

FREQUENTLY ASKED QUESTIONS

Construction Safety: Outrigger Scaffold (Thrust Out) Platforms and Supported Scaffolds

- Q1. If a supported scaffold needs to be installed on an adjacent property in order to repair and/or modify a building, should the scaffold be filed at DOB on both properties? The Code states when a scaffold should be filed, but it doesn't specifically say?
- A1. Applications should be filed under the property which they are installed and referenced on the adjacent property applications as required.
- Q2. Is the base ratio of 4:1 based on measured (feet) dimension or number of scaffold levels?
- A2. BC3314.9.1 states, the 4:1 ratio is a height-to-base ratio. Height and base can be measured in any consistent unit measurement of length such as feet. The most restrictive measurement governs.
- Q3. What do the exposure numbers refer to, is north Exposure #1, east Exposure #2, etc.?
- A3. Typically, Exposure #1 is the street facing or front exposure, then you count clockwise around the perimeter to make up the other exposures.
- Q4. Is the height to base ratio measured from the upper most top rail of the scaffold or the highest scaffold member which may be different?
- A4. BC3314.9.1 states the height is measured from the very top of scaffold to base. See BC3314.1.1.

Q5. If the lot is a corner lot, which side do you pick as Exposure #1?

A5. Typically, Exposure #1 will be the street facing exposure that the property address is listed on. Note that this naming convention is not official. Naming of exposures is up to the users.

Q6. Do these case studies get incorporated into the 32-hour scaffold curriculum?

A6. No, this presentation is standalone.

Q7. Is the factor of safety of 4 to the ultimate strength?

A7. Please see BC3314.4.4.3 for the Code reference in question.
