bracing shall comply with sections 1906.3.5.1 through 1906.3.5.4.

**1906.3.5.1 Approval.** When patented or commercial devices that are not susceptible to design are used for shoring, bracing, or splicing, they shall be approved by the commissioner.

**1906.3.5.2 Splices.** Splices shall develop the full strength of the spliced members.

**1906.3.5.3 Bracing.** Where shore height exceeds 10 feet (3048 mm), or when necessary to provide structural stability, diagonal bracing shall be provided. Struts, anchored into masonry or to panel joints of adjacent braced bays, may be used to prevent buckling of individual members not supported by the diagonal bracing; but, bracing an entire tier of shores with struts without diagonal bracing shall be prohibited unless the system can be demonstrated to be braced by other rigid construction.

**1906.3.5.4 Unbraced length of shores.** The unbraced length of shores shall not exceed the maximum length determined in accordance with the requirements of this code for the structural material used.

**1906.3.6 Foundations.** Foundations for shores more than 10 feet (3048 mm) high and supported on the ground shall be designed by a registered design professional.

**1906.3.7 Settlement.** Formwork shall be so constructed that vertical adjustments can be made to compensate for take-up and settlements. Wedges, jacks, or other positive means shall be provided for this purpose.

**1906.3.8 Structural ramps, runways and platforms** Structural runways, ramps, and platforms shall comply with Section 3315 in addition to the requirements of Section 1906.3.

**1906.4 Construction.** Construction of concrete formwork shall comply with the requirements of Section 1906.4.1 through 1906.4.4.

**1906.4.1 Field constructed lap splices.** Field constructed lap splices, other than approved devices, shall not be used more often than for every other shore under slabs or for every third shore under beams, and shall develop the full strength of the members. Such spliced shores shall be uniformly distributed throughout the work. Splices shall not be located near the midheight of the shores unless lateral support is provided, nor midway between points of lateral support.

**1906.4.2 Vertical shores.** Vertical shores for multistory forms shall be set plumb and in alignment with lower tiers so that loads from upper tiers are transferred directly to the lower tiers, or adequate transfer members shall be provided. Provision shall be made to transfer the lateral loads to the ground or to completed construction of adequate strength. Vertical shores shall be so erected that they cannot tilt, and shall have firm bearing. Inclined shores and the bearing ends of all shores shall be braced against slipping or sliding. The bearing surfaces shall be cut square and have a tight fit at splices.

**1906.4.3 Runways.** Runways for moving equipment shall be provided with struts or legs as required, and shall be supported directly on the formwork or structural member and not on the reinforcement.

**1906.4.4 Unsafe conditions.** Any unsafe condition or necessary adjustment revealed by inspection shall be remedied immediately. If, during construction, any weakness develops and the formwork shows any undue settlement or distortion, the work shall be stopped, the affected construction removed if permanently damaged, and the formwork strengthened.

**1906.5 Removal of forms and shoring.** The removal of forms and shoring shall comply with the requirements of Section 1906.5.1 through 1906.5.6.

**1906.5.1 Removal schedule.** Before starting construction, the contractor shall develop a procedure and schedule for removal of shores and installation of reshores and for calculating the loads

transferred to the structure during the process.

**1906.5.1.1 Data and analysis.** *The structural analysis and concrete strength data used in planning and implementing form removal and reshoring shall be furnished by the registered design professional responsible for the removal schedule to the commissioner when so requested.*

**1906.5.1.2 Support and removal.** *No construction loads shall be supported on, nor any shoring removed from, any part of the structure under construction except when that portion of the structure in combination with the remaining forming and shoring system has sufficient strength to support safely its weight and the loads placed thereon.*

**1906.5.1.3 Concrete strength.** *Sufficient strength shall be demonstrated by structural analysis of the proposed loads, the strength of the forming and shoring system, and concrete strength data. Concrete strength data shall be based on tests of field-cured cylinders or, when approved by the commissioner, on other procedures for evaluating concrete strength.*

**1906.5.2 Construction loads.** *No construction loads exceeding the combination of superimposed dead load plus specified live load shall be supported on any unshored portion of the structure under construction, unless analysis indicates adequate strength to support such additional loads.*

**1906.5.3 Prestressed members.** *Form supports for prestressed concrete members shall not be removed until sufficient prestressing has been applied to prestressed members to carry their dead load and anticipated construction loads.*

**1906.5.4 Manner of removal.** *Forms shall be removed in such a manner as to assure the complete safety of the structure and workers.*

**1906.5.5 Shores support.** *Where the structure as a whole is supported on shores, beam and girder sides, columns, and similar vertical forms may be removed after the concrete is sufficiently hard to withstand damage from the removal. In no case shall the supporting forms or shoring be removed until the members have acquired sufficient strength to support safely their weight and the load thereon.*

**1906.5.6 Control tests and alternate methods.** *The results of control tests, including concrete cylinder specimens prepared in accordance with ANSI/ASTM C31, 2003a, cast-in-place cores, or other device that will produce test specimens representative of the condition of the concrete in place, of suitable size and proportions, and approved by the registered design professional of record shall be evidence*

*that the concrete has attained sufficient strength or the strength as may be specified on the drawings. The contractor may submit alternate methods of stripping, reshoring, and strength control for approval by the registered design professional of record, subject to review by the commissioner.*

**1906.6 Reshoring.** *Reshoring shall be provided to support the construction where forms and shores are stripped before the concrete has attained sufficient strength to support the superimposed loads due to construction above. Reshoring shall comply with Section 1906.6.1 through 1906.6.7.*

**1906.6.1 Reshores limitations.** *Reshores shall comply with the requirements of section 1906.6.1.1 through 1906.6.1.7.*

**1906.6.1.1 Secureness of reshores.** *Reshores of wood or metal shall be screw adjusted or jacked and locked and wedged to make them secure. Reshores shall not be jacked or screwed so tight that they preload the floor below or remove the normal deflection of the slab above.*

**1906.6.1.2 Reshores in proximity to facades.** *Reshores within 10 feet (3048 mm) of the facade of a building shall be secured to prevent them from falling off the building.*

**1906.6.1.3 Wedges.** *Wedges shall not be used within 10 feet (3048 mm) of the facade or at such other locations as determined by the commissioner.*

**1906.6.1.4 Stresses.** *In no case shall shores be so located as to alter the pattern of stresses determined in the original structural analysis or to induce tensile stresses where reinforcing bars are not provided.*

**1906.6.1.5 Angle to surface.** *Reshores shall be perpendicular to the surface that they are supporting.*

**1906.6.1.6 Adjusting devices.** *Adjusting devices shall not be used if heavily rusted, bent, dented, rewelded or having broken weldments or other defects.*

**1906.6.1.7 Metal shoring and accessory parts.** *Metal shoring and accessory parts shall be fully operative when in use.*

**1906.6.2 Site safety provisions.** Reshoring shall comply with all of the requirements of Chapter 33 regarding safeguards during construction and the requirements of Sections 1906.6.2.1 through 1906.6.2.3.

**1906.6.2.1 Emergency.** Extra shores or material and equipment that might be needed in an emergency shall be furnished.

**1906.6.2.2 Stripping.** Care shall be taken while stripping is underway to insure that material does not fall off the building.

**1906.6.2.3 Building materials.** Building materials shall be properly piled and tied or contained.

**1906.6.3 Bracing.** Lateral bracing shall be provided during reshoring operations, and reshores shall be located as close as practical to the same position on each floor to provide continuous support from floor to floor.

**1906.6.4 Reshoring beam and girder construction.** Where reshoring of beam and girder construction is required, the forms shall not be removed from more than one girder at a time, and the girder shall be reshored before any other supports are removed. After the supporting girders are reshored, the form shall be removed from one beam with its adjacent slabs and the beam shall be reshored before any other supports are removed. Slabs spanning 10 feet (3048 mm) or more shall be reshored along the center line of the span.

**1906.6.5 Reshoring flat slabs.** Where reshoring of flat slab construction is required, the formwork cannot be stripped until the concrete has acquired sufficient strength to safely support its weight and the load thereon, or temporary preshores are provided supporting the slab at intervals of no more than 8 feet (2438 mm) on center to be replaced by reshores prior to placing concrete on the floor above. Reshores must be installed and remain in place until the concrete reaches full or sufficient strength to sustain the superimposed loads to which the concrete will be subjected.

**1906.6.6 Stripping operation.** Waste debris as a result of stripping operations shall be immediately contained and removed at reasonable intervals. Stripping operations on concrete structures shall not be performed more than three stories below the story being formed.

**1906.6.7 Prestressed construction.** Solid safety shields shall be provided at end anchorages of prestressing beds, or where necessary, for protection against breakage of prestressing strands, cables, or other assemblies during prestressing or casting operations.

**1906.7 Conduits and pipes embedded in concrete.** Conduits, pipes and sleeves of any material not harmful to concrete and within the limitations of ACI 318, Section 6.3, are permitted to be embedded in concrete with approval of the registered design professional of record.

**1906.8 Construction joints.** Construction joints shall comply with the provisions of Sections 1906.8.1 through 1906.8.6.

**1906.8.1 Surface cleaning.** The surface of concrete construction joints shall be cleaned and laitance removed.

**1906.8.2 Joint treatment.** Immediately before new concrete is placed, construction joints shall be wetted and standing water removed.

**1906.8.3 Location for force transfer.** Construction joints shall be so made and located as not to impair the strength of the structure. Provision shall be made for the transfer of shear and other forces through construction joints in accordance with ACI 318, Section 11.7.9.

**1906.8.4 Location in slabs, beams and girders.** Construction joints in floors shall be located within the middle third of spans of slabs, beams and girders. Joints in girders shall be offset a minimum distance of two times the width of intersecting beams.

**1906.8.5 Vertical support.** Beams, girders or slabs supported by columns or walls shall not be cast or erected until concrete in the vertical support members is no longer plastic.

**1906.8.6 Monolithic placement.** Beams, girders, haunches, drop panels and capitals shall be placed monolithically as part of a slab system, unless otherwise shown in the design drawings or specifications.

## **SECTION BC 1907 DETAILS OF REINFORCEMENT**

**1907.1 Hooks.** Standard hooks on reinforcing bars used in concrete construction shall comply with ACI

318, Section 7.1.

**1907.2 Minimum bend diameters.** Minimum reinforcement bend diameters utilized in concrete construction shall comply with ACI 318, Section 7.2.

**1907.3 Bending.** The bending of reinforcement shall comply with Sections 1907.3.1 and 1907.3.2.

**1907.3.1 Cold bending.** Reinforcement shall be bent cold, unless otherwise permitted by the registered design professional of record.

**1907.3.2 Embedded reinforcement.** Reinforcement partially embedded in concrete shall not be field bent, except as shown on the construction documents or permitted by the registered design professional of record.

**1907.4 Surface conditions of reinforcement.** The surface conditions of reinforcement shall comply with the provisions of Sections 1907.4.1 through 1907.4.3.

**1907.4.1 Coatings.** At the time concrete is placed, reinforcement shall be free from mud, oil or other nonmetallic coatings that decrease bond. Epoxy coatings of steel reinforcement in accordance with ACI 318, Sections 3.5.3.7 and 3.5.3.8, are permitted.

**1907.4.2 Rust or mill scale.** Except for prestressing steel, steel reinforcement with rust, mill scale or a combination of both, shall be permitted, provided the minimum dimensions, including height of deformations and weight of a hand-wire-brushed test specimen, comply with applicable ASTM specifications specified in Section 1903.5.

**1907.4.3 Prestressing steel.** Prestressing steel shall be clean and free of oil, dirt, scale, pitting and excessive rust. A light coating of rust is permitted.

**1907.5 Placing reinforcement.** The placement of concrete reinforcement shall comply with the provisions of Sections 1907.5.1 through 1907.5.4.

**1907.5.1 Support.** Reinforcement, including tendons, and posttensioning ducts shall be accurately placed and adequately supported before concrete is placed, and shall be secured against displacement within tolerances permitted in Section 1907.5.2. Where approved by the registered design professional of record, embedded items (such as dowels or inserts) that either protrude from precast concrete

*members or remain exposed for inspection are permitted to be embedded while the concrete is in a plastic state, provided the following conditions are met:*

- 1. Embedded items are maintained in the correct position while the concrete remains plastic.*
- 2. The concrete is properly consolidated around the embedded item. Embedded items are not required to be hooked or tied to reinforcement within the concrete.*

***1907.5.2 Tolerances.*** *Unless otherwise specified by the registered design professional of record, reinforcement, including tendons, and posttensioning ducts shall be placed within the tolerances specified in Sections 1907.5.2.1 and 1907.5.2.2.*

***1907.5.2.1 Depth and cover.*** *Tolerance for depth,  $d$ , and minimum concrete cover in flexural members, walls and compression members shall be as shown in Table 1907.5.2.1, except that tolerance for the clear distance to formed soffits shall be minus  $\frac{1}{4}$  inch (6.4 mm) and tolerance for cover shall not exceed minus one-third the minimum concrete cover required in the design drawings or specifications.*

**TABLE 1907.5.2.1**  
**TOLERANCES**

<b>DEPTH (d)</b>	<b>TOLERANCE ON</b>	<b>TOLERANCE ON</b>
	<b>d</b>	<b>MINIMUM</b>
$d \leq 8$	$\pm \frac{3}{8}$	$-\frac{3}{8}$
$d > 8$	$\pm \frac{1}{2}$	$-\frac{1}{2}$

**1907.5.2.2 Bends and ends.** Tolerance for longitudinal location of bends and ends of reinforcement shall be  $\pm 2$  inches ( $\pm 51$  mm) except the tolerance shall be  $\pm \frac{1}{2}$  inch ( $\pm 12.7$  mm) at the discontinuous ends of brackets and corbels, and  $\pm 1$  inch (25 mm) at the discontinuous ends of other members. The tolerance for minimum concrete cover of Section 1907.5.2.1 shall also apply at discontinuous ends of members.

**1907.5.3 Welded wire fabric.** Welded wire fabric with wire size not greater than W5 or D5 used in slabs not exceeding 10 feet (3048 mm) in span is permitted to be curved from a point near the top of the slab over the support to a point near the bottom of the slab at midspan, provided such reinforcement is either continuous over, or securely anchored at support.

**1907.5.4 Welding.** Welding of crossing bars shall not be permitted for assembly of reinforcement unless authorized by the registered design professional of record.

**1907.6 Spacing limits for reinforcement.** The clear distance between reinforcing bars, bundled bars, tendons and ducts shall comply with ACI 318, Section 7.6.

**1907.7 Concrete protection for reinforcement.** The minimum concrete cover for reinforcement shall comply with Sections 1907.7.1 through 1907.7.7.

**1907.7.1 Cast-in-place concrete (nonprestressed).** Minimum concrete cover shall be provided for reinforcement in nonprestressed, cast-in-place concrete construction in accordance with Table 1907.7.1, but shall not be less than required by Sections 1907.7.5 and 1907.7.7.

**TABLE 1907.7.1  
MINIMUM CONCRETE COVER**

CONCRETE EXPOSURE	MINIMUM COVER (inches)
1. Concrete cast against and permanently exposed to earth	3
2. Concrete exposed to earth or weather No. 6 through No. 18 bar No. 5 bar, W31 or D31 wire, and smaller	2 1½
3. Concrete not exposed to weather or in contact with ground Slabs, walls, joists: No. 14 and No. 18 bars No. 11 bar and smaller Beams, columns: Primary reinforcement, ties, stirrups, spirals Shells, folded plate members: No. 6 bar and larger No. 5 bar, W31 or D31 wire, and smaller	1½ ¾ 1½ ¾ ½

For SI: 1 inch = 25.4 mm.

**1907.7.2 Cast-in-place concrete (prestressed).** *The minimum concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in cast-in-place prestressed concrete shall comply with ACI 318, Section 7.7.2.*

**1907.7.3 Precast concrete (manufactured under plant control conditions).** *The minimum concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in precast concrete manufactured under plant control conditions shall comply with ACI 318, Section 7.7.3.*

**1907.7.4 Bundled bars.** *The minimum concrete cover for bundled bars shall comply with ACI 318, Section 7.7.4.*

**1907.7.5 Corrosive environments.** *In corrosive environments or other severe exposure conditions, prestressed and nonprestressed reinforcement shall be provided with additional protection in accordance with ACI 318, Section 7.7.5.*

**1907.7.6 Future extensions.** *Exposed reinforcement, inserts and plates intended for bonding with future extensions shall be protected from corrosion.*

**1907.7.7 Fire protection.** *When this code requires a thickness of cover for fire protection greater than the minimum concrete cover specified in Section 1907.7, such greater thickness shall be used.*

**1907.8 Special reinforcement details for columns.** *Offset bent longitudinal bars in columns and load transfer in structural steel cores of composite compression members shall comply with the provisions of ACI 318, Section 7.8.*

**1907.9 Connections.** *Connections between concrete framing members shall comply with the provisions of ACI 318, Section 7.9.*

**1907.10 Lateral reinforcement for compression members.** *Lateral reinforcement for compression members shall comply with the provisions of ACI 318, Section 7.10.*

**1907.11 Lateral reinforcement for flexural members.** *Lateral reinforcement for compression reinforcement in flexural members shall comply with the provisions of ACI 318, Section 7.11.*

**1907.12 Shrinkage and temperature reinforcement.** *Reinforcement for shrinkage and temperature stresses in concrete members shall comply with the provisions of ACI 318, Section 7.12.*

**1907.13 Requirements for structural integrity.** *The detailing of reinforcement and connections between concrete members shall comply with the provisions of ACI 318, Section 7.13.*

**SECTION BC 1908**  
**MODIFICATIONS TO ACI 318**

**1908.1 General.** *The text of ACI 318 shall be modified as indicated in Sections 1908.1.1 through 1908.1.7.*

**1908.1.1 ACI 318, Section 21.1.** *Modify existing definitions and add the following definitions to ACI 318, Section 21.1.*

**DESIGN DISPLACEMENT.** *Total lateral displacement expected for the design-basis earthquake, as specified by Section 9.5.5.7 of ASCE 7 or 1617.5.4 of this code.*

**STORY DRIFT RATIO.** *The design displacement over a story divided by the story height.*

**WALL PIER.** *A wall segment with a horizontal length-to-thickness ratio of at least 2.5, but not exceeding six, whose clear height is at least two times its horizontal length.*

**1908.1.2 ACI 318, Section 21.2.1.** *Modify Sections 21.2.1.2, 21.2.1.3 and 21.2.1.4 to read as follows:*

*21.2.1.2 For structures assigned to Seismic Design Category B, provisions of Chapters 1 through 18 and 22 shall apply except as modified by the provisions of this chapter. Where the seismic design loads are computed using provisions for intermediate or special concrete systems, the requirements of Chapter 21 for intermediate or special systems, as applicable, shall be satisfied.*

*21.2.1.3 For structures assigned to Seismic Design Category C, intermediate or special moment frames, or ordinary or special reinforced concrete structural walls shall be used to resist seismic forces induced by earthquake motions. Where the design seismic loads are computed using provisions for special concrete systems, the requirements of Chapter 21 for special systems, as applicable, shall be satisfied.*

*21.2.1.4 For structures assigned to Seismic Design Category D, E or F, special moment frames, special reinforced concrete structural walls, diaphragms and trusses and foundations complying with Sections 21.2 through 21.10 shall be used to resist forces induced by earthquake motions*

*when special systems are required. Intermediate moment frames and ordinary reinforced concrete walls, where allowed, shall comply with Chapter 21. Frame members not proportioned to resist earthquake forces shall comply with Section 21.11.*

**1908.1.3 ACI 318, Section 21.2.5.** *Modify ACI 318, Section 21.2.5, by renumbering as Section 21.2.5.1 and adding new Sections 21.2.5.2, 21.2.5.3 and 21.2.5.4 to read as follows:*

*21.2.5 Reinforcement in members resisting earthquake-induced forces.*

*21.2.5.1 Except as permitted in Sections 21.2.5.2 through 21.2.5.4, reinforcement resisting earthquake-induced flexural and axial forces in frame members and in structural wall boundary elements shall comply with ASTM A 706. ASTM 615, Grades 40 and 60 reinforcement, shall be permitted in these members if (a) the actual yield strength based on mill tests does not exceed the specified yield strength by more than 18,000 psi (retests shall not exceed this value by more than an additional 3,000 psi), and (b) the ratio of the actual ultimate tensile strength to the actual tensile yield strength is not less than 1.25.*

*21.2.5.2 Prestressing steel shall be permitted in flexural members of frames, provided the average prestress,  $f_{pc}$ , calculated for an area equal to the member's shortest cross-sectional dimension multiplied by the perpendicular dimension shall be the lesser of 700 psi (4.83MPa) or  $f'_c / 6$  at locations of nonlinear action where prestressing steel is used in members of frames.*

*21.2.5.3 Unless the seismic-force-resisting frame is qualified for use through structural testing as required by the ACI Provisional Standard ITG/T1.1, for members in which prestressing steel is used together with mild reinforcement to resist earthquake-induced forces, prestressing steel shall not provide more than one-quarter of the strength for either positive or negative moments at the nonlinear action location and shall be anchored at the exterior face of the joint or beyond.*

*21.2.5.4 Anchorages for tendons must be demonstrated to perform satisfactorily for seismic loadings. Anchorage assemblies shall withstand, without failure, a minimum of 50 cycles of loading ranging between 40 and 85 percent of the minimum specified tensile strength of the prestressing steel.*

**1908.1.4 ACI 318, Section 21.7.** *Modify ACI 318, Section 21.7, by adding a new Section 21.7.10 to read as follows:*

21.7.10 Wall piers and wall segments.

21.7.10.1 Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in Section 21.7.10.2.

**Exceptions:**

1. Wall piers that satisfy Section 21.11.
2. Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers, and such segments have a total stiffness of at least six times the sum of the stiffness of all the wall piers.

21.7.10.2 Transverse reinforcement shall be designed to resist the shear forces determined from Sections 21.3.4.2 and 21.4.5.1. Where the axial compressive force, including earthquake effects, is less than  $A_g f'_c / 20$ , transverse reinforcement in wall piers is permitted to have standard hooks at each end in lieu of hoops. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least the development length of the largest longitudinal reinforcement in the wall pier.

21.7.10.3 Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

**1908.1.5 ACI 318, Section 21.10.1.1.** Modify ACI 318, Section 21.10.1.1, to read as follows:

21.10.1.1 Foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and the ground shall comply with the requirements of Section 21.10 and other applicable provisions of ACI 318 unless modified by Chapter 18 of this code.

**1908.1.6 ACI 318, Section 21.11.** Modify ACI Sections 21.11.1 and 21.11.2.2 and add Sections 21.11.5 through 21.11.7 as follows:

21.11.1 Frame members assumed not to contribute to lateral resistance shall be detailed according to Section 21.11.2 or 21.11.3 depending on the magnitude of moments induced in those members when subjected to the design displacement. If effects of design displacements are not explicitly checked, it shall be permitted to apply the requirements of Section 21.11.3. Slab-column

connections shall comply with Sections 21.11.5 through 21.11.7. Conformance to Section 21.11 satisfies the deformation compatibility requirements of Section 9.5.2.2.4.3 of ASCE 7.

21.11.2.2 Members with factored gravity axial forces exceeding  $(A_g f'_c / 10)$  shall satisfy Sections 21.4.3, 21.4.4.1(c), 21.4.4.3 and 21.4.5. The maximum longitudinal spacing of ties shall be,  $S_{\phi}$  for the full column height. The spacing,  $S_{\phi}$ , shall not be more than six diameters of the smallest longitudinal bar enclosed or 6 inches (152 mm), whichever is smaller. Lap splices of longitudinal reinforcement in such members need not satisfy Section 21.4.3.2 in structures where the seismic force-resisting system does not include special moment frames.

21.11.5 Reinforcement to resist punching shear shall be provided in accordance with Sections 21.11.5.1 and 21.11.5.2 at slab column connections where story drift ratio exceeds  $[0.035 - 0.05 (V_u / \Phi V_c)]$  except that Sections 21.11.5.1 and 21.11.5.2 need not be satisfied where  $V_u / \Phi V_c$  is less than 0.2 or where the story drift ratio is less than 0.005.  $V_u$  equals the factored punching shear from gravity load excluding shear stress from unbalanced moment.  $V_u$  is calculated for the load combination  $1.2D + 1.0L + 0.2S$ . The load factor on  $L$  is permitted to be reduced to 0.5 in accordance with Section 9.2.1(a). In no case shall shear reinforcement be less than that required in Section 11.12 for loads without consideration of seismic effects.

21.11.5.1 — The slab shear reinforcement shall provide  $V_s$  not less than  $3.5 \sqrt{f'_c}$ .

21.11.5.2 — Slab shear reinforcement shall extend not less than five times the slab thickness from the face of column.

21.11.6 — Bottom bars or wires within the column strip shall conform to Section 13.3.8.5 except that splices shall be Class B.

21.11.7—Within the effective slab width defined in Section 13.5.3.2, the ratio of nonprestressed bottom reinforcement to gross concrete area shall not be less than 0.004. Where bottom reinforcement is not required to be continuous, such reinforcement shall extend a minimum of five times the slab thickness plus one development length beyond the face of the column or terminated at the slab edge with a standard hook.

**1908.1.7 ACI 318, Section 21.13.2.** Modify ACI 318, Section 21.13.2, to read as follows:

21.13.2 In connections between wall panels, or between wall panels and the foundation, yielding

*shall be restricted to reinforcement.*

**1908.2 General.** *The text of ACI 318 shall be modified as indicated in Sections 1908.2.1 through 1908.2.4.*

**1908.2.1 ACI 318, Section 10.15.** *Modify ACI 318 by adding Section 10.15.4 to read as follows:*

*10.15.4 When the specified compressive strength of concrete in a column is greater than 1.4 times that specified for a floor system, the following additional requirements shall be adhered to:*

- 1. All of the design provisions of Section 10.15 (unmodified) are adhered to.*
- 2. The concrete construction is supervised and inspected continuously by a full-time professional engineer responsible for the concrete placement special inspection. Such professional engineer shall not delegate this responsibility to any subordinates.*

**1908.2.2 ACI 318, Section 16.3.** *Modify ACI 318 by adding Section 16.3.3 to read as follows:*

*16.3.3 - Lifting devices shall have a capacity sufficient to support four times the appropriate portion of the member's dead weight. The inclination of the lifting force shall be considered.*

**1908.2.3 ACI 318, Section 21.12.3.** *Modify ACI 318, Section 21.12.3 to read as follows:*

*21.12.3* *Design shear strength of beams and columns resisting earthquake effect shall not be less than either 1 or 2:*

- 1. The sum of the shear associated with development of nominal moment strengths of the member at each restrained end of the clear span and the shear calculated for factored gravity loads;*
- 2. The maximum shear obtained from design load combinations that include earthquake effect E, with E assumed to be twice that prescribed by this code for earthquake-resistant design.*

**1908.2.4 ACI 318, Section 21.12.6.8.** *Modify ACI 318, Section 21.12.6.8 to read as follows:*

*21.12.6.8 At the critical sections for columns defined in 11.12.1.2, two-way shear caused by*

factored gravity loads shall not exceed  $0.4 V_c$ , where  $V_c$  shall be calculated as defined in 11.12.2.1. for nonprestressed slabs and in 11.12.2.2. for prestressed slabs. For slabs with shear reinforcing, it shall be permitted to waive this requirement if the contribution of the earthquake-induced factored two way shear stress transferred by eccentricity of shear in accordance with 11.12.6.1 and 11.12.6.2 at the point of maximum stress does not exceed one-half of the stress  $V_n$  permitted by 11.12.6.2.

## **SECTION BC 1909**

### **STRUCTURAL PLAIN CONCRETE**

**1909.1 Scope.** The design and construction of structural plain concrete, both cast-in-place and precast, shall comply with the minimum requirements of Section 1909 and ACI 318, Chapter 22.

**1909.1.1 Special structures.** For special structures, such as arches, underground utility structures, gravity walls and shielding walls, the provisions of Section 1909 shall govern where applicable.

**1909.2 Limitations.** The use of structural plain concrete columns and structural plain concrete footings on piles is not permitted. In addition to the limitations set forth in Section 1910 of this chapter, the use of structural plain concrete shall otherwise be limited to:

1. Members that are continuously supported by soil, such as walls and footings, or by other structural members capable of providing continuous vertical support.
2. Members for which arch action provides compression under all conditions of loading.
3. Walls and pedestals.

**1909.3 Joints.** Contraction or isolation joints shall be provided to divide structural plain concrete members into flexurally discontinuous elements in accordance with ACI 318, Section 22.3.

**1909.4 Design.** Structural plain concrete walls, footings and pedestals shall be designed for adequate strength in accordance with ACI 318, Sections 22.4 through 22.8.

**Exception:** For Group R-3 occupancies and buildings of other occupancies less than two stories in height of light-frame construction, the required edge thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either

*side of the supported wall.*

**1909.5 Precast members.** *The design, fabrication, transportation and erection of precast, structural plain concrete elements shall be in accordance with ACI 318, Section 22.9.*

**1909.6 Walls.** *In addition to the requirements of this section, structural plain concrete walls shall comply with the applicable requirements of ACI 318, Chapter 22.*

**1909.6.1 Basement walls.** *The thickness of exterior basement walls and foundation walls shall be not less than 7½ inches (191 mm). Structural plain concrete exterior basement walls shall be exempt from the requirements for special exposure conditions of Section 1904.2.2.*

**1909.6.2 Other walls.** *Except as provided in Section 1909.6.1, the thickness of bearing walls shall be not less than  $1/24$  the unsupported height or length, whichever is shorter, but not less than 5½ inches (140 mm).*

**1909.6.3 Openings in walls.** *Not less than two No. 5 bars shall be provided around window and door openings. Such bars shall extend at least 24 inches (610 mm) beyond the corners of openings.*

## **SECTION BC 1910 SEISMIC DESIGN PROVISIONS**

**1910.1 General.** *The design and construction of concrete components that resist seismic forces shall conform to the requirements of this section and to ACI 318 as modified by Section 1908.*

**1910.2 Classification of shear walls.** *Structural concrete shear walls that resist seismic forces shall be classified in accordance with Sections 1910.2.1 through 1910.2.4.*

**1910.2.1 Ordinary plain concrete shear walls.** *Ordinary plain concrete shear walls are walls conforming to the requirements of Chapter 22 of ACI 318.*

**1910.2.2 Detailed plain concrete shear walls.** *Detailed plain concrete shear walls are walls conforming to the requirements for ordinary plain concrete shear walls and shall have reinforcement as follows: Vertical reinforcement of at least 0.20 square inch (129 mm<sup>2</sup>) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for*

one of the two No. 5 bars required by Section 22.6.6.5 of ACI 318. Horizontal reinforcement at least 0.20 square inch (129 mm<sup>2</sup>) in cross-sectional area shall be provided:

1. Continuously at structurally connected roof and floor levels and at the top of walls;
2. At the bottom of load-bearing walls or in the top of foundations where doweled to the wall;  
and
3. At a maximum spacing of 120 inches (3048 mm).

Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.

**1910.2.3 Ordinary reinforced concrete shear walls.** Ordinary reinforced concrete shear walls are walls conforming to the requirements of ACI 318 for ordinary reinforced concrete structural walls.

**1910.2.4 Special reinforced concrete shear walls.** Special reinforced concrete shear walls are walls conforming to the requirements of ACI 318 for special reinforced concrete structural walls or special precast structural walls.

**1910.3 Seismic Design Category B.** Structures assigned to Seismic Design Category B, as determined in accordance with Section 1616, shall conform to the requirements for Seismic Design Category A and to the additional requirements for Seismic Design Category B of this section.

**1910.3.1 Ordinary moment frames.** In flexural members of ordinary moment frames forming part of the seismic-force-resisting system, at least two main flexural reinforcing bars shall be provided continuously top and bottom throughout the beams, through or developed within exterior columns or boundary elements.

**1910.3.1.1 Shear.** Columns of ordinary moment frames having a clear height-to-maximum-plan-dimension ratio of five or less shall be designed for shear in accordance with Section 21.12.3 of ACI 318.

**1910.4 Seismic Design Category C.** Structures assigned to Seismic Design Category C, as determined in accordance with Section 1616, shall conform to the requirements for Seismic Design Category B and to the additional requirements for Seismic Design Category C of this section.

**1910.4.1 Seismic-force-resisting systems.** Moment frames used to resist seismic forces shall be intermediate moment frames or special moment frames. Shear walls used to resist seismic forces shall be ordinary reinforced concrete shear walls or special reinforced concrete shear walls. Ordinary reinforced concrete shear walls constructed of precast concrete elements shall comply with the additional requirements of Section 21.13 of ACI 318 for intermediate precast concrete structural walls, as modified by Section 1908.1.7.

**1910.4.2 Discontinuous members.** Columns supporting reactions from discontinuous stiff members, such as walls, shall be designed for the special load combinations in Section 1605.4 and shall be provided with transverse reinforcement at the spacing,  $S_o$ , as defined in Section 21.12.5.2 of ACI 318 over their full height beneath the level at which the discontinuity occurs. This transverse reinforcement shall be extended above and below the column as required in Section 21.4.4.5 of ACI 318.

**1910.4.3 Plain concrete.** Structural plain concrete members in structures assigned to Seismic Design Category C shall conform to ACI 318 and with Sections 1910.4.3.1 through 1910.4.3.3.

**1910.4.3.1 Walls.** Structural plain concrete walls are not permitted in structures assigned to Seismic Design Category C.

**Exception:** Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings constructed with stud-bearing walls. Such walls shall have reinforcement in accordance with Section 22.6.6.5 of ACI 318.

**1910.4.3.2 Footings.** Isolated footings of plain concrete supporting pedestals or columns are permitted provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.

**Exception:** In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.

**1910.4.3.2.1 Reinforcing bars.** Plain concrete footings supporting walls shall be provided with not less than two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings which exceed 8 inches (203 mm) in thickness, a minimum of

*one bar shall be provided at the top and bottom of the footing. For foundation systems consisting of a plain concrete footing and a plain concrete stem wall, a minimum of one bar shall be provided at the top of the stem wall and at the bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.*

**Exceptions:**

- 1. In detached one- and two-family dwellings three stories or less in height and constructed with stud-bearing walls, plain concrete footings supporting walls are permitted without longitudinal reinforcement.*
- 2. Where a slab-on-ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top or bottom of the footing.*

**1910.4.3.3 Pedestals.** *Plain concrete pedestals shall not be used to resist lateral seismic forces.*

**1910.5 Seismic Design Category D.** *Structures assigned to Seismic Design Category D, as determined in accordance with Section 1616, shall conform to the requirements for Seismic Design Category C and to the additional requirements of this section.*

**1910.5.1 Seismic-force-resisting systems.** *Moment frames used to resist seismic forces shall be special moment frames. Shear walls used to resist seismic forces shall be special reinforced concrete shear walls.*

**1910.5.2 Frame members not proportioned to resist forces induced by earthquake motions.** *Frame components assumed not to contribute to lateral force resistance shall conform to ACI 318, Section 21.11, as modified by Section 1908.1. 6 of this chapter.*

## **SECTION BC 1911**

### **MINIMUM SLAB PROVISIONS**

**1911.1 General.** *The thickness of concrete floor slabs supported directly on the ground shall not be less than 3½ inches (89 mm). A 6-mil (0.006 inch; 0.152 mm) polyethylene vapor retarder with joints lapped not less than 6 inches (152 mm) shall be placed between the base course or subgrade and the concrete floor slab, or other acceptable equivalent methods or materials shall be used to retard vapor transmission through the floor slab.*

**Exception:** A vapor retarder is not required:

1. For detached structures accessory to occupancies in Group R-3, such as garages, utility buildings or other unheated facilities.
2. For unheated storage rooms having an area of less than 70 square feet (6.5 m<sup>2</sup>) and carports attached to occupancies in Group R-3.
3. For buildings of other occupancies where migration of moisture through the slab from below will not be detrimental to the intended occupancy of the building.
4. For drive ways, walks, patios and other flat work that will not be enclosed at a later date.
5. Where approved based on local site conditions.

## **SECTION BC 1912**

### **ANCHORAGE TO CONCRETE—ALLOWABLE STRESS DESIGN**

**1912.1 Scope.** The provisions of this section shall govern the allowable stress design of headed bolts and headed stud anchors cast in normal-weight concrete for purposes of transmitting structural loads from one connected element to the other. These provisions do not apply to anchors installed in hardened concrete or where load combinations include earthquake loads or effects. The bearing area of headed anchors shall be not less than one and one-half times the shank area. Where strength design is used, or where load combinations include earthquake loads or effects, the design strength of anchors shall be determined in accordance with Section 1913. Bolts shall conform to ASTM A 307 or an acceptable equivalent.

**1912.2 Allowable service load.** The allowable service load for headed anchors in shear or tension shall be as indicated in Table 1912.2. Where anchors are subject to combined shear and tension, the following relationship shall be satisfied:

$$(P_s/P_t)^{5/3} + (V_s/V_t)^{5/3} \leq 1 \quad \text{(Equation 19-1)}$$

where:

$P_s$  = Applied tension service load, pounds (newtons).

$P_t$  = Allowable tension service load from Table 1912.2, pounds (newtons).

$V_s$  = Applied shear service load, pounds (newtons).

$V_t$  = Allowable shear service load from Table 1912.2, pounds (newtons).

**TABLE 1912.2**  
**ALLOWABLE SERVICE LOAD ON EMBEDDED BOLTS (pounds)**

BOLT DIAMETER (inches)	MINIMUM EMBEDMENT (inches)	EDGE DISTANCE (inches)	SPACING (inches)	MINIMUM CONCRETE STRENGTH (psi)					
				$f'_c = 2,500$		$f'_c = 3,000$		$f'_c = 4,000$	
				Tension	Shear	Tension	Shear	Tension	Shear
$\frac{1}{4}$	$2\frac{1}{2}$	$1\frac{1}{2}$	3	200	500	200	500	200	500
$\frac{3}{8}$	3	$2\frac{1}{4}$	$4\frac{1}{2}$	500	1,100	500	1,100	500	1,100
$\frac{1}{2}$	4	3	6	950	1,250	950	1,250	950	1,250
	4	5	5	1,450	1,600	1,500	1,650	1,550	1,750
$\frac{5}{8}$	$4\frac{1}{2}$	$3\frac{3}{4}$	$7\frac{1}{2}$	1,500	2,750	1,500	2,750	1,500	2,750
	$4\frac{1}{2}$	$6\frac{1}{4}$	$7\frac{1}{2}$	2,125	2,950	2,200	3,000	2,400	3,050
$\frac{3}{4}$	5	$4\frac{1}{2}$	9	2,250	3,250	2,250	3,560	2,250	3,560
	5	$7\frac{1}{2}$	9	2,825	4,275	2,950	4,300	3,200	4,400
$\frac{7}{8}$	6	$5\frac{1}{4}$	$10\frac{1}{2}$	2,550	3,700	2,550	4,050	2,550	4,050
1	7	6	12	3,050	4,125	3,250	4,500	3,650	5,300
$1\frac{1}{8}$	8	$6\frac{3}{4}$	$13\frac{1}{2}$	3,400	4,750	3,400	4,750	3,400	4,750
$1\frac{1}{4}$	9	$7\frac{1}{2}$	15	4,000	5,800	4,000	5,800	4,000	5,800

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 0.00689 MPa, 1 pound = 4.45 N.

**1912.3 Required edge distance and spacing.** *The allowable service loads in tension and shear specified in Table 1912.2 are for the edge distance and spacing specified. The edge distance and spacing are permitted to be reduced to 50 percent of the values specified with an equal reduction in allowable service load. Where edge distance and spacing are reduced less than 50 percent, the allowable service load shall be determined by linear interpolation.*

**1912.4 Reserved.**

**1912.5 Increase for special inspection.** *Where special inspection is provided for the installation of anchors, a 100-percent increase in the allowable tension values of Table 1912.2 is permitted. No increase in shear value is permitted.*

### **SECTION BC 1913 ANCHORAGE TO CONCRETE—STRENGTH DESIGN**

**1913.1 Scope.** *The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318, provided they are within the scope of Appendix D.*

**Exception:** *Where the basic concrete breakout strength in tension of a single anchor,  $N_b$ , is determined in accordance with Equation (D-7), the concrete breakout strength requirements of Section D.4.2.2 shall be considered satisfied by the design procedures of Sections D.5.2 and D.6.2 for anchors exceeding 2 inches (51 mm) in diameter or 25 inches (635 mm) tensile embedment depth.*

**1913.1.1 Anchors outside scope of Appendix D.** *The strength design of anchors that are not within the scope of Appendix D of ACI 318, as modified by this code, shall be in accordance with a procedure subject to the approval of the commissioner.*

### **SECTION BC 1914 SHOTCRETE**

**1914.1 General.** *Shotcrete is mortar or concrete that is pneumatically projected at high velocity onto a surface. Except as specified in this section, shotcrete shall conform to the requirements of this chapter for*

*plain or reinforced concrete.*

**1914.2 Proportions and materials.** Shotcrete proportions shall be selected that allow suitable placement procedures using the delivery equipment selected and shall result in finished in-place hardened shotcrete meeting the strength requirements of this code.

**1914.3 Aggregate.** Coarse aggregate, if used, shall not exceed  $\frac{3}{4}$  inch (19.1 mm).

**1914.4 Reinforcement.** Reinforcement used in shotcrete construction shall comply with the provisions of Sections 1914.4.1 through 1914.4.4.

**1914.4.1 Size.** The maximum size of reinforcement shall be No. 5 bars unless it is demonstrated by preconstruction tests that adequate encasement of larger bars will be achieved.

**1914.4.2 Clearance.** When No. 5 or smaller bars are used, there shall be a minimum clearance between parallel reinforcement bars of 2½ inches (64 mm). When bars larger than No. 5 are permitted, there shall be a minimum clearance between parallel bars equal to six diameters of the bars used. When two curtains of steel are provided, the curtain nearer the nozzle shall have a minimum spacing equal to 12 bar diameters and the remaining curtain shall have a minimum spacing of six bar diameters.

**Exception:** Subject to the approval of the commissioner, required clearances shall be reduced where it is demonstrated by preconstruction tests that adequate encasement of the bars used in the design will be achieved.

**1914.4.3 Splices.** Lap splices of reinforcing bars shall utilize the noncontact lap splice method with a minimum clearance of 2 inches (51 mm) between bars. The use of contact lap splices necessary for support of the reinforcing is permitted when approved by the commissioner, based on satisfactory preconstruction tests that show that adequate encasement of the bars will be achieved, and provided that the splice is oriented so that a plane through the center of the spliced bars is perpendicular to the surface of the shotcrete.

**1914.4.4 Spirally tied columns.** Shotcrete shall not be applied to spirally tied columns.

**1914.5 Preconstruction tests.** When required by the commissioner, a test panel shall be shot, cured, cored or sawn, examined and tested prior to commencement of the project. The sample panel shall be

representative of the project and simulate job conditions as closely as possible. The panel thickness and reinforcing shall reproduce the thickest and most congested area specified in the structural design. It shall be shot at the same angle, using the same nozzleman and with the same concrete mix design that will be used on the project. The equipment used in preconstruction testing shall be the same equipment used in the work requiring such testing, unless substitute equipment is approved by the commissioner.

**1914.6 Rebound.** Any rebound or accumulated loose aggregate shall be removed from the surfaces to be covered prior to placing the initial or any succeeding layers of shotcrete. Rebound shall not be used as aggregate.

**1914.7 Joints.** Except where permitted herein, unfinished work shall not be allowed to stand for more than 30 minutes unless edges are sloped to a thin edge. For structural elements that will be under compression and for construction joints shown on the approved construction documents, square joints are permitted. Before placing additional material adjacent to previously applied work, sloping and square edges shall be cleaned and wetted.

**1914.8 Damage.** In-place shotcrete that exhibits sags, sloughs, segregation, honeycombing, sand pockets or other obvious defects shall be removed and replaced. Shotcrete above sags and sloughs shall be removed and replaced while still plastic.

**1914.9 Curing.** During the curing periods specified herein, shotcrete shall be maintained above 40°F (4°C) and in moist condition.

**1914.9.1 Initial curing.** Shotcrete shall be kept continuously moist for 24 hours after shotcreting is complete or shall be sealed with an approved curing compound.

**1914.9.2 Final curing.** Final curing shall continue for seven days after shotcreting, or for three days if high-early-strength cement is used, or until the specified strength is obtained. Final curing shall consist of the initial curing process or the shotcrete shall be covered with an approved moisture-retaining cover.

**1914.9.3 Natural curing.** Natural curing shall not be used in lieu of that specified in this section unless the relative humidity remains at or above 85 percent, and is authorized by the registered design professional of record and approved by the commissioner.

**1914.10 Strength tests.** Strength tests for shotcrete shall be made by an approved agency on specimens that

are representative of the work and that have been water soaked for at least 24 hours prior to testing. When the maximum-size aggregate is larger than  $\frac{3}{8}$  inch (9.5 mm), specimens shall consist of not less than three 3-inch-diameter (76 mm) cores or 3-inch (76 mm) cubes. When the maximum-size aggregate is  $\frac{3}{8}$  inch (9.5 mm) or smaller, specimens shall consist of not less than 2-inch-diameter (51 mm) cores or 2-inch (51 mm) cubes.

**1914.10.1 Sampling.** Specimens shall be taken from the in-place work or from test panels, and shall be taken at least once each shift, but not less than one for each 50 cubic yards (38.2 m<sup>3</sup>) of shotcrete.

**1914.10.2 Panel criteria.** When the maximum-size aggregate is larger than  $\frac{3}{8}$  inch (9.5 mm), the test panels shall have minimum dimensions of 18 inches by 18 inches (457 mm by 457 mm). When the maximum size aggregate is  $\frac{3}{8}$  inch (9.5 mm) or smaller, the test panels shall have minimum dimensions of 12 inches by 12 inches (305 mm by 305 mm). Panels shall be shot in the same position as the work, during the course of the work and by the nozzlemen doing the work. The conditions under which the panels are cured shall be the same as the work.

**1914.10.3 Acceptance criteria.** The average compressive strength of three cores from the in-place work or a single test panel shall equal or exceed  $0.85 f'_c$  with no single core less than  $0.75 f'_c$ . The average compressive strength of three cubes taken from the in-place work or a single test panel shall equal or exceed  $f'_c$  with no individual cube less than  $0.88 f'_c$ . To check accuracy, locations represented by erratic core or cube strengths shall be retested.

## **SECTION BC 1915 REINFORCED GYPSUM CONCRETE**

**1915.1 General.** Reinforced gypsum concrete shall comply with the requirements of ASTM C 317 and ASTM C 956.

**1915.2 Minimum thickness.** The minimum thickness of reinforced gypsum concrete shall be 2 inches (51 mm) except the minimum required thickness shall be reduced to 1½ inches (38 mm), provided the following conditions are satisfied:

1. The overall thickness, including the formboard, is not less than 2 inches (51 mm).
2. The clear span of the gypsum concrete between supports does not exceed 33 inches (838 mm).

3. *Diaphragm action is not required.*

4. *The design live load does not exceed 40 pounds per square foot (psf) (1915 Pa).*

**1915.3 Limitations of use.** *Reinforced gypsum concrete shall not be used where exposed directly to the weather or where subject to frequent or continuous wetting. Precast units shall be protected by coverings or coatings from the weather and from contact with moisture during shipment and during storage at the work site.*

## **SECTION BC 1916 CONCRETE-FILLED PIPE COLUMNS**

**1916.1 General.** *Concrete-filled pipe columns shall be manufactured from standard, extra-strong or double-extra-strong steel pipe or tubing that is filled with concrete so placed and manipulated as to secure maximum density and to ensure complete filling of the pipe without voids.*

**1916.2 Design.** *The safe supporting capacity of concrete-filled pipe columns shall be computed in accordance with ACI 318 and AISC-LRFD or AISC 335 or as determined by a test approved by the commissioner.*

**1916.3 Connections.** *Caps, base plates and connections shall be in accordance with ACI 318 and AISC-LRFD or AISC 335 and shall be positively attached to the shell and anchored to the concrete core. Welding of brackets without mechanical anchorage shall be prohibited. Where the pipe is slotted to accommodate webs of brackets or other connections, the integrity of the shell shall be restored by welding to ensure hooping action of the composite section.*

**1916.4 Reinforcement.** *Steel reinforcement shall be in the form of rods, structural shapes or pipe embedded in the concrete core in accordance with ACI 318 and AISC-LRFD or AISC 335 with sufficient clearance to ensure the composite action of the section, but not nearer than 1 inch (25 mm) to the exterior steel shell. Structural shapes used as reinforcement shall be milled to ensure bearing on cap and base plates.*

**1916.5 Fire-resistance-rating protection.** *Pipe columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire-resistant covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of pipe columns shall be 4 inches (102 mm) except that in structures of Type V*

construction not exceeding three stories or 40 feet (12 192 mm) in height, pipe columns used in the basement and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).

**1916.6 Approvals.** Details of column connections and splices shall be shop fabricated in accordance with ACI 318 and AISC-LRFD or AISC 335. Shop-fabricated concrete-filled pipe columns shall be inspected by an approved agency pursuant to Chapter 17 of this code.

## **SECTION BC 1917 STRUCTURAL INTEGRITY REQUIREMENTS**

**1917.1 General.** Reinforced concrete structures shall meet all the requirements of sections 1917.1 through 1917.3. Concrete slabs on metal deck shall be governed by the provisions of Chapter 22. Reinforcement provided for gravity, seismic and wind forces or for other purposes may be regarded as forming part of, or the whole of, these requirements. Reinforcing provided for one requirement may be counted towards the other requirements.

**1917.2 Continuity and ties.** The structural integrity requirements of ACI 318, Section 7.13, shall apply. In addition, the following requirements shall be met.

**1917.2.1 Slab reinforcement.** At all floor and roof levels, slabs shall have a mat of bottom reinforcement in two perpendicular (or roughly perpendicular) directions. Reinforcement in this bottom mat shall be made continuous with lap, mechanical or welded tension splices.

**1917.2.1.1 Bottom mat reinforcement.** In each direction, the bottom mat reinforcement shall be not less than, the steel required for temperature reinforcement. The bottom mat reinforcement shall be anchored at discontinuous edges within the column strip, re-entrant corners, elevation changes and anywhere else the continuity of the reinforcing is interrupted.

**Exception:** Flat plate middle strip bottom mat reinforcing perpendicular to discontinuous slab edges.

In addition, the main bottom mat reinforcement in one-way slabs shall be anchored at discontinuous edges.

**1917.2.2 Peripheral ties.** At each floor and roof level, reinforcement forming a continuous peripheral tie shall be provided. Peripheral ties shall be located within perimeter beams or walls, where they

occur, or within 4 feet (1219 mm) of the edge of slab, where perimeter beams or walls do not occur. Continuous tie reinforcement shall be equal to half of the bottom reinforcement within the edge or edge strip for two-way slabs but not less than two bars.

**1917.2.3 Horizontal ties.** At each column, beam reinforcement or slab bottom reinforcement shall be provided at each level that can develop a tension force equal to the maximum of 1 or 2:

1. Three times the load entering the column at that level, using a load combination of  $1.0 \times DL$  (self weight of structure only).
2. One and a half times the load entering the column at that level using the load combinations of  $(1.2 DL + 1.6 LL)$  or  $1.4 DL$ .

**1917.2.3.1** This beam or slab bottom reinforcement shall be distributed around the column perimeter and shall be extended on all sides of the column into the adjacent slab for at least  $\frac{1}{3}$  of the span length. Where reinforcing bars cannot be extended beyond the column (e.g., at slab edges and openings), they shall be hooked or otherwise developed within the column.

**1917.2.4 Vertical ties.** Each column and each wall carrying vertical load shall be vertically tied continuously from its lowest to highest level. The vertical ties composed of vertical column reinforcement shall be capable of resisting a tensile force equal to the maximum design dead and live load received by the column or wall from any one story within four floors below.

**1917.3 Precast concrete general.** Precast concrete structural elements shall be reinforced to meet all of the requirements of this section. However, reinforcement provided for gravity, seismic and wind forces and for other purposes may be regarded as forming part of, or the whole of, these requirements. Reinforcing provided for one requirement may be counted towards the other requirements.

**1917.3.1 Continuity and ties.** The structural integrity requirements of ACI 318, Section 16.5, shall apply. In precast and composite structures, ties within precast structural elements shall be continuous and shall be anchored to the supporting structure. In addition to Sections 1917.2.2 and 1917.2.4 the following requirements shall be met.

**1917.3.1.1 End connections.** End connections of all precast slabs, beams and girders shall have an axial tension capacity equal to the larger of the vertical shear capacity of the connection at either end, or at least 2 percent of the maximum factored vertical dead and live load in the precast

*compression element, whichever is larger, but not less than 20 kips or 2,500 pounds per linear foot of slab (36.48 kN/m). Where more than one element frames in one direction, none of the elements or connections shall have an axial tension capacity of less than 1 percent of the column load but not less than 20 kips.*

**1917.3.1.2 Side connections.** *Side connections of all precast elements shall have an axial tension capacity not less than the steel required for temperature reinforcement of the larger element at either side.*

**1917.3.1.3 Connection forces.** *For design of the connections, the transverse shear force and the axial tensile force need not be considered to act simultaneously.*

**1917.3.2 Joints.** *Joints in precast structures shall not rely on friction due to gravity to transfer load.*

**1917.3.3 Bearing.** *The net bearing area shall not be less than 2 inches (51 mm) wide and 3 inches (76 mm) long in the direction of the member.*

**CHAPTER 20**  
**ALUMINUM**

**SECTION BC 2001**  
**GENERAL**

**2001.1 Scope.** *This chapter shall govern the quality, design, fabrication and erection of aluminum.*

**SECTION BC 2002**  
**MATERIALS**

**2002.1 General.** *Aluminum used for structural purposes in buildings and structures shall comply with AA ASM 35 and Parts 1-A and 1-B of the Aluminum Design Manual. The nominal loads shall be the minimum design loads required by Chapter 16 of this code.*

**SECTION BC 2003**  
**ADDITIONAL REQUIREMENTS**

**2003.1 Identification.** *Aluminum for structural elements shall at all times in the fabricator's plant, be marked, segregated, or otherwise handled so that the separate alloys and tempers are positively identified, and after completion of fabrication shall be marked to identify alloy and temper. Such markings shall be affixed to completed members and assemblies or to boxed or bundled shipments of multiple units prior to shipment from the fabricator's plant.*

**2003.2 Quality Control.** *In addition to the requirements of Section 2002, the quality control of aluminum used for structural purposes shall comply with Sections 2003.2.1 and 2003.2.2.*

**2003.2.1 Reference.** *Welding operations in structural connections where the calculated stresses in welds are 50 percent or more of the basic allowable values shall be subjected to the special inspections as required by Chapter 17 of this code.*

**2003.2.2 Welding operations.** *Welding operations performed on aluminum used for structural purposes shall comply with the following:*

- 1. Welding work shall be performed only by persons who have obtained a license from the commissioner.*

2. *Tack welds that are not later incorporated into finished welds carrying calculated stress shall not be considered as structural welds.*

3. *The inspection of welding operations shall include a check to ascertain that the welders employed on the work have the required license.*

**2003.3 Erection.** *In addition to the requirements of Section 2002, the erection of aluminum used for structural purposes shall comply with Sections 2003.3.1 through 2003.3.3.*

**2003.3.1 Bracing.** *All framework shall be carried up true and plumb. Temporary bracing shall be provided to support all loads imposed upon the framework during construction that are in excess of those for which the framework was designed.*

**2003.3.2 Temporary Connections.** *As erection progresses, the work shall be securely bolted, or welded, to resist all dead loads, wind, and erection stresses.*

**2003.3.3 Alignment.** *The structure shall be properly aligned before riveting, permanent bolting, or welding is performed.*

**CHAPTER 21**

**MASONRY**

**SECTION BC 2101**

**GENERAL**

**2101.1 Scope.** *This chapter shall govern the materials, design, construction and quality of masonry.*

**2101.2 Design methods.** *Masonry shall comply with the provisions of one of the following design methods in this chapter as well as the requirements of Sections 2101 through 2104. Masonry designed by the working stress design provisions of Section 2101.2.1, the strength design provisions of Section 2101.2.2 or the prestressed masonry provisions of Section 2101.2.3 shall comply with Section 2105 for Quality Assurance.*

**2101.2.1 Working stress design.** *Masonry designed by the working stress design method shall comply with the provisions of Sections 2106 and 2107.*

**2101.2.2 Strength design.** *Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108.*

**2101.2.3 Prestressed masonry.** *Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of ACI 530/ASCE 5/TMS 402 and Section 2106. Special inspection during construction shall be provided as set forth in Section 1704.5.*

**2101.2.4 Empirical design.** *Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 or Chapter 5 of ACI 530/ASCE 5/TMS 402.*

**2101.2.5 Glass masonry.** *Glass masonry shall comply with the provisions of Section 2110 or with the requirements of Chapter 7 of ACI 530/ASCE 5/TMS 402.*

**2101.2.6 Masonry veneer.** *Masonry veneer shall comply with the provisions of Chapter 14.*

**2101.3 Construction documents.** *The construction documents shall show all of the items required by this code including the following:*

1. *Specified size, grade, type and location of reinforcement, anchors and wall ties.*

2. *Reinforcing bars to be welded and welding procedure.*
3. *Size and location of structural elements.*
4. *Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.*

**2101.3.1 Fireplace drawings.** *The construction documents shall describe in sufficient detail the location, size and construction of masonry fireplaces. The thickness and characteristics of materials and the clearances from walls, partitions and ceilings shall be clearly indicated. The masonry fireplace shall comply with the provisions of Section 2111.0.*

## **SECTION BC 2102**

### **DEFINITIONS AND NOTATIONS**

**2102.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**ANCHOR.** *Metal rod, wire or strap that secures masonry to its structural support.*

**ARCHITECTURAL TERRA COTTA.** *Plain or ornamental hard-burned modified clay units, larger in size than brick, with glazed or unglazed ceramic finish.*

**AREA.**

**Bedded.** *The area of the surface of a masonry unit that is in contact with mortar in the plane of the joint.*

**Gross cross-sectional.** *The area delineated by the out-to-out specified dimensions of masonry in the plane under consideration.*

**Net cross-sectional.** *The area of masonry units, grout and mortar crossed by the plane under consideration based on out-to-out specified dimensions.*

**BED JOINT.** *The horizontal layer of mortar on which a masonry unit is laid.*

**BOND BEAM.** *A horizontal grouted element within masonry in which reinforcement is embedded.*

**BOND REINFORCING.** *The adhesion between steel reinforcement and mortar or grout.*

**BRICK.**

**Calcium silicate (sand lime brick).** *A masonry unit made of sand and lime.*

**Clay or shale.** *A masonry unit made of clay or shale, usually formed into a rectangular prism while in the plastic state and burned or fired in a kiln.*

**Concrete.** *A masonry unit having the approximate shape of a rectangular prism and composed of inert aggregate particles embedded in a hardened cementitious matrix.*

**BUTTRESS.** *A projecting part of a masonry wall built integrally therewith to provide lateral stability.*

**CAST STONE.** *A building stone manufactured from portland cement concrete precast and used as a trim, veneer or facing on or in buildings or structures.*

**CELL.** *A void space having a gross cross-sectional area greater than 1½ square inches (967 mm<sup>2</sup>).*

**CHIMNEY.** *A primarily vertical enclosure containing one or more flues used to remove hot gases from burning fuel, refuse, or from industrial processes to the outside atmosphere.*

**CHIMNEY TYPES.**

**High-heat appliance type.** *An approved chimney for removing the products of combustion from fuel-burning, high-heat appliances producing combustion gases in excess of 2,000°F (1093°C) measured at the appliance flue outlet (see Section 2113.11.3).*

**Low-heat appliance type.** *An approved chimney for removing the products of combustion from fuel-burning, low-heat appliances producing combustion gases not in excess of 1,000°F (538°C) under normal operating conditions, but capable of producing combustion gases of 1,400°F (760°C) during intermittent forces firing for periods up to 1 hour. Temperatures shall be measured at the appliance flue outlet.*

**Masonry type.** *A field-constructed chimney of solid masonry units or stones.*

**Medium-heat appliance type.** *An approved chimney for removing the products of combustion from fuel-burning, medium-heat appliances producing combustion gases between 1000°F (538°C) and 2,000°F (1093°C) measured at the appliance flue outlet (see Section 2113.11.2).*

**CLEANOUT.** *An opening to the bottom of a grout space of sufficient size and spacing to allow the removal of debris.*

**COLLAR JOINT.** *Vertical longitudinal joint between wythes of masonry or between masonry and backup construction that is permitted to be filled with mortar or grout.*

**COLUMN, MASONRY.** *An isolated vertical member whose horizontal dimension measured at right angles to its thickness does not exceed three times its thickness and whose height is at least four times its thickness.*

**COMPOSITE ACTION.** *Transfer of stress between components of a member designed so that in resisting loads, the combined components act together as a single member.*

**COMPOSITE MASONRY.** *Multiwythe masonry members acting with composite action.*

**COMPRESSIVE STRENGTH OF MASONRY.** *Maximum compressive force resisted per unit of net cross-sectional area of masonry, determined by the testing of masonry prisms or a function of individual masonry units, mortar and grout.*

**CONNECTOR.** *A mechanical device for securing two or more pieces, parts or members together, including anchors, wall ties and fasteners.*

**COVER.** *Distance between surface of reinforcing bar and edge of member.*

**DIAPHRAGM.** *A roof or floor system designed to transmit lateral forces to shear walls or other lateral-load-resisting elements.*

**DIMENSIONS.**

**Actual.** *The measured dimension of a masonry unit or element.*

**Nominal.** *A dimension equal to a specified dimension plus an allowance for the joints with which the units are to be laid. Thickness is given first, followed by height and then length.*

**Specified.** *The dimensions specified for the manufacture or construction of masonry, masonry units, joints or any other component of a structure.*

**EFFECTIVE HEIGHT.** *For braced members, the effective height is the clear height between lateral supports and is used for calculating the slenderness ratio. The effective height for unbraced members is calculated in accordance with engineering mechanics.*

**FIREPLACE.** *A hearth and fire chamber or similar prepared place in which a fire may be made and which is built in conjunction with a chimney.*

**FIREPLACE THROAT.** *The opening between the top of the firebox and the smoke chamber.*

**FLUE.** *A passageway within a chimney or vent through which gaseous combustion products pass.*

**FLUE, APPLIANCE.** *The passage(s) within an appliance through which combustion products pass from the combustion chamber of the appliance to the draft hood inlet opening on an appliance equipped with a draft hood or to the outlet of the appliance on an appliance not equipped with a draft hood.*

**FLUE GASES.** *Products of combustion plus excess air in appliance flues or heat exchangers.*

**FLUE LINER (LINING).** *A system or material used to form the inside surface of a flue in a chimney or vent, for the purpose of protecting the surrounding structure from the effects of combustion products and for conveying combustion products without leakage into the atmosphere.*

**GROUT.** *Flowable cementitious material comprising cement mixed with fine or coarse aggregates and having a compressive strength not less than 2,000 pounds per square inch (13 790 kPa) at 28 days, and a slump of 8 inches to 11 inches (203 mm to 279 mm).*

**GROUTED MASONRY.**

**Grouted hollow-unit masonry.** *That form of grouted masonry construction in which certain designated*

*cells of hollow units are continuously filled with grout.*

**Grouted multi-wythe masonry.** *That form of grouted masonry construction in which the space between the wythes is solidly or periodically filled with grout.*

**HEAD JOINT.** *Vertical mortar joint placed between masonry units within the wythe at the time the masonry units are laid.*

**HEADER (Bonder).** *A masonry unit that connects two or more adjacent wythes of masonry.*

**HEIGHT, WALLS.** *The vertical distance from the foundation wall or other immediate support of such wall to the top of the wall.*

**MASONRY.** *A built-up construction or combination of building units or materials of clay, shale, concrete, glass, gypsum, stone or other approved units bonded together with or without mortar or grout or other accepted method of joining.*

**Ashlar masonry.** *Masonry composed of various sized rectangular units having sawed, dressed or squared bed surfaces, properly bonded and laid in mortar.*

**Coursed ashlar.** *Ashlar masonry laid in courses of stone of equal height for each course, although different courses shall be permitted to be of varying height.*

**Glass unit masonry.** *Nonload-bearing masonry composed of glass units bonded by mortar.*

**Plain masonry.** *Masonry in which the tensile resistance of the masonry is taken into consideration and the effects of stresses in reinforcement are neglected.*

**Random ashlar.** *Ashlar masonry laid in courses of stone set without continuous joints and laid up without drawn patterns. When composed of material cut into modular heights, discontinuous but aligned horizontal joints are discernible.*

**Reinforced masonry.** *Masonry construction in which reinforcement acting in conjunction with the masonry is used to resist forces.*

**Solid masonry.** *Masonry consisting of solid masonry units laid contiguously with the joints between*

*the units filled with mortar.*

**MASONRY UNIT.** *Brick, tile, stone, glass block or concrete block conforming to the requirements specified in Section 2103.*

**Clay.** *A building unit larger in size than a brick, composed of burned clay, shale, fire clay or mixtures thereof.*

**Concrete.** *A building unit or block larger in size than 12 inches by 4 inches by 4 inches (305 mm by 102 mm by 102 mm) made of cement and suitable aggregates.*

**Hollow.** *A masonry unit whose net cross-sectional area in any plane parallel to the load-bearing surface is less than 75 percent of its gross cross-sectional area measured in the same plane.*

**Solid.** *A masonry unit whose net cross-sectional area in every plane parallel to the load-bearing surface is 75 percent or more of its gross cross-sectional area measured in the same plane.*

**MEAN DAILY TEMPERATURE.** *The average daily temperature of temperature extremes predicted by a local weather bureau for the next 24 hours.*

**MORTAR.** *A plastic mixture of approved cementitious materials, fine aggregates and water used to bond masonry or other structural units.*

**MORTAR, SURFACE-BONDING.** *A mixture to bond concrete masonry units that contains hydraulic cement, glass fiber reinforcement with or without inorganic fillers or organic modifiers and water.*

**PLASTIC HINGE.** *The zone in a structural member in which the yield moment is anticipated to be exceeded under loading combinations that include earthquakes.*

**PRESTRESSED MASONRY.** *Masonry in which internal stresses have been introduced to counteract potential tensile stresses in masonry resulting from applied loads.*

**PRISM.** *An assemblage of masonry units and mortar with or without grout used as a test specimen for determining properties of the masonry.*

**RUBBLE MASONRY.** *Masonry composed of roughly shaped stones.*

**Coursed rubble.** Masonry composed of roughly shaped stones fitting approximately on level beds and well bonded.

**Random rubble.** Masonry composed of roughly shaped stones laid without regularity of coursing but well-bonded and fitted together to form well-divided joints.

**Rough or ordinary rubble.** Masonry composed of unsquared field stones laid without regularity of coursing but well-bonded.

**RUNNING BOND.** The placement of masonry units such that head joints in successive courses are horizontally offset at least one-quarter the unit length.

#### **SHEAR WALL.**

**Detailed plain masonry shear wall.** A masonry shear wall designed to resist lateral forces neglecting stresses in reinforcement, and designed in accordance with Section 2106.1.1.

**Intermediate pre-stressed masonry shear wall.** A pre-stressed masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.2.

**Intermediate reinforced masonry shear wall.** A masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.

**Ordinary plain masonry shear wall.** A masonry shear wall designed to resist lateral forces neglecting stresses in reinforcement, and designed in accordance with Section 2106.1.1.

**Ordinary plain pre-stressed masonry shear wall.** A pre-stressed masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.1.

**Ordinary reinforced masonry shear wall.** A masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.

**Special pre-stressed masonry shear wall.** A pre-stressed masonry shear wall designed to resist lateral

forces considering stresses in reinforcement and designed in accordance with Section 2106.1.1.3 except that only grouted, laterally restrained tendons are used.

**Special reinforced masonry shear wall.** A masonry shear wall designed to resist lateral forces considering stresses in reinforcement, and designed in accordance with Section 2106.1.1.

**SHELL.** The outer portion of a hollow masonry unit as placed in masonry.

**SPECIFIED.** Required by construction documents.

**SPECIFIED COMPRESSIVE STRENGTH OF MASONRY,  $f'_m$ .** Minimum compressive strength, expressed as force per unit of net cross-sectional area, required of the masonry used in construction by the construction documents, and upon which the project design is based. Whenever the quantity  $f'_m$  is under the radical sign, the square root of numerical value only is intended and the result has units of pounds per square inch (psi) (Mpa).

**STACK BOND.** The placement of masonry units in a bond pattern is such that head joints in successive courses are vertically aligned. For the purpose of this code, requirements for stack bond shall apply to masonry laid in other than running bond.

**STONE MASONRY.** Masonry composed of field, quarried or cast stone units bonded by mortar.

**Ashlar stone masonry.** Stone masonry composed of rectangular units having sawed, dressed or squared bed surfaces and bonded by mortar.

**Rubble stone masonry.** Stone masonry composed of irregular-shaped units bonded by mortar.

**STRENGTH.**

**Design strength.** Nominal strength multiplied by a strength reduction factor.

**Nominal strength.** Strength of a member or cross section calculated in accordance with these provisions before application of any strength-reduction factors.

**Required strength.** Strength of a member or cross section required to resist factored loads.

**TIE, LATERAL.** Loop of reinforcing bar or wire enclosing longitudinal reinforcement.

**TIE, WALL.** A connector that connects wythes of masonry walls together.

**TILE.** A ceramic surface unit, usually relatively thin in relation to facial area, made from clay or a mixture of clay or other ceramic materials, called the body of the tile, having either a “glazed” or “unglazed” face and fired above red heat in the course of manufacture to a temperature sufficiently high enough to produce specific physical properties and characteristics.

**TILE, STRUCTURAL CLAY.** A hollow masonry unit composed of burned clay, shale, fire clay or mixture thereof, and having parallel cells.

**WALL.** A vertical element with a horizontal length-to-thickness ratio greater than three, used to enclose space.

**Cavity wall.** A wall built of masonry units or of concrete, or a combination of these materials, arranged to provide an airspace within the wall, and in which the inner and outer parts of the wall are tied together with metal ties.

**Composite wall.** A wall built of a combination of two or more masonry units bonded together, one forming the backup and the other forming the facing elements.

**Dry-stacked, surface-bonded walls.** A wall built of concrete masonry units where the units are stacked dry, without mortar on the bed or head joints, and where both sides of the wall are coated with a surface-bonding mortar.

**Masonry-bonded hollow wall.** A wall built of masonry units so arranged as to provide an airspace within the wall, and in which the facing and backing of the wall are bonded together with masonry units.

**Parapet wall.** The part of any wall entirely above the roof line.

**WEB.** An interior solid portion of a hollow masonry unit as placed in masonry.

**WYTHER.** Each continuous, vertical section of a wall, one masonry unit in thickness.

**NOTATIONS.**

- $A_n$  = Net cross-sectional area of masonry, square inches ( $mm^2$ ).
- $b$  = Effective width of rectangular member or width of flange for T and I sections, inches (mm).
- $d_b$  = Diameter of reinforcement, inches (mm).
- $f_r$  = Modulus of rupture, psi (MPa).
- $f_y$  = Specified yield stress of the reinforcement or the anchor bolt, psi (MPa).
- $f'm$  = Specified compressive strength of masonry at age of 28 days, psi (MPa).
- $K$  = The lesser of the masonry cover, clear spacing between adjacent reinforcement, or five times  $d_b$ , inches (mm).
- $L_s$  = Distance between supports, inches (mm).
- $L_w$  = Length of wall, inches (mm).
- $l_d$  = Required development length of reinforcement, inches (mm).
- $l_{de}$  = Embedment length of reinforcement, inches (mm).
- $P_w$  = Weight of wall tributary to section under consideration, pounds (N).
- $T$  = Specified wall thickness dimension or the least lateral dimension of a column, inches (mm).
- $V_n$  = Nominal shear strength, pounds (N).
- $V_u$  = Required shear strength due to factored loads, pounds (N).
- $W$  = Wind load, or related internal moments in forces.
- $\gamma$  = Reinforcement size factor.

$\rho_n$  = Ratio of distributed shear reinforcement on plane perpendicular to plane of  $A_{mv}$ .

$\rho_{max}$  = Maximum reinforcement ratio.

$\phi$  = Strength reduction factor.

### **SECTION BC 2103**

#### **MASONRY CONSTRUCTION MATERIALS**

**2103.1 Concrete masonry units.** Concrete masonry units shall conform to the following standards: ASTM C 55 for concrete brick; ASTM C 90 for load-bearing concrete masonry units; ASTM C 129 for non-load bearing concrete masonry units or ASTM C 744 for prefaced concrete and calcium silicate masonry units.

**2103.2 Clay or shale masonry units.** Clay or shale masonry units shall conform to the following standards: ASTM C 34 for structural clay load-bearing wall tile; ASTM C 56 for structural clay nonload-bearing wall tile; ASTM C 62 for building brick (solid masonry units made from clay or shale); ASTM C 1088 for solid units of thin veneer brick; ASTM C 126 for ceramic-glazed structural clay facing tile, facing brick and solid masonry units; ASTM C 212 for structural clay facing tile; ASTM C 216 for facing brick (solid masonry units made from clay or shale); ASTM C 652 for hollow brick (hollow masonry units made from clay or shale) and ASTM C 73 for calcium silicate face brick.

**Exception:** Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E 119 and shall comply with the requirements of Table 602.

**2103.3 Stone masonry units.** Stone masonry units shall conform to the following standards: ASTM C 503 for marble building stone (exterior); ASTM C 568 for limestone building stone; ASTM C 615 for granite building stone; ASTM C 616 for sandstone building stone or ASTM C 629 for slate building stone.

**2103.4 Ceramic tile.** Ceramic tile shall be as defined in, and shall conform to the requirements of, ANSI A137.1.

**2103.5 Glass unit masonry.** Hollow glass units shall be partially evacuated and have a minimum average glass face thickness of  $3/16$  inch (4.8 mm). Solid glass-block units shall be provided when required. The

*surfaces of units intended to be in contact with mortar shall be treated with a polyvinyl butyral coating or latex-based paint. Reclaimed units shall not be used.*

**2103.6 Second-hand units.** *Second-hand masonry units shall not be reused unless they conform to the requirements of new units. The units shall be of whole, sound materials and free from cracks and other defects that will interfere with proper laying or use. Old mortar shall be cleaned from the unit before reuse.*

**Exception:** *second-hand masonry units need not conform to the requirements for new units when their reuse is to comply with historic restoration standards or requirements of the New York City Landmarks Preservation Commission or the New York State Historic Preservation Office.*

**2103.7 Mortar.** *Mortar for use in masonry construction shall conform to ASTM C 270 and shall conform to the proportion specifications of Table 2103.7(1) or the property specifications of Table 2103.7(2). Type S or N mortar shall be used for glass unit masonry. The amount of water used in mortar for glass unit masonry shall be adjusted to account for the lack of absorption. Re-tempering of mortar for glass unit masonry shall not be permitted after initial set. Unused mortar shall be discarded within 2 ½ hours after initial mixing except that unused mortar for glass unit masonry shall be discarded within 1 ½ hours after initial mixing.*

- a. Portland cement conforming to the requirements of ASTM C 150.
- b. Blended cement conforming to the requirements of ASTM C 595.
- c. Masonry cement conforming to the requirements of ASTM C 91.
- d. Mortar cement conforming to the requirements of ASTM C 1329.
- e. Hydrated lime conforming to the requirements of ASTM C 207.

	S	1,800	75	18
	N	750	75	20 <sup>d</sup>
	O	350	75	20 <sup>d</sup>

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 6.895 kPa.

- a. This aggregate ratio (measured in damp, loose condition) shall not be less than  $2\frac{1}{4}$ , and not more than 3 times the sum of the separate volumes of cementitious materials.
- b. Average of three 2-inch cubes of laboratory-prepared mortar, in accordance with ASTM C 270.
- c. When structural reinforcement is incorporated in cement-lime or mortar cement mortars, the maximum air content shall not exceed 12 percent.
- d. When structural reinforcement is incorporated in masonry cement mortar, the maximum air content shall not exceed 18 percent.

**2103.8 Surface-bonding mortar.** *Surface-bonding mortar shall comply with ASTM C 887. Surface bonding of concrete masonry units shall comply with ASTM C 946.*

**2103.9 Mortars for ceramic wall and floor tile.** *Portland cement mortars for installing ceramic wall and floor tile shall comply with ANSI A108.1A and ANSI A108.1B and be of the compositions indicated in Table 2103.9.*

**TABLE 2103.9  
CERAMIC TILE MORTAR COMPOSITIONS**

LOCATION	MORTAR	COMPOSITION
Walls	Scratchcoat	1 cement; $\frac{1}{3}$ hydrated lime; 4 dry or 5 damp sand
	Setting bed and leveling coat	1 cement; $\frac{1}{2}$ hydrated lime; 5 damp sand to 1 cement 1 hydrated lime, 7 damp sand
Floors	Setting bed	1 cement; $\frac{1}{10}$ hydrated lime; 5 dry or 6 damp sand; or 1 cement; 5 dry or 6 damp sand
Ceilings	Scratchcoat and sand bed	1 cement; $\frac{1}{2}$ hydrated lime; $2\frac{1}{2}$ dry sand or 3 damp sand

**2103.9.1 Dry-set portland cement mortars.** Premixed prepared portland cement mortars, which require only the addition of water and are used in the installation of ceramic tile, shall comply with ANSI A118.1. The shear bond strength for tile set in such mortar shall be as required in accordance with ANSI A118.1. Tile set in dry-set portland cement mortar shall be installed in accordance with ANSI A108.5.

**2103.9.2 Electrically conductive dry-set mortars.** Premixed prepared portland cement mortars, which require only the addition of water and comply with ANSI A118.2, shall be used in the installation of electrically conductive ceramic tile. Tile set in electrically conductive dry-set mortar shall be installed in accordance with ANSI A108.7.

**2103.9.3 Latex-modified portland cement mortar.** Latex-modified portland cement thin-set mortars in which latex is added to dry-set mortar as a replacement for all or part of the gauging water that are used for the installation of ceramic tile shall comply with ANSI A118.4. Tile set in latex-modified portland cement shall be installed in accordance with ANSI A108.5.

**2103.9.4 Epoxy mortar.** Ceramic tile set and grouted with chemical-resistant epoxy shall comply with ANSI A118.3. Tile set and grouted with epoxy shall be installed in accordance with ANSI A108.6.

**2103.9.5 Furan mortar and grout.** Chemical-resistant furan mortar and grout that are used to install ceramic tile shall comply with ANSI A118.5. Tile set and grouted with furan shall be installed in accordance with ANSI A108.8.

**2103.9.6 Modified epoxy-emulsion mortar and grout.** Modified epoxy-emulsion mortar and grout that are used to install ceramic tile shall comply with ANSI A118.8. Tile set and grouted with modified epoxy-emulsion mortar and grout shall be installed in accordance with ANSI A108.9.

**2103.9.7 Organic adhesives.** Water-resistant organic adhesives used for the installation of ceramic tile shall comply with ANSI A136.1. The shear bond strength after water immersion shall not be less than 40 psi (275 kPa) for Type I adhesive, and not less than 20 psi (138 kPa) for Type II adhesive, when tested in accordance with ANSI A136.1. Tile set in organic adhesives shall be installed in accordance with ANSI A108.4.

**2103.9.8 Portland cement grouts.** Portland cement grouts used for the installation of ceramic tile shall comply with ANSI A118.6. Portland cement grouts for tile work shall be installed in accordance with ANSI A108.10.

**2103.10 Grout.** *Grout shall conform to Table 2103.10 or to ASTM C 476. When grout conforms to ASTM C 476, the grout shall be specified by proportion requirements or property requirements.*

**TABLE 2103.10  
GROUT PROPORTIONS BY VOLUME FOR  
MASONRY CONSTRUCTION**

TYPE	PARTS BY VOLUME OF PORTLAND CEMENT OR BLENDED CEMENT	PARTS BY VOLUME OF HYDRATED LIME OR LIME PUTTY	AGGREGATE, MEASURED IN A DANK, LOOSE CONDITION	
			Fine	Coarse
Fine grout	1	0.1 <sub>10</sub>	2½-3 times the sum of the volumes of the cementitious materials	—
Coarse grout	1	0.1 <sub>10</sub>	2½-3 times the sum of the volumes of the cementitious materials	1-2 times the sum of the volumes of the cementitious materials

**2103.11 Metal reinforcement and accessories.** Metal reinforcement and accessories shall conform to Sections 2103.11.1 through 2103.11.7.

**2103.11.1 Deformed reinforcing bars.** Deformed reinforcing bars shall conform to one of the following standards: ASTM A 615 for deformed and plain billet-steel bars for concrete reinforcement; ASTM A 706 for low-alloy steel deformed bars for concrete reinforcement; ASTM A 767 for zinc-coated reinforcing steel bars; ASTM A 775 for epoxy-coated reinforcing steel bars and ASTM A 996 for rail steel and axle steel deformed bars for concrete reinforcement.

**2103.11.2 Joint reinforcement.** Joint reinforcement shall comply with ASTM A 951. The maximum spacing of crosswires in ladder-type joint reinforcement and of point of connection of cross wires to longitudinal wires of truss-type reinforcement shall be 16 inches (406 mm).

**2103.11.3 Deformed reinforcing wire.** Deformed reinforcing wire shall conform to ASTM A 496.

**2103.11.4 Wire fabric.** Wire fabric shall conform to ASTM A 185 for plain steel-welded wire fabric for concrete reinforcement or ASTM A 496 for welded deformed steel wire fabric for concrete reinforcement.

**2103.11.5 Anchors, ties and accessories.** Anchors, ties and accessories shall conform to the following standards: ASTM A 36 for structural steel; ASTM A 82 for plain steel wire for concrete reinforcement; ASTM A 185 for plain steel-welded wire fabric for concrete reinforcement; ASTM A 167, Type 304, for stainless and heat-resisting chromium- nickel steel plate, sheet and strip and ASTM A 366 for cold-rolled carbon steel sheet, commercial quality.

**2103.11.6 Prestressing tendons.** Prestressing tendons shall conform to one of the following standards:

- a. Wire . . . . .ASTM A 421
- b. Low-relaxation wire . . .ASTM A 421
- c. Strand . . . . .ASTM A 416
- d. Low-relaxation strand. . ASTM A 416
- e. Bar . . . . .ASTM A 722

**Exceptions:**

1. *Wire, strands and bars not specifically listed in ASTM A 421, ASTM A 416 or ASTM A 722 are permitted, provided they conform to the minimum requirements in ASTM A 421, ASTM A 416, or ASTM A 722 and are approved by the architect/engineer.*
2. *Bars and wires of less than 150 kips per square inch (ksi) (1034 MPa) tensile strength and conforming to ASTM A 82, ASTM A 510, ASTM A 615, ASTM A 616, ASTM A 996 or ASTM A 706/A 706 M are permitted to be used as pre-stressed tendons provided that:*
  - 2.1 *The stress relaxation properties have been assessed by tests according to ASTM E 328 for the maximum permissible stress in the tendon.*
  - 2.2 *Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402, Chapter 4, addressing pre-stressing tendons are met.*

**2103.11.7 Corrosion protection.** *Corrosion protection for pre-stressing tendons, pre-stressing anchorages, couplers and end block shall comply with the requirements of ACI 530.1/ASCE 6/TMS 602, Article 2.4G. Corrosion protection for carbon steel accessories used in exterior wall construction or interior walls exposed to a mean relative humidity exceeding 75 percent shall comply with either Section 2103.11.7.1 or 2103.11.7.2. Corrosion protection for carbon steel accessories used in interior walls exposed to a mean relative humidity equal to or less than 75 percent shall comply with either Section 2103.11.7.1, 2103.11.7.2 or 2103.11.7.3.*

**2103.11.7.1 Hot-dipped galvanized.** *Apply a hot-dipped galvanized coating after fabrication as follows:*

1. *For joint reinforcement, wall ties, anchors and inserts, apply a minimum coating of 1.5 ounces per square foot (psf) (458 g/m<sup>2</sup>) complying with the requirements of ASTM A 153, Class B.*
2. *For sheet metal ties and sheet metal anchors, comply with the requirements of ASTM A 153, Class B.*
3. *For steel plates and bars, comply with the requirements of either ASTM A 123 or ASTM A*

153, Class B.

**2103.11.7.2 Epoxy coatings.** Carbon steel accessories shall be epoxy-coated as follows:

1. For joint reinforcement, comply with the requirements of ASTM A 884 Class B, Type 2 – 18 mils (457 $\mu$ m).
2. For wire ties and anchors, comply with the requirements of ASTM A 899 Class C— 20mils (508 $\mu$ m).
3. For sheet metal ties and anchors, provide a minimum thickness of 20 mils (508 $\mu$ m) or in accordance with the manufacturer's specification.

**2103.11.7.3 Mill galvanized.** Apply a mill galvanized coating as follows:

1. For joint reinforcement, wall ties, anchors and inserts, apply a minimum coating of 0.1 ounce psf (31g/m<sup>2</sup>) complying with the requirements of ASTM A 641.
2. For sheet metal ties and sheet metal anchors, apply a minimum coating complying with Coating Designation G-60 according to the requirements of ASTM A 653.
3. For anchor bolts, steel plates or bars not exposed to the earth, weather or a mean relative humidity exceeding 75 percent, a coating is not required.

**2103.11.8 Tests.** Where unidentified reinforcement is approved for use, not less than three tension and three bending tests shall be made on representative specimens of the reinforcement from each shipment and grade of reinforcing steel proposed for use in the work.

## **SECTION BC 2104 CONSTRUCTION**

**2104.1 Masonry construction.** Masonry construction shall comply with the requirements of Sections 2104.1.1 through 2104.5 and with ACI 530.1/ASCE 6/TMS 602.

**2104.1.1 Tolerances.** Masonry, except masonry veneer, shall be constructed within the tolerances specified in ACI 530.1/ASCE 6/TMS 602.

**2104.1.2 Placing mortar and units.** Placement of mortar and units shall comply with Sections 2104.1.2.1 through 2104.1.2.5.

**2104.1.2.1 Bed and head joints.** Unless otherwise required or indicated on the construction documents, head and bed joints shall be  $\frac{3}{8}$  inch (9.5 mm) thick, except that the thickness of the bed joint of the starting course placed over foundations shall not be less than  $\frac{1}{4}$  inch (6.4 mm) and not more than  $\frac{3}{4}$  inch (19.1 mm).

**2104.1.2.1.1 Open-end units.** Open-end units with beveled ends shall be fully grouted. Head joints of open-end units with beveled ends need not be mortared. The beveled ends shall form a grout key that permits grouts within  $\frac{5}{8}$  inch (15.9 mm) of the face of the unit. The units shall be tightly butted to prevent leakage of the grout.

**2104.1.2.2 Hollow units.** Hollow units shall be placed such that face shells of bed joints are fully mortared. Webs shall be fully mortared in all courses of piers, columns, pilasters, in the starting course on foundations where adjacent cells or cavities are to be grouted, and where otherwise required. Head joints shall be mortared a minimum distance from each face equal to the face shell thickness of the unit.

**2104.1.2.3 Solid units.** Unless otherwise required or indicated on the construction documents, solid units shall be placed in fully mortared bed and head joints. The ends of the units shall be completely buttered. Head joints shall not be filled by slushing with mortar. Head joints shall be constructed by shoving mortar tight against the adjoining unit. Bed joints shall not be furrowed deep enough to produce voids.

**2104.1.2.4 Glass unit masonry.** Glass units shall be placed so head and bed joints are filled solidly. Mortar shall not be furrowed. Unless otherwise required, head and bed joints of glass unit masonry shall be  $\frac{1}{4}$  inch (6.4 mm) thick, except that vertical joint thickness of radial panels shall not be less than  $\frac{1}{8}$  inch (3.2 mm). The bed joint thickness tolerance shall be minus  $\frac{1}{16}$  inch (1.6 mm) and plus  $\frac{1}{8}$  inch (3.2 mm). The head joint thickness tolerance shall be plus or minus  $\frac{1}{8}$  inch (3.2 mm).

**2104.1.2.5 All units.** Units shall be placed while the mortar is soft and plastic. Any unit disturbed to the extent that the initial bond is broken after initial positioning shall be removed and relaid in fresh mortar.

**2104.1.3 Installation of wall ties.** The ends of wall ties shall be embedded in mortar joints. Wall tie ends shall engage outer face shells of hollow units by at least ½ inch (12.7 mm). Wire wall ties shall be embedded at least 1½ inches (38 mm) into the mortar bed of solid masonry units or solid-grouted hollow units. Wall ties shall not be bent after being embedded in grout or mortar.

**2104.1.4 Chases and recesses.** Chases and recesses shall be constructed as masonry units are laid. Masonry directly above chases or recesses wider than 12 inches (305 mm) shall be supported on lintels.

**2104.1.5 Lintels.** The design of masonry lintels shall be in accordance with the masonry design provisions of either Section 2107 or 2108. Minimum length of end support shall be 4 inches (102 mm).

**2104.1.6 Support on wood.** Masonry shall not be supported on wood girders or other forms of wood construction except as permitted in Section 2304.12.

**2104.1.7 Masonry protection.** The top of unfinished masonry work shall be covered to protect the masonry from the weather.

**2104.1.8 Weep holes.** Weep holes shall be provided in the exterior wythe of masonry walls and shall be at a maximum spacing of 33 inches (838 mm) on center (o.c.). Weep holes shall not be less than ³/16 inch (4.8 mm) in diameter.

**2104.2 Corbeled masonry.** The maximum corbeled projection beyond the face of the wall shall not be more than one-half of the wall thickness nor one-half the wythe thickness for hollow walls. The maximum projection of one unit shall neither exceed one-half the height of the unit nor one-third the thickness at right angles to the wall.

**2104.2.1 Molded cornices.** Unless structural support and anchorage are provided to resist the overturning moment, the center of gravity of projecting masonry or molded cornices shall lie within the middle one-third of the supporting wall. Terra cotta and metal cornices shall be provided with a structural frame of approved noncombustible material anchored in a manner approved by the commissioner.

**2104.3 Cold weather construction.** The cold weather construction provisions of ACI 530.1/ASCE 6/TMS 602, Article 1.8 C, or the following procedures shall be implemented when either the ambient temperature

*falls below 40°F (4°C) or the temperature of masonry units is below 40°F (4°C).*

**2104.3.1 Preparation.**

- 1. Temperatures of masonry units shall not be less than 20°F (-7°C) when laid in the masonry. Masonry units containing frozen moisture, visible ice or snow on their surface shall not be laid.*
- 2. Visible ice and snow shall be removed from the top surface of existing foundations and masonry to receive new construction. These surfaces shall be heated to above freezing, using methods that do not result in damage.*
- 3. No salt or other chemicals for the purpose of lowering the freezing temperature of water shall be permitted in the mortar mix.*

**2104.3.2 Construction.** *The following requirements shall apply to work in progress and shall be based on ambient temperature.*

**2104.3.2.1 Construction requirements for temperatures between 40°F (4°C) and 32°F (0°C).** *The following construction requirements shall be met when the ambient temperature is between 40°F (4°C) and 32°F (0°C):*

- 1. Glass unit masonry shall not be laid.*
- 2. Water and aggregates used in mortar and grout shall not be heated above 140°F (60°C).*
- 3. Mortar sand or mixing water shall be heated to produce mortar temperatures between 40°F (4°C) and 120°F (49°C) at the time of mixing. When water and aggregates for grout are below 32°F (0°C), they shall be heated.*

**2104.3.2.2 Construction requirements for temperatures between 32°F (0°C) and 25°F (-4°C).** *The requirements of Section 2104.3.2.1 and the following construction requirements shall be met when the ambient temperature is between 32°F (0°C) and 25°F (-4°C):*

- 1. The mortar temperature shall be maintained above freezing until used in masonry.*

2. Aggregates and mixing water for grout shall be heated to produce grout temperatures between 70°F (21°C) and 120°F (49°C) at the time of mixing. Grout temperature shall be maintained above 70°F (21°C) at the time of grout placement.

**2104.3.2.3 Construction requirements for temperatures between 25°F (-4°C) and 20°F (-7°C).** The requirements of Sections 2104.3.2.1 and 2104.3.2.2 and the following construction requirements shall be met when the ambient temperature is between 25°F (-4°C) and 20°F (-7°C):

1. Masonry surfaces under construction shall be heated to 40°F (4°C).
2. Wind breaks or enclosures shall be provided when the wind velocity exceeds 15 miles per hour (mph) (24 km/h).
3. Prior to grouting, masonry shall be heated to a minimum of 40°F (4°C).

**2104.3.2.4. Construction requirements for temperatures below 20°F (-7°C).** The requirements of Sections 2104.3.2.1, 2104.3.2.2 and 2104.3.2.3 and the following construction requirement shall be met when the ambient temperature is below 20°F (-7°C): Enclosures and auxiliary heat shall be provided to maintain air temperature within the enclosure to above 32°F (0°C).

**2104.3.3 Protection.** The requirements of this section and Sections 2104.3.3.1 through 2104.3.3.4 apply after the masonry is placed and shall be based on anticipated minimum daily temperature for grouted masonry and anticipated mean daily temperature for ungrouted masonry.

**2104.3.3.1 Glass unit masonry.** The temperature of glass unit masonry shall be maintained above 40°F (4°C) for 48 hours after construction.

**2104.3.3.2 Protection requirements for temperatures between 40°F (4°C) and 25°F (-4°C).** When the temperature is between 40°F (4°C) and 25°F (-4°C), newly constructed masonry shall be covered with a weather-resistive membrane for 24 hours after being completed.

**2104.3.3.3 Protection requirements for temperatures between 25°F (-4°C) and 20°F (-7°C).** When the temperature is between 25°F (-4°C) and 20°F (-7°C), newly constructed masonry shall be completely covered with weather-resistive insulating blankets, or equal protection, for 24 hours after being completed. The time period shall be extended to 48 hours for grouted masonry, unless the only cement in the grout is Type III portland cement.

**2104.3.3.4 Protection requirements for temperatures below 20°F (-7°C).** When the temperature is below 20°F (-7°C), newly constructed masonry shall be maintained at a temperature above 32°F (0°C) for at least 24 hours after being completed by using heated enclosures, electric heating blankets, infrared lamps or other acceptable methods. The time period shall be extended to 48 hours for grouted masonry, unless the only cement in the grout is Type III portland cement.

**2104.4 Hot weather construction.** The hot weather construction provisions of ACI 530.1/ASCE 6/TMS 602, Article 1.8 D, or the following procedures shall be implemented when the temperature or the temperature and wind-velocity limits of this section are exceeded.

**2104.4.1 Preparation.** The following requirements shall be met prior to conducting masonry work.

**2104.4.1.1 Temperature.** When the ambient temperature exceeds 100°F (38°C), or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (13 km/h):

1. Necessary conditions and equipment shall be provided to produce mortar having a temperature below 120°F (49°C).
2. Sand piles shall be maintained in a damp, loose condition.

**2104.4.1.2 Special conditions.** When the ambient temperature exceeds 115°F (46°C), or 105°F (40°C) with a wind velocity greater than 8 mph (13 km/h), the requirements of Section 2104.4.1.1 shall be implemented, and materials and mixing equipment shall be shaded from direct sunlight.

**2104.4.2 Construction.** The following requirements shall be met while masonry work is in progress.

**2104.4.2.1 Temperature.** When the ambient temperature exceeds 100°F (38°C), or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (13 km/h):

1. The temperature of mortar and grout shall be maintained below 120°F (49°C).
2. Mixers, mortar transport containers and mortar boards shall be flushed with cool water before they come into contact with mortar ingredients or mortar.
3. Mortar consistency shall be maintained by retempering with cool water.

4. Mortar shall be used within 2 hours of initial mixing.

**2104.4.2.2 Special conditions.** When the ambient temperature exceeds 115°F (46°C), or exceeds 105°F (40°C) with a wind velocity greater than 8 mph (13 km/h), the requirements of Section 2104.4.2.1 shall be implemented and cool mixing water shall be used for mortar and grout. The use of ice shall be permitted in the mixing water prior to use. Ice shall not be permitted in the mixing water when added to the other mortar or grout materials.

**2104.4.3 Protection.** When the mean daily temperature exceeds 100°F (38°C), or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (13 km/h), newly constructed masonry shall be fog sprayed until damp at least three times a day until the masonry is three days old.

**2104.5 Wetting of brick.** Brick (clay or shale) at the time of laying shall require wetting if the unit's initial rate of water absorption exceeds 21.42 grams per 30 square inches (19 355 mm<sup>2</sup>) per minute or 0.025 ounce psi (1 g/645 mm<sup>2</sup>), as determined by ASTM C 67.

## **SECTION BC 2105 QUALITY ASSURANCE**

**2105.1 General.** A quality assurance program shall be used to ensure that the constructed masonry is in compliance with the construction documents. The quality assurance program shall comply with the inspection and testing requirements of Chapter 17.

**2105.2 Acceptance relative to strength requirements.**

**2105.2.1 Compliance with  $f'_m$ .** Compressive strength of masonry shall be considered satisfactory if the compressive strength of each masonry wythe and grouted collar joint equals or exceeds the value of  $f'_m$ .

**2105.2.2 Determination of compressive strength.** The compressive strength for each wythe shall be determined by the unit strength method or by the prism test method as specified herein.

**2105.2.2.1 Unit strength method.**

**2105.2.2.1.1 Clay masonry.** The compressive strength of masonry shall be determined based

*on the strength of the units and the type of mortar specified using Table 2105.2.2.1.1, provided:*

- 1. Units conform to ASTM C 62, ASTM C 216 or ASTM C 652 and are sampled and tested in accordance with ASTM C 67.*
- 2. Thickness of bed joints does not exceed  $\frac{5}{8}$  inch (15.9 mm).*
- 3. For grouted masonry, the grout meets one of the following requirements:*
  - 3.1. Grout conforms to ASTM C 476.*
  - 3.2. Minimum grout compressive strength equals  $f'_m$  but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.*

TABLE 2105.2.2.1.1  
 COMPRESSIVE STRENGTH OF CLAY MASONRY

NET AREA COMPRESSIVE STRENGTH OF CLAY MASONRY UNITS (psi)		NET AREA COMPRESSIVE STRENGTH OF MASONRY (psi)
Type M or S mortar	Type N mortar	
1,700	2,100	1,000
3,350	4,150	1,500
4,950	6,200	2,000
6,600	8,250	2,500
8,250	10,300	3,000
9,900	—	3,500
13,200	—	4,000

For SI: 1 pound per square inch = 0.00689 Mpa.

**2105.2.2.1.2 Concrete masonry.** *The compressive strength of masonry shall be determined based on the strength of the unit and type of mortar specified using Table 2105.2.2.1.2, provided:*

1. *Units conform to ASTM C 55 or ASTM C 90 and are sampled and tested in accordance with ASTM C 140.*
2. *Thickness of bed joints does not exceed  $\frac{3}{8}$  inch (15.9 mm).*
3. *For grouted masonry, the grout meets one of the following requirements:*
  - 3.1. *Grout conforms to ASTM C 476.*
  - 3.2. *Minimum grout compressive strength equals  $f'_m$  but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.*

**TABLE 2105.2.2.1.2  
COMPRESSIVE STRENGTH OF CONCRETE MASONRY**

NET AREA COMPRESSIVE STRENGTH OF CONCRETE MASONRY UNITS (psi)		NET AREA COMPRESSIVE STRENGTH OF MASONRY (psi) <sup>a</sup>
Type M or S mortar	Type N mortar	
1,250	1,300	1,000
1,900	2,150	1,500
2,800	3,050	2,000
3,750	4,050	2,500
4,800	5,250	3,000

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 0.00689 MPa.

a. For units less than 4 inches in height, 85 percent of the values listed.

**2105.2.2.2 Prism test method.**

**2105.2.2.2.1 General.** *The compressive strength of masonry shall be determined by the prism test method:*

1. *Where specified in the construction documents.*
2. *Where masonry does not meet the requirements for application of the unit strength method in Section 2105.2.2.1.*

**2105.2.2.2.2 Number of prisms per test.** *A prism test shall consist of three prisms constructed and tested in accordance with ASTM C 1314.*

**2105.3 Testing prisms from constructed masonry.** *When approved by the commissioner acceptance of masonry that does not meet the requirements of Section 2105.2.2.1 or 2105.2.2.2 shall be permitted to be based on tests of prisms cut from the masonry construction in accordance with Sections 2105.3.1, 2105.3.2 and 2105.3.3.*

**2105.3.1 Prism sampling and removal.** *A set of three masonry prisms that are at least 28 days old shall be saw cut from the masonry for each 5,000 square feet (465 m<sup>2</sup>) of the wall area that is in question but not less than one set of three masonry prisms for the project. The length, width and height dimensions of the prisms shall comply with the requirements of ASTM C 1314. Transporting, preparation and testing of prisms shall be in accordance with ASTM C 1314.*

**2105.3.2 Compressive strength calculations.** *The compressive strength of prisms shall be the value calculated in accordance ASTM C 1314, except that the net cross-sectional area of the prism shall be based on the net mortar bedded area.*

**2105.3.3 Compliance.** *Compliance with the requirement for the specified compressive strength of masonry,  $f'_m$ , shall be considered satisfied provided the modified compressive strength equals or exceeds the specified  $f'_m$ . Additional testing of specimens cut from locations in question shall be permitted.*

**SECTION BC 2106  
SEISMIC DESIGN**

**2106.1 Seismic design requirements for masonry.** *Masonry structures and components shall comply with the requirements in Section 1.13.2.2 of ACI 530/ASCE 5/TMS 402 and Section 1.13.3, 1.13.4, 1.13.5, 1.13.6 or 1.13.7 of ACI 530/ASCE 5/TMS 402 depending on the structure's seismic design category as determined in Section 1616.3. All masonry walls, unless isolated on three edges from in-plane motion of the basic structural systems, shall be considered to be part of the seismic-force-resisting system. In addition, the following requirements shall be met.*

**2106.1.1 Basic seismic-force-resisting system.** *Buildings relying on masonry shear walls as part of the basic seismic-force-resisting system shall comply with Section 1.13.2.2 of ACI 530/ASCE 5/TMS 402 or with Section 2106.1.1.1, 2106.1.1.2 or 2106.1.1.3.*

**2106.1.1.1 Ordinary plain prestressed masonry shear walls.** *Ordinary plain prestressed masonry shear walls shall comply with the requirements of Chapter 4 of ACI 530/ASCE 5/TMS 402.*

**2106.1.1.2 Intermediate prestressed masonry shear walls.** *Intermediate prestressed masonry shear walls shall comply with the requirements of Section 1.13.2.2.4 of ACI 530/ASCE 5/TMS 402 and shall be designed by Chapter 4, Section 4.5.3.3, of ACI 530/ASCE 5/TMS 402 for flexural strength and by Section 3.2.4.1.2 of ACI 530/ASCE 5/TMS 402 for shear strength. Sections 1.13.2.2.5(a), 3.2.3.5 and 3.2.4.3.2(c) of ACI 530/ASCE 5/TMS 402 shall be applicable for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section 1.13.2.2.4 of ACI 530/ASCE 5/TMS 402. Tendons shall be located in cells that are grouted the full height of the wall.*

**2106.1.1.3 Special prestressed masonry shear walls.** *Special prestressed masonry shear walls shall comply with the requirements of Section 1.13.2.2.5 of ACI 530/ASCE 5/TMS 402 and shall be designed by Chapter 4, Section 4.5.3.3, of ACI 530/ASCE 5/TMS 402 for flexural strength and by Section 3.2.4.1.2 of ACI 530/ASCE 5/TMS 402 for shear strength. Sections 1.13.2.2.5(a), 3.2.3.5 and 3.2.4.3.2(c) of ACI 530/ASCE 5/TMS 402 shall be applicable for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section 1.13.2.2.5 of ACI 530/ASCE 5/TMS 402. Special prestressed masonry shear walls shall also comply with the requirements of Section 3.2.3.5 of ACI 530/ASCE 5/TMS 402.*

**2106.1.1.3.1 Prestressing tendons.** *Prestressing tendons shall consist of bars conforming to ASTM A 722.*

**2106.1.1.3.2 Grouting.** *All cells of the masonry wall shall be grouted.*

**2106.2 Anchorage of masonry walls.** *Masonry walls shall be anchored to the roof and floors that provide lateral support for the wall in accordance with Section 1604.8.2.*

**2106.3 Seismic Design Category B.** *Structures assigned to Seismic Design Category B shall conform to the requirements of Section 1.13.4 of ACI 530/ASCE 5/TMS 402.*

**2106.3.1 Masonry walls not part of the lateral-force-resisting system.** *Masonry partition walls, masonry screen walls and other masonry elements that are not designed to resist vertical or lateral loads, other than those induced by their own mass, shall be isolated from the structure so that the vertical and lateral forces are not imparted to these elements. Isolation joints and connectors between these elements and the structure shall be designed to accommodate the design story drift.*

**2106.4 Seismic Design Category C.** *Structures assigned to Seismic Design Category C shall conform to the requirements of Section 1.13.5 of ACI 530/ASCE 5/TMS 402 and the additional requirements of this section.*

**2106.4.1 Design of discontinuous members that are part of the lateral-force-resisting system.** *Columns and pilasters that are part of the lateral-force-resisting system and that support reactions from discontinuous stiff members such as walls shall be provided with transverse reinforcement spaced at no more than one-fourth of the least nominal dimension of the column or pilaster. The minimum transverse reinforcement ratio shall be 0.0015. Beams supporting reactions from discontinuous walls or frames shall be provided with transverse reinforcement spaced at no more than one-half of the nominal depth of the beam. The minimum transverse reinforcement ratio shall be 0.0015.*

**2106.4.2 Masonry walls not part of the lateral-force-resisting system.** *Masonry partition walls, masonry screen walls and other masonry elements that are not designed to resist vertical or lateral loads, other than those loads induced by their own mass, shall be isolated from the structure so that the vertical and lateral forces are not imparted to these elements. Isolation joints and connectors between these elements and the structure shall be designed to accommodate the design story drift.*

**2106.5 Seismic Design Category D.** Structures assigned to Seismic Design Category D shall conform to the requirements of Section 2106.4, Section 1.13.6 of ACI 530/ASCE 5/TMS 402 and the additional requirements of this section.

**2106.5.1 Loads for shear walls designed by the working stress design method.** When calculating in-plane shear or diagonal tension stresses by the working stress design method, shear walls that resist seismic forces shall be designed to resist 1.5 times the forces required by Chapter 16. The 1.5 multiplier need not be applied to the overturning moment.

**2106.5.2 Shear wall shear strength.** For a shear wall whose nominal shear strength exceeds the shear corresponding to development of its nominal flexural strength, two shear regions exist.

For all cross sections within a region defined by the base of the shear wall and a plane at a distance  $L_w$  above the base of the shear wall, the nominal shear strength shall be determined by Equation 21-1.

$$V_n = A_n \rho_n f_y$$

(Equation 21-1)

*The required shear strength for this region shall be calculated at a distance  $L_w/2$  above the base of the shear wall, but not to exceed one-half story height.*

*For the other region, the nominal shear strength of the shear wall shall be determined from Section 2108.*

**2106.6** *Reserved.*

### **SECTION BC 2107 WORKING STRESS DESIGN**

**2107.1 General.** *The design of masonry structures using working stress design shall comply with Section 2106 and the requirements of Chapters 1 and 2, except Section 2.1.2.1 and 2.1.3.3 of ACI 530/ASCE 5/TMS 402. The text of ACI 530/ASCE 5/TMS 402 shall be modified as follows.*

**2107.2 Modifications to ACI 530/ASCE 5/TMS 402.**

**2107.2.1 ACI 530/ASCE 5/TMS 402, Chapter 2.** *Special inspection during construction shall be provided as set forth in Section 1704.5.*

**2107.2.2 ACI 530/ASCE 5/TMS 402, Section 2.1.6.** *Masonry columns used only to support light-frame roofs of carports, porches, sheds or similar structures with a maximum area of 450 square feet (41.8 m<sup>2</sup>) assigned to Seismic Design Category B or C are permitted to be designed and constructed as follows:*

- 1. Concrete masonry materials shall be in accordance with Section 2103.1. Clay or shale masonry units shall be in accordance with Section 2103.2.*
- 2. The nominal cross-sectional dimension of columns shall not be less than 8 inches (203 mm).*
- 3. Columns shall be reinforced with not less than one No. 4 bar centered in each cell of the column.*
- 4. Columns shall be grouted solid.*

5. *Columns shall not exceed 12 feet (3658 mm) in height.*
6. *Roofs shall be anchored to the columns. Such anchorage shall be capable of resisting the design loads specified in Chapter 16.*
7. *Where such columns are required to resist uplift loads, the columns shall be anchored to their footings with two No. 4 bars extending a minimum of 24 inches (610 mm) into the columns and bent horizontally a minimum of 15 inches (381 mm) in opposite directions into the footings. One of these bars is permitted to be the reinforcing bar specified in Item 3 above. The total weight of a column and its footing shall not be less than 1.5 times the design uplift load.*

**2107.2.3 ACI 530/ASCE 5/TMS 402, Section 2.1.10.6.1.1, lap splices.** *The minimum length of lap splices for reinforcing bars in tension or compression,  $l_{ld}$ , shall be calculated by Equation 21-2, but shall not be less than 15 inches (381 mm).*

$$l_{ld} = \frac{0.16d_b^2 f_y \gamma}{K\sqrt{f'_m}} \quad \text{(Equation 21-2)}$$

$$\text{For SI: } l_{ld} = \frac{1.95d_b^2 f_y \gamma}{K\sqrt{f'_m}}$$

where:

$d_b$  = Diameter of reinforcement, inches (mm).

$f_y$  = Specified yield stress of the reinforcement or the anchor bolt, psi (MPa).

$f'_m$  = Specified compressive strength of masonry at age of 28 days, psi (MPa).

$l_{ld}$  = Minimum lap splice length, inches (mm).

$K$  = The lesser of the masonry cover, clear spacing between adjacent reinforcement or five times  $d_b$ , inches (mm).

$\gamma$  = 1.0 for No. 3 through No. 5 reinforcing bars. 1.4 for No. 6 and No. 7 reinforcing bars. 1.5 for No. 8 through No. 9 reinforcing bars.

**2107.2.4 ACI 530/ASCE 5/TMS 402, maximum bar size.** The bar diameter shall not exceed one-eighth of the nominal wall thickness and shall not exceed one-quarter of the least dimension of the cell, course or collar joint in which it is placed.

**2107.2.5 ACI 530/ASCE 5/TMS 402, splices for large bars.** Reinforcing bars larger than No. 9 in size shall be spliced using mechanical connectors in accordance with ACI 530/ASCE 5/TMS 402, Section 2.1.10.6.3.

**2107.2.6 ACI 530/ASCE 5/TMS 402, Maximum reinforcement percentage.** Special reinforced masonry shear walls having a shear span ratio,  $M/Vd$ , equal to or greater than 1.0 and having an axial load,  $P$  greater than  $0.05 f'_m A_n$  which are subjected to in-plane forces, shall have a maximum reinforcement ratio,  $\rho_{max}$ , not greater than that computed as follows:

$$\rho_{\max} = \frac{nf'_m}{2f_y \left( n + \frac{f_y}{f'_m} \right)} \quad (\text{Equation 21-3})$$

**SECTION BC 2108**  
**STRENGTH DESIGN OF MASONRY**

**2108.1 General.** *The design of masonry structures using strength design shall comply with Section 2106 and the requirements of Chapters 1 and 3 of ACI 530/ASCE 5/TMS 402. The minimum nominal thickness for hollow clay masonry in accordance with Section 3.2.5.5 of ACI 530/ASCE 5/TMS 402 shall be 4 inches (102 mm). The text of ACI 530/ASCE 5/TMS 402 shall be modified as follows;*

**2108.2 ACI 530/ASCE 5/TMS 402, Section 3.2.2(g).** *Modify Section 3.2.2(g) as follows:*

*3.2.2(g). The relationship between masonry compressive stress and masonry strain shall be assumed to be defined by the following:*

*Masonry stress of  $0.80 f'_m$  shall be assumed uniformly distributed over an equivalent compression zone bounded by edges of the cross section and a straight line located parallel to the neutral axis at a distance,  $a = 0.80 c$ , from the fiber of maximum compressive strain. The distance,  $c$ , from the fiber of maximum strain to the neutral axis shall be measured perpendicular to that axis. For out-of-plane bending, the width of the equivalent stress block shall not be taken greater than six times the nominal thickness of the masonry wall or the spacing between reinforcement, whichever is less. For in-plane bending of flanged walls, the effective flange width shall not exceed six times the thickness of the flange.*

**2108.3 ACI 530/ASCE 5/TMS 402, Section 3.2.3.4.** *Modify Section 3.2.3.4 (b) and (c) as follows:*

*3.2.3.4 (b). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength,  $f_y$ , of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls or special moment frames of masonry.*

*3.2.3.4 (c). Mechanical splices shall be classified as Type 1 or 2 according to Section 21.2.6.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls or special moment frames. Type 2 mechanical splices are permitted in any location within a member.*

**2108.4 ACI 530/ASCE 5/TMS 402, Section 3.2.3.5.1.** *Add the following text to Section 3.2.3.5.1:*

*For special prestressed masonry shear walls, strain in all prestressing steel shall be computed to be compatible with a strain in the extreme tension reinforcement equal to five times the strain associated with the reinforcement yield stress,  $f_y$ . The calculation of the maximum reinforcement shall consider forces in the prestressing steel that correspond to these calculated strains.*

**SECTION BC 2109**  
**EMPIRICAL DESIGN OF MASONRY**

**2109.1 General.** *Empirically designed masonry shall conform to this chapter or Chapter 5 of ACI 530/ASCE 5/TMS 402.*

**2109.1.1 Limitations.** *Empirical masonry design shall not be utilized for any of the following conditions:*

- 1. The design or construction of masonry in buildings assigned to Seismic Design Category D as specified in Section 1616, and the design of the seismic-force-resisting system for buildings assigned to Seismic Design Category B or C.*
- 2. Buildings more than 35 feet (10 668 mm) in height which have masonry wall lateral-force-resisting systems.*

*In buildings that exceed one or more of the above limitations, masonry shall be designed in accordance with the engineered design provisions of Section 2107 or 2108.*

**2109.2 Lateral stability.**

**2109.2.1 Shear walls.** *Where the structure depends upon masonry walls for lateral stability, shear walls shall be provided parallel to the direction of the lateral forces resisted.*

**2109.2.1.1 Shear wall thickness.** *Minimum nominal thickness of masonry shear walls shall be 8 inches (203 mm).*

**Exception:** *Shear walls of one-story buildings are permitted to be a minimum nominal thickness of 6 inches (152 mm).*

**2109.2.1.2 Cumulative length of shear walls.** *In each direction in which shear walls are required*

*for lateral stability, shear walls shall be positioned in two separate planes. The minimum cumulative length of shear walls provided shall be 0.4 times the long dimension of the building. Cumulative length of shear walls shall not include openings or any element whose length is less than one-half its height.*

**2109.2.1.3 Maximum diaphragm ratio.** *Masonry shear walls shall be spaced so that the length-to-width ratio of each diaphragm transferring lateral forces to the shear walls does not exceed the values given in Table 2109.2.1.3.*

**TABLE 2109.2.1.3  
DIAPHRAGM LENGTH-TO-WIDTH RATIOS**

FLOOR OR ROOF DIAPHRAGM CONSTRUCTION	MAXIMUM LENGTH-TO-WIDTH RATIO OF DIAPHRAGM PANEL
Cast-in-place concrete	5:1
Precast concrete	4:1
Metal deck with concrete fill	3:1
Metal deck with no fill	2:1
Wood	2:1

**2109.2.2 Roofs.** *The roof construction shall be designed so as not to impart out-of-plane lateral thrust to the walls under roof gravity load.*

**2109.2.3 Surface-bonded walls.** *Dry-stacked, surface-bonded concrete masonry walls shall comply with the requirements of this code for masonry wall construction, except where otherwise noted in this section.*

**2109.2.3.1 Strength.** *Dry-stacked, surface-bonded concrete masonry walls shall be of adequate strength and proportions to support all superimposed loads without exceeding the allowable stresses listed in Table 2109.2.3.1. Allowable stresses not specified in Table 2109.2.3.1 shall comply with the requirements of ACI 530/ASCE 5/TMS 402.*

**TABLE 2109.2.3.1  
ALLOWABLE STRESS GROSS CROSS-SECTIONAL  
AREA FOR DRY-STACKED, SURFACE-BONDED  
CONCRETE MASONRY WALLS**

DESCRIPTION	MAXIMUM ALLOWABLE STRESS (psi)
Compression standard block	45
Shear	10
Flexural tension	
Vertical span	18
Horizontal span	30

For SI: 1 pound per square inch = 0.006895 Mpa.

**2109.2.3.2 Construction.** *Construction of dry-stacked, surface-bonded masonry walls, including stacking and leveling of units, mixing and application of mortar and curing and protection shall comply with ASTM C 946.*

**2109.3 Compressive stress requirements.**

**2109.3.1 Calculations.** *Compressive stresses in masonry due to vertical dead plus live loads, excluding wind or seismic loads, shall be determined in accordance with Section 2109.3.2.1. Dead and live loads shall be in accordance with Chapter 16, with live load reductions as permitted in Section 1607.9.*

**2109.3.2 Allowable compressive stresses.** *The compressive stresses in masonry shall not exceed the values given in Table 2109.3.2. Stress shall be calculated based on specified rather than nominal dimensions.*

**TABLE 2109.3.2  
ALLOWABLE COMPRESSIVE STRESSES FOR EMPIRICAL DESIGN OF MASONRY**

CONSTRUCTION; COMPRESSIVE STRENGTH OF UNIT GROSS AREA (psi)	ALLOWABLE COMPRESSIVE STRESSES <sup>a</sup> GROSS CROSS-SECTIONAL AREA (psi)	
	Type M or S mortar	Type N mortar
Solid masonry of brick and other solid units of clay or shale; sand-lime or concrete brick:		
8,000 or greater	350	300
4,500	225	200
2,500	160	140
1,500	115	100
Grouted masonry, of clay or shale; sand-lime or concrete:		
4,500 or greater	225	200
2,500	160	140
1,500	115	100
Solid masonry of solid concrete masonry units:		
3,000 or greater	225	200
2,000	160	140
1,200	115	100
Masonry of hollow load-bearing units:		
2,000 or greater	140	120
1,500	115	100
1,000	75	70
700	60	55
Hollow walls (noncomposite masonry bonded) <sup>b</sup>		
Solid units:		
2,500 or greater	160	140
1,500	115	100
Hollow units	75	70
Stone ashlar masonry:		
Granite	720	640
Limestone or marble	450	400
Sandstone or cast stone	360	320
Rubble stone masonry		
Coursed, rough or random	120	100

For SI: 1 pound per square inch = 0.006895 MPa.

- a. Linear interpolation for determining allowable stresses for masonry units having compressive strengths which are intermediate between those given in the table is permitted.
- b. Where floor and roof loads are carried upon one wythe, the gross cross-sectional area is that of the wythe under load; if both wythes are loaded, the gross cross-sectional area is that of the wall minus the area of the cavity between the wythes. Walls bonded with metal ties shall be considered as noncomposite walls unless collar joints are filled with mortar or grout.

**2109.3.2.1 Calculated compressive stresses.** *Calculated compressive stresses for single wythe walls and for multi-wythe composite masonry walls shall be determined by dividing the design load by the gross cross-sectional area of the member. The area of openings, chases or recesses in walls shall not be included in the gross cross-sectional area of the wall.*

**2109.3.2.2 Multi-wythe walls.** *The allowable stress shall be as given in Table 2109.3.2 for the weakest combination of the units used in each wythe.*

**2109.4 Lateral support.**

**2109.4.1 Intervals.** *Masonry walls shall be laterally supported in either the horizontal or vertical direction at intervals not exceeding those given in Table 2109.4.1.*

**TABLE 2109.4.1  
WALL LATERAL SUPPORT REQUIREMENTS**

<b>CONSTRUCTION</b>	<b>MAXIMUM WALL LENGTH TO THICKNESS OR WALL HEIGHT TO THICKNESS</b>
Bearing walls Solid units or fully grouted All others	20 18
Nonbearing walls Exterior Interior	18 36

**2109.4.2 Thickness.** *Except for cavity walls and cantilever walls, the thickness of a wall shall be its nominal thickness measured perpendicular to the face of the wall. For cavity walls, the thickness shall be determined as the sum of the nominal thicknesses of the individual wythes. For cantilever walls, except for parapets, the ratio of height-to-nominal thickness shall not exceed six for solid masonry or four for hollow masonry. For parapets, see Section 2109.5.5.*

**2109.4.3 Support elements.** *Lateral support shall be provided by cross-walls, pilasters, buttresses or structural frame members when the limiting distance is taken horizontally, or by floors, roofs acting as diaphragms or structural frame members when the limiting distance is taken vertically.*

**2109.5 Thickness of masonry.** *Minimum thickness requirements shall be based on nominal dimensions of masonry.*

**2109.5.1 Thickness of walls.** *The thickness of masonry walls shall conform to the requirements of Section 2109.5.*

**2109.5.2 Minimum thickness.** *The minimum thickness of masonry bearing walls more than one story high shall be 8 inches (203 mm) where the height floor to floor does not exceed 12 feet (3658 mm), the floor live load does not exceed 60 pounds per square feet (psf) (0.156 kg/m<sup>2</sup>), and the roof is designed so that the dead load imparts no lateral thrust to the wall. Bearing walls of one-story buildings shall not be less than 6 inches (152 mm) thick. However, the overall thickness of cavity or masonry-bonded hollow walls shall not be less than 8 inches (203 mm), including cavity.*

**2109.5.2.1 Walls above roof level.** *Masonry walls above roof level, 12 feet (3658 mm) or less in height, enclosing stairways, machinery rooms, shafts, or penthouses, may be up to 8 inches (203 mm) thick and shall be considered as neither increasing the height nor requiring any increase in the thickness of the wall below.*

**2109.5.3 Rubble stone walls.** *The minimum thickness of rough or random or coursed rubble stone walls shall be 16 inches (406 mm).*

**2109.5.4 Change in thickness.** *Where walls of masonry of hollow units or masonry\_bonded hollow walls are decreased in thickness, a course or courses of solid masonry shall be interposed between the wall below and the thinner wall above, or special units or construction shall be used to transmit the loads from face shells or wythes above to those below.*

**2109.5.5 Parapet walls.**

**2109.5.5.1 Minimum thickness.** *Unreinforced parapet walls shall be at least 8 inches (203 mm) thick, and their height shall not exceed three times their thickness.*

**2109.5.5.2 Parapet wall construction.** *All cells in the hollow masonry units and all joints in solid, cavity, or masonry-bonded hollow wall construction shall be filled solid with mortar. All corners of masonry parapet walls shall be reinforced with joint reinforcement or its equivalent at vertical intervals not greater than 12 inches (305 mm). Such reinforcement shall extend around the corner for at least 4 feet (1219 mm) in both directions and splices shall be lapped at least 6 inches (152 mm).*

**2109.5.5.3 Parapet anchorage.** *Parapets of buildings taller than 35 feet (10 668 mm) shall be reinforced vertically and shall be anchored to the roof and floors that provide lateral support for the wall in accordance with section 1604.8.2.*

**2109.5.5.4 Additional provisions.** *Additional provisions for parapet walls are contained in Sections 1503.2 and 1503.3.*

**2109.5.6 Foundation walls.** *Foundation walls shall comply with the requirements of Sections 2109.5.6.1 and 2109.5.6.2.*

**2109.5.6.1 Minimum thickness.** *Minimum thickness for foundation walls shall comply with the requirements of Table 2109.5.6.1. The provisions of Table 2109.5.6.1 are only applicable where the following conditions are met:*

- 1. The foundation wall does not exceed 8 feet (2438 mm) in height between lateral supports,*
- 2. The terrain surrounding foundation walls is graded to drain surface water away from foundation walls,*
- 3. Backfill is drained to remove ground water away from foundation walls,*
- 4. Lateral support is provided at the top of foundation walls prior to back-filling,*

5. *The length of foundation walls between perpendicular masonry walls or pilasters is a maximum of three times the basement wall height,*
6. *The backfill is granular and soil conditions in the area are non-expansive, and*
7. *Masonry is laid in running bond using Type M or S mortar.*

**TABLE 2109.5.6.1  
FOUNDATION WALL CONSTRUCTION**

WALL CONSTRUCTION	NOMINAL WALL THICKNESS (inches)	MAXIMUM DEPTH OF UNBALANCED BACKFILL (feet)
Hollow unit masonry	8	5
	10	6
	12	7
Solid unit masonry	8	5
	10	7
	12	7
Fully grouted masonry	8	7
	10	8
	12	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

*2109.5.6.2 Design requirements. Where the requirements of Section 2109.5.6.1 are not met, foundation walls shall be designed in accordance with Section 1805.5.*

*2109.5.7 Partitions. The minimum thickness for partitions shall be as follows:*

**TABLE 2109.5.7**  
**MINIMUM THICKNESS OF MASONRY PARTITIONS**

<i>Height of Walls</i>	<i>Thickness</i>
8 ft. and under.....	2 in.
Over 8 ft. to 12 ft.....	3 in.
Over 12 ft. to 16 ft.....	4 in.
Over 16 ft. to 20 ft.....	6 in.
Over 20 ft. to 24 ft.....	8 in.

## **2109.6 Bond.**

**2109.6.1 General.** *The facing and backing of multi-wythe masonry walls shall be bonded in accordance with Section 2109.6.2, 2109.6.3 or 2109.6.4.*

### **2109.6.2 Bonding with masonry headers.**

**2109.6.2.1 Solid units.** *Where the facing and backing (adjacent wythes) of solid masonry construction are bonded by means of masonry headers, no less than 4 percent of the wall surface of each face shall be composed of headers extending not less than 3 inches (76 mm) into the backing. The distance between adjacent full-length headers shall not exceed 24 inches (610 mm) either vertically or horizontally. In walls in which a single header does not extend through the wall, headers from the opposite sides shall overlap at least 3 inches (76 mm), or headers from opposite sides shall be covered with another header course overlapping the header below at least 3 inches (76 mm).*

**2109.6.2.2 Hollow units.** *Where two or more hollow units are used to make up the thickness of a wall, the stretcher courses shall be bonded at vertical intervals not exceeding 34 inches (864 mm) by lapping at least 3 inches (76 mm) over the unit below, or by lapping at vertical intervals not exceeding 17 inches (432 mm) with units that are at least 50 percent greater in thickness than the units below.*

**2109.6.2.3 Masonry bonded hollow walls.** *In masonry bonded hollow walls, the facing and backing shall be bonded so that not less than 4 percent of the wall surface of each face is composed of masonry bonded units extending not less than 3 inches (76 mm) into the backing. The distance between adjacent bonders shall not exceed 24 inches (610 mm) either vertically or horizontally.*

### **2109.6.3 Bonding with wall ties or joint reinforcement.**

**2109.6.3.1 Bonding with wall ties.** *Except as required by Section 2109.6.3.1.1, where the facing and backing (adjacent wythes) of masonry walls are bonded with wire size W2.8 (MW 18) wall ties or metal wire of equivalent stiffness embedded in the horizontal mortar joints, there shall be at least one metal tie for each 4 ½ square feet (0.42 m<sup>2</sup>) of wall area. The maximum vertical distance between ties shall not exceed 24 inches (610 mm), and the maximum horizontal distance shall not exceed 36 inches (914 mm). Rods or ties bent to rectangular shape shall be used with hollow*

*masonry units laid with the cells vertical. In other walls, the ends of ties shall be bent to 90-degree (1.57 rad) angles to provide hooks no less than 2 inches (51 mm) long. Wall ties shall be without drips. Additional bonding ties shall be provided at all openings, spaced not more than 36 inches (914 mm) apart around the perimeter and within 12 inches (305 mm) of the opening.*

**2109.6.3.1.1 Bonding with adjustable wall ties.** *Where the facing and backing (adjacent wythes) of masonry are bonded with adjustable wall ties, there shall be at least one tie for each 1.77 square feet (0.16 m<sup>2</sup>) of wall area. Neither the vertical nor horizontal spacing of the adjustable wall ties shall exceed 16 inches (406 mm). The maximum vertical offset of bed joints from one wythe to the other shall be 1¼ inches (32 mm). The maximum clearance between connecting parts of the ties shall be 1/16 inch (1.6 mm). When pintle legs are used, ties shall have at least two wire size W2.8 (MW 18) legs.*

**2109.6.3.2 Bonding with prefabricated joint reinforcement.** *Where the facing and backing (adjacent wythes) of masonry are bonded with prefabricated joint reinforcement, there shall be at least one cross wire serving as a tie for each 2<sup>2</sup>/3 square feet (0.25 m<sup>2</sup>) of wall area. The vertical spacing of the joint reinforcing shall not exceed 24 inches (610 mm). Cross wires on prefabricated joint reinforcement shall not be less than W1.7 (MW 11) and shall be without drips. The longitudinal wires shall be embedded in the mortar.*

#### **2109.6.4 Bonding with natural or cast stone.**

**2109.6.4.1 Ashlar masonry.** *In ashlar masonry, bonder units, uniformly distributed, shall be provided to the extent of not less than 10 percent of the wall area. Such bonder units shall extend not less than 4 inches (102 mm) into the backing wall.*

**2109.6.4.2 Rubble stone masonry.** *Rubble stone masonry 24 inches (610 mm) or less in thickness shall have bonder units with a maximum spacing of 36 inches (914 mm) vertically and 36 inches (914 mm) horizontally, and if the masonry is of greater thickness than 24 inches (610 mm), shall have one bonder unit for each 6 square feet (0.56 m<sup>2</sup>) of wall surface on both sides.*

#### **2109.6.5 Masonry bonding pattern.**

**2109.6.5.1 Masonry laid in running bond.** *Each wythe of masonry shall be laid in running bond, head joints in successive courses shall be offset by not less than one-fourth the unit length or the masonry walls shall be reinforced longitudinally as required in Section 2109.6.5.2.*

**2109.6.5.2 Masonry laid in stack bond.** Where unit masonry is laid with less head joint offset than in Section 2109.6.5.1, the minimum area of horizontal reinforcement placed in mortar bed joints or in bond beams spaced not more than 48 inches (1219 mm) apart, shall be 0.0003 times the vertical cross-sectional area of the wall.

## **2109.7 Anchorage.**

**2109.7.1 General.** Masonry elements shall be anchored in accordance with Sections 2109.7.2 through 2109.7.4.

**2109.7.2 Intersecting walls.** Masonry walls depending upon one another for lateral support shall be anchored or bonded at locations where they meet or intersect by one of the methods indicated in Sections 2109.7.2.1 through 2109.7.2.5.

**2109.7.2.1 Bonding pattern.** Fifty percent of the units at the intersection shall be laid in an overlapping masonry bonding pattern, with alternate units having a bearing of not less than 3 inches (76 mm) on the unit below.

**2109.7.2.2 Steel connectors.** Walls shall be anchored by steel connectors having a minimum section of 1/4 inch (6.4 mm) by 1 1/2 inches (38 mm), with ends bent up at least 2 inches (51 mm) or with cross pins to form anchorage. Such anchors shall be at least 24 inches (610 mm) long and the maximum spacing shall be 48 inches (1219 mm).

**2109.7.2.3 Joint reinforcement.** Walls shall be anchored by joint reinforcement spaced at a maximum distance of 8 inches (203 mm). Longitudinal wires of such reinforcement shall be at least wire size W1.7 (MW 11) and shall extend at least 30 inches (762 mm) in each direction at the intersection.

**2109.7.2.4 Interior nonload-bearing walls.** Interior nonload-bearing walls shall be anchored at their intersection, at vertical intervals of not more than 16 inches (406 mm) with joint reinforcement or 1/4-inch (6.4 mm) mesh galvanized hardware cloth.

**2109.7.2.5 Ties, joint reinforcement or anchors.** Other metal ties, joint reinforcement or anchors, if used, shall be spaced to provide equivalent area of anchorage to that required by this section and be approved by the commissioner.

**2109.7.3 Floor and roof anchorage.** Floor and roof diaphragms providing lateral support to masonry shall comply with the live loads in Section 1607.3 and shall be connected to the masonry in accordance with Sections 2109.7.3.1 through 2109.7.3.3.

**2109.7.3.1 Wood floor joists.** Wood floor joists bearing on masonry walls shall be anchored to the wall at intervals not to exceed 72 inches (1829 mm) by metal strap anchors. Joists parallel to the wall shall be anchored with metal straps spaced not more than 72 inches (1829 mm) o.c. extending over or under and secured to at least three joists. Blocking shall be provided between joists at each strap anchor.

**2109.7.3.1.1 Bearing details.** Concentrated loads shall be supported upon construction of solid masonry, concrete, or masonry of hollow units with cells filled with mortar, grout, or concrete and of sufficient height to distribute safely the loads to the wall or column, or other adequate provisions shall be made to distribute the loads.

**2109.7.3.1.2 Joists.** Solid construction for support under joists shall be at least 2 ¼ inches (57 mm) in height, and joists supported on such construction shall extend into the masonry at least 3 inches (76 mm).

**2109.7.3.1.3 Beams.** Solid construction for support under beams, girders, or other concentrated loads shall be at least 4 inches (102 mm) in height, and the bearing of beams shall extend into the masonry at least 4 inches (102 mm).

**2109.7.3.1.4 Isolated piers.** Isolated masonry piers shall be bonded as required for solid walls of the same thickness and shall be provided with adequate means for distributing the load at the top of the pier.

**2109.7.3.2 Steel floor joists.** Steel floor joists bearing on masonry walls shall be anchored to the wall with ⅜-inch (9.5 mm) round bars, or their equivalent, spaced not more than 72 inches (1829 mm) o.c. Where joists are parallel to the wall, anchors shall be located at joist bridging.

**2109.7.3.3 Roof diaphragms.** Roof diaphragms shall be anchored to masonry walls with ½-inch-diameter (12.7 mm) bolts, 72 inches (1829 mm) o.c. or their equivalent. Bolts shall extend and be embedded at least 15 inches (381 mm) into the masonry, or be hooked or welded to not less than 0.20 square inch (0.02 m<sup>2</sup>) of bond beam reinforcement placed not less than 6 inches (152 mm)

*from the top of the wall.*

**2109.7.4 Walls adjoining structural framing.** *Where walls are dependent upon the structural frame for lateral support, they shall be anchored to the structural members with metal anchors or otherwise keyed to the structural members. Metal anchors shall consist of ½-inch (12.7 mm) bolts spaced at 48 inches (1219 mm) o.c. embedded 4 inches (102 mm) into the masonry, or their equivalent area.*

**2109.7.4.1 Use of existing walls.** *An existing masonry wall may be used in the alteration or extension of a building provided that it meets the requirements of this standard.*

**2109.7.4.2 Walls of insufficient thickness.** *Existing walls of masonry units that are structurally sound, but that are of insufficient thickness when increased in height, may be strengthened by an addition of similar masonry units laid in type M or S mortar. The foundations and lateral support shall be equivalent to those required for newly constructed walls under similar conditions. All such linings shall be thoroughly bonded into existing masonry by toothings to assure combined action of wall and lining. Toothings shall be distributed uniformly throughout the wall, and shall aggregate in vertical cross-sectional area at least 15 percent of the total surface area of the lining. Stresses in the masonry under the new conditions shall not exceed the allowable stresses.*

**2109.7.4.3 Precautions during erection.** *Temporary bracing shall be used wherever necessary to resist loads to which the walls may be subjected during erection. Such bracing shall remain in place as long as may be required for safety.*

**2109.7.4.4 Horizontal joints.** *All concrete framed buildings to be constructed over 35 feet (10 668 mm) in height (as measured from adjoining grade to the main roof level), whose exterior wythe are of cavity wall construction with steel lintels, shall have horizontal joints in the exterior wythe to prevent masonry distress induced by vertical shortening of the structural frame.*

**2109.7.4.4.1 Joint minimum thickness.** *Unless substantiated as indicated by 2109.7.4.4.2, horizontal joints shall be ¼ inch (6.4 mm) minimum thickness, with neoprene, polyethylene, or urethane gasket or equivalent joint filler filling the entire joint, except for a recess from the toe of the lintel angle to the exterior of the facing brick, to provide space for caulking. These joints shall be placed at each floor.*

**2109.7.4.4.2 Joint thickness by analysis.** *The applicant of record shall submit an engineering analysis establishing that proposed building horizontal joints spaced further apart than in*

2109.7.4.4.1 are sufficient to provide for the effects of vertical shortening of the structural frame.

## **SECTION BC 2110 GLASS UNIT MASONRY**

**2110.1 Scope.** This section covers the empirical requirements for non-load-bearing glass unit masonry elements in exterior or interior walls.

**2110.1.1 Limitations.** Solid or hollow approved glass block shall not be used in firewalls, party walls, fire barriers or fire partitions, or for load-bearing construction. Such blocks shall be erected with mortar and reinforcement in metal channel-type frames, structural frames, masonry or concrete recesses, embedded panel anchors as provided for both exterior and interior walls or other approved joint materials. Wood strip framing shall not be used in walls required to have a fire-resistance rating by other provisions of this code.

**Exception:** Glass-block assemblies having a fire protection rating of not less than  $\frac{3}{4}$  hour shall be permitted as opening protectives in accordance with Section 715 in barriers and fire partitions that have a required fire-resistance rating of 1 hour and do not enclose exit stairways or exit passageways.

**2110.2 Units.** Hollow or solid glass-block units shall be standard or thin units.

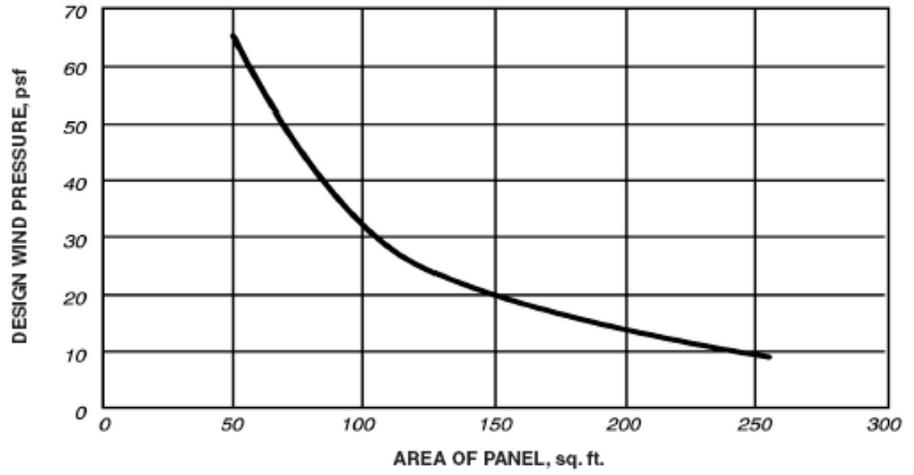

**2110.2.1 Standard units.** The specified thickness of standard units shall be  $3\frac{7}{8}$  inches (98 mm).

**2110.2.2 Thin units.** The specified thickness of thin units shall be  $3\frac{1}{8}$  inches (79 mm) for hollow units or 3 inches (76 mm) for solid units.

**2110.3 Panel size.**

**2110.3.1 Exterior standard-unit panels.** The maximum area of each individual exterior standard-unit panel shall be 144 square feet (13.4 m<sup>2</sup>) when the design wind pressure is 20 psf (958 N/m<sup>2</sup>). The maximum panel dimension between structural supports shall be 25 feet (7620 mm) in width or 20 feet (6096 mm) in height. The panel areas are permitted to be adjusted in accordance with Figure 2110.3.1 for other wind pressures.

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 pound per square foot = 47.9 N/m<sup>2</sup>.

**FIGURE 2110.3.1**  
**GLASS MASONRY DESIGN WIND LOAD RESISTANCE**

**2110.3.2 Exterior thin-unit panels.** *The maximum area of each individual exterior thin-unit panel shall be 85 square feet (7.9 m<sup>2</sup>). The maximum dimension between structural supports shall be 15 feet (4572 mm) in width or 10 feet (3048 mm) in height. Thin units shall not be used in applications where the design wind pressure exceeds 20 psf (958 N/m<sup>2</sup>).*

**2110.3.3 Interior panels.** *The maximum area of each individual standard-unit panel shall be 250 square feet (23.2 m<sup>2</sup>). The maximum area of each thin-unit panel shall be 150 square feet (13.9 m<sup>2</sup>). The maximum dimension between structural supports shall be 25 feet (7620 mm) in width or 20 feet (6096 mm) in height.*

**2110.3.4 Solid units.** *The maximum area of solid glass-block wall panels in both exterior and interior walls shall not be more than 100 square feet (9.3 m<sup>2</sup>).*

**2110.3.5 Curved panels.** *The width of curved panels shall conform to the requirements of Sections 2110.3.1, 2110.3.2 and 2110.3.3, except additional structural supports shall be provided at locations where a curved section joins a straight section, and at inflection points in multi-curved walls.*

#### **2110.4 Support.**

**2110.4.1 Isolation.** *Glass unit masonry panels shall be isolated so that in-plane loads are not imparted to the panel.*

**2110.4.2 Vertical.** *Maximum total deflection of structural members supporting glass unit masonry shall not exceed  $1/600$ .*

**2110.4.3 Lateral.** *Glass unit masonry panels more than one unit wide or one unit high shall be laterally supported along their tops and sides. Lateral support shall be provided by panel anchors along the top and sides spaced not more than 16 inches (406 mm) o.c. or by channel-type restraints. Glass unit masonry panels shall be recessed at least 1 inch (25 mm) within channels and chases. Channel-type restraints shall be oversized to accommodate expansion material in the opening and packing and sealant between the framing restraints and the glass unit masonry perimeter units. Lateral supports for glass unit masonry panels shall be designed to resist applied loads, or a minimum of 200 pounds per lineal feet (plf) (2919 N/m) of panel, whichever is greater.*

#### **Exceptions:**

1. *Lateral support at the top of glass unit masonry panels that are no more than one unit wide shall not be required.*
2. *Lateral support at the sides of glass unit masonry panels that are no more than one unit high shall not be required.*

**2110.4.3.1 Single unit panels.** *Single unit glass unit masonry panels shall conform to the requirements of Section 2110.4.3, except lateral support shall not be provided by panel anchors.*

**2110.5 Expansion joints.** *Glass unit masonry panels shall be provided with expansion joints along the top and sides at all structural supports. Expansion joints shall have sufficient thickness to accommodate displacements of the supporting structure, but shall not be less than  $\frac{3}{8}$  inch (9.5 mm) in thickness. Expansion joints shall be entirely free of mortar or other debris and shall be filled with resilient material. The sills of glass-block panels shall be coated with approved water-based asphaltic emulsion, or other elastic waterproofing material, prior to laying the first mortar course.*

**2110.6 Mortar.** *Mortar for glass unit masonry shall comply with Section 2103.7.*

**2110.7 Reinforcement.** *Glass unit masonry panels shall have horizontal joint reinforcement spaced not more than 16 inches (406 mm) on center, located in the mortar bed joint, and extending the entire length of the panel but not across expansion joints. Longitudinal wires shall be lapped a minimum of 6 inches (152 mm) at splices. Joint reinforcement shall be placed in the bed joint immediately below and above openings in the panel. The reinforcement shall have not less than two parallel longitudinal wires of size W1.7 (MW 11), and have welded cross wires of size W1.7 (MW 11).*

## **SECTION BC 2111 MASONRY FIREPLACES**

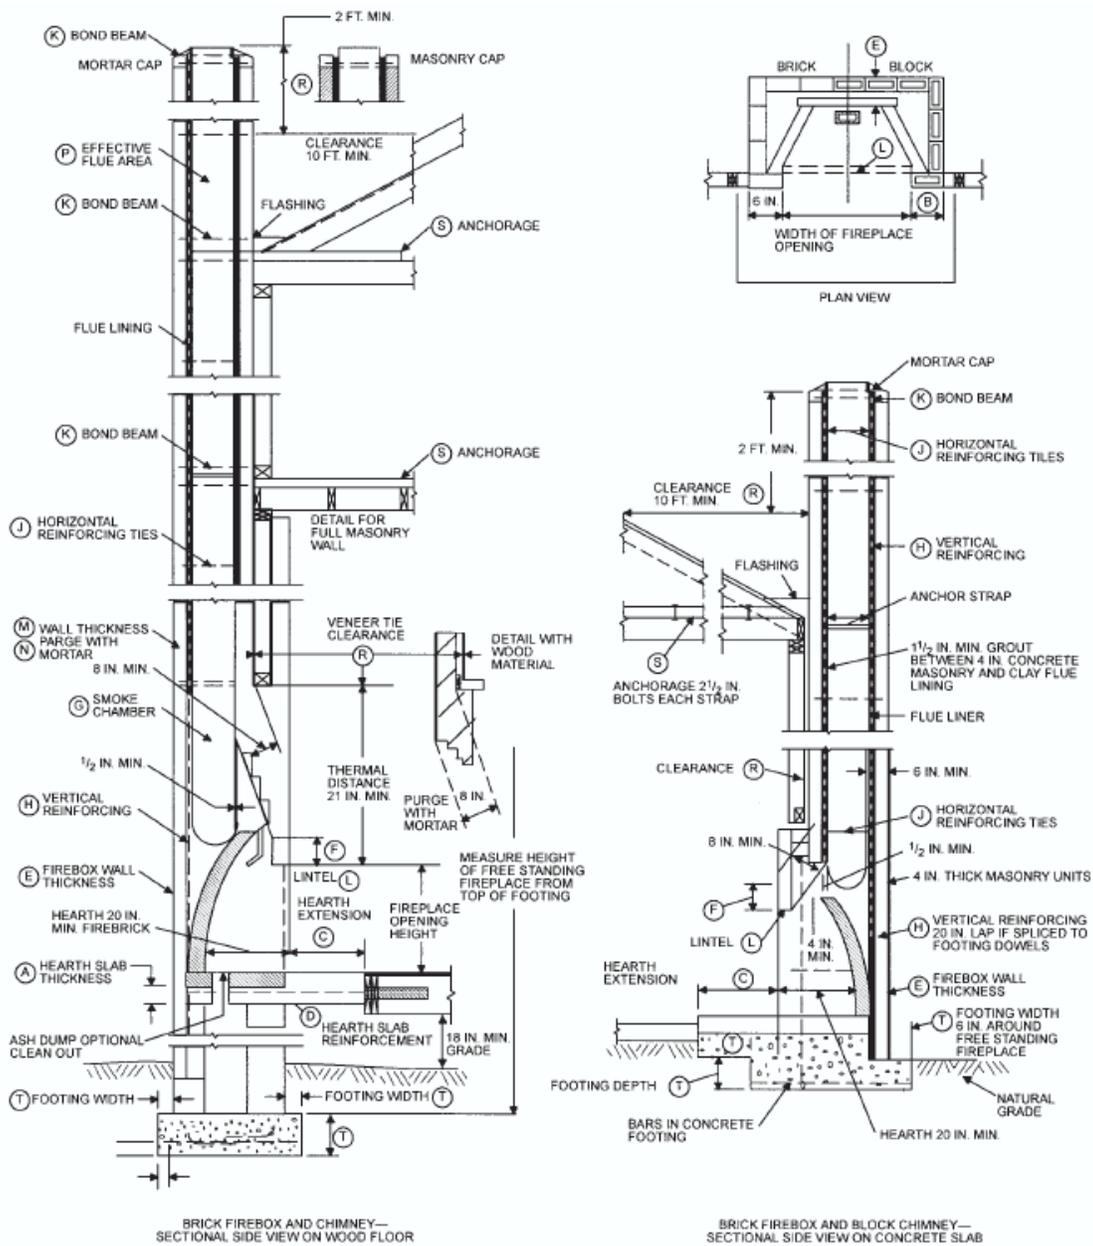

**2111.1 Definition.** *A masonry fireplace is a fireplace constructed of concrete or masonry. Masonry fireplaces shall be constructed in accordance with this section, Table 2111.1 and Figure 2111.1.*

**TABLE 2111.1  
SUMMARY OF REQUIREMENTS FOR MASONRY FIREPLACES AND CHIMNEYS<sup>a</sup>**

ITEM	LETTER	REQUIREMENTS	SECTION
Hearth and hearth extension thickness	A	4-inch minimum thickness for hearth, 4-inch minimum thickness for hearth extension.	2111.9
Hearth extension (each side of opening)	B	8 inches for fireplace opening less than 6 square feet. 12 inches for fireplace opening greater than or equal to 6 square feet.	2111.10
Hearth extension (front of opening)	C	16 inches for fireplace opening less than 6 square feet. 20 inches for fireplace opening greater than or equal to 6 square feet.	2111.10
Firebox dimensions	—	20-inch minimum firebox depth. 12-inch minimum firebox depth for Rumford fireplaces.	2111.6
Hearth and hearth extension reinforcing	D	Reinforced to carry its own weight and all imposed loads.	2111.9
Thickness of wall of firebox	E	10 inches solid masonry or 8 inches where firebrick lining is used.	2111.5
Distance from top of opening to throat	F	8 inches minimum.	2111.7 2111.7.1
Smoke chamber wall thickness dimensions	G	6 inches lined; 8 inches unlined. Not taller than opening width; walls not inclined more than 45 degrees from vertical for prefabricated smoke chamber linings or 30 degrees from vertical for corbeled masonry.	2111.8
Chimney vertical reinforcing	H	Four No. 4 full-length bars for chimney up to 40 inches wide. Add two No. 4 bars for each additional 40 inches or fraction of width, or for each additional flue.	2111.3.1, 2113.3.1
Chimney horizontal reinforcing	J	1/4-inch ties at each 18 inches, and two ties at each bend in vertical steel.	2111.3.2, 2113.3.2
Fireplace lintel	L	Noncombustible material with 4-inch bearing length of each side of opening.	2111.7
Chimney walls with flue lining	M	4-inch-thick solid masonry with 5/8-inch fireclay liner or equivalent. 1/2-inch grout or airspace between fireclay liner and wall.	2113.11.1
Effective flue area (based on area of fireplace opening and chimney)	P	See Section 2113.16.	2113.16
Clearances From chimney From fireplace From combustible trim or materials Above roof	R	2 inches interior, 1 inch exterior or 12 inches from lining. 2 inches back or sides or 12 inches from lining. 6 inches from opening 3 feet above roof penetration, 2 feet above part of structure within 10 feet.	2113.19 2111.11 2111.12 2113.9
Anchorage strap Number required Embedment into chimney Fasten to Number of bolts	S	3/16 inch by 1 inch Two 12 inches hooked around outer bar with 6-inch extension. 4 joists Two 1/2-inch diameter.	2111.4 2113.4.1
Footing Thickness Width	T	12-inch minimum. 6 inches each side of fireplace wall.	2111.2

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 square foot = 0.0929 m<sup>2</sup>, 1 degree = 0.017 rad.

a. This table provides a summary of major requirements for the construction of masonry chimneys and fireplaces. Letter references are to Figure 2111.1, which shows examples of typical construction. This table does not cover all requirements, nor does it cover all aspects of the indicated requirements. For the actual mandatory requirements of the code, see the indicated section of text.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

**FIGURE 2111.1  
FIREPLACE AND CHIMNEY DETAILS**

**2111.2 Footings and foundations.** Footings for masonry fireplaces and their chimneys shall be constructed of reinforced concrete or solid masonry at least 12 inches (305 mm) thick and shall extend at least 6 inches (152 mm) beyond the face of the fireplace or foundation wall on all sides. Footings shall be founded on natural undisturbed earth or engineered fill below frost depth. In areas not subjected to freezing, footings shall be at least 12 inches (305 mm) below finished grade. Foundations and footings shall be designed to support the fireplace loading and shall have a minimum fire resistance rating of three hours.

**2111.2.1 Ash dump clean-out.** Clean-out openings, located within foundation walls below fireboxes, when provided, shall be equipped with ferrous metal or masonry doors and frames constructed to remain tightly closed, except when in use. Clean outs shall be accessible and located so that ash removal will not create a hazard to combustible materials.

**2111.3 Seismic reinforcing.** Masonry or concrete fireplaces shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category D, masonry and concrete fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2, 2111.4 and 2111.4.1 for chimneys serving fireplaces. In Seismic Design Category B or C, reinforcement and seismic anchorage is not required.

**2111.3.1 Vertical reinforcing.** For fireplaces with chimneys up to 40 inches (1016 mm) wide, four No. 4 continuous vertical bars, anchored in the foundation, shall be placed in the concrete, between wythes of solid masonry or within the cells of hollow unit masonry and grouted in accordance with Section 2103.10. For fireplaces with chimneys greater than 40 inches (1016 mm) wide, two additional No. 4 vertical bars shall be provided for each additional 40 inches (1016 mm) in width or fraction thereof.

**2111.3.2 Horizontal reinforcing.** Vertical reinforcement shall be placed enclosed within ¼-inch (6.4 mm) ties or other reinforcing of equivalent net cross-sectional area, spaced not to exceed 18 inches (457 mm) on center in concrete; or placed in the bed joints of unit masonry at a minimum of every 18 inches (457 mm) of vertical height. Two such ties shall be provided at each bend in the vertical bars.

**2111.4 Seismic anchorage.** Masonry and concrete chimneys in Seismic Design Category D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements.

**2111.4.1 Anchorage.** Two ¾-inch by 1-inch (4.8 mm by 25 mm) straps shall be embedded a minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor

joists with two ½-inch (12.7 mm) bolts.

**2111.5 Firebox walls.** Masonry fireboxes shall be constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete. When a lining of firebrick at least 2 inches (51 mm) in thickness or other approved lining is provided, the minimum thickness of back and side-walls shall each be 8 inches (203 mm) of solid masonry, including the lining. The approved lining shall be able to withstand a temperature of 2000°F (1093°C) without cracking. The width of joints between firebricks shall not be greater than ¼ inch (6.4 mm). When no lining is provided, the total minimum thickness of back and side-walls shall be 12 inches (305 mm) of solid masonry. Firebrick shall conform to ASTM C 27 or ASTM C 1261 and shall be laid with medium-duty refractory mortar conforming to ASTM C 199.

**2111.5.1 Steel fireplace units.** Steel fireplace units are permitted to be installed with solid masonry to form a masonry fireplace provided they are installed according to either the requirements of their listing or the requirements of this section. Steel fireplace units incorporating a steel firebox lining shall be constructed with steel not less than ¼ inch (6.4 mm) in thickness, and an air-circulating chamber which is ducted to the interior of the building. The firebox lining shall be encased with solid masonry to provide a total thickness at the back and sides of not less than 8 inches (203 mm), of which not less than 4 inches (102 mm) shall be of solid masonry or concrete. Circulating air ducts employed with steel fireplace units shall be constructed of metal or masonry.

**2111.6 Firebox dimensions.** The firebox of a concrete or masonry fireplace shall have a minimum depth of 20 inches (508 mm). The throat shall not be less than 8 inches (203 mm) above the fireplace opening. The throat opening shall not be less than 4 inches (102 mm) in depth. The cross-sectional area of the passageway above the firebox, including the throat, damper and smoke chamber, shall not be less than the cross-sectional area of the flue.

**Exception:** Rumford fireplaces shall be permitted provided that the depth of the fireplace is at least 12 inches (305 mm) and at least one-third of the width of the fireplace opening, and the throat is at least 12 inches (305 mm) above the lintel, and at least <sup>1</sup>/20 the cross-sectional area of the fireplace opening.

**2111.7 Lintel and throat.** Masonry over a fireplace opening shall be supported by a lintel of noncombustible material. The minimum required bearing length on each end of the fireplace opening shall be 4 inches (102 mm). The fireplace throat or damper shall be located a minimum of 8 inches (203 mm) above the top of the fireplace opening.

**2111.7.1 Damper.** Masonry fireplaces shall be equipped with a ferrous metal damper located at least 8

inches (203 mm) above the top of the fireplace opening. Dampers shall be installed in the fireplace or at the top of the flue venting the fireplace, and shall be operable from the room containing the fireplace. Damper controls shall be permitted to be located in the fireplace. The damper shall be able to withstand distortion from binding, cracking or corrosion when exposed to the fireplace operating temperature.

**2111.8 Smoke chamber walls.** Smoke chamber walls shall be constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete. Corbeling of masonry units shall not leave unit cores exposed to the inside of the smoke chamber. The inside surface of corbeled masonry shall be parged smooth. Where no lining is provided, the total minimum thickness of front, back and side walls shall be 8 inches (203 mm) of solid masonry. When a lining of firebrick at least 2 inches (51 mm) thick, or a lining of vitrified clay at least  $\frac{3}{8}$  inch (15.9 mm) thick, is provided, the total minimum thickness of front, back and side walls shall be 6 inches (152 mm) of solid masonry, including the lining. Firebrick shall conform to ASTM C 27 or ASTM C 1261 and shall be laid with refractory mortar conforming to ASTM C 199.

**2111.8.1 Smoke chamber dimensions.** The inside height of the smoke chamber from the fireplace throat to the beginning of the flue shall not be greater than the inside width of the fireplace opening. The inside surface of the smoke chamber shall not be inclined more than 45 degrees (0.76 rad) from vertical when prefabricated smoke chamber linings are used or when the smoke chamber walls are rolled or sloped rather than corbeled. When the inside surface of the smoke chamber is formed by corbeled masonry, the walls shall not be corbeled more than 30 degrees (0.52 rad) from vertical.

**2111.9 Hearth and hearth extension.** Masonry fireplace hearths and hearth extensions shall be constructed of concrete, ceramic tile, masonry or equivalent, supported by noncombustible materials, and reinforced to carry their own weight and all imposed loads. No combustible material shall remain against the underside of hearths or hearth extensions after construction.

**2111.9.1 Hearth thickness.** The minimum thickness of fireplace hearths shall be 4 inches (102 mm).

**2111.9.2 Hearth extension thickness.** The minimum thickness of hearth extensions shall be 2 inches (51 mm).

**Exception:** When the bottom of the firebox opening is raised at least 8 inches (203 mm) above the top of the hearth extension, a hearth extension of not less than  $\frac{3}{8}$ -inch-thick (9.5 mm) brick, concrete, stone, tile or other approved noncombustible material is permitted.

**2111.10 Hearth extension dimensions.** *Hearth extensions shall extend at least 16 inches (406 mm) in front of, and at least 8 inches (203 mm) beyond, each side of the fireplace opening. Where the fireplace opening is 6 square feet (0.56 m<sup>2</sup>) or larger, the hearth extension shall extend at least 20 inches (508 mm) in front of, and at least 12 inches (305 mm) beyond, each side of the fireplace opening.*

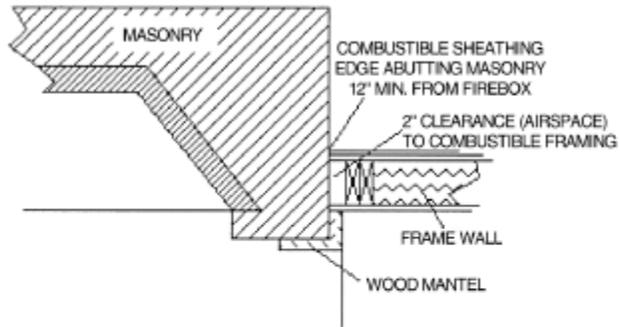

**2111.10.1 Elevated or overhanging fireplace.** *Where a fireplace is elevated or overhangs a floor, the hearth extension shall also extend over the area under the fireplace.*

**2111.11 Fireplace clearance.** *Any portion of a masonry fireplace located in the interior of a building or within the exterior wall of a building shall have a clearance to combustibles of not less than 2 inches (51 mm) from the front faces and sides of masonry fireplaces and not less than 4 inches (102 mm) from the back faces of masonry fireplaces. The airspace shall not be filled, except to provide fireblocking in accordance with Section 2111.13.*

**Exceptions:**

1. *Masonry fireplaces listed and labeled for use in contact with combustibles in accordance with UL 127, and installed in accordance with the manufacturer's installation instructions, are permitted to have combustible material in contact with their exterior surfaces.*
2. *When masonry fireplaces are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete walls less than 12 inches (306 mm) from the inside surface of the nearest firebox lining.*
3. *Exposed combustible trim and the edges of sheathing materials, such as wood siding, flooring and drywall, are permitted to abut the masonry fireplace sidewalls and hearth extension, in accordance with Figure 2111.11, provided such combustible trim or sheathing is a minimum of 12 inches (306 mm) from the inside surface of the nearest firebox lining.*
4. *Exposed combustible mantels or trim is permitted to be placed directly on the masonry fireplace front surrounding the fireplace opening provided such combustible materials shall not be placed within 6 inches (153 mm) of a fireplace opening. Combustible material within 12 inches (306 mm) of the*

*fireplace opening shall not project more than  $\frac{1}{8}$  inch (3.2 mm) for each 1-inch (25 mm) distance from such opening.*

For SI: 1 inch = 25.4 mm

**FIGURE 2111.11  
ILLUSTRATION OF EXCEPTION TO  
FIREPLACE CLEARANCE PROVISION**

**2111.12 Mantel and trim.** Woodwork or other combustible materials shall not be placed within 6 inches (152 mm) of a fireplace opening. Combustible material within 12 inches (305 mm) of the fireplace opening shall not project more than 1/8 inch (3.2 mm) for each 1-inch (25mm) distance from such opening.

**2111.13 Fireplace fireblocking.** All spaces between fireplaces and floors and ceilings through which fireplaces pass shall be fire-blocked with approved noncombustible material securely fastened in place. The fire-blocking of spaces between wood joists, beams or headers shall be to a depth of 1 inch (25 mm) and shall only be placed on strips of metal or metal lath laid across the spaces between combustible material and the chimney.

**2111.14 Exterior air.** Factory-built or masonry fireplaces covered in this section shall be equipped with an exterior air supply to ensure proper fuel combustion unless the room is mechanically ventilated and controlled so that the indoor pressure is neutral or positive.

**2111.14.1 Factory-built fireplaces.** Exterior combustion air ducts for factory-built fireplaces shall be listed components of the fireplace, and installed according to the fireplace manufacturer's instructions.

**2111.14.2 Masonry fireplaces.** Listed combustion air ducts for masonry fireplaces shall be installed according to the terms of their listing and manufacturer's instructions.

**2111.14.3 Exterior air intake.** The exterior air intake shall be capable of providing all combustion air from the exterior of the dwelling. The exterior air intake shall not be located within the garage, attic, basement or crawl space of the dwelling nor shall the air intake be located at an elevation higher than the firebox. The exterior air intake shall be covered with a corrosion-resistant screen of 1/4-inch (6.4 mm) mesh.

**2111.14.4 Clearance.** Unlisted combustion air ducts shall be installed with a minimum 1-inch (25 mm) clearance to combustibles for all parts of the duct within 5 feet (1524 mm) of the duct outlet.

**2111.14.5 Passageway.** The combustion air passageway shall be a minimum of 6 square inches (3870 mm<sup>2</sup>) and not more than 55 square inches (0.035 m<sup>2</sup>), except that combustion air systems for listed fireplaces or for fireplaces tested for emissions shall be constructed according to the fireplace manufacturer's instructions.

**2111.14.6 Outlet.** The exterior air outlet is permitted to be located in the back or sides of the firebox

*chamber or within 24 inches (610 mm) of the firebox opening on or near the floor. The outlet shall be closable and designed to prevent burning material from dropping into concealed combustible spaces.*

## **SECTION BC 2112 MASONRY HEATERS**

**2112.1 Definition.** *A masonry heater is a heating appliance constructed of concrete or solid masonry, hereinafter referred to as “masonry,” having a mass of at least 1,760 pounds (800 kg), excluding the chimney and foundation, which is designed to absorb and store heat from a solid fuel fire built in the firebox by routing the exhaust gases through internal heat exchange channels in which the flow path downstream of the firebox includes at least one 180-degree (3.14 rad) change in flow direction before entering the chimney, and that delivers heat by radiation from the masonry surface of the heater that shall not exceed 230°F (110°C) except within 8 inches (203 mm) surrounding the fuel loading door(s).*

**2112.2 Installation.** *Masonry heaters may be installed only when their use is permitted by the New York City Air Pollution Control Code. When such use is permitted, masonry heaters shall be installed in accordance with ASTM E 1602. If permitted, such appliances shall be operated in compliance with the New York City Air Pollution Control Code.*

**2112.3 Seismic reinforcing.** *Seismic reinforcing shall not be required within the body of a masonry heater whose height is equal to or less than 2.5 times its body width and where the masonry chimney serving the heater is not supported by the body of the heater. Where the masonry chimney shares a common wall with the facing of the masonry heater, the chimney portion of the structure shall be reinforced in accordance with Sections 2113.3 and 2113.4.*

**2112.4 Masonry heater clearance.** *Wood or other combustible framing shall not be placed within 4 inches (102 mm) of the outside surface of a masonry heater, provided the wall thickness of the firebox is not less than 8 inches (203 mm) and the wall thickness of the heat exchange channels is not less than 5 inches (127 mm). A clearance of at least 8 inches (203 mm) shall be provided between the gas-tight capping slab of the heater and a combustible ceiling. The required space between the heater and combustible material shall be fully vented to permit the free flow of air around all heater surfaces.*

## **SECTION BC 2113 MASONRY CHIMNEYS**

**2113.1 General.** *A masonry chimney is a chimney constructed of concrete or masonry, hereinafter referred*

to as “masonry.” Masonry chimneys shall be constructed, anchored, supported and reinforced as required in this chapter.

Chimneys shall be designed and constructed so as to provide the necessary draft and capacity for each appliance connected to them to completely exhaust the products of combustion to the outside air. The temperature on adjacent combustible surfaces shall not be raised above 160°F (71°C). Condensation shall not be allowed to develop to an extent that can cause deterioration of the chimney or vent.

In any case, the outlet shall be arranged so that the flue gases are not directed so that they jeopardize people, overheat combustible structures, or enter building openings in the vicinity of the outlet. Gas-fired appliances shall be vented in accordance with this code and NFPA 54.

Chimneys shall not be supported by the equipment they serve unless such equipment has been specifically designed for such loads.

**2113.1.1 Chimney adequacy for temperature and gas action.** Chimneys shall be of adequate structural strength, and resistant to the temperatures to which they may be subjected and to the corrosive action of gases.

**2113.1.2 Chimney caps.** Termination caps shall not be permitted and a 3 inch (76 mm) minimum drain shall be installed to receive collected water. A positive means shall be provided to prevent water from entering the appliance.

**Exception:** Termination caps shall be permitted on listed factory-built chimneys,

**2113.1.2.1 Decorative shrouds.** Decorative shrouds shall not be installed at the termination of factory-built chimneys except where such shrouds are listed and labeled for use with the specific factory-built chimney system and are installed in accordance with the manufacturers’ installation instructions.

**2113.1.3 Chimney linings.** The lining in chimneys shall not be considered as taking either compression or tension stresses.

**2113.1.4 Chimney expansion and contraction.** Expansion and contraction in chimney walls due to temperature variations shall be accommodated solely by the use of steel reinforcing rings.

**2113.1.5 Reinforcing Rings.** Reinforcing rings shall be provided at all changes in wall thickness, at the top of the chimney, and above and below all flue openings.

**2113.1.6 Adjoining chimneys and vents.** Adjoining chimneys and vents shall be in accordance with Sections 2113.1.6.1 to 2113.1.6.8.

**2113.1.6.1 Responsibility of owner of taller building.** Whenever a building is erected, enlarged, or increased in height so that any portion of such building, except chimneys or vents, extends higher than the top of any previously constructed chimneys or vents within 100 feet (30 480 mm), the owner of such new or altered building shall have the responsibility of altering such chimneys or vents to make them conform with the requirements of this chapter. A chimney or vent that is no longer connected with a fireplace or combustion or other equipment for which a chimney or vent was required, shall be exempt from this requirement. Such alterations shall be accomplished by one of the following means or a combination thereof:

1. Carry up the previously constructed chimneys or vents to the height required in this chapter.
2. Offset such chimneys or vents to a distance beyond that required in this chapter from the new or altered building provided that the new location of the outlet of the offset chimney or vent shall otherwise comply with the requirements of this chapter.
3. Such requirements shall not dispense with or modify any additional requirements that may be applicable pursuant to rules of the New York City Department of Environmental Protection.

**2113.1.6.2 Protection of draft.** After the alteration of a chimney or vent as required by this section, it shall be the responsibility of the owner of the new or altered building to provide any mechanical equipment or devices necessary to maintain the proper draft in the equipment.

**2113.1.6.3 Written notification.** The owner of the new or altered building shall notify the owner of the building affected in writing at least 45 days before starting the work required and request written consent to do such work. Such notice shall be accompanied by plans indicating the manner in which the proposed alterations are to be made.

**2113.1.6.4 Approval.** *The plans and method of alteration shall be subject to the approval of the commissioner.*

**2113.1.6.5 Refusal of consent.** *If consent is not granted by the owner of the previously constructed building to do the alteration work required by this section, such owner shall signify his or her refusal in writing to the owner of the new or altered building and to the commissioner; and the owner of the new or altered building having submitted plans that conform to the requirements of this section, shall thereupon be released from any responsibility for the proper operation of the equipment due to loss of draft and for any health hazard or nuisance that may occur as a result of the new or altered building. Such responsibilities shall then be assumed by the owner of the previously constructed building. Similarly, should such owner fail to grant consent within forty-five days from the date of written request or fail to signify his or her refusal, he or she shall then assume all responsibilities as prescribed above.*

**2113.1.6.6 Procedure.** *It shall be the obligation of the owner of the new or altered building to:*

- 1. Schedule this work so as to create a minimum of disturbance to the occupants of the affected building; and*
- 2. Provide such essential services as are normally supplied by the equipment while it is out of service; and*
- 3. Where necessary, support such extended chimneys, vents and equipment from this building or to carry up such chimneys or vents within his or her building; and*
- 4. Provide for the maintenance, repair, and/or replacement of such extensions and added equipment; and*
- 5. Make such alterations of the same material as the original chimney or vent so as to maintain the same quality and appearance, except where the affected owner of the chimney or vent shall give his or her consent to do otherwise. All work shall be done in such fashion as to maintain the architectural aesthetics of the existing building. Where there is practical difficulty in complying strictly with the provisions of this Item, the commissioner may permit an equally safe alternative.*

**2113.1.6.7 Existing violations.** Any existing violations on the previously constructed equipment shall be corrected by the owner of the equipment before any equipment is added or alterations made at the expense of the owner of the new or altered building.

**2113.1.6.8 Variance.** The commissioner may grant a variance in accordance with the provisions of this code.

**2113.2 Footings and foundations.** Foundations for masonry chimneys shall be constructed of concrete or solid masonry at least 12 inches (305 mm) thick and shall extend at least 6 inches (152 mm) beyond the face of the foundation or support wall on all sides. Footings shall be founded on natural undisturbed earth or engineered fill below frost depth. In areas not subjected to freezing, footings shall be at least 12 inches (305 mm) below finished grade.

**2113.3 Seismic reinforcing.** Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category D, masonry and concrete chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2, and 2113.4. In Seismic Design Category B or C, reinforcement and seismic anchorage is not required.

**2113.3.1 Vertical reinforcing.** For chimneys up to 40 inches (1016 mm) wide, four No. 4 continuous vertical bars anchored in the foundation shall be placed in the concrete, between wythes of solid masonry or within the cells of hollow unit masonry and grouted in accordance with Section 2103.10. Grout shall be prevented from bonding with the flue liner so that the flue liner is free to move with thermal expansion. For chimneys greater than 40 inches (1016 mm) wide, two additional No. 4 vertical bars shall be provided for each additional 40 inches (1016 mm) in width or fraction thereof.

**2113.3.2 Horizontal reinforcing.** Vertical reinforcement shall be placed enclosed within ¼-inch (6.4 mm) ties, or other reinforcing of equivalent net cross-sectional area, spaced not to exceed 18 inches (457 mm) o.c. in concrete, or placed in the bed joints of unit masonry, at a minimum of every 18 inches (457 mm) of vertical height. Two such ties shall be provided at each bend in the vertical bars.

**2113.4 Seismic anchorage.** Masonry and concrete chimneys and foundations in Seismic Design Category D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements.

**2113.4.1 Anchorage.** Two 3/16-inch by 1-inch (4.8 mm by 25 mm) straps shall be embedded a

*minimum of 12 inches (305 mm) into the chimney. Straps shall be hooked around the outer bars and extend 6 inches (152 mm) beyond the bend. Each strap shall be fastened to a minimum of four floor joists with two ½-inch (12.7 mm) bolts.*

**2113.5 Corbeling.** *Masonry chimneys shall not be corbeled more than half of the chimney's wall thickness from a wall or foundation, nor shall a chimney be corbeled from a wall or foundation that is less than 12 inches (305 mm) in thickness unless it projects equally on each side of the wall, except that on the second story of a two-story dwelling, corbeling of chimneys on the exterior of the enclosing walls is permitted to equal the wall thickness. The projection of a single course shall not exceed one-half the unit height or one-third of the unit bed depth, whichever is less. No masonry shall be corbeled from hollow or cavity wall masonry units.*

**2113.6 Changes in dimension.** *The chimney wall or chimney flue lining shall not change in size or shape within 6 inches (152 mm) above or below where the chimney passes through floor components, ceiling components or roof components.*

**2113.7 Offsets.** *Where a masonry chimney is constructed with a fireclay flue liner surrounded by one wythe of masonry, the maximum offset shall be such that the centerline of the flue above the offset does not extend beyond the center of the chimney wall below the offset. Where the chimney offset is supported by masonry below the offset in an approved manner, the maximum offset limitations shall not apply. Each individual corbeled masonry course of the offset shall not exceed the projection limitations specified in Section 2113.5.*

**2113.8 Additional load.** *Chimneys shall not support loads other than their own weight unless they are designed and constructed to support the additional load. Masonry chimneys are permitted to be constructed as part of the masonry walls or concrete walls of the building.*

**2113.9 Termination.** *Chimneys serving appliances that operate at less than 600°F (316°C) shall extend at least 3 feet (914 mm) above the highest construction, such as a roof ridge, parapet wall, or penthouse, within 10 feet (3048 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimney located beyond 10 feet (3048 mm) from such construction, but not more than the distance determined from Equation 21-5 and Table 2113.9, shall be at least as high as the construction.*

*Chimneys serving appliances that operate at between 600°F (316°C) and 1000°F (538°C) shall extend*

*at least 10 feet (3048 mm) above the highest construction, such as a roof ridge, or parapet wall or penthouse within 20 feet (6096 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such construction does not include other chimneys, vents or open structural framing. Any chimney located beyond 20 feet (6096 mm) from such construction, but not more than the distance determined from Equation 21-5 and Table 2113.9, shall be at least as high as the construction.*

**(Equation 21-5)**

$$D = F \sqrt{A}$$

where:

*D = Distance, in feet, measured from the center of the chimney outlet to the nearest edge of the construction.*

*F = Value determined from Table 2113.9.*

*A = Free area, in square inches, of chimney flue space.*

**TABLE 2113.9**  
**"F" FACTOR FOR DETERMINING CHIMNEY DISTANCES**

<b>"F" FACTOR FOR DETERMINING CHIMNEY DISTANCES</b>			
<b>Type of Fuel</b>	<b>"F" Factor</b>		
	<i>600°F (316°C) and less</i>	<i>600°F (316°C) to 1000°F (538°C)</i>	<i>Greater than 1000°F (538°C)</i>
<i>Gas</i>	2	2	3
<i>No. 2 Fuel Oil</i>	2.5	2.5	3
<i>No. 4, No. 6 Fuel Oils, Solid Fuels and Incinerators</i>	3	3	3

**2113.9.1 Spark arrestors.** *Where a spark arrestor is installed on a masonry chimney, the spark arrestor shall meet all of the following requirements:*

- 1. The net free area of the arrestor shall not be less than four times the net free area of the outlet of the chimney flue it serves.*
- 2. The arrestor screen shall have heat and corrosion resistance equivalent to 19-gage galvanized steel or 24-gage stainless steel.*
- 3. Openings shall not permit the passage of spheres having a diameter greater than ½ inch (12.7 mm) nor block the passage of spheres having a diameter less than ⅜ inch (9.5 mm).*
- 4. The spark arrestor shall be accessible for cleaning and the screen or chimney cap shall be removable to allow for cleaning of the chimney flue.*

**2113.10 Wall thickness.** *Masonry chimney walls shall be constructed of concrete, solid masonry units or hollow masonry units grouted solid with not less than 4 inches (102 mm) nominal thickness, or 8 inches (203 mm) nominal thickness for chimney walls extending more than 3 feet (914 mm) above the highest lateral support point.*

**2113.11 Flue lining (material).** *Masonry chimneys shall be lined. The lining material shall be appropriate for the type of appliance connected, according to the terms of the appliance listing and the manufacturer's instructions.*

**2113.11.1 Residential-type appliances (general).** *Flue lining systems shall comply with one of the following:*

- 1. Clay flue lining complying with the requirements of ASTM C 315, or equivalent.*
- 2. Listed chimney lining systems complying with UL 1777.*
- 3. Factory-built chimneys or chimney units listed for installation within masonry chimneys.*
- 4. Other approved materials that will resist corrosion, erosion, softening or cracking from flue gases and condensate at temperatures up to 1,800°F (982°C).*

**2113.11.1.1 Flue linings for specific appliances.** *Flue linings other than those covered in Section 2113.11.1 intended for use with specific appliances shall comply with Sections 2113.11.1.2 through 2113.11.1.4 and Sections 2113.11.2 and 2113.11.3.*

**2113.11.1.2 Gas appliances.** *Flue lining systems for gas appliances shall be in accordance with the New York City Fuel Gas Code.*

**2113.11.1.3 Pellet fuel-burning appliances.** *Pellet fuel-burning appliances may be installed only when their use is permitted by the New York City Air Pollution Control Code. Any such appliances shall be listed and labeled and shall be installed in accordance with the terms of the listing. If permitted, such appliances shall be operated in compliance with the New York City Air Pollution Control Code. Flue lining and vent systems for use in masonry chimneys with pellet fuel-burning appliances shall be limited to flue lining systems complying with Section 2113.11.1 and pellet vents listed for installation within masonry chimneys (see Section 2113.11.1.5 for marking).*

**2113.11.1.4 Oil-fired appliances approved for use with L-vent.** *Flue lining and vent systems for use in masonry chimneys with oil-fired appliances approved for use with Type L vent shall be limited to flue lining systems complying with Section 2113.11.1 and listed chimney liners complying with UL 641 (see Section 2113.11.1.5 for marking).*

**2113.11.1.5 Notice of usage.** *When a flue is relined with a material not complying with Section 2113.11.1, the chimney shall be plainly and permanently identified by a label attached to a wall, ceiling or other conspicuous location adjacent to where the connector enters the chimney. The label shall include the following message or equivalent language: "This chimney is for use only with (type or category of appliance) that burns (type of fuel). Do not connect other types of appliances."*

## **2113.11.2 Concrete and masonry chimneys for medium heat appliances.**

**2113.11.2.1 General.** *Concrete and masonry chimneys for medium-heat appliances shall comply with Sections 2113.1 through 2113.5.*

**2113.11.2.2 Construction.** *Chimneys for medium-heat appliances shall be constructed of solid masonry units or of concrete with walls a minimum of 8 inches (203 mm) thick, or with stone masonry a minimum of 12 inches (305 mm). Chimneys for medium-heat appliances constructed with radial brick may be permitted to have different requirements. Design of all such chimneys*

*shall be submitted to the commissioner for approval.*

**2113.11.2.3 Lining.** *Concrete and masonry chimneys shall be lined with an approved medium-duty refractory brick a minimum of 4½ inches (114 mm) thick laid on the 4½-inch bed (114 mm) in an approved medium-duty refractory mortar. The lining shall start 2 feet (610 mm) or more below the lowest chimney connector entrance. Chimneys terminating 25 feet (7620 mm) or less above a chimney connector entrance shall be lined to the top.*

**2113.11.2.4 Multiple passageway.** *Concrete and masonry chimneys containing more than one passageway shall have the liners separated by a minimum 4-inch-thick (102 mm) concrete or solid masonry wall.*

**2113.11.2.5 Termination height.** *Chimneys serving appliances that operate at greater than 1,000°F (538°C) shall extend at least 20 feet (6096 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or in another building. However, such construction does not include other chimneys, vents, or open structural framing. Any chimney located beyond 50 feet (15 240 mm) from such construction but not more than the distance determined from Equation 21-5 and Table 2113.9, shall be at least as high as the construction.*

**2113.11.2.6 Clearance.** *A minimum clearance of 4 inches (102 mm) shall be provided between the exterior surfaces of a concrete or masonry chimney for medium-heat appliances and combustible material.*

**2113.11.3 Concrete and masonry chimneys for high-heat appliances.**

**2113.11.3.1 General.** *Concrete and masonry chimneys for high-heat appliances shall comply with Sections 2113.1 through 2113.5.*

**2113.11.3.2 Construction.** *Chimneys for high-heat appliances shall be constructed with double walls of solid masonry units or of concrete, each wall to be a minimum of 8 inches (203 mm) thick with a minimum airspace of 2 inches (51 mm) between the walls. Alternate chimney designs for high-heat appliances constructed with radial brick shall be permitted subject to the approval of the commissioner.*

**2113.11.3.3 Lining.** *The inside of the interior wall shall be lined with an approved high-duty refractory brick, a minimum of 4½ inches (114 mm) thick laid on the ½-inch bed (114 mm) in an approved high-duty refractory mortar. The lining shall start at the base of the chimney and extend continuously to the top.*

**2113.11.3.4 Termination height.** *Concrete and masonry chimneys for high-heat appliances shall extend at least 20 feet (6069 mm) above the highest construction, such as roof ridge, parapet wall, penthouse, or other obstruction within 50 feet (15 240 mm) of the chimney outlet, whether the construction is on the same building as the chimney or on another building. However, such constructions do not include other chimneys, vents, or open structural framing. Any chimney located beyond 50 feet (15 240 mm) from such construction but not more than the distance determined from Equation 21-5 and Table 2113.9, shall be at least as high as the construction.*

**2113.11.3.5 Clearance.** *Concrete and masonry chimneys for high-heat appliances shall have approved clearance from buildings and structures to prevent overheating combustible materials, permit inspection and maintenance operations on the chimney and prevent danger of burns to persons.*

**2113.12 Flue lining (installation).** *Flue liners shall be installed in accordance with ASTM C 1283 and extend from a point not less than 8 inches (203 mm) below the lowest inlet or, in the case of fireplaces, from the top of the smoke chamber, to a point above the enclosing walls. The lining shall be carried up vertically, with a maximum slope no greater than 30 degrees (0.52 rad) from the vertical. Fireclay flue liners shall be laid in medium-duty refractory mortar conforming to ASTM C 199, with tight mortar joints left smooth on the inside and installed to maintain an airspace or insulation not to exceed the thickness of the flue liner separating the flue liners from the interior face of the chimney masonry walls. Flue lining shall be supported on all sides. Only enough mortar shall be placed to make the joint and hold the liners in position.*

**2113.13 Additional requirements.**

**2113.13.1 Listed materials.** *Listed materials used as flue linings shall be installed in accordance with the terms of their listings and the manufacturer's instructions.*

**2113.13.2 Space around lining.** *The space surrounding a chimney lining system or vent installed within a masonry chimney shall not be used to vent any other appliance.*

**Exception:** This shall not prevent the installation of a separate flue lining in accordance with the manufacturer's instructions.

**2113.14 Multiple flues.** When two or more flues are located in the same chimney, masonry wythes shall be built between adjacent flue linings. The masonry wythes shall be at least 4 inches (102 mm) thick and bonded into the walls of the chimney.

**Exception:** When venting only one appliance, two flues are permitted to adjoin each other in the same chimney with only the flue lining separation between them. The joints of the adjacent flue linings shall be staggered at least 4 inches (102 mm).

**2113.15 Flue area (appliance).** Chimney flues shall not be smaller in area than the area of the connector from the appliance. Chimney flues connected to more than one appliance shall not be less than the area of the largest connector plus 50 percent of the areas of additional chimney connectors.

**Exceptions:**

1. Chimney flues serving oil-fired appliances sized in accordance with NFPA 31.
2. Chimney flues serving gas-fired appliances sized in accordance with the New York City Fuel Gas Code.

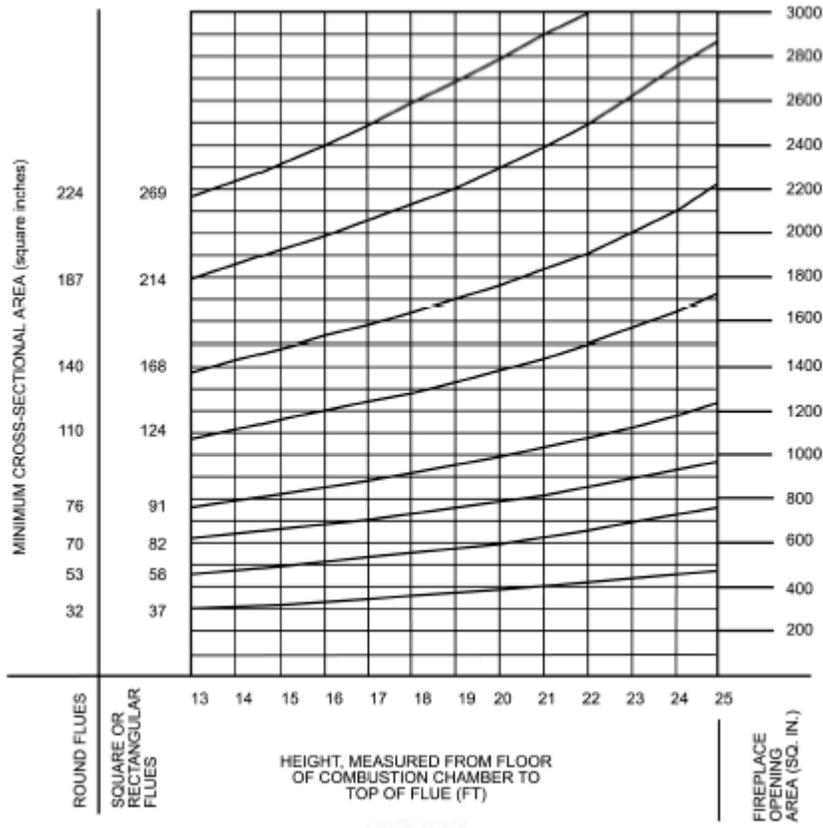

**2113.16 Flue area (masonry fireplace).** Flue sizing for chimneys serving fireplaces shall be in accordance with Section 2113.16.1 or 2113.16.2.

**2113.16.1 Minimum area.** Round chimney flues shall have a minimum net cross-sectional area of at least  $1/12$  of the fireplace opening. Square chimney flues shall have a minimum net cross-sectional area of at least  $1/10$  of the fireplace opening. Rectangular chimney flues with an aspect ratio less than 2 to 1 shall have a minimum net cross-sectional area of at least  $1/10$  of the fireplace opening. Rectangular chimney flues with an aspect ratio of 2 to 1 or more shall have a minimum net cross-sectional area of at least  $1/8$  of the fireplace opening.

**2113.16.2 Determination of minimum area.** The minimum net cross-sectional area of the flue shall be determined in accordance with Figure 2113.16. A flue size providing at least the equivalent net cross-sectional area shall be used. Cross-sectional areas of clay flue linings are as provided in Tables 2113.16(1) and 2113.16(2) or as provided by the manufacturer or as measured in the field. The height

*of the chimney shall be measured from the firebox floor to the top of the chimney flue.*

**FIGURE 2113.16  
FLUE SIZES FOR MASONRY CHIMNEYS**

For SI: 1 inch = 25.4 mm, 1 square inch = 645 mm<sup>2</sup>.

**TABLE 2113.16(1)

17 <sup>1</sup> / <sub>2</sub> × 17 <sup>1</sup> / <sub>2</sub>	226
19 <sup>1</sup> / <sub>2</sub> × 19 <sup>1</sup> / <sub>2</sub>	269
20 × 20	286

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm<sup>2</sup>.

a. Flue sizes are based on ASTM C 315.

**2113.17 Inlet.** *Inlets to masonry chimneys shall enter from the side. Inlets shall have a thimble of fireclay, rigid refractory material or metal that will prevent the connector from pulling out of the inlet or from extending beyond the wall of the liner.*

**2113.18 Masonry chimney cleanout openings.** *Cleanout openings shall be provided within 6 inches (152 mm) of the base of each flue within every masonry chimney. The upper edge of the cleanout shall be located at least 6 inches (152 mm) below the lowest chimney inlet opening. The height of the opening shall be at least 6 inches (152 mm). The cleanout shall be provided with a noncombustible cover.*

**Exception:** *Chimney flues serving masonry fireplaces, where cleaning is possible through the fireplace opening.*

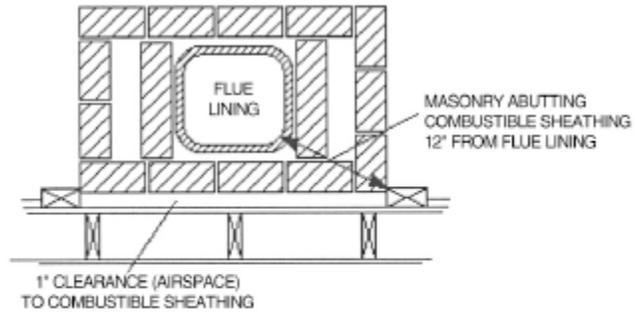

**2113.19 Chimney clearances.** *Any portion of a masonry chimney located in the interior of the building or within the exterior wall of the building shall have a minimum airspace clearance to combustibles of 2 inches (51 mm). Chimneys located entirely outside the exterior walls of the building, including chimneys that pass through the soffit or cornice, shall have a minimum airspace clearance of 1 inch (25 mm). The airspace shall not be filled, except to provide fireblocking in accordance with Section 2113.20.*

**Exceptions:**

- 1. Masonry chimneys equipped with a chimney lining system listed and labeled for use in chimneys in contact with combustibles in accordance with UL 1777, and installed in accordance with the manufacturer's instructions, are permitted to have combustible material in contact with their exterior surfaces.*
- 2. Where masonry chimneys are constructed as part of masonry or concrete walls, combustible materials shall not be in contact with the masonry or concrete wall less than 12 inches (305 mm) from the inside surface of the nearest flue lining.*
- 3. Exposed combustible trim and the edges of sheathing materials, such as wood siding, are permitted to abut the masonry chimney sidewalls, in accordance with Figure 2113.19, provided such combustible trim or sheathing is a minimum of 12 inches (305 mm) from the inside surface of the nearest flue lining. Combustible material and trim shall not overlap the corners of the chimney by more than 1 inch (25 mm).*

**2113.19.1 Additional requirements for clearance.**

- 1.** *Trimmers shall be not less than 5 inches (127 mm) from the inside face of the concrete or masonry chimney wall. Finished flooring shall have at least one-half inch clearance from chimney walls.*
- 2.** *A clearance of at least 2 inches (51 mm) shall be provided between the exterior surfaces of interior masonry or concrete chimneys for all wood- burning appliances.*
- 3.** *No combustible lathing, furring, or plaster grounds shall be placed against a chimney at any point more than 1½ inches (38 mm) from the corner of the chimney; but this shall not prevent plastering directly on masonry or on metal lath and metal furring nor shall it prevent placing chimneys for low temperature equipment entirely on the exterior of a building against the sheathing.*

For SI: 1 inch = 25.4 mm

**FIGURE 2113.19  
ILLUSTRATION OF EXCEPTION TO  
CHIMNEY CLEARANCE PROVISION**

**2113.20 Chimney fireblocking.** All spaces between chimneys and floors and ceilings through which chimneys pass shall be fireblocked with noncombustible material securely fastened in place. The fireblocking of spaces between wood joists, beams or headers shall be to a depth of 1 inch (25 mm) and shall only be placed on strips of metal or metal lath laid across the spaces between combustible material and the chimney.

**2113.21 Test run.** All new chimneys shall be test run by the registered design professional responsible for the testing under standard conditions to demonstrate fire safety and the complete exhausting of smoke and the products of combustion to the outer air. The results of such test run shall be certified as correct by the design professional engineer responsible for the test and shall be submitted in writing to the department.

**2113.22 Requirement of a smoke test.** A smoke test shall be made as outlined below. Any faults or leaks found shall be corrected. Such smoke test shall be witnessed by a representative of the commissioner. In lieu thereof, the commissioner may accept the test report of the design professional engineer responsible for the test, which shall be submitted in writing to the department.

**2113.22.1 Smoke test.** To determine the tightness of chimney construction, a smoke test shall be made in accordance with the following conditions and requirements:

1. The equipment, materials, power and labor necessary for such test shall be furnished by, and at the expense of, the owner or holder of the work permit.
2. If the test shows any evidence of leakage or other defects, such defects shall be corrected in accordance with the requirement of this chapter and the test shall be repeated until the results are satisfactory.
3. Method of test. The chimney shall be filled with a thick penetrating smoke produced by one or more smoke machines, or smoke bombs, or other equivalent method. As the smoke appears at the stack opening on the roof, such opening shall be tightly closed, and a pressure equivalent to ½ inch (12.7 mm) column of water measured at the base of the stack shall be applied. The test shall be conducted for a length of time sufficient to permit the inspection of the chimney.

**SECTION BC 2114**  
**STRUCTURAL INTEGRITY REQUIREMENTS**

**2114.1 General.** *Load-bearing masonry structures shall be reinforced to meet all of the requirements of this section. However, reinforcement provided for gravity, seismic or wind forces or for other purposes may be regarded as satisfying part of, or the whole of, these requirements. Reinforcement provided for one requirement may be counted towards the other requirements.*

**2114.2 Continuity and ties.** *Load-bearing masonry structures shall be reinforced to obtain a continuous system of vertical and horizontal ties. Continuity of all ties shall be ensured by providing lap, welded or mechanical tension splices. The following requirements shall be met for walls, columns and piers:*

**2114.2.1 Horizontal.** *At each floor and roof level, continuous horizontal ties shall be provided in all load-bearing masonry walls, and around the perimeter of the building.—Minimum horizontal tie reinforcement shall be not less than the equivalent of two No. 4 bars.*

**2114.2.1.1 Location of horizontal ties.** *Ties shall be located within the thickness of walls or beams, where they occur, or within 1 foot (305 mm) of the edge of slab, where walls or beams do not occur.*

**2114.2.1.2 End connections of horizontal ties.** *All horizontal ties shall be terminated in a perpendicular horizontal tie. Where no perpendicular horizontal tie exists within 4 feet (1219 mm) of the end of a wall, the horizontal tie shall be anchored at the end of the wall. The vertical reinforcement at the end of such walls shall not be less than two No. 4 bars placed within 16 inches (406 mm) of the end of the wall. This vertical reinforcement shall be continuous from the lowest to highest level of the wall, and anchored at each end in a horizontal tie or the foundation element.*

**2114.2.2 End connections.** *Where slab or beam elements are supported on a masonry wall, column or pier, the connection shall be designed to sustain an axial tension capacity equal to the greater of the vertical shear capacity of the connected element at either end or two percent of the maximum factored vertical dead and live load in the compression masonry element. The design of the end connections shall ensure the transfer of such loads to horizontal or vertical ties.*

*Where more than one element frames in one direction, none of the elements or connections shall have an axial tension capacity of less than one percent of the vertical load.*

*For the design of the connections, the transverse shear force and the axial tensile force need not be considered to act simultaneously.*

*The reinforcement of the end connections shall be equivalent to at least one No. 4 bar, at a maximum spacing of 24 inches (610 mm) on center. Where end connections occur at a masonry pier or column, reinforcement equivalent to a minimum of four fully developed No. 4 bars shall be provided. The reinforcement shall be distributed around the perimeter of the column or pier. The minimum anchorage into both the slab and the masonry compression element shall be equivalent to the capacity of the fully developed No. 4 bar.*

*Where the floor extends on both sides of a bearing wall, the portion of the tie within the slab shall alternate between both sides.*

**2114.2.3 Vertical ties.** *Each column, pier and wall shall be vertically tied continuously from its lowest to highest level. The vertical reinforcement shall be terminated in a horizontal tie or foundation or their equivalent. Where openings in bearing walls greater than 24 inches (610 mm) in height occur, ties shall be provided at each side of the opening that extend and are anchored in the masonry above and below the opening. Vertical ties shall be placed on both sides of control joints in bearing walls.*

**2114.2.3.1 Vertical ties reinforcing.** *Vertical tie reinforcing shall not be less than the equivalent of one No. 4 bar, at a maximum spacing of 48 inches (1219 mm) on center. A minimum of four continuous No. 4 bars shall be provided per masonry column or pier.*

## **CHAPTER 22**

### **STEEL**

#### **SECTION BC 2201**

##### **GENERAL**

**2201.1 Scope.** *The provisions of this chapter govern the quality, design, fabrication and erection of steel used structurally in buildings or structures.*

#### **SECTION BC 2202**

##### **DEFINITIONS AND NOMENCLATURE**

**2202.1 Definitions.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meaning shown herein.*

**ADJUSTED SHEAR RESISTANCE.** *In Type II shear walls, the unadjusted shear resistance multiplied by the shear resistance adjustment factors of Table 2211.3.*

**STEEL CONSTRUCTION, COLD-FORMED.** *That type of construction made up entirely or in part of steel structural members cold formed to shape from sheet or strip steel such as roof deck, floor and wall panels, studs, floor joists, roof joists and other structural elements.*

**STEEL JOIST.** *Any steel structural member of a building or structure made of hot-rolled or cold-formed solid or open-web sections, or riveted or welded bars, strip or sheet steel members, or slotted and expanded, or otherwise deformed rolled sections.*

**STEEL MEMBER, STRUCTURAL.** *Any steel structural member of a building or structure consisting of a rolled steel structural shape other than cold-formed steel, or steel joist members.*

**TYPE I SHEAR WALL.** *A wall designed to resist in-plane lateral forces that is fully sheathed and provided with hold-down anchors at each end of the wall segment. Type I walls are permitted to have openings where detailing for force transfer around the openings is provided (see Figure 2202.1).*

**TYPE II SHEAR WALL.** *A wall designed to resist in-plane lateral forces that is sheathed with wood structural panel or sheet steel that contains openings, that have not been specifically designed and detailed for force transfer around wall openings. Hold-down anchors for Type II shear walls are only required at*

*the ends of the wall (see Figure 2202.1).*

***TYPE II SHEAR WALL SEGMENT.*** *A section of shear wall with full-height sheathing and which meets the aspect ratio limits of Section 2211.3.2(3).*

***UNADJUSTED SHEAR RESISTANCE.*** *In Type II walls, the unadjusted shear\_resistance is based on the design shear and the limitations of Section 2211.3.1.*

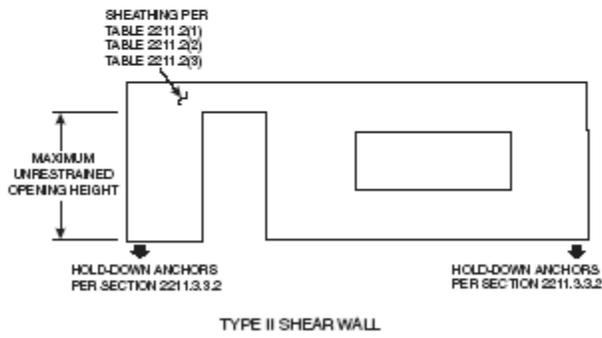

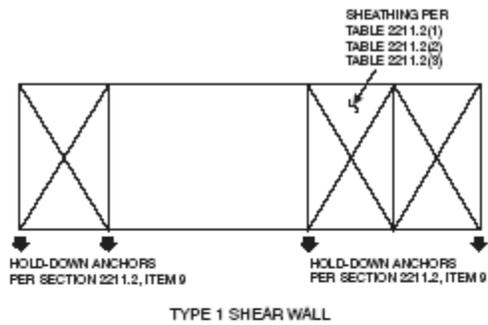

FIGURE 2201.1  
TYPE I AND TYPE II SHEAR WALLS

**2202.2 Nomenclature.** *The following symbols shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

$\phi$  = Resistance factor (see Section 2211.2.1).

$\Omega$  = Factor of safety (see Section 2211.2.1).

$\Omega_o$  = System over-strength factor (see Section 1617.6).

$C_o$  = Shear resistance adjustment factor from Table 2211.3.

$\Sigma L_i$  = Sum of widths of Type II shear wall segments, feet (mm/1,000).

$C$  = Compression chord uplift force, lbs (kN).

$V$  = Shear force in Type II shear wall, lbs (kN).

$H$  = The height of a shear wall measured as:

1. The maximum clear height from top of foundation to bottom of diaphragm framing above; or
2. The maximum clear height from top of a diaphragm to bottom of diaphragm framing above.

$v$  = Unit shear force, plf (kN/m).

$w$  = The width of a shear wall or wall pier in the direction of application of force measured as the sheathed dimension of the shear wall.

### **SECTION BC 2203**

#### **IDENTIFICATION AND PROTECTION OF STEEL FOR STRUCTURAL PURPOSES**

**2203.1 Identification.** *Steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Steel that is not readily identifiable as to grade from marking and test records shall be tested to determine conformity to such standards.*

**2203.2 Protection.** *Painting of structural steel shall comply with the requirements contained in either the AISC Load and Resistance Factor Design Specification for Structural Steel Buildings (AISC-LRFD), AISC Specification for Structural Steel Buildings—Allowable Stress Design (AISC 335) or AISC Specification for the Design of Steel Hollow Structural Sections (AISC-HSS). Individual structural members and assembled panels of cold-formed steel construction, except where fabricated of approved corrosion-resistant steel or of steel having a corrosion resistant or other approved coating, shall be protected against corrosion with an approved coat of paint, enamel or other approved protection.*

**2203.2.1 Protection of structural steel.** *All structural steel shall receive one coat of paint, zinc, or bituminous coating, or equivalent metal protection before erection. The protection shall be applied thoroughly and evenly to dry surfaces which have been cleaned of loose mill scale, loose rust, weld slag flux deposit, dirt, and other foreign matter. Oil and grease deposits shall be removed. Surfaces inaccessible after assembly shall be treated as required by this section prior to assembly. Structural steel that will remain exposed to the weather or to a corrosive atmosphere shall receive an additional coat of metal protection of another color after erection, except for types of structural steels that have been specifically intended for use under exposure to the weather without protection. All abrasions to, or deteriorations of, the protective coating shall be spot painted.*

**Exceptions:** *Surfaces of structural steel shall not be required to receive metal protection when the structural steel is used under the conditions listed below. However, these surfaces shall be cleaned of oil and grease by solvent cleaners and be cleaned of dirt and other foreign material by thorough brushing with a fiber brush.*

- 1. Structural steel that is encased in concrete (other than cinder concrete) or surfaces that abut concrete (other than cinder concrete) at interior locations.*
- 2. Structural steel encased in non-corrosive fire resistive materials that are bonded or secured to the steel surfaces by approved means.*
- 3. Surfaces of structural steel that are to be riveted, bolted or welded together; provided, however, that parts of structural members left unpainted because of welding, bolting or riveting operations are not exempted from painting and shall receive a field application of approved metal protection.*

4. *Surfaces of structural steel within 2 inches (51 mm) of field welds shall be free of protective coatings that would prevent proper welding or produce objectionable fumes while welding is being done.*
5. *Surfaces of structural steel that have been machine finished.*
6. *Surfaces of types of structural steel that have been specifically approved for use without metal protection.*
7. *Structural steel members that are completely concealed by interior finish such as lath and plaster, and masonry, need not be painted except that where such members are subject to condensation from piping, are in shower or steam rooms, are exposed to chemical fumes or are exposed to other conditions of potentially aggressive corrosion.*

**SECTION BC 2204**  
**CONNECTIONS**

**2204.1 Welding.** *The details of design, workmanship and technique for welding, inspection of welding and qualification of welding operators shall conform to the requirements of the specifications listed in Sections 2205, 2206, 2207, 2209 and 2210. Special inspection of welding shall be provided where required by Section 1704.*

**2204.1.1 Tack welds.** *Tack welds, which are later incorporated into finished welds carrying calculated stress, shall not be considered as structural welds.*

**2204.2 Bolting.** *The design, installation and inspection of bolts shall be in accordance with the requirements of the specifications listed in Sections 2205, 2206, 2209 and 2210. Special inspection of the installation of high-strength bolts shall be provided where required by Section 1704.*

**2204.2.1 Anchor rods.** *Anchor rods shall be set accurately to the pattern and dimensions called for on the plans. The protrusion of the threaded ends through the connected material shall be sufficient to fully engage the threads of the nuts, but shall not be greater than the length of the threads on the bolts.*

**SECTION BC 2205**  
**STRUCTURAL STEEL**

**2205.1 General.** *The design, fabrication and erection of structural steel for buildings and structures shall be in accordance with either the AISC-LRFD, AISC 335 or AISC-HSS. Where required, the seismic design of steel structures shall be in accordance with the additional provisions of Section 2205.2.*

**2205.1.1 Structural steel.** *Material for use as structural steel not listed in AISC-LRFD and AISC 335 may be used in accordance with AISC-LRFD and AISC 335 when approved by the commissioner for such use.*

**2205.2 Seismic requirements for steel structures.** *The design of structural steel structures to resist seismic forces shall be in accordance with the provisions of Section 2205.2.1 or 2205.2.2 for the appropriate seismic design category.*

**2205.2.1 Seismic Design Category B or C.** *Structural steel structures assigned to Seismic Design Category B or C, in accordance with Section 1616, shall be of any construction permitted in Section 2205. An R factor as set forth in Section 1617.6 for the appropriate steel system is permitted where the structure is designed and detailed in accordance with the provisions of AISC 341, Parts I and III. Systems not detailed in accordance with the above shall use the R factor in Section 1617.6 designated for “steel systems not detailed for seismic.”*

*Pre-qualified moment connections detailed in FEMA 350 (FEMA 2000a) may be considered as pre-qualified with regard to AISC 341 requirements for Special Moment Frames (SMF’s), Intermediate Moment Frames (IMF’s), and link-to-column connections of Eccentrically Brace Frames (EBF’s).*

**2205.2.2 Seismic Design Category D.** *Structural steel structures assigned to Seismic Design Category D shall be designed and detailed in accordance with AISC 341, Part I or Part III.*

**2205.3 Seismic requirements for composite construction.** *The design, construction and quality of composite steel and concrete components that resist seismic forces shall conform to the requirements of the AISC-LRFD and ACI 318. An R factor as set forth in Section 1617.6 for the appropriate composite steel and concrete system is permitted where the structure is designed and detailed in accordance with the provisions of AISC 341, Part II. In Seismic Design Category B or above, the design of such systems shall conform to the requirements of AISC 341, Part II.*

**2205.3.1 Seismic Design Category D.** *Composite structures are permitted in Seismic Design Categories D, subject to the limitations in Section 1617.6, where substantiating evidence is provided to demonstrate that the proposed system will perform as intended by AISC 341, Part II. The*

*substantiating evidence shall be subject to the commissioner's approval. Where composite elements or connections are required to sustain inelastic deformations, the substantiating evidence shall be based on cyclic testing.*

**2205.4 Composite members.** *In addition to the provisions for composite members in Reference Standards AISC-LRFD and AISC 335, the following provisions shall be used:*

**2205.4.1 Heavy vehicle loads.** *Composite construction used for members subject to heavy vehicle loads (excluding passenger cars), shall be designed for moving loads and shall be proportioned in accordance with the requirements for Highway Bridges, AASHTO HB-16 REV 02, Standard Specification for Highway Bridges.*

**2205.4.2 Concrete encased beams.** *Where the design strength of concrete encased structural steel beams is determined from the plastic stress distribution of the structural steel beam alone in accordance with AISC-LRFD or from AISC 335 where the allowable bending stress of the structural steel beam alone is used, the yield stress of the structural steel shall not exceed 36 ksi (250 Mpa), the steel beam depth shall not exceed 40 inches (1016 mm), the concrete compressive strength shall not be less than 3,000 psi (20 685 kPa) and the concrete aggregate shall conform with ASTM C33.*

**2205.4.3 Special cases.** *Where special cases for composite construction are considered in accordance with AISC-LRFD and AISC 335, test programs shall be satisfactory to the commissioner.*

**2205.5 Ponding.** *In addition to the provisions of AISC-LRFD and AISC 335, in flat roof systems (slope less than 1° (0.02 rad)) where secondary members are made up of members of materials other than steel, the depth of the structural steel members shall not be less than  $f_b/600$  times the span length whether designed as simple or continuous.  $f_b$  shall be taken as the computed bending stress of the structural steel member.*

**2205.6 Fabrication, erection and quality control.** *In addition to the provisions for fabrication, erection and quality control in AISC-LRFD and AISC 335, the following provisions shall be used.*

**2205.6.1 Shop drawings.** *Shop drawings shall include the location of oversized, short slotted and long slotted holes.*

**2205.6.2 Field connections.** *Field connections shall meet the requirements for corresponding types of shop connections described in AISC-LRFD and AISC 335. No holes, copes or cuts of any type shall be made to facilitate erection unless specifically shown on the shop drawings or authorized in writing by the engineer or architect of record.*

**2205.6.3 Handling and storing materials.** *All structural steel members shall be shipped and handled in a manner that will not cause injury to protective coatings or permanent deformations of the members. Structural steel members shall not be dropped, thrown, or dragged. Any bends, crimps or other evidence of permanent deformations shall be straightened by methods approved by the engineer or architect of record or the piece shall be rejected. Materials shall be stored out of contact with the ground, kept clean, and protected against damage and corrosion.*

**2205.6.4 Structural steel erection.**

**2205.6.4.1 Placing of structural members.** *During the placing of a structural member, the load shall not be released from the hoisting rope until the member is securely supported.*

*Open web steel joists that are hoisted singly shall be transferred from their place of storage directly to their permanent location and safely secured. No load shall be placed on open web steel joists until they are permanently fastened in place.*

**2205.6.4.2 Tag lines.** *While structural members or assemblies are being hoisted, tag lines shall be used to prevent uncontrolled movement.*

**2205.6.4.3 Erection of trusses.** *All trusses shall be laterally braced or guyed as necessary for the safety of the structure.*

**2205.6.4.4 Erection of frames.** *All structural frames shall be properly braced with shores or guyed cables and turnbuckles as necessary for the safety of the structure.*

**2205.6.4.5 Permanent flooring and steel erection in tiered buildings.** *The permanent floors of such buildings or other structures shall be installed as soon as possible as the erection of structural steel members progresses. In no case shall there be more than eight stories, floors or equivalent levels or 120 feet (36 576 mm), whichever is less, between the erection floor and the uppermost permanent floor.*

## **SECTION BC 2206**

### **STEEL JOISTS**

**2206.1 General.** *The design, manufacturing and use of open web steel joists and joist girders shall be in accordance with one of the following Steel Joist Institute specifications:*

1. *Standard Specifications for Open Web Steel joists, K Series.*
2. *Standard Specifications for Longspan Steel joists, LH Series and Deep Longspan Steel joists, DLH Series.*
3. *Standard Specifications for Joist Girders.*

*Where required, the seismic design of buildings shall be in accordance with the additional provisions of Section 2205.2 or 2211.*

**2206.2 Painting.** *Open web steel joists shall be painted. The shop coat shall be applied at the place of manufacture. All abrasions shall be touched up at the job site with the same material. Steel joists that remain exposed to the weather or a corrosive atmosphere shall receive an additional coat of metal protection of another color after erection, except for types of structural steels that have been specifically approved for use under exposure to the weather without metal protection.*

**2206.3 Limitations of use.** *Open web steel joists are prohibited in high rise buildings in all occupancy groups except R-2 and R-3.*

## **SECTION BC 2207**

### **STEEL CABLE STRUCTURES**

**2207.1 General.** *The design, fabrication and erection including related connections, and protective coatings of steel cables for buildings shall be in accordance with ASCE 19.*

**2207.1.1 Protection of steel cables.** *The minimum protection of all wires or strands used in building structures shall be a class "A" coating as defined in ASTM A 586 and A 603, whether the cable is used on the interior or exterior.*

**2207.2 Seismic requirements for steel cable.** *The design strength of steel cables shall be determined by the*

*provisions of ASCE 19 except as modified by these provisions.*

1. *A load factor of 1.1 shall be applied to the prestress force included in  $T_3$  and  $T_4$  as defined in Section 3.12.*
2. *In Section 3.2.1, Item (c) shall be replaced with “1.5  $T_3$ ” and Item (d) shall be replaced with “1.5  $T_4$ ”*

**SECTION BC 2208  
STEEL STORAGE RACKS**

**2208.1 Storage racks.** *The design, testing and utilization of industrial steel storage racks shall be in accordance with the RMI Specification for the Design, Testing and Utilization of Industrial Steel Storage Racks. Racks in the scope of this specification include industrial pallet racks, movable shelf racks and stacker racks, and does not apply to other types of racks, such as drive-in and drive-through racks, cantilever racks, portable racks or rack buildings. Where required, the seismic design of storage racks shall be in accordance with the provisions of Section 9.6.2.9 of ASCE 7.*

**SECTION BC 2209  
COLD-FORMED STEEL**

**2209.1 General.** *The design of cold-formed carbon and low-alloy steel structural members shall be in accordance with the North American Specification for the Design of Cold-formed steel Structural Members (AISI-NASPEC). The design of cold-formed stainless-steel structural members shall be in accordance with ASCE 8. Cold-formed steel light-framed construction shall comply with Section 2210.*

**2209.1.1 Other steels.**

1. *Cold-formed steel not listed in the North American Specification for the Design of Cold-formed steel Structural Members (AISI-NASPEC) may be used in accordance with AISI-NASPEC when approved by the commissioner for such use.*
2. *Cold-formed stainless steel not listed in ASCE 8 may be used in accordance with ASCE 8 when approved by the commissioner for such use.*

**2209.1.2 Load tests.** *The Load test requirements of Chapter 17 shall apply in lieu of the load test procedures of Chapter 6.2 of ASCE 8 and Chapter F of AISI-NASPEC.*

**2209.1.3 Fabrication and erection.**

1. *All materials shall be flat, clean and straight. If straightening or flattening is necessary, it shall be done by a suitable process or method and in a manner that will not injure the material.*
2. *Profiles used structurally shall conform to the specified dimension. Care shall be taken not to stretch, bend, or otherwise distort parts of the sections unless such forming is an integral part of the design.*
3. *Components may be cut by slitting, shearing, sawing, or flame cutting. All punched holes and sheared or flame cut edges of material in members subject to calculated stress shall be clean and free from notches and burred edges.*
4. *Care shall be taken to avoid damage when loading, unloading, and handling members.*

**2209.2 Composite slabs on steel decks.** *Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3.*

**SECTION BC 2210**

**COLD-FORMED STEEL LIGHT-FRAMED CONSTRUCTION**

**2210.1 General.** *The design, installation and construction of cold-formed carbon or low-alloy steel, structural and nonstructural steel framing, shall be in accordance with the Standard for Cold-formed steel Framing—General Provisions, American Iron and Steel Institute (AISI-General) and AISI-NASPEC.*

**2210.2 Headers.** *The design and installation of cold-formed steel box and back-to-back headers, and double L-headers used in single-span conditions for load-carrying purposes shall be in accordance with the Standard for Cold-formed steel Framing—Header Design, American Iron and Steel Institute (AISI-Header), subject to the limitations therein.*

**2210.3 Trusses.** *The design, quality assurance, installation and testing of cold-formed steel trusses shall be in accordance with the Standard for Cold-formed steel Framing—Trusses, American Iron and Steel Institute (AISI-Truss), subject to the limitations therein.*

**SECTION BC 2211**

## **COLD-FORMED STEEL LIGHT-FRAMED SHEAR WALLS**

**2211.1 General.** *In addition to the requirements of Section 2210, the design of cold-formed steel light-framed shear walls, to resist wind and seismic loads shall be in accordance with the requirements of Section 2211.2 for Type I (segmented) shear walls or Section 2211.3 for Type II (perforated) shear walls.*

*Light-framed structures assigned to Seismic Design Category B, in accordance with Section 1616, shall be of any construction permitted in Section 2210. An R factor as set forth in Section 1617.6 for the appropriate steel system is permitted where the lateral design of the structure is in accordance with the provisions of Section 2211.4. Systems not detailed in accordance with Section 2211.4 shall use the R factor in Section 1617.6 designated for “steel systems not detailed for seismic.”*

*In Seismic Design Category D, the lateral design of light-framed structures shall also comply with the requirements in Section 2211.4*

**2211.2 Type I shear walls.** *The design of Type I shear walls, of cold-formed steel light-framed construction, to resist wind and seismic loads, shall be in accordance the requirements of this section.*

- 1. The nominal shear value for Type I shear walls, as shown in Table 2211.2(1) for wind loads, Table 2211.2(2) for wind or seismic loads or Table 2211.2(3) for seismic loads, is permitted to establish allowable shear values or design strength values.*
- 2. Boundary members, chords, collectors and connections thereto shall be proportioned to transmit the induced forces.*
- 3. As an alternative to the values in Tables 2211.2(1), 2211.2(2) and 2211.2(3), shear values are permitted to be calculated by the principles of mechanics by using approved fastener values and shear values appropriate for the sheathing material attached.*
- 4. Type I shear walls sheathed with wood structural or sheet steel panels are permitted to have window openings, between hold-down anchors at each end of a wall segment, where details are provided to account for force transfer around openings.*
- 5. The aspect ratio limitations of Section 2211.2.2, Item 5, shall apply to the entire Type I segment and to each wall pier at the side of each opening.*

6. *The height of the wall pier ( $h$ ) shall be defined as the clear height of the pier at the side of an opening.*
7. *The width of a pier ( $w$ ) shall be defined as the sheathed width of the pier.*
8. *The width of wall piers shall not be less than 24 inches (610 mm).*
9. *Hold-down anchors shall be provided at each end of a Type I shear wall capable of resisting the design forces.*

**TABLE 2211.2(1)  
NOMINAL SHEAR VALUES FOR WIND FORCES IN POUNDS PER FOOT FOR SHEAR WALLS  
FRAMED WITH COLD-FORMED STEEL STUDS<sup>a</sup>**

ASSEMBLY DESCRIPTION	MAXIMUM HEIGHT/LENGTH RATIO $h/w$	FASTENER SPACING AT PANEL EDGES <sup>b</sup> (inches)				MAXIMUM FRAMING SPACING (inches o.c.)
		6	4	3	2	
<sup>15</sup> / <sub>32</sub> -inch structural 1 sheathing (4-ply) plywood one side	2:1	1,065 <sup>c</sup>	—	—	—	24
<sup>7</sup> / <sub>16</sub> -inch rated sheathing (OSB), one side	2:1	910 <sup>c</sup>	1,410	1,735	1,910	24
<sup>7</sup> / <sub>16</sub> -inch rated sheathing (OSB), one side, oriented perpendicular to framing	2:1	1,020 <sup>c</sup>	—	—	—	24
<sup>7</sup> / <sub>16</sub> -inch rated sheathing (OSB), one side	4:1 <sup>d</sup>	—	1,025	1,425	1,825	24
0.018-inch steel sheet, one side	2:1	485	—	—	—	24
0.027-inch steel sheet, one side	4:1 <sup>d</sup>	—	1,000	—	—	24

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.

- a. Nominal shear values shall be multiplied by the resistance factor  $\phi$  to determine design strength or divided by the safety factor  $\Omega$  to determine allowable shear values as set forth in Section 2211.2.1.
- b. Screws shall be attached to intermediate supports at 12 inches on center unless otherwise shown.
- c. Where fully blocked gypsum board is applied to the opposite side of this assembly, in accordance with Table 2211.2(2) with screw spacing at 7 inches o.c. edge and 7 inches o.c. field, these nominal values are permitted to be increased by 30 percent.
- d. Where aspect ratio ( $h/w$ ) is greater than 2:1, the design shear shall be reduced as required by Section 2211.2.2, item 5.

**TABLE 2211.2(2)**

0.027-inch minimum thickness steel sheet one side	2:1 <sup>c</sup>	—	1,000	1,085	1,170	24

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.

- Nominal shear values shall be multiplied by the resistance factor  $\phi$  to determine design strength or divided by the safety factor  $\Omega$  to determine allowable shear values as set forth in Section 2211.2.1.
- Screws shall be attached to intermediate supports at 12 inches o.c. unless otherwise shown.
- In Seismic Design Category A, B and C the aspect ratio ( $h/w$ ) is permitted to be 4:1 where the design shear is reduced as required by Section 2211.2.2, item 5.

**2211.2.1 Design shear determination.** Where allowable stress design (ASD) is used, the allowable shear value shall be determined by dividing the nominal shear value, shown in Tables 2211.2(1), 2211.2(2) and 2211.2(3), by a factor of safety ( $\Omega$ ) of 2.5.

Where load and resistance factor design (LRFD) is used, the design strength value shall be determined by multiplying the nominal shear value, shown in Tables 2211.2(1), 2211.2(2) and 2211.2(3), by a resistance factor ( $\Phi$ ) of 0.55.

**2211.2.2 Limitations for systems.** The lateral-resistant systems listed in Tables 2211.2(1), 2211.2(2) and 2211.2(3) shall conform to the following requirements:

1. Studs shall be a minimum  $1\frac{5}{8}$  inches (41 mm) by  $3\frac{1}{2}$  inches (89 mm) with a  $\frac{3}{8}$ -inch (9.5 mm) return lip. As a minimum, studs shall be doubled (back to back) at shear wall ends.
2. Track shall be a minimum  $1\frac{1}{4}$  inches (32 mm) by  $3\frac{1}{2}$  inches (89 mm).
3. Both studs and track shall have a minimum uncoated base metal thickness of 33 mils (0.84 mm) and shall be of the following grades of structural quality steel: ASTM A 653 SS Grade 33, ASTM A 792 SS Grade 33 or ASTM A 875 SS Grade 33.
4. Fasteners along the edges in shear panels shall be placed not less than  $\frac{3}{8}$  inch (9.5 mm) in from panel edges.
5. The height-to-width shear wall aspect ratio ( $h/w$ ) of wall systems shall not exceed the values in Tables 2211.2(1), 2211.2(2) and 2211.2(3). Where the limiting ratio of  $h/w$  is greater than 2:1, the shear values shall be multiplied by  $2w/h$ .
6. Panel thicknesses shown are minimums. Panels less than 12 inches (305 mm) wide shall not be used. All panel edges shall be fully blocked.
7. Where horizontal strap blocking is used to provide edge blocking, it shall be a minimum  $1\frac{1}{2}$  inches (38 mm) wide and of the same material and equal or greater thickness as the track and studs.
8. The design shear values for shear panels with different nominal shear values applied to the same side of a wall are not cumulative except as permitted in Tables 2211.2(1),

2211.2(2) and 2211.2(3). For walls with material applied to both faces of the same wall, the design shear value of material of the same capacity is cumulative. Where the material nominal shear values are not equal, the design shear value shall be either two times the design shear value of the material with the smaller values or shall be taken as the value of the stronger side, whichever is greater. Summing shear values of dissimilar material applied to opposite faces or to the same wall line is not allowed unless permitted by Table 2211.2(1).

**2211.2.2.1 Sheet steel sheathing.** Steel sheets, attached to cold-formed steel framing, are permitted to resist horizontal forces produced by wind or seismic loads.

1. Steel sheets shall have a minimum base metal thickness as shown in Table 2211.2(1) or 2211.2(3), and shall be of the following grades of structural quality steel: ASTM A 653 SS Grade 33, ASTM A792 SS Grade 33 or ASTM A 875 SS Grade 33.
2. Nominal shear values, used to establish the allowable shear value or design strength value, are given in Tables 2211.2(1) for wind loads and 2211.2(3) for seismic loads.
3. Steel sheets are permitted to be applied either parallel or perpendicular to framing. All edges of steel sheets shall be attached to framing members, strap blocking or shall be overlapped and attached to each other with screw spacing as required for edges.
4. Screws used to attach steel sheets shall be a minimum No. 8 modified truss head.

**2211.2.2.2 Wood structural panel sheathing.** Cold-formed steel framed wall systems, sheathed with wood structural panels, are permitted to resist horizontal forces produced by wind or seismic loads subject to the following:

1. Nominal shear values, used to establish the allowable shear value or design strength value, are given in Tables 2211.2(1), for wind loads, and 2211.2(3), for seismic loads.
2. Wood structural panels shall comply with DOC PS 1 or PS 2 and shall be manufactured using exterior glue.

3. *Wood structural panels shall be attached to steel framing with flat-head self-drilling tapping screws with a minimum head diameter of 0.292 inch (7.4 mm).*
4. *Where  $\frac{7}{16}$ -inch (11.1 mm) oriented strand board (OSB) is specified,  $\frac{15}{32}$ -inch (12 mm) structural 1 sheathing (plywood) is permitted.*
5. *Structural panels are permitted to be applied either parallel or perpendicular to framing.*
6. *Increases of the nominal loads shown in Tables 2211.2(1) and 2211.2(3) shall not be permitted for duration of load as permitted in Chapter 23.*

**2211.2.2.3 Gypsum board panel sheathing.** *Cold-formed steel framed wall systems, sheathed with gypsum board, are permitted to resist horizontal forces produced by wind or seismic loads subject to the following:*

1. *Nominal shear values, used to establish the allowable shear value or design strength value, are given in Table 2211.2(2).*
2. *The shear values listed in Table 2211.2(2) shall not be cumulative with the shear values of other materials applied to the same wall unless otherwise permitted herein.*
3. *The nominal shear values shown are for gypsum board that is applied to both sides of the wall.*
4. *Where gypsum board is only applied to one side of the wall, the nominal shear values shall be taken as one-half of the value shown.*
5. *Where gypsum board is applied perpendicular to studs, end joints of adjacent courses of gypsum board sheets shall not occur over the same stud.*
6. *Screws used to attach gypsum board shall be a minimum No. 6 in accordance with ASTM C 954.*
7. *Walls resisting seismic loads shall be subject to the limitations in Section 1617.6.*

**2211.3 Type II shear walls.** *Type II (Perforated) shear walls sheathed with wood structural panels or sheet steel are permitted to resist wind and seismic loads when designed in accordance with this section. Type II walls shall meet the requirements for Type I walls except as revised by this section.*

90%	1.00	0.95	0.91	0.87	0.83
100%	1.00	1.00	1.00	1.00	1.00

a. See Section 2211.3.2, Item 2.

b. See Section 2211.3.2, Item b.

**2211.3.1 Limitations.** *The following limitations shall apply to the use of Type II shear walls:*

1. *A Type II shear wall segment, meeting the minimum aspect ratio ( $h/w$ ) of Section 2211.3.2, Item 3, shall be located at each end of a Type II shear wall. Openings shall be permitted to occur beyond the ends of the Type II shear wall; however, the width of such openings shall not be included in the width of the Type II shear wall.*
2. *In Seismic Design Categories B, C, and D, the nominal shear values shall be based upon edge screw spacing not less than 4 inches (102 mm) o.c.*
3. *A Type II shear wall shall not have out-of-plane (horizontal) offsets. Where out-of-plane offsets occur, portions of the wall on each side of the offset shall be considered as separate Type II shear walls.*
4. *Collectors for shear transfer shall be provided through the full length of the Type II shear wall.*
5. *A Type II shear wall shall have uniform top of wall and bottom of wall elevations. Type II shear walls not having uniform elevations shall be designed by other methods.*
6. *Type II shear wall height,  $h$ , shall not exceed 20 feet (6096 mm).*

**2211.3.2 Type II shear wall resistance.** *The Type II shear wall resistance shall be equal to the adjusted shear resistance multiplied by the sum of the widths ( $\Sigma L_i$ ) of the Type II shear wall segments and shall be calculated in accordance with the following:*

1. *Percent full-height sheathing. The percent of full-height sheathing shall be calculated as the sum of widths ( $\Sigma L_i$ ) of Type II shear wall segments divided by the total width of the Type II shear wall including openings.*
2. *Maximum opening height ratio. The maximum opening height ratio shall be calculated by dividing the maximum opening clear height by the shear wall height,  $h$ .*
3. *Unadjusted shear resistance. The unadjusted shear resistance shall be the design shear values calculated in accordance with Section 2211.2.1 based upon the values*

*in Tables 2211.2(1) and 2211.2(3). The aspect ratio of all Type II shear wall segments used in calculations shall not exceed 2:1.*

**Exception:** *Where permitted by Tables 2211.2(1) and 2211.2(3), the aspect\_ratio (h/w) of Type II wall segments greater than 2:1, but in no case greater than 4:1, is permitted to be included in the calculation of the unadjusted shear resistance for the wall, provided the values are multiplied by  $2w/h$ .*

4. *Adjusted shear resistance. The adjusted shear resistance shall be calculated by multiplying the unadjusted shear resistance by the shear resistance adjustment factors of Table 2211.3. For intermediate percentages of full-height sheathing, the values are permitted to be determined by interpolation.*

**2211.3.3 Anchorage and load path.** *Design of Type II shear wall anchorage and load path shall conform to the requirements of this section, or shall be calculated using principles of mechanics.*

**2211.3.3.1 Anchorage for in-plane shear.** *The unit shear force,  $v$ , transmitted into the top and out of the base of the Type II shear wall full-height sheathing segments, and into collectors (drag struts) connecting shear wall segments, shall be calculated in accordance with the following:*

$$v = \frac{V}{C_o \Sigma L_i} \quad \text{(Equation 22-1)}$$

where:

$v$  = Unit shear force, plf (kN/m).

$V$  = Shear force in Type II shear wall, lbs (kN).

$C_o$  = Shear resistance adjustment factor from Table 2211.3.

$\Sigma L_i$  = Sum of widths of Type II shear wall segments, feet (mm/1,000).

**2211.3.3.2 Uplift anchorage at Type II shear wall ends.** Anchorage for uplift forces due to overturning shall be provided at each end of the Type II shear wall. Where seismic loads govern, the uplift anchorage shall be determined in accordance with the requirements of Section 2211.4.3.

**2211.3.3.3 Uplift anchorage between Type II shear wall ends.** In addition to the requirements of Section 2211.3.3.1, Type II shear wall bottom plates at full-height sheathing shall be anchored for a uniform uplift force,  $t$ , equal to the unit shear force,  $v$ , determined in Section 2211.3.3.1.

**2211.3.3.4 Compression chords.** Vertical elements at each end of each Type II shear wall segment shall be designed for a compression force,  $C$ , from each story calculated in accordance with the following:

$$C = \frac{Vh}{C_o \Sigma L_i} \quad (\text{Equation 22-2})$$

where:

$C$  = Compression chord uplift force, lbs (kN).

$V$  = Shear force in Type II shear wall, lbs (kN).

$h$  = Shear wall height feet, (mm/1,000).

$C_o$  = Shear resistance adjustment factor from Table 2211.3.

$\Sigma L_i$  = Sum of widths of Type II shear wall segments, feet (mm/1,000).

**2211.3.3.5 Load path.** A load path to the foundation shall be provided for the uplift shear and compression forces as determined from Sections 2211.3.3.1 through 2211.3.3.4, inclusive. Elements resisting shear wall forces contributed by multiple stories shall be designed for the sum of forces contributed by each story.

#### **2211.4 Seismic Design Category D.**

**2211.4.1 General.** In addition to the requirements of Sections 2211.2 and 2211.3, light-framed cold-formed steel wall systems, that resist seismic loads, in buildings assigned to Seismic Design Category D, shall comply with the requirements of this section.

**2211.4.2 Connections.** Connections for diagonal bracing members, top chord splices, boundary members and collectors shall be designed to develop the lesser of the nominal tensile strength of the member or the design seismic force multiplied by the seismic overstrength factor,  $\Omega_o$ , from Section 1617.6. The pull-out resistance of screws shall not be used to resist design seismic forces.

**2211.4.3 Anchorage of braced wall segments.** Studs or other vertical boundary members at the ends of wall segments, that resist seismic loads, braced with either sheathing or diagonal braces, shall be anchored such that the bottom track is not required to resist uplift by bending of the track web. Both flanges of the studs shall be braced to prevent lateral torsional buckling. Studs or other vertical boundary members and anchorage thereto shall have the nominal strength to resist design seismic force multiplied by the seismic overstrength factor,  $\Omega_o$ , from Section 1617.6.

**2211.4.4 Sheet steel sheathing.** Where steel sheathing provides lateral resistance, the design and construction of such walls shall be in accordance with the additional requirements of this section. Perimeter members at openings shall be provided and shall be detailed to distribute the shearing stresses. Wall studs and track shall have a minimum uncoated base metal thickness of 33 mils (0.84 mm) and shall not have an uncoated base metal thickness greater than 48 mils (1.10 mm). The nominal shear value for light-framed wall systems for buildings in Seismic Design Category D shall be based upon values from Table 2211.2(3).

**2211.4.5 Wood structural panel sheathing.** Where wood structural panels provide lateral resistance, the design and construction of such walls shall be in accordance with the additional requirements of this section. Perimeter members at openings shall be provided and shall be detailed to distribute the shearing stresses. Wood sheathing shall not be used to splice these members. Wall studs and track shall have a minimum uncoated base metal thickness of 33 mils (0.84 mm) and shall not have an

*uncoated base metal thickness greater than 48 mils (1.10 mm). The nominal shear value for light-framed wall systems for buildings in Seismic Design Category D shall be based upon values from Table 2211.2(3).*

**2211.4.6 Diagonal bracing.** *Where diagonal bracing is provided for lateral resistance, provisions shall be made for pretensioning or other methods of installing. Tension-only bracing shall be used to guard against loose diagonal straps. The l/r of the brace is permitted to exceed 200.*

**2211.4.7 Gypsum board panel sheathing.** *Gypsum board panel sheathing is permitted to resist seismic loads, subject to the limitations in Table 2211.2(2) and Section 1617.6.*

## **SECTION BC 2212**

### **MINIMUM THICKNESS OF METAL**

**2212.1 Exterior members.** *All exterior structural steel members exposed to weather shall have a minimum thickness of metal of 0.23 inches (5.8 mm).*

**Exceptions:**

1. *When an approved type of atmospheric corrosion resistant steel is used.*
2. *Exposed surfaces are zinc coated with a minimum weight of coating of approximately 0.6 ounces per square foot (0.00156 kg/m<sup>2</sup>) of exposed surface and covered with a protective coating as required by Section 2203.2.*
3. *Exposed surfaces are protected by other means approved by the commissioner.*
4. *Temporary construction that will be in place for a period of one year or less, provided that all surfaces which are exposed to the weather shall have a protective coating as required by Section 2203.2.*
5. *Joists or purlins that are exposed to the weather but which do not support more than 200 square feet (19 m<sup>2</sup>) of floor or roof area, and which have a protective coating as required by 2203.2.*

**SECTION BC 2213**  
**STRUCTURAL INTEGRITY REQUIREMENTS**

**2213.1 General.** *Structural steel members shall be designed to meet all of the requirements of this section. However, details provided for gravity, seismic and wind forces and for other purposes may be regarded as forming part of, or the whole of, these requirements. Detailing provided for one requirement may be counted towards the other requirements.*

**Exceptions:**

1. *One story structures less than 5,000 square feet (465 m<sup>2</sup>) not to exceed 15 feet (4572 mm) in height.*
2. *Structures in occupancy category R-3 not more than three stories in height.*

**2213.2 Continuity and ties.** *The following requirements shall be met:*

1. *All bolted connections shall have at least two bolts.*
2. *Bolted connections of all columns, beams, braces and other structural elements that are part of the lateral load resisting system shall be designed as bearing type connections with pretensioned bolts or as slip critical connections.*
3. *End connections of all beams and girders shall have a design axial tension strength equal to the larger of the provided vertical shear strength of the connections at either end, but not less than 10 kips (45 kN). For the design of the connections, the shear force and the axial tensile force need not be considered to act simultaneously. For the purpose of this provision, a connection shall be considered compliant if it meets the following requirements:*
  - 3.1. *For single plate shear connections, the nominal axial tension strength shall be determined for the limit state of bolt bearing, where deformation is not a consideration, on the plate and beam web.*
  - 3.2. *For single angle and double angle shear connections, the nominal tension strength shall be determined for the limit state of bolt bearing, where*

*deformation is not a consideration, on the angles and beam web and for tension yielding on the gross area of the angles.*

- 3.3. *All other connections shall be designed for the required tension force in accordance with either the AISC-LRFD, AISC 335, or AISC-HSS.*

*For the purpose of meeting this integrity provision only, bolts in connections with short-slotted holes parallel to the direction of the tension force are permitted. For the purpose of checking bearing these bolts shall be assumed to be located at the end of the slots.*

4. *Elements and their connections that brace compression members shall have an available axial tension strength equal to at least two percent of the required strength of the compression member being braced, but not less than 10 kips (45 kN). For design of the connections, the shear force and the axial tension force need not be considered to act simultaneously. Where more than one element braces a compression member in one direction, all elements and connections shall have an available axial tension strength equal to at least 1 percent of the required strength of the compression member but not less than 10 kips (45 kN).*

**2213.2.1 Vertical ties.** *Column splices shall have an available tension strength at least equal to the largest design gravity load reaction applied to the column at any floor level located within four floors below the splice.*

**2213.3 Composite construction.** *For steel framing members and/or decking acting compositely with concrete slabs, the following requirements shall be met.*

1. *Shear studs shall not be less than ½ inch (12.7 mm) in diameter. The spacing of shear studs shall not be greater than one every 12 inches (305 mm) averaged over the length of the beam.*
2. *Connections at the discontinuous edges of permanent metal decking to supporting members shall have a minimum connection strength in the direction parallel to the rib of the deck equal to the shear strength of a ¾-inch (19.1 mm) puddle weld every 12 inches (305 mm) on center.*
3. *Side lap connections of permanent metal decking shall have a minimum strength equal to the strength of a button punch every 24 inches (610 mm) on center.*

4. *Welded wire fabric reinforcement in concrete slabs shall be continuous over all supports and in all spans. Minimum area of continuous reinforcement shall be 0.0015 times the area of concrete. The welded wire fabric reinforcement shall have tension splices and be anchored at discontinuous edges.*

## **CHAPTER 23**

### **WOOD**

#### **SECTION BC 2301**

##### **GENERAL**

**2301.1 Scope.** *The provisions of this chapter shall govern the materials, design, construction and quality of wood members and their fasteners.*

**2301.2 General design requirements.** *The design of structural elements or systems, constructed partially or wholly of wood or wood-based products, shall be based on one of the following methods.*

**2301.2.1 Allowable stress design.** *Design using allowable stress design methods shall resist the applicable load combinations of Chapter 16 in accordance with the provisions of Sections 2304, 2305 and 2306.*

**2301.2.2 Load and resistance factor design (LRFD).** *Design using load and resistance factor design (LRFD) methods shall resist the applicable load combinations of Chapter 16 in accordance with the provisions of Sections 2304, 2305 and 2307.*

**2301.2.3 Conventional light-frame wood construction.** *The design and construction of conventional light-frame wood construction shall be in accordance with the provisions of Sections 2304 and 2308.*

**Exception:** *Buildings designed in accordance with the provisions of the AF&PA Wood Frame Construction Manual for One- and Two-Family Dwellings shall be deemed to meet the requirements of the provisions of Section 2308.*

**2301.3 Nominal sizes.** *For the purposes of this chapter, where dimensions of lumber are specified, they shall be deemed to be nominal dimensions unless specifically designated as actual dimensions (see Section 2304.2).*

#### **SECTION BC 2302**

##### **DEFINITIONS**

**2302.1 Definitions.** *The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.*

**ADJUSTED SHEAR RESISTANCE.** *The unadjusted shear resistance multiplied by the shear resistance adjustment factors of Table 2305.3.7.2.*

**BRACED WALL LINE.** *A series of braced wall panels in a single story that meets the requirements of Section 2308.3 or 2308.12.4.*

**BRACED WALL PANEL.** *A section of wall braced in accordance with Section 2308.9.3 or 2308.12.4.*

**COLLECTOR.** *A horizontal diaphragm element parallel and in line with the applied force that collects and transfers diaphragm shear forces to the vertical elements of the lateral-force-resisting system and/or distributes forces within the diaphragm.*

**CONVENTIONAL LIGHT-FRAME WOOD CONSTRUCTION.** *A type of construction whose primary structural elements are formed by a system of repetitive wood-framing members. See Section 2308 for conventional light-frame wood construction provisions.*

**CRIPPLE WALL.** *A framed stud wall extending from the top of the foundation to the underside of floor framing for the lowest occupied floor level.*

**DIAPHRAGM, UNBLOCKED.** *A diaphragm that has edge nailing at supporting members only. Blocking between supporting structural members at panel edges is not included. Diaphragm panels are field nailed to supporting members.*

**DRAG STRUT.** *See “Collector.”*

**FIBERBOARD.** *A fibrous, homogeneous panel made from lignocellulosic fibers (usually wood or cane) and having a density of less than 31 pounds per cubic foot (pcf) (497 kg/m<sup>3</sup>) but more than 10 pcf (160 kg/m<sup>3</sup>).*

**FIRECUTTING.** *The ends of wood beams, joists, and rafters resting on masonry or concrete walls shall be fire cut to a bevel of three inches in their depth.*

**GLUED BUILT-UP MEMBER.** *A structural element, the section of which is composed of built-up lumber, wood structural panels or wood structural panels in combination with lumber, all parts bonded together with structural adhesives.*

**GRADE (LUMBER).** *The classification of lumber in regard to strength and utility in accordance with American Softwood Lumber Standard DOC PS 20 and the grading rules of an approved lumber rules-writing agency.*

**HARDBOARD.** *A fibrous-felted, homogeneous panel made from lignocellulosic fibers consolidated under heat and pressure in a hot press to a density not less than 31 pcf (497 kg/m<sup>3</sup>).*

**NAILING, BOUNDARY.** *A special nailing pattern required by design at the boundaries of diaphragms.*

**NAILING, EDGE.** *A special nailing pattern required by design at the edges of each panel within the assembly of a diaphragm or shear wall.*

**NAILING, FIELD.** *Nailing required between the sheathing panels and framing members at locations other than boundary nailing and edge nailing.*

**NATURALLY DURABLE WOOD.** *The heartwood of the following species with the exception that an occasional piece with corner sapwood is permitted if 90 percent or more of the width of each side on which it occurs is heartwood.*

***Decay resistant.** Redwood, cedar, black locust and black walnut.*

***Termite resistant.** Redwood and Eastern red cedar.*

**NOMINAL SIZE (LUMBER).** *The commercial size designation of width and depth, in standard sawn lumber and glued-laminated lumber grades; somewhat larger than the standard net size of dressed lumber, in accordance with DOC PS 20 for sawn lumber and with the National Design Specification for Wood Construction (NDS) for glued-laminated lumber.*

**PARTICLEBOARD.** *A generic term for a panel primarily composed of cellulosic materials (usually wood), generally in the form of discrete pieces or particles, as distinguished from fibers. The cellulosic material is combined with synthetic resin or other suitable bonding system by a process in which the interparticle bond is created by the bonding system under heat and pressure.*

**PERFORATED SHEAR WALL.** *A wood structural panel sheathed wall with openings, that has not been specifically designed and detailed for force transfer around openings.*

**PERFORATED SHEAR WALL SEGMENT.** A section of shear wall with full-height sheathing that meets the aspect ratio limits of Section 2305.3.3.

**PRESERVATIVE-TREATED WOOD.** Wood (including plywood) pressure treated with preservatives in accordance with Section 2303.1.8.

**REFERENCE RESISTANCE (D).** The resistance (force or moment as appropriate) of a member or connection computed at the reference end use conditions.

**SHEAR WALL.** A wall designed to resist lateral forces parallel to the plane of a wall.

**STRUCTURAL GLUED-LAMINATED TIMBER.** Any member comprising an assembly of laminations of lumber in which the grain of all laminations is approximately parallel longitudinally, in which the laminations are bonded with adhesives.

**SUBDIAPHRAGM.** A portion of a larger wood diaphragm designed to anchor and transfer local forces to primary diaphragm struts and the main diaphragm.

**TIE-DOWN (HOLD-DOWN).** A device used to resist uplift of the chords of shear walls.

**TREATED WOOD.** Wood impregnated under pressure with compounds that reduce its susceptibility to flame spread or to deterioration caused by fungi, insects or marine borers.

**UNADJUSTED SHEAR RESISTANCE.** The allowable shear set forth in Table 2306.4.1 where the aspect ratio of any perforated shear wall segment used in calculation of perforated shear wall resistance does not exceed 2:1. Where the aspect ratio of any perforated shear wall segment used in calculation of perforated shear wall resistance is greater than 2:1, but not exceeding 3.5:1, the unadjusted shear resistance shall be the allowable shear set forth in Table 2306.4.1, multiplied by  $2w/h$ .

**WOOD SHEAR PANEL.** A wood floor, roof or wall component sheathed to act as a shear wall or diaphragm.

**WOOD STRUCTURAL PANEL.** A panel manufactured from veneers, or wood strands or wafers, or a combination of veneer and wood strands or wafers, bonded together with waterproof synthetic resins or other suitable bonding systems. Examples of wood structural panels are:

**Composite panels.** A structural panel that is made of layers of veneer and wood-based material;

**Oriented strand board (OSB).** A wood structural panel that is a mat-formed product composed of thin rectangular wood strands or wafers arranged in oriented layers; or

**Plywood.** A wood structural panel comprised of plies of wood veneer arranged in cross-aligned layers.

### **SECTION BC 2303**

#### **MINIMUM STANDARDS AND QUALITY**

**2303.1 General.** Structural lumber, end-jointed lumber, prefabricated I-joists, structural glued-laminated timber, wood structural panels, fiberboard sheathing (when used structurally), hardboard siding (when used structurally), particleboard, preservative-treated wood, fire-retardant-treated wood, hardwood, plywood, trusses and joist hangers shall conform to the applicable provisions of this section.

**2303.1.1 Lumber.** Lumber used for load-supporting purposes, including end-jointed or edge-glued lumber, machine stress-rated or machine evaluated lumber, shall be identified by the grade mark of a lumber grading or inspection agency that has been approved by the commissioner that complies with DOC PS 20 or equivalent. Grading practices and identification shall comply with rules published by an agency approved in accordance with the procedures of DOC PS 20 or equivalent procedures. In lieu of a grade mark on the material, a certificate of inspection as to species and grade issued by a lumber-grading or inspection agency meeting the requirements of this section is permitted to be accepted for precut, remanufactured or rough-sawn lumber, and for sizes larger than 3 inches (76 mm) nominal thickness. Approved end-jointed lumber is permitted to be used interchangeably with solid-sawn members of the same species and grade.

**2303.1.2 Prefabricated wood I-joists.** Structural capacities and design provisions for prefabricated wood I-joists shall be established and monitored in accordance with ASTM D 5055.

**2303.1.3 Structural glued-laminated timber.** Glued-laminated timbers shall be manufactured and identified as required in AITC A190.1 and ASTM D 3737.

**2303.1.4 Wood structural panels.** Wood structural panels, when used structurally (including those used for siding, roof and wall sheathing, sub-flooring, diaphragms and built-up members), shall conform to the requirements for their type in DOC PS 1 or PS 2. Each panel or member shall be

identified for grade and glue type by the trademarks of an approved testing and grading agency. Wood structural panel components shall be designed and fabricated in accordance with the applicable standards listed in Section 2306.1 and identified by the trademarks of an approved testing and inspection agency indicating conformance with the applicable standard. In addition, wood structural panels when permanently exposed in outdoor applications shall be of exterior type, except that wood structural panel roof sheathing exposed to the outdoors on the underside is permitted to be interior type bonded with exterior glue, Exposure 1.

**2303.1.5 Fiberboard.** Fiberboard for its various uses shall conform to ANSI/AHA A 194.1 or ASTM C 208. Fiberboard sheathing, when used structurally, shall be so identified by an approved agency as conforming to ANSI/AHA A 194.1 or ASTM C 208.

**2303.1.5.1 Jointing.** To ensure tight-fitting assemblies, edges shall be manufactured with square, ship-lapped, beveled, tongue-and-groove or U-shaped joints.

**2303.1.5.2 Roof insulation.** Where used as roof insulation in all types of construction, fiberboard shall be protected with an approved roof covering.

**2303.1.5.3 Wall insulation.** Where installed and fire-blocked to comply with Chapter 7, fiberboards are permitted as wall insulation in all types of construction. In fire walls and fire barriers, unless treated to comply with Section 803.1 for Class A materials, the boards shall be cemented directly to the concrete, masonry or other noncombustible base and shall be protected with an approved noncombustible veneer anchored to the base without intervening airspaces.

**2303.1.5.3.1 Protection.** Fiberboard wall insulation applied on the exterior of foundation walls shall be protected below ground level with a bituminous coating.

**2303.1.5.4 Insulating roof deck.** Where used as roof decking in open beam construction, fiberboard insulation roof deck shall have a nominal thickness of not less than 1 inch (25 mm).

**2303.1.6 Hardboard.** Hardboard siding used structurally shall be identified by an approved agency conforming to AHA A135.6. Hardboard under-layment shall meet the strength requirements of  $7/32$ -inch (5.6 mm) or  $1/4$ -inch (6.4 mm) service class hardboard planed or sanded on one side to a uniform thickness of not less than 0.200 inch (5.1 mm). Prefinished hardboard paneling shall meet the requirements of AHA A135.5. Other basic hardboard products shall meet the requirements of AHA A135.4. Hardboard products shall be installed in accordance with manufacturer's recommendations.

**2303.1.7 Particleboard.** Particleboard shall conform to ANSI A208.1. Particleboard shall be identified by the grade mark or certificate of inspection issued by an approved agency. Particleboard shall not be utilized for applications other than indicated in this section unless the particleboard complies with the provisions of Section 2306.4.3.

**2303.1.7.1 Floor underlayment.** Particleboard floor underlayment shall conform to Type PBU of ANSI A208.1. Type PBU underlayment shall not be less than 1/4-inch (6.4 mm) thick and shall be installed in accordance with the instructions of the Composite Panel Association.

**2303.1.8 Preservative-treated wood.** Lumber, timber, plywood, piles and poles supporting permanent structures required by Section 2304.11 to be preservative- treated shall conform to the requirements of the applicable AWPAs Standard C1, C2, C3, C4, C9, C14, C15, C16, C22, C23, C24, C28, C31, C33 and M4, for the species, product, preservative and end use. Preservatives shall conform to AWPAs P1/P13, P2, P5, P8 and P9. Lumber and plywood used in wood foundation systems shall conform to Chapter 18.

**2303.1.8.1 Identification.** Wood required by Section 2304.11 to be preservative- treated shall bear the quality mark of an inspection agency that maintains continuing supervision, testing and inspection over the quality of the preservative-treated wood. Inspection agencies for preservative-treated wood shall be listed by an accreditation body that complies with the requirements of the American Lumber Standards Treated Wood Program, or its equivalent. The quality mark shall be on a stamp or label affixed to the preservative-treated wood, and shall include the following information:

1. Identification of treating manufacturer.
2. Type of preservative used.
3. Minimum preservative retention (pcf).
4. End use for which the product is treated.
5. AWPAs standard to which the product was treated.
6. Identity of the accredited inspection agency.

**2303.1.8.2 Moisture content.** Where preservative-treated wood is used in enclosed locations where drying in service cannot readily occur, such wood shall be at a moisture content of 19 percent or less before being covered with insulation, interior wall finish, floor covering or other materials.

**2303.1.9 Structural composite lumber.** Structural capacities for structural composite lumber shall be established and monitored in accordance with ASTM D 5456.

**2303.2 Fire-retardant-treated wood.** Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

**2303.2.1 Labeling.** Fire-retardant-treated lumber and wood structural panels shall be labeled. The label shall contain the following items:

1. The identification of an approved agency in accordance with chapter 1 of Title 28 of the Administrative Code.
2. Identification of the treating manufacturer.
3. The name of the fire-retardant treatment.
4. The species of wood treated.
5. Flame spread and smoke-developed index.
6. Method of drying after treatment.
7. Conformance with appropriate standards in accordance with Sections 2303.2.2 through 2303.2.5.
8. For fire-retardant-treated wood exposed to weather, damp or wet locations, include the words

*“No increase in the listed classification when subjected to the Standard Rain Test” (ASTM D 2898).*

**2303.2.2 Strength adjustments.** *Design values for untreated lumber and wood structural panels, as specified in Section 2303.1, shall be adjusted for fire-retardant-treated wood. Adjustments to design values shall be based on an approved method of investigation that takes into consideration the effects of the anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and redrying procedures.*

**2303.2.2.1 Wood structural panels.** *The effect of treatment and the method of redrying after treatment, and exposure to high temperatures and high humidities on the flexure properties of fire-retardant-treated softwood plywood shall be determined in accordance with ASTM D 5516. The test data developed by ASTM D 5516 shall be used to develop adjustment factors, maximum loads and spans, or both, for untreated plywood design values in accordance with ASTM D 6305. Each manufacturer shall publish the allowable maximum loads and spans for service as floor and roof sheathing for its treatment.*

**2303.2.2.2 Lumber.** *For each species of wood treated, the effect of the treatment and the method of redrying after treatment and exposure to high temperatures and high humidities on the allowable design properties of fire-retardant-treated lumber shall be determined in accordance with ASTM D 5664. The test data developed by ASTM D 5664 shall be used to develop modification factors for use at or near room temperature and at elevated temperatures and humidity in accordance with an approved method of investigation. Each manufacturer shall publish the modification factors for service at temperatures of not less than 80°F (26.7°C) and for roof framing. The roof framing modification factors shall take into consideration the climatological location.*

**2303.2.3 Exposure to weather, damp or wet locations.** *Where fire-retardant-treated wood is exposed to weather, or damp or wet locations, it shall be identified as “Exterior” to indicate there is no increase in the listed flame spread index as defined in Section 2303.2 when subjected to ASTM D 2898.*

**2303.2.4 Interior applications.** *Interior fire-retardant-treated wood shall have moisture content of not over 28 percent when tested in accordance with ASTM D 3201 procedures at 92-percent relative humidity. Interior fire-retardant-treated wood shall be tested in accordance with Section 2303.2.2.1 or 2303.2.2.2. Interior fire-retardant-treated wood designated as Type A shall be tested in accordance with the provisions of this section.*

**2303.2.5 Moisture content.** *Fire-retardant-treated wood shall be dried to a moisture content of 19 percent or less for lumber and 15 percent or less for wood structural panels before use. For wood kiln dried after treatment (KDAT), the kiln temperatures shall not exceed those used in kiln drying the lumber and plywood submitted for the tests described in Section 2303.2.2.1 for plywood and 2303.2.2.2 for lumber.*

**2303.2.6 Type I and II construction applications.** *See Section 603.1 for limitations on the use of fire-retardant-treated wood in buildings of Type I or II construction.*

**2303.3 Hardwood plywood.** *Hardwood and decorative plywood shall be manufactured and identified as required in HPVA HP-1.*

**2303.4 Trusses.** *Metal-plate-connected wood trusses shall be manufactured as required by TPI 1. Each manufacturer of trusses using metal plate connectors shall retain an approved agency to make unscheduled inspections of truss manufacturing and delivery operations. The inspection shall cover all phases of truss operations, including lumber storage, handling, cutting fixtures, presses or rollers, manufacturing, bundling and banding.*

**2303.4.1 Truss design drawings.** *Truss construction documents shall be prepared by a registered design professional and shall be provided to the commissioner and approved prior to installation. These construction documents shall include, at a minimum, the information specified below. Truss shop drawings shall be provided with the shipment of trusses delivered to the job site.*

1. *Slope or depth, span and spacing;*
2. *Location of joints;*
3. *Required bearing widths;*
4. *Design loads as applicable;*
5. *Top chord live load (including snow loads);*
6. *Top chord dead load;*

7. *Bottom chord live load;*
8. *Bottom chord dead load;*
9. *Concentrated loads and their points of application;*
10. *Controlling wind and earthquake loads;*
11. *Adjustments to lumber and metal connector plate design value for conditions of use;*
12. *Each reaction force and direction;*
13. *Metal connector plate type, size, thickness or gage, and the dimensioned location of each metal connector plate except where symmetrically located relative to the joint interface;*
14. *Lumber size, species and grade for each member;*
15. *Connection requirements for:*
  - 15.1. *Truss to truss girder;*
  - 15.2. *Truss ply to ply; and*
  - 15.3. *Field splices;*
16. *Calculated deflection ratio or maximum deflection for live and total load;*
17. *Maximum axial compression forces in the truss members to design the size, connections and anchorage of the permanent continuous lateral bracing. Forces shall be shown on the truss construction documents or on supplemental documents; and*
18. *Required permanent truss member bracing location.*

**2303.5 Test standard for joist hangers and connectors.** *For the required test standards for joist hangers and connectors, see Section 1715.1.*

**2303.6 Nails and staples.** Nails and staples shall conform to requirements of ASTM F 1667. Nails used for framing and sheathing connections shall have minimum average bending yield strengths as follows: 80 kips per square inch (ksi) (551 MPa) for shank diameters larger than 0.177 inch (4.50 mm) but not larger than 0.254 inch (6.45 mm), 90 ksi (620 MPa) for shank diameters larger than 0.142 inch (3.61 mm) but not larger than 0.177 inch (4.50 mm) and 100 ksi (689 MPa) for shank diameters of 0.142 inch (3.61 mm) or less.

**2303.7 Shrinkage.** Consideration shall be given in design to the possible effect of cross-grain dimensional changes considered vertically which may occur in lumber fabricated in a green condition.

## **SECTION BC 2304**

### **GENERAL CONSTRUCTION REQUIREMENTS**

**2304.1 General.** The provisions of this section apply to design methods specified in Section 2301.2.

**2304.2 Size of structural members.** Computations to determine the required sizes of members shall be based on the net dimensions (actual sizes) and not nominal sizes.

**2304.3 Wall framing.** The framing of exterior and interior walls shall be in accordance with the provisions specified in Section 2308 unless a specific design is furnished.

**2304.3.1 Bottom plates.** Studs shall have full bearing on a 2-inch-thick (actual 1 ½-inch, 38 mm) or larger plate or sill having a width at least equal to the width of the studs.

**2304.3.2 Framing over openings.** Headers, double joists, trusses or other approved assemblies that are of adequate size to transfer loads to the vertical members shall be provided over window and door openings in load-bearing walls and partitions.

**2304.3.3 Shrinkage.** Wood walls and bearing partitions shall not support more than two floors and a roof unless an analysis satisfactory to the commissioner shows that shrinkage of the wood framing will not have adverse effects on the structure or any plumbing, electrical or mechanical systems, or other equipment installed therein due to excessive shrinkage or differential movements caused by shrinkage. The analysis shall also show that the roof drainage system and the foregoing systems or equipment will not be adversely affected or, as an alternate, such systems shall be designed to accommodate the differential shrinkage or movements.

**2304.4 Floor and roof framing.** *The framing of wood-joisted floors and wood framed roofs shall be in accordance with the provisions specified in Section 2308 unless a specific design is furnished.*

**2304.5 Framing around flues and chimneys.** *Combustible framing shall be a minimum of 2 inches (51 mm), but shall not be less than the distance specified in Sections 2111 and 2113 and the New York City Mechanical Code, from flues, chimneys and fireplaces, and 6 inches (152 mm) away from flue openings.*

**2304.6 Wall sheathing.** *Except as provided for in Section 1405 for weather boarding or where stucco construction that complies with Section 2510 is installed, enclosed buildings shall be sheathed with one of the materials of the nominal thickness specified in Table 2304.6 or any other approved material of equivalent strength or durability.*

**2304.6.1 Wood structural panel sheathing.** *Where wood structural panel sheathing is used as the exposed finish on the exterior of outside walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used on the exterior of outside walls but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). Where wood structural panel sheathing is used elsewhere, it shall be of a type manufactured with intermediate or exterior glue.*

**2304.6.2 Interior paneling.** *Softwood wood structural panels used for interior paneling shall conform with the provisions of Chapter 8 and shall be installed in accordance with Table 2304.9.1. Panels shall comply with DOC PS 1 or PS 2. Prefinished hardboard paneling shall meet the requirements of AHA A135.5, Prefinished Hardboard Paneling. Hardwood plywood shall conform to HPVA HP-1, The American National Standard for Hardwood and Decorative Plywood.*

**TABLE 2304.6  
MINIMUM THICKNESS OF WALL SHEATHING**

SHEATHING TYPE	MINIMUM THICKNESS	MAXIMUM WALL STUD SPACING
Wood boards	$\frac{5}{8}$ inch	24 inches on center
Fiberboard	$\frac{1}{2}$ inch	16 inches on center
Wood structural panel	In accordance with Tables 2308.9.3(2) and 2308.9.3(3)	—
M-S “Exterior Glue” and M-2 “Exterior Glue” Particleboard	In accordance with Tables 2306.4.3 and 2308.9.3(5)	—
Gypsum sheathing	$\frac{1}{2}$ inch	16 inches on center
Gypsum wallboard	$\frac{1}{2}$ inch	24 inches on center
Reinforced cement mortar	1 inch	24 inches on center

For SI: 1 inch = 25.4 mm.

**2304.7 Floor and roof sheathing.**

**2304.7.1 Structural floor sheathing.** *Structural floor sheathing shall be designed in accordance with the general provisions of this code and the special provisions in this section. Floor sheathing conforming to the provisions of Table 2304.7(1), 2304.7(2), 2304.7(3) or 2304.7(4) shall be deemed to meet the requirements of this section.*

**2304.7.2 Structural roof sheathing.** *Structural roof sheathing shall be designed in accordance with the general provisions of this code and the special provisions in this section. Roof sheathing conforming to the provisions of Table 2304.7(1), 2304.7(2), 2304.7(3) or 2304.7(5) shall be deemed to meet the requirements of this section. Wood structural panel roof sheathing shall be bonded by exterior glue.*

Panel span rating	Panel thickness (inches)	Maximum span (inches)		Load <sup>e</sup> (psf)		Maximum span (inches)
		With edge support <sup>f</sup>	Without edge support	Total load	Live load	
16 o.c.	1/2, 19/32, 5/8	24	24	50	40	16 <sup>h</sup>
20 o.c.	19/32, 5/8, 3/4	32	32	40	30	20 <sup>h,i</sup>
24 o.c.	23/32, 3/4	48	36	35	25	24
32 o.c.	7/8, 1	48	40	50	40	32
48 o.c.	1 3/32, 1 1/8	60	48	50	40	48

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>.

a. Applies to panels 24 inches or wider.

b. Floor and roof sheathing conforming with this table shall be deemed to meet the design criteria of Section 2304.7.

c. Uniform load deflection limitations 1/180 of span under live load plus dead load, 1/240 under live load only.

d. Panel edges shall have approved tongue-and-groove joints or shall be supported with blocking unless 1/4-inch minimum thickness underlayment or 1 1/2 inches of approved cellular or lightweight concrete is placed over the subfloor, or finish floor is 3/4-inch wood strip. Allowable uniform load based on deflection of 1/360 of span is 100 pounds per square foot except the span rating of 48 inches on center is based on a total load of 65 pounds per square foot.

e. Allowable load at maximum span.

f. Tongue-and-groove edges, panel edge clips (one midway between each support, except two equally spaced between supports 48 inches on center), lumber blocking or other. Only lumber blocking shall satisfy blocked diaphragm requirements.

g. For 1/2-inch panel, maximum span shall be 24 inches.

h. Span is permitted to be 24 inches on center where 3/4-inch wood strip flooring is installed at right angles to joist.

i. Span is permitted to be 24 inches on center for floors where 1 1/2 inches of cellular or lightweight concrete is applied over the panels.

**TABLE 2304.7(4)**

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>.

- a. Spans limited to value shown because of possible effects of concentrated loads. Allowable uniform loads based on deflection of  $1/360$  of span is 100 pounds per square foot except allowable total uniform load for  $1 1/8$ -inch wood structural panels over joists spaced 48 inches on center is 65 pounds per square foot. Panel edges shall have approved tongue-and-groove joints or shall be supported with blocking, unless  $1/4$ -inch minimum thickness underlayment or  $1 1/2$  inches of approved cellular or lightweight concrete is placed over the subfloor, or finish floor is  $3/4$ -inch wood strip.
- b. Floor panels conforming with this table shall be deemed to meet the design criteria of Section 2304.7.
- c. Applicable to all grades of sanded exterior-type plywood. See DOC PS 1 for plywood species groups.
- d. Applicable to Underlayment grade, C-C (Plugged) plywood, and Single Floor grade wood structural panels.

	5/8	24	45 <sup>c</sup>	55 <sup>c</sup>
23/32, 3/4	24	60 <sup>c</sup>	65 <sup>c</sup>	

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>.

- a. Roof sheathing conforming with this table shall be deemed to meet the design criteria of Section 2304.7.
- b. Uniform load deflection limitations  $1/180$  of span under live load plus dead load,  $1/240$  under live load only. Edges shall be blocked with lumber or other approved type of edge supports.
- c. For composite and four-ply plywood structural panel, load shall be reduced by 15 pounds per square foot.

### **2304.8 Mechanically laminated floors and decks.**

**2304.8.1 General.** *A laminated lumber floor or deck built up of wood members set on edge, when meeting the following requirements, is permitted to be designed as a solid floor or roof deck of the same thickness, and continuous spans are permitted to be designed on the basis of the full cross section using the simple span moment coefficient.*

*Nail lengths shall not be less than two and one-half times the net thickness of each lamination. Where deck supports are 4 feet (1219 mm) on center (o.c.) or less, side nails shall be spaced not more than 30 inches (762 mm) o.c. alternately near top and bottom edges, and staggered one-third of the spacing in adjacent laminations. Where supports are spaced more than 4 feet (1219 mm) o.c., side nails shall be spaced not more than 18 inches (457 mm) o.c. alternately near top and bottom edges, and staggered one-third of the spacing in adjacent laminations. Two side nails shall be used at each end of butt-jointed pieces.*

*Laminations shall be toenailed to supports with 20d or larger common nails. Where the supports are 4 feet (1219 mm) o.c. or less, alternate laminations shall be toenailed to alternate supports; where supports are spaced more than 4 feet (1219 mm) o.c., alternate laminations shall be toenailed to every support. A single-span deck shall have all laminations full length. A continuous deck of two spans shall not have more than every fourth lamination spliced within quarter points adjoining supports. Joints shall be closely butted over supports or staggered across the deck but within the adjoining quarter spans. No lamination shall be spliced more than twice in any span.*

### **2304.9 Connections and fasteners.**

**2304.9.1 Fastener requirements.** *Connections for wood members shall be designed in accordance with the appropriate methodology in Section 2301.2. The number and size of nails connecting wood members shall not be less than that set forth in Table\_2304.9.1.*

34. Interior paneling	1/4" 3/8"	4d <sup>j</sup> 6d <sup>k</sup>

For SI: 1 inch = 25.4 mm.

- a. Common or box nails are permitted to be used except where otherwise stated.
- b. Nails spaced at 6 inches on center at edges, 12 inches at intermediate supports except 6 inches at supports where spans are 48 inches or more. For nailing of wood structural panel and particleboard diaphragms and shear walls, refer to Section 2305. Nails for wall sheathing are permitted to be common, box or casing.
- c. Common or deformed shank.
- d. Common.
- e. Deformed shank.
- f. Corrosion-resistant siding or casing nail.
- g. Fasteners spaced 3 inches on center at exterior edges and 6 inches on center at intermediate supports.
- h. Corrosion-resistant roofing nails with 7/16-inch-diameter head and 1 1/2-inch length for 1/2-inch sheathing and 1 3/4-inch length for 25/32-inch sheathing.
- i. Corrosion-resistant staples with nominal 7/16-inch crown and 1 1/8-inch length for 1/2-inch sheathing and 1 1/2-inch length for 25/32-inch sheathing. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).
- j. Casing or finish nails spaced 6 inches on panel edges, 12 inches at intermediate supports.
- k. Panel supports at 24 inches. Casing or finish nails spaced 6 inches on panel edges, 12 inches at intermediate supports.
- l. For roof sheathing applications, 8d nails are the minimum required for wood structural panels.
- m. Staples shall have a minimum crown width of 7/16 inch.
- n. For roof sheathing applications, fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports.
- o. Fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports for subfloor and wall sheathing and 3 inches on center at edges, 6 inches at intermediate supports for roof sheathing.
- p. Fasteners spaced 4 inches on center at edges, 8 inches at intermediate supports.

**2304.9.2 Sheathing fasteners.** *Sheathing nails or other approved sheathing connectors shall be driven so that their head or crown is flush with the surface of the sheathing.*

**2304.9.3 Joist hangers and framing anchors.** *Connections depending on joist hangers or framing anchors, ties and other mechanical fastenings not otherwise covered are permitted where approved. The vertical load-bearing capacity, torsional moment capacity and deflection characteristics of joist hangers shall be determined in accordance with Section 1715.1.*

**2304.9.4 Other fasteners.** *Clips, staples, glues and other approved methods of fastening are permitted where approved.*

**2304.9.5 Fasteners in preservative-treated and fire-retardant-treated wood.** *Fasteners for preservative-treated and fire-retardant-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fastenings for wood foundations shall be as required in AF & PA Technical Report No. 7.*

**2304.9.6 Load path.** *Where wall framing members are not continuous from foundation sill to roof, the members shall be secured to ensure a continuous load path. Where required, sheet metal clamps, ties or clips shall be formed of galvanized steel or other approved corrosion-resistant material not less than 0.040 inch (1.01 mm) nominal thickness.*

**2304.9.7 Framing requirements.** *Wood columns and posts shall be framed to provide full end bearing. Alternatively, column-and-post end connections shall be designed to resist the full compressive loads, neglecting end-bearing capacity. Column-and-post end connections shall be fastened to resist lateral and net induced uplift forces.*

#### **2304.10 Heavy timber construction.**

##### **2304.10.1 Minimum member sizes.**

**2304.10.1.1 Columns.** *Columns shall be at least 8 inches (203 mm) in all dimensions when supporting floor loads and at least 6 inches (152 mm) wide and 8 inches (203 mm) deep when supporting roof and ceiling loads only.*

**2304.10.1.2 Beams and girders.** *Beams and girders shall be at least 6 inches (152 mm) wide and 10 inches (254 mm) deep.*

**2304.10.1.3 Frames and arches.** *Frames and arches that spring from grade or the floor line and support floor loads shall be at least 8 inches (203 mm) in all dimensions. Frames or arches for roof construction that spring from grade or the floor line and do not support floor loads shall have members at least 6 inches (152 mm) wide and 8 inches (203 mm) deep for the lower half of the height, and at least 6 inches (152 mm) deep for the upper half.*

*Frames or arches for roof construction that spring from the top of walls or wall abutments, framed timber trusses, and other roof framing, which do not support floor loads, shall have members at least 4 inches (102 mm) wide and 6 inches (152 mm) deep. Spaced members may be composed of two or more pieces at least 3 inches (76 mm) thick when blocked solidly through their intervening spaces or when such spaces are tightly closed by a continuous wood cover plate at least 2 inches (51 mm) thick secured to the underside of the members. Splice plates shall be at least 3 inches (76 mm) thick. When protected by approved automatic sprinklers under the roof deck, framing members shall be at least 3 inches (76 mm) wide.*

**2304.10.1.4 Trusses.** *Timber trusses supporting floor loads shall have members at least 8 inches (203 mm) in all dimensions.*

**2304.10.2 Columns.** *Columns shall be continuous or superimposed throughout all stories by means of reinforced concrete or metal caps with brackets, or shall be connected by properly designed steel or iron caps, with pintles and base plates, or by timber splice plates affixed to the columns by metal connectors housed within the contact faces, or by other approved methods.*

**2304.10.2.1 Column connections.** *Girders and beams shall be closely fitted around columns and adjoining ends shall be cross tied to each other, or inter-tied by caps or ties, to transfer horizontal loads across joints. Wood bolsters shall not be placed on tops of columns unless the columns support roof loads only.*

**2304.10.3 Floor framing.** *Approved wall plate boxes or hangers shall be provided where wood beams, girders or trusses rest on masonry or concrete walls. Where intermediate beams are used to support a floor, they shall rest on top of girders, or shall be supported by ledgers or blocks securely fastened to the sides of the girders, or they shall be supported by an approved metal hanger into which the ends of the beams shall be closely fitted.*

**2304.10.4 Roof framing.** *Every roof girder and at least every alternate roof beam shall be anchored to*

*its supporting member; and every monitor and every saw tooth construction shall be anchored to the main roof construction. Such anchors shall consist of steel bolts of sufficient strength to resist vertical uplift of the roof.*

**2304.10.5 Floor decks.** *Floor decks and covering shall not extend closer than ½ inch (12.7 mm) to walls. Such ½-inch (12.7 mm) spaces shall be covered by a molding fastened to the wall either above or below the floor and arranged such that the molding will not obstruct the expansion or contraction movements of the floor. Corbeling of masonry walls under floors is permitted in place of such molding.*

**2304.10.6 Roof decks.** *Where supported by a wall, roof decks shall be anchored to walls to resist uplift forces determined in accordance with Chapter 16. Such anchors shall consist of steel bolts of sufficient strength to resist vertical uplift of the roof.*

**2304.10.7 Fabrication.** *All timber shall be accurately cut and framed to a close fit in such a manner that the joints will have even bearing over the contact surfaces. Mortises shall be true to size for their full depth and tenons shall fit snugly. No shimming in joints, or open joints, shall be permitted.*

**2304.10.8 Erection.** *Joints shall have a tight fit. Fasteners shall be installed in a manner that will not damage the wood. End compression joints shall be brought to full bearing. All framework shall be carried up true and plumb. As erection progresses, the work shall be bolted, or nailed as necessary, to resist all dead load, wind, and erection stresses. The structure shall be properly aligned before final tightening of the connections.*

**2304.11 Protection against decay and termites.**

**2304.11.1 General.** *Where required by this section, protection from decay and termites shall be provided by the use of naturally durable or preservative-treated wood.*

**2304.11.2 Wood used above ground.** *Wood installed above ground in the locations specified in Sections 2304.11.2.1 through 2304.11.2.6 shall be naturally durable wood or preservative-treated wood that uses water-borne preservatives, and shall be treated in accordance with AWPA C2 or C9 or applicable AWPA standards for above ground use.*

**2304.11.2.1 Joists, girders and subfloor.** *Where wood joists or the bottom of a wood structural floor without joists are closer than 18 inches (457 mm), or wood girders are closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated areas located within the*

*perimeter of the building foundation, the floor assembly (including posts, girders, joists and subfloor) shall be of naturally durable or preservative-treated wood.*

**2304.11.2.2 Framing.** *Wood framing members, including wood sheathing, which rest on exterior foundation walls and are less than 8 inches (203 mm) from exposed earth shall be of naturally durable or preservative-treated wood. Wood framing members and furring strips attached directly to the interior of exterior masonry or concrete walls below grade shall be of approved naturally durable or preservative-treated wood.*

**2304.11.2.3 Sleepers and sills.** *Sleepers and sills on a concrete or masonry slab that is in direct contact with earth shall be of naturally durable or preservative-treated wood.*

**2304.11.2.4 Girder ends.** *The ends of wood girders entering exterior masonry or concrete walls shall be provided with a 1/2-inch (12.7 mm) air space on top, sides and end, unless naturally durable or preservative-treated wood is used.*

**2304.11.2.5 Wood siding.** *Clearance between wood siding and earth on the exterior of a building shall not be less than 6 inches (152 mm) except where siding, sheathing and wall framing are of naturally durable or preservative-treated wood.*

**2304.11.2.6 Posts or columns.** *Posts or columns supporting permanent structures and supported by a concrete or masonry slab or footing that is in direct contact with the earth shall be of naturally durable or preservative-treated wood.*

**Exceptions:**

- 1. Posts or columns that are either exposed to the weather or located in basements or cellars, supported by concrete piers or metal pedestals projected at least 1 inch (25 mm) above the slab or deck and 6 inches (152 mm) above exposed earth, and are separated therefrom by an impervious moisture barrier.*
- 2. Posts or columns in enclosed crawl spaces or unexcavated areas located within the periphery of the building, supported by a concrete pier or metal pedestal at a height greater than 8 inches (203 mm) from exposed ground, and are separated therefrom by an impervious moisture barrier.*

**2304.11.3 Laminated timbers.** *The portions of glued-laminated timbers that form the structural supports of a building or other structure and are exposed to weather and not properly protected by a roof, eave or similar covering shall be pressure-treated with preservative, or be manufactured from naturally durable or preservative-treated wood.*

**2304.11.4 Wood in contact with the ground or fresh water.** *Wood in contact with the ground (exposed earth) that supports permanent structures shall be of naturally durable (species for both decay and termite resistance) or preservative-treated wood using water-borne preservatives and shall be treated in accordance with AWPA C2, C9 or other applicable AWPA standard for soil or fresh water contact, where used in the locations specified in Sections 2304.11.4.1 and 2304.11.4.2.*

**Exception:** *Untreated wood is permitted where such wood is continuously and entirely below the ground-water level or submerged in fresh water.*

**2304.11.4.1 Posts or columns.** *Posts and columns supporting permanent structures that are embedded in concrete in direct contact with the earth or embedded in concrete exposed to the weather, or in direct contact with the earth, shall be of preservative-treated wood.*

**2304.11.4.2 Wood structural members.** *Wood structural members that support moisture-permeable floors or roofs that are exposed to the weather, such as concrete or masonry slabs, shall be of naturally durable or preservative-treated wood unless separated from such floors or roofs by an impervious moisture barrier.*

**2304.11.5 Supporting member for permanent appurtenances.** *Naturally durable or preservative-treated wood shall be utilized for those portions of wood members that form the structural supports of buildings, balconies, porches or similar permanent building appurtenances where such members are exposed to the weather without adequate protection from a roof, eave, overhang or other covering to prevent moisture or water accumulation on the surface or at joints between members.*

**2304.11.6 Termite protection.** *In geographical areas where the hazard of termite damage is known to be very heavy, the floor framing shall be of naturally durable or preservative-treated wood, or provided with approved methods of termite protection.*

**2304.11.7 Wood used in retaining walls and cribs.** *Wood installed in retaining or crib walls shall be of preservative-treated wood treated in accordance with AWPA C2 or C9 for soil and fresh water contact.*

**2304.11.8 Attic ventilation.** For attic ventilation, see Section 1203.2.

**2304.11.9 Under-floor ventilation (crawl space).** For under-floor ventilation (crawl space), see Section 1203.3.

**2304.11.10 Firecutting.** The ends of wood beams, joists and rafters resting on masonry or concrete walls shall be firecut to a bevel of three inches in their depth.

**2304.11.11 Debris.** All loose wood and debris and all wood forms shall be removed from spaces under the building. All stump and roots shall be grubbed to a minimum depth of twelve inches.

**2304.12 Wood supporting masonry or concrete.** Wood members shall not be used to permanently support the dead load of any masonry or concrete.

**Exceptions:**

1. Masonry or concrete nonstructural floor or roof surfacing not more than 4 inches (102 mm) thick is permitted to be supported by wood members.
2. Any structure is permitted to rest upon wood piles constructed in accordance with the requirements of Chapter 18.
3. Veneer of brick, concrete or stone applied as specified in Section 1405.5 having an installed weight of 40 pounds per square foot (psf) (1.9 kN/m<sup>2</sup>) or less is permitted to be supported by an approved treated wood foundation when the maximum height of veneer does not exceed 30 feet (9144 mm) above the foundation. Such veneer used as an interior wall finish is permitted to be supported on wood floor construction. The wood floor construction shall be designed to support the additional weight of the veneer plus any other loads and to limit the deflection and shrinkage to <sup>1</sup>/600 of the span of the supporting members.
4. Glass unit masonry having an installed weight of 20 psf (0.96 kN/m<sup>2</sup>) or less is permitted to be installed in accordance with the provisions of Section 2110. The wood construction supporting the glass unit masonry shall be designed for dead and live loads to limit deflection and shrinkage to <sup>1</sup>/600 of the span of the supporting members.

## SECTION BC 2305

### GENERAL DESIGN REQUIREMENTS FOR LATERAL-FORCE-RESISTING SYSTEMS

**2305.1 General.** Structures using wood shear walls and diaphragms to resist wind, seismic and other lateral loads shall be designed and constructed in accordance with the provisions of this section.

**2305.1.1 Shear resistance based on principles of mechanics.** Shear resistance of diaphragms and shear walls are permitted to be calculated by principles of mechanics using values of fastener strength and sheathing shear resistance.

**2305.1.2 Framing.** Boundary elements shall be provided to transmit tension and compression forces. Perimeter members at openings shall be provided and shall be detailed to distribute the shearing stresses. Diaphragm and shear wall sheathing shall not be used to splice boundary elements. Diaphragm chords and collectors shall be placed in, or tangent to, the plane of the diaphragm framing unless it can be demonstrated that the moments, shears and deformations, considering eccentricities resulting from other configurations can be tolerated without exceeding the adjusted resistance and drift limits.

**2305.1.2.1 Framing members.** Framing members shall be at least 2 inch (51 mm) nominal width. In general, adjoining panel edges shall bear and be attached to the framing members and butt along their centerlines. Nails shall be placed not less than  $\frac{3}{8}$  inch (9.5 mm) from the panel edge, not more than 12 inches (305 mm) apart along intermediate supports, and 6 inches (152 mm) along panel edge bearings, and shall be firmly driven into the framing members.

**2305.1.3 Openings in shear panels.** Openings in shear panels that materially affect their strength shall be fully detailed on the plans, and shall have their edges adequately reinforced to transfer all shearing stresses.

**2305.1.4 Shear panel connections.** Positive connections and anchorages, capable of resisting the design forces, shall be provided between the shear panel and the attached components. In Seismic Design Category D, toenails shall not be used to transfer lateral forces in excess of 150 pounds per foot (2189 N/m) from diaphragms to shear walls, drag struts (collectors) or other elements, or from shear walls to other elements.

**2305.1.5 Wood members resisting horizontal seismic forces contributed by masonry and concrete.** Wood shear walls, diaphragms, horizontal trusses and other members shall not be used to resist

*horizontal seismic forces contributed by masonry or concrete construction in structures over one story in height.*

***Exceptions:***

- 1. Wood floor and roof members are permitted to be used in horizontal trusses and diaphragms to resist horizontal seismic forces contributed by masonry or concrete construction (including those due to masonry veneer, fireplaces and chimneys) provided such forces do not result in torsional force distribution through the truss or diaphragm.*
- 2. Wood structural panel sheathed shear walls are permitted to be used to provide resistance to seismic forces contributed by masonry or concrete construction in two-story structures of masonry or concrete construction, provided the following requirements are met:*
  - 2.1. Story-to-story wall heights shall not exceed 12 feet (3658 mm).*
  - 2.2. Diaphragms shall not be designed to transmit lateral forces by rotation. Diaphragms shall not cantilever past the outermost supporting shear wall.*
  - 2.3. Combined deflections of diaphragms and shear walls shall not permit story drift of supported masonry or concrete walls to exceed the limit of Section 1617.3.*
  - 2.4. Wood structural panel sheathing in diaphragms shall have unsupported edges blocked. Wood structural panel sheathing for both stories of shear walls shall have unsupported edges blocked and, for the lower story, shall have a minimum thickness of <sup>15</sup>/<sub>32</sub> inch (11.9 mm).*
  - 2.5. There shall be no out-of-plane horizontal offsets between the first and second stories of wood structural panel shear walls.*

***2305.2 Design of wood diaphragms.***

***2305.2.1 General.*** *Wood diaphragms are permitted to be used to resist horizontal forces provided the deflection in the plane of the diaphragm, as determined by calculations, tests or analogies drawn therefrom, does not exceed the permissible deflection of attached distributing or resisting elements.*

*Connections shall extend into the diaphragm a sufficient distance to develop the force transferred into the diaphragm.*

**2305.2.2 Deflection.** *Permissible deflection shall be that deflection up to which the diaphragm and any attached distributing or resisting element will maintain its structural integrity under design load conditions, such that the resisting element will continue to support design loads without danger to occupants of the structure. Calculations for diaphragm deflection shall account for the usual bending and shear components as well as any other factors, such as nail deformation, which will contribute to deflection. The deflection ( $\Delta$ ) of a blocked wood structural panel diaphragm uniformly nailed throughout is permitted to be calculated by using the following formula. If not uniformly nailed, the constant 0.188 (For SI: 1/1627) in the third term must be modified accordingly.*

$$\Delta = \frac{5vL^3}{8EAb} + \frac{vL}{4Gt} + 0.188Le_n + \frac{\Sigma(\Delta_c X)}{2b} \quad (\text{Equation 23-1})$$

$$\text{For SI: } \Delta = \frac{0.052L^3}{EAb} + \frac{vL}{4Gt} + \frac{Le_n}{1627} + \frac{\Sigma(\Delta_c X)}{2b}$$

where:

- $A$  = Area of chord cross section, in square inches (mm<sup>2</sup>).
- $b$  = Diaphragm width, in feet (mm).
- $E$  = Elastic modulus of chords, in pounds per square inch (N/mm<sup>2</sup>).
- $e_n$  = Nail deformation, in inches (mm).
- $G$  = Modulus of rigidity of wood structural panel, in pounds per square inch (N/mm<sup>2</sup>).
- $L$  = Diaphragm length, in feet (mm).
- $t$  = Effective thickness of wood structural panel for shear, in inches (mm).
- $v$  = Maximum shear due to design loads in the direction under consideration, in pounds per linear foot (plf) (N/mm).
- $\Delta$  = The calculated deflection, in inches (mm).
- $\Sigma(\Delta X)$  = Sum of individual chord-splice values on both sides of the diaphragm, each multiplied by its distance to the nearest support.

**2305.2.3 Diaphragm aspect ratios.** *Size and shape of diaphragms shall be limited as set forth in Table 2305.2.3.*

**TABLE 2305.2.3  
MAXIMUM DIAPHRAGM DIMENSION RATIOS  
HORIZONTAL AND SLOPED DIAPHRAGM**

<b>TYPE</b>	<b>MAXIMUM LENGTH - WIDTH RATIO</b>
Wood structural panel, nailed all edges	4:1
Wood structural panel, blocking omitted at intermediate joints	3:1
Diagonal sheathing, single	3:1
Diagonal sheathing, double	4:1

**2305.2.4 Construction.** Shear panels shall be constructed of wood structural panels, manufactured with exterior glue, not less than 4 feet by 8 feet (1219 mm by 2438 mm), except at boundaries and changes in framing. Boundary elements shall be connected at corners. Wood structural panel thickness for horizontal diaphragms shall not be less than set forth in Tables 2304.7(3) and 2304.7(5) for corresponding joist spacing and loads, except that ¼ inch (6.4 mm) is permitted to be used where perpendicular loads permit. Sheet-type sheathing shall be arranged so that the width of a sheet in a shear wall shall not be less than 2 feet (610 mm).

**2305.2.5 Rigid diaphragms.** Design of structures with rigid diaphragms shall conform to the structure configuration requirements of Section 9.5.2.3 of ASCE 7 and the horizontal shear distribution requirements of Section 9.5.5.5 of ASCE 7.

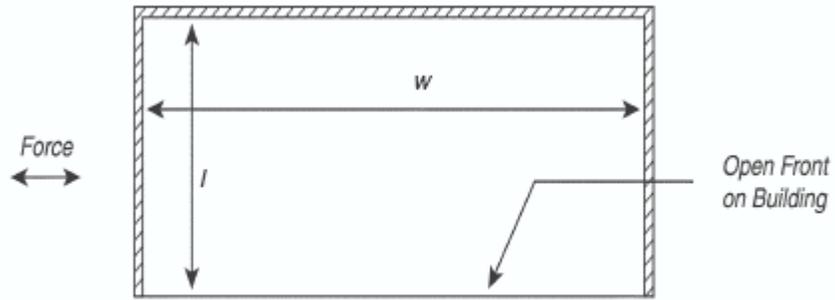

Open front structures with rigid wood diaphragms resulting in torsional force distribution are permitted provided the length,  $l$ , of the diaphragm normal to the open side does not exceed 25 feet (7620 mm), the diaphragm sheathing conforms to Section 2305.2.4, and the  $l/w$  ratio [as shown in Figure 2305.2.5(1)] is less than 1.0 for one-story structures or 0.67 for structures over one story in height.

**Exception:** Where calculations show that diaphragm deflections can be tolerated, the length,  $l$ , normal to the open end is permitted to be increased to a  $l/w$  ratio not greater than 1.5 where sheathed in compliance with Section 2305.2.4 or to 1.0 where sheathed in compliance with Section 2306.3.4 or 2306.3.5.

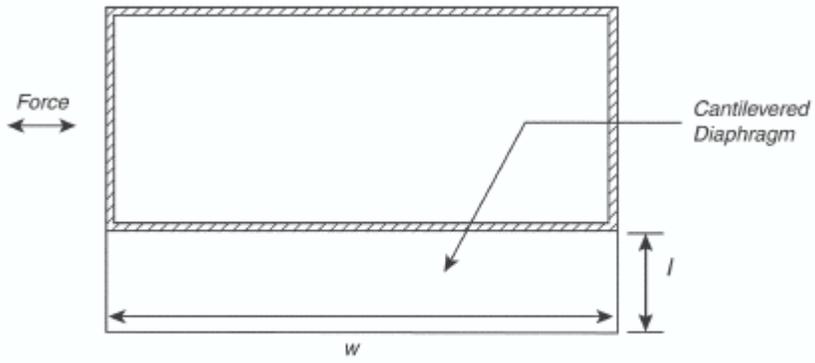

Rigid wood diaphragms are permitted to cantilever past the outermost supporting shear wall (or other vertical resisting element) a length,  $l$ , of not more than 25 feet (7620 mm) or two-thirds of the diaphragm width,  $w$ , whichever is the smaller. Figure 2305.2.5(2) illustrates the dimensions of  $l$  and  $w$  for a cantilevered diaphragm.

Structures with rigid wood diaphragms having a torsional irregularity in accordance with Table 1616.5.1.1, Item 1, shall meet the following requirements: The  $l/w$  ratio shall not exceed 1.0 for one-story structures or 0.67 for structures over one story in height, where  $l$  is the dimension parallel to the load direction for which the irregularity exists.

**Exception:** Where calculations demonstrate that the diaphragm deflections can be tolerated, the width is permitted to be increased and the  $l/w$  ratio is permitted to be increased to 1.5 where sheathed in compliance with Section 2306.3.4 or 2306.3.5.

**FIGURE 2305.2.5(1)**  
**DIAPHRAGM LENGTH AND WIDTH FOR PLAN VIEW OF OPEN FRONT BUILDING**

**FIGURE 2305.2.5(2)**  
**DIAPHRAGM LENGTH AND WIDTH FOR PLAN VIEW OF CANTILEVERED DIAPHRAGM**

### **2305.3 Design of wood shear walls.**

**2305.3.1 General.** *Wood shear walls are permitted to resist horizontal forces in vertical distributing or resisting elements, provided the deflection in the plane of the shear wall, as determined by calculations, tests or analogies drawn therefrom, does not exceed the more restrictive of the permissible deflection of attached distributing or resisting elements or the drift limits of Section 1617.3.*

**2305.3.2 Deflection.** *Permissible deflection shall be that deflection up to which the shear wall and any attached distributing or resisting element will maintain its structural integrity under design load conditions, i.e., continue to support design loads without danger to occupants of the structure.*

*The deflection ( $\Delta$ ) of a blocked wood structural panel shear wall uniformly fastened throughout is permitted to be calculated by the use of the following formula:*

$$\Delta = \frac{8vh^3}{EAb} + \frac{vh}{Gt} + 0.75he_n + d_a \quad (\text{Equation 23-2})$$

$$\text{For SI: } \Delta = \frac{vh^3}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{406.7} + d_a$$

where:

- $A$  = Area of boundary element cross section in square inches (mm<sup>2</sup>) (vertical member at shear wall boundary).
- $b$  = Wall width, in feet (mm).
- $d_a$  = Deflection due to anchorage details (rotation and slip at tie-down bolts).
- $E$  = Elastic modulus of boundary element (vertical member at shear wall boundary), in pounds per square inch (N/mm<sup>2</sup>).
- $e_n$  = Deformation of mechanically fastened connections, in inches (mm<sup>2</sup>).
- $G$  = Modulus of rigidity of wood structural panel, in pounds per square inch (N/mm<sup>2</sup>).
- $h$  = Wall height, in feet (mm).
- $t$  = Effective thickness of wood structural panel for shear, in inches (mm).
- $v$  = Maximum shear due to design loads at the top of the wall, in pounds per linear foot (N/mm).
- $\Delta$  = The calculated deflection, in inches (mm).

**2305.3.3 Shear wall aspect ratios.** *Size and shape of shear walls and shear wall segments within shear walls containing openings shall be limited as set forth in Table 2305.3.3.*

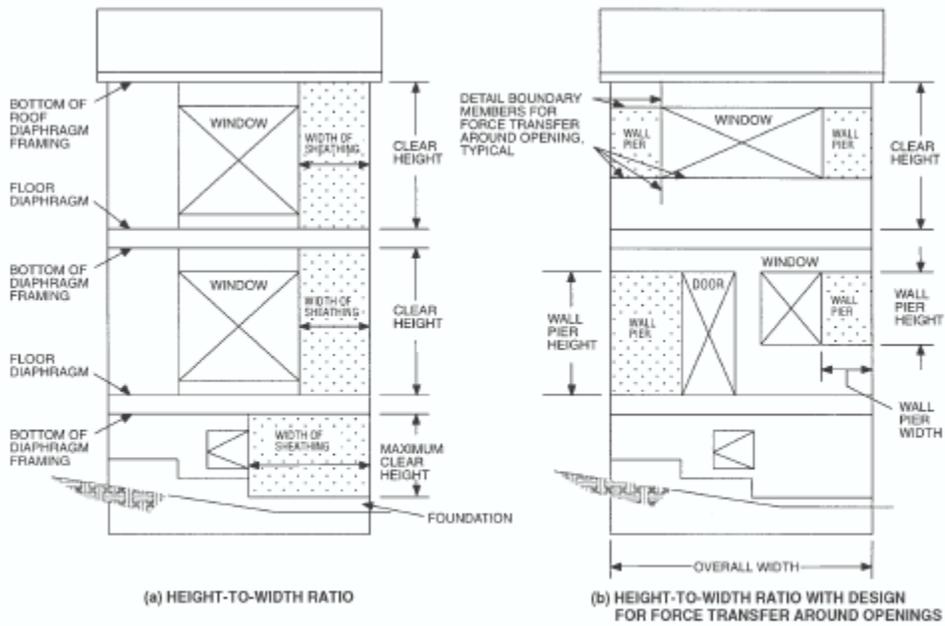

**TABLE 2305.3.3  
MAXIMUM SHEAR WALL ASPECT RATIOS**

TYPE	MAXIMUM HEIGHT- WIDTH RATIO
Wood structural panels or particleboard, nailed edges	For other than seismic: $3\frac{1}{2}$ :1 For seismic: 2:1 <sup>a</sup>
Diagonal sheathing, single	2:1
Fiberboard	$1\frac{1}{2}$ :1
Gypsum board, gypsum lath, cement plaster	$1\frac{1}{2}$ :1 <sup>b</sup>

- a. For design to resist seismic forces, shear wall aspect ratios greater than 2:1, but not exceeding  $3\frac{1}{2}$ :1, are permitted provided the factored shear resistance values in Table 2306.4.1 are multiplied by  $2w/h$ .
- b. Ratio shown is for unblocked construction. Aspect ratio is permitted to be 2:1 where the wall is installed as blocked construction in accordance with Section 2306.4.5.1.2.

**2305.3.4 Shear wall height definition.** *The height of a shear wall shall be defined as:*

1. *The maximum clear height from top of foundation to bottom of diaphragm framing above; or*
2. *The maximum clear height from top of diaphragm to bottom of diaphragm framing above [see Figure 2305.3.4(a)].*

**FIGURE 2305.3.4**  
**GENERAL DEFINITION OF SHEAR WALL HEIGHT, WIDTH AND HEIGHT-TO-WIDTH RATIO**

**2305.3.5 Shear wall width definition.** *The width of a shear wall shall be defined as the sheathed dimension of the shear wall in the direction of application of force [see Figure 2305.3.4(a)].*

**2305.3.5.1 Shear wall segment width definition.** *The width of full-height sheathing adjacent to unrestrained openings in a shear wall.*

**2305.3.6 Overturning restraint.** *Where the dead load stabilizing moment in accordance with Chapter 16 allowable stress design load combinations is not sufficient to prevent uplift due to overturning moments on the wall, an anchoring device shall be provided. Anchoring devices shall maintain a continuous load path to the foundation.*

**2305.3.7 Shear walls with openings.** *The provisions of this section shall apply to the design of shear walls with openings. Where framing and connections around the openings are designed for force transfer around the openings, the provisions of Section 2305.3.7.1 shall apply. Where framing and connections around the openings are not designed for force transfer around the openings, the provisions of Section 2305.3.7.2 shall apply.*

**2305.3.7.1 Force transfer around openings.** *Where shear walls with openings are designed for force transfer around the openings, the limitations of Table 2305.3.3 shall apply to the overall shear wall including openings and to each wall pier at the side of an opening. The height of a wall pier shall be defined as the clear height of the pier at the side of an opening. The width of a wall pier shall be defined as the sheathed width of the pier at the side of an opening. Design for force transfer shall be based on a rational analysis. Detailing of boundary elements around the opening shall be provided in accordance with the provisions of this section [see Figure 2305.3.4(b)].*

**2305.3.7.2 Perforated shear walls.** *The provisions of Section 2305.3.7.2 shall be permitted to be used for the design of perforated shear walls.*

**2305.3.7.2.1 Limitations.** *The following limitations shall apply to the use of Section 2305.3.7.2:*

1. *A perforated shear wall segment shall be located at each end of a perforated shear wall. Openings shall be permitted to occur beyond the ends of the perforated shear wall; however, the width of such openings shall not be included in the width of the perforated shear wall.*

2. *The allowable shear set forth in Table 2306.4.1 shall not exceed 490 plf (7150 N/m).*
3. *Where out-of-plane offsets occur, portions of the wall on each side of the offset shall be considered as separate perforated shear walls.*
4. *Collectors for shear transfer shall be provided through the full length of the perforated shear wall.*
5. *A perforated shear wall shall have uniform top of wall and bottom of wall elevations. Perforated shear walls not having uniform elevations shall be designed by other methods.*
6. *Perforated shear wall height, h, shall not exceed 20 feet (6096 mm).*

**2305.3.7.2.2 Perforated shear wall resistance.** *The resistance of a perforated shear wall shall be calculated in accordance with the following:*

1. *The percent of full-height sheathing shall be calculated as the sum of the widths of perforated shear wall segments divided by the total width of the perforated shear wall including openings.*
2. *The maximum opening height shall be taken as the maximum opening clear height. Where areas above and below an opening remain unsheathed, the height of opening shall be defined as the height of the wall.*
3. *The adjusted shear resistance shall be calculated by multiplying the unadjusted shear resistance by the shear resistance adjustment factors of Table 2305.3.7.2. For intermediate percentages of full-height sheathing, the values in Table 2305.3.7.2 are permitted to be interpolated.*
4. *The perforated shear wall resistance shall be equal to the adjusted shear resistance times the sum of the widths of the perforated shear wall segments.*

**2305.3.7.2.3 Anchorage and load path.** *Design of perforated shear wall anchorage and load path shall conform to the requirements of Sections 2305.3.7.2.4 through 2305.3.7.2.8, or shall be calculated using principles of mechanics. Except as modified by these sections, wall*

*framing, sheathing, sheathing attachment and fastener schedules shall conform to the requirements of Section 2305.2.4 and Table 2306.4.1.*

**2305.3.7.2.4 Uplift anchorage at perforated shear wall ends.** *Anchorage for uplift forces due to overturning shall be provided at each end of the perforated shear wall. The uplift anchorage shall conform to the requirements of Section 2305.3.6 except that for each story the minimum tension chord uplift force,  $T$ , shall be calculated in accordance with the following:*

$$T = \frac{Vh}{C_o \Sigma L_i} \quad (\text{Equation 23-3})$$

where:

$T$  = Tension chord uplift force, pounds (N).

$V$  = Shear force in perforated shear wall, pounds (N).

$h$  = Shear wall height, feet (mm).

$C_o$  = Shear resistance adjustment factor from Table 2305.3.7.2.

$\Sigma L_i$  = Sum of widths of perforated shear wall segments, feet (mm).

**2305.3.7.2.5 Anchorage for in-plane shear.** *The unit shear force,  $v$ , transmitted into the top of a perforated shear wall, out of the base of the perforated shear wall at full-height sheathing and into collectors (drag struts) connecting shear wall segments, shall be calculated in accordance with the following:*

$$v = \frac{V}{C_o \Sigma L_i} \quad (\text{Equation 23-4})$$

where:

$v$  = Unit shear force, pounds per lineal feet (N/m).

$V$  = Shear force in perforated shear wall, pounds (N).

$C_o$  = Shear resistance adjustment factor from Table 2305.3.7.2.

$\Sigma L_i$  = Sum of widths of perforated shear wall segments, feet (mm).

**2305.3.7.2.6 Uplift anchorage between perforated shear wall ends.** *In addition to the requirements of Section 2305.3.7.2.4, perforated shear wall bottom plates at full-height sheathing shall be anchored for a uniform uplift force,  $t$ , equal to the unit shear force,  $v$ , determined in Section 2305.3.7.2.5.*

**TABLE 2305.3.7.2  
SHEAR RESISTANCE ADJUSTMENT FACTOR,  $C_o$**

WALL HEIGHT, H	MAXIMUM OPENING HEIGHT <sup>a</sup>				
	H/3	H/2	2H/3	5H/6	H
8' wall	2'-8"	4'-0"	5'-4"	6'-8"	8'-0"
10' wall	3'-4"	5'-0"	6'-8"	8'-4"	10'-0"
Percent full-height sheathing <sup>b</sup>	Shear resistance adjustment factor				
10%	1.00	0.69	0.53	0.43	0.36
20%	1.00	0.71	0.56	0.45	0.38
30%	1.00	0.74	0.59	0.49	0.42
40%	1.00	0.77	0.63	0.53	0.45
50%	1.00	0.80	0.67	0.57	0.50
60%	1.00	0.83	0.71	0.63	0.56
70%	1.00	0.87	0.77	0.69	0.63
80%	1.00	0.91	0.83	0.77	0.71
90%	1.00	0.95	0.91	0.87	0.83
100%	1.00	1.00	1.00	1.00	1.00

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. See Section 2305.3.7.2.2, Item 2.

b. See Section 2305.3.7.2.2, Item 1.

**2305.3.7.2.7 Compression chords.** Each end of each perforated shear wall segment shall be designed for a compression chord force,  $C$ , equal to the tension chord uplift force,  $T$ , calculated in Section 2305.3.7.2.4.

**2305.3.7.2.8 Load path.** A load path to the foundation shall be provided for each uplift force,  $T$  and  $t$ , for each shear force,  $V$  and  $v$ , and for each compression chord force,  $C$ . Elements resisting shear wall forces contributed by multiple stories shall be designed for the sum of forces contributed by each story.

**2305.3.7.2.9 Deflection of shear walls with openings.** The controlling deflection of a blocked shear wall with openings uniformly nailed throughout shall be taken as the maximum individual deflection of the shear wall segments calculated in accordance with Section 2305.3.2, divided by the appropriate shear resistance adjustment factors of Table 2305.3.7.2.

**2305.3.8 Summing shear capacities.** The shear values for shear panels of different capacities applied to the same side of the wall are not cumulative except as allowed in Table 2306.4.1.

The shear values for material of the same type and capacity applied to both faces of the same wall are cumulative. Where the material capacities are not equal, the allowable shear shall be either two times the smaller shear capacity or the capacity of the stronger side, whichever is greater.

Summing shear capacities of dissimilar materials applied to opposite faces or to the same wall line is not allowed.

**Exception:** For wind design, the allowable shear capacity of shear wall segments sheathed with a combination of wood structural panels and gypsum wallboard on opposite faces, fiberboard structural sheathing and gypsum wall board on opposite faces or hardboard panel siding and gypsum wallboard on opposite faces shall equal the sum of the sheathing capacities of each face separately.

**2305.3.9 Adhesives.** Adhesive attachment of shear wall sheathing is not permitted as a substitute for mechanical fasteners, and shall not be used in shear wall strength calculations alone, or in combination with mechanical fasteners in Seismic Design Category D.

**2305.3.10 Sill plate size and anchorage in Seismic Design Category D.** Two-inch (51 mm) nominal wood sill plates for shear walls shall include steel plate washers, a minimum of  $3/16$  inch by 2 inches

by 2 inches (4.76 mm by 51 mm by 51 mm) in size, between the sill plate and nut. Sill plates resisting a design load greater than 490 plf (LRFD) (7154 N/m) or 350 plf (ASD) (5110 N/m) shall not be less than a 3-inch (76 mm) nominal member. Where a single 3-inch (76 mm) nominal sill plate is used, 2-20d box end nails shall be substituted for 2-16d common end nails found in Line 8 of Table 2304.9.1.

**Exception:** In shear walls where the design load is less than 840 plf (LRFD) (12 264 N/m) or 600 plf (ASD) (8760 N/m), the sill plate is permitted to be a 2-inch (51mm) nominal member if the sill plate is anchored by two times the number of bolts required by design and <sup>3</sup>/<sub>16</sub> inch by 2 inch by 2 inch (4.76 mm by 51 mm by 51 mm) plate washers are used.

## **SECTION BC 2306**

### **ALLOWABLE STRESS DESIGN**

**2306.1 Allowable stress design.** The structural analysis and construction of wood elements in structures using allowable design methods shall be in accordance with the following applicable standards:

**American Forest & Paper Association.**

NDS National Design Specification for Wood Construction

**American Institute of Timber Construction.**

AITC 104	Typical Construction Details
AITC 110	Standard Appearance Grades for Structural Glued Laminated Timber
AITC 112	Standard for Tongue-and-Groove Heavy Timber Roof Decking

**2306.1.3 Treated wood stress adjustments.** *The allowable unit stresses for preservative-treated wood need no adjustment for treatment, but are subject to other adjustments. The allowable unit stresses for fire-retardant-treated wood, including fastener values, shall be developed from an approved method of investigation that considers the effects of anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.*

**2306.2 Wind provisions for walls.**

**2306.2.1 Wall stud bending stress increase.** *The NDS fiber stress in bending ( $F_b$ )<sub>design</sub> values for wood studs resisting wind shall be increased by the factors in Table 2306.2.1, in lieu of the 1.15 repetitive member factor, to take into consideration the load sharing and composite actions provided by the wood structural panels as defined in Section 2302.1, where the studs are designed for bending in accordance with Section 1609.6 spaced no more than 16 inches (406 mm) o.c., covered on the inside with a minimum of 1/2-inch (12.7 mm) gypsum board fastened in accordance with Table 2306.4.5, and sheathed on the exterior with a minimum of 3/8-inch (9.5 mm) wood structural panel sheathing that is attached to the studs using a minimum of 8d common nails spaced a maximum of 6 inches o.c. (152 mm) at panel edges and 12 inches o.c. (305 mm) in the field of the panels.*

**TABLE 2306.2.1  
WALL STUD BENDING STRESS INCREASE FACTORS**

<b>STUD SIZE</b>	<b>SYSTEM FACTOR</b>
2 × 4	1.5
2 × 6	1.4
2 × 8	1.3
2 × 10	1.2
2 × 12	1.15

**2306.3 Wood diaphragms.**

**2306.3.1 Shear capacities modifications.** *The allowable shear capacities in Table 2306.3.1 for horizontal wood structural panel diaphragms shall be increased 40 percent for wind design.*

TABLE 2306.3.1—continued  
**RECOMMENDED SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL  
 PANEL DIAPHRAGMS WITH FRAMING OF DOUGLAS-FIR-LARCH,  
 OR SOUTHERN PINE<sup>a</sup> FOR WIND OR SEISMIC LOADING**

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.

- a. For framing of other species: (1) Find specific gravity for species of lumber in AFPA National Design Specification. (2) For staples find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. (3) For nails find shear value from table above for nail size for actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor =  $[1 - (0.5 - SG)]$ , where SG = Specific Gravity of the framing lumber. This adjustment factor shall not be greater than 1.
- b. Space fasteners maximum 12 inches o.c. along intermediate framing members (6 inches o.c. where supports are spaced 48 inches o.c.).
- c. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where nails are spaced 2 inches o.c. or 2 1/2 inches o.c.
- d. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where both of the following conditions are met: (1) 10d nails having penetration into framing of more than 1 1/2 inches and (2) nails are spaced 3 inches o.c. or less.
- e. 8d is recommended minimum for roofs due to negative pressures of high winds.
- f. Staples shall have a minimum crown width of 7/16 inch.

**2306.3.2 Wood structural panel diaphragms.** *Structural panel diaphragms with wood structural panels are permitted to be used to resist horizontal forces not exceeding those set forth in Table 2306.3.1 or 2306.3.2 or calculated by principles of mechanics without limitations by using values for fastener strength in the NDS structural design properties for wood structural panels based on DOC PS-1 and DOC PS-2 or plywood design properties given in the APA Plywood Design Specification.*

**2306.3.3 Diagonally sheathed lumber diaphragms.** *Diagonally sheathed lumber diaphragms shall be nailed in accordance with Table 2306.3.3.*

**TABLE 2306.3.2  
ALLOWABLE SHEAR IN POUNDS PER FOOT FOR HORIZONTAL BLOCKED DIAPHRAGMS

			4	3	865	900	1,130	1,490	1,430	1,545	

For SI: 1 inch = 25.4 mm.

- For framing of the other species: (1) Find specific gravity for species of framing lumber in AFPA National Design Specification, (2) Find shear value from table above for nail size of actual grade, and (3) Multiply value by the following adjustment factor =  $[1 - 0.5 - SG]$ , where  $SG$  = Specific gravity of the framing lumber. This adjustment factor shall not be greater than 1.
- Fastening along intermediate framing members: Space nails 12 inches on center, except 6 inches on center for spans greater than 32 inches.
- Panels conforming to PS 1 or PS 2.
- This table gives shear values for Cases 1 and 2 as shown in Table 2306.3.1. The values shown are applicable to Cases 3, 4, 5 and 6 as shown in Table 2306.3.1, providing fasteners at all continuous panel edges are spaced in accordance with the boundary fastener spacing.
- The minimum depth of framing members shall be 3 inches.

**TABLE 2306.3.3  
DIAGONALLY SHEATHED LUMBER DIAPHRAGM NAILING SCHEDULE**

SHEATHING NOMINAL DIMENSION	NAILING TO INTERMEDIATE AND END-BEARING STUDS		NAILING AT THE SHEAR PANEL BOUNDARIES	
	Type, size and number of nails per board			
	Common nails	Box nails	Common nails	Box nails
1 x 6	2 - 8d	3 - 8d	3 - 8d	5 - 8d
1 x 8	3 - 8d	4 - 8d	4 - 8d	6 - 8d
2 x 6	2 - 16d	3 - 16d	3 - 16d	5 - 16d
2 x 8	3 - 16d	4 - 16d	4 - 16d	6 - 16d

**2306.3.4 Single diagonally sheathed lumber diaphragms.** Single diagonally sheathed lumber diaphragms shall be constructed of minimum 1-inch (25 mm) thick nominal sheathing boards laid at an angle of approximately 45 degrees (0.78 rad) to the supports. The shear capacity for single diagonally sheathed lumber diaphragms of southern pine or Douglas fir-larch shall not exceed 300 plf (4378 N/m) of width. The shear capacities shall be adjusted by reduction factors of 0.82 for framing members of species with a specific gravity equal to or greater than 0.42 but less than 0.49 and 0.65 for species with a specific gravity of less than 0.42, as contained in the NDS.

**2306.3.4.1 End joints.** End joints in adjacent boards shall be separated by at least one stud or joist space and there shall be at least two boards between joints on the same support.

**2306.3.4.2 Single diagonally sheathed lumber diaphragms.** Single diagonally sheathed lumber diaphragms made up of 2-inch (51 mm) nominal diagonal lumber sheathing fastened with 16d nails shall be designed with the same shear capacities as shear panels using 1-inch (25 mm) boards fastened with 8d nails, provided there are not splices in adjacent boards on the same support and the supports are not less than 4 inch (102 mm) nominal depth or 3 inch (76 mm) nominal thickness.

**2306.3.5 Double diagonally sheathed lumber diaphragms.** Double diagonally sheathed lumber diaphragms shall be constructed of two layers of diagonal sheathing boards at 90 degrees (1.57 rad) to each other on the same face of the supporting members. Each chord shall be considered as a beam with uniform load per foot equal to 50 percent of the unit shear due to diaphragm action. The load shall be assumed as acting normal to the chord in the plan of the diaphragm in either direction. The span of the chord or portion thereof shall be the distance between framing members of the diaphragm, such as the joists, studs and blocking that serve to transfer the assumed load to the sheathing. The shear capacity of double diagonally sheathed diaphragms of Southern pine or Douglas fir-larch shall not exceed 600 plf (8756 kN/m) of width. The shear capacity shall be adjusted by reduction factors of 0.82 for framing members of species with a specific gravity equal to or greater than 0.42 but less than 0.49 and 0.65 for species with a specific gravity of less than 0.42, as contained in the NDS. Nailing of diagonally sheathed lumber diaphragms shall be in accordance with Table 2306.3.3.

**2306.3.6 Gypsum board diaphragm ceilings.** Gypsum board diaphragm ceilings shall be in accordance with Section 2508.5.

**2306.4 Shear walls.** Panel sheathing joints in shear walls shall occur over studs or blocking. Adjacent panel sheathing joints shall occur over and be nailed to common framing members (see Section 2305.3.1

*for limitations on shear wall bracing materials).*

**2306.4.1 Wood structural panel shear walls.** *The allowable shear capacities for wood structural panel shear walls shall be in accordance with Table 2306.4.1. These capacities are permitted to be increased 40 percent for wind design. Shear walls are permitted to be calculated by principles of mechanics without limitations by using values for nail strength given in the NDS and wood structural panel design properties given in the APA/PDS.*

TABLE 2306.4.1

	1 3/8	8d	160	240	310	410	10d	160	240	310 <sup>f</sup>	410			

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5938 N/m.  
a. For framing of other species: (1) Find specific gravity for species of lumber in AF&PA National Design Specification. (2) For species find shear value from table above for Structural I panels (regardless of actual grade) and multiply value by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species. (3) For nail find shear value from table above for nail size for actual grade and multiply value by the following adjustment factor: Specific Gravity Adjustment Factor = [1 - (0.5 - SG)]. where SG = Specific Gravity of the framing lumber. This adjustment factor shall not be greater than 1.  
b. Panel edges backed with 2-inch nominal or wider framing. Install panel either horizontally or vertically. Space fasteners maximum 6 inches on center along intermediate framing members for 7/8-inch and 1 1/8-inch panels in a table on studs spaced 24 inches on center. For other conditions and panel thickness, space fasteners maximum 12 inches on center on intermediate supports.  
c. 3/4-inch panel thickness or siding with a gaurating of 1/6 inches on center is the minimum recommended where applied direct to framing as exterior siding.  
d. Shears are permitted to be increased to values shown for 1 1/8-inch sheathing with same nailing provided: (a) studs are spaced a maximum of 16 inches on center, or (b) if panels are applied with long dimension across studs.  
e. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where nails are spaced 2 inches on center.  
f. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where both of the following conditions are met: (1) 10d nails having penetration into framing of more than 1 1/2 inches and (2) nails are spaced 3 inches on center.  
g. Values apply to all-veneer plywood. Thickness at point of fastener on panel edges governs shear values.  
h. Where panels are applied on both faces of a wall and nail spacing is less than 6 inches, c. on either side, panel joints shall be offset to fall on different framing members. Or framing shall be 3 inches nominal or thicker and nails on each side shall be staggered.  
i. In Seismic Design Category D, E or F, where shear design values exceed 400 pounds per linear foot (LRF) or 30 pounds per linear foot (ASD) all framing members receiving edge nailing from abutting panels shall not be less than a single 3-inch nominal member. Plywood joint and all plate nailing shall be staggered in all cases. See Sect on 2305.3.10 for 8d, 10d plate side and anchorage requirements.  
j. Galvanized nails shall be hot dip coated or tumbled.  
k. Staples shall have a minimum crown width of 7/16 inch.

**2306.4.2 Lumber sheathed shear walls.** *Single and double diagonally sheathed lumber diaphragms are permitted using the construction and allowable load provisions of Sections 2306.3.4 and 2306.3.5.*

**2306.4.3 Particleboard shear walls.** *The design shear capacity of particleboard shear walls shall be in accordance with Table 2306.4.3. Shear panels shall be constructed with particleboard sheets not less than 4 feet by 8 feet (1219 mm by 2438 mm), except at boundaries and changes in framing. Particleboard panels shall be designed to resist shear only, and chords, collector members and boundary elements shall be connected at all corners. Panel edges shall be backed with 2-inch (51 mm) nominal or wider framing. Sheets are permitted to be installed either horizontally or vertically. For  $\frac{3}{8}$ -inch (9.5 mm) particleboard sheets installed with the long dimension parallel to the studs spaced 24 inches (610 mm) o.c, nails shall be spaced at 6 inches (152 mm) o.c. along intermediate framing members. For all other conditions, nails of the same size shall be spaced at 12 inches (305 mm) o.c. along intermediate framing members. Particleboard panels less than 12 inches (305 mm) wide shall be blocked. Particleboard shall not be used to resist seismic forces in structures in Seismic Design Category D.*

**TABLE 2306.4.3

	$\frac{1}{2}$			140	210	270	350
	$\frac{1}{2}$	$1\frac{5}{8}$	10d	185	275	360	460
	$\frac{5}{8}$			200	305	395	520

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.  
a. Values are not permitted in Seismic Design Category D, E or F.

**2306.4.4 Fiberboard shear walls.** *The design shear capacity of fiberboard shear walls shall be in accordance with Table 2308.9.3(4). The fiberboard sheathing shall be applied vertically or horizontally to wood studs not less than 2 inch (51 mm) nominal thickness spaced 16 inches (406 mm) o.c. Blocking not less than 2 inch (51 mm) nominal in thickness shall be provided at horizontal joints. Fiberboard shall not be used to resist seismic forces in structures in Seismic Design Category D.*

**2306.4.5 Shear walls sheathed with other materials.** *Shear capacities for walls sheathed with lath and plaster, and gypsum board shall be in accordance with Table 2306.4.5. Shear walls sheathed with lath, plaster and gypsum board shall be constructed in accordance with Chapter 25 and Section 2306.4.5.1. Walls resisting seismic loads shall be subject to the limitations in Section 1617.6.*

**2306.4.5.1 Application of gypsum board or lath and plaster to wood framing.**

**2306.4.5.1.1 Joint staggering.** *End joints of adjacent courses of gypsum board shall not occur over the same stud.*

**2306.4.5.1.2 Blocking.** *Where required in Table 2306.4.5, wood blocking having the same cross-sectional dimensions as the studs shall be provided at joints that are perpendicular to the studs.*

**2306.4.5.1.3 Nailing.** *Studs, top and bottom plates and blocking shall be nailed in accordance with Table 2304.9.1.*

**2306.4.5.1.4 Fasteners.** *The size and spacing of nails shall be set forth in Table 2306.4.5. Nails shall be spaced not less than  $\frac{3}{8}$  inch (9.5 mm) from edges and ends of gypsum boards or sides of studs, blocking and top and bottom plates.*

**2306.4.5.1.5 Gypsum lath.** *Gypsum lath shall be applied perpendicular to the studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.*

**2306.4.5.1.6 Gypsum sheathing.** *Four-foot-wide (1219 mm) pieces of gypsum sheathing shall be applied parallel or perpendicular to studs. Two-foot-wide (610 mm) pieces of gypsum sheathing shall be applied perpendicular to the studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.*

**2306.4.5.1.7 Other gypsum boards.** *Gypsum board shall be applied parallel or perpendicular*

*to studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.*

**TABLE 2306.4.5  
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per foot = 14.5939 N/m.

- These shear walls shall not be used to resist loads imposed by masonry or concrete construction (see Section 2305.1.5). Values shown are for short-term loading due to wind or seismic loading in Seismic Design Categories A, B and C. Walls resisting seismic loads shall be subject to the limitations in Section 1617.6. Values shown shall be reduced 25 percent for normal loading.
- Applies to nailing at studs, top and bottom plates and blocking.
- Alternate nails are permitted to be used if their dimensions are not less than the specified dimensions. Drywall screws are permitted to be substituted for the 5d, 6d (cooler) nails listed above.  $1\frac{1}{4}$  inches Type S or W, No. 6 for 6d (cooler) nails.
- For properties of cooler nails, see ASTM C 514.
- Except as noted, shear values are based on a maximum framing spacing of 16 inches on center.
- Maximum framing spacing of 24 inches on center.
- All edges are blocked, and edge nailing is provided at all supports and all panel edges.
- First number denotes fastener spacing at the edges; second number denotes fastener spacing in the field.
- Screws are Type W or S.
- Staples shall have a minimum crown width of  $\frac{7}{16}$  inch, measured outside the legs.
- Staples for the attachment of gypsum lath and woven-wire lath shall have a minimum crown width of  $\frac{3}{4}$  inch, measured outside the legs.

**SECTION BC 2307**  
**LOAD AND RESISTANCE FACTOR DESIGN**

**2307.1 Load and resistance factor design (LRFD).** *The structural analysis and construction of wood elements and structures using load and resistance factor design (LRFD) methods shall be in accordance with ASCE 16.*

**SECTION BC 2308**  
**CONVENTIONAL LIGHT-FRAME CONSTRUCTION**

**2308.1 General.** *The requirements of this section are intended for conventional light-frame construction. Other methods are permitted to be used provided a satisfactory design is submitted showing compliance with other provisions of this code. Interior non-load-bearing partitions, ceilings and curtain walls of conventional light-frame construction are not subject to the limitations of this section. Alternatively, compliance with the following standard shall be permitted subject to the limitations therein and the limitations of this code: American Forest and Paper Association (AF&PA) Wood Frame Construction Manual for One- and Two-Family Dwellings (WCFM).*

**2308.2 Limitations.** *Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.*

1. *Buildings shall be limited to a maximum of three stories above grade. For the purposes of this section, for buildings in Seismic Design Category D as determined in Section 1616, cripple stud walls shall be considered to be a story.*

**Exception:** *Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.*

2. *Bearing wall floor-to-floor heights shall not exceed 10 feet (3048 mm).*
3. *Loads as determined in Chapter 16 shall not exceed the following:*
  - 3.1. *Average dead loads shall not exceed 15 psf (718 N/m<sup>2</sup>) for roofs and exterior walls, floors and partitions.*

- 3.2. *Live loads shall not exceed 40 psf (1916 N/m<sup>2</sup>) for floors.*
- 3.3. *Ground snow loads shall not exceed 50 psf (2395 N/m<sup>2</sup>).*
4. *Wind speeds shall not exceed 110 miles per hour (mph) (48.4 m/s) (3-second gust) for buildings in Exposure Category A or B.*
5. *Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.*
6. *The use of the provisions for conventional light-frame construction in this section shall not be permitted for buildings in Seismic Design Category B, C, or D for Seismic Use Group III, as determined in Section 1616.*
- ~~7. *Conventional light-frame construction is limited in irregular structures in Seismic Design Category D, as specified in Section 2308.12.6.*~~

**2308.2.1 Basic wind speed greater than 100 mph (3-second gust).** *Where the basic wind speed exceeds 100 mph (3-second gust), the provisions of either the AF&PA Wood Frame Construction Manual for One- and Two-Family Dwellings (WFCM), or the SBCCI Standard for Hurricane-Resistant Residential Construction (SSTD 10), are permitted to be used.*

**2308.2.2 Buildings in Seismic Design Category B, C, or D.** *Buildings of conventional light-frame construction in Seismic Design Category B or C, as determined in Section 1616, shall comply with the additional requirements in Section 2308.11.*

**Exceptions:**

1. *Detached one- and two-family dwellings in Seismic Design Category B.*
- ~~2. *Detached one- and two-family dwellings in Seismic Design Category C where masonry veneer is limited to the first two stories above grade.*~~

*Buildings of conventional light-frame construction in Seismic Design Category D, as determined in Section 1616, shall comply with the additional requirements in Section 2308.12.*

**2308.3 Braced wall lines.** Buildings shall be provided with exterior and interior braced wall lines as described in Section 2308.9.3 and installed in accordance with Sections 2308.3.1 through 2308.3.4.

**2308.3.1 Spacing.** Spacing of braced wall lines shall not exceed 35 feet (10 668 mm) o.c. in both the longitudinal and transverse directions in each story.

**2308.3.2 Braced wall panel connections.** Forces shall be transferred from the roofs and floors to braced wall panels and from the braced wall panels in upper stories to the braced wall panels in the story below by the following:

1. Braced wall panel top and bottom plates shall be fastened to joists, rafters or full-depth blocking. Braced wall panels shall be extended and fastened to roof framing at intervals not to exceed 50 feet (15 240 mm) between parallel braced wall lines.

**Exception:** Where roof trusses are used, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other approved methods.

2. Bottom plate fastening to joist or blocking below shall be with not less than 3-16d nails at 16 inches (406 mm) o.c.
3. Blocking shall be nailed to the top plate below with not less than 3-8d toenails per block.
4. Joists parallel to the top plates shall be nailed to the top plate with not less than 8d toenails at 6 inches (152 mm) o.c.

In addition, top plate laps shall be nailed with not less than 8-16d face nails on each side of each break in the top plate.

**2308.3.3 Sill anchorage.** Where foundations are required by Section 2308.3.4, braced wall line sills shall be anchored to concrete or masonry foundations. Such anchorage shall conform to the requirements of Section 2308.6 except that such anchors shall be spaced at not more than 4 feet (1219 mm) o.c. for structures over two stories in height. The anchors shall be distributed along the length of the braced wall line. Other anchorage devices having equivalent capacity are permitted.

**2308.3.3.1 Anchorage to all-wood foundations.** Where all-wood foundations are used, the force

*transfer from the braced wall lines shall be determined based on calculation and shall have a capacity greater than or equal to the connections required by Section 2308.3.3.*

**2308.3.4 Braced wall line support.** *Braced wall lines shall be supported by continuous foundations.*

**Exception:** *For structures with maximum plan dimensions not over 50 feet (15 240 mm), continuous foundations are required at exterior walls only.*

**2308.4 Design of portions.** *Where a building of otherwise conventional construction contains non-conventional structural elements, those elements shall be designed to resist the forces specified in Chapter 16. The extent of such design need only demonstrate compliance of non-conventional elements with other applicable provisions of this code, and shall be compatible with the performance of the conventional framed system.*

**2308.5 Connections and fasteners.** *Connections and fasteners used in conventional light-frame construction shall comply with the requirements of Section 2304.9.*

**2308.6 Foundation plates or sills.** *Foundations and footings shall be as specified in Chapter 18. Foundation plates or sills resting on concrete or masonry foundations shall comply with Section 2304.3.1. Foundation plates or sills shall be bolted or anchored to the foundation with not less than ½-inch-diameter (12.7 mm) steel bolts or approved anchors. Bolts shall be embedded at least 7 inches (178 mm) into concrete or masonry, and spaced not more than 6 feet (1829 mm) apart. There shall be a minimum of two bolts or anchor straps per piece with one bolt or anchor strap located not more than 12 inches (305 mm) or less than 4 inches (102 mm) from each end of each piece. A properly sized nut and washer shall be tightened on each bolt to the plate.*

**2308.7 Girders.** *Girders for single-story construction or girders supporting loads from a single floor shall not be less than 4 inches by 6 inches (102 mm by 152 mm) for spans 6 feet (1829 mm) or less, provided that girders are spaced not more than 8 feet (2438 mm) o.c. Spans for built-up 2-inch (51 mm) girders shall be in accordance with Table 2308.9.5 or 2308.9.6. Other girders shall be designed to support the loads specified in this code. Girder end joints shall occur over supports.*

*Where a girder is spliced over a support, an adequate tie shall be provided. The ends of beams or girders supported on masonry or concrete shall not have less than 4 inches (102 mm) of bearing.*

**2308.8 Floor joists.** *Spans for floor joists shall be in accordance with Table 2308.8(1) or 2308.8(2). For*

*other grades and or species, refer to the AF&PA Span Tables for Joists and Rafters.*

Spruce-Pine-Fir	6-2	7-9	9-6	11-0	5-7	7-1	8-8	10-1	

Check sources for availability of lumber in lengths greater than 20 feet.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.8 N/m<sup>2</sup>.

a. End bearing length shall be increased to 2 inches.

**2308.8.1 Bearing.** Except where supported on a 1-inch by 4-inch (25.4 mm by 102 mm) ribbon strip and nailed to the adjoining stud, the ends of each joist shall not have less than 1½ inches (38 mm) of bearing on wood or metal, or less than 4 inches (102 mm) on masonry.

**2308.8.2 Framing details.** Joists shall be supported laterally at the ends and at each support by solid blocking except where the ends of the joists are nailed to a header, band or rim joist or to an adjoining stud or by other means. Solid blocking shall not be less than 2 inches (51 mm) in thickness and the full depth of the joist. Notches on the ends of joists shall not exceed one-fourth the joist depth. Holes bored in joists shall not be within 2 inches (51 mm) of the top or bottom of the joist, and the diameter of any such hole shall not exceed one-third the depth of the joist. Notches in the top or bottom of joists shall not exceed one-sixth the depth and shall not be located in the middle third of the span.

Joist framing from opposite sides of a beam, girder or partition shall be lapped at least 3 inches (76 mm) or the opposing joists shall be tied together in an approved manner.

Joists framing into the side of a wood girder shall be supported by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

**2308.8.2.1 Engineered wood products.** Cuts, notches and holes bored in trusses, laminated veneer lumber, glue-laminated members or I-joists are not permitted unless the effects of such penetrations are specifically considered in the design of the member.

**2308.8.3 Framing around openings.** Trimmer and header joists shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 3 feet (914 mm). The ends of header joists more than 6 feet (1829 mm) long shall be supported by framing anchors or joist hangers unless bearing on a beam, partition or wall. Tail joists over 12 feet (3658 mm) long shall be supported at the header by framing anchors or on ledger strips not less than 2 inches by 2 inches (51 mm by 51 mm).

**2308.8.4 Supporting bearing partitions.** Bearing partitions parallel to joists shall be supported on beams, girders, doubled joists, walls or other bearing partitions. Bearing partitions perpendicular to joists shall not be offset from supporting girders, walls or partitions more than the joist depth unless such joists are of sufficient size to carry the additional load.

**2308.8.5 Lateral support.** Floor, attic and roof framing with a nominal depth-to-thickness ratio greater than or equal to 5:1 shall have one edge held in line for the entire span. Where the nominal depth-to-thickness ratio of the framing member exceeds 6:1, there shall be one line of bridging for

*each 8 feet (2438 mm) of span, unless both edges of the member are held in line. The bridging shall consist of not less than 1-inch by 3-inch (25 mm by 76 mm) lumber, double nailed at each end, of equivalent metal bracing of equal rigidity, full-depth solid blocking or other approved means. A line of bridging shall also be required at supports where equivalent lateral support is not otherwise provided.*

**2308.8.6 Structural floor sheathing.** *Structural floor sheathing shall comply with the provisions of Section 2304.7.1.*

**2308.8.7 Under-floor ventilation.** *For under-floor ventilation, see Section 1203.3.*

**2308.9 Wall framing.**

**2308.9.1 Size, height and spacing.** *The size, height and spacing of studs shall be in accordance with Table 2308.9.1 except that utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior non-load-bearing walls.*

**TABLE 2308.9.1  
SIZE, HEIGHT AND SPACING OF WOOD STUDS**

STUD SIZE (inches)	BEARING WALLS				NONBEARING WALLS	
	Laterally unsupported stud height <sup>a</sup> (feet)	Supporting roof and ceiling only	Supporting one floor, roof and ceiling	Supporting two floors, roof and ceiling	Laterally unsupported stud height <sup>a</sup> (feet)	Spacing (inches)
2 × 3 <sup>b</sup>	—	—	—	—	10	16
2 × 4	10	24	16	—	14	24
3 × 4	10	24	24	16	14	24
2 × 5	10	24	24	—	16	24
2 × 6	10	24	24	16	20	24

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. Listed heights are distances between points of lateral support placed perpendicular to the plane of the wall. Increases in unsupported height are permitted where justified by an analysis.
- b. Shall not be used in exterior walls.

**2308.9.2 Framing details.** Studs shall be placed with their wide dimension perpendicular to the wall. Not less than three studs shall be installed at each corner of an exterior wall.

**Exception:** At corners, two studs are permitted, provided wood spacers or backup cleats of  $\frac{3}{8}$ -inch-thick (9.5 mm) wood structural panel,  $\frac{3}{8}$ -inch (9.5 mm) Type M “Exterior Glue” particleboard, 1-inch-thick (25 mm) lumber or other approved devices that will serve as an adequate backing for the attachment of facing materials are used. Where fire-resistance ratings or shear values are involved, wood spacers, backup cleats or other devices shall not be used unless specifically approved for such use.

**2308.9.2.1 Top plates.** Bearing and exterior wall studs shall be capped with double top plates installed to provide overlapping at corners and at intersections with other partitions. End joints in double top plates shall be offset at least 48 inches (1219 mm), and shall be nailed with not less than eight 16d face nails on each side of the joint. Plates shall be a nominal 2 inches (51 mm) in depth and have a width at least equal to the width of the studs.

**Exception:** A single top plate is permitted, provided the plate is adequately tied at joints, corners and intersecting walls by at least the equivalent of 3-inch by 6-inch (76 mm by 152 mm) by 0.036-inch-thick (0.914 mm) galvanized steel that is nailed to each wall or segment of wall by six 8d nails or equivalent, provided the rafters, joists or trusses are centered over the studs with a tolerance of no more than 1 inch (25 mm).

**2308.9.2.2 Top plates for studs spaced at 24 inches (610 mm).** Where bearing studs are spaced at 24-inch (610 mm) intervals and top plates are less than two 2-inch by 6-inch (51 mm by 152 mm) or two 3-inch by 4-inch (76 mm by 102 mm) members and where the floor joists, floor trusses or roof trusses that they support are spaced at more than 16-inch (406 mm) intervals, such joists or trusses shall bear within 5 inches (127 mm) of the studs beneath or a third plate shall be installed.

**2308.9.2.3 Nonbearing walls and partitions.** In non-bearing walls and partitions, studs shall be spaced not more than 28 inches (711 mm) o.c. and are permitted to be set with the long dimension parallel to the wall. Interior nonbearing partitions shall be capped with no less than a single top plate installed to provide overlapping at corners and at intersections with other walls and partitions. The plate shall be continuously tied at joints by solid blocking at least 16 inches (406 mm) in length and equal in size to the plate or by  $\frac{1}{2}$ -inch by  $1\frac{1}{2}$ -inch (12.7 mm by 38 mm) metal ties with spliced sections fastened with two 16d nails on each side of the joint.

**2308.9.2.4 Plates or sills.** Studs shall have full bearing on a plate or sill not less than 2 inches (51 mm) in thickness having a width not less than that of the wall studs.

**2308.9.3 Bracing.** Braced wall lines shall consist of braced wall panels that meet the requirements for location, type and amount of bracing as shown in Figure 2308.9.3, specified in Table 2308.9.3(1), and are in line or offset from each other by not more than 4 feet (1219 mm). Braced wall panels shall start not more than 8 feet (2438 mm) from each end of a braced wall line. A designed collector shall be provided if the bracing begins more than 12.5 feet (3810 mm) from an end of a braced wall line. Braced wall panels shall be clearly indicated on the plans. Construction of braced wall panels shall be by one of the following methods:

1. Nominal 1-inch by 4-inch (25 mm by 102 mm) continuous diagonal braces let into top and bottom plates and intervening studs, placed at an angle not more than 60 degrees (1.0 rad) or less than 45 degrees (0.79 rad) from the horizontal and attached to the framing in conformance with Table 2304.9.1.
2. Wood boards of  $\frac{5}{8}$ -inch (15.9 mm) net minimum thickness applied diagonally on studs spaced not over 24 inches (610 mm) o.c.
3. Wood structural panel sheathing with a thickness not less than  $\frac{5}{16}$  inch (7.9 mm) for a 16-inch (406 mm) stud spacing and not less than  $\frac{3}{8}$  inch (9.5 mm) for a 24-inch (610 mm) stud spacing in accordance with Tables 2308.9.3(2) and 2308.9.3(3).
4. Fiberboard sheathing panels not less than  $\frac{1}{2}$  inch (12.7 mm) thick applied vertically or horizontally on studs spaced not over 16 inches (406 mm) o.c. where installed with fasteners in accordance with Section 2306.4.4 and Table 2308.9.3(4).
5. Gypsum board [sheathing  $\frac{1}{2}$  inch (12.7 mm) thick by 4 feet (1219 mm) wide wallboard or veneer base] on studs spaced not over 24 inches (610 mm) o.c. and nailed at 7 inches (178 mm) o.c. with nails as required by Table 2306.4.5.
6. Particleboard wall sheathing panels where installed in accordance with Table 2308.9.3(5).
7. Portland cement plaster on studs spaced 16 inches (406 mm) o.c. installed in accordance with Section 2510.

8. *Hardboard panel siding where installed in accordance with Section 2303.1.6 and Table 2308.9.3(6).*

*For cripple wall bracing, see Section 2308.9.4.1. For Methods 2, 3, 4, 6, 7 and 8, each panel must be at least 48 inches (1219 mm) in length, covering three stud spaces where studs are spaced 16 inches (406 mm) apart and covering two stud spaces where studs are spaced 24 inches (610 mm) apart.*

*For Method 5, each panel must be at least 96 inches (2438 mm) in length where applied to one face of a panel and 48 inches (1219 mm) where applied to both faces.*

*All vertical joints of panel sheathing shall occur over studs and adjacent panel joints shall be nailed to common framing members. Horizontal joints shall occur over blocking or other framing equal in size to the studding except where waived by the installation requirements for the specific sheathing materials.*

*Sole plates shall be nailed to the floor framing and top plates shall be connected to the framing above in accordance with Section 2308.3.2. Where joists are perpendicular to braced wall lines above, blocking shall be provided under and in line with the braced wall panels.*

**2308.9.3.1 Alternative bracing.** *Any bracing required by Section 2308.9.3 is permitted to be replaced by the following:*

1. *In one-story buildings, each panel shall have a length of not less than 2 feet 8 inches (813 mm) and a height of not more than 10 feet (3048 mm). Each panel shall be sheathed on one face with 3/8-inch-minimum-thickness (9.5 mm) wood structural panel sheathing nailed with 8d common or galvanized box nails in accordance with Table 2304.9.1 and blocked at wood structural panel edges. Two anchor bolts installed in accordance with Section 2308.6 shall be provided in each panel. Anchor bolts shall be placed at each panel outside quarter points. Each panel end stud shall have a tie-down device fastened to the foundation, capable of providing an approved uplift capacity of not less than 1,800 pounds (8006 N). The tie-down device shall be installed in accordance with the manufacturer's recommendations. The panels shall be supported directly on a foundation or on floor framing supported directly on a foundation that is continuous across the entire length of the braced wall line. This foundation shall be reinforced with not less than one No. 4 bar top and bottom.*

*Where the continuous foundation is required to have a depth greater than 12 inches (305 mm), a minimum 12-inch by 12-inch (305 mm by 305 mm) continuous footing or turned down slab edge is permitted at door openings in the braced wall line. This continuous footing or turned down slab edge shall be reinforced with not less than one No. 4 bar top and bottom. This reinforcement shall be lapped 15 inches (381 mm) with the reinforcement required in the continuous foundation located directly under the braced wall line.*

- 2. In the first story of two-story buildings, each wall panel shall be braced in accordance with Section 2308.9.3.1, Item 1, except that the wood structural panel sheathing shall be provided on both faces, three anchor bolts shall be placed at one-quarter points, and tie-down device uplift capacity shall not be less than 3,000 pounds (13 344 N).*

<b>C</b>	<i>One story, top of two or three story</i>	-	X	X	X	X	X	X	X	<i>Each end and not more than 25 feet on center</i>
	<i>First story of two story or second story of three story</i>	-	X	X	X	X <sup>e</sup>	X	X	X	<i>Each end and not more than 25 feet on center but total length shall not be less than 25% of building length<sup>f</sup></i>
	<i>First story of three story</i>	-	X	X	X	X <sup>e</sup>	X	X	X	<i>Each end and not more than 25 feet on center but total length shall not be less than 40% of building length<sup>f</sup></i>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. This table specifies minimum requirements for braced panels that form interior or exterior braced wall lines.

b. See Section 2308.9.3 for full description.

c. See Section 2308.9.3.1 for alternative braced panel requirement.

d. Building length is the dimension parallel to the braced wall length.

e. Gypsum wallboard applied to framing supports that are spaced at 16 inches on center.

f. The required lengths shall be doubled for gypsum board applied to only one face of a braced wall panel.

**TABLE 2308.9.3(2)  
EXPOSED PLYWOOD PANEL SIDING**

MINIMUM THICKNESS <sup>a</sup> (inch)	MINIMUM NUMBER OF PLIES	STUD SPACING (inches) Plywood siding applied directly to studs or over sheathing
$\frac{3}{8}$	3	16 <sup>b</sup>
$\frac{1}{2}$	4	24

For SI: 1 inch = 25.4 mm.

a. Thickness of grooved panels is measured at bottom of grooves.

b. Spans are permitted to be 24 inches if plywood siding applied with face grain perpendicular to studs or over one of the following: (1) 1-inch board sheathing, (2)  $\frac{7}{16}$ -inch wood structural panel sheathing or (3)  $\frac{3}{8}$ -inch wood structural panel sheathing with strength axis (which is the long direction of the panel unless otherwise marked) of sheathing perpendicular to studs.

		Siding nailed to studs	Nailable sheathing	
			Sheathing parallel to studs	Sheathing perpendicular to studs
$\frac{5}{16}$	12/0, 16/0, 20/0 Wall-16" o.c.	16	—	16
$\frac{3}{8}, \frac{15}{32}, \frac{1}{2}$	16/0, 20/0, 24/0, 32/16 Wall-24" o.c.	24	16	24
$\frac{7}{16}, \frac{15}{32}, \frac{1}{2}$	24/0, 24/16, 32/16 Wall-24" o.c.	24	24 <sup>a</sup>	24

For SI: 1 inch = 25.4 mm.

a. Plywood shall consist of four or more plies.

b. Blocking of horizontal joints shall not be required except as specified in Sections 2306.4 and 2308.12.4.

**TABLE 2308.9.3(4)**  
**ALLOWABLE SHEAR VALUES (plf) FOR WIND OR SEISMIC LOADING ON**  
**VERTICAL DIAPHRAGMS OF FIBERBOARD SHEATHING BOARD CONSTRUCTION**  
**FOR TYPE V CONSTRUCTION ONLY<sup>a, b, c, d, e, f, g, h</sup>**

THICKNESS AND GRADE	FASTENER SIZE	SHEAR VALUE (pounds per linear foot) 3-INCH NAIL SPACING AROUND PERIMETER AND 6-INCH AT INTERMEDIATE POINTS
$1/2$ " Structural	No. 11 gage galvanized roofing nail $1\frac{1}{2}$ " long, $7/16$ " head	125 <sup>g</sup>
$25/32$ " Structural	No. 11 gage galvanized roofing nail $1\frac{3}{4}$ " long, $7/16$ " head	175 <sup>g</sup>

For SI: 1 inch = 25.4 mm, 1 pound per foot = 14.5939 N/m.

- a. Fiberboard sheathing diaphragms shall not be used to brace concrete or masonry walls.
- b. Panel edges shall be backed with 2 inch or wider framing of Douglas fir-larch or Southern pine.
- c. Fiberboard sheathing on one side only.
- d. Fiberboard panels are installed with their long dimension parallel or perpendicular to studs.
- e. Fasteners shall be spaced 6 inches on center along intermediate framing members.
- f. For framing of other species: (1) Find specific gravity for species of lumber in AF&PA National Design Specification, and (2) Multiply the shear value from the above table by 0.82 for species with specific gravity of 0.42 or greater, or 0.65 for all other species.
- g. The same values can be applied when staples are used as described in Table 2304.9.1.

*h. Values are not permitted in Seismic Design Category D, E or F.*

**TABLE 2308.9.3(5)**  
**ALLOWABLE SPANS FOR PARTICLEBOARD WALL SHEATHING**  
 (Not Exposed to the Weather, Long Dimension of the Panel Parallel or Perpendicular to Stud)

GRADE	THICKNESS (inch)	STUD SPACING (inches)	
		Siding nailed to studs	Sheathing under coverings specified in Section 2308.9.3 parallel or perpendicular to studs
M-S "Exterior Glue" and M-2 "Exterior Glue"	$\frac{3}{8}$	16	—
	$\frac{1}{2}$	16	16

For SI: 1 inch = 25.4 mm.

**TABLE 2308.9.3(6)  
HARDBOARD SIDING**

SIDING	MINIMUM NOMINAL THICKNESS (inch)	2 × 4 FRAMING MAXIMUM SPACING	NAIL SIZE <sup>a,b,d</sup>	NAIL SPACING	
				General	Bracing panels <sup>e</sup>
<b>1. Lap siding</b>					
Direct to studs	$\frac{3}{8}$	16" o.c.	8d	16" o.c.	Not applicable
Over sheathing	$\frac{3}{8}$	16" o.c.	10d	16" o.c.	Not applicable
<b>2. Square edge panel siding</b>					
Direct to studs	$\frac{3}{8}$	24" o.c.	6d	6" o.c. edges; 12" o.c. at intermediate supports	4" o.c. edges; 8" o.c. at intermediate supports
Over sheathing	$\frac{3}{8}$	24" o.c.	8d	6" o.c. edges; 12" o.c. at intermediate supports	4" o.c. edges; 8" o.c. at intermediate supports
<b>3. Shiplap edge panel siding</b>					
Direct to studs	$\frac{3}{8}$	16" o.c.	6d	6" o.c. edges; 12" o.c. at intermediate supports	4" o.c. edges; 8" o.c. at intermediate supports
Over sheathing	$\frac{3}{8}$	16" o.c.	8d	6" o.c. edges; 12" o.c. At intermediate supports	4" o.c. edges; 8" o.c. at intermediate supports

For SI: 1 inch = 25.4 mm.

a. Nails shall be corrosion resistant.

b. Minimum acceptable nail dimensions:

	Panel Siding (inch)	Lap Siding (inch)
Shank diameter	0.092	0.099
Head diameter	0.225	0.240

c. Where used to comply with Section 2308.9.3.

d. Nail length must accommodate the sheathing and penetrate framing 1½ inches.

**2308.9.4 Cripple walls.** *Foundation cripple walls shall be framed of studs not less in size than the studding above with a minimum length of 14 inches (356 mm), or shall be framed of solid blocking. Where exceeding 4 feet (1219 mm) in height, such walls shall be framed of studs having the size required for an additional story.*

**2308.9.4.1 Bracing.** *For the purposes of this section, cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a story and shall be braced in accordance with Table 2308.9.3(1) for Seismic Design Category B or C. See Section 2308.12.4 for Seismic Design Category D.*

**2308.9.4.2 Nailing of bracing.** *Spacing of edge nailing for required wall bracing shall not exceed 6 inches (152 mm) o.c. along the foundation plate and the top plate of the cripple wall. Nail size, nail spacing for field nailing and more restrictive boundary nailing requirements shall be as required elsewhere in the code for the specific bracing material used.*

**2308.9.5 Openings in exterior walls.**

**2308.9.5.1 Headers.** *Headers shall be provided over each opening in exterior-bearing walls. The spans in Table 2308.9.5 are permitted to be used for one- and two-family dwellings. Headers for other buildings shall be designed in accordance with Section 2301.2.1 or 2301.2.2. Headers shall be of two pieces of nominal 2-inch (51 mm) framing lumber set on edge as permitted by Table 2308.9.5 and nailed together in accordance with Table 2304.9.1 or of solid lumber of equivalent size.*

**2308.9.5.2 Header support.** *Wall studs shall support the ends of the header in accordance with Table 2308.9.5. Each end of a lintel or header shall have a length of bearing of not less than 1½ inches (38 mm) for the full width of the lintel.*

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.8 N/m<sup>2</sup>.

a. Spans are given in feet and inches (ft-in).

b. Tabulated values are for No. 2 grade lumber.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the header is permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

e. Use 30 pounds per square foot ground snow load for cases in which ground snow load is less than 30 pounds per square foot and the roof live load is equal to or less than 20 pounds per square foot.

**2308.9.6 Openings in interior bearing partitions.** Headers shall be provided over each opening in interior bearing partitions as required in Section 2308.9.5. The spans in Table 2308.9.6 are permitted to be used for one- and two-family dwellings. Wall studs shall support the ends of the header in accordance with Table 2308.9.5 or 2308.9.6 as appropriate.

	4-2 x 10	7-2	2	6-2	2	5-6	2
	4-2 x 12	8-4	2	7-2	2	6-5	2

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

a. Spans are given in feet and inches (ft-in).

b. Tabulated values are for No. 2 grade lumber.

c. Building width is measured perpendicular to the ridge. For widths between those shown, spans are permitted to be interpolated.

d. NJ - Number of jack studs required to support each end. Where the number of required jack studs equals one, the headers are permitted to be supported by an approved framing anchor attached to the full-height wall stud and to the header.

**2308.9.7 Openings in interior nonbearing partitions.** *Openings in nonbearing partitions are permitted to be framed with single studs and headers. Each end of a lintel or header shall have a length of bearing of not less than 1½ inches (38 mm) for the full width of the lintel.*

**2308.9.8 Pipes in walls.** *Stud partitions containing plumbing, heating or other pipes shall be so framed and the joists underneath so spaced as to give proper clearance for the piping. Where a partition containing such piping runs parallel to the floor joists, the joists underneath such partitions shall be doubled and spaced to permit the passage of such pipes and shall be bridged. Where plumbing, heating or other pipes are placed in or partly in a partition, necessitating the cutting of the soles or plates, a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1½ inches (38 mm) wide shall be fastened to each plate across and to each side of the opening with not less than six 16d nails.*

**2308.9.9 Bridging.** *Unless covered by interior or exterior wall coverings or sheathing meeting the minimum requirements of this code, stud partitions or walls with studs having a height-to-least-thickness ratio exceeding 50 shall have bridging not less than 2 inches (51 mm) in thickness and of the same width as the studs fitted snugly and nailed thereto to provide adequate lateral support. Bridging shall be placed in every stud cavity and at a frequency such that no stud so braced shall have a height-to-least-thickness ratio exceeding 50 with the height of the stud measured between horizontal framing and bridging or between bridging, whichever is greater.*

**2308.9.10 Cutting and notching.** *In exterior walls and bearing partitions, any wood stud is permitted to be cut or notched to a depth not exceeding 25 percent of its width. Cutting or notching of studs to a depth not greater than 40 percent of the width of the stud is permitted in nonbearing partitions supporting no loads other than the weight of the partition.*

**2308.9.11 Bored holes.** *A hole not greater in diameter than 40 percent of the stud width is permitted to be bored in any wood stud. Bored holes not greater than 60 percent of the width of the stud are permitted in nonbearing partitions or in any wall where each bored stud is doubled, provided not more than two such successive doubled studs are so bored.*

*In no case shall the edge of the bored hole be nearer than ⅝ inch (15.9 mm) to the edge of the stud.*

*Bored holes shall not be located at the same section of stud as a cut or notch.*

**2308.10 Roof and ceiling framing.** *The framing details required in this section apply to roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) or greater. Where the roof slope is less than three units vertical in 12 units horizontal (25-percent slope), members supporting rafters and ceiling joists such as ridge board, hips and valleys shall be designed as beams.*

**2308.10.1 Wind uplift.** *Roof assemblies shall have rafter and truss ties to the wall below. Resultant uplift loads shall be transferred to the foundation using a continuous load path. The rafter or truss to wall connection shall comply with Tables 2304.9.1 and 2308.10.1.*

**TABLE 2308.10.1  
REQUIRED RATING OF APPROVED UPLIFT CONNECTORS (pounds)<sup>a,b,c,e,f,g,h</sup>**

BASIC WIND SPEED (3-second gust)	ROOF SPAN (feet)							OVERHANGS (pounds/feet) <sup>d</sup>
	12	20	24	28	32	36	40	
100	-131	-281	-262	-305	-349	-393	-436	-53.36
110	-175	-292	-351	-409	-467	-526	-584	-64.56

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 mile per hour = 1.61 km/hr, 1 pound = 0.454 Kg, 1 pound/foot = 14.5939 N/m.

- a. The uplift connection requirements are based on a 30-foot mean roof height located in Exposure B. For Exposure C or D and for other mean roof heights, multiply the above loads by the adjustment coefficients in Table 1609.6.2.1(4).
- b. The uplift connection requirements are based on the framing being spaced 24 inches on center. Multiply by 0.67 for framing spaced 16 inches on center and multiply by 0.5 for framing spaced 12 inches on center.
- c. The uplift connection requirements include an allowance for 10 pounds of dead load.
- d. The uplift connection requirements do not account for the effects of overhangs. The magnitude of the above loads shall be increased by adding the overhang loads found in the table. The overhang loads are also based on framing spaced 24 inches on center. The overhang loads given shall be multiplied by the overhang projection and added to the roof uplift value in the table.
- e. The uplift connection requirements are based upon wind loading on end zones as defined in Section 1609.6.3. Connection loads for connections located a distance of 20 percent of the least horizontal dimension of the building from the corner of the building are permitted to be reduced by multiplying the table connection value by 0.7 and multiplying the overhang load by 0.8.
- f. For wall-to-wall and wall-to-foundation connections, the capacity of the uplift connector is permitted to be reduced by 100 pounds for each full wall above. (For example, if a 500-pound rated connector is used on the roof framing, a 400-pound rated connector is permitted at the next floor level down.)
- g. Interpolation is permitted for intermediate values of basic wind speeds and roof spans.
- h. The rated capacity of approved tie-down devices is permitted to include up to a 60-percent increase for wind effects where allowed by material specifications.

**2308.10.2 Ceiling joist spans.** Allowable spans for ceiling joists shall be in accordance with Table 2308.10.2(1) or 2308.10.2(2). For other grades and species, refer to the AF&PA Span Tables for Joists and Rafters.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.9 N/m<sup>2</sup>.

**2308.10.4 Ceiling joist and rafter framing.** Rafters shall be framed directly opposite each other at the ridge. There shall be a ridge board at least 1-inch (25 mm) nominal thickness at ridges and not less in depth than the cut end of the rafter. At valleys and hips, there shall be a single valley or hip rafter not less than 2-inch (51 mm) nominal thickness and not less in depth than the cut end of the rafter.

**2308.10.4.1 Ceiling joist and rafter connections.** Ceilings joists and rafters shall be nailed to each other and the assembly shall be nailed to the top wall plate in accordance with Tables 2304.9.1 and 2308.10.1. Ceiling joists shall be continuous or securely joined where they meet over interior partitions and fastened to adjacent rafters in accordance with Tables 2308.10.4.1 and 2304.9.1 to provide a continuous rafter tie across the building where such joists are parallel to the rafters. Ceiling joists shall have a bearing surface of not less than 1½ inches (38 mm) on the top plate at each end.

Where ceiling joists are not parallel to rafters, an equivalent rafter tie shall be installed in a manner to provide a continuous tie across the building, at a spacing of not more than 4 feet (1219 mm) o.c. The connections shall be in accordance with Tables 2308.10.4.1 and 2304.9.1, or connections of equivalent capacities shall be provided. Where ceiling joists or rafter ties are not provided at the top of the rafter support walls, the ridge formed by these rafters shall also be supported by a girder conforming to Section 2308.4.

Rafter ties shall be spaced not more than 4 feet (1219 mm) o.c. Rafter tie connections shall be based on the equivalent rafter spacing in Table 2308.10.4.1. Where rafter ties are spaced at 32 inches (813 mm) o.c., the number of 16d common nails shall be two times the number specified for rafters spaced 16 inches (406 mm) o.c., with a minimum of 4-16d common nails where no snow loads are indicated. Where rafter ties are spaced at 48 inches (1219 mm) o.c., the number of 16d common nails shall be two times the number specified for rafters spaced 24 inches (610 mm) o.c., with a minimum of 6-16d common nails where no snow loads are indicated. Rafter/ceiling joist connections and rafter/tie connections shall be of sufficient size and number to prevent splitting from nailing.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 47.8 N/m<sup>2</sup>.

- a. 40d box or 16d sinker box nails are permitted to be substituted for 16d common nails.
- b. Nailing requirements are permitted to be reduced 25 percent if nails are clinched.
- c. Rafter tie heel joint connections are not required where the ridge is supported by a load-bearing wall, header or ridge beam.
- d. When intermediate support of the rafter is provided by vertical struts or purlins to a load-bearing wall, the tabulated heel joint connection requirements are permitted to be reduced proportionally to the reduction in span.
- e. Equivalent nailing patterns are required for ceiling joist to ceiling joist lap splices.
- f. Connected members shall be of sufficient size to prevent splitting due to nailing.
- g. For snow loads less than 30 pounds per square foot, the required number of nails is permitted to be reduced by multiplying by the ratio of actual snow load plus 10 divided by 40, but not less than the number required for no snow load.

**2308.10.4.2 Notches and holes.** Notching at the ends of rafters or ceiling joists shall not exceed one-fourth the depth. Notches in the top or bottom of the rafter or ceiling joist shall not exceed one-sixth the depth and shall not be located in the middle one-third of the span, except that a notch not exceeding one-third of the depth is permitted in the top of the rafter or ceiling joist not further from the face of the support than the depth of the member.

Holes bored in rafters or ceiling joists shall not be within 2 inches (51 mm) of the top and bottom and their diameter shall not exceed one-third the depth of the member.

**2308.10.4.3 Framing around openings.** Trimmer and header rafters shall be doubled, or of lumber of equivalent cross section, where the span of the header exceeds 4 feet (1219 mm). The ends of header rafters more than 6 feet (1829 mm) long shall be supported by framing anchors or rafter hangers unless bearing on a beam, partition or wall.

**2308.10.5 Purlins.** Purlins to support roof loads are permitted to be installed to reduce the span of rafters within allowable limits and shall be supported by struts to bearing walls. The maximum span of 2-inch by 4-inch (51 mm by 102 mm) purlins shall be 4 feet (1219 mm). The maximum span of the 2-inch by 6-inch (51 mm by 152 mm) purlin shall be 6 feet (1829 mm), but in no case shall the purlin be smaller than the supported rafter. Struts shall not be smaller than 2-inch by 4-inch (51 mm by 102 mm) members. The unbraced length of struts shall not exceed 8 feet (2438 mm) and the minimum slope of the struts shall not be less than 45 degrees (0.79 rad) from the horizontal.

**2308.10.6 Blocking.** Roof rafters and ceiling joists shall be supported laterally to prevent rotation and lateral displacement in accordance with the provisions of Section 2308.8.5.

#### **2308.10.7 Wood trusses.**

**2308.10.7.1 Design.** Wood trusses shall be designed in accordance with the requirements of this chapter and accepted engineering practice. Members are permitted to be joined by nails, glue, bolts, timber connectors, metal connector plates or other approved framing devices.

**2308.10.7.2 Bracing.** The bracing of wood trusses shall comply with their appropriate engineered design.

**2308.10.7.3 Alterations to trusses.** Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a

*registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heater) shall not be permitted without verification that the truss is capable of supporting such additional loading.*

**2308.10.8 Roof sheathing.** *Roof sheathing shall be in accordance with Tables 2304.7(3) and 2304.7(5) for wood structural panels, and Tables 2304.7(1) and 2304.7(2) for lumber and shall comply with Section 2304.7.2.*

**2308.10.8.1 Joints.** *Joints in lumber sheathing shall occur over supports unless approved end-matched lumber is used, in which case each piece shall bear on at least two supports.*

**2308.10.9 Roof planking.** *Planking shall be designed in accordance with the general provisions of this code. In lieu of such design, 2-inch (51 mm) tongue-and groove planking is permitted in accordance with Table 2308.10.9. Joints in such planking are permitted to be randomly spaced, provided the system is applied to not less than three continuous spans, planks are center matched and end matched or splined, each plank bears on at least one support, and joints are separated by at least 24 inches (610 mm) in adjacent pieces.*

4.5			950	1,300,000
5.0			1,060	1,600,000

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot = 0.0479 kN/m<sup>2</sup>, 1 pound per square inch = 0.00689 N/mm<sup>2</sup>.

a. Spans are based on simple beam action with 10 pounds per square foot dead load and provisions for a 300-pound concentrated load on a 12-inch width of decking. Random layup is permitted in accordance with the provisions of Section 2308.10.9. Lumber thickness is 1½ inches nominal.

**2308.10.10 Attic ventilation.** For attic ventilation, see Section 1203.2.

**2308.11 Additional requirements for conventional light-frame construction in Seismic Design Category B or C.** Structures of conventional light-frame construction in Seismic Design Category B or C, as determined in Section 1616, shall comply with Sections 2308.11.1 through 2308.11.3, in addition to the provisions of Sections 2308.1 through 2308.10.

**2308.11.1 Number of stories.** Structures of conventional light-frame construction shall not exceed two stories in height in Seismic Design Category C.

**Exception:** Detached one- and two-family dwellings are permitted to be three stories in height in Seismic Design Category C.

**2308.11.2 Concrete or masonry.** Concrete or masonry walls, or masonry veneer shall not extend above the basement.

**Exceptions:**

1. Masonry veneer is permitted to be used in the first two stories above grade or the first three stories above grade where the lowest story has concrete or masonry walls in Seismic Design Category B, provided that structural use panel wall bracing is used, and the length of bracing provided is 1.5 times the required length as determined in Table 2308.9.3(1).
2. Masonry veneer is permitted to be used in the first story above grade or the first two stories above grade where the lowest story has concrete or masonry walls in Seismic Design Category B or C.
3. Masonry veneer is permitted to be used in the first two stories above grade in Seismic Design Categories Band C provided the following criteria are met:
  - 3.1. Type of brace per Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.4.1 shall be a minimum of 350 plf (5108 N/m) (ASD).
  - 3.2. The bracing of the top story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 40 percent of the braced wall line. The bracing of

*the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 35 percent of the braced wall line.*

3.3. *Hold-down connectors shall be provided at the ends of braced walls for the second floor to first floor wall assembly with an allowable design of 2,000 pounds (907.0 kg). Hold-down connectors shall be provided at the ends of each wall segment of the braced walls for the first floor to foundation with an allowable design of 3,900 pounds (1768 kg). In all cases, the hold-down connector force shall be transferred to the foundation.*

3.4. *Cripple walls shall not be permitted.*

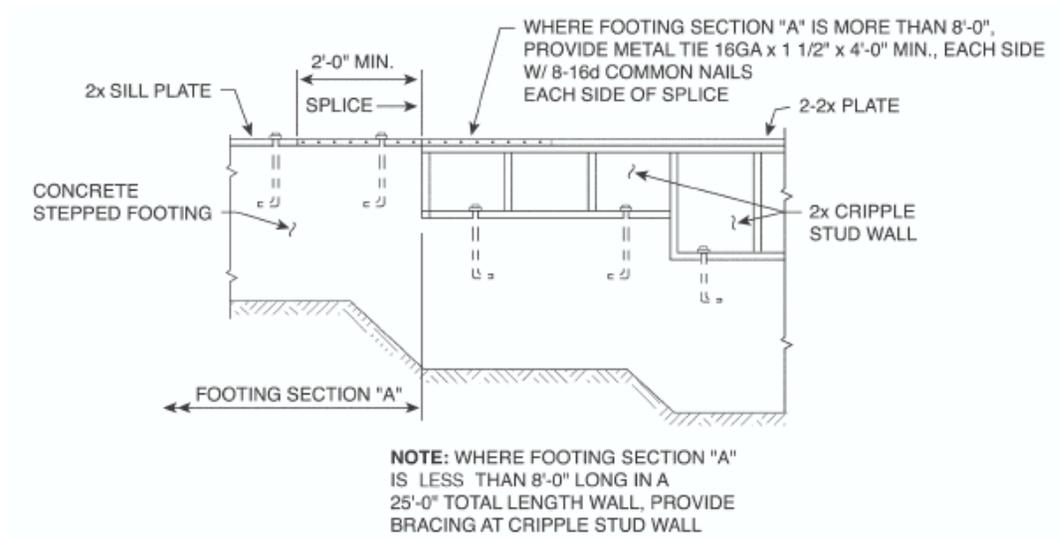

**2308.11.3 Framing and connection details.** *Framing and connection details shall conform to Sections 2308.11.3.1 through 2308.11.3.3.*

**2308.11.3.1 Anchorage.** *Braced wall lines shall be anchored in accordance with Section 2308.6 at foundations.*

**2308.11.3.2 Stepped footings.** *Where the height of a required braced wall panel extending from foundation to floor above varies more than 4 feet (1219 mm), the following construction shall be used:*

1. *Where the bottom of the footing is stepped and the lowest floor framing rests directly on a sill bolted to the footings, the sill shall be anchored as required in Section 2308.3.3.*
2. *Where the lowest floor framing rests directly on a sill bolted to a footing not less than 8 feet (2438 mm) in length along a line of bracing, the line shall be considered to be braced. The double plate of the cripple stud wall beyond the segment of footing extending to the lowest framed floor shall be spliced to the sill plate with metal ties, one on each side of the sill and plate. The metal ties shall not be less than 0.058 inch [1.47 mm (16 galvanized gage)] by 1.5 inches (38 mm) wide by 48 inches (1219 mm) with eight 16d common nails on each side of the splice location (see Figure 2308.11.3.2). The metal tie shall have a minimum yield of 33,000 pounds per square inch (psi) (227 Mpa).*

3. *Where cripple walls occur between the top of the footing and the lowest floor framing, the bracing requirements for a story shall apply.*

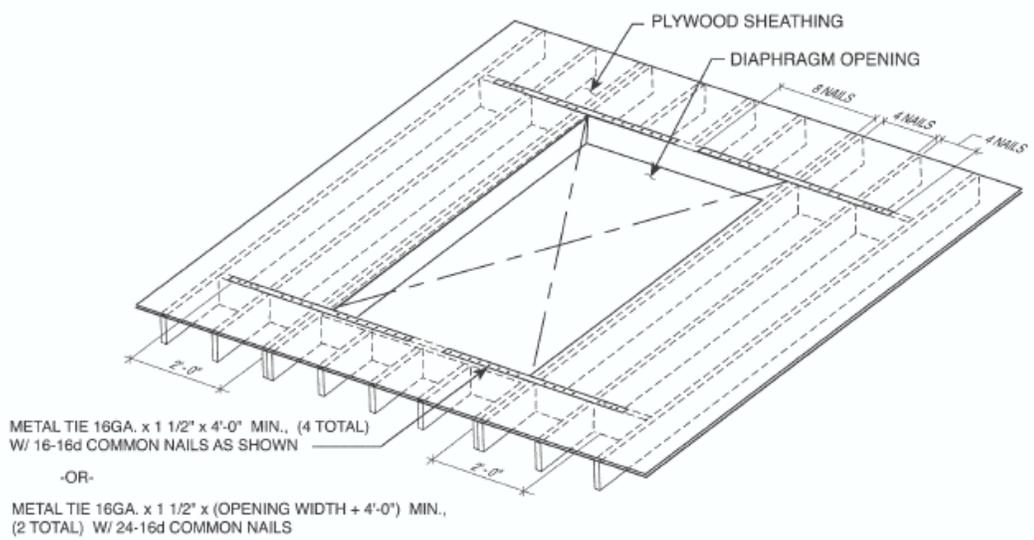

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

**FIGURE 2308.11.3.2**  
**STEPPED FOOTING CONNECTION DETAILS**

**2308.11.3.3 Openings in horizontal diaphragms.** *Openings in horizontal diaphragms with a dimension perpendicular to the joist that is greater than 4 feet (1.2 m) shall be constructed in accordance with the following:*

1. *Blocking shall be provided beyond headers.*
2. *Metal ties not less than 0.058 inch [1.47 mm (16 galvanized gage)] by 1.5 inches (38 mm) wide with eight 16d common nails on each side of the header-joist intersection shall be provided (see Figure 2308.11.3.3). The metal ties shall have a minimum yield of 33,000 psi (227 Mpa).*

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

**FIGURE 2308.11.3.3**  
**OPENINGS IN HORIZONTAL DIAPHRAGMS**

**2308.12 Additional requirements for conventional light-frame construction in Seismic Design Category D.** Structures of conventional light-frame construction in Seismic Design Category D, as determined in Section 1616, shall conform to Sections 2308.12.1 through 2308.12.8, in addition to the requirements for Seismic Design Category B or C in Section 2308.11.

**2308.12.1 Number of stories.** Structures of conventional light-frame construction shall not exceed one story in height in Seismic Design Category D.

**Exception:** Detached one- and two-family dwellings are permitted to be two stories high in Seismic Design Category D.

**2308.12.2 Concrete or masonry.** Concrete or masonry walls, or masonry veneer shall not extend above the basement.

**Exception:** Masonry veneer is permitted to be used in the first story above grade in Seismic Design Category D provided the following criteria are met:

1. Type of brace in accordance with Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.4.1 shall be a minimum of 350 plf (5108 N/m) (ASD).
2. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 45 percent of the braced wall line.
3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable design of 2,100 pounds (1768 kg).
4. Cripple walls shall not be permitted.

**2308.12.3 Braced wall line spacing.** Spacing between interior and exterior braced wall lines shall not exceed 25 feet (7620 mm).

**2308.12.4 Braced wall line sheathing.** Braced wall lines shall be braced by one of the types of sheathing prescribed by Table 2308.12.4 as shown in Figure 2308.9.3. The sum of lengths of braced wall panels at each braced wall line shall conform to Table 2308.12.4. Braced wall panels shall be distributed along the length of the braced wall line and start at not more than 8 feet (2438 mm) from

*each end of the braced wall line. A designed collector shall be provided where the bracing begins more than 8 feet (2438 mm) from each end of a braced wall line. Panel sheathing joints shall occur over studs or blocking. Sheathing shall be fastened to studs and top and bottom plates and at panel edges occurring over blocking. Wall framing to which sheathing used for bracing is applied shall be nominal 2 inch wide (actual 1½ inch, 38 mm) or larger members.*

*Cripple walls having a stud height exceeding 14 inches (356 mm) shall be considered a story for the purpose of this section and shall be braced as required for braced wall lines in accordance with Table 2308.12.4. Where interior braced wall lines occur without a continuous foundation below, the length of parallel exterior cripple wall bracing shall be one and one-half times the lengths required by Table 2308.12.4. Where the cripple wall sheathing type used is Type S-W, and this additional length of bracing cannot be provided, the capacity of Type S-W sheathing shall be increased by reducing the spacing of fasteners along the perimeter of each piece of sheathing to 4 inches (102 mm) o.c.*

**TABLE 2308.12.4**

**WALL BRACING IN SEISMIC DESIGN CATEGORIES D AND E**

(Minimum Length of Wall Bracing per each 25 Linear Feet of Braced Wall Line<sup>a</sup>)

STORY LOCATION	SHEATHING TYPE <sup>b</sup>	$0.50 \leq S_{DS} < 0.75$	$0.75 \leq S_{DS} \leq 1.00$	$1.00 \leq S_{DS}$
Top or only story	G-P <sup>d</sup>	14 feet 8 inches <sup>c</sup>	18 feet 8 inches <sup>c</sup>	25 feet 0 inches <sup>c</sup>
	S-W	8 feet 0 inches <sup>c</sup>	9 feet 4 inches <sup>c</sup>	12 feet 0 inches <sup>c</sup>
Story below top story	G-P <sup>d</sup>	NP	NP	NP
	S-W	13 feet 4 inches <sup>c</sup>	17 feet 4 inches <sup>c</sup>	21 feet 4 inches <sup>c</sup>
Bottom story of three stories	G-P <sup>d</sup>	Conventional construction not permitted; conformance with Section 2301.2.1 or 2301.2.2 is required.		
	S-W			

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. Minimum length of panel bracing of one face of wall for S-W sheathing or both faces of wall for G-P sheathing;  $h/w$  ratio shall not exceed 2:1. For S-W panel bracing of the same material on two faces of the wall, the minimum length is permitted to be one-half the tabulated value but the  $h/w$  ratio shall not exceed 2:1 and design for uplift is required.
- b. G-P = gypsum board, fiberboard, particleboard, lath and plaster, or gypsum sheathing boards; S-W = wood structural panels and diagonal wood sheathing. NP = not permitted.
- c. Applies to one- and two-family detached dwellings only.
- d. Nailing as specified below shall occur at all panel edges at studs, at top and bottom plates, and, where occurring, at blocking:
  - For  $1/2$ -inch gypsum board, 5d (0.113 inch diameter) cooler nails at 7 inches on center;
  - For  $5/8$ -inch gypsum board, No. 11 gage (0.120 inch diameter) at 7 inches on center;
  - For gypsum sheathing board,  $1\ 3/4$  inches long by  $7/16$ -inch head, diamond point galvanized nails at 4 inches on center;
  - For gypsum lath, No. 13 gage (0.092 inch) by  $1\ 1/8$  inches long,  $19/64$ -inch head, plasterboard at 5 inches on center;
  - For portland cement plaster, No. 11 gage (0.120 inch) by  $1\ 1/2$  inches long,  $7/16$ -inch head at 6 inches on center;
  - For fiberboard and particleboard, No. 11 gage (0.120 inch) by  $1\ 1/2$  inches long,  $7/16$ -inch head, galvanized nails at 3 inches on center.

**2308.12.5 Attachment of sheathing.** Fastening of braced wall panel sheathing shall not be less than that prescribed in Table 2308.12.4 or 2304.9.1. Wall sheathing shall not be attached to framing members by adhesives.

**2308.12.6 Irregular structures.** Conventional light-frame construction shall not be used in irregular portions of structures in Seismic Design Category D. Such irregular portions of structures shall be designed to resist the forces specified in Chapter 16 to the extent such irregular features affect the performance of the conventional framing system. A portion of a structure shall be considered to be irregular where at least one of the conditions described in Items 1 through 6 below is present.

1. Where exterior braced wall panels are not in one plane vertically from the foundation to the uppermost story in which they are required, the structure shall be considered to be irregular [see Figure 2308.12.6(1)].

**Exception:** Floors with cantilevers or setbacks not exceeding four times the nominal depth of the floor joists [see Figure 2308.12.6(2)] are permitted to support braced wall panels provided:

1. Floor joists are 2 inches by 10 inches (51 mm by 254 mm) or larger and spaced not more than 16 inches (406 mm) o.c.
  2. The ratio of the back span to the cantilever is at least 2:1.
  3. Floor joists at ends of braced wall panels are doubled.
  4. A continuous rim joist is connected to the ends of cantilevered joists. The rim joist is permitted to be spliced using a metal tie not less than 0.058 inch (1.47 mm) (16 galvanized gage) and 1½ inches (38 mm) wide fastened with six 16d common nails on each side. The metal tie shall have a minimum yield of 33,000 psi (227 Mpa).
  5. Joists at setbacks or the end of cantilevered joists shall not carry gravity loads from more than a single story having uniform wall and roof loads, nor carry the reactions from headers having a span of 8 feet (2438 mm) or more.
2. Where a section of floor or roof is not laterally supported by braced wall lines on all

*edges, the structure shall be considered to be irregular [see Figure 2308.12.6(3)].*

**Exception:** *Portions of roofs or floors that do not support braced wall panels above are permitted to extend up to 6 feet (1829 mm) beyond a braced wall line [see Figure 2308.12.6(4)].*

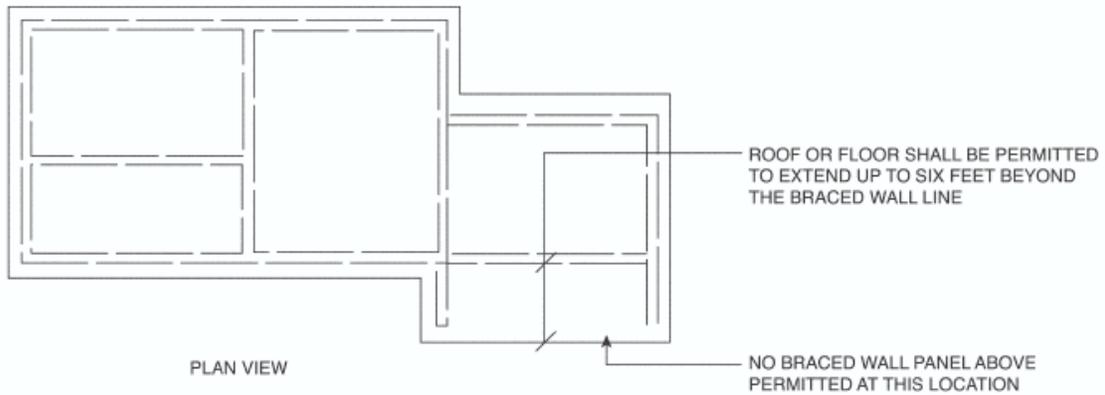

3. *Where the end of a required braced wall panel extends more than 1 foot (305 mm) over an opening in the wall below, the structure shall be considered to be irregular. This requirement is applicable to braced wall panels offset in plane and to braced wall panels offset out of plane as permitted by the exception to Item 1 above in this section [see Figure 2308.12.6(5)].*

**Exception:** *Braced wall panels are permitted to extend over an opening not more than 8 feet (2438 mm) in width where the header is a 4-inch by 12-inch (102 mm by 305 mm) or larger member.*

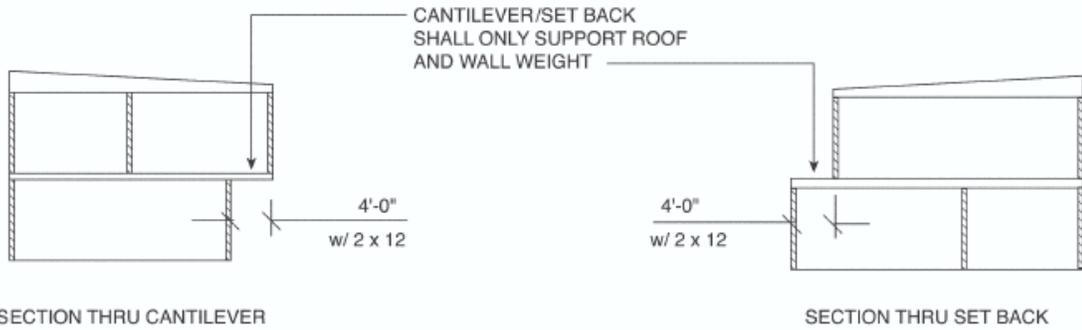

4. *Where portions of a floor level are vertically offset such that the framing members on either side of the offset cannot be lapped or tied together in an approved manner, the structure shall be considered to be irregular [see Figure 2308.12.6(6)].*

**Exception:** *Framing supported directly by foundations need not be lapped or tied directly together.*

5. *Where braced wall lines are not perpendicular to each other, the structure shall be considered to be irregular [see Figure 2308.12.6(7)].*
6. *Where openings in floor and roof diaphragms having a maximum dimension greater than 50 percent of the distance between lines of bracing or an area greater than 25 percent of the area between orthogonal pairs of braced wall lines are present, the structure shall be considered to be irregular [see Figure 2308.12.6(8)].*

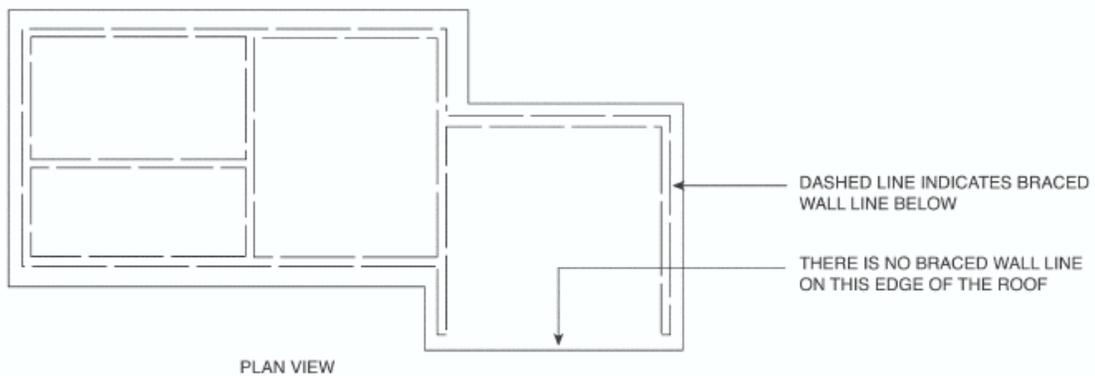

**FIGURE 2308.12.6(1)

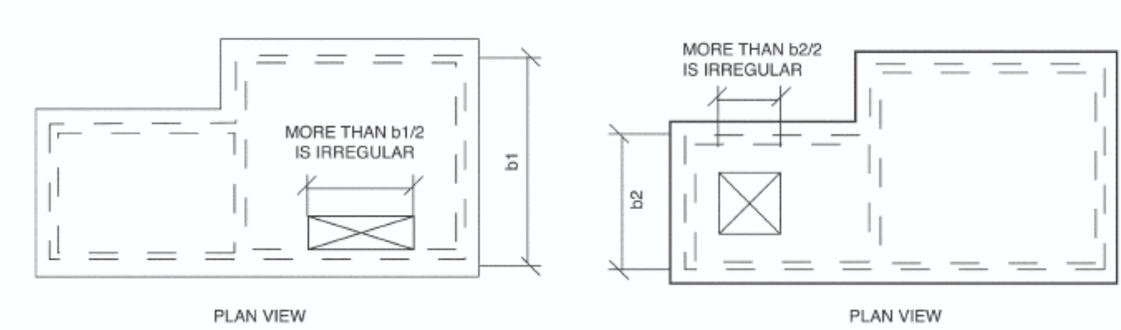

FIGURE 2308.12.6(8)  
OPENING LIMITATIONS FOR FLOOR AND ROOF DIAPHRAGMS

**2308.12.7 Exit facilities.** *Exterior exit balconies, stairs and similar exit facilities shall be positively anchored to the primary structure at not over 8 feet (2438 mm) o.c. or shall be designed for lateral forces. Such attachment shall not be accomplished by use of toenails or nails subject to withdrawal.*

**2308.12.8 Steel plate washers.** *Steel plate washers shall be placed between the foundation sill plate and the nut. Such washers shall be a minimum of  $\frac{3}{16}$  inch by 2 inches by 2 inches (4.76 mm by 51 mm by 51 mm) in size.*

**CHAPTER 24**  
**GLASS AND GLAZING**

**SECTION BC 2401**  
**GENERAL**

**2401.1 Scope.** *The provisions of this chapter shall govern the materials, design, construction and quality of glass, light transmitting ceramic and light-transmitting plastic panels for exterior and interior use in both vertical and sloped applications in buildings and structures.*

**2401.2 Glazing replacement.** *The installation of replacement glass shall be as required for new installations.*

**SECTION BC 2402**  
**DEFINITIONS**

**2402.1 Definitions.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**DALLE GLASS.** *A decorative composite glazing material made of individual pieces of glass that are embedded in a cast matrix of concrete or epoxy.*

**DECORATIVE GLASS.** *A carved, leaded or Dalle glass or glazing material whose purpose is decorative or artistic, not functional; whose coloring, texture or other design qualities or components cannot be removed without destroying the glazing material and whose surface, or assembly into which it is incorporated, is divided into segments.*

**SECTION BC 2403**  
**GENERAL REQUIREMENTS FOR GLASS**

**2403.1 Identification.** *Each pane shall bear the manufacturer's label designating the type and thickness of the glass or glazing material. The identification shall not be omitted unless approved and an affidavit is furnished by the glazing contractor certifying that each light is glazed in accordance with approved construction documents that comply with the provisions of this chapter. Safety glazing shall be identified in accordance with Section 2406.2.*

*Each pane of tempered glass, except tempered spandrel glass, shall be permanently identified by the manufacturer. The identification label shall be acid etched, sand blasted, ceramic fired, embossed or shall be of a type that once applied cannot be removed without being destroyed. Tempered spandrel glass shall be provided with a removable paper marking by the manufacturer.*

**2403.2 Glass supports.** *Where one or more sides of any pane of glass are not firmly supported, or are subjected to unusual load conditions, detailed construction documents, detailed shop drawings and analysis or test data assuring safe performance for the specific installation shall be prepared by an architect or engineer.*

**2403.3 Framing.** *To be considered firmly supported, the framing members for each individual pane of glass shall be designed so the deflection of the edge of the glass perpendicular to the glass pane shall not exceed  $1/175$  of the glass edge length or  $3/4$  inch (19.1 mm), whichever is less, when subjected to the larger of the positive or negative load where loads are combined as specified in Section 1605.*

**2403.4 Interior glazed areas.** *Where interior glazing is installed adjacent to a walking surface, the differential deflection of two adjacent unsupported edges shall not be greater than the thickness of the panels when a force of 50 pounds per linear foot (plf) (730 N/m) is applied horizontally to one panel at any point up to 42 inches (1067 mm) above the walking surface.*

**2403.5 Louvered windows or jalousies.** *Float, wired and patterned glass in louvered windows and jalousies shall be no thinner than nominal  $3/16$  inch (4.8 mm) and no longer than 48 inches (1219 mm). Exposed glass edges shall be smooth.*

*Wired glass with wire exposed on longitudinal edges shall not be used in louvered windows or jalousies.*

*Where other glass types are used, the design shall be submitted to the Department for approval.*

**2403.6 Protection of glass panels.** *Glass panels installed in areas where they will be subject to unusual conditions of construction damage, such as spatter from welds or locations near materials hoists, shall be protected by a hardboard covering or its equivalent during the period that such work is in progress.*

**SECTION BC 2404  
WIND, SNOW, SEISMIC  
AND DEAD LOADS ON GLASS**

**2404.1 Vertical glass.** *Glass sloped 15 degrees (0.26 rad) or less from vertical in windows, curtain and window walls, doors and other exterior applications shall be designed to resist the wind loads in Section 1609 for components and cladding. Glass in glazed curtain walls, glazed storefronts and glazed partitions shall meet the seismic requirements of ASCE 7, Section 9.6.2.10. Glazing firmly supported on all four edges is permitted to be designed by the following provisions. Where the glass is not firmly supported on all four edges, analysis or test data ensuring safe performance for the specific installation shall be prepared by an approved agency or special inspector. The design of vertical glazing shall be based on the following equation:*

$$F_{gw} \leq F_{ga} \quad \text{(Equation 24-1)}$$

where:

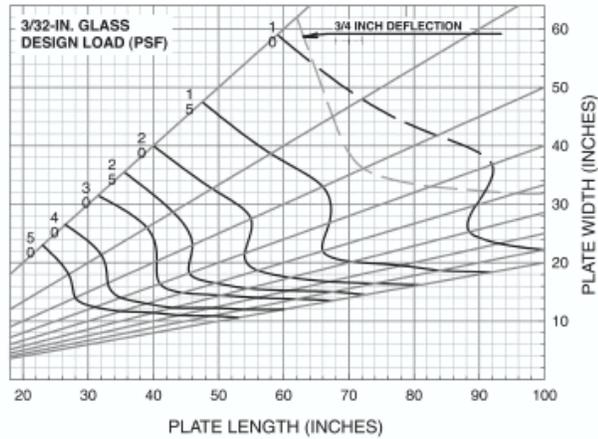

$F_{gw}$  is the wind load on the glass computed in accordance with Section 1609 and  $F_{ga}$  is the maximum allowable load on the glass computed by the following formula:

$$F_{ga} = c_1 F_{ge} \quad \text{(Equation 24-2)}$$

where:

$F_{ge}$  = Maximum allowable equivalent load, pounds per square foot (psf) (kN/m<sup>2</sup>) determined from Figures 2404(1) through 2404(12) for the applicable glass dimensions and thickness.

$c_1$  = Factor determined from Table 2404.1 based on glass type.

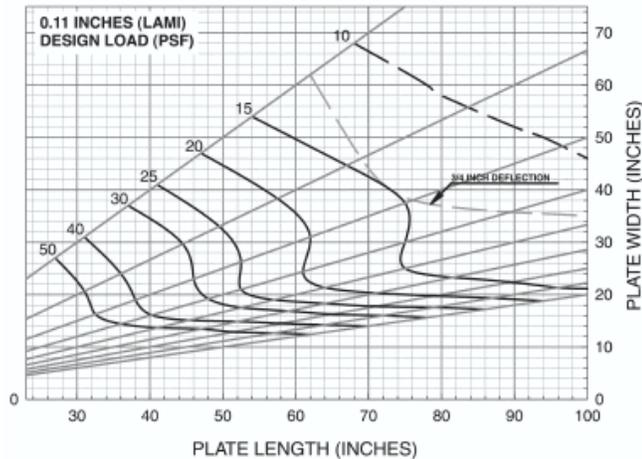

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

**FIGURE 2404(1)<sup>a, b, c, d, e, f</sup>**  
**MAXIMUM ALLOWABLE LOAD FOR VERTICAL AND SLOPED**  
**RECTANGULAR GLASS SUPPORTED ON ALL EDGES**

**NOTES:**

- In each graph, the vertical axis is the lesser dimension; the horizontal axis is the greater dimension.
- The diagonal number on each graph shows the equivalent design load in psf.
- The dashed lines indicate glass that has deflection in excess of  $\frac{3}{4}$  inch.
- Interpolation between lines is permitted. Extrapolation is not allowed.
- For laminated glass, the applicable glass thickness is the total glass thickness.
- For insulating glass panes, the applicable glass thickness is the thickness of one pane.

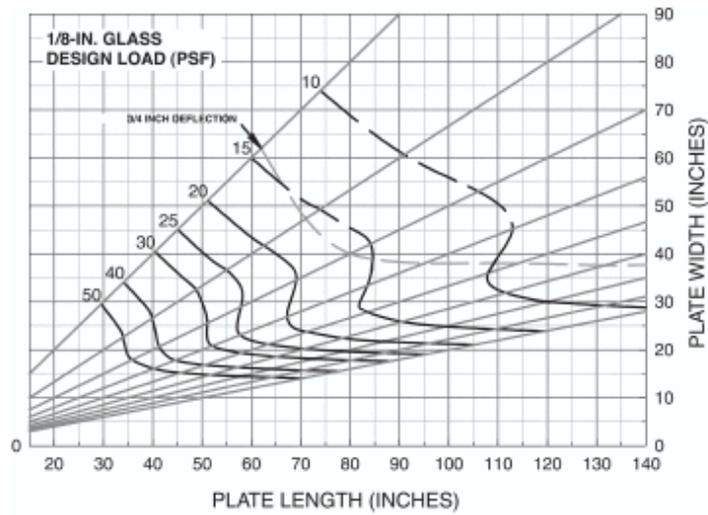

For SI: 1 inch = 25.4 mm, 1 pound per square foot = 0.0479 kPa.

**TABLE 2404.1**  
**c<sub>1</sub> FACTORS FOR VERTICAL AND SLOPED GLASS<sup>a</sup>**  
**[For use with Figures 2404(1) through 2404(12)]**

GLASS TYPE	FACTOR
<b>Single Glass</b>	
Regular (annealed)	1.0
Heat strengthened	2.0
Fully tempered	4.0
Wired	0.50
Patterned <sup>c</sup>	1.0
Sandblasted <sup>d</sup>	0.50
Laminated—regular plies <sup>e</sup>	0.7/0.90 <sup>f</sup>
Laminated—heat-strengthened plies <sup>e</sup>	1.5/1.8 <sup>f</sup>
Laminated—fully tempered plies <sup>e</sup>	3.0/3.6 <sup>f</sup>
<b>Insulating Glass<sup>b</sup></b>	
Regular (annealed)	1.8
Heat strengthened	3.6
Fully tempered	7.2
Laminated—regular plies <sup>e</sup>	1.4/1.6 <sup>f</sup>
Laminated—heat-strengthened plies <sup>e</sup>	2.7/3.2 <sup>f</sup>
Laminated—fully tempered plies <sup>e</sup>	5.4/6.5 <sup>f</sup>

- a. Either Table 2404.1 or 2404.2 shall be appropriate for sloped glass depending on whether the snow or wind load is dominant (see Section 2404.2). For glass types (vertical or sloped) not included in the tables, refer to ASTM E 1300 for guidance.
- b. Values apply for insulating glass with identical panes.
- c. The value for patterned glass is based on the thinnest part of the pattern; interpolation between graphs is permitted.
- d. The value for sandblasted glass is for moderate levels of sandblasting.
- e. Values for laminated glass are based on the total thickness of the glass and apply for glass with two equal glass ply thicknesses.
- f. The lower value applies if, for any laminated glass pane, either the ratio of the long to short dimension is greater than 2.0 or the lesser dimension divided by the thickness of the pane is 150 or less; the higher value applies in all other cases.

**2404.2 Sloped glass.** *Glass sloped more than 15 degrees (0.26 rad) from vertical in skylights, sunrooms, sloped roofs and other exterior applications shall be designed to resist the most critical of the following combinations of loads.*

$$F_g = W_o - D \quad \text{(Equation 24-3)}$$

$$F_g = W_i + D + 0.5 S \quad \text{(Equation 24-4)}$$

$$F_g = 0.5 W_i + D + S \quad \text{(Equation 24-5)}$$

where:

$D$  = Glass dead load (psf)  
For glass sloped 30 degrees (0.52 rad) or less from horizontal,

$$D = 13 t_g \quad \text{(For SI: } 0.0245 t_g \text{)}$$

For glass sloped more than 30 degrees (0.52 rad) from horizontal,

$$D = 13 t_g \cos \theta \quad \text{(For SI: } 0.0245 t_g \cos \theta \text{)}$$

$F_g$  = Total load, psf (kN/m<sup>2</sup>) on glass.

$S$  = Snow load, psf (kN/m<sup>2</sup>) as determined in Section 1608.

$t_g$  = Total glass thickness, inches (mm) of glass panes and plies.

$W_i$  = Inward wind force, psf (kN/m<sup>2</sup>) as calculated in Section 1609.

***Exception:*** Unit skylights shall be designed in accordance with Section 2405.5. The design of sloped glazing shall be based on the following equation:

$W_o$  = Outward wind force, psf (kN/m<sup>2</sup>) as calculated in Section 1609.

$\theta$  = Angle of slope from horizontal.

**Exception:** Unit skylights shall be designed in accordance with Section 2405.5.

The design of sloped glazing shall be based on the following equation:

$$F_g \leq F_{ga} \quad (\text{Equation 24-6})$$

where  $F_g$  is the maximum load on the glass determined from Equations 24-3 through 24-5, and  $F_{ga}$  is the maximum allowable load on the glass.

If  $F_g$  is determined by Equation 24-3 or 24-4 above,  $F_{ga}$  shall be computed as for vertical glazing in Section 2404.1. If  $F_g$  is determined by Equation 24-5 above,  $F_{ga}$  shall be computed by the following equation:

$$F_{ga} = c_2 F_{ge} \quad (\text{Equation 24-7})$$

where:

$F_{ge}$  = Maximum allowable equivalent load (psf) determined from Figures 2404(1) through 2404(12) for the applicable glass dimensions and thickness.

$c_2$  = Factor determined from Table 2404.2 based on glass type.

**TABLE 2404.2**  
**c<sub>2</sub> FACTORS FOR SLOPED GLASS<sup>a</sup>**  
**[For use with Figures 2404(1) through 2404(12)]**

GLASS TYPE	FACTOR
<b>Single Glass</b>	
Regular (annealed)	0.6
Heat strengthened	1.6
Fully tempered	3.6
Wired	0.3
Patterned <sup>c</sup>	0.6
Laminated — regular plies <sup>d</sup>	0.3/0.45 <sup>e</sup>
Laminated — heat-strengthened plies <sup>d</sup>	0.8/1.2 <sup>e</sup>
Laminated — fully tempered plies <sup>d</sup>	1.8/2.7 <sup>e</sup>
<b>Insulating Glass<sup>b</sup></b>	
Regular (annealed)	1.1
Heat strengthened	2.9
Fully tempered	6.5
Laminated — regular plies <sup>d</sup>	0.54/0.81 <sup>e</sup>
Laminated — heat-strengthened plies <sup>d</sup>	1.4/2.2 <sup>e</sup>
Laminated — fully tempered plies <sup>d</sup>	3.3/4.9 <sup>e</sup>

- a. Either Table 2404.1 or 2404.2 shall be appropriate for sloped glass depending on whether the snow or wind load is dominant (see Section 2404.2). For glass types (vertical or sloped) not included in the tables, refer to ASTM E 1300 for guidance.
- b. Values apply for insulating glass with identical panes.
- c. The value for patterned glass is based on the thinnest part of the pattern; interpolation between graphs is permitted.
- d. Values for laminated glass are based on the total thickness of the glass and apply for glass with two equal glass ply thicknesses.
- e. The lower value applies where, for any laminated glass pane, either the ratio of the long to short dimension is greater than 2.0 or the lesser dimension divided by the thickness of the pane is 150 or less. The higher value applies in all other cases.

**SECTION BC 2405**  
**SLOPED GLAZING AND SKYLIGHTS**

**2405.1 Scope.** *This section applies to the installation of glass and other transparent, translucent or opaque glazing material installed at a slope more than 15 degrees (0.26 rad) from the vertical plane, including glazing materials in skylights, roofs and sloped walls.*

**2405.2 Allowable glazing materials and limitations.** *Sloped glazing shall be any of the following materials, subject to the listed limitations:*

1. *For monolithic glazing systems, the glazing material of the single light or layer shall be laminated glass with a minimum 30-mil (0.76 mm) polyvinyl butyral (or equivalent) interlayer, wired glass, light-transmitting plastic materials meeting the requirements of Section 2607, heat-strengthened glass or fully tempered glass.*
2. *For multiple-layer glazing systems, each light or layer shall consist of any of the glazing materials specified in Item 1 above. Annealed glass is permitted to be used as specified within Exceptions 2 and 3 of Section 2405.3. For additional requirements for plastic skylights, see Section 2610. Glass-block construction shall conform to the requirements of Section 2101.2.5.*

**2405.3 Screening.** *Where used in monolithic glazing systems, heat-strengthened glass and fully tempered glass shall have screens installed below the glazing material. The screens and their fastenings shall: (1) be capable of supporting twice the weight of the glazing; (2) be firmly and substantially fastened to the framing members and (3) be installed within 4 inches (102 mm) of the glass. The screens shall be constructed of a noncombustible material not thinner than No. 12 B&S gage (0.0808 inch) with mesh not larger than 1 inch by 1 inch (25 mm by 25 mm). In a corrosive atmosphere, structurally equivalent noncorrosive screen materials shall be used. Heat-strengthened glass, fully tempered glass and wired glass, when used in multiple-layer glazing systems as the bottom glass layer over the walking surface, shall be equipped with screening that conforms to the requirements for monolithic glazing systems.*

**Exception:** *In monolithic and multiple-layer sloped glazing systems, the following applies:*

1. *Fully tempered glass installed without protective screens where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane shall have the highest point of the glass 10 feet (3048 mm) or less above the walking surface.*

2. *Screens are not required below any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.*
3. *Any glazing material, including annealed glass, is permitted to be installed without screens in the sloped glazing systems of commercial or detached noncombustible greenhouses used exclusively for growing plants and not open to the public, provided that the height of the greenhouse at the ridge does not exceed 30 feet (9144 mm) above grade.*
4. *Screens shall not be required within individual dwelling units in Groups R-2 and R-3 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and the following conditions are met:*
  - 4.1. *Each pane of the glass is 16 square feet (1.5 m<sup>2</sup>) or less in area.*
  - 4.2. *The highest point of the glass is 12 feet (3658 mm) or less above any walking surface or other accessible area.*
  - 4.3. *The glass thickness is <sup>3</sup>/16 inch (4.8 mm) or less.*
5. *Screens shall not be required for laminated glass with a 15-mil (0.38 mm) polyvinyl butyral (or equivalent) interlayer used within individual dwelling units in Groups R-2 and R-3 within the following limits:*
  - 5.1. *Each pane of glass is 16 square feet (1.5m<sup>2</sup>) or less in area.*
  - 5.2. *The highest point of the glass is 12 feet (3658 mm) or less above a walking surface or other accessible area.*

**2405.4 Framing.** *In Type I and II construction, sloped glazing and skylight frames shall be constructed of noncombustible materials. In structures where acid fumes deleterious to metal are incidental to the use of the buildings, approved pressure-treated wood or other approved noncorrosive materials are permitted to be used for sash and frames. Framing supporting sloped glazing and skylights shall be designed to resist the tributary roof loads in Chapter 16. Skylights set at an angle of less than 45 degrees (0.79 rad) from the horizontal plane shall be mounted at least 4 inches (102 mm) above the plane of the roof on a curb*

constructed as required for the frame. Skylights shall not be installed in the plane of the roof where the roof pitch is less than 45 degrees (0.79 rad) from the horizontal.

**Exception:** Installation of a skylight without a curb shall be permitted on roofs with a minimum slope of 14 degrees (three units vertical in 12 units horizontal) in Group R-3 occupancies. All unit skylights installed in a roof with a pitch flatter than 14 degrees (0.24 rad) shall be mounted at least 4 inches (102 mm) above the plane of the roof on a curb constructed as required for the frame unless otherwise specified in the manufacturer's installation instructions.

**2405.5 Unit skylights.** Unit skylights shall be tested and labeled as complying with 101/I.S.2/NAFS Voluntary Performance Specification for Windows, Skylights and Glass. The label shall state the name of the manufacturer, the approved agency, the product designation and the performance grade rating as specified in 101/I.S.2/NAFS. If the product manufacturer has chosen to have the performance grade of the skylight rated separately for positive and negative design pressure, then the label shall state both performance grade ratings as specified in 101/I.S.2/NAFS and the skylight shall comply with Section 2405.5.2. If the skylight is not rated separately for positive and negative pressure, then the performance grade rating shown on the label shall be the performance grade rating determined in accordance with 101/I.S.2/NAFS for both positive and negative design pressure, and the skylight shall conform to Section 2405.5.1.

**2405.5.1 Unit skylights rated for the same performance grade for both positive and negative design pressure.** The design of unit skylights shall be based on the following equation:

$$F_g \leq PG \quad (\text{Equation 24-8})$$

where:

$F_g$  is the maximum load on the skylight determined from Equations 24-3 through 24-5 in Section 2404.2.

$PG$  is the performance grade rating of the skylight.

*2405.5.2 Unit skylights rated for separate performance grades for positive and negative design pressure. The design of unit skylights rated for performance grade for both positive and negative design pressures shall be based on the following equations:*

$$F_{gi} \leq PG_{Pos} \quad (\text{Equation 24-9})$$

$$F_{go} \leq PG_{Neg} \quad (\text{Equation 24-10})$$

where:

$PG_{Pos}$  is the performance grade rating of the skylight under positive design pressure,

$PG_{Neg}$  is the performance grade rating of the skylight under negative design pressure, and

$F_{gi}$  and  $F_{go}$  are determined in accordance with the following:

If  $W_o \geq D$ , where  $W_o$  is the outward wind force, psf (kN/m<sup>2</sup>) as calculated in Section 1609 and  $D$  is the dead weight of the glazing, psf (kN/m<sup>2</sup>) as determined in Section 2404.2 for glass, or by the weight of the plastic, psf (kN/m<sup>2</sup>) for plastic glazing.

$F_{gi}$  is the maximum load on the skylight determined from Equations 24-4 and 24-5 in Section 2404.2,

$F_{go}$  is the maximum load on the skylight determined from Equation 24-3.

If  $W_o < D$ , where  $W_o$  is the outward wind force, psf (kN/m<sup>2</sup>) as calculated in Section 1609 and  $D$  is the dead weight of the glazing, psf (kN/m<sup>2</sup>) as determined in Section 2404.2 for glass, or by the weight of the plastic for plastic glazing.

$F_{gi}$  is the maximum load on the skylight determined from Equations 24-3 through 24-5 in Section 2404.2,

$$F_{go} = 0.$$

**SECTION BC 2406**  
**SAFETY GLAZING**

**2406.1 Human impact loads.** *Individual glazed areas, including glass mirrors, in hazardous locations as defined in Section 2406.3 shall comply with Sections 2406.1.1 through 2406.1.5.*

**2406.1.1 CPSC 16 CFR 1201.** *Except as provided in Sections 2406.1.2 through 2406.1.5, all glazing shall pass the test requirements of CPSC 16 CFR 1201, listed in Chapter 35. Glazing shall comply with the CPSC 16 CFR, Part 1201 criteria, for Category I or II as indicated in Table 2406.1.*

**2406.1.2 Wired glass.** *In other than Group E, wired glass installed in fire doors, fire windows and view panels in fire-resistant walls shall comply with ANSI Z97.1.*

**2406.1.3 Plastic glazing.** *Plastic glazing shall meet the weathering requirements of ANSI Z97.1.*

**2406.1.4 Glass block.** *Glass-block walls shall comply with Section 2101.2.5.*

**2406.1.5 Louvered windows and jalousies.** *Louvered windows and jalousies shall comply with Section 2403.5.*

**TABLE 2406.1  
MINIMUM CATEGORY CLASSIFICATION OF GLAZING**

EXPOSED SURFACE AREA OF ONE SIDE OF ONE LITE	GLAZING IN STORM OR COMBINATION DOORS (Category class)	GLAZING IN DOORS (Category class)	GLAZED PANELS REGULATED BY ITEM 7 OF SECTION 2406.3 (Category class)	GLAZED PANELS REGULATED BY ITEM 6 OF SECTION 2406.3 (Category class)	DOORS AND ENCLOSURES REGULATED BY ITEM 5 OF SECTION 2406.3 (Category class)	SLIDING GLASS DOORS PATIO TYPE (Category class)
9 square feet or less	I	I	No requirement	I	II	II
More than 9 square feet	II	II	II	II	II	II

For SI: 1 square foot = 0.0929m<sup>2</sup>.

**2406.2 Identification of safety glazing.** Except as indicated in Section 2406.1.2, each pane of safety glazing installed in hazardous locations shall be identified by a label specifying the labeler, whether the manufacturer or installer, and the safety glazing standard with which it complies, as well as the information specified in Section 2403.1. The label shall be acid etched, sand blasted, ceramic fired or an embossed mark, or shall be of a type that once applied cannot be removed without being destroyed.

**Exceptions:**

1. For other than tempered glass, labels are not required, provided the Department approves the use of a certificate, affidavit or other evidence confirming compliance with this code.
2. Tempered spandrel glass is permitted to be identified by the manufacturer with a removable paper label.

**2406.2.1 Multilight assemblies.** Multilight glazed assemblies having individual lights not exceeding 1 square foot (0.09 square meter) in exposed area shall have at least one light in the assembly marked as indicated in Section 2406.2. Other lights in the assembly shall be marked "CPSC 16 CFR 1201" or "ANSI Z97.1," as appropriate.

**2406.3 Hazardous locations.** The following shall be considered specific hazardous locations requiring safety glazing materials:

1. Glazing in swinging doors except jalousies (see Section 2406.3.1).
2. Glazing in fixed and sliding panels of sliding door assemblies and panels in sliding and bifold closet door assemblies.
3. Glazing in storm doors.
4. Glazing in unframed swinging doors.
5. Glazing in doors and enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers. Glazing in any portion of a building wall enclosing these compartments where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above a standing surface.

6. *Glazing in an individual fixed or operable panel adjacent to a door where the nearest exposed edge of the glazing is within a 24-inch (610 mm) arc of either vertical edge of the door in a closed position and where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the walking surface.*

***Exceptions:***

1. *Panels where there is an intervening wall or other permanent barrier between the door and glazing.*
  2. *Where access through the door is to a closet or storage area 3 feet (914 mm) or less in depth. Glazing in this application shall comply with Section 2406.3, Item 7.*
  3. *Glazing in walls perpendicular to the plane of the door in a closed position, other than the wall towards which the door swings when opened within dwelling units in Group R-2 or R-3.*
7. *Glazing in an individual fixed or operable panel, other than in those locations described in preceding Items 5 and 6, which meets all of the following conditions:*
    - 7.1. *Exposed area of an individual pane greater than 9 square feet (0.84 m<sup>2</sup>);*
    - 7.2. *Exposed bottom edge less than 18 inches (457 mm) above the floor;*
    - 7.3. *Exposed top edge greater than 36 inches (914 mm) above the floor; and*
    - 7.4. *One or more walking surface(s) within 36 inches (914 mm) horizontally of the plane of the glazing.*

***Exception:*** *Safety glazing for Item 7 is not required for the following installations:*

1. *A horizontal protective bar 1½ inches (38 mm) or more in height, capable of withstanding a horizontal load of 50 pounds p/f (730 N/m) without contacting the glass, is installed on the accessible sides of the glazing 34 inches to 38 inches (864 mm to 965 mm) above the floor.*

2. *The outboard pane in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 25 feet (7620 mm) or more above any grade, roof, walking surface or other horizontal or sloped (within 45 degrees of horizontal) (0.78 rad) surface adjacent to the glass exterior.*
8. *Glazing in guards and railings, including structural baluster panels and nonstructural in-fill panels, regardless of area or height above a walking surface.*
9. *Glazing in walls and fences enclosing indoor and outdoor swimming pools, hot tubs and spas where all of the following conditions are present:*
  - 9.1. *The bottom edge of the glazing on the pool or spa side is less than 60 inches (1524 mm) above a walking surface on the pool or spa side of the glazing; and*
  - 9.2. *The glazing is within 60 inches (1524 mm) horizontally of the water's edge of a swimming pool or spa.*
10. *Glazing adjacent to stairways, landings and ramps within 36 inches (914 mm) horizontally of a walking surface; when the exposed surface of the glass is less than 60 inches (1524 mm) above the plane of the adjacent walking surface.*
11. *Glazing adjacent to stairways within 60 inches (1524 mm) horizontally of the bottom tread of a stairway in any direction when the exposed surface of the glass is less than 60 inches (1524 mm) above the nose of the tread.*

**Exception:** *Safety glazing for Item 10 or 11 is not required for the following installations where:*

1. *The side of a stairway, landing or ramp which has a guardrail or handrail, including balusters or in-fill panels, complying with the provisions of Sections 1012 and 1607.7; and*
2. *The plane of the glass is greater than 18 inches (457 mm) from the railing.*

**2406.3.1 Exceptions:** *The following products, materials and uses shall not be considered specific hazardous locations:*

1. *Openings in doors through which a 3-inch (76 mm) sphere is unable to pass.*
2. *Decorative glass in Section 2406.3, Item 1, 6 or 7.*
3. *Glazing materials used as curved glazed panels in revolving doors.*
4. *Commercial refrigerated cabinet glazed doors.*
5. *Glass-block panels complying with Section 2101.2.5.*
6. *Louvered windows and jalousies complying with the requirements of Section 2403.5.*
7. *Mirrors and other glass panels mounted or hung on a surface that provides a continuous backing support.*

**2406.4 Fire department access panels.** *Fire department glass access panels shall be of tempered glass. For insulating glass units, all panes shall be tempered glass.*

#### **SECTION BC 2407**

##### **GLASS IN HANDRAILS AND GUARDS**

**2407.1 Materials.** *Glass used as structural balustrade panels in railings shall be constructed of either single fully tempered glass, laminated fully tempered glass or laminated heat-strengthened glass. Glazing in railing in-fill panels shall be of an approved safety glazing material that conforms to the provisions of Section 2406.1.1. For all glazing types, the minimum nominal thickness shall be ¼ inch (6.4 mm). Fully tempered glass and laminated glass shall comply with Category II of CPSC 16 CFR 1201, listed in Chapter 35.*

**2407.1.1 Loads.** *The panels and their support system shall be designed to withstand the loads specified in Section 1607.7. A safety factor of four shall be used.*

**2407.1.2 Support.** *Each handrail or guard section shall be supported by a minimum of three glass balusters or shall be otherwise supported to remain in place should one baluster panel fail. Glass balusters shall not be installed without an attached handrail or guard.*

**2407.1.3 Parking garages.** *Glazing materials shall not be installed in railings in parking garages except for pedestrian areas not exposed to impact from vehicles.*

**SECTION BC 2408**  
**GLAZING IN ATHLETIC FACILITIES**

**2408.1 General.** *Glazing in athletic facilities and similar uses subject to impact loads, which forms whole or partial wall sections or which is used as a door or part of a door, shall comply with this section.*

**2408.2 Racquetball and squash courts.**

**2408.2.1 Testing.** *Test methods and loads for individual glazed areas in racquetball and squash courts subject to impact loads shall conform to those of CPSC 16 CFR, Part 1201, listed in Chapter 35, with impacts being applied at a height of 59 inches (1499 mm) above the playing surface to an actual or simulated glass wall installation with fixtures, fittings and methods of assembly identical to those used in practice.*

*Glass walls shall comply with the following conditions:*

1. *A glass wall in a racquetball or squash court, or similar use subject to impact loads, shall remain intact following a test impact.*
2. *The deflection of such walls shall not be greater than 1½ inches (38 mm) at the point of impact for a drop height of 48 inches (1219 mm).*

*Glass doors shall comply with the following conditions:*

1. *Glass doors shall remain intact following a test impact at the prescribed height in the center of the door.*
2. *The relative deflection between the edge of a glass door and the adjacent wall shall not exceed the thickness of the wall plus ½ inch (12.7 mm) for a drop height of 48 inches (1219 mm).*

**2408.3 Gymnasium and basketball courts.** Glazing in multipurpose gymnasiums, basketball courts and similar athletic facilities subject to human impact loads shall comply with Category II of CPSC 16 CFR 1201, listed in Chapter 35.

**SECTION BC 2409**  
**GLASS IN FLOORS AND SIDEWALKS**

**2409.1 General.** Glass installed in the walking surface of floors, landings, stairwells and similar locations shall comply with Sections 2409.2 through 2409.4.

**2409.2 Design load.** The design for glass used in floors, landings, stair treads and similar locations shall be determined as indicated in Section 2409.4 based on the load that produces the greater stresses from the following:

1. The uniformly distributed unit load ( $F_u$ ) from Section 1607;
2. The concentrated load ( $F_c$ ) from Table 1607.1; or
3. The actual load ( $F_a$ ) produced by the intended use.

The dead load ( $D$ ) for glass in psf ( $\text{kN/m}^2$ ) shall be taken as the total thickness of the glass plies in inches by 13 (For SI: glass plies in mm by 0.0245). Load reductions allowed by Section 1607.9 are not permitted.

**2409.3 Laminated glass.** Laminated glass having a minimum of two plies shall be used. The glass shall be capable of supporting the total design load, as indicated in Section 2409.4, with any one ply broken.

**2409.4 Design formula.** Glass in floors and sidewalks shall be designed to resist the most critical of the following combinations of loads:

$$F_g = 2F_u + D \quad \text{(Equation 24-11)}$$

$$F_g = (8F_c/A) + D \quad \text{(Equation 24-12)}$$

$$F_g = F_a + D \quad \text{(Equation 24-13)}$$

where:

$A$  = Area of rectangular glass, ft<sup>2</sup> (m<sup>2</sup>).

$D$  = Glass dead load (psf) =  $13 t_g$  (for SI:  $0.0245 t_g$ , kN/m<sup>2</sup>).

$t_g$  = Total glass thickness, inches (mm).

$F_a$  = Actual intended use load, psf (kN/m<sup>2</sup>).

$F_c$  = Concentrated load, pounds (kN).

$F_g$  = Total load, psf (kN/m<sup>2</sup>) on glass.

$F_u$  = Uniformly distributed load, psf (kN/m<sup>2</sup>).

The design of the glazing shall be based on

$$F_g \leq F_{ga} \quad \text{(Equation 24-14)}$$

where  $F_g$  is the maximum load on the glass determined from the load combinations above, and  $F_{ga}$  is the maximum allowable load on the glass, computed by the following formula:

$$F_{ga} = 0.67 c_2 F_{ge} \quad \text{(Equation 24-15)}$$

where:

$F_{ge}$  = Maximum allowable equivalent load, psf (kN/m<sup>2</sup>), determined from Figures 2404(1) through 2404(12) for the applicable glass dimensions and thickness; and

$c_2$  = Factor determined from Table 2404.2 based on glass type.

The factor,  $c_2$ , for laminated glass found in Table 2404.2 shall apply to two-ply laminates only. The value of  $F_a$  shall be doubled for dynamic applications.

**CHAPTER 25**  
**GYP SUM BOARD AND PLASTER**

**SECTION BC 2501**  
**GENERAL**

**2501.1 Scope.**

**2501.1.1 General.** Provisions of this chapter shall govern the materials, design, construction and quality of gypsum board, lath, gypsum plaster and cement plaster.

**2501.1.2 Performance.** Lathing, plastering and gypsum board construction shall be done in the manner, and with the materials, specified in this chapter and referenced standards listed in Chapter 35. When fire protection is required, such construction shall also comply with the provisions of Chapter 7.

**2501.1.3 Other materials.** Other approved wall or ceiling coverings shall be permitted to be installed in accordance with the recommendations of the manufacturer and the approval of the commissioner.

**SECTION BC 2502**  
**DEFINITIONS**

**2502.1 Definitions.** The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

**CEMENT PLASTER.** A mixture of portland or blended cement, portland cement or blended cement and hydrated lime, masonry cement or plastic cement and aggregate and other approved materials as specified in this code.

**EXTERIOR SURFACES.** Weather-exposed surfaces.

**GYP SUM BOARD.** Gypsum wallboard, gypsum sheathing, gypsum base for gypsum veneer plaster, exterior gypsum soffit board, predecorated gypsum board or water-resistant gypsum backing board complying with the standards listed in Tables 2506.2, 2507.2 and Chapter 35.

**GYP SUM PLASTER.** A mixture of calcined gypsum or calcined gypsum and lime and aggregate and other

*approved materials as specified in this code.*

**GYPSUM VENEER PLASTER.** *Gypsum plaster applied to an approved base in one or more coats normally not exceeding ¼ inch (6.4 mm) in total thickness.*

**INTERIOR SURFACES.** *Surfaces other than weather-exposed surfaces.*

**WEATHER-EXPOSED SURFACES.** *Surfaces of walls, ceilings, floors, roofs, soffits and similar surfaces exposed to the weather except the following:*

- 1. Ceilings and roof soffits enclosed by walls, fascia, bulkheads or beams that extend a minimum of 12 inches (305 mm) below such ceiling or roof soffits.*
- 2. Walls or portions of walls beneath an unenclosed roof area, where located a horizontal distance from an open exterior opening equal to at least twice the height of the opening.*
- 3. Ceiling and roof soffits located a minimum horizontal distance of 10 feet (3048 mm) from the outer edges of the ceiling or roof soffits.*

**WIRE BACKING.** *Horizontal strands of tautened wire attached to surfaces of vertical supports which, when covered with the building paper, provide a backing for cement plaster.*

### **SECTION BC 2503**

#### **RESERVED**

### **SECTION BC 2504**

#### **VERTICAL AND HORIZONTAL ASSEMBLIES**

**2504.1 Scope.** *The following requirements shall be met where construction involves gypsum board, lath and plaster in vertical and horizontal assemblies.*

**2504.1.1 Wood framing.** *Wood supports for lath or gypsum board, as well as wood stripping or furring, shall not be less than 2 inches (51 mm) nominal thickness in the least dimension.*

**Exception:** *The minimum nominal dimension of wood furring strips installed over solid backing shall not be less than 1 inch by 2 inches (25 mm by 51 mm).*

**2504.1.2 Studless partitions.** *The minimum thickness of vertically erected studless solid plaster partitions of 3/8-inch (9.5 mm) and 3/4-inch (19.1 mm) rib metal lath or 1/2-inch-thick (12.7 mm) long-length gypsum lath and gypsum board partitions shall be 2 inches (51 mm).*

**SECTION BC 2505**  
**SHEAR WALL CONSTRUCTION**

**2505.1 Resistance to shear (wood framing).** *Wood-framed shear walls sheathed with gypsum board, lath and plaster shall be designed and constructed in accordance with Section 2306.4 and are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 1617.6.*

**2505.2 Resistance to shear (steel framing).** *Cold-formed steel framed shear walls sheathed with gypsum board and constructed in accordance with the materials and provisions of Sections 2211.1, 2211.2, 2211.2.1 and 2211.2.2.3 are permitted to resist wind and seismic loads. Walls resisting seismic loads shall be subject to the limitations in Section 1617.6.*

**SECTION BC 2506**  
**GYPSUM BOARD MATERIALS**

**2506.1 General.** *Gypsum board materials and accessories shall be identified by the manufacturer's designation to indicate compliance with the appropriate standards referenced in this section and stored to protect such materials from the weather.*

**2506.2 Standards.** *Gypsum board materials shall conform to the appropriate standards listed in Table 2506.2 and Chapter 35 and, where required for fire protection, shall conform to the provisions of Chapter 7.*

**2506.2.1 Other materials.** *Metal suspension systems for acoustical and lay-in panel ceilings shall conform with Section 803.9.*

**TABLE 2506.2  
GYPSUM BOARD MATERIALS AND ACCESSORIES**

MATERIAL	STANDARD
Accessories for gypsum board	ASTM C 1047
Gypsum sheathing	ASTM C 79
Gypsum wallboard	ASTM C 36
Joint reinforcing tape and compound	ASTM C 474; C 475
Nails for gypsum boards	ASTM C 514, F 547, F 1667
Steel screws	ASTM C 954; C 1002
Steel studs, nonload bearing	ASTM C 645
Steel studs, load bearing	ASTM C 955
Water-resistant gypsum backing board	ASTM C 630
Exterior soffit board	ASTM C 931
Fiber-reinforced gypsum panels	ASTM C 1278
Gypsum backing board and gypsum shaftliner board	ASTM C 442
Gypsum ceiling board	ASTM C 1395
Standard specification for gypsum board	ASTM C 1396
Predecorated gypsum board	ASTM C 960
Adhesives for fastening gypsum wallboard	ASTM C 557
Testing gypsum and gypsum products	ASTM C 22; C 472; C 473
Glass mat gypsum substrate	ASTM C 1177
Glass mat gypsum backing panel	ASTM C 1178

**SECTION BC 2507**  
**LATHING AND PLASTERING**

**2507.1 General.** *Lathing and plastering materials and accessories shall be marked by the manufacturer's designation to indicate compliance with the appropriate standards referenced in this section and stored in such a manner to protect them from the weather.*

**2507.2 Standards.** *Lathing and plastering materials shall conform to the standards listed in Table 2507.2 and Chapter 35 and, where required for fire protection, shall also conform to the provisions of Chapter 7.*

**TABLE 2507.2  
LATH, PLASTERING MATERIALS AND ACCESSORIES**

MATERIAL	STANDARD
Accessories for gypsum veneer base	ASTM C 1047
Exterior plaster bonding compounds	ASTM C 932
Gypsum base for veneer plasters	ASTM C 588
Gypsum casting and molding plaster	ASTM C 59
Gypsum Keene's cement	ASTM C 61
Gypsum lath	ASTM C 37

Welded wire lath	ASTM C 933
Woven wire plaster base	ASTM C 1032

**SECTION BC 2508**  
**GYPSUM CONSTRUCTION**

**2508.1 General.** *Gypsum board and gypsum plaster construction shall be of the materials listed in Tables 2506.2 and 2507.2. These materials shall be assembled and installed in compliance with the appropriate standards listed in Tables 2508.1 and 2511.1, and Chapter 35.*

**TABLE 2508.1  
INSTALLATION OF GYPSUM CONSTRUCTION**

<b>MATERIAL</b>	<b>STANDARD</b>
Gypsum sheathing	ASTM C 1280
Gypsum veneer base	ASTM C 844
Gypsum board	GA-216; ASTM C 840
Interior lathing and furring	ASTM C 841
Steel framing for gypsum boards	ASTM C 754; C 1007

**2508.2 Limitations.** Gypsum wallboard or gypsum plaster shall not be used in any exterior surface where such gypsum construction will be exposed directly to the weather. Gypsum wallboard shall not be used where there will be direct exposure to water or continuous high humidity conditions. Gypsum sheathing shall be installed on exterior surfaces in accordance with ASTM C 1280.

**2508.2.1 Weather protection.** Gypsum wallboard, gypsum lath or gypsum plaster shall not be installed until weather protection for the installation is provided.

**2508.3 Single-ply application.** Edges and ends of gypsum board shall occur on the framing members, except those edges and ends that are perpendicular to the framing members. Edges and ends of gypsum board shall be in moderate contact except in concealed spaces where fire-resistance-rated construction, shear resistance or diaphragm action is not required.

**2508.3.1 Floating angles.** Fasteners at the top and bottom plates of vertical assemblies, or the edges and ends of horizontal assemblies perpendicular to supports, and at the wall line are permitted to be omitted except on shear resisting elements or fire-resistance-rated assemblies. Fasteners shall be applied in such a manner as not to fracture the face paper with the fastener head.

**2508.4 Joint treatment.** Gypsum board fire-resistance-rated assemblies shall have joints and fasteners treated.

**Exception:** Joint and fastener treatment need not be provided where any of the following conditions occur:

1. Where the gypsum board is to receive a decorative finish such as wood paneling, battens, acoustical finishes or any similar application that would be equivalent to joint treatment.
2. On single-layer systems where joints occur over wood framing members.
3. Square edge or tongue-and-groove edge gypsum board (V-edge), gypsum backing board or gypsum sheathing.
4. On multilayer systems where the joints of adjacent layers are offset from one to another.
5. Assemblies tested without joint treatment.

**TABLE 2508.5  
SHEAR CAPACITY FOR HORIZONTAL WOOD FRAMED GYPSUM BOARD DIAPHRAGM CEILING ASSEMBLIES**

<b>MATERIAL</b>	<b>THICKNESS OF MATERIAL (MINIMUM) (inches)</b>	<b>SPACING OF FRAMING MEMBERS (MAXIMUM) (inches)</b>	<b>SHEAR VALUE<sup>a,b</sup> (plf of ceiling)</b>	<b>MINIMUM FASTENER SIZE</b>
Gypsum board	1/2	16 o.c.	90	5d cooler or wallboard nail; 1 5/8-inch long; 0.086-inch shank; 1 5/64-inch head <sup>c</sup>
Gypsum board	1/2	24 o.c.	70	5d cooler or wallboard nail; 1 5/8-inch long; 0.086-inch shank; 1 5/64-inch head <sup>c</sup>

For SI: 1 inch = 25.4 mm.

- a. Values are not cumulative with other horizontal diaphragm values and are for short-term loading due to wind or seismic loading. Values shall be reduced 25 percent for normal loading.
- b. Values shall be reduced 50 percent in Seismic Categories D, E and F.
- c. 1 1/4-inch, No. 6 Type S or W screws are permitted to be substituted for the listed nails.

**2508.5 Horizontal gypsum board diaphragm ceilings.** Gypsum board shall be permitted to be used on wood joists to create a horizontal diaphragm ceiling in accordance with Table 2508.5.

**2508.5.1 Diaphragm proportions.** The maximum allowable diaphragm proportions shall be 1 1/2:1 between shear resisting elements. Rotation or cantilever conditions shall not be permitted.

**2508.5.2 Installation.** Gypsum board used in a horizontal diaphragm ceiling shall be installed perpendicular to ceiling framing members. End joints of adjacent courses of gypsum board shall not occur on the same joist.

**2508.5.3 Blocking of perimeter edges.** All perimeter edges shall be blocked using a wood member not less than 2-inch by 6-inch (51 mm by 152 mm) nominal dimension. Blocking material shall be installed flat over the top plate of the wall to provide a nailing surface not less than 2 inches (51 mm) in width for the attachment of the gypsum board.

**2508.5.4 Fasteners.** Fasteners used for the attachment of gypsum board to a horizontal diaphragm ceiling shall be as defined in Table 2508.5. Fasteners shall be spaced not more than 7 inches (178 mm) on center (o.c.) at all supports, including perimeter blocking, and not more than 3/8 inch (9.5 mm) from the edges and ends of the gypsum board.

**2508.5.5 Lateral force restrictions.** Gypsum board shall not be used in diaphragm ceilings to resist lateral forces imposed by masonry or concrete construction.

**SECTION BC 2509**

**GYPSUM BOARD IN SHOWERS  
AND WATER CLOSETS**

**2509.1 Wet areas.** Showers and public toilet walls shall conform to Sections 1210.2 and 1210.3.

**2509.2 Base for tile.** When gypsum board is used as a base for tile or wall panels for tubs, shower or water closet compartment walls, water-resistant gypsum backing board shall be used as a substrate. Regular gypsum wallboard is permitted under tile or wall panels in other wall and ceiling areas when installed in accordance with GA-216 or ASTM C 840.

**2509.3 Limitations.** Water-resistant gypsum backing board shall not be used in the following locations:

1. Over a vapor retarder in shower or bathtub compartments.
2. Where there will be direct exposure to water or in areas subject to continuous high humidity.
3. On ceilings where frame spacing exceeds 12 inches (305 mm) o.c. for 1/2-inch-thick (12.7 mm) water-resistant gypsum backing board and more than 16 inches (406 mm) o.c. for 5/8-inch-thick (15.9 mm) water-resistant gypsum backing board.

**SECTION BC 2510  
LATHING AND FURRING FOR  
CEMENT PLASTER (STUCCO)**

**2510.1 General.** Exterior and interior cement plaster and lathing shall be done with the appropriate materials listed in Table 2507.2 and Chapter 35.

**2510.2 Weather protection.** Materials shall be stored in such a manner as to protect such materials from the weather.

**2510.3 Installation.** Installation of these materials shall be in compliance with ASTM C 926 and ASTM C 1063.

**2510.4 Corrosion resistance.** Metal lath and lath attachments shall be of corrosion-resistant material.

**2510.5 Backing.** Backing or a lath shall provide sufficient rigidity to permit plaster applications.

**2510.5.1 Support of lath.** Where lath on vertical surfaces extends between rafters or other similar projecting members, solid backing shall be installed to provide support for lath and attachments.

**2510.5.2 Use of gypsum backing board.**

**2510.5.2.1 Use of gypsum board as a backing board.** Gypsum lath or gypsum wallboard shall not be used as a backing for cement plaster.

**Exception:** Gypsum lath or gypsum wallboard is permitted, with a weather-resistant barrier, as a backing for self-furred metal lath or self-furred wire fabric lath and cement plaster where either of the following conditions occur:

1. On horizontal supports of ceilings or roof soffits.
2. On interior walls.

**2510.5.2.2 Use of gypsum sheathing backing.** Gypsum sheathing is permitted as a backing for metal or wire fabric lath and cement plaster on walls. A weather-resistant barrier shall be provided in accordance with Section 2510.6.

**2510.5.3 Backing not required.** Wire backing is not required under expanded metal lath or paperbacked wire fabric lath.

**2510.6 Weather-resistant barriers.** Weather-resistant barriers shall be installed as required in Section 1404.2 and, where applied over wood-based sheathing, shall include a weather-resistant vapor-permeable barrier with a performance at least equivalent to two layers of Grade D paper.

**2510.7 Preparation of masonry and concrete.** Surfaces shall be clean, free from efflorescence, sufficiently damp and rough for proper bond. If the surface is insufficiently rough, approved bonding agents or a portland cement dash bond coat mixed in proportions of not more than two parts volume of sand to one part volume of portland cement or plastic cement shall be applied. The dash bond coat shall be left undisturbed and shall be moist cured not less than 24 hours.

**SECTION BC 2511  
INTERIOR PLASTER**

*2511.1 General. Plastering gypsum plaster or cement plaster shall not be less than three coats where applied over metal lath or wire fabric lath and not less than two coats where applied over other bases permitted by this chapter.*

***Exception:** Gypsum veneer plaster and cement plaster specifically designed and approved for one-coat applications.*

**TABLE 2511.1  
INSTALLATION OF PLASTER CONSTRUCTION**

MATERIAL	STANDARD
Gypsum plaster	ASTM C 842
Gypsum veneer plaster	ASTM C 843
Interior lathing and furring (gypsum plaster)	ASTM C 841
Lathing and furring (cement plaster)	ASTM C 1063
Portland cement plaster	ASTM C 926
Steel framing	ASTM C 754; C 1007

**2511.1.1 Installation.** *Installation of lathing and plaster materials shall conform with Table 2511.1 and Section 2507.*

**2511.2 Limitations.** *Plaster shall not be applied directly to fiber insulation board. Cement plaster shall not be applied directly to gypsum lath or gypsum plaster except as specified in Sections 2510.5.1 and 2510.5.2.*

**2511.3 Grounds.** *Where installed, grounds shall ensure the minimum thickness of plaster as set forth in ASTM C 842 and ASTM C 926. Plaster thickness shall be measured from the face of lath and other bases.*

**2511.4 Interior masonry or concrete.** *Condition of surfaces shall be as specified in Section 2510.7. Approved specially prepared gypsum plaster designed for application to concrete surfaces or approved acoustical plaster is permitted. The total thickness of base coat plaster applied to concrete ceilings shall be as set forth in ASTM C 842 or ASTM C 926. Should ceiling surfaces require more than the maximum thickness permitted in ASTM C 842 or ASTM C 926, metal lath or wire fabric lath shall be installed on such surfaces before plastering.*

**2511.5 Wet areas.** *Showers and public toilet walls shall conform to Sections 1210.2 and 1210.3. When wood frame walls and partitions are covered on the interior with cement plaster or tile of similar material and are subject to water splash, the framing shall be protected with an approved moisture barrier.*

## **SECTION BC 2512 EXTERIOR PLASTER**

**2512.1 General.** *Plastering with cement plaster shall not be less than three coats where applied over metal lath or wire fabric lath and not less than two coats where applied over masonry, concrete or gypsum board backing as specified in Section 2510.5. If the plaster surface is to be completely covered by veneer or other facing material, or is completely concealed by another wall, plaster application need be only two coats, provided the total thickness is as set forth in ASTM C 926.*

**2512.1.1 On-grade floor slab.** *On wood framed or steel stud construction with an on-grade concrete floor slab system, exterior plaster shall be applied in such a manner as to cover, but not to extend below, the lath and paper. The application of lath, paper and flashing or drip screeds shall comply with ASTM C 1063.*

**2512.1.2 Weep screeds.** *A minimum 0.019-inch (0.48 mm) (No. 26 galvanized sheet gage), corrosion-resistant weep screed with a minimum vertical attachment flange of <sup>3</sup>/<sub>2</sub> inches (89 mm) shall be*

*provided at or below the foundation plate line on exterior stud walls in accordance with ASTM C 926. The weep screed shall be placed a minimum of 4 inches (102 mm) above the earth or 2 inches (51 mm) above paved areas and be of a type that will allow trapped water to drain to the exterior of the building. The weather-resistant barrier shall lap the attachment flange. The exterior lath shall cover and terminate on the attachment flange of the weep screed.*

**2512.2 Plasticity agents.** *Only approved plasticity agents and approved amounts thereof shall be added to portland cement. When plastic cement or masonry cement is used, no additional lime or plasticizers shall be added. Hydrated lime or the equivalent amount of lime putty used as a plasticizer is permitted to be added to cement plaster or cement and lime plaster in an amount not to exceed that set forth in ASTM C 926.*

**2512.3 Limitations.** *Gypsum plaster shall not be used on exterior surfaces.*

**2512.4 Cement plaster.** *Plaster coats shall be protected from freezing for a period of not less than 24 hours after set has occurred. Plaster shall be applied when the ambient temperature is higher than 40°F (4°C), unless provisions are made to keep cement plaster work above 40°F (4°C) during application and 48 hours thereafter.*

**2512.5 Second-coat application.** *The second coat shall be brought out to proper thickness, rodded and floated sufficiently rough to provide adequate bond for the finish coat. The second coat shall have no variation greater than ¼ inch (6.4 mm) in any direction under a 5-foot (1524 mm) straight edge.*

**2512.6 Curing and interval.** *First and second coats of cement plaster shall be applied and moist cured as set forth in ASTM C 926 and Table 2512.6.*

**TABLE 2512.6  
CEMENT PLASTERS<sup>a</sup>**

COAT	MINIMUM PERIOD MOIST CURING	MINIMUM INTERVAL BETWEEN COATS
First	48 hours <sup>a</sup>	48 hours <sup>b</sup>
Second	48 hours	7 days <sup>c</sup>
Finish	—	Note c

- a. The first two coats shall be as required for the first coats of exterior plaster, except that the moist-curing time period between the first and second coats shall not be less than 24 hours. Moist curing shall not be required where job and weather conditions are favorable to the retention of moisture in the cement plaster for the required time period.
- b. Twenty-four-hour minimum interval between coats of interior cement plaster. For alternate method of application, see Section 2512.8.
- c. Finish coat plaster is permitted to be applied to interior portland cement base coats after a 48-hour period.

**2512.7 Application to solid backings.** Where applied over gypsum backing as specified in Section 2510.5 or directly to unit masonry surfaces, the second coat is permitted to be applied as soon as the first coat has attained sufficient hardness.

**2512.8 Alternate method of application.** The second coat is permitted to be applied as soon as the first coat has attained sufficiently rigidity to receive the second coat.

**2512.8.1 Admixtures.** When using this method of application, calcium aluminate cement up to 15 percent of the weight of the portland cement is permitted to be added to the mix.

**2512.8.2 Curing.** Curing of the first coat is permitted to be omitted and the second coat shall be cured as set forth in ASTM C 926 and Table 2512.6.

**2512.9 Finish coats.** Cement plaster finish coats shall be applied over base coats that have been in place for the time periods set forth in ASTM C 926. The third or finish coat shall be applied with sufficient material and pressure to bond and to cover the brown coat and shall be of sufficient thickness to conceal the brown coat.

### **SECTION BC 2513 EXPOSED AGGREGATE PLASTER**

**2513.1 General.** Exposed natural or integrally colored aggregate is permitted to be partially embedded in a natural or colored bedding coat of cement plaster or gypsum plaster, subject to the provisions of this section.

**2513.2 Aggregate.** The aggregate shall be applied manually or mechanically and shall consist of marble chips, pebbles or similar durable, moderately hard (three or more on the Mohs hardness scale), nonreactive materials.

**2513.3 Bedding coat proportions.** The bedding coat for interior or exterior surfaces shall be composed of one-part portland cement, one-part Type S lime and a maximum of three parts of graded white or natural sand by volume. The bedding coat for interior surfaces shall be composed of 100 pounds (45.4 kg) of neat gypsum plaster and a maximum of 200 pounds (90.8 kg) of graded white sand. A factory-prepared bedding coat for interior or exterior use is permitted. The bedding coat for exterior surfaces shall have a minimum compressive strength of 1,000 pounds per square inch (psi) (6895 kPa).

**2513.4 Application.** *The bedding coat is permitted to be applied directly over the first (scratch) coat of plaster, provided the ultimate overall thickness is a minimum of 7/8 inch (22 mm), including lath. Over concrete or masonry surfaces, the overall thickness shall be a minimum of 1/2 inch (12.7 mm).*

**2513.5 Bases.** *Exposed aggregate plaster is permitted to be applied over concrete, masonry, cement plaster base coats or gypsum plaster base coats installed in accordance with Section 2511 or 2512.*

**2513.6 Preparation of masonry and concrete.** *Masonry and concrete surfaces shall be prepared in accordance with the provisions of Section 2510.7.*

**2513.7 Curing of base coats.** *Cement plaster base coats shall be cured in accordance with ASTM C926. Cement plaster bedding coats shall retain sufficient moisture for hydration (hardening) for 24 hours minimum or, where necessary, shall be kept damp for 24 hours by light water spraying.*

**CHAPTER 26**

**PLASTIC**

**SECTION BC 2601**

**GENERAL**

**2601.1 Scope.** *These provisions shall govern the materials, design, application, construction and installation of foam plastic, foam plastic insulation, plastic veneer, interior plastic finish and trim, and light-transmitting plastics. See Chapter 14 for requirements for exterior wall finish and trim.*

**SECTION BC 2602**

**DEFINITIONS**

**2602.1 General.** *The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.*

**FOAM PLASTIC INSULATION.** *A plastic that is intentionally expanded by the use of a foaming agent to produce a reduced-density plastic containing voids consisting of open or closed cells distributed throughout the plastic for thermal insulating or acoustical purposes and that has a density less than 20 pounds per cubic foot (pcf) (320 kg/m<sup>3</sup>).*

**LIGHT-DIFFUSING SYSTEM.** *Construction consisting in whole or in part of lenses, panels, grids or baffles made with light-transmitting plastics positioned below independently mounted electrical light sources, skylights or light-transmitting plastic roof panels. Lenses, panels, grids and baffles that are part of an electrical fixture shall not be considered as a light-diffusing system.*

**LIGHT-TRANSMITTING PLASTIC ROOF PANELS.** *Structural plastic panels other than skylights that are fastened to structural members, or panels or sheathing, and that are used as light-transmitting media in the plane of the roof.*

**LIGHT-TRANSMITTING PLASTIC WALL PANELS.** *Plastic materials that are fastened to structural members, or to structural panels or sheathing, and that are used as light-transmitting media in exterior walls.*

**PLASTIC, APPROVED.** *Any thermoplastic, thermosetting or reinforced thermosetting plastic material that conforms to combustibility classifications specified in the section applicable to the application and*

*plastic type.*

**PLASTIC GLAZING.** *Plastic materials that are glazed or set in frame or sash and not held by mechanical fasteners that pass through the glazing material.*

**REINFORCED PLASTIC, GLASS FIBER.** *Plastic reinforced with glass fiber having not less than 20 percent of glass fibers by weight.*

**THERMOPLASTIC MATERIAL.** *A plastic material that is capable of being repeatedly softened by increase of temperature and hardened by decrease of temperature.*

**THERMOSETTING MATERIAL.** *A plastic material that is capable of being changed into a substantially nonreformable product when cured.*

### **SECTION BC 2603**

#### **FOAM PLASTIC INSULATION**

**2603.1 General.** *The provisions of this section shall govern the requirements and uses of foam plastic insulation in buildings and structures.*

**2603.2 Labeling and identification.** *Packages and containers of foam plastic insulation and foam plastic insulation components delivered to the job site shall bear the label of an approved agency showing the manufacturer's name, the product listing, product identification and information sufficient to determine that the end use will comply with the code requirements.*

**2603.3 Surface-burning characteristics.** *Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.*

#### **Exceptions:**

1. *Foam plastic interior trim shall comply with the flame spread and smoke-developed indexes as provided for in Section 2604.2.*

2. *In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved automatic sprinkler system shall be provided in both the room and that part of the building in which the room is located.*
3. *Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly shall be exempt from the flame spread requirements of this section provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256. The smoke-developed index shall not be limited for roof applications.*
4. *Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.8 using the thickness and density intended for use.*
5. *Foam plastic interior signs in covered mall buildings shall not be required to comply with the flame spread and smoke-developed indexes of this section, provided the signs comply with Section 402.14.*

**2603.4 Thermal barrier.** *Except as provided for in Sections 2603.4.1 and 2603.8, foam plastic shall be separated from the interior of a building by an approved thermal barrier of 0.5-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (120°C) after 15 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on FM 4880, UL 1040, NFPA 286 or UL 1715. Combustible concealed spaces shall comply with Section 717.*

**2603.4.1 Thermal barrier not required.** *The thermal barrier specified in Section 2603.4 is not required under the conditions set forth in Sections 2603.4.1.1 through 2603.4.1.13.*

**2603.4.1.1 Masonry or concrete construction.** *Foam plastic insulation in a masonry or concrete wall, floor or roof system shall be permitted without a thermal barrier provided that each face is covered by a minimum of 1 inch (25 mm) thickness of masonry or concrete.*

**2603.4.1.2 Cooler and freezer walls.** Foam plastic installed in a maximum thickness of 10 inches (254 mm) in cooler and freezer walls shall be permitted without thermal barrier, provided that the walls:

1. Have a flame spread index of 25 or less and a smoke-developed index of not more than 450, where tested in a minimum 4-inch (102 mm) thickness.
2. Have flash ignition and self-ignition temperatures of not less than 600°F and 800°F (316°C and 427°C), respectively.
3. Have a covering of not less than 0.032-inch (0.8 mm) aluminum or corrosion-resistant steel having a base metal thickness not less than 0.0160 inch (0.4 mm) at any point.
4. Are protected by an automatic sprinkler system. Where the cooler or freezer is within a building, both the cooler or freezer and that part of the building in which it is located shall be sprinklered.

**2603.4.1.3 Walk-in coolers.** In nonsprinklered buildings, foam plastic having a thickness that does not exceed 4 inches (102 mm) and a maximum flame spread index of 75 is permitted without thermal barrier in walk-in coolers or freezer units where the aggregate floor area does not exceed 400 square feet (37 m<sup>2</sup>) and the foam plastic is covered by a metal facing not less than 0.032-inch-thick (0.81 mm) aluminum or corrosion-resistant steel having a minimum base metal thickness of 0.016 inch (0.41 mm). A thickness of up to 10 inches (254 mm) is permitted where protected by a thermal barrier.

**2603.4.1.4 Exterior walls — one-story buildings.** For one-story buildings, foam plastic having a flame spread index of 25 or less, and a smoke-developed index of not more than 450, shall be permitted without thermal barriers in or on exterior walls in a thickness not more than 4 inches (102 mm) where the foam plastic is covered by a thickness of not less than 0.032-inch-thick (0.81 mm) aluminum or corrosion-resistant steel having a base metal thickness of 0.0160 inch (0.41 mm) and the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

**2603.4.1.5 Roofing.** In construction classes that permit wood sheathing, foam plastic insulation under a roof assembly or roof covering shall be permitted without a thermal barrier, provided that it is installed in accordance with the code and the manufacturer's instructions. It shall be

separated from the interior of the building by wood structural panel sheathing not less than 0.47 inch (11.9 mm) in thickness bonded with exterior glue, with edges supported by blocking, tongue-and-groove joints or other approved type of edge support, or an equivalent material. A thermal barrier is not required for foam plastic insulation that is a part of a Class A, B or C roof-covering assembly, provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256.

**2603.4.1.6 Attics and crawl spaces.** Within an attic or crawl space where entry is made only for service of utilities, foam plastic insulation shall be permitted without thermal barrier if protected against ignition by 1.5-inch-thick (38 mm) mineral fiber insulation; 0.25-inch-thick (6.4 mm) wood structural panel, particleboard or hardboard; 0.375-inch (9.5 mm) gypsum wallboard, corrosion-resistant steel having a base metal thickness of 0.016 inch (0.4 mm) or other approved material installed in such a manner that the foam plastic insulation is not exposed. The protective covering shall be consistent with the requirements for the type of construction.

**2603.4.1.7 Doors not required to have a fire protection rating.** Where pivoted or side-hinged doors are permitted without a fire protection rating, foam plastic insulation, having a flame spread index of 75 or less and a smoke-developed index of not more than 450, shall be permitted as a core material without a thermal barrier where the door facing is of metal having a minimum thickness of 0.032-inch (0.8 mm) aluminum or steel having a base metal thickness of not less than 0.016 inch (0.4 mm) at any point.

**2603.4.1.8 Exterior doors in buildings of Group R-2 or R-3.** In occupancies classified as Group R-2 or R-3, foam-filled exterior entrance doors to individual dwelling units that do not require a fire-resistance rating shall be permitted without a thermal barrier, provided that the doors are faced with wood or other approved materials.

**2603.4.1.9 Garage doors.** Where garage doors are permitted without a fire-resistance rating, foam plastic is permitted as a core material, provided that the door facing shall be metal having a minimum thickness of 0.032-inch (0.8 mm) aluminum or 0.010-inch (0.25 mm) steel or the facing shall be minimum 0.125-inch-thick (3.2 mm) wood. Garage doors having facings other than those described above shall be tested in accordance with, and meet the acceptance criteria of DASMA 107.

**2603.4.1.9.1 Garage doors in one- and two-family dwellings.** *Garage doors using foam plastic insulation complying with Section 2603.3 in detached and attached garages associated with one- and two-family dwellings need not be provided with a thermal barrier.*

**2603.4.1.10 Siding backer board.** *Foam plastic insulation of not more than 2,000 British thermal units per square feet (Btu/sq. ft.) (22.7 MJ/m<sup>2</sup>) as determined by NFPA 259 shall be permitted as a siding backer board with a maximum thickness of 0.5 inch (12.7 mm) without a thermal barrier, provided it is separated from the interior of the building by not less than 2 inches (51 mm) of mineral fiber insulation or equivalent or where applied as insulation over existing wall construction.*

**2603.4.1.11 Interior trim.** *Foam plastic used as interior trim in accordance with Section 2604 shall be permitted without a thermal barrier.*

**2603.4.1.12 Interior signs.** *Foam plastic used for interior signs in covered mall buildings in accordance with Section 402.14 shall be permitted without a thermal barrier.*

**2603.4.1.13 Type V construction.** *Foam plastic spray applied to a sill plate and header of Type V construction is permitted without a thermal barrier, subject to all of the following:*

1. *The maximum thickness of the foam plastic shall be 3¼ inches (82.6 mm).*
2. *The density of the foam plastic shall be in the range of 1.5 to 2.0 pcf (24 to 32 kg/m<sup>3</sup>).*
3. *The foam plastic shall have a flame spread index of 25 or less and an accompanying smoke-developed index of 450 or less when tested in accordance with ASTM E84.*

**2603.5 Exterior walls of buildings of any height.** *Exterior walls of buildings of Type I, II, III or IV construction of any height shall comply with 2603.5.1 through 2603.5.7. Exterior walls of cold storage buildings required to be constructed of noncombustible materials, where the building is more than one story in height, shall also comply with the provisions of Sections 2603.5.1 through 2603.5.7. Exterior walls of buildings of Type V construction shall comply with Sections 2603.2, 2603.3 and 2603.4.*

**2603.5.1 Fire-resistance-rated walls.** *Where the wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E 119 shall be provided to substantiate that the fire-resistance rating is maintained.*

**2603.5.2 Reserved.**

**2603.5.3 Potential heat.** *The potential heat of foam plastic insulation in any portion of the wall or panel shall not exceed the potential heat expressed in Btu per square feet ( $\text{mJ}/\text{m}^2$ ) of the foam plastic insulation contained in the wall assembly tested in accordance with Section 2603.5.5. The potential heat of the foam plastic insulation shall be determined by tests conducted in accordance with NFPA 259 and the results shall be expressed in Btu per square feet ( $\text{mJ}/\text{m}^2$ ).*

**Exception:** *One-story buildings complying with Section 2603.4.1.4.*

**2603.5.4 Flame spread and smoke-developed indexes.** *Foam plastic insulation, exterior coatings and facings shall be tested separately in the thickness intended for use, but not to exceed 4 inches (102 mm), and shall each have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84.*

**Exception:** *Prefabricated or factory-manufactured panels having minimum 0.020-inch (0.51 mm) aluminum facings and a total thickness of 0.25 inch (6.4 mm) or less are permitted to be tested as an assembly where the foam plastic core is not exposed in the course of construction.*

**2603.5.5 Test standard.** *The wall assembly shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.*

**Exception:** *One-story buildings complying with Section 2603.4.1.4.*

**2603.5.6 Label required.** *The edge or face of each piece of foam plastic insulation shall bear the label of an approved agency. The label shall contain the manufacturer's or distributor's identification, model number, serial number or definitive information describing the product or materials' performance characteristics and approved agency's identification.*

**2603.5.7 Ignition.** *Exterior walls shall not exhibit sustained flaming where tested in accordance with NFPA 268. Where a material is intended to be installed in more than one thickness, tests of the minimum and maximum thickness intended for use shall be performed.*

**Exception:** *Assemblies protected on the outside with one of the following:*

1. *A thermal barrier complying with Section 2603.4.*
2. *A minimum 1-inch (25 mm) thickness of concrete or masonry.*
3. *Glass-fiber-reinforced concrete panels of a minimum thickness of 0.375 inch (9.5 mm).*
4. *Metal-faced panels having minimum 0.019-inch-thick (0.48 mm) aluminum or 0.016-inch thick (0.41 mm) corrosion-resistant steel outer facings.*
5. *A minimum 0.875-inch (22.2 mm) thickness of stucco complying with Section 2510.*

**2603.6 Roofing assembly.** *Foam plastic insulation meeting the requirements of Sections 2603.2, 2603.3 and 2603.4 shall be permitted as part of a roof-covering assembly, provided the assembly with the foam plastic insulation is a Class A, B or C roofing assembly where tested in accordance with ASTM E 108 or UL 790.*

**2603.7 Plenums.** *Foam plastic insulation shall not be used as interior wall or ceiling finish in plenums except as permitted in Section 2604 or when protected by a thermal barrier in accordance with Section 2603.4.*

**2603.8 Special approval.** *Foam plastic shall not be required to comply with the requirements of Sections 2603.4 through 2603.7, where specifically approved by the department based on large-scale tests such as, but not limited to, FM 4880, UL 1040, NFPA 286 or UL 1715. Such testing shall be related to the actual end-use configuration and be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as interior finish on the basis of special tests shall also conform to the flame spread requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.*

## **SECTION BC 2604**

### **INTERIOR FINISH AND TRIM**

**2604.1 General.** *Plastic materials installed as interior finish or trim shall comply with Chapter 8. Foam plastics shall only be installed as interior finish where approved in accordance with the special provisions of Section 2603.8. Foam plastics that are used as interior finish shall also meet the flame spread index requirements for interior finish in accordance with Chapter 8. Foam plastics installed as interior trim shall*

comply with Section 2604.2.

**2604.2 Foam plastic interior trim.** Foam plastic used as interior trim shall comply with Sections 2604.2.1 through 2604.2.4.

**2604.2.1 Density.** The minimum density of the interior trim shall be 20 pcf (320 kg/m<sup>3</sup>).

**2604.2.2 Thickness.** The maximum thickness of the interior trim shall be 0.5 inch (12.7 mm) and the maximum width shall be 8 inches (204 mm).

**2604.2.3 Area limitation.** The interior trim shall not constitute more than 10 percent of the aggregate wall and ceiling area of any room or space.

**2604.2.4 Flame spread.** The flame spread index shall not exceed 75 where tested in accordance with ASTM E 84. The smoke-developed index shall not be limited.

## **SECTION BC 2605**

### **PLASTIC VENEER**

**2605.1 Interior use.** Where used within a building, plastic veneer shall comply with the interior finish requirements of Chapter 8.

**2605.2 Exterior use.** Exterior plastic veneer shall be permitted to be installed on the exterior walls of buildings of any type of construction in accordance with all of the following requirements:

1. Plastic veneer shall comply with Section 2606.4.
2. Plastic veneer shall not be attached to any exterior wall to a height greater than 50 feet (15 240 mm) above grade.
3. Sections of plastic veneer shall not exceed 300 square feet (27.9 m<sup>2</sup>) in area and shall be separated by a minimum of 4 feet (1219 mm) vertically.

**Exception:** The area and separation requirements and the smoke-density limitation are not applicable to plastic veneer applied to buildings constructed of Type VB construction, provided the walls are not required to have a fire-resistance rating.

**SECTION BC 2606**  
**LIGHT-TRANSMITTING PLASTICS**

**2606.1 General.** *The provisions of this section and Sections 2607 through 2611 shall govern the quality and methods of application of light-transmitting plastics for use as light-transmitting materials in buildings and structures. Foam plastics shall comply with Section 2603. Light-transmitting plastic materials that meet the other code requirements for walls and roofs shall be permitted to be used in accordance with the other applicable chapters of the code.*

**2606.2 Approval for use.** *Sufficient technical data shall be submitted to substantiate the proposed use of any light-transmitting material, as approved by the department and subject to the requirements of this section.*

**2606.3 Identification.** *Each unit or package of light-transmitting plastic shall be identified with a mark or decal satisfactory to the commissioner, which includes identification as to the material classification.*

**2606.4 Specifications.** *Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E 84, or not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:*

***Class CC1:** Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,*

***Class CC2:** Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.*

**2606.5 Structural requirements.** *Light-transmitting plastic materials in their assembly shall be of adequate strength and durability to withstand the loads indicated in Chapter 16. Technical data shall be submitted to establish stresses, maximum unsupported spans and such other information for the various thicknesses and forms used as deemed necessary by the department.*

**2606.6 Fastening.** Fastening shall be adequate to withstand the loads in Chapter 16. Proper allowance shall be made for expansion and contraction of light-transmitting plastic materials in accordance with accepted data on the coefficient of expansion of the material and other material in conjunction with which it is employed.

**2606.7 Light-diffusing systems.** Light diffusing systems shall comply with Sections 2603.7.1 through 2603.7.6. Light-diffusing systems shall not be installed in the following occupancies and locations:

1. Any room in which the net floor area per occupant is 20 square feet (1.86 m<sup>2</sup>) or less, or any room leading therefrom through which it is necessary for occupants to pass in order to reach the only exit.
2. Group I-2.
3. Group I-3.
4. Exit stairways and exit passageways.

**2606.7.1 Support.** Light-transmitting plastic diffusers shall be supported directly or indirectly from ceiling or roof construction by use of noncombustible hangers. Hangers shall be at least No. 12 steel-wire gage (0.106 inch) galvanized wire or equivalent.

**Exception:** Light-transmitting plastic diffusers used in suspended acoustical ceiling systems shall conform with the support requirements as set forth in Section 803.9.

**2606.7.2 Installation.** Light-transmitting plastic diffusers shall comply with Chapter 8 unless the light-transmitting plastic diffusers will fall from the mountings before igniting, at an ambient temperature of at least 200°F (93°C) below the ignition temperature of the panels. The panels shall remain in place at an ambient room temperature of 175°F (79°C) for a period of not less than 15 minutes.

**2606.7.3 Size limitations.** Individual panels or units shall not exceed 10 feet (3048 mm) in length nor 30 square feet (2.79 m<sup>2</sup>) in area.

**2606.7.4 Fire suppression system.** In buildings that are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, plastic light-diffusing systems shall be

*protected both above and below unless the sprinkler system has been specifically approved for installation only above the light-diffusing system. Areas of light-diffusing systems that are protected in accordance with this section shall not be limited.*

**2606.7.5 Electrical lighting fixtures.** *Light-transmitting plastic panels and light-diffuser panels that are installed in approved electrical lighting fixtures shall comply with the requirements of Chapter 8 unless the light-transmitting plastic panels conform to the requirements of Section 2606.7.2.*

**2606.8 Partitions.** *Light-transmitting plastics used in or as partitions shall comply with the requirements of Chapters 6 and 8.*

**2606.9 Bathroom accessories.** *Light-transmitting plastics shall be permitted as glazing in shower stalls, shower doors, bathtub enclosures and similar accessory units. Safety glazing shall be provided in accordance with Chapter 24.*

**2606.10 Awnings, patio covers and similar structures.** *Awnings constructed of light-transmitting plastics shall be constructed in accordance with provisions specified in Section 3105 and Chapter 32 for projections and appendages. Patio covers constructed of light-transmitting plastics shall comply with Section 2606. Light-transmitting plastics used in canopies at motor fuel-dispensing facilities shall comply with Section 2606 except as modified by Section 406.5.2.*

**2606.11 Greenhouses.** *Light-transmitting plastics shall be permitted in lieu of plain glass in greenhouses.*

**2606.12 Solar collectors.** *Light-transmitting plastic covers on solar collectors having noncombustible sides and bottoms shall be permitted on buildings not over three stories in height or 9,000 square feet (836.1 m<sup>2</sup>) in total floor area, provided the light-transmitting plastic cover does not exceed 33.33 percent of the roof area for CC1 materials or 25 percent of the roof area for CC2 materials.*

**Exception:** *Light-transmitting plastic covers having a thickness of 0.010 inch (0.3 mm) or less or shall be permitted to be of any plastic material provided the area of the solar collectors does not exceed 33.33 percent of the roof area.*

**SECTION BC 2607**  
**LIGHT-TRANSMITTING PLASTIC WALL PANELS**

**2607.1 General.** *Light-transmitting plastics shall be permitted to be used as wall panels in exterior walls, provided that the walls are not required to have a fire-resistance rating and the installation conforms to the requirements of this section. Such panels shall be erected and anchored on a foundation, waterproofed or otherwise protected from moisture absorption and sealed with a coat of mastic or other approved waterproof coating. Light-transmitting plastic wall panels shall also comply with Section 2606.*

**Exception:** *Light-transmitting plastics shall not be used as wall panels in exterior walls in occupancies in Groups A-1, A-2, H, I-2 and I-3.*

**2607.2 Installation.** *Exterior wall panels installed as provided for herein shall not alter the type of construction classification of the building.*

**2607.3 Height limitation.** *Light-transmitting plastics shall not be installed more than 75 feet (22 860 mm) above grade plane, except as allowed by Section 2607.5.*

**2607.4 Area limitation and separation.** *The maximum area of a single wall panel and minimum vertical and horizontal separation requirements for exterior light-transmitting plastic wall panels shall be as provided for in Table 2607.4. The maximum percentage of wall area of any story in light-transmitting plastic wall panels shall not exceed that indicated in Table 2607.4 or the percentage of unprotected openings permitted by Section 704.8, whichever is smaller.*

**Exceptions:**

- 1. In structures provided with approved flame barriers extending 30 inches (760 mm) beyond the exterior wall in the plane of the floor, a vertical separation is not required at the floor except that provided by the vertical thickness of the flame barrier projection.*
- 2. Veneers of approved weather-resistant light-transmitting plastics used as exterior siding in buildings of Type V construction in compliance with Section 1406.*
- 3. The area of light-transmitting plastic wall panels in exterior walls of greenhouses shall be exempt from the area limitations of Table 2607.4 but shall be limited as required for unprotected openings in accordance with Section 704.8.*

**TABLE 2607.4  
AREA LIMITATION AND SEPARATION REQUIREMENTS FOR  
LIGHT-TRANSMITTING PLASTIC WALL PANELS<sup>a</sup>**

FIRE SEPARATION DISTANCE (feet)	CLASS OF PLASTIC	MAXIMUM PERCENTAGE AREA OF EXTERIOR WALL IN PLASTIC WALL PANELS	MAXIMUM SINGLE AREA OF PLASTIC WALL PANELS (square feet)	MINIMUM SEPARATION OF PLASTIC WALL PANELS (feet)	
				Vertical	Horizontal
Less than 6	—	Not Permitted	Not Permitted	—	—
6 or more but less than 11	CC1	10	50	8	4
	CC2	Not Permitted	Not Permitted	—	—
11 or more but less than or equal to 30	CC1	25	90	6	4
	CC2	15	70	8	4
Over 30	CC1	50	Not Limited	3 <sup>b</sup>	0
	CC2	50	100	6 <sup>b</sup>	3

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m<sup>2</sup>.

a. For combinations of plastic glazing and plastic wall panel areas permitted, see Section 2607.6.

b. For reductions in vertical separation allowed, see Section 2607.4.

**2607.5 Automatic sprinkler system.** Where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum percentage area of exterior wall in any story in light-transmitting plastic wall panels and the maximum square footage of a single area given in Table 2607.4 shall be increased 100 percent, but the area of light-transmitting plastic wall panels shall not exceed 50 percent of the wall area in any story, or the area permitted by Section 704.8 for unprotected openings, whichever is smaller. These installations shall be exempt from height limitations.

**2607.6 Combinations of glazing and wall panels.** Combinations of light-transmitting plastic glazing and light-transmitting plastic wall panels shall be subject to the area, height and percentage limitations and the separation requirements applicable to the class of light-transmitting plastic as prescribed for light-transmitting plastic wall panel installations.

## **SECTION BC 2608**

### **LIGHT-TRANSMITTING PLASTIC GLAZING**

**2608.1 Buildings of Type VB construction.** Openings in the exterior walls of buildings of Type VB construction, where not required to be protected by Section 704, shall be permitted to be glazed or equipped with light-transmitting plastic. Light-transmitting plastic glazing shall also comply with Section 2606.

**2608.2 Buildings of other types of construction.** Openings in the exterior walls of buildings of types of construction other than Type VB, where not required to be protected by Section 704, shall be permitted to be glazed or equipped with light-transmitting plastic in accordance with Section 2606 and all of the following:

1. The aggregate area of light-transmitting plastic glazing shall not exceed 25 percent of the area of any wall face of the story in which it is installed. The area of a single pane of glazing installed above the first story above grade plane shall not exceed 16 square feet (1.5 m<sup>2</sup>) and the vertical dimension of a single pane shall not exceed 4 feet (1219 mm).

**Exception:** Where an automatic sprinkler system is provided throughout in accordance with Section 903.3.1.1, the area of allowable glazing shall be increased to a maximum of 50 percent of the wall face of the story in which it is installed with no limit on the maximum dimension or area of a single pane of glazing.

2. Approved flame barriers extending 30 inches (762 mm) beyond the exterior wall in the plane of the

*floor, or approved vertical panels not less than 4 feet (1219 mm) in height, shall be installed between glazed units located in adjacent stories.*

**Exception:** *Approved vertical panels not less than 3 feet (914 mm) in height or flame barriers extending 30 inches (762 mm) beyond the exterior wall shall be installed between glazed units located in adjacent stories in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

3. *Light-transmitting plastics shall not be installed more than 75 feet (22 860 mm) above grade level.*

**Exception:** *Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

## **SECTION BC 2609**

### **LIGHT-TRANSMITTING PLASTIC ROOF PANELS**

**2609.1 General.** *Light-transmitting plastic roof panels shall comply with this section and Section 2606. Light-transmitting plastic roof panels shall not be installed in Groups H, I-2 and I-3. In all other groups, light-transmitting plastic roof panels shall comply with any one of the following conditions:*

1. *The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*
2. *The roof construction is not required to have a fire-resistance rating by Table 601.*
3. *The roof panels meet the requirements for roof coverings in accordance with Chapter 15.*

**2609.2 Separation.** *Individual roof panels shall be separated from each other by a distance of not less than 4 feet (1219 mm) measured in a horizontal plane.*

#### **Exceptions:**

1. *The separation between roof panels is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*

2. *The separation between roof panels is not required in low-hazard occupancy buildings complying with the conditions of Section 2609.4, Exception 2 or 3.*

**2609.3 Location.** *Where exterior wall openings are required to be protected by Section 704.8, a roof panel shall not be installed within 6 feet (1829 mm) of such exterior wall.*

**2609.4 Area limitations.** *Roof panels shall be limited in area and the aggregate area of panels shall be limited by a percentage of the floor area of the room or space sheltered in accordance with Table 2609.4.*

**Exceptions:**

1. *The area limitations of Table 2609.4 shall be permitted to be increased by 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.*
2. *Low-hazard occupancy buildings, such as swimming pool shelters, shall be exempt from the area limitations of Table 2609.4, provided that the buildings do not exceed 5,000 square feet (465 m<sup>2</sup>) in area and have a minimum fire separation distance of 10 feet (3048 mm).*
3. *Greenhouses that are occupied for growing plants on a production or research basis, without public access, shall be exempt from the area limitations of Table 2609.4 provided they have a minimum fire separation distance of 4 feet (1219 mm).*
4. *Roof coverings over terraces and patios in Group R-3 occupancies shall be exempt from the area limitations of Table 2609.4.*

**TABLE 2609.4**  
**AREA LIMITATIONS FOR LIGHT-TRANSMITTING**  
**PLASTIC ROOF PANELS**

<b>CLASS OF PLASTIC</b>	<b>MAXIMUM AREA OF INDIVIDUAL ROOF PANELS (square feet)</b>	<b>MAXIMUM AGGREGATE AREA OF ROOF PANELS (percent of floor area)</b>
CC1	300	30
CC2	100	25

For SI: 1 square foot = 0.0929 m<sup>2</sup>.

**SECTION BC 2610**  
**LIGHT-TRANSMITTING PLASTIC**  
**SKYLIGHT GLAZING**

**2610.1 Light-transmitting plastic glazing of skylight assemblies.** *Skylight assemblies glazed with light-transmitting plastic shall conform to the provisions of this section and Section 2606. Unit skylights glazed with light-transmitting plastic shall also comply with Section 2405.5.*

**Exception:** *Skylights in which the light-transmitting plastic conforms to the required roof-covering class in accordance with Section 1505.*

**2610.2 Mounting.** *The light-transmitting plastic shall be mounted above the plane of the roof on a curb constructed in accordance with the requirements for the type of construction classification, but at least 4 inches (102 mm) above the plane of the roof. Edges of light-transmitting plastic skylights or domes shall be protected by metal or other approved noncombustible material, or the light-transmitting plastic dome or skylight shall be shown to be able to resist ignition where exposed at the edge to a flame from a Class B brand as described in ASTM E 108 or UL 790.*

**Exceptions:**

1. *Curbs shall not be required for skylights used on roofs having a minimum slope of three units vertical in 12 units horizontal (25-percent slope) in occupancies in Group R-3 and on buildings with a nonclassified roof covering.*
2. *The metal or noncombustible edge material is not required where nonclassified roof coverings are permitted.*

**2610.3 Slope.** *Flat or corrugated light-transmitting plastic skylights shall slope at least four units vertical in 12 units horizontal (4:12). Dome-shaped skylights shall rise above the mounting flange a minimum distance equal to 10 percent of the maximum span of the dome but not less than 3 inches (76 mm).*

**Exception:** *Skylights that pass the Class B Burning Brand Test specified in ASTM E 108 or UL 790 shall have no minimum slope requirement.*

**2610.4 Maximum area of skylights.** *Each skylight shall have a maximum area within the curb of 100 square feet (9.3 m<sup>2</sup>).*

**Exception:** The area limitation shall not apply where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or the building is equipped with smoke and heat vents in accordance with Section 910.

**2610.5 Aggregate area of skylights.** The aggregate area of skylights shall not exceed 33⅓ percent of the floor area of the room or space sheltered by the roof in which such skylights are installed where Class CC1 materials are utilized, and 25 percent where Class CC2 materials are utilized.

**Exception:** The aggregate area limitations of light-transmitting plastic skylights shall be increased 100 percent beyond the limitations set forth in this section where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or the building is equipped with smoke and heat vents in accordance with Section 910.

**2610.6 Separation.** Skylights shall be separated from each other by a distance of not less than 4 feet (1219 mm) measured in a horizontal plane.

**Exceptions:**

1. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. In Group R-3, multiple skylights located above the same room or space with a combined area not exceeding the limits set forth in Section 2610.4.

**2610.7 Location.** Where exterior wall openings are required to be protected in accordance with Section 704, a skylight shall not be installed within 6 feet (1829 mm) of such exterior wall.

**2610.8 Combinations of roof panels and skylights.** Combinations of light-transmitting plastic roof panels and skylights shall be subject to the area and percentage limitations and separation requirements of Section 2609 applicable to roof panel installations.

**SECTION BC 2611**

**LIGHT-TRANSMITTING PLASTIC INTERIOR SIGNS**

**2611.1 General.** Light-transmitting plastic interior wall signs shall be limited as specified in Sections

*2611.2 through 2611.4. Light-transmitting plastic interior wall signs in covered mall buildings shall comply with Section 402.14. Light-transmitting plastic interior signs shall also comply with Section 2606.*

**2611.2 Aggregate area.** *The sign shall not exceed 20 percent of the wall area.*

**2611.3 Maximum area.** *The sign shall not exceed 24 square feet (2.2 m<sup>2</sup>).*

**2611.4 Encasement.** *Edges and backs of the sign shall be fully encased in metal.*

**CHAPTER 27**  
**ELECTRICAL**

**SECTION BC 2701**  
**GENERAL**

*2701.1 Scope. This chapter governs the electrical components, equipment and systems used in buildings and structures covered by this code. Electrical components, equipment and systems shall be designed and constructed in accordance with the provisions of the New York City Electrical Code.*

**SECTION BC 2702**  
**EMERGENCY POWER SYSTEMS**

*2702.1 Installation. Emergency systems shall be installed in accordance with the New York City Electrical Code, NFPA 110 and NFPA 111, and shall have an on-premises fuel supply sufficient for not less than 6-hour full-demand operation of the system. However, for R-2 occupancies required to provide emergency power systems pursuant to the provisions of Section 403.11.2, and for voluntarily installed emergency power systems, natural gas from the public utility street main shall be permitted as fuel supply.*

*2702.1.1 Stationary generators. Emergency power generators shall be listed in accordance with UL 2200.*

*2702.1.2 Capacity. The emergency power system shall have a capacity and rating that supplies all equipment required to be operational at the same time.*

*2702.2 Where required. Emergency power systems shall be provided where required by this section.*

*2702.2.1 Group A occupancies. Emergency power shall be provided for voice/alarm communication systems in Group A occupancies in accordance with Section 907.2.1.2.*

*2702.2.2 Smoke control systems. Emergency power shall be provided for smoke control systems in accordance with Section 909.11.*

*2702.2.3 Exit signs. Emergency power shall be provided for exit signs in accordance with Section 1011.5.3.*

**2702.2.4 Means of egress illumination.** *Emergency power shall be provided for means of egress illumination in accordance with Section 1006.3.*

**2702.2.5 Accessible means of egress elevators.** *Emergency power shall be provided for elevators that are part of an accessible means of egress in accordance with Section 1007.4*

**2702.2.6 Horizontal sliding doors.** *Emergency power shall be provided for horizontal sliding doors in accordance with Section 1008.1.3.3*

**2702.2.7 Semiconductor fabrication facilities.** *Emergency power shall be provided for semiconductor fabrication facilities in accordance with Section 415.9.10.*

**2702.2.8 Membrane structures.** *Emergency power shall be provided for auxiliary inflation systems in accordance with Section 3102.8.2. Emergency power shall be provided for exit signs in tents and membrane structures.*

**2702.2.9 Hazardous materials.** *Emergency power shall be provided in occupancies with hazardous materials in accordance with Section 414.5.4 and the New York City Fire Code.*

**2702.2.10 Highly toxic and toxic materials.** *Emergency power shall be provided for occupancies with highly toxic or toxic materials in accordance with the New York City Fire Code.*

**2702.2.11 Organic peroxides.** *Emergency power shall be provided for occupancies with organic peroxides in accordance with the New York City Fire Code.*

**2702.2.12 Pyrophoric materials.** *Emergency power shall be provided for occupancies with silane gas in accordance with the New York City Fire Code.*

**2702.2.13 Covered mall buildings.** *Emergency power shall be provided for voice/alarm communication systems in covered mall buildings in accordance with Section 402.12*

**2702.2.14 High-rise buildings.** *Emergency power shall be provided in high-rise buildings in accordance with Section 403.11.*

**2702.2.15 Underground buildings.** *Emergency power shall be provided in underground buildings in accordance with Section 405.10.*

**2702.2.16 Group I-3 occupancies.** Emergency power shall be provided for doors in Group I-3 occupancies in accordance with Section 408.4.2.

**2702.2.17 Reserved.**

**2702.2.18 Elevators.** Emergency power for elevators, including elevators provided to accommodate ambulance stretchers pursuant to Section 3002.4, shall be provided as set forth in Section 3003.1

**2702.2.19 Smokeproof enclosures and pressurized elevator shaft.** Emergency power shall be provided for smoke-proof enclosures as required by Section 909.20 and for pressurized elevator shafts provided in accordance with Item 5 of Section 403.9.1.1.

**2702.2.20 Occupancy Groups B, E and R-1.** An emergency power system shall be required in those Group B, E and R-1 occupancies specified in this section:

1. Group B occupancies with occupied floor less than 75 feet (22 860 mm) above the lowest fire department vehicle access having a gross floor area over 15,000 square feet (1,393.6 m<sup>2</sup>) per floor or a total gross floor area of 100,000 square feet (9,290.3 m<sup>2</sup>) or more.
2. Group E occupancies with occupied floor less than 75 feet (22 860 mm) above the lowest level of fire department vehicle access having a gross floor area over 15, 000 square feet (1,393.6 m<sup>2</sup>) per floor or a total gross floor area of 100,000 square feet (9,290.3 m<sup>2</sup>) or more.
3. All Group R-1 occupancies.

**2702.2.20.1 Equipment requiring emergency power system.** With respect to such occupancy Groups B, E and R-1, the following equipment, where such equipment is required by this code, shall be provided with an emergency power system:

1. Exit signs and means of egress illumination required by Chapter 10;
2. Elevator car lighting;
3. Emergency voice/alarm communications systems;

4. *Automatic fire detection systems;*
5. *Fire alarm systems;*
6. *Electrically powered fire pumps;*
7. *Ventilating systems used for smoke venting or control;*
8. *Stair pressurization;*
9. *At least three elevators in a building at one time with manual transfer to other elevators as required by Section 3003.*

**2702.3 Maintenance.** *Emergency power systems shall be maintained and tested in accordance with the New York City Fire Code and New York City Electrical Code.*

**CHAPTER 28**  
**MECHANICAL SYSTEMS**

**SECTION BC 2801**  
**GENERAL**

**2801.1 Scope.** *Mechanical appliances, equipment and systems shall be constructed, installed and maintained in accordance with the New York City Mechanical Code and the New York City Fuel Gas Code. Masonry chimneys, fireplaces and barbecues shall comply with the New York City Mechanical Code and Chapter 21 of this code.*

**CHAPTER 29**  
**PLUMBING SYSTEMS**

**SECTION BC 2901**  
**GENERAL**

*2901.1 Scope. The provisions of this chapter and the New York City Plumbing Code shall govern the erection, installation, alteration, repairs, relocation, replacement, addition to, use or maintenance of plumbing equipment and systems. Plumbing systems and equipment shall be constructed, installed and maintained in accordance with the New York City Plumbing Code.*

**SECTION BC 2902**  
**MINIMUM PLUMBING FACILITIES**

*2902.1 Minimum number of fixtures. Plumbing fixtures shall be provided for the type of occupancy and in the minimum number shown in Table 403.1 of the New York City Plumbing Code. Types of occupancies not shown in Table 403.1 of the New York City Plumbing Code shall be considered individually by the commissioner. The number of occupants shall be determined by this code. Occupancy classification shall be determined in accordance with Chapter 3. However, with respect to the number of required plumbing fixtures in occupancy Group B, Table 403.1 of the New York City Plumbing Code shall be modified as follows:*

**TABLE 403.1**  
**MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES**

NO.	CLASSIFICATION	USE GROUP	DESCRIPTION	WATER CLOSETS (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			
2	Business (see Sections 403.2, 403.4 and 403.6)	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses	No. of persons for each sex	No. of fixtures	No. of persons	No. of fixtures		1 per 100	1 service sink
				1-20	1	1-25	1			
				21-45	2	26-50	2			
				46-70	3	51-75	3			
				71-100	4	76-115	4			
				101-140	5	116-160	5			
				141-190	6					
				1 fixture for each additional 50 persons		1 fixture for each additional 60 persons				

**2902.1.1 Unisex toilet and bath fixtures.** *Fixtures located within unisex toilet bathing rooms complying with Section 404 of the New York City Plumbing Code are permitted to be included in determining the minimum required number of fixtures for assembly and mercantile occupancies.*

**2902.2 Reserved.**

**2902.3 Reserved.**

**2902.4 Reserved.**

**2902.5 Reserved.**

**2902.6 Reserved.**

**CHAPTER 30**  
**ELEVATORS AND CONVEYING SYSTEMS**

**SECTION BC 3001**  
**GENERAL**

**3001.1 Scope.** *This chapter establishes the minimum safety requirements for, and governs the design, construction, installation, alteration, maintenance, inspection, test and operation of, elevators, dumbwaiters, escalators, moving walks, industrial lifts and loading ramps, mechanical parking equipment, console or stage lifts, power operated scaffolds, amusement devices, and special hoisting and conveying equipment. This chapter and all the provisions of this code for new installations shall also apply to elevators in existing buildings moved to new hoistways.*

*High-rise buildings elevators shall also conform to the provisions of Section 403 of this code.*

**Exception:** *Personnel and material hoists used for construction operations subject to the requirements of Chapter 33.*

**3001.2 Referenced standards.** *Except as otherwise provided for in this code, the design, construction, installation, alteration, repair and maintenance of elevators and other conveying systems and their components shall conform to ASME A17.1 as modified by Appendix K, ASME A17.2, ASME A18.1, ASME A17.5, ANSI A10.5, ASME QEI-1, ASME A90.1, ASME B20.1 as modified by Appendix K, ALI ALCTV, and for construction in areas of special flood hazard, Appendix G.*

**3001.3 Accessibility.** *Passenger elevators required to be accessible by Chapter 11 shall conform to ICC A117.1.*

**3001.4 Change in use.** *A change in use of an elevator from freight to passenger, passenger to freight, or from one freight class to another freight class shall comply with Section 8.7 of ASME A17.1.*

**3001.5 Piping or ductwork.** *No piping or ductwork of any kind shall be permitted within hoistway or elevator enclosures except:*

- 1. As required for the elevator installation; and*
- 2. Low voltage wiring less than 50 volts required for fire alarm systems required by this code.*

**3001.6 Elevator mirrors.** A mirror shall be installed in each self-service passenger elevator in in multiple dwellings. Such mirror shall be affixed and maintained in a manner sufficient to enable persons entering such elevator to view the inside thereof prior to entry to determine whether any person is in the elevator.

**3001.7 Car switch operation.** Elevators with car switch operation (manual operation) shall be provided with a signal system by means of which signals can be given from any landing whenever the elevator is desired at that landing.

**3001.8 Prohibited devices.** The following devices shall be prohibited:

**3001.8.1 Manlifts.** The installation of manlifts is prohibited.

**3001.8.2 Sidewalk elevators.** The installation of sidewalk elevators located outside the street line is prohibited

**3001.9 Approved equipment.** Buffers, PA interlocks, elevator entrances, wedge shackles, and elevator governors shall be approved by the commissioner.

**3001.10 Construction documents.** Applications for elevator, escalator, moving walkway and stairway, dumbwaiter, and similar equipment shall contain construction documents that include the following:

1. The location of all machinery, switchboards, junction boxes, and reaction points, with loads indicated;
2. The details of all hoistway conditions including bracket spacing;
3. The estimated maximum vertical forces on the guide rails on application of the safety device;
4. In the case of freight elevators for class B or C loading, the horizontal forces on the guide-rail faces during loading and unloading; and the estimated maximum horizontal forces in a postwise direction on the guide-rail faces on application of the safety device;
5. The size and weight per foot of any rail reinforcements where provided;
6. Compliance with the accessibility features of this code;
7. The details of capability of the withstanding forces (impact) on door entrance assembly and retaining devices;

8. *The withstanding hourly fire rating of the hoistway and the hoistway door assembly;*
9. *The impact loads imposed on machinery and sheave beams, supports and floors or foundations;*
10. *The impact load on buffer supports due to buffer engagement at the maximum permissible speed and load;*
11. *Where compensation tie down is applied, the load on the compensation tie down supports; and*
12. *The total static and dynamic loads from the governor, ruper and tension system.*

**SECTION BC 3002**  
**HOISTWAY ENCLOSURES**

**3002.1 Hoistway enclosure protection.** *Elevator, dumbwaiter and other hoistway enclosures shall have a fire-resistance rating not less than that specified in Chapter 6 and shall be constructed in accordance with Chapter 7.*

**3002.1.1 Opening protectives.** *Openings in hoistway enclosures shall be protected as required in Chapter 7.*

**3002.1.2 Hardware.** *Hardware on opening protectives shall be of an approved type installed as tested, except that approved interlocks, mechanical locks and electric contacts, door and gate electric contacts and door-operating mechanisms shall be exempt from the fire test requirements.*

**3002.2 Number of elevator cars in a hoistway.** *Where four or more elevator cars serve all or the same portion of a building, the elevators shall be located in at least two separate hoistways. Not more than four elevator cars shall be located in any single hoistway enclosure. Elevators that service different risers shall be located in separate hoistways.*

**3002.3 Emergency signs.** *An approved pictorial sign of a standardized design shall be posted adjacent to each elevator call station on all floors instructing occupants to use the exit stairways and not to use the elevators in case of fire. The sign shall read: IN FIRE EMERGENCY, DO NOT USE ELEVATOR. USE EXIT STAIRS. The emergency sign shall not be required for elevators that are part of an accessible means of egress complying with 1007.4.*

**3002.4 Elevator car to accommodate ambulance stretcher.** *In buildings five stories in height or more, at least one elevator shall be provided for Fire Department emergency access to all floors. Emergency power shall be provided in accordance with Sections 2702 and 3003. Such elevator car shall be of such a size and arrangement to*

accommodate a 24-inch by 76-inch (610 mm by 1930 mm) ambulance stretcher in the horizontal, open position and shall be identified by the international symbol for emergency medical services (star of life). The symbol shall not be less than 3 inches (76 mm) high and shall be placed on both jambs of the hoistway entrances on each floor.

**3002.5 Emergency doors.** Where an elevator is installed in a single blind hoistway or on the outside of a building, there shall be installed in the blind portion of the hoistway or blank face of the building, an emergency door in accordance with ASME A17.1.

**3002.6 Reserved.**

**3002.7 Common enclosure with stairway.** Elevators shall not be in a common shaft enclosure with a stairway.

### **SECTION BC 3003 ELEVATOR EMERGENCY OPERATIONS**

**3003.1 Emergency power.** In buildings and structures where emergency power is required or furnished to operate an elevator, the operation shall be in accordance with Sections 3003.1.1 through 3003.1.4.

**3003.1.1 Manual transfer.** Emergency power shall be manually transferable to all elevators in each bank.

**3003.1.2 One elevator.** Where only one elevator is installed, the elevator shall automatically transfer to emergency power within 60 seconds after failure of normal power.

**3003.1.3 Two or more elevators.** Where two or more elevators are controlled by a common operating system, all elevators shall automatically transfer to emergency power within 60 seconds after failure of normal power where the emergency power source is of sufficient capacity to operate all elevators at the same time. Where the emergency power source is not of sufficient capacity to operate all elevators at the same time, all elevators shall transfer to emergency power in sequence, return to the designated landing and disconnect from the emergency power source. After all elevators have been returned to the designated level, at least three elevators shall remain operable from the emergency power source.

**3003.1.4 Venting.** Where emergency power is connected to elevators, the machine room ventilation or air conditioning shall be connected to the emergency power source.

**3003.2 Fire fighters' emergency operation.** Elevators shall be provided with Phase I emergency recall operation and Phase II emergency in-car operation in accordance with ASME A17.1 as modified by Appendix K.

**3003.3 Elevator in readiness.** Requirements for elevator in readiness shall be as defined in Sections 3003.3.1 through 3003.3.2 .

**3003.3.1 High-rise buildings.** Except as provided in Section 3003.3.2, in high-rise buildings as defined in Section 403, all floors shall be served by at least one elevator that shall be kept available for immediate use by the Fire Department during all hours of the night and day, including holidays, Saturdays and Sundays. There shall be available at all times a person competent to operate the elevator. However, an attendant shall not be required for buildings with occupied floors of 150 feet (45 720 mm) or less above the lowest level of the fire department vehicle access that have elevators with automatic or continuous pressure\_operation with keyed switches meeting the requirements of ASME A17.1 as modified by Appendix K so as to permit sole use of the elevators by the Fire Department.

**3003.3.2 Number of Elevators.** A number of elevators shall be kept available at every floor for the sole use of the Fire Department as required by Section 3003.3.2.1 and Section 3003.3.2.2. This requirement shall apply to the following types of buildings:

1. High-rise buildings with occupancies classified in Groups A, B, E, I, F, H, M and S;
2. Buildings with Group B occupancies with a gross area of 200, 000 square feet (18 581 m<sup>2</sup>);
3. Buildings with a main use or dominant occupancy in Group R-1 or R-2.

**3003.3.2.1 Three or fewer elevators.** Where a floor is serviced by three or fewer elevator cars, every car shall be kept available for sole use by the Fire Department.

**3003.3.2.2 More than three elevators.** Where a floor is serviced by more than three elevator cars, at least three elevator cars with a total rated load capacity of not less than 6,000 pounds (2722 kg) shall be kept available for sole use by the Fire Department. Such cars shall include not more than two cars that service all floors and at least one other car in another bank servicing that floor. If the total load capacity of all cars servicing the floor is less than 6,000 pounds (2722 kg), all such cars shall be kept available for sole use by the Fire Department.

**3003.3.3 Operation and control.** Elevators that are kept for the sole use of the Fire Department and that have automatic or continuous pressure operation shall be controlled by keyed switches meeting the requirements of ASME 17.1.

**3003.3.4 Other elevator cars.** *In high rise buildings classified in occupancy groups A, B, E, F, H, I, M and S, in low-rise buildings classified in occupancy group B with a gross area of 200,000 square feet (18 581 m<sup>2</sup>) or more and in buildings classified in occupancy group R-1 or R-2, all other automatically operated cars shall have manual operation capability.*

**SECTION BC 3004  
HOISTWAY VENTING**

**3004.1** *Reserved.*

**3004.2** *Reserved.*

**3004.3** *Reserved.*

**3004.4** *Reserved.*

**3004.5 Plumbing and mechanical systems.** *Plumbing and mechanical systems shall not be located in an elevator shaft.*

**Exception:** *Floor drains sumps and sump pumps shall be permitted at the base of the shaft provided they are indirectly connected to the plumbing system.*

**3004.6 Control of smoke and hot gases.** *Hoistways of elevators shall be provided with any one of the following means to prevent the accumulation of smoke and hot gases in case of fire in accordance with Sections 3004.6.1 through 3004.6.4.*

**3004.6.1 Vents in the hoistway enclosures.** *Hoistway enclosures may be vented in accordance with the following:*

*1. Location of vents:*

*1.1. The vents in the side of the hoistway enclosure below the elevator machine room floor or in the roof of the hoistway shall open either directly to the outer air or through non-combustible ducts to the outer air.*

- 1.2. *The vents in the wall or roof of an overhead elevator machine room through the smoke hole in the top of the elevator hoistway shall be vented to the outer air through non-combustible ducts.*
2. *Area of vents. The area of vents in the hoistway or the elevator machine room and the smoke hole shall be not less than 3½ percent of the area of the hoistway nor less than 3 square feet (0.28 m<sup>2</sup>) for each elevator car, whichever is greater. Such vents shall comply with the following requirements:*
  - 2.1. *Open Vents. Of the total required vent area, not less than one-third shall be permanently open or equipped with an openable hinged damper. The smoke hole shall be permanently open.*
  - 2.2. *Closed Vents. The two-thirds closed portion of the required vent area either in the hoistway enclosure or in the elevator machine room may consist of windows or skylights glazed with annealed glass not more than ⅛-inch (3.2 mm) thick. A closed damper that opens upon the activation of a smoke detector placed at the top of the hoistway shall be considered closed.*

**3004.6.2 Mechanical ventilation of the hoistway enclosure.** *Hoistway enclosures may be mechanically vented. The system of mechanical ventilation shall be of sufficient capacity to exhaust at least 12 air changes per hour of the volume of such hoistways through a roof or an approved location on an exterior wall other than the lot line wall. Such system shall comply with the following requirements:*

1. *The smoke detector shall be placed at the top of the hoistway and shall activate the mechanical ventilation system.*
2. *Such mechanical ventilation system shall not pass through the overnight sleeping areas of a hotel, multiple dwelling, hospital, or similar buildings.*
3. *Such mechanical ventilation system shall be equipped with a manual shut-off in or near the elevator control panel at the designated level.*

**3004.6.3 Air pressurization of hoistway enclosure.** *Hoistways may be air pressurized. Where such system is utilized, the air shall not cause erratic operation of the landing or car door equipment, traveling cables, selector tapes, governor ropes, compensating ropes, or any other components sensitive to excess movement or deflection.*

**3004.6.4 Alternate means.** *The commissioner may accept alternate means to prevent the accumulation of smoke and hot gases in the hoistways and machine rooms in case of fire.*

**SECTION BC 3005**  
**CONVEYING SYSTEMS**

**3005.1 General.** *Conveying systems shall comply with the provisions of this section.*

**3005.2 Escalators and moving walks.** *Escalators and moving walks shall be constructed of approved noncombustible and fire-retardant materials. This requirement shall not apply to electrical equipment, wiring, wheels, handrails and the use of 1/28-inch (0.9 mm) wood veneers on balustrades backed up with noncombustible materials.*

**3005.2.1 Enclosure.** *Escalator floor openings shall be enclosed except where Exception 2 of Section 707.2 is satisfied.*

**3005.2.2 Escalators.** *Where provided in below-grade transportation stations, escalators shall have a clear width of 32 inches (813 mm) minimum.*

**Exception:** *The clear width is not required in existing facilities undergoing alterations.*

**3005.3 Conveyors.** *Conveyors and related equipment shall comply with ASME B20.1.*

**3005.3.1 Enclosure.** *Conveyors and related equipment connecting successive floors or levels shall be enclosed with fire barrier walls and approved opening protectives complying with the requirements of Section 3002 and Chapter 7.*

**3005.3.2 Conveyor safeties.** *Power-operated conveyors, belts, and other material-moving devices shall be equipped with automatic limit switches, which will shut off the power in an emergency and automatically stop all operation of the device.*

**3005.4 Reserved.**

**3005.5 Amusement devices.** *Amusement devices shall also comply with rules of the department.*

**SECTION BC 3006**  
**MACHINE ROOMS**

**3006.1 Access.** *An approved means of access shall be provided to elevator machine rooms and overhead machinery spaces.*

**3006.2 Venting.** *Elevator machine rooms that contain solid-state equipment for elevator operation shall be provided with an independent ventilation or air-conditioning system to protect against the overheating of the electrical equipment. The system shall be capable of maintaining temperatures within the range established for the elevator equipment.*

**3006.3 Pressurization.** *The elevator machine room serving a pressurized elevator hoistway shall be pressurized upon activation of a heat or smoke detector located in the elevator machine room.*

**3006.4 Machine rooms and machinery spaces.** *Elevator machine rooms and machinery spaces shall be enclosed with construction having a fire-resistance rating not less than the required rating of the hoistway enclosure served by the machinery. Openings shall be protected with assemblies having a fire-resistance rating not less than that required for the hoistway enclosure doors.*

**3006.5 Sprinklers prohibited.** *Sprinklers are not permitted in elevator machine rooms.*

**3006.6 Plumbing systems.** *Plumbing systems not related to elevator machinery shall not be located in elevator equipment rooms.*

**3006.7 Elevator machinery noise control in multiple dwellings.** *Gear-driven machinery, gearless machinery, and motor generators located in an elevator machinery room or shaft on a roof, or on a floor other than a floor on grade, shall be supported on vibration isolator pads having a minimum thickness of ½ inch (12.7 mm).*

## **SECTION BC 3007**

### **SERVICE EQUIPMENT CERTIFICATES**

**3007.1 Required.** *No service equipment shall be placed in operation until a service equipment certificate of compliance has been obtained in accordance with the provisions of this code.*

**3007.2 Posting of inspection certificate.** *At the time a service equipment certificate of compliance is issued, an inspection certificate issued by the commissioner shall be posted. No such inspection certificate shall be issued for elevators that are not subject to periodic inspections pursuant to this code. The inspection certificate shall be in such form as the commissioner shall determine by rule and shall be posted in a frame with a transparent cover in*

*the car of every passenger and freight elevator and on or near every escalator and moving walk and power operated scaffold.*

**3007.2.1 Alternate posting locations.** *In lieu of posting the inspection certificate in those locations specified in this section, the inspection certificate may be kept in the on-site building manager's office. In such case, the building manager's office must be open during normal business hours. In addition, notice must be posted in each location and kept in a frame with a transparent cover, or a plaque with an indelible inscription, stating that the inspection certificate is located in the building manager's office and identifying the location of such office.*

**3007.3 Temporary use certificates.** *The commissioner may issue temporary use certificates for any equipment or device regulated by this code, except power-operated scaffolds, provided that such partial use and operation may be made safely and without endangering public health, safety, and welfare and provided further that such temporary use certificate shall not be issued for a period of more than thirty calendar days, subject to renewal for additional thirty-day periods at the discretion of the commissioner. Temporary use certificates for elevators shall also be conditioned upon compliance with the following:*

- 1. The class of service to be permitted shall be designated on the temporary use certificate.*
- 2. The hoistway shall be enclosed throughout in an enclosure complying with ASME 17.1 or with a temporary enclosure in accordance with the requirements for workers' elevators (temporary elevators) of the Industrial Code of the State of New York, No. 23.*

**3007.3.1 Posting of temporary use certificate.** *The temporary use certificate shall be posted in a conspicuous location on, or adjacent to, the device covered by the certificate and shall state that the device has not been finally approved by the commissioner.*

**SECTION BC 3008**  
**ELEVATOR, AMUSEMENT, AND OTHER DEVICE OPERATORS**

**3008.1 Elevator operators.** *With the exception of automatic operation, continuous pressure elevators and sidewalk elevators, every passenger and freight elevator with a rise of more than one story shall be in the charge of a designated competent operator, who shall be at least 18 years old, free from serious physical or mental defects, and selected with consideration of his or her abilities to perform his or her duties in a careful and competent manner. Such designated competent operator shall be instructed in accordance with requirements of department rules.*

**3008.2 Amusement device operators.** Operators of amusement devices shall meet the requirements of rules of the department.

**3008.3 Other device operators.** Other devices regulated by this code shall, when deemed necessary by the commissioner to protect public safety, be in the charge of a designated competent operator conforming to such qualifications as the commissioner may prescribe, except that operators for workers' hoists shall be assigned as required by the applicable provisions of ASME 10.4

**3008.4 Sanction for unlawful operation.** If the commissioner finds that any person engaged in operating an elevator, amusement, or other device is not competent to operate the elevator, amusement or other device, the owner, agent or lessee of such elevator, amusement, or other device shall, upon notice from the commissioner, discontinue the operation of such device by such operator.

## **SECTION BC 3009 ELEVATOR BEING SERVICED**

**3009.1 Signage.** When an existing or new automatic passenger elevator in any building or structure is being serviced by an elevator maintenance company, elevator maintenance personnel, or other person and there are no maintenance personnel available to remain in the elevator car, "CAUTION" sign tapes shall be placed across the car door jamb. One strip of "CAUTION" sign tape shall be placed at a height of 18 inches (457 mm) above the car floor and another strip of "CAUTION" sign tape shall be placed at a height of 54 inches (1372 mm) above the car floor.

**3009.1.1 Sign tape.** The "CAUTION" sign tape shall be 3 inches (76 mm) in width with the words "CAUTION – DO NOT ENTER" repeated every 6 inches (152 mm). The lettering shall be black on yellow background. The letters shall be at least 2 inches (51 mm) high.

## **SECTION BC 3010 ACCIDENTS**

**3010.1 Accidents.** The owner of any device regulated by this chapter shall promptly notify the commissioner of every accident involving injury to any person requiring the services of a physician or damage to property or to apparatus exceeding one thousand dollars on, about, or in connection with such equipment, before commencing any repairs and shall afford the commissioner every facility for investigating such accident or damage. The commissioner shall make an investigation immediately thereafter, and shall prepare a full and complete report of such investigation. Such report shall give in detail all material facts and information available and the cause or

*causes as far as they can be determined. Such report shall be a public record. When an accident involves the failure or destruction of any part of the construction or operating mechanism of such equipment, no such equipment shall be used until it has been made safe, and re-inspected by the commissioner; and the commissioner may order the discontinuance of such equipment until a new service equipment certificate has been issued by him or her for its use. No part shall be removed from the premises of the damaged construction or operating mechanism until permission to do so has been granted by the commissioner.*

**SECTION BC 3011  
EXISTING INSTALLATIONS**

**3011.1 General.** *Existing installations shall be modified in accordance with department rules.*

**SECTION BC 3012  
INSPECTION AND TESTING**

**3012.1 Elevators and Conveying Systems.** *Inspection and testing of elevators and conveying systems shall be in accordance with Appendix K. Refer to Chapter 3 of Title 28 of the Administrative Code for additional requirements.*

**3012.2 Amusement devices.** *Inspection and testing of amusement devices shall comply with rules of the department. Refer to Chapter 3 of Title 28 of the Administrative Code for additional requirements.*

**CHAPTER 31**  
**SPECIAL CONSTRUCTION**

**SECTION BC 3101**  
**GENERAL**

**3101.1 Scope.** *The provisions of this chapter shall govern special building construction including membrane structures, temporary structures, pedestrian walkways and tunnels, awnings and canopies, marquees, signs, telecommunications towers and antennas, swimming pools and enclosures, sidewalk cafés, and fences.*

**SECTION BC 3102**  
**MEMBRANE STRUCTURES**

**3102.1 General.** *The provisions of this section shall apply to air-supported structures, air-inflated structures, membrane-covered cable structures, membrane-covered frame structures, and tents, collectively known as membrane structures.*

**3102.1.1 Certificates of occupancy.** *The duration of certificates of occupancy for air-inflated structures, air-supported structures, and tents may be limited in accordance with the requirements of Chapter 1.*

**3102.2 Definitions.** *The following terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein:*

**AIR-INFLATED STRUCTURE.** *A building where the shape of the structure is maintained by air pressurization of cells or tubes to form a barrel vault over the usable area. Occupants of such a structure do not occupy the pressurized area used to support the structure.*

**AIR-SUPPORTED STRUCTURE.** *A building wherein the shape of the structure is attained and maintained by elevated air pressure and occupants of the structure are within the elevated pressure area. Air-supported structures are of two basic types:*

**Double skin.** *Similar to a single skin, but with an attached liner that is separated from the outer skin and provides an airspace which serves for insulation, acoustic, aesthetic or similar purposes.*

*Single skin.* Where there is only the single outer skin and the air pressure is directly against that skin.

**CABLE-RESTRAINED, AIR-SUPPORTED STRUCTURE.** A structure in which the uplift is resisted by cables or webbings which are anchored to either foundations or dead men. Reinforcing cable or webbing is attached by various methods to the membrane or is an integral part of the membrane. This is not a cable-supported structure.

**MEMBRANE-COVERED CABLE STRUCTURE.** A nonpressurized structure in which a mast and cable system provides support and tension to the membrane weather barrier and the membrane imparts stability to the structure.

**MEMBRANE-COVERED FRAME STRUCTURE.** A nonpressurized building wherein the structure is composed of a rigid framework to support a tensioned membrane which provides the weather barrier.

**NONCOMBUSTIBLE MEMBRANE STRUCTURE.** A membrane structure in which the membrane and all component parts of the structure are noncombustible.

**TENT.** A non-pressurized membrane structure of a fabric weather barrier supported by poles and guys, in which the fabric weather barrier does not impart stability to the structure. Tents need not be fully enclosed on the sides.

**3102.3 Type of construction.** Noncombustible membrane structures shall be classified as Type IIB construction. Noncombustible frame or cable-supported structures covered by an approved membrane in accordance with Section 3102.3.1 shall be classified as Type IIB construction. Heavy timber frame-supported structures covered by an approved membrane in accordance with Section 3102.3.1 shall be classified as Type IV construction. Other membrane structures shall be classified as Type V construction.

**3102.3.1 Membrane and interior liner material.** Membranes and interior liners shall be either noncombustible as set forth in Section 703.4, or flame resistant as determined in accordance with NFPA 701 and the manufacturer's test protocol.

**3102.4 Allowable floor areas.** The area of a membrane structure shall not exceed the limitations set forth in Table 503, except as provided in Section 506.

**3102.5 Maximum height.** Membrane structures shall not exceed one story nor shall such structures exceed the height limitations in feet set forth in Table 503. Membrane structures may be erected above the roof of

a building provided that such roof is of noncombustible construction required to have a fire-resistance rating

**Exception:** Noncombustible membrane structures serving as roofs only.

**3102.6 Mixed construction.** Membrane structures shall be permitted to be utilized as specified in this section as a portion of buildings of other types of construction. Height and area limits shall be as specified for the type of construction and occupancy of the building.

**3102.6.1 Noncombustible membrane.** A noncombustible membrane shall be permitted for use as the roof or as a skylight of any building or atrium of a building of any type of construction, provided it is at least 20 feet (6096 mm) above any floor, balcony or gallery, and meets the fire classification requirements of Section 1505 for roof assemblies.

**3102.6.1.1 Flame-resistant membrane.** A flame-resistant membrane shall be permitted to be used as the roof or as a skylight on buildings of Type IIB, III, IV and V construction, provided it is at least 20 feet (6096 mm) above any floor, balcony or gallery, and meets the fire classification requirements of Section 1505 for roof assemblies.

**3102.7 Engineering design.** Membrane structures shall be designed and constructed to sustain dead loads; loads due to tension or inflation; live loads including wind, snow or flood and seismic loads and in accordance with Chapter 16 and Appendix G.

**Exception:** Tents, air-inflated structures, and air-supported structures shall be designed by either an alternate engineering design approved by the commissioner or as follows:

1. Tents. Tents shall be guyed, supported, and braced to withstand a wind pressure of 10 psf (478.8 Pa) of projected area of the tent. The poles and their supporting guys, stays, stakes, fastenings, etc. shall be of sufficient strength and attached so as to resist wind pressure of 20 psf (957.6 Pa) of projected area of the tent.
2. Air-inflated structures and air-supported structures.
  - 2.1. Air-inflated structures and air-supported structures shall be anchored to the ground or supporting structure by either ballast or positive anchorage, sufficiently and evenly distributed, and adequate to resist the inflation lift load, the aerodynamic lift load, and

*the drag (shear) load due to wind impact. The latter factors shall be based on a fastest mile wind speed of 70 mph (112.65 km/hr), and an estimated stagnation of not less than 0.5 q for structures on grade whose height is equal to, or less than, the width of the structure. For greater heights, or for elevated structures, increased anchorage shall be provided, justified by analytical and/or experimental data subject to approval by the commissioner.*

*2.2. The skin of the structure shall be of such strength, and the joints so constructed, as to provide a minimum dead load strip tensile strength at 70°F (21°C) of 4 times the 70 mph (121.65 km/hr) design load (inflation and aerodynamic loading). The joints shall provide a dead load strip tensile strength of 160°F (71°C) of twice the 70 mph (121.65 km/hr) design load (i.e., a factor of safety of 4 and 2 respectively). In addition, the material shall provide a trapezoidal tear strength of at least 15 percent of the maximum design tensile load. Material and joint strengths shall be so certified by the manufacturer, justified by analytical and/or experimental data.*

**3102.8 Inflation systems.** *Air-supported structures and air-inflated structures shall be provided with primary and auxiliary inflation systems to meet the minimum requirements of Sections 3102.8.1 through 3102.8.3.*

**3102.8.1 Equipment requirements.** *The primary inflation system shall consist of one or more blowers and shall include provisions for automatic control to maintain the required inflation pressures. Such system shall be so designed as to prevent over pressurization of the system.*

**3102.8.1.1 Auxiliary inflation system.** *In addition to the primary inflation system, in structures exceeding 1,500 square feet (140 m<sup>2</sup>) in area, an auxiliary inflation system shall be provided with sufficient capacity to maintain the inflation of the structure in case of primary system failure. The auxiliary inflation system shall operate automatically when there is a loss of internal pressure and when the primary blower system becomes inoperative.*

**3102.8.1.2 Blower equipment.** *Blower equipment shall meet the following requirements:*

*1. Blowers shall be powered by continuous-rated motors at the maximum power required for any flow condition as required by the structural design.*

2. *Blowers shall be provided with inlet screens, belt guards and other protective devices as required by the commissioner to provide protection from injury.*
3. *Blowers shall be housed within a weather-protecting structure.*
4. *Blowers shall be equipped with backdraft check dampers to minimize air loss when inoperative.*
5. *Blower inlets shall be located to provide protection from air contamination. The location of inlets shall be approved.*

**3102.8.2 Emergency power.** *Wherever an auxiliary inflation system is required, an approved emergency power-generating system shall be provided. However, notwithstanding Section 2702.1, the emergency power-generating system shall be equipped with a suitable means for automatically starting the generator set upon failure of the normal electrical service and for automatic transfer and operation of all of the required electrical functions at full power within 60 seconds of such service failure. Emergency power shall be capable of operating independently for a minimum of 4 hours.*

**3102.8.3 Support provisions.** *A system capable of supporting the membrane in the event of deflation shall be provided for in air-supported structures and air-inflated structures having an occupant load of more than 50 or where covering a swimming pool regardless of occupant load. Such support system shall be capable of maintaining the membranes at least 7 feet (2134 mm) above the floor, seating area or surface of the water. When air-supported structures or air-inflated structures are used as a roof on Type I or II construction buildings, such support system shall be capable of maintaining the membranes not less than 20 feet (6096 mm) above the floor or seating area.*

**3102.9 Separation.** *No air-inflated structure, air-supported structure, or tent shall be erected closer than 20 feet (6096 mm) to any interior lot line nor closer than 30 feet (9144 mm) in any direction to an unprotected opening, required exterior stairway or corridor, or required exit door, on the same level or above the level of such structure. Such structure may abut another building on the same tax lot if the following conditions exist:*

1. *No unprotected openings or exits are located above or within 30 feet (9144 mm) of such structure.*
2. *No doors serving as a required exit are located between such structure and the abutted building.*

3. *The exterior wall of the abutted building meets the requirements of Section 705 for fire walls.*

**3102.10 Exits.** *In addition to the requirements of Chapter 10, travel distance to an exit from any point within a tent, air-supported structure, or air-inflated structure shall not exceed 75 feet (22 860 mm).*

**3102.10.1 Exit openings from tents.** *Exit openings from tents shall remain open unless covered by a flame-resistant curtain of a contrasting color to the tent. Such curtain shall be supported at least 80 inches (2032 mm) above the floor level at the exit and, when open, no part of the curtain shall obstruct the exit.*

**3102.10.2 Exit openings from air-supported structures and air-inflated structures.** *Exit doors in air-supported structures and air-inflated structures shall close automatically against normal operational pressures. Opening force at the edge of such doors shall not exceed 15 pounds (6.80 kg), with the structure at operational pressure. Exit doors shall be located in frames constructed such that they will remain operative and support the weight of the pressurized membrane structure in a state of total collapse.*

### **SECTION BC 3103 TEMPORARY STRUCTURES**

**3103.1 General.** *The provisions of this section shall apply to temporary platforms, reviewing stands, outdoor bandstands and similar miscellaneous structures erected for a period of 30 days or less. Such structures may be constructed of wood whether located inside or outside of the fire districts.*

**3103.1.1 Permit required.** *Temporary structures that cover an area in excess of 120 square feet (11.16 m<sup>2</sup>), including connecting areas or spaces with a common means of egress or entrance, shall not be erected, operated or maintained for any purpose without obtaining a permit from the department.*

**3103.2 Construction documents.** *A permit application and construction documents shall be submitted for each installation of a temporary structure. The construction documents shall include a site plan indicating the location of the temporary structure and information delineating the means of egress and the occupant load.*

**3103.3 Location.** *Temporary structures shall be located in accordance with the requirements of Table 602 based on the fire-resistance rating of the exterior walls for the proposed type of construction.*

**3103.4 Means of egress.** Temporary structures shall conform to the means of egress requirements of Chapter 10 and shall have a maximum exit access travel distance of 100 feet (30 480 mm).

**SECTION BC 3104**  
**PEDESTRIAN WALKWAYS AND TUNNELS**

**3104.1 General.** This section shall apply to connections between buildings such as pedestrian walkways or tunnels, located at, above or below grade level, that are used as a means of travel by persons. The pedestrian walkway shall not contribute to the building area or the number of stories or height of connected buildings.

**3104.2 Separate structures.** Connected buildings shall be considered to be separate structures.

**Exceptions:**

1. Buildings on the same tax lot in accordance with Section 503.1.3.
2. For purposes of calculating the number of Type B units required by Chapter 11, structurally connected buildings and buildings with multiple wings shall be considered one structure.

**3104.3 Construction.** The pedestrian walkway shall be of a construction type that is at least equal to the higher type of the two buildings connected.

**Exception:** Exterior pedestrian walkways serving as a required exit shall be constructed of noncombustible materials.

**3104.4 Contents.** Only materials approved by the department shall be located in the pedestrian walkway. Decorations may be permitted in accordance with the New York City Fire Code.

**3104.5 Fire barriers between pedestrian walkways and buildings.** Walkways shall be separated from the interior of the building by fire barrier walls with a fire-resistance rating of not less than 2 hours. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the 10-foot

(3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a ¾-hour fire protection rating in accordance with Section 715.

**Exception:** On pedestrian walkways having a maximum height above grade of 3 stories or 40 feet (12 192 mm), whichever is less; or 5 stories or 55 feet (16 764 mm) where sprinklered, whichever is less, the walls separating the pedestrian walkway from a connected building are not required to have a fire barrier by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm), the pedestrian walkway and connected buildings are equipped throughout with an automatic sprinkler system in accordance with NFPA 13 as modified in Appendix Q and the wall is constructed of a tempered, wired or laminated glass wall and doors subject to the following:
  - 1.1. The glass shall be protected by an automatic sprinkler system in accordance with NFPA 13 as modified in Appendix Q and the sprinkler system shall completely wet the entire surface of interior sides of the glass wall when actuated.
  - 1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.
  - 1.3. Obstructions shall not be installed between the sprinkler heads and the glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm), and both sidewalls of the pedestrian walkway are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases.
3. Buildings are on the same tax lot, in accordance with Section 503.1.3.
4. Where exterior walls of connected buildings are required by Section 704 to have a fire-resistance rating greater than 2 hours, the walkway shall be equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13 as modified in Appendix Q.
5. The pedestrian walkway does not serve as a required exit.

**3104.6 Public way.** Pedestrian walkways over a public way shall also comply with Chapter 32.

**3104.7 Width.** *The unobstructed width of pedestrian walkways shall not be less than 36 inches (914 mm). The total width shall not exceed 30 feet (9144 mm).*

**3104.8 Egress.** *Access shall be provided at all times to a pedestrian walkway that serves as a required exit. Doors satisfying the requirements of Chapter 10 shall enclose each end of such pedestrian walkway. The width of such pedestrian walkway shall be at least equal to the width of the doors opening onto such pedestrian walkway, but in no case less than 44 inches (1118 mm). The floor level at doors shall be the same as that of the connected building.*

**Exception:** *The floor level at doors of open pedestrian walkways shall be at least 7½ inches (191 mm) below the level of the door. Where the requirements of Chapter 11 are applicable, the differences in levels shall be accommodated by means of ramps in compliance with the provisions of Chapter 11.*

**3104.9 Exit access travel.** *The length of exit access travel shall not exceed 200 feet (60 960 mm).*

**Exceptions:**

- 1. Exit access travel distance on a pedestrian walkway equipped throughout with an automatic sprinkler system in accordance with NFPA 13 as modified in Appendix Q shall not exceed 250 feet (76 200 mm).*
- 2. Exit access travel distance on a pedestrian walkway constructed with both sides at least 50 percent open shall not exceed 300 feet (91 440 mm).*
- 3. Exit access travel distance on a pedestrian walkway constructed with both sides at least 50 percent open, and equipped throughout with an automatic sprinkler system in accordance with NFPA 13 as modified in appendix Q, shall not exceed 400 feet (122 m).*

**3104.10 Tunneled walkway.** *Separation between the tunneled walkway and the building to which it is connected shall not be less than 2-hour fire-resistant construction and openings therein shall be protected in accordance with Table 715.3.*

**3104.11 Ventilation.** *Smoke and heat vents shall be provided for enclosed walkways and tunneled walkways as required for Group F-1 occupancies in accordance with Section 910.*

**SECTION BC 3105**  
**AWNINGS AND CANOPIES**

**3105.1 General.** *Awnings and canopies shall comply with the requirements of this section, the requirements of Chapter 32 for projections over public ways, and other applicable sections of this code.*

**Exception:** *Canopies projecting over public rights-of-way governed by Title 19 of the Administrative Code and rules of the New York City Department of Transportation.*

**3105.2 Definition.** *The following term shall, for the purposes of this section and as used elsewhere in this code, have the meaning shown herein.*

**RETRACTABLE AWNING.** *A retractable awning is a cover with a frame that retracts against a building or other structure to which it is entirely supported.*

**3105.3 Design and construction.** *Awnings and canopies shall be designed and constructed to withstand wind or other lateral loads and live loads as required by Chapter 16 with due allowance for shape, open construction and similar features that relieve the pressures or loads. Structural members shall be protected to prevent deterioration. Awnings shall have frames of noncombustible material, covered with flame-resistant fabric in accordance with NFPA 701, plastic in accordance with Section 2605, sheet metal, or other equivalent material, and shall be either fixed, retractable, folding or collapsible.*

**3105.4 Reserved.**

**SECTION BC 3106**  
**MARQUEES**

**3106.1 General.** *Marquees shall comply with this section and other applicable sections of this code. Marquees projecting beyond the street line shall also comply with the requirements of Chapter 32. Signs placed on marquees shall also comply with Section 3107.*

**3106.2 Thickness.** *The maximum height or thickness of a marquee measured vertically from its lowest to its highest point shall not be limited.*

**Exception:** *Marquees projecting beyond the street line shall meet the height and thickness requirements of Chapter 32.*

**3106.3 Roof construction.** Where the roof or any part thereof is a skylight, the skylight shall comply with the requirements of Chapter 24. Every roof and skylight of a marquee shall be drained in accordance with the provisions of the New York City Plumbing Code.

**3106.4 Location prohibited.** Every marquee shall be so located as not to interfere with the operation of any exterior standpipe, and such that the marquee does not obstruct the clear passage of stairways or exit discharge from the building or the installation or maintenance of street lighting.

**3106.5 Construction.** A marquee shall be supported entirely from the building and constructed of noncombustible materials. Marquees shall be designed as required in Chapter 16. Structural members shall be protected to prevent deterioration.

## **SECTION BC 3107**

### **SIGNS**

**3107.1 General.** Signs shall be designed, constructed and maintained in accordance with Appendix H.

## **SECTION BC 3108**

### **RADIO, TELEVISION, AND TELECOMMUNICATIONS TOWERS AND ANTENNAS**

**3108.1 General.** Subject to the provisions of Chapter 16 and the requirements of Chapter 15 governing the fire-resistance ratings of buildings for the support of roof structures, radio, television, and telecommunications towers and antennas shall be designed and constructed as herein provided. All such towers and antennas shall be collectively referred to as "towers" for the purposes of this section.

**3108.2 Location and access.** Towers shall be located and equipped with step bolts and ladders so as to provide ready access for inspection purposes. Guy wires or other accessories shall not cross or encroach upon any street or other public space, or over above-ground electric utility lines, or encroach upon any privately owned property without written consent of the owner of the encroached-upon property, space or above-ground electric utility lines.

**3108.3 Construction.** Towers shall be constructed of approved corrosion-resistant noncombustible material. The minimum type of construction of isolated radio towers not more than 100 feet (30 480 mm) in height shall be Type IIB.

**3108.4 Loads.** Towers shall be designed to resist wind loads in accordance with TIA/EIA-222. Consideration shall be given to conditions involving wind load on ice-covered sections.

**3108.4.1 Dead load.** Towers shall be designed for the dead load plus ice load.

**3108.4.2 Wind load.** Towers shall be provided with adequate foundations and anchorage designed to resist two times the calculated wind load.

**3108.5 Grounding.** Towers shall be permanently and effectively grounded in accordance with the New York City Electrical Code.

## **SECTION BC 3109**

### **SWIMMING POOLS, SWIMMING POOL ENCLOSURES, AND SAFETY DEVICES**

**3109.1 General.** Swimming pools, swimming pool enclosures, and swimming pool safety devices shall comply with the requirements of this section and other applicable sections of this code.

**3109.2 Definitions.** The following terms shall, for the purposes of this section and as used elsewhere in this code, have the meaning shown herein.

**SWIMMING POOL.** Any indoor or outdoor swimming, wading, spa, or special-purpose pool.

#### **Exceptions:**

1. Portable, freestanding wading pools containing water less than 24 inches (610 mm) in depth.
2. Float tanks or relaxation tanks sized for use by one person at a time.
3. Pools used for religious purposes.
4. Spa pools used for prescribed medical therapy or rehabilitation and under medical supervision.

**SWIMMING POOL, PRIVATE.** A swimming pool that is accessory to a one- or two-family dwelling, or to a single dwelling unit of a multiple dwelling, and that is solely for the use of the occupants for non-commercial purposes.

**SWIMMING POOL, PUBLIC.** *A swimming pool that is not a private swimming pool. Public swimming pools include swimming pools that are accessory to bathing establishments as such term is defined in the New York City Health Code, whether owned or operated by city agencies, or commercial interests or private entities, including, but not limited to, public or private schools, corporations, hotels, motels, camps, apartment houses, condominiums, country clubs, gymnasia and health establishments.*

**3109.3 All swimming pools.** *Public and private swimming pools shall comply with the requirements for safety and accessibility as provided in this section.*

**3109.3.1 Entrapment avoidance.** *Where the suction inlet system, such as an automatic cleaning system, is a vacuum cleaner system which has a single suction\_inlet, or multiple suction inlets which can be isolated by valves, each suction inlet shall protect against user entrapment by an approved antivortex cover, a 12-inch by 12-inch (305 mm by 305 mm) or larger grate, or other approved means. In addition, all swimming pools and spas shall be equipped with an alternative backup system which shall provide vacuum relief should grate covers be missing. Alternative vacuum relief devices shall include one of the following:*

1. *Approved vacuum release system.*
2. *Approved vent piping.*
3. *Other approved devices or means.*

**3109.3.2 Water circulation, water treatment, and drainage.** *The supply, circulation, treatment, and drainage of water for swimming pools shall meet the requirements of the New York City Plumbing Code.*

**3109.3.3 Electrical precautions.** *No overhead electrical conductors shall be installed within 15 feet (4572 mm) of any swimming pool. All metal fences, enclosures, or railings that might become electrically charged as a result of contact with broken overhead conductors or from any other cause near, or adjacent to, a swimming pool shall be grounded in accordance with the provisions of lightning protection in the New York City Electrical Code.*

**3109.3.4 Facilities for people with disabilities.** *Facilities for people with physical disabilities shall be provided where required by Chapter 11 of this code.*

**3109.4 Public swimming pools.** Public swimming pools shall comply with the requirements for safety and accessibility as provided in Section 3109.3 and 3109.4.

**Exceptions:** A swimming pool with a power safety cover or a spa with a safety cover complying with ASTM F 1346.

**3109.4.1 Barrier height and clearances.** Public swimming pools shall be completely enclosed by a fence, wall, building, or other solid barrier, or any combination thereof, at least 6 feet (1829 mm) in height. Openings in the enclosure shall not permit the passage of a 4-inch-diameter (102 mm) sphere. The enclosure shall be equipped with self-closing and self-latching gates.

**Exception:** Enclosures shall be at least 4 feet (1219 mm) in height when surrounding wading pools with water less than 24 inches (610 mm) in depth.

**3109.4.2 Other laws.** In addition to the requirements of this section, any other, more stringent requirements for the construction and design of swimming pool and barriers that may be provided for in Article 165 of the New York City Health Code, as administered by the New York City Department of Health and Mental Hygiene, shall also be applicable.

**3109.5 Private swimming pools.** Private swimming pools shall comply with the requirements for safety and accessibility as provided in Section 3109.3 and this section.

**Exception:** An above-ground private swimming pool which has a maximum water depth of 4 feet (1219 mm) and an area not exceeding 500 square feet (46.45 m<sup>2</sup>) that is accessory to an R-3 occupancy and is privately used for non-commercial purposes shall not be required to comply with Sections 3109.3.1, 3109.3.2, 3109.5.2, 3109.5.3, and 3109.5.4.

**3109.5.1 Barrier height and clearances.** The top of the barrier enclosing a private swimming pool shall be at least 48 inches (1219 mm) above grade measured on the side of the barrier that faces away from the swimming pool. The maximum vertical clearance between grade and the bottom of the barrier shall be 2 inches (51 mm) measured on the side of the barrier that faces away from the swimming pool. Where the top of the pool structure is above grade, the barrier is authorized to be erected at grade level or mounted on top of the pool structure. The maximum vertical clearance between the top of the pool structure and the bottom of the barrier shall be 4 inches (102 mm).

**3109.5.1.1 Openings.** Openings in the barrier shall not allow passage of a 4-inch-diameter (102

mm) sphere.

**3109.5.1.2 Solid barrier surfaces.** Solid barriers which do not have openings shall not contain indentations or protrusions except for normal construction tolerances and tooled masonry joints.

**3109.5.1.3 Closely spaced horizontal members.** Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is less than 45 inches (1143 mm), the horizontal members shall be located on the swimming pool side of the fence. Spacing between vertical members shall not exceed 1¾ inches (44 mm) in width. Where there are decorative cutouts within vertical members, spacing within the cutouts shall not exceed 1¾ inches (44 mm) in width.

**3109.5.1.4 Widely spaced horizontal members.** Where the barrier is composed of horizontal and vertical members and the distance between the tops of the horizontal members is 45 inches (1143 mm) or more, spacing between vertical members shall not exceed 4 inches (102 mm). Where there are decorative cutouts within vertical members, spacing within the cutouts shall not exceed 1¾ inches (44 mm) in width.

**3109.5.1.5 Chain link dimensions.** Maximum mesh size for chain link fences shall be a 2¼ inch square (57 mm square) unless the fence is provided with slats fastened at the top or the bottom which reduce the openings to no more than 1¾ inches (44 mm).

**3109.5.1.6 Diagonal members.** Where the barrier is composed of diagonal members, the spacing between parallel diagonal members shall be no more than 1¾ inches (44 mm).

**3109.5.1.7 Gates.** Access gates shall comply with the requirements of Sections 3109.5.1.1 through 3109.5.1.6 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool and shall be self-closing and have a self-latching device. Gates other than pedestrian access gates shall have a self-latching device. Where the release mechanism of the self-latching device is located less than 54 inches (1372 mm) from the bottom of the gate, the release mechanism shall be located on the pool side of the gate at least 3 inches (76 mm) below the top of the gate, and the gate and barrier shall have no opening greater than ½ inch (12.7 mm) within 18 inches (457 mm) of the release mechanism.

**3109.5.1.8 Dwelling wall as a barrier.** Where a wall of a dwelling serves as part of the barrier, one of the following shall apply:

1. *Doors with direct access to the swimming pool through that wall shall be equipped with an alarm which produces an audible warning when the door and its screen are opened. The alarm shall sound continuously for a minimum of 30 seconds immediately after the door is opened and be capable of being heard throughout the dwelling during normal household activities. The alarm shall automatically reset under all conditions. The alarm shall be equipped with a manual means to temporarily deactivate the alarm for a single opening. Such deactivation shall last no more than 15 seconds. The deactivation switch shall be located at least 54 inches (1372 mm) above the threshold of the door.*
2. *The swimming pool shall be equipped with a power safety cover which complies with ASTM F 1346.*
3. *The door providing access to the swimming pool from the dwelling shall open inward, away from the swimming pool, and shall be self-closing and have a self-latching device. The release mechanism of the self-latching device shall be located no less than 54 inches (1372 mm) from the bottom of the door.*

**3109.5.1.9 Pool structure as barrier.** *Where an aboveground private swimming pool structure is used as a barrier or where the barrier is mounted on top of the pool structure, and the means of access is a ladder or steps, then the ladder or steps either shall be capable of being secured, locked or removed to prevent access, or the ladder or steps shall be surrounded by a barrier which meets the requirements of Sections 3109.5.1.1 through 3109.5.1.8. When the ladder or steps are secured, locked or removed, any opening created shall not allow the passage of a 4-inch-diameter (102 mm) sphere.*

**3109.5.2 Indoor swimming pools.** *Walls surrounding indoor private swimming pools shall not be required to comply with Section 3109.5.1.8.*

**3109.5.3 Prohibited locations.** *Barriers shall be located so as to prohibit permanent structures, equipment or similar objects from being used to climb the barriers.*

**3109.5.4 Construction requirements.** *Private swimming pools shall be constructed so as to be water tight and easily cleaned. They shall be built of nonabsorbent materials with smooth surfaces and shall be free of open cracks and open joints.*

**3109.5.4.1 Walls.** *The walls of swimming pools shall be vertical for at least the top 30 inches (762 mm) below the normal water level. The junctions between the side walls and the bottom shall be covered. A swimming pool overflow shall be provided meeting the requirements of the New York City Plumbing Code.*

**3109.5.4.2 Bottom slopes.** *The bottom of the swimming pool shall slope downward toward the main drains. The slope in shallow areas with depths less than 5 feet (1524 mm) shall not exceed 1 unit vertical in 12 units horizontal. In portions of the swimming pool with depth greater than 5 feet (1524 mm), the slope shall not be steeper than 1 unit vertical in 3 units horizontal.*

**3109.5.4.3 Ladders.** *There shall be a ladder or steps with handrails at the deep end and at the shallow end of every swimming pool. Ladders and steps shall have no slip treads. All ladders shall be rigidly installed and shall be constructed of corrosion-resistant materials.*

**3109.5.4.4 Walkways .** *Every swimming pool shall have a walkway at least 5 feet (1524 mm) wide around its entire perimeter. The walkway shall have a non-slip surface and shall be constructed to drain away from the swimming pool.*

**3109.5.4.5 Handholds.** *Every swimming pool shall be constructed so that either the overflow gutter, if provided, or the tops of the side walls afford a continuous handhold for bathers.*

**3109.5.4.6 Markings.** *Permanent markings showing the depth of the shallow end, break points, diving depth, and deep end shall be provided so as to be visible from both inside and outside the swimming pool.*

**3109.5.4.7 Diving boards and towers.** *Diving towers shall be rigidly constructed and permanently anchored. The depth of the water below a diving board shall be at least 102 inches (2591 mm) for a board 39 inches (991 mm) or less above the water. For a diving board more than 39 inches (991 mm) and not more than 118 inches (2997 mm) above the water, the depth of the water below the board shall be at least 144 inches (3658 mm). For a diving board or platform more than 118 inches (2997 mm) above the water, the depth of the water below the board shall be at least 192 inches (4877 mm). Indoor swimming pools shall provide at least 144 inches (3658 mm) overhead clearance above all diving boards.*

**SECTION BC 3110  
SIDEWALK CAFÉS**

**3110.1 General.** Sidewalk cafés provided beyond the building line shall comply with the requirements of this section, the New York City Zoning Resolution, the Commissioners of the Department of Consumer Affairs and Department of Transportation, and with the projection limitations of Chapter 32 of this code.

**3110.2 Enclosures.** Enclosed sidewalk cafés shall be constructed of noncombustible material. The walls of such enclosures shall not extend more than 8 feet (2438 mm) above the sidewalk. Light transmitting plastic glazing complying with Section 2606 shall be permitted as glazing within such walls. Light-transmitting plastic skylight glazing complying with Section 2610 may be installed in the roofs of such enclosures.

**3110.3 Awnings.** Awnings supported entirely from the building may be placed over unenclosed sidewalk cafés provided they are at least 8 feet (2438 mm) clear above the sidewalk and within the limits specified by the Commissioner of the Department of Consumer Affairs. Such awnings shall be in compliance with Section 3105 of this code.

**3110.4 Obstructions prohibited.** No part of any awning, enclosure, fixture, equipment or removable platform of a sidewalk café shall be located:

1. Beneath a fire escape so as to obstruct operation of fire escape drop ladders or counter-balanced stairs;
2. So as to obstruct any exit from a building;
3. So as to obstruct any cellar access hatch or areaway;
4. So as to interfere with any vent or other mechanical ventilation outlet or inlet;
5. So as to interfere with or obscure any standpipe connections, hydrant or associated signage in any way that would hinder its use by the fire department.

**Exception:** Upon special application, the commissioner may permit an easily removable, prominently designated platform, designed in accordance with Section 3110.5, to cover a cellar entrance or areaway that is not used as a required means of egress.

**3110.5 Removable platforms.** Removable platforms of sidewalk cafés shall be constructed in accordance with the requirements of this section.

**3110.5.1 Continuity.** *Removable platforms shall be constructed to provide for a continuous unbroken and level floor without openings or cracks so as to prevent any material or liquid from falling through to the area beneath.*

**3110.5.2 Maintenance.** *No papers, trash or other materials may be permitted to accumulate in the area beneath the floor of any removable platform.*

**3110.6 Accessibility.** *Sidewalk cafés and access thereto shall comply with Chapter 11.*

**3110.7 Assembly seating.** *Unless separated from seating inside the building by fire partitions complying with Section 708, the seating for enclosed sidewalk cafés shall be added to that inside the building in order to determine whether a place of assembly permit is required.*

**3110.8 Rules.** *In addition to the requirements specified herein, the commissioner may promulgate such additional rules necessary to secure safety.*

## **SECTION BC 3111**

### **FENCES**

**3111.1 Permitted heights.** *Fences are permitted to be erected to a maximum height of 10 feet (3048 mm) above the ground.*

#### **Exceptions:**

- 1. In residence districts, as established by the New York City Zoning Resolution, fences are permitted to be erected to a maximum height of 6 feet (1829 mm) above the ground.*
- 2. Fences in residence districts used in conjunction with non-residence buildings and public playgrounds, excluding buildings accessory to dwellings, are permitted to be erected to a maximum height of 15 feet (4572 mm) above the ground.*
- 3. Higher fences may be permitted by the commissioner where required for the enclosure of public playgrounds, school yards, parks, and similar public facilities.*

**CHAPTER 32**  
**ENCROACHMENTS INTO THE PUBLIC RIGHT-OF-WAY**

**SECTION BC 3201**  
**GENERAL**

**3201.1 Scope.** *The provisions of this chapter shall govern the encroachment of structures into the public right-of-way.*

**3201.1.1 Encroachments removable.** *All encroachments permitted beyond the street line by the provisions of this chapter shall be constructed so that they may be removed at any time without endangering the structural safety or fire safety of the building except that footings as permitted under Section 3202.1.1 of this code need not be removable.*

**3201.2 Measurement.** *The projection of any structure or appendage shall be the distance measured horizontally from the lot line to the outermost point of the projection.*

**3201.3 Other laws.** *The provisions of this chapter shall not be construed to permit the violation of other laws regulating the use and occupancy of public property.*

**3201.3.1 Restrictions on construction and projections on certain streets, parkways, boardwalks and beaches.** *Notwithstanding the provisions of this chapter, it shall be unlawful to build, erect, or make areaways, steps or other encroachments or projections prohibited by Sections 19-131, 19-132, 19-135, 18-109, 18-112 and 18-113 of the Administrative Code.*

**3201.4 Drainage.** *Drainage water collected from a roof, awning, canopy or marquee, other than canvas and flexible material, and condensate from mechanical equipment shall not flow over a public walking surface.*

**3201.5 Permission revocable.** *Any permission, expressed or implied, permitting the construction of encroachments within the area of the street under the provisions of this chapter shall be revocable, except footings as permitted under Section 3202.1.1.*

**3201.6 Existing projections.** *Any part of a building that projects beyond a street line on January 1, 1938 may be maintained as constructed until its removal is directed in accordance with applicable law.*

**3201.7 Alteration of existing encroachments.** *Alterations to existing encroachments beyond the street line may be permitted in whole or in part, provided that such alterations conform with the requirements of this chapter.*

**3201.8 Definitions.** *As used in this chapter, the following terms shall have the following meanings:*

**CURB LINE.** *The line coincident with the face of the street curb adjacent to the roadway.*

**FOOTING.** *A foundation element consisting of an enlargement of a foundation pier or foundation wall, wherein the soil materials along the side of and underlying the element may be visually inspected prior to and during its construction.*

**PROJECTING SIGN.** *A sign other than a wall sign, which projects from and is supported by a wall of a building or structure.*

**SIGN.** *Any letter, figure, character, mark, plane, point, marquee sign, design, poster, pictorial, picture, stroke, stripe, line, trademark, reading matter or illuminated service, which shall be constructed, placed, attached, painted, erected, fastened or manufactured in any manner whatsoever, so that the same shall be used for the attraction of the public to any place, subject, person, firm, corporation, public performance, article, machine or merchandise, whatsoever, which is displayed in any manner outdoors. Every sign shall be classified and conform to the requirements of that classification as set forth in this chapter.*

**STREET.** *A thoroughfare dedicated or devoted to public use by legal mapping or other lawful means, or a public way.*

**STREET LINE.** *A lot line separating a street from other land.*

**VAULT.** *Any space below the surface of the a street, that is covered over, except those openings that are used exclusively as places for descending, by means of steps, to the cellar or basement of any building.*

## **SECTION BC 3202 ENCROACHMENTS**

**3202.1 Encroachments below grade.** *Encroachments below grade shall comply with Sections 3202.1.1 through 3202.1.4.*

**3202.1.1 Footings.** Exterior wall and column footings may be constructed to project beyond the street line not more than 12 inches (305 mm), provided that the top of the footing is not less than 8 feet (2438 mm) below the ground or sidewalk level. Foundation walls required to support permitted projections may be constructed to project not more than the permitted projection beyond the street line.

**3202.1.2 Vaults.** Vaults may be permitted in accordance with the New York City Charter and Chapter 19 of the Administrative Code. Such vaults shall comply with the provisions of this code and other applicable laws and rules.

**3202.1.3 Areaways.** Areaways, subject to approval by the Commissioner of the Department of Transportation, shall be protected by grates, guards or other approved means.

**3202.1.4 Tunnels between buildings.** Tunnels connecting buildings, and projecting beyond street lines, may be constructed subject to the approval of the Commissioner of the Department of Transportation. Such tunnels shall comply with the provisions of this code and other applicable laws and regulations.

**3202.2 Encroachments above grade.** Encroachments into the public right-of-way above grade shall be prohibited except as provided for in Sections 3202.2.1 through 3202.2.3.

**3202.2.1 Encroachments subject to the area limitations.** Encroachments that are subject to area limitations are those elements listed in sections 3202.2.1.1 through 3202.2.1.8, generally of an architectural character, that form an integral part of the building facade. The aggregate area of all such elements constructed to extend beyond the street line shall not exceed 10 square feet (0.93 m<sup>2</sup>) within any 100 square feet (9.1 m<sup>2</sup>) of wall area, except that a veneer may be applied to the entire facade of a building erected before December 6, 1968, if such veneer does not project more than 4 inches (102 mm) beyond the street line. The area of any such projection shall be measured at that vertical plane, parallel to the wall, in which the area of the projection is greatest. This plane of measurement may be at the street line, the line of maximum projection, or any point in between.

**3202.2.1.1 Entrance details.** Entrance details, including steps, and doors when fully open, may be constructed to project beyond the street line not more than 18 inches (457 mm). Entrance steps that project beyond the street line shall be guarded at each end by railings or check pieces at least 3 feet (914 mm) high or by other members of the entrance detail providing equivalent protection.

**3202.2.1.2 Architectural details.** Details such as cornices, eaves, bases, sills, headers, band course, opening frames, sun control devices, rustications, applied ornament or sculpture, grilles,

windows when fully open, air conditioning units, and other similar elements may be constructed:

1. To project not more than 4 inches (102 mm) beyond the street line when less than 10 feet (3048 mm) above the ground or sidewalk level.
2. To project not more than 10 inches (254 mm) beyond the street line when more than 10 feet (3048 mm) above the ground or sidewalk level.

**Exception:** Architectural details that are more than 10 feet (3048 mm) above the sidewalk and that project more than 10 inches (254 mm) may be permitted subject to the approval of the Commissioner of the Department of Transportation.

**3202.2.1.3 Balconies.** Balconies, including railings and supporting brackets, no parts of which are less than 10 feet (3048 mm) above the ground or sidewalk level, may be constructed to project not more than 22 inches (559 mm) beyond the street line. When permitted by the provisions of this code, fire escapes that are part of a required exit may be constructed to project not more than 4 feet 6 inches (1372 mm) beyond the street line provided no part, including any movable ladder or stair, is lower than 10 feet (3048 mm) above the ground or sidewalk level when not in use.

**3202.2.1.4 Marquees.** Marquees may be constructed to project beyond the street line provided that they comply with Section 3106 and Sections 3202.2.1.4.1 through 3202.2.1.4.5.

**3202.2.1.4.1 Height.** Marquees shall receive structural support only from the building, and shall be at least 10 feet (3048 mm) above the ground level or sidewalk.

**3202.2.1.4.2 Projection.** Marquees shall project no closer to the curb line than 2 feet (610 mm).

**3202.2.1.4.3 Thickness.** Marquees shall be no thicker nor shall the fascia be higher than 3 feet (914 mm) when measured from top to bottom.

**3202.2.1.4.4 Dimensions.** Dimensions shall include all decoration, but shall exclude any tension supports suspending the marquee from the wall.

**3202.2.1.4.5 Occupancy restrictions.** Marquees may be erected on:

1. Buildings of an essentially public nature including but not limited to the following:

*1.1 Public buildings.*

*1.2 Theatres.*

*1.3 Hotels.*

*1.4 Terminals.*

*1.5 Large department stores.*

*1.6 Supermarkets.*

*1.7 Multiple dwellings.*

*2. Warehouses or markets in one of the following established market areas:*

*2.1 Bronx.*

*2.1.1 Edgewater Road and Halleck Street between Lafayette Avenue and East Bay Avenue.*

*2.1.2 Lafayette Avenue between Edgewater Road and the Bronx River.*

*2.1.3 East Bay Avenue between Halleck Street and the Bronx River.*

*2.1.4 Hunt's Point Avenue between East Bay Avenue and the Bronx River.*

*2.1.5 Exterior Street between East 149<sup>th</sup> Street and East 157<sup>th</sup> Street.*

*2.1.6 Cromwell Avenue between East 150th Street and East 153rd Street.*

*2.1.7 East 150th Street between Exterior Street and River Avenue.*

*2.1.8 Westchester Avenue between St. Ann's Avenue and Bergen Avenue.*

*2.1.9 Brook Avenue between East 150th Street and East 156th Street.*

2.1.10. *Bergen Avenue between East 149th Street and East 156th Street.*

2.1.11. *East 152nd Street between Bergen Avenue and Brook Avenue.*

2.1.12. *East 153<sup>nd</sup> Street between Bergen Avenue and Brook Avenue.*

2.2. *Brooklyn.*

2.2.1. *North 6<sup>th</sup> Street between Berry Street and Wythe Avenue.*

2.3. *Manhattan.*

2.3.1. *John Street to Fulton Street between South Street and Front Street.*

2.3.2. *Fulton Street to Dover Street between South Street and Water Street.*

2.3.3. *South Street and Front Street between John Street and Dover Street.*

2.3.4. *Water Street between Fulton Street and Dover Street.*

2.3.5. *Horatio Street to West 14th Street between West Street and 9th Avenue.*

2.3.6. *West Street, Washington Street, Greenwich Street*

2.3.7. *9th Avenue and 10th Avenue between Horatio Street and West 14th Street.*

2.3.8. *West 16th Street, north side, and West 17th Street, south side, between 10th Avenue and 11th Avenue.*

2.3.9. *West 24<sup>th</sup> Street to West 26<sup>th</sup> Street, south side, between 11<sup>th</sup> Avenue and 12<sup>th</sup> Avenue.*

2.3.10. *West 27th Street, north side, to West 28th Street between 11th Avenue and 12th Avenue.*

2.3.11. *12th Avenue and St. Claire Place between 125th Street and 132nd Street.*

2.3.12. 12th Avenue, west side, between 132nd Street and 133<sup>rd</sup> Street.

2.4. Queens.

2.4.1. 95<sup>th</sup> Avenue, north side, between Sutphin Boulevard and 148<sup>th</sup> Street.

**3202.2.1.4.6 Change of occupancy.** When the occupancy or use of a building with a marquee is changed to an occupancy or use for which a projecting marquee is not permitted, the marquee shall be removed.

**Exception:** Where such marquee is subject to the jurisdiction of the Landmarks Preservation Commission such marquee shall not be removed without the prior approval of the Landmarks Preservation Commission.

**3202.2.1.4.7 Other agency approvals.** An applicant wishing to erect a marquee shall provide proof that the Commissioners of the Departments of Transportation, Consumer Affairs, and Environmental Protection have not permitted the use of a space or structure on or under the sidewalk beneath the proposed marquee in such a manner that the construction of the proposed marquee shall interfere with the removal or repair of any such permitted use or structure.

**3202.2.1.5 Light fixtures** Light fixtures that are supported entirely from the building may be constructed to project not more than 2 feet (610 mm) beyond the street line, provided no part of the fixture is less than 8 feet (2438 mm) above the ground or sidewalk level.

**3202.2.1.6 Flagpoles.** Flagpoles that are supported entirely from the building may be constructed to project not more than 18 feet (5486 mm) beyond the street line, but not closer than 2 feet (610 mm) to the curb line, provided that no part of the flagpole is less than 15 feet (4572 mm) above the ground or sidewalk level.

**3202.2.1.7 Wall signs** Wall signs may be constructed to project not more than 12 inches (305 mm) beyond the street line when conforming to the requirements of this code and Section H111 of Appendix H.

**3202.2.1.8 Projecting signs** All permitted projecting signs may be constructed to project not more than 10 feet (3048 mm) beyond the street line, but not closer to the curb line than 2 feet (610 mm), when conforming to the requirements of this code and Section H112 of Appendix H, and provided that no part of the sign is less than 10 feet (3048 mm) above the ground or sidewalk level.

**Exceptions:** *Permanent projecting signs are prohibited on buildings in the areas indicated below:*

*1. Borough of Manhattan.*

*1.1. Projecting signs. No permanent projecting sign shall be erected on any building on:*

*1.1.1. 5<sup>th</sup> Avenue between Washington Square north and 110<sup>th</sup> Street;*

*1.1.2. 34<sup>th</sup> Street between Park Avenue and 7<sup>th</sup> Avenue;*

*1.1.3. Madison Avenue between 23<sup>rd</sup> Street and 96<sup>th</sup> Street;*

*1.1.4. 57<sup>th</sup> Street between Lexington Avenue and Broadway;*

*1.1.5. Vanderbilt Avenue between 42<sup>nd</sup> Street and 47<sup>th</sup> Street;*

*1.1.6. Park Avenue between 32<sup>nd</sup> Street and 40<sup>th</sup> Street;*

*1.1.7. Park Avenue between 45<sup>th</sup> Street and 96<sup>th</sup> Street;*

*1.1.8. 33<sup>rd</sup> Street between Lexington Avenue and 5<sup>th</sup> Avenue;*

*1.1.9. 35<sup>th</sup> through 41<sup>st</sup> Streets between Lexington Avenue and 5<sup>th</sup> Avenue;*

*1.1.10. 43<sup>rd</sup> through 56<sup>th</sup> Streets between Lexington Avenue and 5<sup>th</sup> Avenue;*

*1.1.11. 58<sup>th</sup> Street between Lexington Avenue and 5<sup>th</sup> Avenue;*

*1.1.12. 60<sup>th</sup> Street between Lexington Avenue and 5<sup>th</sup> Avenue;*

*1.1.13. Nassau Street between Wall Street and Frankfort Street; or*

*1.1.14. John Street between Broadway and William Street.*

*1.2. Illuminated projecting signs. No permanent illuminated projecting sign shall be erected on any building on:*

*1.2.1. 72<sup>nd</sup> Street between Central Park West and River Drive.*

*2. Borough of Brooklyn.*

*2.1. Projecting signs. No permanent projecting sign shall be erected on any building on:*

*2.1.1. Fulton Street between Flatbush Avenue and Joralemon Street and Willoughby Street.*

*2.2. Illuminated projecting signs. No permanent illuminated projecting sign shall be erected on any building on:*

*2.2.1. Fulton Street between Flatbush Avenue and Prospect Street and Henry Street;*

*2.2.2. Washington Street between Myrtle Avenue and Prospect Street;*

*2.2.3. Court Street between Fulton Street and Livingston Street;*

*2.2.4. Pierrepont Street between Fulton Street and Clinton Street;*

*2.2.5. Montague Street between Court Street and Clinton Street;*

*2.2.6. Remsen Street between Court Street and Clinton Street; or*

*2.2.7. Joralemon Street between Court Street and Clinton Street.*

***3202.2.2 Encroachments not subject to area limitations.***

***3202.2.2.1 Ramps.*** *When a building erected prior to December 6, 1969 is altered to provide access to individuals who use wheelchairs, ramps constructed to provide such access may, with the approval of the commissioner, project beyond the street line for a distance of not more than 44 inches (1118 mm). Ramps shall comply with the applicable provisions of Chapter 11.*

**3202.2.2.2 Bridges between buildings.** Bridges connecting buildings, and projecting beyond street lines may be permitted in accordance with applicable law. Such bridges shall be of a construction class that is at least equal to the higher class of the two buildings connected, and shall otherwise comply with the provisions of this code and other applicable laws and rules.

**3202.2.3 Awnings.** Awnings constructed in accordance with Section 3105 and supported entirely from the building may project beyond the street line as follows:

**3202.2.3.1 Store front awnings.** Store front awnings may project beyond the street line not more than 8 feet (2438 mm), provided no part of the awning is less than 8 feet (2438 mm) above the ground or sidewalk level, except for a flexible valance which may be not less than 7 feet (2134 mm) above the ground or sidewalk level, and provided that the awning box or cover does not project more than 12 inches (305 mm).

**3202.2.3.2 Awnings over windows or doors.** Awnings over windows or doors may project beyond the street line not more than 5 feet (1524 mm), provided that no part of the awning is less than 8 feet (2438 mm) above the ground or sidewalk level.

**3202.3 Reserved.**

**3202.4 Temporary encroachments.** Encroachments of temporary nature shall comply with Sections 3202.4.1 and 3202.4.2.

**3202.4.1 Sidewalk cafés.** Enclosures for sidewalk cafés, where permitted by the Commissioner of the Department of Consumer Affairs pursuant to applicable law and constructed in compliance with Section 3110, may be constructed beyond the street line.

**3202.4.2 Storm enclosures.** Storm enclosures projecting not more than 18 inches (457 mm) beyond the street line may be permitted during the period between November 15 and the following April 15. Such enclosures shall be removed at the end of this period. Construction of storm enclosures must comply with the requirements of this code including the fire resistance rating of the building to which it is appurtenant and Chapter 11 of this code.

**CHAPTER 33**  
**SAFEGUARDS DURING CONSTRUCTION OR DEMOLITION**

**SECTION BC 3301**  
**GENERAL**

**3301.1 Scope.** *The provisions of this chapter shall govern the conduct of all construction or demolition operations with regard to the safety of the public and property. For regulations relating to the safety of persons employed in construction or demolition operations, OSHA Standards shall apply.*

**3301.1.1 Responsibility for safety.** *Nothing in this chapter shall be construed to relieve persons engaged in construction or demolition operations from complying with other applicable provisions of law, nor is it intended to alter or diminish any obligation otherwise imposed by law on the owner, construction manager, general contractor, contractors, materialmen, registered design professionals, or other party involved in a construction or demolition project to engage in sound design and engineering, safe construction or demolition practices including but not limited to debris removal, and to act in a reasonable and responsible manner to maintain a safe construction or demolition site.*

**3301.1.2 Fire Code.** *In addition to the requirements of this chapter, construction or demolition operations shall also be conducted in conformance with the New York City Fire Code.*

**3301.2 Contractors.** *Contractors, construction managers, and subcontractors engaged in building work shall institute and maintain safety measures and provide all equipment or temporary construction necessary to safeguard all persons and property affected by such contractor's operations.*

**3301.3 Site Safety Managers, Coordinators and Superintendent of Construction.** *A Site Safety Manager or Site Safety Coordinator must be designated and present on the construction or demolition of major buildings as defined by and in accordance with Section 3310. A Superintendent of Construction is required for the construction or demolition of such other buildings identified pursuant to rules promulgated by the commissioner.*
