

# TROUT IN THE CLASSROOM

*Watershed Health and Management*

Environmental  
Protection

# What is a Watershed?

# What is a Watershed?

Definition: An area of land that drains into a specific body of water.

# NYC Watersheds: Croton, Catskill, Delaware

- NYC residents receive drinking water from these upstate watersheds every day
- Forests cover approximately 75% of the NYC watersheds
- DEP works collaboratively with watershed partners and communities to manage and protect water quality in the watersheds
- Because our watersheds are so healthy, they are great trout habitat!

# Which Watershed Looks Healthier To You?

# Water from NYC Watersheds is Filtered by Forests

Let's find out why these forests are important for us and our trout!

# Our Trout Don't Lie!

- Trout are an *indicator species* and help us determine the health of the stream
- Trout, like many other animals, are also residents of our planet and rely on us to protect their waterways
- What are some of the water quality parameters that trout are most sensitive to?

# Trout and Water Quality

- Trout are sensitive to:
  - Temperature
  - Dissolved oxygen levels
  - Sediment and turbidity
  - Nutrients (e.g. nitrogen and phosphorous)
  - Contaminants
  - pH
- Trout eat aquatic macroinvertebrates (macros), which have varying levels of pollution tolerance
- DEP ecologists survey trout and macros in watershed streams because when they are healthy, they can be confident that the watershed is healthy

# Trees and Trout

- Forests help protect trout from:
  - Sediment in the water (stabilize stream banks)
  - Nutrient runoff from fertilizer and animal waste (filter runoff)
  - Pollutants from roadways and industry (filter runoff)
- Trees shade the river, keeping it cool in the summer for cold-water fish like trout
- Downed trees and roots give trout places to hide from predators
- Fallen leaves provide a food source for the bugs that trout eat

# Why Are Forest Ecosystems Important?

# Forest Ecosystems

- Forests are important because they:
  - Stabilize soil and prevent erosion
  - Provide a home for native plants and animals
  - Filter our air and provide us with oxygen
  - Give us happiness and enjoyment
  - Regulate the water cycle – help to create rainfall
  - Purify the water which makes sure we have clean water to drink!
- We call these benefits ***ecosystem services***
- Can you think of any human activities that impact forest ecosystems?

# Land Uses That Impact Forests and Watershed Health

- Agriculture
- Impermeable surfaces
- Houses and lawns
- Factories and industrial areas

# Agriculture

- Can increase **erosion** leading to more sediment in water
- Can cause **nutrient runoff**
  - Nitrogen-> Nitrates
  - Phosphorus-> Phosphates
- Can cause **pesticide runoff**
- ...and more!
- Trout are very sensitive to high levels of sediment, nutrients (especially forms of nitrogen), and pesticides in their water

Wikimedia Commons

# Impermeable Surfaces

- **Impermeable** surfaces like paved roads, parking lots, and sidewalks do not allow water to seep into the ground or **percolate**
- Water moves much faster – leading to **higher turbidity** in streams making it harder for aquatic animals to breathe
- **Runoff** from impermeable surfaces often contains contaminants (oil residue, chemicals, nutrients)

# Houses and Lawns

- Many lawns use chemicals and fertilizers that can **run off** into our streams
- Forests and other ecosystems are better able to filter contaminants from water
- Lawns provide little to no habitat for insects and pollinators (a **biological desert**)

# Factories and Other Industrial Areas

- Can create concentrated air and water pollution
- Contaminants in **runoff** and discharge from factories are especially dangerous when directly next to water bodies
- Pollution from chemicals, sediments, and noise is toxic and hurts animals like trout
- Warm water discharges can also be harmful

# Can We Keep Our Watersheds Healthy?

- Raise your hand if you like...
  - Food
  - Electricity
  - Having a roof over your head
- The real question is...how can we provide the resources we need and keep our watersheds healthy?

# Conserve Our Forests!

- All four of the land uses we talked about can result in **deforestation**
- NYC DEP and partners work together every day to preserve forests around watershed streams and reservoirs
- Our three watersheds cover 2000 square miles of land and 60% is privately owned
- We work with landowners to make sure forests are protected through **best management practices** while still supporting watershed communities and their economies

# Best Management Practices for Forest Protection

- Keep steep hillsides forested to avoid erosion
- Keep factories away from water bodies
- Support agriculture that uses fewer chemical fertilizers and pesticides
- Repair and preserve **riparian buffers**: nature is our best water filter
- What else can you do to protect our trout and watersheds?

# You Play a Critical Role in Managing the Health of the Water System and Watershed!

- If you litter, the future will be bitter
- Leave only footprints, take only memories (conserve our wild spaces)
- Save it for a sunny day (creating more wastewater when it's raining can lead to sewage overflows into local waterways)
- Trash it, don't flush it (grease should go in the trash, not down the drain since it clogs our pipes)
- Only flush the 4 Ps (pee, poop, puke, and (toilet) paper)
- If it's yellow, let it mellow. If it's brown, flush it down. (conserve water at home)

# Activity

- Create a Public Service Announcement!
- Invent your own tagline and campaign to help protect the health of our trout and our watersheds

*Mediterranean Association to Save the Sea Turtles*

*Johanan Colon*
