CITY OF NEW YORK
DEPARTMENT OF BUILDINGS

Pursuant to Administrative Code Section 27-131, the following equipment or material has been found acceptable for use in accordance with the Report of Materials and Equipment Acceptance (MEA) Division.

Patricia J. Lancaster, F.A.I.A., Commissioner
MEA101-00-E Vol. V
Report of Material and Equipment Acceptance Division

1.0 MANTFACTLRER

LOUISIANA-PACIFIC CORPORATION 2706 HIGHWAY 421 NORTH WILMINGTON, NORTH CAROLINA 28401 9L0.762.93"S www. lpcorp.com

2.0 TRADE NAME

LPI 18. LPI 20 W, LPI 20, LPI 20X1.5 (Also known as LPI 20PLUS). LPI 20X1.7, LPI 32W, LPI 32 AND LPI 42X1.8 (Also known as LPI 42PLUS) Series Wood I-JOISTS and RIM BOARDS

3.0 PRODUCT

Wooden I-joists, with flanges made of kiln-dried, solid sawn lumber and webs of oriented strand board structural panels. The I-joist series, depths and flange sizes are given in Table I.

4.0 USES

LPI Wood I-Joists are intended for structural applications such as, but not limited to, Moor joists, roof joists, blocking panels and rim joists.

5.0 DESCRIPTION

5.1 Pertinent Code Sections

Pertinent code sections for the LPI Wood I-Joists are: Article 7 Wood. Section 27-61 7 and Reference Standard RS-10, Section 27-133 Alternate or Equivalent MateriaL

5.2 General

LPI Wood I-Joists have structural wood flanges and a single web as specified in the approved Quality Assurance Manual (herein referred to as the Manual) that contains the manufacturing standards. Web sections are end-jointed together to form a continuous web. Web end joints shall be of the types specified in the Manual. The web-flange connection is made by inserting the beveled edge of the web into a groove centered in the wide face of the flange member.

The flange sizes, depths and manufacturing tolerances of the I-joists shall be as specified in the Manual.

5.3 Materials

5.3.1 Flanges

The flange material is solid sawn lumber that meets the requirements noted in the Manual.

5.3.2 Webs

Web panels must be at least 3/S-inch (9.5 mm) thick and comply with U.S. Voluntary Product Standard PS 2-92 and the Manual.

5.3.3 Adhesive

Adhesives are exterior wet use types complying with ASTM D25:9 and shall be of the types specified in the Manual.

5.3.4 Quality Assurance Manuals

All LPI Wood I-Joists are manufactured under a strict Quality Assurance Program outlined in the below Quality Assurance Manuals:

1. Quality Assurance Manual for LPI 13, LPI 20W. LPI 20, LPI 20XI.5 (LPI 20PLUS) and LPI 20X1.7 Series I-Joists, 2004.
2. Quality Assurance Manual for LPI 32W, LPI 32, LPI 42XI.5, LPI 42X1.S and LPI 42X2.0 Series I-Joists, 2004.

6.0 DESIGN AND INSTALLATION

6.1 Design

LPI Wood I-Joists must be designed in accordance with Tables I to 9 of this report, except that appropriate design load(s). Deflection limitation(s) and other performance standards of the New York City Building Code shall apply. The following conditions also apply:

1. Web stiffeners are optional when the LPI Wood I-Joists arc designed in accordance with Tables I to S, except when any of the following conditions are encountered:

   a. Bird's mouth cuts. See Figure 6, Detail 6.
   b. Where sloped joist hangers support I-joists.
   c. Where joist hangers do not laterally support the I-joist's top flange.
   d. When required by Table I due to actual reaction loads.

2. The tabulated maximum resistive moments given in Table I for I-joist shall not be increased by any code allowed repetitive member use factor.

3. An analytical approach for the location and size of I-Joist web holes, including use of the LP design software can be used in lieu of the hole chart tables or web hole equations noted in this report, provided the hole calculations are reviewed and approved by a professional engineer. Size and location of allowable web holes are noted in Tables 2A. 2B. 3A, and 3B for the LPI 18 Series I-joists, ind in Tables 4A, 4B, 5A. and 5B for all other LPI Series I-joists described in this report. Web hole equations are noted in Tables 6 and 7 for the LPI IS and other LPI Series I-joists. respectively. If the engineer uses the LP design software for web hole design, the engineer must provide proper reference to the Software. Figure 1 shows the web hole drawings.

4. For the purpose of nailed connections, such as i wood structural panel connection to an I-joist top flange, the assumed specific gravity for the flange material shall be 0.42.

6.2 LPI I-Joist Rim Board Applications

The LPI I-Joists are recognized for use as rim boards as shown in Figure 4, Detail 2. For the purpose of this report, rim boards are defined as

continuously supported structural members, either located at the joist elevation in an end bearing wall or located parallel to the joist framing, that are the full depth of the joist space and are used for any of the following purposes:

1. Transfer, from above to below, of all vertical loads at the rim board location. Allowable vertical loads are noted in Figure 4.

2. Provide diaphragm attachment (sheathing to the top edge of rim board).

3. Transfer of maximum 230 plf (3358 N/m) in-plane lateral loads from the diaphragm to the wall plate below. See Figure 4 for shear transfer details.

4. Provide lateral support to the joist or rafter (resistance against rotation) through attachment to the joist or rafter.

6.3 Installation

LPI Wood I-Joists are installed using details shown in Figures 1 to 8 of this report.

1. All I-joist top flanges must be laterally supported, and the ends must be restrained to prevent rollover. This support is normally provided by diaphragm sheathing attached to the top flange and to an end wall or shear-transfer panel capable of transferring 50 pounds per foot (730 N/m). Blocking or cross-bracing with equivalent strength may also be used.

2. Sheathing attachment to the I-joist flanges shall not exceed the nail sizing and minimum spacing requirements given in Table 8 of this report.

3. I-joist attachment to supports shall not exceed the nail sizing and minimum spacing requirements given in Table 8 of this report.

4. Bridging may be omitted in floor and roof joist applications. Bracing is required during construction in accordance with the manufacturer's instructions.

5. The material, size, and attachment of web reinforcement shall be as illustrated and described in Figure 7 of this report.

6. Details are directed towards proper installation of all LPI wood I-joists. Other considerations, such as diaphragm connections, nailing and load transfers, require supplementary consideration by the responsible engineer.

7. Handling and Storage:

   a. Unload I-joists carefully, by lifting. Support the bundles to reduce excessive bowing. Individual I-joists should be handled in a manner that prevents physical damage to the I-joist during measuring, cutting, erection, etc. I-joists should be handled vertically and not flatwise.

   b. I-joists should remain stored in wrapped and strapped bundles, stacked no more than 12 feet high, using blocking supports between bundles spaced no more than 10 feet apart.

   c. I-joists must not be stored in contact with the ground, or have prolonged exposure to the weather

   d. When I-joist are stored out of doors or exposed to wet weather conditions during construction, the user shall inspect I-joists for flange-web separation, swelling and warping and replaced if so damaged.

6.4 One-Hour Fire-Resistance-Rated Floor-Ceiling Assembly

The single-layer floor or roof deck consists of 23/32-inch (18.3 mm) thick tongue-and-groove APA-rated plywood sheathing, Sturd-I-Floor or equivalent (Exposure 1 or Exterior glue), over LPI I-joists spaced up to 24 inches (610 mm) on center. In lieu of the 23/32-inch (18.3 mm)

thick floor sheathing, 19/32-inch (15.1 mm) thick sheathing with a ¾-inch (19.1 mm) thick fill of Gyp-Crete is acceptable.

The cavity may be insulated with optional 3-1.2-inch (89 mm) thick R-11 glass fiber insulation batts. If the glass fiber insulation batts are used, the insulation must be installed between I-joists with stay wires placed a minimum of 12 inches (305 mm) on center. Stay wires ends shall be ¾ inch (19.1 mm) above the lower surface of the bottom flanges. Insulation shall be pulled down to completely cover the I-joist web. RCI resilient channels, attached to the bottom flange of the I-joists with the gypsum wallboard attached to the channel, are options, provided the channels are spaced up to 16 inches (406 mm) on center.

The ceiling consists of two layers of ½ -inch (12.7 mm) thick Type X gypsum board attached to the I-joist's bottom flange. Long edges of sheathing must be perpendicular to the I-joists with staggered end joints. The first layer of gypsum wallboard is attached perpendicular to the I-joists, with end joints staggered, using 1-5/8-inch (41.3 mm) long Type W screws spaced 12 inches (305 mm) on center. The second layer of gypsum wallboard is attached perpendicular to the I-joists. All joints are staggered from the first layer, using 2-1/4-inch (57 mm) long Type W screws spaced 12 inches (305 mm) on center on the I-joists, and 1-1/2-inch (38 mm) long Type G screws spaced 16 inches (406 mm) on center between the I-joists. The second layer must be finished with joint tape and compound. See Figure 8 for additional details.

6.5 Sound Ratings

The systems in Section 6.4 have the sound transmission and impact insulation classification noted in Table 9 of this report.

7.0 IDENTIFICATION

LPI Wood I-Joists shall be identified with the Louisiana-Pacific Corporation name or logo; the quality control agency name or logo (APA-The Engineered Wood Association), the report number (MEA-101-00-E); the mill number and the date of fabrication.

8.0 EVIDENCE SUBMITTED

Tests - Flange Tension Tests, EI and Moment Capacity Tests, Shear Capacity Tests, Multiple Span Bearing Capacity Tests, Minimum End Bearing Tests, Round Web Opening Shear Capacity Tests, and Rectangular Web Opening Shear Capacity Tests.

Laboratory - In-house testing was performed by Louisiana-Pacific Corporation and was witnessed by a representative of PFS Corporation, Intertek Testing Services or APA-The Engineered Wood Association. Tables and drawings contained in this report were prepared by Louisiana-Pacific Corporation and sealed by Daniel Michael McGee, P.E., New York State License No. 04103.

Test Reports for LPI wood I-joists are as follows:

1. LPI 32 Series I-Joists: Tension, EI, Bending, Moment, Deflection, Creep, K-factor, MOE and Web Hole Tests.
2. LPI 32 Series I-Joists: Single and Multiple Span Shear.
3. LPI 20 Series I-Joist General Specifications: Test Reports, Sample Calculations and Data.
4. Qualification Test Data for LPI 20 Series- 14" Depth.
5. Qualification Test Data for LPI 20 Series- 16" Depth.
6. Qualification Test Data for LPI 20X1.5 (20Plus) Series.
7. Qualification Test Data for LPI 20X1.7 Series- 16" Depth.
8. Qualification Test Data for LPI 20X1.7 Series- Revised Moment Design Values.
9. Qualification Test Data for LPI 20X1.7 Series I-Joists Manufactured by LP Hines.
10. Confirmation Test Data for LPI 20X1.7 Series I-Joists Manufactured by LP Wilmington.
11. Confirmation Test Data for LPI 20X1.7 Series I-Joists Manufactured by Les Chantiers de Chibougamau.
12. Confirmation Test Data for LPI 32 Series I-Joists Manufactured by LP Hines.
13. Confirmation Test Data for LPI 32 Series I-Joists Manufactured by LP Wilmington.

14. Confirmation Test Data for LPI 20X1.7 and 32 Series I-Joists, having Ashland Isoset finger-joint adhesive, Manufactured by Les Chantiers de Chibougamau.
15. Confirmation Test Data for LPI 20 Series I-Joists Manufactured by LP Hines.
16. Confirmation Test Data for LPI 20 Series I-Joists Manufactured by LP Wilmington.
17. Confirmation Test Data for LPI 20, 20X1.7 and 32 Series I-Joists Manufactured by LP Larouche.
18. Confirmation Test Data for LPI 20X1.7 and 32 Series I-Joists Manufactured by Jager-Bolton.
19. Qualification Test Data for LPI 42X1.8 (LPI 42Plus) Series.
20. Sound Transmission Loss and Impact Sound Transmission Test Data by NU Laboratories, Inc.
21. ASTM E 119 Fire Endurance Test of a Wood I-Joist Floor-Ceiling and Roof-Ceiling Assembly by PFS Corporation.

9.0 CONDITIONS OF USE

The LPI I-Joists described in this report shall comply with this report and are subject to the following conditions:

1. The LPI wood I-joists shall be designed in accordance with this report. Details provided in Figures 1 through 8 and Tables 1 through 9 of this report must be confirmed for applicability for each project. Engineering calculations may be required. The following items should be considered when submitting calculations to the building official: lateral support, vertical support, connections (including selection of joist hangers), lateral force resistance, location and size of web holes and applied loads and spans.

2. Structural designs using LPI I-Joists shall conform to the manufacturer's specifications except that appropriate design load(s), deflection limitation(s) and other performance standards of the New York City Building Code shall apply.

3. Where a one-hour fire-resistance rating is required, construction shall comply with Section 6.4 of this report.

4. Where sound transmission and impact requirements are required by the codes, construction shall comply with Section 6.5 and Table 9 of this report.

5. The I-joists must be installed in accordance with this report and the manufacturer's installation details. Installation details may require supplementary consideration as noted in Section 6.3.

6. The I-joists are manufactured in accordance with the Quality Assurance Manuals with third-party inspections by APA-The Engineered Wood Association at the Louisiana-Pacific Corporation Engineered Wood Products facilities in Wilmington, North Carolina, Red Bluff, California, Larouche, Quebec, Canada, St. Prime, Quebec, Canada and at the Jager Building Systems facility in Bolton, Ontario, Canada and at the Les Chantiers de Chibougamau, Limited, facility in Chibougamau, Quebec, Canada.

10.0 RECOMMENDATIONS

That the LPI I-Joists be accepted on the condition that all uses, locations and installations shall comply with the applicable requirements of the New York City Building Code and Technical Policy and Procedure Notice #8, 1992 dated August 19, 1992, and TPPN #2/00 dated July 24, 2000 (attached) and on further condition that:

1. Structure designs using wood I-joists shall conform to the manufacturer's specifications except that appropriate design load(s), deflection limitation(s) and other performance standards of the New York City Building Code shall apply.

2. When stored out-of-doors or exposed to wet weather conditions during construction, be inspected by the user for flange-web separation, swelling or warping and be replaced if so damaged.

3. Glue used shall not delaminate during a fire.

4. Wood I-Joists shall be used in locations that will ultimately be protected from the weather and be marked "Exposure 1", indicating the exposure durability as defined in PS 2-92, "Performance Standards for Wood-Based Structural Use Panels."

5. The size of any cutouts in the web of the joist shall not exceed the manufacturer's recommendations.

6. The cutting of openings for ducts, pipes, conduits, etc. in wood I-joists shall be subject to a controlled inspection.

7. Firestopping shall be provided between the ceiling and the floor or roof above and shall be divided into approximately equal areas not greater than 500 square feet.

8. The building permit applicant shall notify the Fire Department of the proposed installation of wood I-joists prior to the Building Department issuance of a construction permit. Evidence of such notification shall be a certifying statement submitted on Form TR-1, Technical Report, reading as follows:

> I hereby state that I have mailed a copy of this statement to the Fire Department, Bureau of Fire Prevention, Technology Management Unit, as notification of the proposed installation of wood I-joists at this location.

This statement shall be placed on the reverse side of the form in the lower right-hand box.

The copy of the completed Form TR-1 shall be mailed to the address at:

Chief-In-Charge of the Bureau of Fire Prevention
Fire Department
Bureau of Fire Prevention
Technology Management Unit
9 MetroTech Center
Brooklyn, New York 11201-3857

All shipments and deliveries of such material shall be provided with a permanent marking suitably placed, certifying that the material shipped or delivered is equivalent to those tested and accepted for use, as provided for in Section 27-131 of the Building Code.

Final Acceptance _July 29, 2005._

Examined by _Donald_

	16	3-1/2	9725	1100	0.813	2020	1280	1800		3500

For SI Units: 1 in = 25.4 mm, 1 ft = 304.8 mm, 1 ft-lb. = 1.356 N-m, 1 LB = 4.448 N, 1 in²-lb = 0.00287 N-m²

NOTES:

1. The moment and shear values are for normal duration of load. Duration of load adjustments may be applied in accordance with the applicable requirements of the New York City Building Code.
 The allowable design values are for dry use conditions only. Dry use applies to products installed in dry, covered and well ventilated conditions, where the equilibrium moisture content will not exceed 16%.
 When calculating deflection, both bending and shear deformation shall be determined:
 For bending deflection use the standard engineering formulas.
 Example: Formula for uniform load on a simple span I-joist:

$$\Delta = \frac{22.5WL^4}{EI} + \frac{WL^2}{K}$$

where:

Δ = Deflection in inches.
W = Uniform load in pounds per lineal foot (plf).
L = Design span in feet.
K = Shear deformation coefficient.
EI = Stiffness in lbs-in².

4. Moment capacity shall **not** be increased by any code allowed repetitive member use factor.
5. W/ W.S. is with web stiffeners, W/O W.S. is without web stiffeners.

DESIGN ASSUMPTIONS:

1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 110 plf (e.g., 40 psf Live Load and a 15 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular hole or obround hole, or to the nearest edge of a rectangular hole, from the closest support.
3. Obround holes are not allowed for LPI 18 Series I-Joists.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole locations.

GENERAL NOTES:

1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 6).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

DESIGN ASSUMPTIONS:

1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 130 plf (e.g. 40 psf Live Load and a 25 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular hole or obround hole, or to the nearest edge of a rectangular hole from the closest support 3.
3. Obround holes are not allowed for LPI 18 Series I-Joists.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 5" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.

GENERAL NOTES:

1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 6).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion. 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

DESIGN ASSUMPTIONS:

1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 110 plf (e.g., 40 psf Live Load and 15 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular or obround hole, or to the nearest edge of a rectangular hole, from the closest support.
3. Obround holes are (up to) full web-depth holes with semi-circular ends defined by three overlapping circular holes spaced up to 1-1/2" apart center-to-center.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.

GENERAL NOTES:

1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange. Obround holes may be up to full web-depth.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater. **Exception:** adjacent obround holes may be spaced as close as 24" clear distance between holes.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 7).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

DESIGN ASSUMPTIONS:

1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 110 plf (e.g., 40psf Live Load and a 15 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular or obround hole, or to the nearest edge of a rectangular hole (measured from the inside face of the nearest applicable support.
3. Obround holes are (up to) full web-depth holes with semi-circular ends defined by three overlapping circular holes spaced up to 1-1/2" apart, center to center of holes.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.

GENERAL NOTES:

1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange. Obround holes may be up to full web-depth.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater. Exception: adjacent obround holes may be spaced as close as 24" clear distance between holes.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 7).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

DESIGN ASSUMPTIONS:

1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 130 plf (e.g., 40 psf Live Load and a 25 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular or obround hole, or to the nearest edge of a rectangular hole, from the nearest support.
3. Obround holes are (up to) full web-depth holes with semi-circular ends defined by three overlapping circular holes spaced up to 1-1/2" apart center-to-center of holes.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.

GENERAL NOTES:

1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange. Obround holes may be up to full web-depth.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater. Exception: adjacent obround holes may be spaced as close as 24" clear distance between holes.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 7).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

DESIGN ASSUMPTIONS:
1. The hole locations listed above are valid for joists supporting only uniform loads. The total uniform load must not exceed 80 plf (e.g. 40 psf Live Load and a 25 psf Dead Load, spaced up to 24" oc). The uniform Dead Load must be at least 10 plf.
2. Hole location is measured from the inside face of bearing to the center of a circular or obround hole, or to the nearest edge of a rectangular hole, from the closest support.
3. Obround holes are (up to) full web-depth holes with semi-circular ends defined by three overlapping circular holes spaced up to 1-1/2" apart, center-to-center of holes.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9-1/2" and 8" for 11-7/8" LPI joists. Maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located in the span where designated "-", without further analysis by a design professional (see note 8 below).
6. Clear Span has NOT been verified for these joists and is shown for informational purposes only! Verify that the joist selected will work for the span and loading conditions needed before checking hole location.

GENERAL NOTES:
1. CUT HOLES CAREFULLY! DO NOT OVERCUT HOLES! DO NOT CUT JOIST FLANGES!
2. Circular and rectangular holes may be placed anywhere within the depth of the joist. A minimum ¼" clear distance is required between the hole and a flange. Obround holes may be up to full web-depth.
3. Round holes up to 1-1/2" diameter may be placed anywhere in the web.
4. Perforated "knockouts" may be neglected when locating web holes.
5. Holes larger than 1-1/2" are not permitted in cantilevers without special engineering.
6. Multiple holes must have a clear separation along the length of the joist of at least twice the length of the larger adjacent hole, or a minimum of 12" center-to-center, whichever is greater. Exception: adjacent obround holes may be spaced as close as 24" clear distance between holes.
7. Multiple holes may be spaced closer provided they fit within the boundary of an acceptable larger hole. Example: two 3" round holes aligned parallel to the joist length may be spaced 2" apart (clear distance) provided that a 3" high by 8" long rectangle or an 8" diameter round hole are acceptable for the joist depth at that location and completely encompass the holes.
8. Larger holes, greater uniform loads or non-uniform loads, and closer proximity to supports and other holes may be possible with further analysis (See Section 6.1.3 or the web hole shear equations listed in Table 7).
9. Not all series are available in all depths. Check availability with a local LP Engineered Wood Products distributor.
10. SI Units Conversion: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

TABLE 6 – LPI 18 SERIES I-JOISTS WEB HOLE EQUATIONS
### (May be used in lieu of the web hole charts)

General Equation Form for Circular and Rectangular Holes:

Allowable Web Hole Shear (lbs) $= C1 * (D - H)/D + C2 * W + C3$

Where: D = Joist Depth (in.)
H = Hole Height (in.)
W = Hole Width (in.)

Equation Constants:

Circular Holes			
Joist	Equation Constants		
Depth	C1	C2	C3
<= 16"	946	0	328
Rectangular Holes			
Joist	Equation Constants		
Depth	C1	C2	C3
9.5	554	-20.4	256
11.875	554	-20.4	256
14	977	-30.7	375
16	977	-30.7	375

DESIGN ASSUMPTIONS (SEE TABLES 2 AND 3 FOR MORE DESIGN ASSUMPTIONS):

1. The Allowable Web Hole Shear calculated from above is for normal load duration and can be adjusted for other durations.
2. The critical location for web hole shear is at the center of a circular hole, or at either edge of a rectangular hole.
3. Obround holes are not allowed in the LPI 18 series.
4. Maximum hole depth for circular and rectangular holes is Joist Depth less 4", except the maximum hole depth is 6" for 9½" and 8" for 11-7/8" LPI joists. The maximum hole width for rectangular holes is 18". Where the Maximum Hole Dimension for rectangular holes exceeds the maximum hole depth, the dimension refers to hole width and the hole depth is assumed to be the maximum for that joist depth.
5. Holes cannot be located any closer than 1' or 3 times the length of the hole from the inside face of the closest bearing, without further analysis by a design professional.

FOR GENERAL NOTES, SEE TABLES 2 AND 3.

## TABLE 7 - WEB HOLE EQUATIONS (NOT INCLUDING LPI 13)
(May be used in lieu of the web hole charts)

General Equation Form for Circular and Rectangular Holes:

Allowable Web Hole Shear (lbs) = $C1 * (D - H)/D - C2 * W - C3$

Where:
D = Joist Depth (in.)
H = Hole Height (in.)
W = Hole Width (in.)

Equation Constants:

Circular Holes

Joist	Equation Constants		
Depth	C1	C2	C3
<= 16"	1041	0	361

Rectangular Holes

Joist	Equation Constants		
Depth	C1	C2	C3
9-1/2"	610	-22.4	342
11-7/8"	610	-22.4	431
14"	1075	-33.8	463 Z
16"	1075	-33.8	-431

Allowable Web Hole Shear for Obround Holes:

Joist Depth	Shear (lbs)
9-1/2"	533
11-7/8"	541
14"	469
16"	424

DESIGN ASSUMPTIONS (SEE TABLES 4 AND 5 FOR MORE DESIGN ASSUMPTIONS):
1. The Allowable Web Hole Shear calculated from above is for normal load duration and can be adjusted for other durations.
2. The critical location for web hole shear is at the center of a circular hole, or at either edge of a rectangular or obround hole.
3. Holes cannot be located any closer than 1" or 3 times the length of the hole from the inside face of the closest bearing, without further analysis by a design professional.

FOR GENERAL NOTES, SEE TABLES 4 AND 5.

FIGURE 1 - WEB HOLE DRAWINGS

FIGURE 2 – I-JOIST LOAD BEARING CANTILEVER DETAILS

NOTES

1. When the i-joists are cantilevered over the supporting wall, the installation shall comply with the following details and the LOAD BEARING CANTILEVER TABLES. The maximum cantilever length is 2'-0"

2. First consult the LOAD BEARING CANTILEVER TABLES to determine the reinforcement needed, if any, then refer to the details below for the necessary construction methods.

3. The 3/4" OSB (or equal) reinforcement must match the full depth of the LPI Joist.

4. SI Units Conversion: 1 in. = 25.4 mm, 1 ft. = 304.8 mm

Roof Span — 2'-0"

2'-0"

LPI blocking

1" OSB (or equal) closure

2'-0" max.

(N) No Reinforcement

3/4" OSB (or equal) reinforcement one side, 4'-0" long minimum.

1" OSB (or equal) closure

LPI blocking

2'-0" max

2'-0" min

Attach reinforcement to top and bottom flanges with 8d common nails at 6" o.c.

(L) 3/4" OSB (or equal) Reinforcement One Side

3/4" OSB (or equal) reinforcement both sides, 4'-0" long minimum

1" OSB (or equal) closure

LPI blocking

2'-0" max.

2'-0" min

Attach reinforcement to top and bottom flanges with 8d common nails at 6" o.c. both sides with nails staggered to avoid splitting

3/4" OSB (or equal) Reinforcement Both Sides

For SI Units: 1 in. = 25.4 mm, 1 ft. = 304.8 mm.

FIGURE 3 - TYPICAL I-JOIST FLOOR LAYOUT

Nonbearing cantilevers
See FIGURE 4 Details ⑩ ⑪
Load bearing cantilevers:
See Figure 2 Details ⑪ ⓛ ⑫

Temporary construction bracing is required for lateral support before decking is completed

12" I-joist blocking or 2 x squash blocks are required to support bearing wall from above

Holes may be cut in web for plumbing, wiring and duct work. See FIGURE 1 and TABLES 2 to 7 for hole sizes and locations.

NOTE: Never cut or notch flanges

Nonbearing cantilevers
See FIGURE 4 Details ⑩ ⑪
Load bearing cantilevers:
See FIGURE 2 Details
Ⓝ Ⓛ ⑫

⑦ ⑧ ⑨
Use NYC MEA-recognized hangers.

See Details
① ② ③ ④ ⑤

Some details have been omitted for clarity

For SI Units Conversion: 1 in. = 25.4 mm, 1 ft. = 304.8 mm.

NOTES:
1. These instructions are offered as a guide and are typical for good practice in the handling, storage and installation of I-joists. In some instances, other or additional details may be necessary.
2. All rim joists, blocking, connections, and temporary bracing must be installed before erectors are allowed on the structure.
3. No loads other than the weight of the erectors are to be imposed on the structure before it is permanently sheathed.
4. Numbered details are noted in Figure 4.

FIGURE 4 – I-JOIST FLOOR FRAMING DETAILS

① LPI Blocking   ② LPI Rim Joist   ③ LPI Blocking at Interior Support

④ Squash Blocks   ⑤ Non-Stacking Walls   ⑥ Post Loads
NOTES:
1. 1-1/2" minimum bearing is required at joist ends. 3-1/2" minimum bearings are required at intermediate supports.
2. Top and bottom flanges must be laterally retained at all supports.
3. Lateral support should be considered for bottom flange where there is no sheathing on underside.
4. Refer to Table 8 for I-joist nailing schedules.

LPI RIM JOIST OR BLOCKING PANEL MAXIMUM PLF DESIGN VALUES		
JOIST SERIES	JOIST DEPTH	MAXIMUM (PLF)
LPI 32W LPI 32 LPI 42X1.8	9-1/2"	2200
	11-7/8"	2200
	14"	1600
	16"	1500
LPI 20W LPI 20 LPI 20X1.5 LPI 20X1.7	9-1/2"	1907
	11-7/8"	1762
	14"	1600
	16"	1500

For SI Units: 1 in. = 25.4 mm; 1 PLF = 14.6 N/m

NOTE: The allowable shear values in pounds per foot (up to 230 PLF) for horizontal wood structural panel diaphragms with framing of nominal 2-inch thick Douglas fir-larch or southern pine are applicable to LPI Rim Joist.
FIGURE 4 – I-JOIST FLOOR FRAMING DETAILS - (Continued)

⑦ Hanger Detail

⑧ Hanger Detail

⑨ Hanger Detail

⑩ Non-Load Bearing Cantilever

⑪ Non-Load Bearing
FILLER BLOCKS:
For all I-joist series except for the LPI 42X1.8 series, use 2x lumber (minimum SPF) + 5/8-inch OSB (or equal) attached with two rows of 8d nails staggered at 6 inches on center from each side. For the LPI 42X1.8 series I-joists, use two 2x lumber (minimum SPF) attached with two rows of 10d nails staggered at 6 inches on center from each side.

FILLERS:
For all I-joist series except for the LPI 42X1.8 series, use 2 pieces of 1/2-inch OSB (or equal) attached with two rows of 8d nails staggered at 6 inches on center from each side. For the LPI 42X1.8 series, use 2x lumber (minimum SPF) attached with two rows of 10d nails staggered at 6 inches on center from each side.
FIGURE 5 - TYPICAL I-JOIST ROOF LAYOUT
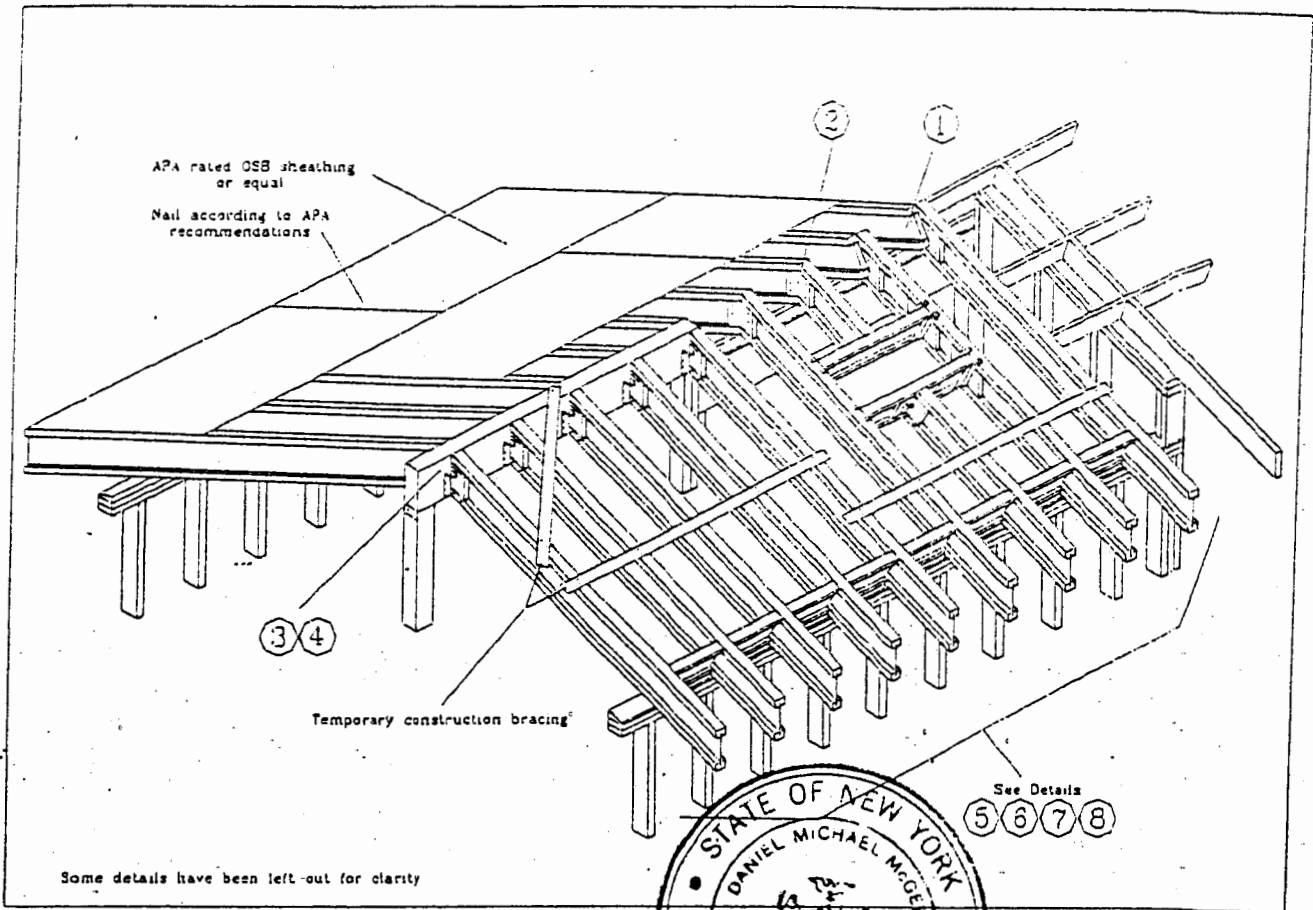

For SI Units: 1 ft. = 304.8 mm.

NOTES:
1. These instructions are offered as a guide and are typical for good practice in the handling, storage and installation of I-joists.
2. All rim joists, blocking, connections, and temporary bracing must be installed before erectors are allowed on the structure.
3. No loads other than the weight of the erectors are to be imposed on the structure before it is permanently sheathed.
4. Numbered details are noted in Figure 6.
FIGURE 6 – I-JOIST ROOF FRAMING DETAILS
For SI Units: 1 in. = 25.4 mm; 1 ft. = 304.8 mm.

NOTES:
1. I-joist flange may be birdsmouth cut only at low end of the I-joist. Birdsmouth cut must not overhang the inside face of bearing plate. The I-joist must bear fully on plate.
2. All end bearings must be laterally supported I-joist blocking is recommended.
3. All details are valid to a maximum 12:12 slope unless otherwise noted.
4. Refer to TABLE 8 for I-joist nailing schedules.

FIGURE 7 – I-JOIST WEB STIFFENER DETAILS
For SI Units: 1 in. = 25.4 mm; 1 ft. = 304.8 mm; 1 lbf = 4.5 N.

NOTES:

1. Web Stiffeners, when required, must be installed in pairs – one to each side of the web. In addition to the requirements noted in Table 1, web stiffeners are required at birds-mouth cut locations, at sloped hanger locations, and for lateral support of the joist when used with hangers if the sides of the hanger do not laterally support the I-joist flange.

2. Web stiffeners should be cut to fit between the flanges of the I-joist, leaving a minimum 1/8 inch gap (1 inch maximum). At bearing locations, the stiffeners should be installed tight to the bottom flange with the gap to the top flange. At locations of concentrated loads, the stiffeners should be installed tight to the top flange with the gap to the bottom flange.

3. Web stiffeners should be cut from APA-rated (or equal) OSB or plywood, or from 2x lumber or structural composite lumber.

4. Web stiffeners should be the same width as the bearing surface, with a minimum of 3-1/2 inches.

5. For all I-joist series except for the LPI 42X1.8 series, web stiffeners shall be a minimum of 23/32 inch thick. For the LPI 42X1.8 series I-joists, web stiffeners shall be a minimum of 1-1/2 inches thick.

6. For all I-joist series except for the LPI 42X1.8 series, nail web stiffeners to the I-joist with 5-8d nails, equally spaced and staggered (see drawing above). For the LPI 42X1.8 series I-joists, nail web stiffeners to the I-joist with 5-10d nails, equally spaced and staggered.

	JOIST DEPTH			
	9-1/2"	11-7/8"	14"	16"
STIFFENER HEIGHT	6-3/8"	8-3/4"	10-7/8"	12-7/8"

TABLE 8 – NAILING SCHEDULES

I-JOISTS TO SUPPORTS		
NAIL SIZE	MINIMUM DISTANCE FROM JOIST END	CLOSEST O.C. SPACING
8d box, common	1"	2"
10d box	1"	2"
12d box	1"	2"
16d sinker	1-1/2"	3"
SHEATHING TO I-JOIST TOP FLANGE		
8d box, common	1"	2"
10d box	1"	2"
12d box	1"	2"
For SI Units: 1 inch = 25.4 mm.

FIGURE 8 - ONE-HOUR FLOOR-CEILING FIRE-RESISTIVE ASSEMBLY

3/4" Gypcrete (Optional)

23/32" tongue and groove sheathing (19/32" sheathing may be substituted when 3/4" Gypcrete is used)

9-1/2" (or deeper) LP I-joists spaced 24" (or less) on center.

Two layers of 1/2" thick, Type X gypsum wallboard, either directly applied to I-joists or attached to resilient channels spaced at 16" on center. Attach first layer w/ 1-5/8" Type W screws. Attach second layer w/ 2-1/4" Type W screws.

1-1/2" Type G screws, spaced 8" on center and 6" from each end of the butt joint, must be used to fasten the face layer to the base layer at the face layer butt joints.

For SI Units: 1 in. = 25.4 mm.

TABLE 9 - SOUND AND IMPACT RATINGS FOR ONE-HOUR FLOOR-CEILING ASSEMBLY

FLOOR ASSEMBLY	STC	IIC

w/ RESILIENT CHANNEL w/ CARPET/PAD		
w/ GYPCRETE	50	
w/ RESILIENT CHANNEL w/ CARPET/PAD		
w/ GYPCRETE	50	50
w/o RESILIENT CHANNEL w/ CARPET/PAD		

NOTES:
1. Carpet is minimum 57 ounce carpet with 0.531 inch pile height and 1/2 inch thick 4 pcf density foam pad.
2. Vinyl is minimum 0.06 inch thick with cushioned vinyl minimum 0.01 inch thick wear layer.
3. Gyp-Crete is minimum 3/4 inch thick over 19/32 inch plywood.
   The plywood must be glued at tongue and groove joints and to the I-joists.
4. Cavity is insulated with 3-1/2 inch thick fiberglass batts between joists.
5. For other details see FIGURE 8.

TECHNICAL
POLICY AND PROCEDURE NOTICE # 8/92

TO: Distribution

FROM: Richard C. Visconti, A.I.A.

DATE: August 19, 1992

SUBJECT: Laminated Wood "I" Beams

PURPOSE: To interpret the requirements of the Administrative Code, Sections 27-617 and 27-620, pertaining to firestopping requirements per RS 10-8 and Inspection of Methods of Construction per Table 10-2 for laminated wood "I" beams used in fire resistance rated floor/roof-ceiling assemblies.

To establish a new administrative procedure for applicant notification to the Fire Department of proposed use of laminated wood "I" beams.

SPECIFICS:

1. Firestopping

    Reference Standard RS 10-8, Section 9.2.1 - General Requirements for Firestopping states that, "the space between the ceiling and the floor or roof above shall be divided by providing firestopping where ceilings are suspended below solid joists or suspended from or attached directly to the bottom of open wood floor trusses in buildings of combustible construction."

    The Department now interprets the requirement to comply with the firestopping provisions of Section 9.2.1 et seq. to include laminated wood "I" beam assemblies. Therefore, the space between the ceiling and the floor or roof above shall be divided into approximately equal areas not greater than 500 square feet.

Firestopping is subject to controlled inspection pursuant to Section 27-345.

2. Inspection of Methods of Construction

Table 10-2 – Operations on Structural Elements that shall be Subject to Controlled Inspection, lists the "Fabrication of glue-laminated assemblies and of plywood components."

The Department now interprets the requirement to comply with the controlled inspection provision of Table 10-2 to include laminated wood "I" beams. Therefore, the cutting of openings for ducts, pipes, conduit, etc. in laminated wood "I" beams shall be considered fabrication and, therefore, subject to controlled inspection.

3. Notification

The applicant shall be required to notify the Fire Department of the proposed installation of laminated wood "I" beams prior to the Department issuing a construction permit. Evidence of such notification shall be a certifying statement submitted on Form TR-1, Technical Report, reading as follows:

I hereby state that I have mailed a copy of this statement to the Fire Department, Bureau of Fire Prevention, Technology Management Unit, as notification of the proposed installation of laminated wood "I" beams at this location.

This statement shall be placed on the reverse side of the form in the lower right-hand box.

The copy of the completed Form TR-1 shall be mailed to:

> Chief-in-Charge of the Bureau of Fire Prevention
> Fire Department
> Bureau of Fire Prevention
> Technology Management Unit
> 250 Livingston Street
> Brooklyn, NY 11201-5884

ISSUANCE #586

TECHNICAL
POLICY AND PROCEDURE NOTICE #2/00

TO: Distribution

FROM: Satish K. Babbar, R.A

DATE: July 24, 2000

SUBJECT: Semi-Controlled Inspection for Structural Light Gage Cold-Formed Steel, Plate Connected Wood Floor Trusses and Laminated Wood "I" Beams

---

EFFECTIVE: Immediately

SUPERCEDES: Brooklyn Borough Memorandum by Borough Superintendent George E. Berger dated August 11, 1983.

BACKGROUND: There have been several structural failures involving lightweight floor construction. Professional inspection is needed during construction of buildings and other structures utilizing it in order to insure that the delivered members are not damaged or defective, the installation is proper and safeguards are taken to prevent failure.

PURPOSE: To set forth the requirements for the semi-controlled inspection of the construction, including size, quality, framing, erection and both temporary and permanent bracing of light gage cold-formed steel structural members, plate connected wood floor trusses and laminated wood "I" beams.

REFERENCE: Section 27-132(b) of the Administrative Code.

SPECIFICS:

REQUIREMENTS: The plans submitted for approval/ acceptance/professional certification showing these members shall be complete including member sizes, positions, locations, permanent and temporary bracing, fasteners (location, type and spacing), stiffeners, connections, etc., as needed for the proper erection of the structure.

The construction of all light gage cold-formed steel structural members, plate connected wood floor trusses and laminated wood "I" beams shall be subject to semi-controlled inspection for size, quality, framing, erection and both temporary and permanent bracing, as set forth below.

Size   Profiles used structurally shall conform to the specified dimension. Care shall be taken not to stretch, bend, or otherwise distort parts of the sections unless such forming is in the integral part of the design.

Quality   All materials shall be clean, straight, and undamaged. Damaged members shall be discarded. Only BSA/MEA approved laminated wood "I" beams shall be used. Glue shall completely bond all laminated wood "I" beam surfaces being joined. Quality Control for the erection of all members shall be under the supervision of the professional designated to perform the semi-controlled inspection.

Framing   Components may be cut by slitting, shearing, sawing, or flame cutting, as appropriate, in accordance with manufacturers' instructions and the design drawings. All punched holes and sheared or flame cut edges of material in members subject to calculated stress shall be clean and free from notches and burred edges. The approved/ accepted/professionally certified drawings shall be adhered to regarding member dimensions, locations, positions, beam separators, bearing surfaces and fasteners, including shear connectors, plate connectors, screws, bolts and welds, as applicable.

Erection   Care shall be taken to avoid damage to members when erecting, loading, unloading and otherwise handling them.

Bracing   Temporary bracing, shoring, jacks, etc. shall not be removed until the registered architect or professional engineer determines that they are no longer needed. Permanent bracing, web stiffeners, bridging, wind bracing, etc. shall be installed according to the approved/accepted/professionally certified drawings.

INSPECTIONS AND REPORT TO BE SUBMITTED: These inspections are to be performed by, or under the direct supervision of, licensed professional engineers or registered architects, who shall submit form(s) TR-1 indicating the following: "Semi-controlled inspection of light gauge cold-formed steel structural members, plate connected wood floor trusses or laminated wood "I" beams (as applicable) per TPPN #2/00".
