Notes

1. Emission factors, derived from the NONROAD model output, were back calculated from the NONROAD regional emissions estimates. For PM, a base year of 2013 was used in conjunction with a 90% control efficiency for use of diesel particulate fiilters on all equipment.

2. Concrete pumps are truck mounted and use the truck engine to power the pumps at high load. This application of truck engines is not addressed by the MOBILE6 model, and since it is not a non-road engine, it is not included in the NONROAD model. Emission factors were obtained from a study which developed factors specifically for this type of activity. FEIS for the Proposed Manhattanville In West Harlem Rezoning And Academic Mixed-Use Development, CPC–NYCDCP, November 16, 2007

3. DPF (%) = Diesel Particulate Filter (percent PM removed or 1 - control eff = 1 - 0.90 = 0.10 or 10%) for equipment greater than 50 hp.
