**NYC Waste Characterization Study
Final Report, Volume 1**

Section 9: Comparison with Other Jurisdictions

[This page intentionally left blank.]

Section 9 Comparison with Other Jurisdictions

9.1 Introduction

Section 9 presents a comparison of the results of the New York City Waste Characterization Study (“NYC WCS”) and the results of waste composition studies from nine other jurisdictions across the United States. In all but one case, the studies from the other jurisdictions examined only disposed waste (i.e., refuse) and these results have been compared with the Citywide refuse results from the NYC WCS. The exception is Seattle Washington. Two studies were conducted for Seattle, a 2002 study which estimates the composition of Seattle’s refuse and a 2005 study which estimates the composition of Seattle’s recycling. The results of the Seattle studies are compared with the Citywide refuse and recycling results from the NYCWCS. The results of all these studies have been published within the past six years.

The purpose of these comparisons is to present the differences and similarities in the composition of the waste across geographic regions and over time. Because each of the studies sorted the waste using different material groups¹ and categories¹, adjustments have been made to make the results comparable to the NYC WCS.

The comparison includes a summary of the methodologies of each study, a comparison of the material group and the adjustments made to each group, a comparison of the material categories and the adjustments made to each category, and a comparison of the most prevalent materials in each study.

Section 9 is divided into 11 subsections. After the Introduction and Summary Comparison of all the studies is presented. These are followed by individual comparisons of the NYC WCS and the studies from the other jurisdictions. The jurisdictions included in this section include:

- 9.3 The City of Los Angeles, California
- 9.4 The City of Philadelphia, Pennsylvania
- 9.5 The City of Phoenix, Arizona
- 9.6 The City of San Diego, California
- 9.7 The City of San Francisco, California
- 9.8 The City of Seattle, Washington
- 9.9 Alameda County, California
- 9.10 The State of Pennsylvania
- 9.11 The State of Georgia

With the exception of the Seattle Recycling Study, the composition of the refuse from these jurisdictions is being compared to the composition of the refuse in New York City (“NYC”) without corresponding comparison of recycling programs. Therefore, the refuse composition will reflect the recycling programs in place in a jurisdiction, and the recycling rates and habits, which will differ from place to place. For example, Philadelphia has a much lower percentage

¹ Material groups refer to the largest aggregation of material used to estimate waste composition (e.g., Paper, Plastics, Glass, etc.). Material categories refer to the aggregation of material used to estimate waste composition below the material groups (e.g., Newspaper, High Grade Paper, Mixed Low Grade Paper, etc.).

of food waste in its refuse than New York City. But this may be explained by Philadelphia's lower diversion rate. Because there is more paper, plastic, and metal in Philadelphia's refuse than in New York City's refuse, the amount of food waste in Philadelphia's refuse would represent a greater percentage of the total refuse than an identical amount of food waste in New York City's refuse.

9.2 Comparison of Other Jurisdictions: A Summary

The ten waste composition studies that are compared to the NYC WCS in this section were conducted during the past six years. The earliest studies, San Diego and Alameda County, were published in 2000 and the Final Report for the NYC WCS will be published in 2006. All the studies in these comparisons examined waste generated by the residential sector. Nine of the ten studies compared with the NYC WCS estimate the composition of refuse. The Seattle Recycling Study estimated the composition of recycling. The NYC WCS characterized the both refuse and recycling (i.e. Paper, MGP, and aggregated recycling) and the aggregated recycling results were compared to Seattle's recycling stream. For the other studies, the NYC WCS recycling results were not part of the comparisons because the other studies characterized only the disposed waste (i.e., refuse).

All but one study² were based on sampling the residential waste at transfer stations or disposal sites and sorting the waste by hand. The material groups and material categories used in the ten studies differed from each other and from the material groups and material categories used in the NYC WCS. The explanation of how the material groups and categories were adjusted to make them comparable to the NYC WCS is included in the description of the individual studies.

Six of the ten studies presented results for both single-family and multi-family residences. The composition of the single-family residential refuse was compared with the weighted average composition of the two low density strata of the NYC WCS. The composition of the multi-family residential refuse was compared with the weighted average composition of the high and medium density strata of the NYC WCS. Three of the studies presented the aggregated residential results and these results were compared with the aggregated residential results of the NYC WCS. One study presented the results of single family residences only and these results were compared with the results of the low density strata of the NYC WCS. The ten studies include sixteen separate sets of data, each of which are compared with one of five sets of data from the NYC WCS. Table 1-225 shows the types of results presented in each study and the comparisons used.

² The "Characterization of Municipal Solid Waste for the City of Los Angeles" also included generator sampling for multi-family residences.

**Table 1-225
Types of Residential Refuse Results Presented in Comparative Studies**

Study	Type of Results	Comparison
The Los Angeles Study (1)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The Los Angeles Study (2)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (18)
The Philadelphia Study (3)	Residential	Citywide Annual Residential (19)
The Phoenix Study (4)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The San Diego Study (5)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The San Diego Study (6)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (18)
The San Francisco Study (7)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The San Francisco Study (8)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (18)
The Seattle Refuse Study (9)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The Seattle Refuse Study (10)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (18)
The Seattle Recycling Study (11)	Single-Family	Average of Low Density Strata in the NYC WCS (20)
The Seattle Recycling Study (12)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (21)
The Alameda County Study (13)	Single-Family	Average of Low Density Strata in the NYC WCS (17)
The Alameda County Study (14)	Multi-Family	Average of High and Medium Density Strata in the NYC WCS (18)
The Pennsylvania Study (15)	Residential	Citywide Annual Residential (19)
The Georgia Study (16)	Residential	Citywide Annual Residential (19)

Figures may not add due to rounding

- (1) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Aggregated Recycling Recycling (Paper and MGP)" (Volume 1, Section 1, Table 1-20) weighted average of low density strata
- (2) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Aggregated Recycling (Paper and MGP)" (Volume 1, Section 1, Table 1-20) weighted average of high and medium density strata
- (3) 2005 Residential Recycling Composition Study; Seattle Public Utilities, 2005; "Composition by Weight: Single-Family [January 2005 - December 2005]; [Table 4-8, page 15]
- (4) 2005 Residential Recycling Composition Study; Seattle Public Utilities, 2005; "Composition by Weight: Multi-Family [January 2005 - December 2005]; [Table 4-9, page 16]

The most remarkable feature of Table 1-226A is the overall consistency across the studies. In all the results, Organics and Paper material groups represent the largest percentages of material. In all studies, the Metals Group presents a relatively narrow range of percentages, from 3.0 percent, in the Alameda County Study (Single-Family) and 6.5 percent in the Philadelphia Study. With the exception of the Philadelphia Study, the percentage of Glass in the studies ranges from 1.6 percent to 5.5 percent.

While the consistency among the studies is notable, there are some anomalies.

- As noted above, the percentage of Glass in the Philadelphia Study is remarkably high, almost three times higher than the average percentage of the other studies.
- The percentage of Construction and Demolition Waste in the San Diego Study is more than three times the average percentage of C&D in the other studies. The percentage of C&D in the Pennsylvania study is also much higher than in the other studies.

The comparison of the Seattle Recycling Study and the NYC WCS aggregated recycling results shown in Table 1-226B is discussed in more detail in Section 9.8.

Table 1-227A compares the ten most prevalent materials categories in the seventeen comparisons of refuse results and shows the percentage contribution to the total amount of waste. Table 1-227B compares the ten most prevalent materials categories in the comparison of recycling results and shows the percentage contribution to the total amount of recycling.

Unlike the material groups shown in Table 1-226, the material categories shown in Table 1-227 have not been adjusted. Therefore, with many more categories, it is more difficult to observe patterns across the studies. However, Table 1-227 does present a few interesting features.

- Food Waste and Newspapers are the only categories included in all seventeen lists.
- Food Waste represents the largest material category in fifteen of the seventeen lists. The exceptions are the Philadelphia Study in which the Other Paper, Other combustibles, and Other Plastics categories are a greater percentage of the refuse than Food Waste, and the Phoenix Study in which the Leaves and Grass category is a greater percentage of the refuse than Food Waste.
- The percentage of Food Waste ranges from 10.6 percent in the Philadelphia Study to 42.2 percent in the San Francisco Study
- The percentage of Newspaper is relatively consistent across the studies, ranging from 2.2 percent in the Seattle Study (Single-Family) to 11.0 percent in the San Diego Study (Multi-Family).
- The Plastic Film category appears in fourteen of the seventeen studies and accounts for between 2.4 percent and 7.4 percent in these studies.
- The Uncoated Corrugated Cardboard appears in twelve of the seventeen lists and accounts for between 2.0 percent and 8.0 percent in these studies.
- The Leaves and Grass category appears in eleven of the seventeen lists and accounts for between 2.0 percent and 10.0 percent in these studies, with the exception of the Phoenix Study in which Leaves and Grass account for 23.5 percent of the refuse.
- The Mixed Low Grade Paper or Mixed Paper categories appears in ten of the seventeen lists representing between 4.4 percent in the Pennsylvania Study to 8.8 percent in the NYC WCS (Multi-Family).

The comparison of these ten waste composition studies suggests that over time, at least the six years during which these studies were conducted, and across geographic regions, the composition of residential refuse in the United States has been remarkably similar.

9.3 Characterization of Municipal Solid Waste for the City of Los Angeles

9.3.1 Introduction

The “Characterization of Municipal Solid Waste for the City of Los Angeles” (the “Los Angeles Study”) was carried out in 2000 and 2001 by the Cascadia Consulting Group, Inc. for the City of Los Angeles Bureau of Sanitation, Solid Resources Citywide Recycling Division. The objective of the Los Angeles Study was “to characterize and quantify refuse disposed by five sectors

within the City of Los Angeles”.³ The characterization of municipal solid waste (“MSW”) used composition estimates derived from hand-sorting MSW and applying statistical analysis to the number of samples of MSW from each waste sector. Quantity estimates (i.e., generation rates) were derived from data supplied by the California Integrated Waste Management Board’s (“CIWMB”) Disposed Reporting System, data obtained through surveys of disposal facility staff and drivers of individual vehicles at those facilities, and measurements taken of waste at the point of generation.

A summary methodological comparison of the Los Angeles Study and the NYC WCS is presented in Table 1-228.

³ “Characterization of Municipal Solid Waste for the City of Los Angeles”; Prepared by Cascadia Consulting Group Inc. for the City of Los Angeles Bureau of Sanitation; December 2001; Page 1.

**Table 1-228
Methodological Comparison of the NYC WCS and the Los Angeles Study**

	NYC WCS	Los Angeles Study
Date of Study	2004/2005	2000/2001
Population Studied		
Description of Population	Residential population of New York City	Residential population of the City of Los Angeles
Number of Population	8,008,278	3,819,951
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multifamily residences
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	City of Los Angeles
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Single-family and multifamily residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Single-family residential - 80 samples acquired at disposal sites Multifamily residential - 89 samples acquired at generator sites
Total Residential Samples	3,600 samples	160 samples (80 at disposal sites; 80 at generator sites)
Total Tons Sorted	329 tons	20 tons (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	No
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 300 lbs for Refuse Samples
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Stratified randomly sampling - Single-Family samples based on expected deliveries at disposal sites. Samples were randomly selected from tipped loads.
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Nine material groups; 58 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	Yes
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The summary of the two studies shows some of the key methodological differences between the two studies.

- The Los Angeles Study did not study seasonal variation. The NYC WCS studied waste over four seasons.
- The Los Angeles Study analyzed only the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Los Angeles Study acquired and sorted 160 residential refuse samples and the NYC WCS acquired 3,600 residential refuse samples.
- The Los Angeles Study acquired samples from single-family residences at disposal/transfer station sites. In order to characterize the multi-family residences, samples were acquired at the generator sites.

The NYC WCS acquired samples only at transfer stations. However, strata-specific routes for the Residential Study and building-specific collections for the Multi-Unit Study (“MUS”) were developed which resulted in wastes from specific sectors being delivered to the transfer stations.

- The purpose of the Los Angeles Study was to characterize refuse from single-family and multi-family residences. To do this the Los Angeles Study used stratified random sampling in which components of the study (i.e., single-family residences) were subdivided to reflect its contribution to the citywide refuse stream. Samples of refuse from single-family residences were acquired at three disposal sites and the number of samples acquired at each site was weighted, based on the expected number of tons from these sources delivered at each site. That is, if 50 percent of the refuse from single-family residences were expected to be delivered to a site, then 50 percent of the samples would be acquired from that site. This weighting gave the refuse from each residence an equal opportunity to be sorted.

The purpose of the NYC WCS was to characterize the waste from each of the eight housing density and income strata. Although NYC WCS divided the residential households into housing density and income strata, it acquired an equal number of samples from each stratum. It did not weight the number of samples based on each strata’s contribution to the overall waste stream because this might have prevented a complete characterization of each of the eight strata. The NYC WCS aggregated the results of the characterization of the eight strata into a citywide composition based on the methodology explained in Volume 2, Section 2.

The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Los Angeles Study and the NYC WCS. The Los Angeles Study sorted the refuse into 58 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure of the two studies, two comparisons of the results from the residential sector can be made:

1. The results of the Single-Family component of the Los Angeles Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the two low density strata has been used.
2. The results of the Multi-Family component of the Los Angeles Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the four high and medium density strata has been used.

9.3.2 Adjustments to the Studies and Study Results

Different material groups and categories were used in the Los Angeles Study and the NYC WCS. The material groups and categories used in the two studies have been adjusted to accomplish the comparison. Table 1-229 shows the adjustments in terms of material groups and compares:

- The composition of the Los Angeles Study Single-family component with the composition of the low density strata in the NYC WCS.
- The composition of the Los Angeles Multi-family component with the composition of the high and medium density strata in the NYC WCS.

**Table 1-229
Composition by Material Groups in the NYC WCS and the Los Angeles Study**

NYC WCS Material Groups	Los Angeles Study Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	Los Angeles Single-Family (2)	NYC WCS Multi-Family (3)	Los Angeles Multi-Family (4)
Paper	Paper	None	20.7%	22.6%	24.3%	32.2%
Plastic	Plastics	None	12.5%	10.1%	15.6%	9.6%
Glass	Glass	None	1.6%	2.2%	3.1%	5.5%
Metal	Metal	None	3.5%	4.3%	3.7%	4.0%
Organics	Other Organics	None	50.5%	50.5%	45.8%	44.1%
Appliances & Electronics		(5)	1.5%	0.4%	1.3%	1.8%
C&D	Construction & Demolition	None	8.5%	9.4%	5.5%	2.1%
Miscellaneous Inorganics		(6)	1.0%	0.0%	0.6%	0.0%
HHW	HHW	None	0.2%	0.3%	0.3%	0.4%
Total			99.9%	99.8%	100.1%	99.7%
	Special Wastes (7)		N/A	0.2%	N/A	0.0%
Total			99.9%	100.0%	100.1%	99.7%

Figures may not add due to rounding

- (1) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17 pages 42-45) weighted average of low density strata
- (2) Characterization of Municipal Solid Waste for the City of Los Angeles, City of Los Angeles Department of Sanitation, 2001; "Composition of Single-Family Residential Waste (Table 6, page 13)
- (3) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17 pages 42-45) weighted average of high and medium density strata
- (4) Characterization of Municipal Solid Waste for the City of Los Angeles, City of Los Angeles Department of Sanitation, 2001; "Composition of Multi-Family Residential Waste (Table 8, page 16)
- (5) The "Appliances & Electronics" group in the NYC WCS is included in "Major Appliances" category from the "Metals" group in the Los Angeles Study
- (6) The categories in the "Miscellaneous Inorganics" group in the NYC WCS are included in the "Special Wastes" group in the Los Angeles Study
- (7) Certain categories in the "Special Wastes" group were included in other groups in the NYC WCS and other categories, including "Sewage Solids", "Industrial Sludge", "Treated Medical Wastes", "Ash", and "Remainder/Composite Special Wastes" were excluded from the NYC WCS

Similar adjustments were necessary to make the comparisons in the material categories. Table 1-230 shows the adjustment to the material categories and makes the same comparisons as those in Table 1-229.

Table 1-230
Material Categories in the NYC WCS and the Los Angeles Study

Material Group	NYC WCS	Los Angeles	Adjustment to Material Category	NYC WCS	Los Angeles	NYC WCS	Los Angeles
	Material Category	Material Category		Single-Family (1)	Single-Family (2)	Multi-Family (3)	Multi-Family (4)

9.4 Characterization of Municipal Solid Waste for the City of Philadelphia, Pennsylvania

9.4.1 Introduction

The “Municipal Waste Composition Analysis” (the “Philadelphia Study”) was carried out in 1999 and 2000 by Camp Dresser & McKee, Inc. for the City of Philadelphia Department of Streets, Sanitation Division. It was conducted to “perform a field study of the composition of residential solid waste the Department of Streets collects throughout the City”.⁴ The composition analysis of MSW used estimates derived from hand-sorting MSW and applying statistical analysis to the number of samples of MSW. Quantity estimates (i.e., generation rates) were derived from data supplied by the City of Philadelphia Department of Streets.

A table summarizing the composition of recyclables was included in the Philadelphia Study. The data was obtained from the Philadelphia Department of Streets and is believed to be a summary of the materials received by Philadelphia’s recycling processor. However, the basis of this summary was not available and comparisons with the NYC WCS recycling composition results have not been made because of the uncertainty of the methods used to obtain this data and, consequently, its accuracy and applicability to the NYC WCS data.

The Philadelphia Study field work targeted only residential refuse. A summary methodological comparison of the Philadelphia Study and the NYC WCS is presented in Table 1-232.

⁴ “Municipal Waste Composition Analysis”, City of Philadelphia Department of Streets, Sanitation Division, 2000, page 1-1.

**Table 1-232
Methodological Comparison of the NYC WCS and the Philadelphia Study**

	NYC WCS	Philadelphia Study
Date of Study	2004/2005	2000
Population Studied		
Description of Population	Residential population of New York City	Residential population of the City of Philadelphia
Number of Population	8,008,278	1,517,550
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multifamily residences
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	12 of 13 Refuse Collection Districts in the City of Philadelphia
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	1) Residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Spring (1999) - 60 samples; Summer (1999) - 67 samples Fall (1999) - 66 samples; Winter (2000) - 65 samples
Total Residential Samples	3,600 samples	258 samples
Total Tons Sorted	329 tons	32 tons (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Yes, four seasons aggregated into annual results
Sample Size	200 lbs to 250 lbs	250 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Stratified Sampling by Refuse Collection District. Trucks within Refuse Collection Districts selected by the City of Philadelphia. Samples were randomly selected from tipped loads
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Refuse Waste (Refuse and Recycling), with recycling data provided by the City of Philadelphia
Material Groups and Material Categories	Nine material groups; 91 material categories	No material groups; 24 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	No
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals Regression analysis using DSNY collection tonnages to estimate strata waste generation Regression analysis for MUS to identify building characteristics associated with successful recycling	Means with Confidence Intervals

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The summary of the two studies shows some of the key methodological differences between the two studies.

- The Philadelphia Study analyzed only the refuse stream, although an estimate of the waste (refuse and recycling) was made using recycling data provided by the City of Philadelphia Department of Streets. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Philadelphia Study acquired and sorted 258 residential refuse samples and the NYC WCS acquired and sorted 3,600 residential refuse samples.
- The Philadelphia Study stratified sampling based on Philadelphia's refuse collection districts. That is, the number of samples acquired from each of the 12 refuse collection districts was proportional to the amount of residential refuse collected in each district. If 10 percent of the residential refuse was collected in District 1, then 10 percent of the samples were targeted to be acquired from District 1. The selection of trucks from which samples were to be taken within each district was made by the City of Philadelphia Department of Street and it is not known if these trucks were randomly selected.

The purpose of the NYC WCS was to characterize the waste from each of the eight housing density and income strata. All census tracts in the City were classified by housing density and income into eight strata. Collection routes serving a single stratum were identified by DSNY and the trucks from which samples were to be taken were randomly selected from these routes. The NYC WCS acquired an equal number of samples from each stratum. The NYC WCS aggregated the results of the characterization of the eight strata into a citywide composition based on the methodology explained in Volume 2, Section 2.

There were a number of similarities between the two studies. Both studies acquired samples at city transfer stations. The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Philadelphia Study and the NYC WCS. The Philadelphia Study sorted the refuse into 24 material categories and the NYC WCS sorted refuse and recycling into 91 material categories. Both the Philadelphia Study and the NYC WCS estimated the composition of the refuse over four seasons.

Based on the structure of the Philadelphia Study and NYC WCS, the most useful comparison is between the results of the NYC WCS Annual Citywide Residential Refuse Study and the annual composition results of the Philadelphia Study.

9.4.2 Adjustments to the Studies and Study Results

Different material categories were used in the NYC WCS and in the Philadelphia Study. The Philadelphia Study used 24 material categories, but did not aggregate these into material groups. For the purposes of this report, R. W. Beck has separated the categories into groups approximately comparable to the material groups in the NYC WCS. Table 1-233 shows how this was done and compares the results in terms of material groups.

Table 1-233
Composition by Material Groups in the NYC WCS and the Philadelphia Study

NYC WCS Material Groups	Philadelphia Study Material Groups (1)	Adjustments to Material Groups	NYC WCS Residential (2)	Philadelphia Study Residential (3)
Paper	Paper	None	23.3%	29.0%
Plastic	Plastics	None	14.8%	13.2%
Glass	Glass	None	2.6%	9.2%
Metal	Metal	None	3.7%	6.5%
Organics	Other Organics	None	47.0%	38.6%
Appliances & Electronics	Appliances & Electronics	None	1.4%	0.1%
C&D	Construction & Demolition	None	6.3%	3.4%
Miscellaneous Inorganics	Miscellaneous Inorganics	None	0.7%	0.0%
HHW	HHW	None	0.3%	0.0%
TOTAL			100.0%	100.0%

- (1) The Philadelphia Study did not include material groups. For the purposes of this analysis, R.W. Beck has created these material groups from the Philadelphia Study's material categories
- (2) NYC WCS "Citywide Refuse Results Across Seasons, Waste Characterization Study, Refuse (Annual)" (Volume 1, Section 2, Table 1-28)
- (3) Municipal Waste Composition Analysis; City of Philadelphia Department of Streets, 2000; "Cumulative Composition of Samples with Statistical Analysis" (Table 3-4, page 3-7)

Similar adjustments were necessary to make comparisons in the material categories. Table 1-234 compares the material categories in the two studies and shows the adjustments that were made.

**Table 1-234
Material Categories in the WCS and the Philadelphia Study**

Material Group	NYC WCS Material Category	Philadelphia Study Material Category	Adjustment to Material Category	NYC WCS Residential (1)	Philadelphia Residential (2)

9.5 Characterization of Municipal Solid Waste for the City of Phoenix

9.5.1 Introduction

The “Characterization of Waste from Single-Family Residences for the City of Phoenix” (the “Phoenix Study”) was carried out by the Cascadia Consulting Group, Inc. for the City of Phoenix Department of Public Works in 2003. The objective of the Phoenix Study was to “conduct a study estimating the composition of disposed waste from single-family residences and to determine the relative amount of recyclable material in the disposed waste from each of six service areas”.⁵ The characterization of municipal solid waste (“MSW”) used composition estimates derived from hand-sorting MSW and applying statistical analysis to the number of samples of MSW from single-family residences in each of Phoenix’s six service areas. Quantity estimates (i.e., generation rates) were derived from data supplied by the City of Phoenix Department of Public Works. A summary methodological comparison of the Phoenix Study and the NYC WCS is presented in Table 1-236.

⁵ “Characterization of Waste from Single-Family Residences”; City of Phoenix Department of Public Works, 2003; page 1.

**Table 1-236
Methodological Comparison of the NYC WCS and the Phoenix Study**

	NYC WCS	Phoenix Study
Date of Study	2004/2005	2003
Population Studied		
Description of Population	Residential population of New York City	Residential single-family residences in the City of Phoenix
Number of Population	8,008,278	1,452,825
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family residences
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	City of Phoenix, Arizona
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Single-family residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Winter samples (143); Summer samples (140)
Total Residential Samples	3,600 samples	283 samples
Total Tons Sorted	329 tons	30 Tons (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Sampled and sorted during two season, but did not report seasonal results
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 300 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Stratified randomly sampling - The number of truck trips (segments of collection routes a truck travels before it tips its load were randomly selected for each season and service area. Samples were randomly selected from tipped loads
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Residential Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Eight material groups; 89 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	Yes
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	Yes
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	Correlation between participation in recycling services and recyclables in the refuse
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The summary of the two studies shows some of the key methodological differences between the two studies.

- The Phoenix Study examined only refuse from single-family residences. The NYC WCS examined refuse and recycling for residential residences (single-family and multi-family residences).
- Although the Phoenix Study sampled and sorted over two seasons, it did not report seasonal results. The NYC WCS studied waste over four seasons and reported seasonal results.
- The Phoenix Study analyzed only the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Phoenix Study acquired and sorted 283 residential refuse samples and the NYC WCS acquired and sorted 3,600 residential refuse samples.
- One purpose of the Phoenix was to characterize refuse from single-family residences in each of the six service areas. The Phoenix Study used “truck trips” (the segment of the collection route that a truck travels before it brings its contents to the solid waste disposal facility) as the basis for sampling. An equal number of samples from each service area were randomly selected from truck trips in that service area. The results from the six service areas were aggregated into a citywide single-family refuse composition estimate.

The purpose of the NYC WCS was to characterize the waste from each of the eight housing density and income strata. The NYC WCS divided the residential households into housing density and income strata and targeted an equal number of samples from each stratum. The NYC WCS aggregated the results of the characterization of the eight strata into a citywide composition based on the methodology explained in Volume 2, Section 2.

The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Phoenix Study and the NYC WCS. Both studies acquired samples at transfer stations, selecting random portions of the tipped loads. The Phoenix Study sorted the refuse into 89 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure of the Phoenix Study and the NYC WCS, the most useful comparison is between the results of the Phoenix Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse across Seasons). The weighted average of the two low density strata has been used.

9.5.2 Adjustments to the Studies and Study Results

Slightly different material groups and material categories were used in the NYC WCS and in the Phoenix Study. The material groups and categories used in the two studies have been adjusted to accomplish the comparison. Table 1-237 compares the results of the Phoenix Study and the NYC WCS in terms of material groups and shows the adjustments made to each group.

**Table 1-237
Composition by Material Groups in the NYC WCS and the Phoenix Study**

NYC WCS Material Groups	Phoenix Study Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	Phoenix Study Single-Family (2)
Paper	Paper	None	20.7%	18.2%
Plastic	Plastics	None	12.5%	8.3%
Glass	Glass	(3)	1.6%	2.4%
Metal	Metal	(4)	3.5%	4.2%
Organics	Organics	(5)	50.5%	57.5%
Appliances & Electronics		(6)	1.5%	0.9%
C&D	C&D Wastes	None	8.5%	7.2%
Miscellaneous Inorganics		(7)	1.0%	0.6%
HHW	HHW	None	0.2%	0.2%
	Other Materials	(8)		
Total			99.9%	99.5%

Figures may not add due to rounding

- (1) NYC WCS "Refuse Results Across Seasons" weighted average of low density strata (Volume 1, Section 2, Table 1-28)
- (2) Characterization of Waste from Single-Family Residences; City of Phoenix Department of Public Works, 2003; "Material Categories in Single-family Residential Waste (Table 2, page 9)
- (3) The "Fluorescent Tubes" category, classified as "Glass" in the Phoenix Study, has been included in HHW in the NYC WCS
- (4) The "Motor Oil Filters" category, classified as "Metal" in the Phoenix Study, has been included in HHW in the NYC WCS
- (5) Several categories, such as "Textiles/Clothing" and "Furniture", classified as "Other Materials" in the Phoenix Study, have been included in the "Organics" group of the NYC WCS
- (6) The categories in the "Appliances & Electronics" group in the NYC WCS are included as "Other Materials" group in the Phoenix Study
- (7) The categories in the "Miscellaneous Inorganics" group in the NYC WCS are included in the "Other Materials" group in the Phoenix Study
- (8) The categories in the "Other Materials" group of the Phoenix Study are included in several other group of the NYC WCS

Similar adjustments were necessary to make comparisons in the material categories. Table 1-238 compares the materials categories in the NYC WCS and the Phoenix Study and shows the adjustments that were made.

**Table 1-238
Material Categories in the NYC WCS and the Phoenix Study**

NYC WCS		Phoenix		NYC WCS	Phoenix		
Material Group	Material Category	Material Category	Adjustment to Material Category	Single-Family (1)	Single-Family (2)

9.6 Characterization of Municipal Solid Waste for the City of San Diego

9.6.1 Introduction

The “Waste Composition Study 1999-2000” (the “San Diego Study”) was carried out by the Cascadia Consulting Group, Inc. for the City of San Diego Environmental Services Department in 2000. The objective of the San Diego Study was to “obtain detailed information on the amount and types of trash and recyclables being disposed by single-family residences, multi-family residences...”⁶ The waste was analyzed over three sampling seasons: November 1999, February/March 2000 and May 2000. A summary methodological comparison of the San Diego Study and the NYC WCS is presented in Table 1-240.

⁶ “Waste Composition Study 1999-2000”; City of San Diego Environmental Services Department; 2000, page 1.

Table 1-240
Methodological Comparison of the NYC WCS and the San Diego Study

	NYC WCS	San Diego Study
Date of Study	2004/2005	1999/2000
Population Studied		
Description of Population	Residential population of New York City	Residential population of San Diego, California
Number of Population	8,008,278	1,223,400
Dwelling Types Represented	All dwelling types represented; Only MUS stratified by dwelling type	Single-family and multi-family residences
Geographic Areas Studied	New York City (five boroughs)	City of San Diego, California
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Single-family and multi-family residential Refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Single-family (174 samples); multi-family residential (54 samples)
Total Residential Samples	3,600 samples	228 samples
Total Tons Sorted	329 tons	29 tons (1)
Seasonality Studied	Yes, four seasons aggregated into annual results (WCS)	Yes, three season (Fall, Winter, Spring) aggregated into annual results
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 300 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Randomly-selected collection routes. Samples evenly distributed among generator types and by season. Samples randomly selected from tipped loads
Streams Characterized	Residential Refuse, MGP, Paper, Aggregated Recycling, Waste,	Residential Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Nine material groups; 67 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	No, but did estimate amount of yard waste generated in six residential areas
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	Correlation between prevalence of yard waste and yard waste collection services
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The summary of the two studies shows some of the key methodological differences between the two studies.

- The San Diego Study examined the variation in the waste over three seasons, fall, winter, and spring. The NYC WCS studied waste over four seasons, fall, winter, spring, and summer.
- The San Diego Study analyzed the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The San Diego Study analyzed 228 residential refuse samples. The NYC WCS acquired and hand-sorted 3,600 residential refuse samples.
- The San Diego Study set a target number of refuse samples for each generator type (single-family and multi-family) and allocated these evenly across the three seasons of the study. The samples of C&D were allocated by vehicle type across the generator sectors.

The NYC WCS set a target number of residential refuse and recycling samples by the eight housing density and income strata. The NYC WCS aggregated the results of the characterization of the eight strata into a citywide composition based on the methodology explained in Volume 2, Section 2.

Both studies acquired samples at transfer stations. The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the San Diego Study and the NYC WCS. The San Diego Study sorted the refuse into 89 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure of the two studies, two comparisons of the results from the residential sector can be made:

1. The results of the Single-Family component of the San Diego Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the two low density strata has been used.
2. The results of the Multi-Family component of the San Diego Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/ Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the four high and medium density strata has been used.

9.6.2 Adjustments to the Studies and Study Results

Different material groups and material categories were used in the San Diego Study and the NYC WCS. The material groups and categories used in the two studies have been adjusted to accomplish the comparison. Table 1-241 compares the composition of the two studies in terms of material groups and shows the adjustments made to each group.

**Table 1-241
Composition by Material Groups in the NYC WCS and the San Diego Study**

NYC WCS Material Groups	San Diego Study Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	San Diego Single-Family (2)	NYC WCS Multi-Family (3)	San Diego Multi-Family (4)
Paper	Paper	None	20.7%	25.0%	24.3%	38.3%
Plastic	Plastics	None	12.5%	7.7%	15.6%	7.8%
Glass	Glass	None	1.6%	2.7%	3.0%	3.7%
Metal	Metal	None	3.5%	5.1%	3.7%	6.0%
Organics	Other Organics	None	50.5%	40.3%	45.8%	36.7%
Appliances & Electronics		(5)	1.5%	0.5%	1.3%	0.2%
C&D	Construction & Demolition	None	8.5%	17.6%	5.5%	5.6%
Miscellaneous Inorganics		(6)	1.0%	1.0%	0.6%	1.3%
HHW	HHW	None	0.2%	0.1%	0.3%	0.3%
	Special Wastes	(7)				
	Mixed Residue	(8)				
Total			100.0%	100.0%	100.0%	99.9%

Figures may not add due to rounding

- (1) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of low density strata
- (2) Waste Composition Study 1999-2000; City of San Diego Environmental Services Department, 2000, "Composition of Disposed Single-Family Residential Waste"; (Table 10, page 13)
- (3) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of high and medium density strata
- (4) Waste Composition Study 1999-2000; City of San Diego Environmental Services Department, 2000, "Composition of Disposed Multi-Family Residential Waste" (Table 13, page 16)
- (5) The categories in the "Appliances & Electronics" group in the NYC WCS are included as "Major Appliances" in the "Metals" group of the San Diego Study
- (6) The categories in the "Miscellaneous Inorganics" group in the NYC WCS are included in the "Special Wastes" group from the San Diego Study
- (7) The categories in the "Special Wastes" group of the San Diego Study are included in several other groups of the NYC WCS
- (8) The "Mixed Residue" group of the San Diego Study are included as "fines" in the "Organics" group of the NYC WCS

Similar adjustments were necessary to make the comparisons in the material categories. Table 1-242 compares the material categories in the NYC WCS and the San Diego Study and shows the adjustments that were made.

**Table 1-242

9.7 Characterization of Municipal Solid Waste for the City of San Francisco

9.7.1 Introduction

The “Waste Characterization Study” (the “San Francisco Study”) was carried out by Environmental Science Associates for the City and County of San Francisco Department of the Environment in 2004/2005. The objective of the San Francisco Study was to “identify the major constituents of the San Francisco municipal solid waste stream”⁷ and “characterize and quantify the municipal solid waste (MSW) sent to landfill from San Francisco”.⁸ The characterization of the MSW was carried out by hand-sorting and visual characterization at the facilities of Norcal, a private waste management company operating most of the solid waste infrastructure in 2004/2005. A summary methodological comparison of the San Francisco Study and the NYC WCS is presented in Table 1-244.

⁷ “Waste Characterization Study”; City and County of San Francisco Department of the Environment; 2005, page iii.

⁸ “Waste Characterization Study”; City and County of San Francisco Department of the Environment; 2005, page 1.

**Table 1-244
Methodological Comparison of the NYC WCS and the San Francisco Study**

	NYC WCS	San Francisco Study
Date of Study	2004/2005	2004/2005
Population Studied		
Description of Population	Residential population of New York City	Residential population of San Francisco, California
Number of Population	8,008,278	776,733
Dwelling Types Represented	All dwelling types represented; Only MUS stratified by dwelling type	Single-family and multi-family residences
Geographic Areas Studied	New York City (five boroughs)	City of San Francisco, California
Residential Components of Study	Single-Season Snapshot (PWCS), Residential (WCS), Street Basket (WCS), Multi-Unit Apartment Study (WCS)	Single-family and multi-family residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Single-Family (40 samples); multi-family residential (21 samples) ; multi family commercially collected (21 samples)
Total Residential Samples	3,600 samples	82 samples
Total Tons Sorted	329 tons	10 tons (1)
Seasonality Studied	Yes, four seasons aggregated into annual results (WCS)	Yes, two seasons (Winter, Spring)
Sample Size	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Residential Refuse 200 lbs to 300 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Selection of vehicles made by Crew Chief; Selection for each waste sector was done by taking the first vehicles from that sector to arrive at the transfer station on a given day. Samples were randomly selected from tipped loads.
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Residential Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Eight material groups; 63 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	Yes
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	No
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The summary of the two studies shows some of the key methodological differences between the two studies.

- The San Francisco Study examined the variation in the Norcal waste over two seasons, winter and spring. The NYC WCS studied waste over four seasons, fall, winter, spring, and summer.
- The San Francisco Study analyzed the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The San Francisco Study analyzed 82 residential refuse samples. The NYC WCS acquired and hand-sorted 3,600 residential refuse samples.
- The San Francisco Study identified the vehicles from which samples were to be taken and selecting the first vehicles to arrive at the transfer station each day until the requisite number of samples for that day was acquired.

The NYC WCS randomly selected the vehicles from which samples were to be acquired from a list of collection routes within each density/income strata.

Both studies acquired samples at transfer stations. The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the San Francisco Study and the NYC WCS. The San Francisco Study sorted the refuse into 63 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure of the two studies, two comparisons of the results from the residential sector can be made:

1. The results of the Single-Family component of the San Francisco Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the two low density strata has been used.
2. The results of the Multi-Family component of the San Francisco Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/ Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the four high and medium density strata has been used.

9.7.2 Adjustments to the Studies and Study Results

Different material groups and material categories were used in the San Francisco Study and the NYC WCS. The material groups and categories used in the two studies have been adjusted to accomplish the comparison. Table 1-245 compares the composition of the two studies in terms of material groups and shows the adjustments made to each group.

**Table 1-245
Composition by Material Groups in the NYC WCS and the San Francisco Study**

NYC WCS Material Groups	San Francisco Study Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	San Francisco Single-Family (2)	NYC WCS Multi-Family (3)	San Francisco Multi-Family (4)
Paper	Paper	None	20.7%	20.5%	24.3%	25.1%
Plastic	Plastics	None	12.5%	11.3%	15.6%	11.4%
Glass	Glass	None	1.6%	2.0%	3.0%	4.3%
Metal	Metal	None	3.5%	3.1%	3.7%	3.3%
Organics	Organics	(5)	50.5%	58.8%	45.8%	47.1%
Appliances & Electronics		(6)	1.5%	0.2%	1.3%	0.0%
C&D	CDL Wastes	None	8.5%	1.8%	5.5%	4.9%
Miscellaneous Inorganics		(7)	1.0%	0.4%	0.6%	1.1%
HHW	Hazardous Wastes	None	0.2%	1.9%	0.3%	2.5%
	Other Materials (8)					
Total			99.9%	100.0%	100.0%	99.7%

Figures may not add due to rounding

- (1) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of low density strata
- (2) Waste Characterization Study; City and County of San Francisco Department of the Environment; 2005; "Characterization of Waste Disposed through Fantastic 3 Single-Family Residential Program"; (Table A-2, page A-4)
- (3) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of high and medium density strata
- (4) Waste Characterization Study; City and County of San Francisco Department of the Environment; 2005; "Characterization of Waste Disposed through Fantastic 3 Multifamily Residential Program"; (Table A-4, page A-5)
- (5) Several categories in the "Organics" group of the NYC WCS, such as "Textiles" and Furniture" are taken from the "Other Materials" group from the San Francisco Study
- (6) The categories in the "Appliances & Electronics" group in the NYC WCS are included as "Other Materials" group from the San Francisco Study
- (7) The categories in the "Miscellaneous Inorganics" group in the NYC WCS are included in the "CDL Wastes" group from the San Francisco Study
- (8) The categories in the "Other Materials" group of the San Francisco Study are included in several other groups of the NYC WCS

Similar adjustments were necessary to make the comparisons in the material categories. Table 1-246 compares the material categories in the NYC WCS and the San Francisco Study and shows the adjustments that were made.

Table 1-246
Material Categories in the NYC WCS and the San Francisco Study

Material Group	NYC WCS	San Francisco Study	Adjustment to Material Category	NYC WCS	San Francisco	NYC WCS	San Francisco

9.8 Characterization of Municipal Solid Waste for the City of Seattle

9.8.1 Introduction

The City of Seattle has conducted two composition studies during the past five years, a 2002 report on refuse composition and a 2005 study on recycling composition. Although the two studies were not conducted at the same time, they have been combined to compare both Seattle Studies to the refuse and recycling results from the NYC WCS.

The “2002 Residential Waste Stream Composition Study” (the “Seattle Refuse Study”) was carried out by the Cascadia Consulting Group, Inc. for the Seattle Public Utilities (“SPU”) in 2002/2003. The Seattle Refuse Study, the eighth in a series of waste stream composition studies conducted by the SPU, was to “obtain information about the City’s residential...waste stream to estimate (its) recycling potential”.⁹ The Seattle Refuse Study analyzed single-family and multi-family waste from two service areas (North and South Areas) in the City. Composition estimates were developed by sampling refuse and sorting and weighing these samples.

The “2005 Residential Recycling Composition Study” (the “Seattle Recycling Study”) was also carried out by the Cascadia Consulting Group, Inc. for the SPU, in 2004/2005. The purpose of the Seattle Recycling Study was “to better understand the types and quantities of recyclables set out by Seattle residents” and “to determine payment from the City (Seattle) to the private company that processes Seattle’s residential recycling”.¹⁰ Like the Seattle Refuse Study, the Seattle Recycling Study analyzed samples from single-family and multi-family residences from the North and South service areas of Seattle.

A summary methodological comparison of the two Seattle Studies and the NYC WCS is presented in Table 1-248.

⁹ “2002 Residential Waste Stream Composition Study”; Seattle Public Utilities; 2003; page 1.

¹⁰ “2005 Residential Recycling Composition Study”, Seattle Public Utilities, June 2006, page 1.

**Table 1-248
Methodological Comparison of the NYC WCS and the Seattle Studies**

	NYC WCS	Seattle Refuse Study and Seattle Recycling Study
Date of Study	2004/2005	Refuse Study 2002/2003; Recycling Study 2004/2005
Population Studied		
Description of Population	Residential population of New York City	Residential population of Seattle, Washington
Number of Population	8,008,278	563,374
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multi-family residences
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	City of Seattle, Washington
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Single-family and multi-family residential refuse and recycling
Number of Residential Samples (2)	Single-Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Refuse Samples: Single-Family (204 samples); Multi Family (105 samples) Recycling Samples: Single-Family (173 samples); Multi Family (88 samples)
Total Residential Samples	3,600 samples	570 samples
Total Tons Sorted	329 tons	71 tons
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Yes, four seasons as well as aggregated into annual results
Sample Size	200 lbs to 300 lbs for refuse samples; 100 lbs to 150 lbs for recycling	200 lbs to 300 lbs for refuse and commingled samples; 30 lbs to 50 lbs for glass
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Randomly-selected collection routes for each of the four subpopulations (Single-Family North, Single-Family South, Multi-Family North and Multi-Family South). Samples were evenly distributed in the North and South Service Areas and by Season. In both studies samples were randomly selected from tipped loads.
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Residential Refuse and Recycling
Material Groups and Material Categories	For Refuse and Recycling: Nine material groups; 91 material categories	For Refuse samples, 8 material groups; 89 material categories. For Recycling samples, 6 material hroups and 29 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	For Refuse: high and low income and large and small households; None for Recycling
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	Yes
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-service (>24 oz)	No
Generation	Yes, per household and per capita	No
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The comparison shows some of the key methodological differences between the two studies.

- The Seattle Recycling Study examined two streams of recycling: (1) glass and (2) commingled paper and containers. The NYC WCS also analyzed two streams of recycling: (1) MGP, which included metal and plastics, as well as glass, and (2) Paper.
- The Seattle Refuse Study acquired and sorted 309 refuse samples; the NYC WCS acquired and sorted 3,200 refuse samples.
- The Seattle Recycling Study acquired and sorted 261 residential recycling samples and the NYC WCS acquired and sorted 1,600 residential recycling samples (320 samples of Paper and 1,280 samples of MGP).
- The Seattle Studies randomly selected collection routes for single-family and multi-family residences in the North and South Service Areas. Two-thirds of the refuse and recycling samples were acquired from single-family residences and one-third from multi-family residences. Given this ratio of single-family and multi-family residences, samples were evenly distributed across the two services area and across seasons.

The NYC WCS used eight housing density and income strata as the basis for sampling. An equal number of samples were acquired from each stratum. Every census tract in New York City was classified by strata. Vehicles targeted for sampling were randomly selected from collection routes within a single stratum, called “pure routes.” The NYC WCS aggregated the results of the characterization of the eight strata into a citywide composition based on the methodology explained in Volume 2, Section 2. In the PWCS, vehicles targeted for sampling were randomly selected from collection routes within each borough.

Both the Seattle Studies and the NYC WCS acquired samples at transfer stations. The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Seattle Study and the NYC WCS. The Seattle Refuse Study sorted the refuse into 89 material categories and the Seattle Recycling Study sorted samples into 29 categories. The NYC WCS sorted refuse and recycling into the same 91 material categories.

Based on the structure of the studies, four comparisons of the results from the residential sector can be made:

1. The results of the Single-Family component of the Seattle Refuse Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the two low density strata has been used.
2. The results of the Multi-Family component of the Seattle Refuse Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the four high and medium density strata has been used.

3. The results of the Single-Family component of the Seattle Recycling Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Annual Aggregated Recycling Across Seasons). The weighted average of the two low density strata has been used.
4. The results of the Multi-Family component of the Seattle Recycling Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/Medium Income) of the NYC WCS (Annual Aggregated Recycling). The weighted average of the four high and medium density strata has been used.

During the period of the Seattle Refuse Study (January 2002 to December 2002), approximately 142,910 tons of refuse were collected from Seattle residents. About 63 percent (89,942 tons) was collected from single-family residents and approximately 37 percent (52,969 tons) from multi-family residents. During the period of the Seattle Recycling Study (January 2005 to December 2005), approximately 83,200 tons of recyclables were collected from Seattle residents. About 79 percent (65,400 tons) was collected from single-family residents and approximately 21 percent (17,800 tons) from multi-family residents.

During the period of the NYC WCS (September 2004 to September 2005) approximately 2,811,524 tons of refuse and 603,000 tons of recycling were collected from New York City residents. About 26 percent (735,563 tons) of the refuse was collected from residents in the low density housing strata and approximately 72 percent (2,020,242 tons) was collected from residents in the high and medium housing density strata. About 29 percent (176,644 tons) of the recycling was collected from residents in the low density housing strata and approximately 71 percent (426,500 tons) was collected from residents in the high and medium housing density strata.¹¹

9.8.2 Adjustments to the Studies and Study Results

Different material groups and categories were used in the two Seattle Studies and the NYC WCS. The material groups and categories used in the studies have been adjusted to accomplish the comparison. Table 1-249A compares the Seattle Refuse Study's overall residential results and the NYC WCS citywide refuse results, in terms of material groups and shows the adjustments made to each group.

Because the Seattle Recycling Study did not report the glass and commingled streams of recycling separately, the results of the Seattle Recycling Study have been compared with the NYC WCS aggregated recycling stream (Paper and MGP). Again, different material groups and categories were used in the NYC WCS and in the Seattle Recycling Study. The differences in the materials groups and categories used in the two studies have been adjusted to accomplish the comparison of the results. Table 1-249B compares the results of the Seattle Recycling Study and the NYC WCS in terms of material groups and shows the adjustments made to each group.

¹¹ These totals and percentages do not include the Low Density/Low Income Strata which was excluded from the NYC WCS, as discussed in Volume 1, Section 2.

Table 1-249A
Composition by Material Groups in the NYC WCS and the Seattle Study
Refuse

NYC WCS Material Groups	Seattle Study Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	Seattle Single-Family (2)	NYC WCS Multi-Family (3)	Seattle Multi-Family (4)
Paper	Paper	None	20.7%	21.2%	24.3%	25.0%

- (4) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Aggregated Recycling (Paper and MGP)" (Volume 1, Section 1, Table 1-20) weighted average of high and medium density strata
- (5) 2005 Residential Recycling Composition Study; Seattle Public Utilities; 2005; "Composition by Weight - Multifamily" (January 2005 - December 2005); (Table 4-9, page 16)

9.8.3 Most Prevalent Materials

Based on the results of the Seattle Refuse Study and the NYC WCS, the most prevalent materials in the refuse stream are shown in Table 1-251A. Based on the results of the Seattle Recycling Study and the NYC WCS, the most prevalent materials in the residential recycling streams are shown in Table 1-251B.

A summary comparison of the Seattle Refuse Study and the other refuse studies is presented Section 9.2.

From the comparison of the Seattle Recycling Study and the NYC WCS, the following conclusions can be drawn:

- In both studies, paper accounts for more than half the recycling (by weight) for both single-family and multi-family households.
- The percentage of paper collected in recycling from Seattle residents is significantly higher than the percentage of paper collected in recycling from New York City residents.
- Glass accounts for approximately the same percentage of the recycling streams in both studies.
- The composition of New York City’s recyclable materials has a higher percentage of metal and plastic than Seattle’s recyclable materials.
- The composition of Seattle’s recyclable materials has a significantly higher percentage of paper than New York City’s recyclable materials.
- Approximately 4.3 percent of the recycling collected from single-family households and 4.7 percent of the recycling collected from multi-family households in Seattle residents consisted of contaminants, including non-conforming glass in the glass compartment, and non-conforming paper, metal, plastic and other non-recyclables and recyclable glass in the in the commingled container.
- Approximately 9.5 percent of the recycling collected from households in New York City’s low density strata and 10.1 percent of the recycling collected from New York City’s high density and medium density households consisted of materials which were not designated for recycling under the City’s current curbside recycling program.

9.9 Characterization of Municipal Solid Waste for Alameda County, California

9.9.1 Introduction

The “2000 Solid Waste Characterization Study” (the “Alameda County Study”) was carried out by R.W. Beck, Inc. for the Alameda County Waste Management Authority (“ACWMA”) in 2000. The objectives of the Alameda County Study were to “Determine the composition of the County’s aggregate solid waste stream..., compare the results of the 2000 Study with the results of those (studies) from 1995 and 1990...”. The Alameda County Study analyzed both Single-Family residential waste and Multi-Family residential waste. Geographically, the Alameda Study sampled waste from 17 jurisdictions within the County, including 14 incorporated municipalities, two Sanitation Districts, and the unincorporated area of the County. These sectors and jurisdictions were selected to be consistent with the 1995 Study. A summary methodological comparison of the Alameda County Study and the NYC WCS is presented in Table 1-252.

**Table 1-252
Methodological Comparison of the NYC WCS and the Alameda Study**

	NYC WCS	Alameda County Study
Date of Study	2004/2005	2000
Population Studied		
Description of Population	Residential population of New York City	Residential population of Alameda County, California
Number of Population	8,008,278	1,448,905
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multifamily residences
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	Alameda County (17 jurisdictions - 14 incorporated municipalities, two Sanitary Districts, and the unincorporated area of the County)
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	1) Single-family and multifamily residential refuse 2) Roll-off boxes from single generators 3) Self-Haul Waste
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Single-family residential - 260 samples (hand-sorted) Multifamily residential - 121 samples (hand-sorted)
Total Residential Samples	3,600 samples	381 samples hand-sorted
Total Tons Sorted	329 tons	Approximately 120 tons (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Sorting took place over four seasons, but seasonal results were not reported
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 300 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Five generator sectors 17 jurisdictions sectors selected to be consistent with 1995 Study. Samples randomly selected from collection routes. Samples randomly selected from tipped loads.
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Seven material groups; 45 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	Yes
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The comparison in Table 1-252 shows some of the key methodological differences between the two studies.

- The Alameda County Study based its analysis on 17 geographic jurisdictions within the County. The NYC WCS based its analysis on eight housing density and income strata within the City, which accounted for virtually the entire population and geographic areas of the City.
- Although the Alameda County Study sampled and sorted over four seasons, seasonal results were not published. The NYC WCS studied waste over four seasons and reported the seasonal results.
- The Alameda County Study analyzed only the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Alameda County Study acquired and hand-sorted 381 residential refuse samples and the NYC WCS acquired and hand-sorted 3,600 residential refuse samples.
- The Alameda County Study selected generator types and jurisdictions to be consistent with a 1995 Study. The NYC WCS selected the housing density and income strata for the WCS to be consistent with the 1989/1990 Study.

Both the Alameda County Study and the NYC WCS acquired samples at transfer stations. The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Alameda County Study and the NYC WCS. The Seattle Study sorted the refuse into 45 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure of the two studies, two comparisons of the results from the residential sector can be made:

1. The results of the Single-Family component of the Alameda County Study and the results from the Low Density strata (Low Density/High Income and Low Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the two low density strata has been used.
2. The results of the Multi-Family component of the Alameda County Study and the results of the High Density and Medium Density strata (High Density/High Income, High Density/Medium Income, Medium Density/High Income and Medium Density/Medium Income) of the NYC WCS (Citywide Refuse Across Seasons). The weighted average of the four high and medium density strata has been used.

9.9.2 Adjustments to the Studies and Study Results

Different material groups and categories were used in the NYC WCS and in the Alameda County Study. The material groups and categories used in the two studies have been adjusted to accomplish the comparison. Table 1-253 compares the NYC WCS and the Alameda County Study in terms of material groups and shows the adjustments made to the material groups.

**Table 1-253
Composition by Material Groups in the NYC WCS and the Alameda County Study**

NYC WCS Material Groups	Alameda County Material Groups	Adjustments to Material Groups	NYC WCS Single-Family (1)	Alameda County Single-Family (2)	NYC WCS Multi-Family (3)	Alameda County Multi-Family (4)
Paper	Paper	None	20.7%	33.3%	24.3%	32.5%
Plastic	Plastics	None	12.5%	12.3%	15.6%	11.3%
Glass	Glass	None	1.6%	3.2%	3.0%	3.6%
Metal	Metal	None	3.5%	3.0%	3.7%	3.8%
Organics	Other Organics	(5)	50.5%	43.5%	45.8%	43.2%
	Yard Waste					
Appliances & Electronics		(6)	1.5%	1.4%	1.3%	2.4%
C&D		(7)	8.5%	1.1%	5.5%	0.8%
Miscellaneous Inorganics		(8)	1.0%	1.4%	0.6%	1.4%
HHW	Hazardous Wastes	(9)	0.2%	0.6%	0.3%	0.8%
	Other Wastes (5)	(10)				
Total			99.9%	99.8%	100.0%	99.8%

Figures may not add due to rounding

- (1) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of low density strata
- (2) 2000 Solid Waste Characterization Study; Alameda County Waste Management Authority; 2000; "Single-Family Aggregate Waste Composition and Disposal"; (Table 4-3, page 4-13)
- (3) NYC WCS "Housing Density and Income Details, Annual Waste Characterization, Refuse" (Volume 1, Section 1, Table 1-17) weighted average of high and medium density strata
- (4) 2000 Solid Waste Characterization Study; Alameda County Waste Management Authority; 2000; "Multi-Family Aggregate Waste Composition and Disposal"; (Table 4-4, page 4-17)
- (5) The "Organics" group in the NYC WCS combines the "Other Organics" and "Yard Waste" groups from the Alameda County Study
- (6) The "Appliances & Electronics" group in the NYC WCS combines categories from the "Metals" and "Other Wastes" groups from the Alameda County Study
- (7) The "C&D" group in the NYC WCS includes categories from the "Other Wastes" group from the Alameda County Study
- (8) The "Miscellaneous Inorganics" group in the NYC WCS includes categories from the "Other Wastes" group from the Alameda County Study
- (9) The "HHW" group in the NYC WCS is the single category "Hazardous Wastes" from the "Other Wastes" group from the Alameda County Study
- (10) The "Other Wastes" group in the Alameda County Study includes categories that are included in various groups in the NYC WCS

Similar adjustments were necessary to make the comparisons in the material categories. Table 1-254 compares the materials categories in the two studies and shows the adjustments that were made.

**Table 1-254
Material Categories in the NYC WCS and the Alameda County Study**

Material Group	NYC WCS Material Category	Alameda County Material Category	Adjustment to Material Category	NYC WCS Single-Family (1)	Alameda County Single-Family (2)	NYC WCS Multi-Family (3)	Alameda County Multi-Family (4)

9.10 Characterization of Municipal Solid Waste for the State of Pennsylvania

9.10.1 Introduction

The “Statewide Waste Composition Study” (the “Pennsylvania Study”) was carried out by R. W. Beck, Inc. for the Pennsylvania Department of Environmental Protection in 2001/2002. The objective of the Pennsylvania Study was to “better understand the composition of the waste being disposed in Pennsylvania”.¹² The Pennsylvania Study considered the composition of the waste in six regions of the State, as well as the aggregate composition for the State. It focused on the State’s disposed waste stream.

Although the Pennsylvania Study refers to a “series of recycling composition sorts at material recovery facilities (MRFs) across the State¹³”, these studies were highly focused on specific MRFs, each one, in effect a case study. Because the data from these studies were not consistent with the recycling composition results of the NYC WCS, a comparison of the two studies would not be appropriate.

A summary methodological comparison of the Pennsylvania Study and the NYC WCS is presented in Table 1-256.

¹² “Statewide Waste Composition Study”; 2002; Pennsylvania Department of Environmental Protection; (page 1-1).

¹³ “Statewide Waste Composition Study”; 2002; Pennsylvania Department of Environmental Protection; (page 1-2).

**Table 1-256
Methodological Comparison of the NYC WCS and the Pennsylvania Study**

	NYC WCS	Pennsylvania Study
Date of Study	2004/2005	2000/2001
Population Studied		
Description of Population	Residential population of New York City	Residential population of the State of Pennsylvania
Number of Population	8,008,278	12,281,054
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multifamily residences (reported in aggregate as Residential)
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	State of Pennsylvania (six regions)
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Residential - 630 samples hand-sorted (133 visually characterized)
Total Residential Samples	3,600 samples	763 samples (630 samples hand-sorted, 133 visually characterized)
Total Tons Sorted	329 tons	79 tons hand-sorted (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Sampling took place over four seasons, but seasonal results were not developed
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 250 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Sampling sites (landfills and transfer stations) selected in each of the six regions. At each site a list of haulers, including the origin and type of waste, was provided. Target vehicles were randomly selected for each generator type. Samples were randomly selected from tipped loads.
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Six material groups; 37 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<20 oz.) and multi-service (>21 oz)	No
Generation	Yes, per household and per capita	No
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The comparison in Table 1-256 shows some of the key methodological differences between the two studies.

- The Pennsylvania Study examined waste from six regions in the State of Pennsylvania. The NYC WCS analyzed waste from the City of New York, including the City's five borough in the PWCS and eight housing density and income strata for the WCS.
- Although the Pennsylvania Study sampled and sorted over four seasons, seasonal results were not published. The NYC WCS studied waste over four seasons and reported the seasonal and annual results.
- The Pennsylvania Study analyzed only the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Pennsylvania Study acquired and hand-sorted 763 residential refuse samples and the NYC WCS acquired and hand-sorted 3,600 residential refuse samples.
- The Pennsylvania Study used a list of incoming vehicles provided at each sampling site to randomly select vehicles targeted for sampling. Target vehicles were classified on the basis of the origin of the waste and the generator type. The NYC WCS classified each of the census tracts into one of eight housing density and income strata. Collection routes serving a single stratum were identified and vehicles targeted for sampling were randomly selected from these routes.
- The Pennsylvania Study acquired and sorted samples at transfer stations or landfills across the State. The NYC WCS acquired samples at four transfer stations and sorted all samples at two marine transfer stations.

The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Pennsylvania Study and the NYC WCS. The Pennsylvania Study sorted the refuse into 37 material categories and the NYC WCS sorted refuse and recycling into 91 material categories.

Based on the structure and results of the two studies, a comparison of the aggregated residential results can be made. Although the Pennsylvania Study acquired samples from both single-family and multi-family residences, only the aggregated residential results were reported.

9.10.2 Adjustments to the Studies and Study Results

Different material groups and material categories were used in the NYC WCS and in the Pennsylvania Study. The material groups and categories in the two studies have been adjusted to accomplish the comparison. Table 1-257 compares the Pennsylvania Study and the NYC WCS in terms of material groups and shows the adjustments that were made to each group.

Table 1-257
Composition by Material Groups in the NYC WCS and the Pennsylvania Study

NYC WCS Material Groups	Pennsylvania Material Groups	Adjustments to Material Groups	NYC WCS Residential (1)	Pennsylvania Residential (2)
Paper	Paper	None	23.3%	28.6%
Plastic	Plastics	None	14.8%	9.6%
Glass	Glass	None	2.6%	3.5%
Metal	Metal	None	3.7%	5.8%
Organics	Organics	(3)	47.0%	36.8%
Appliances & Electronics		(4)	1.4%	1.5%
C&D		(5)	6.3%	11.3%
Miscellaneous Inorganics	Inorganics	(6)	0.7%	2.6%
HHW		(7)	0.3%	0.3%
Total			100.0%	100.0%

Figures may not add due to rounding

- (1) NYC WCS "Citywide Refuse Results Across Seasons, Waste Characterization Study, Refuse (Annual)"
(Volume 1, Section 2, Table 1-28)
- (2) Statewide Waste Composition Study; 2002; Pennsylvania Department of Environmental Protection;
"Statewide Residential Aggregate Landfilled MSW Composition Detail"; (Table 3, page 4-15)
- (3) Certain categories in the NYC WCS, such as "Carpet" and "Furniture" are included in the "Other Inorganics" group of
the Pennsylvania Study
- (4) The "Appliances & Electronics" categories in the NYC WCS are included in the "Metal" and "Other Inorganics" groups of
the Pennsylvania Study
- (5) The "C&D" categories in the NYC WCS are included in the "Other Inorganics" group of the Pennsylvania Study
- (6) The "Miscellaneous Inorganics" categories in the NYC WCS are included in the "Other Inorganics" group of the Pennsylvania Study
- (7) The "HHW" group in the NYC WCS is the single category "HHW" from the "Inorganics" group from the Pennsylvania Study

Similar adjustments were necessary to make the comparison of material categories. Table 1-258 compares the material categories in the NYC WCS and the Pennsylvania Study, shows the adjustments made to the categories, and compares the results.

**Table 1-258
Material Categories in the NYC WCS and the Pennsylvania Study**

NYC WCS		Pennsylvania Study		NYC WCS	Pennsylvania

9.11 Characterization of Municipal Solid Waste for the State of Georgia

9.11.1 Introduction

The “Georgia Statewide Waste Characterization Study” (the “Georgia Study”) was carried out by R.W. Beck, Inc. for the Georgia Department of Community Affairs in 2004/2005. The purpose of the Georgia Study was “to prepare information that can be used by cities and counties across Georgia to estimate the composition of their disposed municipal solid waste streams...”¹⁴ The Georgia Study developed composition estimates for disposed waste for each of Georgia’s thirteen Regional Development Centers (“RDCs”). The estimates were developed for the residential and sectors, as well as for waste delivered to disposal sites by transfer trailer. A summary methodological comparison of the Georgia Study and the NYC WCS is presented in Table 1-260.

¹⁴ “Georgia Statewide Waste Characterization Study”; Georgia Department of Community Affairs, 2005, page 1-2.

Table 1-260
Methodological Comparison of the NYC WCS and the Georgia Study

	NYC WCS	Georgia Study
Date of Study	2004/2005	2004/2005
Population Studied		
Description of Population	Residential population of New York City	Residential population of the State of Georgia
Number of Population	8,008,278	9,072,576
Dwelling Types Represented	Single-family, two+ family houses; apartment buildings for WCS; for MUS apartment buildings	Single-family and multifamily residences (reported in aggregate as Residential)
Geographic Areas Studied	New York City (five boroughs), using US census tract as geographical unit	State of Georgia (thirteen Regional Development Centers)
Residential Components of Study	1) Single-Season Snapshot (PWCS); Refuse, Paper, MGP, Waste, 2) Four Season and annual residential (WCS); Refuse, Paper, MGP, Aggregated Recycling, Waste 3) Multi-Unit Apartment Study; Refuse, Paper, MGP, Aggregated Recycling, Waste	Residential refuse
Number of Residential Samples (2)	Single -Season (PWCS) -- 400 samples (200 Refuse, 100 Paper, 100 MGP) Curbside Residential (WCS) 3,200 samples (1,600 Refuse, 320 Paper, 1280 MGP)	Residential - 240 samples
Total Residential Samples	3,600 samples	240 samples
Total Tons Sorted	329 tons	30 tons (1)
Seasonality Studied	Yes, four seasons as well as aggregated into annual results (WCS)	Sampling took place over four seasons, but seasonal results were not reported
Sample Size	200 lbs to 300 lbs for Refuse samples; 100 lbs to 150 lbs for Recycling Samples	200 lbs to 250 lbs
Method of Random Selection	For the WCS, all NYC census tracts characterized by housing density and income strata; Collection routes serving a single strata were identified and vehicles targeted for sampling were randomly selected from these routes. For PWCS, collection routes were randomly selected by Borough. In both studies, samples were randomly selected from tipped loads.	Distribution of samples was based on tonnages disposed in each RDC. Trucks arriving at sampling/sorting sites were randomly selected in proportion to the number of samples targeted. Samples were randomly selected from tipped loads
Streams Characterized	Residential Refuse, Paper, MGP, Aggregated Recycling, Waste,	Refuse
Material Groups and Material Categories	Nine material groups; 91 material categories	Seven material groups; 39 material categories
Specific Areas of Study		
Housing Density and Income	Yes, eight housing density and income strata	No
Reusability	Yes, through product classification	No
Percentage of Waste Designated for Recycling	Yes	No
Container Deposit	Yes, by deposit, non-deposit, potential deposit	No
Container Size	Yes, single-serve (<24 oz.) and multi-serve (>24 oz)	No
Generation	Yes, per household and per capita	No
Presentation of Results		
Material Composition Percentages	Yes	Yes
Material Composition Tonnages	Yes	Yes
Other	Means with Confidence Intervals	Means with Confidence Intervals
	Regression analysis using DSNY collection tonnages to estimate strata waste generation	
	Regression analysis for MUS to identify building characteristics associated with successful recycling	

(1) Actual data was not available; assumes an average sample weight of 250 lbs

(2) NYC WCS samples do not include MUS samples because the MUS was not designed to estimate residential waste composition

The comparison in Table 1-260 shows some of the key methodological differences between the two studies.

- The Georgia Study examined waste from the thirteen Regional Development Centers, which account for approximately 90 percent of the waste disposed in the State. The NYC WCS analyzed waste from New York City's five boroughs (in the PWCS) and eight housing density and income strata (in the WCS), which accounted for virtually all residential waste generated in the City.
- Although the Georgia Study sampled and sorted over four seasons, seasonal results were not published. The NYC WCS studied waste over four seasons and reported the seasonal results.
- The Georgia Study analyzed only the refuse stream. The NYC WCS analyzed Refuse, Paper, MGP, Aggregated Recycling (Paper and MGP), and Waste (Refuse and Recycling).
- The Georgia Study acquired and sorted 240 residential refuse samples and the NYC WCS acquired and sorted 3,600 residential refuse samples.
- The Georgia Study used a list of incoming vehicles provided at each sampling site to randomly select vehicles targeted for sampling, distributing the number of samples to the RDCs and generator sectors. Target vehicles were classified on the basis of the origin of the waste and the generator type. The NYC WCS classified each of the census tracts into one of eight housing density and income strata. Residential collection routes serving a single stratum were identified and vehicles targeted for sampling were randomly selected from these routes.
- The Georgia Study acquired and sorted samples at transfer stations or landfills across the State. The NYC WCS acquired samples at four transfer stations and sorted all samples at two marine transfer stations.

The procedures used to acquire random samples from tipped loads and sort the samples were virtually the same in both the Georgia Study and the NYC WCS. The Georgia Study sorted the refuse into 39 material categories and the NYC WCS sorted refuse and recycling into 91 material categories. Both studies tested sub-samples of waste for moisture.

Based on the structure and results of the two studies, a comparison of the aggregated residential results can be made. Although the Georgia Study acquired samples from both single-family and multi-family residences, only the aggregated residential results were reported.

9.11.2 Adjustments to the Studies and Study Results

Different material groups and categories were used in the NYC WCS and in the Georgia Study. The differences in the materials groups and categories used in the two studies have been adjusted to accomplish the comparison.

Table 1-261 compares the results of the Georgia Study and the NYC WCS in terms of material groups and shows the adjustments made to each group.

Table 1-261
Composition by Material Groups in the NYC WCS and the Georgia Study

NYC WCS Material Groups	Georgia Material Groups	Adjustments to Material Groups	NYC WCS Residential (1)	Georgia Residential (2)
Paper	Paper	None	23.3%	37.1%
Plastic	Plastics	None	14.8%	16.6%
Glass	Glass	None	2.6%	4.7%
Metal	Metal	None	3.7%	5.0%
Organics	Organics	(3)	47.0%	31.0%
Appliances & Electronics		(4)	1.4%	1.5%
C&D	C&D	None	6.3%	2.8%
Miscellaneous Inorganics	Inorganics	(5)	0.7%	0.9%
HHW		(6)	0.3%	0.3%
Total			100.0%	99.9%

Figures may not add due to rounding

(1) NYC WCS "Citywide Refuse Results Across Seasons, Waste Characterization Study, Refuse (Annual)"
 (Volume 1, Section 2, Table 1-28)

(2) Georgia Statewide Waste Characterization Study; 2005; Georgia Department of Community Affairs; "Landfilled
 Aggregate MSW Composition by Generator Sector (Residential)"; (Table 4-3, page 4-10)

(3) The "Carpet/Upholstery" category in the NYC WCS is included in the "Inorganics" group of
 the Georgia Study

(4) The "Appliances & Electronics" categories in the NYC WCS are included in the "Other Inorganics" group of
 the Georgia Study

(5) The "Miscellaneous Inorganics" categories in the NYC WCS are included in the "Inorganics" group of the Georgia Study

(6) The "HHW" categories in the NYC WCS is the single category "HHW" from the "Inorganics" group from the Georgia Study

Similar adjustments were necessary to make the comparisons in the material categories. Table 1-262 compares the material categories in the NYC WCS and the Georgia Study and the adjustments that were made.

**Table 1-262
Material Categories in the NYC WCS and the Georgia Study**

Material Group	NYC WCS Material Category	Georgia Study Material Category	Adjustment to Material Category	NYC WCS Residential (1)	Georgia Residential (2)
Paper	Newspaper	Newspaper	None	3.7%	6.5%
Paper	Plain OCC/Kraft Paper	Corrugated Cardboard	None	1.2%	6.0%
Paper	High Grade Paper	Office	None	0.7%	2.9%

Glossary of Abbreviations and Definitions

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
1989/1990 WCS	The waste characterization study conducted by the New York City Department of Sanitation in 1989 and 1990.
Absolute Variability	The variability from sampling unit to sampling unit, which is measured by the Standard Deviation.
Borough	The five political/geographic areas of New York City: Manhattan, Brooklyn, Bronx, Queens, and Staten Island.
Bulk Item	As defined for the NYC WCS, any item of waste that will not fit into a 96-gallon container.
BWPRR	Bureau of Waste Prevention, Reuse and Recycling
C&D	An abbreviation of construction and demolition debris, a material group in the NYC WCS.
Capture Rate	The amount of materials set out for residential recycling collection as a percentage of designated recyclable materials in both recycling and refuse streams. This ratio measures how much of the targeted materials are actually being recycled, which is a measure of how successfully such materials are recycled.
Census Tracts	Census tracts are small, relatively permanent statistical subdivisions of a county. New York City includes 2,217 census tracts containing on average about 4,000 inhabitants.
City	New York City
Confidence Interval	A range within which the true Mean of the population is believed to lie with the given confidence level.
Confidence Level	The certainty with which the true Mean lies within the interval determined. For the NYC WCS, a 90 percent confidence level is used. A 90 percent confidence level is the industry standard for Waste Characterization Studies. Note that the use of a 90 percent level instead of a 95 percent level (the standard for scientific research) does not (a) affect the calculation of means, only the width of intervals around the means or (b) preclude the application of a 95 percent confidence level to results if such an analysis is of interest.
Contamination Rate	The percentage of material that is found in the containers set out for residential recycling collection that is not accepted in New York City's curbside recycling program.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Correlation, negative	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A negative correlation occurs when one variable increases and the other variable decreases.
Correlation, positive	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A positive correlation occurs when one variable increases and the other variable also increases.
Count	The process of counting the individual items that were subsorted.
Curbside Collection	The collection of residential refuse or recycling in bins or bags set out in proximity to residences that generate these types of waste. DSNY provides curbside refuse collection to all residents two or three times per week and recycling curbside collection once per week.
Density/Income Strata	Divisions of New York City's population based on median housing density and median household income.
Deposit (containers)	Beverage containers for which, under the New York State Redeemable Container Law, the purchaser is required to pay a deposit. The deposit may be redeemed when the empty containers are returned to a retailer or authorized redemption center.
District	The 59 areas within New York City used by the Department of Sanitation to administer the City's waste management program. These districts are co-terminus, or identical, to the 59 Community Districts.
Diversion Rate	The amount of materials set out for recycling collection as a percentage of the total residential waste collected.
DSNY	Department of Sanitation of New York City
Dual-bin Trucks	DSNY collection trucks with two compartments used for the simultaneous collection of curbside residential Paper and MGP.
Durable	An item of residential waste that is not putrescible, packaging, or unfinished material, but is a durable object, such as an appliance, piece of furniture, or other household item.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Film (Plastic)	A category of flexible plastic materials used for packaging, trash bags and other applications, typically made of polyethylene or polypropylene.
HDPE	An abbreviation for high density polyethylene; a plastic denoted by a #2 inside the chasing arrows recycling symbol.
HHW	An abbreviation for Household Hazardous Waste, one of the material groups in the NYC WCS.
H/H	An abbreviation for the high housing density and high income stratum.
H/L	An abbreviation for the high housing density and low income stratum.
H/M	An abbreviation for the high housing density and medium income stratum.
Illegally Disposed Street Basket Waste	Residential or commercial waste that is illegally disposed of in street baskets (e.g. home-use products, such as large detergent bottles, cereal boxes, or personal mail; construction materials, etc.).
L/H	An abbreviation for the low housing density and high income stratum.
L/M	An abbreviation for the low housing density and medium income stratum.
Late Week/Early Week	A criterion used in the PWCS based on the idea that the composition of the waste discarded during the latter part of a week differs significantly from the composition of waste discarded during the early part of a week.
LDPE	An abbreviation for low density polyethylene, a plastic denoted by #4 inside the “chasing arrows” recycling symbol.
Lower Boundary	For a given material, the lowest average percentage of that material expected in the population consistent with the sample, at the confidence level specified.
M/H	An abbreviation for the medium housing density and high income stratum.
M/L	An abbreviation for the medium housing density and low income stratum.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
M/M	An abbreviation for the medium housing density and medium income stratum.
Material Categories	The classification of all materials in the waste stream into categories for sorting, weighing, and counting purposes. In the NYC WCS, 91 Material Categories were used to characterize the City's waste stream.
Material Groups	Groupings of material categories used to simplify or generalize results. The Material Groups used in the NYC WCS are: Paper, Plastic, Glass, Metal, Organics, Appliances/Electronics, Construction and Demolition Debris, Miscellaneous Inorganics, and Household Hazardous Waste.
Mean	The sum of the values of all observations divided by the number of observations, also known as average. In analyzing the composition of samples of waste, refuse, recycling, and the contents of street baskets, the best estimate of the true percentage of each material in the population is the Mean percentage of that material from all of the samples.
MGP	An abbreviation for Metal, Glass, and Plastic. One of the two streams of recycling collected by the DSNY consisting of plastic bottles and jugs; glass bottles and jars; metal cans and household objects; aluminum foil, trays and cans, and gable top beverage cartons. The other stream of recycling collected by DSNY is Paper.
Mixed Cullet	Broken glass in small pieces (under 3" x 3") of mixed color.
Moisture and Particulate Test	A laboratory test that determines the amount of moisture in a sample of material and determines the amount of fugitive or foreign material adhering to the sample.
Multiserve (containers)	Beverage containers with a capacity of more than 24 ounces of liquid.
Multi-Unit Apartment Study or Multi-Unit Study (MUS)	The component of the 2004/2005 waste characterization study that examined the correlation between the physical and operational characteristics of multi-unit buildings (those buildings with 6 or more residential units) and recycling success.
Non-deposit (containers)	Beverage containers which are not designated as deposit containers under the New York State Redeemable Container Law.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
NYC	New York City
NYC WCS	New York City Waste Characterization Study
Observation	The value(s) associated with a given sampling unit.
OCC	An abbreviation for old corrugated cardboard, one of the material categories in the PWCS and the NYC WCS.
ONP	An abbreviation for old newspaper, one of the material categories in the PWCS and the NYC WCS.
Paper	The second of two streams of recyclable materials collected by DSNY consisting of newspapers; magazines; catalogues; junk mail; white office paper; mixed paper; and gray and corrugated cardboard/paperboard. The other stream of is Metals/Glass/Plastic (MGP).
PET	An abbreviation for polyethylene terephthalate, a plastic denoted by #1 inside the “chasing arrows” recycling symbol.
Population (Statistics)	The entire aggregation of items from which a sample can be drawn. In the NYC WCS, the population was all of the residential waste collected at the curb by DSNY.
PP	An abbreviation for polyethylene propylene, a plastic denoted by #5 inside the “chasing arrows” recycling symbol.
Potential Deposit	Beverage containers which are not currently designated as deposit containers under the New York State Redeemable Container Law, but which may be designated in future legislation.
PS	An abbreviation for polystyrene, a plastic denoted by #6 inside the “chasing arrows” recycling symbol.
Pure Routes	DSNY Refuse and Recycling collection routes that include only residences from a single housing density and income stratum.
PWCS	The preliminary waste characterization study conducted by the New York City Department of Sanitation in 2004.
PVC	An abbreviation for polyvinyl chloride, a plastic denoted by #3 inside the “chasing arrows” recycling symbol.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Recycling	The act of recovering items or materials that might have been discarded and, usually after processing, returning them to the stream of commerce. Also, the materials that are set out for recycling collection.
Recycling Subindicators	A set of abbreviations used to indicate; i) those materials designated for recycling under New York City’s current curbside recycling program during the study period (“R”); ii) those materials for which markets exist and which could be added to a future New York City curbside program (“PR”); and iii) those materials that are not designated for recycling under New York City’s curbside recycling program because established or emerging markets do not presently exist (“NR”).
Refuse	Items or materials that are discarded and disposed.
Relative Variability	The variability from Sampling Unit to Sampling Unit in relation to the Mean. This is calculated by dividing the Standard Deviation by the Mean.
Residential Study	The component of the 2004/2005 waste characterization study that addressed the generation and composition of the curbside residential waste.
Sample	A portion of a population used to estimate the composition of the population as a whole. The Sample is made up of multiple Sampling Units.
Sample Acquisition, or Sampling	The procedure for selecting Sampling Units from the population.
Sample Number	The number of sampling units in a sample.
Sample Weight	The weight of a sampling unit. In the WCS, each refuse sampling unit was between 200 and 300 pounds.
Sampling Unit	A single elementary unit used as the basis for estimating the composition of the population.
Section	Each of the City’s 59 Sanitation Districts is divided into 3 to 5 Sanitation District Sections within which routes are designed and tonnage data collected daily.
Single-serve (containers)	Beverage containers with a capacity of less than 24 ounces of liquid.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Sorting	The procedure for separating a heterogeneous amount of material, such as a 200 pound Sampling Units of refuse, into its constituent material categories.
Sorting Period	The days or weeks when the sampling and sorting of waste took place during the NYC WCS.
Standard Deviation	A measure of the dispersion or variability around the Mean of the weights of a group of Sampling Units of New York City waste.
Street Basket Waste Study	The component of the 2004/2005 waste characterization study that addressed the composition of the street basket waste.
Subsorts	The process of sorting a particular material into smaller constituent components (e.g. drinking containers were subsorted into deposit and non-deposit containers).
Upper Boundary	For a given material, the highest average percentage of that material expected in a population consistent with the sample, at the confidence level specified.
Waste	The combination of Refuse and Recycling
Waste Generation	The rate at which waste is set out for collection, typically reported in terms of amounts per generator per time period (e.g. pounds per capita per week).
WCS	The waste characterization study conducted over four seasons by the New York City Department of Sanitation in 2004 and 2005.

NYC Waste Characterization Study

Final Report, Volume 2

Section 1: Introduction

Section 1.0 Introduction

During 2004 and 2005, the R. W. Beck Project Team conducted two **waste** characterization studies for the **DSNY**¹. The first study, the **PWCS**, took place during May and June of 2004. The purpose of the PWCS was to provide DSNY with a “snapshot” of the **City’s** residential **Refuse** and **Recycling** waste streams by **sorting samples** of each type of waste and analyzing the results.

The second study, the New York City **WCS** was conducted from the fall of 2004 through the summer of 2005. The WCS consisted of three separate studies:

- The **Residential Study**, which was designed to estimate the generation rates and composition of **curbside** residential refuse and recycling by eight housing **Density/Income Strata** over four seasons;
- The **Street Basket Waste Study**, which was designed to estimate the composition of street basket waste from dedicated DSNY street basket collection routes; and

Both the PWCS and WCS involved a significant amount of planning, and the purpose of this volume of the Final Report is to describe and explain the methodologies and procedures used to develop the final results. This volume is divided into four sections:

- Section 1: Introduction
- Section 2: Planning for the PWCS and the WCS Residential Study
- Section 3: Planning for the Street Basket Study
- Section 4: Implementation of the Studies

The **Multi-Unit Study**, which was designed to determine the **correlation** between physical and operational characteristics of multi-unit buildings and successful recycling. The Multi-Unit Study is discussed in Volume 3 of the Final Report.

¹ Terms and abbreviations defined in the glossary are printed in bold the first time they appear in each Volume.

**NYC Waste Characterization Study
Final Report, Volume 2**

**Section 2: Planning for the PWCS and the
WCS Residential Study**

Section 2 Planning for the PWCS and the WCS Residential Study

2.0 Introduction

Planning for the Waste Characterization in the PWCS and the WCS Residential Study consisted of developing a **sampling** plan and the related procedures necessary to implement these plans for each study.

2.1 The Sampling Plan

The following discussion of the Sampling Plan for the PWCS and WCS makes a distinction between a “**sampling unit**” and a “**sample**.” A sampling unit is a single elementary unit used as the basis for estimating the composition of the **population**¹. For reasons explained below, the sampling unit for refuse in the PWCS and WCS was 200 pounds to 300 pounds of refuse. A sample is a portion of the population used to estimate the composition of the population as a whole. A sample comprised of 200 sampling units of refuse was used to estimate citywide composition of refuse in the PWCS. For the WCS, the sample comprised the 1,600 sampling units of refuse used to estimate the citywide composition of refuse over four seasons.

Each sampling plan addressed four issues: (1) the sample size, or number of sampling units to be selected; (2) the method for selecting which parts of the waste stream to sample; (3) the weight of each sampling unit; and (4) the procedures for acquiring sampling units. Separate sampling plans were developed for refuse and recycling in both the PWCS and the WCS.

2.1.1 Sample Number

In any characterization study, the number of sampling units that are sorted affects the accuracy of the estimate. For example, if only one sampling unit of a particular material stream were sorted, it is very unlikely that the estimate resulting from sorting that single sampling unit would match the composition of the entire material stream. On the other hand, if hundreds of thousands of sampling units were sorted, enough so that every ounce of the City’s refuse and recycling materials were sorted, the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate.

Determining the number of sampling units to be sorted is closely related to the nature of the material that will be sorted. If the material being sorted was consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few sampling units to develop an estimate if there were only two materials in the material stream and they were always found in the same proportion in every sampling unit. Of course, this is not the case. Refuse, and to a lesser degree,

¹ Population is used here in the statistical sense to mean all measurements of interest. In this case, the population is the residential refuse set out for collection in New York City.

recycling materials, are extremely variable. The percentage of each type of waste or recycling material can vary considerably among households. Even from the same household, the type of refuse or recycling materials can vary depending on when it is generated. For example, during the autumn, one would expect to find large amounts of leaves in the refuse stream, but in the winter there will be few, if any, leaves in the refuse stream. On the other hand, food waste will be found throughout the year. In the recycling stream, it is likely that milk cartons will occur year around, while certain water, soda and refreshment containers may increase during the hot summer months when consumption of these items increases.

Because of the potential for variability in waste, a different number of sampling units may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently in the refuse stream than leaves, fewer sampling units would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

In the PWCS and WCS, the estimate of the composition of waste is presented as three numbers: (1) the Sample **Mean**; (2) the **Confidence Level**; and (3) the Confidence Interval². The Sample Mean is the average percentage of a given material found in the sampling units sorted. For example, after sorting thirty sampling units of refuse, a list of thirty percentages of food waste will be obtained – one for each refuse sampling unit sorted. If the average of the thirty percentages of food waste is 16 percent, then the Sample Mean for food waste found in the sampling units is 16 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sampling units taken. The Sample Mean is simply the average value of the sampling units. It is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tells us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's true mean value. The higher the Confidence Level, the greater our certainty that the Mean of the entire population is contained within the Confidence Interval. For example, if the Confidence Interval around the Sample Mean – 15 percent to 17 percent for food waste – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of food waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted industry standard and was used in this study.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population mean. For example, our Sample Mean of 16 percent for food waste may have a Confidence Interval of ± 1 percent, at a 90 percent Confidence Level. That is, based on our number of

2 The Statistical Results of the PWCS and WCS can be found in Volume 1, Section 8, Tables 1-163 through 1-190.

sampling units and results obtained, we would expect that 90 percent of the time, the amount of food waste in the refuse of the entire population would be between 15 percent and 17 percent. Described another way, if we could actually go out and determine the exact percentage of food waste in our population, we are 90 percent certain that the actual percentage of food waste in the refuse stream would fall between 15 percent and 17 percent. If we wanted a more accurate estimate, we would have to sort more sampling units. The results could also be calculated at a 95 percent Confidence Level. However, given the same number of sampling units, the Confidence Interval at a 95 percent Confidence Level would be wider. In other words, the cost of being more confident that the interval contains the population Mean is a wider Confidence Interval.

It should be noted that the use of a 90 percent level instead of a 95 percent level (the standard for scientific research) does not affect the calculation of the means, only the width of intervals around the means. So for example, a mean of 5 percent of the composition of a particular material category might have a confidence interval of 4 percent to 6 percent at a 90 percent level and 3 percent to 7 percent at a 95 percent level. In reference to each statistic, we would correspondingly say that we are confident that the true mean for that material – if we were able to sample all the waste in New York City – would fall 90 percent of the time between 4 percent and 6 percent and 95 percent of the time between 3 percent and 7 percent.

For this reason, it is not applicable to say that a 95 percent confidence level is “better” than a 90 percent level; nor to expect that the results in terms of means – the statistic that primarily inform us about the make up of New York City waste – would change if a different confidence level were applied.

In recommending the number of sampling units to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard Waste is much more variable than **Paper**. Therefore, for a given number of sampling units, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred sampling units of refuse may provide a Confidence Interval of ± 8 percent for Paper, but a ± 30 percent for Yard Waste. To achieve a ± 8 percent for Yard Waste would require significantly more sampling units to be sorted and a higher cost to obtain such accuracy of the results.

In practical terms, “variability” simply means the variation we are likely to find among sampling units. If we sort through 10 sampling units and each one has between 28 percent and 32 percent of a given waste type, we can be reasonably certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same 10 sampling units and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy by sampling more waste is high. Below that point,

significant increases in accuracy can be achieved with relatively little cost. However, the general pattern is clear: the more sampling units that are sorted, the greater the accuracy of the estimate.

The PWCS Sampling Plan called for 200 sampling units of Residential Refuse and 200 sampling units of Recycling (100 sampling units of **MGP** and 100 sampling units of Paper). The WCS Sampling Plan called for 1,600 sampling units of Residential Refuse and 1,600 sampling units of Residential Recycling. Because the results of the PWCS indicated greater variability in the MGP stream than in the Paper stream, the number of MGP sampling units was increased relative to the number of Paper sampling units. For this reasons, 1,280 sampling units of MGP were targeted and 320 sampling units of Paper. Table 2-1 presents the number of samples targeted and acquired for the PWCS and the WCS.

Table 2-1
Number of Samples Targeted and Acquired ⁽¹⁾

Number of Samples Targeted						
Streams	PWCS ⁽²⁾	Fall	Winter	Spring	Summer	WCS
Refuse	200	400	400	400	400	1,600
Paper	100	80	80	80	80	320
MGP	100	320	320	320	320	1,280
Street Basket	-	50	50	50	50	200
Total	400	850	850	850	850	3,400

Number of Samples Acquired						
Streams	PWCS ⁽²⁾	Fall	Winter	Spring	Summer	WCS
Refuse	200	399	409	401	400	1,609
Paper	99	80	85	80	80	325
MGP	104	320	340	320	320	1,300
Street Basket	-	50	50	50	50	200
Total	403	849	884	851	850	3,434

(1) Based on the results of the PWCS, which showed that MGP samples were more heterogeneous than Paper samples, it was decided to target more MGP samples than Paper samples for the WCS. Heterogeneity of the population, in this case MGP, requires that more samples be drawn in order to obtain the same degree of accuracy.

(2) Street Basket samples were not collected during the Preliminary Waste Characterization Study.

2.1.2 Sample Unit Weight

For both refuse and recycling, the number of sampling units and the mass of the sampling units assure that the sample will appropriately represent the overall population (i.e., waste stream).

The procedures for analyzing the composition of municipal solid waste were initially developed over 30 years ago and have been extensively revised and refined in the past three decades. Studies by the USEPA and academic sources (e.g., Klee, A.J and D. Carruth. "Sample Weights in Solid Waste Composition Studies." *American Society of Civil Engineers Journal of Sanitary Engineering Division*. Vol. 96. 945-954. August 1970) suggest a 200 to 300-pound quantity of refuse is sufficient to characterize municipal solid waste. This weight is based on factors such as particle size, material components, and the level of mixing that occurs during collection. These sources also suggest that, as the size of a refuse sampling unit increases beyond 200 to 300 pounds, the statistical benefits associated with the larger size is outweighed by the incremental increase in the cost of processing the sampling units. As a result, the MSW sampling unit weight of 200 to 300 pounds has been the industry guideline for MSW composition studies in the United States for the past 15 years. The refuse sampling units for the PWCS and the WCS used this guideline.

Paper and MGP collected for recycling differs from refuse in several ways. First, these streams target a specific set of materials and, therefore, tend to be more homogeneous than refuse. Second, particle size, particularly in the paper stream, is more uniform, compared to refuse. Because of these characteristics and based on the Project Team's experience in previous waste characterization studies, the target weight of recycling sampling units for the PWCS and the WCS was 100 to 125 pounds. A total of 678,467 pounds of residential refuse and recycling were sorted during the PWCS and the WCS. The number of samples and the average **sample weights** for the PWCS and the WCS can be found in Table 2-17 in Volume 2, Section 4.

2.1.3 The Method for Selecting Sampling Units

The PWCS and the WCS used different criteria for selecting sampling units.

2.1.3.1 PWCS Sample Selection

The PWCS Refuse Sampling Plan used two criteria to select the samples. First, sampling units were selected to provide an estimate of the composition of refuse and recycling citywide. Based on the results of previous studies, it was estimated that a total of 200 Refuse sampling units, 100 MGP sampling units, and 100 Paper sampling units would provide a confidence interval of ± 7.5 percent at a 90 percent confidence level for the major **Material Categories**.

To obtain representative amounts of waste from each of the City's five **boroughs**, the number of sampling units was based on the contribution of each borough to the total amount of refuse collected by DSNY during the period of July 2003 to February 2004. The PWCS Recycling Sample Plan selected samples based on the average tons of Paper and MGP collected from each borough from April 5, 2004 to April 18, 2004. Table 2-2 shows the average weekly tons collected from each borough, the percentage of Refuse, MGP, and Paper collected from each borough, and the number of sampling units to be acquired from each borough for the PWCS.

**Table 2-2
Refuse and Recycling Collection and Sample Selection for the PWCS**

Borough	Refuse			Paper			MGP		
	Average Weekly Tons Collected ⁽¹⁾	Percent Collected	Number of Samples	Average Weekly Tons Collected ⁽¹⁾	Percent Collected	Number of Samples	Average Weekly Tons Collected ⁽¹⁾	Percent Collected	Number of Samples
Manhattan	10,431	18.01%	36	1,781	23.92%	24	793	18.10%	18
Bronx	9,032	15.60%	32	669	8.98%	9	644	14.70%	15
Brooklyn	18,100	31.25%	64	1,961	26.33%	26	1,224	27.93%	28
Queens	16,021	27.66%	53	2,308	30.99%	31	1,357	30.97%	31
Staten Island	4,328	7.47%	16	728	9.78%	10	364	8.31%	8
Total ⁽²⁾	57,912	100.00%	200	7,447	100.00%	100	4,382	100.00%	100

(1) Average weekly tonnage of refuse collected between July 2003 and February 2004; average weekly tonnage of Paper and MGP collected between April 5 and April 18, 2004.

(2) The sum of values may not add to the total shown due to rounding.

The PWCS was not designed to produce statistically significant waste composition results by borough, only for the City as a whole. Although the sampling was weighted to reflect the relative **waste generation** of the five boroughs, not enough samples were acquired to characterize each borough on its own at the same level of precision required to characterize the City as a whole. However, when the DSNY asked for borough-specific results from the PWCS, there was enough data to produce them, and they are consequently published in the Final Report (Volume 1, Section 4.2 Tables 1-94 through 1-98). It should be cautioned that the borough-specific results for the PWCS will have wider confidence intervals than citywide results, for this reason.

The second criterion in the PWCS Sampling Plan was used to test the hypothesis that curbside refuse collected early in the week differed quantitatively from the waste collected late in the week. The hypothesis held that the composition of waste generated by weekend social events and yard work and collected early in the week would be significantly different from the composition of the waste collected and disposed later in the week. If this hypothesis were true, the sampling plan for the WCS would have been adjusted to take into account this **early week/late week** variation in waste generation.

To test this hypothesis, samples were scheduled to be acquired from early week (“EW”) collections and late week (“LW”) collections from each of the five boroughs. The first waste collections of the week are Monday and Tuesday, for areas with 3-day per week collection, and Monday, Tuesday, or Wednesday for areas with 2-day per week collection. Since residents receive recycling collection once a week, the early-week/late-week criterion could not be applied to the recycling sample.

2.1.3.1.1 Selecting PWCS Sampling Units

Using these criteria and routing data provided by DSNY, R. W. Beck developed a list of EW and LW routes in each of the five boroughs for each day of the **Sorting Period**. Using a random number generator, routes from the list were selected for sampling. Table 2-3 shows the number of EW and LW samples targeted for acquisition from each borough for the PWCS.

**Table 2-3
Number of Samples Targeted for the PWCS**

Borough	Refuse		Paper	MGP	Total
	Number of Early Week Samples	Number of Late Week Samples	Number of Samples	Number of Samples	Number of Samples
Manhattan	17	19	24	18	78
Bronx	13	18	9	15	55
Brooklyn	26	38	26	28	118
Queens	30	23	31	31	115
Staten Island	9	7	10	8	34
Total	95	105	100	100	400

The results of the PWCS regarding the differences in early week samples and late week samples were mixed. On the one hand, there was a statistically significant difference between the early week samples and the late week samples for certain materials, such as Paper and Organics. However, these differences were only slightly outside the confidence intervals. On the other hand, Plastics, Glass, Metal, Appliances & Electronics, Construction Debris, Miscellaneous Inorganics, and Household Hazardous Waste showed no statistically significant differences between early week and late week samples. Given the mixed results of the PWCS in this regard, the relatively minor statistically significant differences in Paper and Organics, and the complexity that adding the EW/LW criteria would have added to the planning of the WCS, it was decided not to incorporate this criteria into the planning of the WCS.

2.1.3.2 WCS Sample Selection

2.1.3.2.1 Determining Housing Density and Income Strata

One purpose of the WCS Residential Study was to characterize the City’s residential refuse and recycling by housing density and income strata over four seasons. The planning for the WCS began by defining housing density and income strata for the City and determining the location of these strata within the City.

For the purposes of the WCS Residential Study, the City was divided into nine housing density and income strata. A matrix of these strata is shown in Table 2-4.

**Table 2-4
Housing Density and Income Strata**

High Density	Medium Density	Low Density
High Income	High Income	High Income
High Density	Medium Density	Low Density
Medium Income	Medium Income	Medium Income
High Density	Medium Density	Low Density
Low Income	Low Income	Low Income

The methodology used to define these strata is the same one currently used by the DSNY’s Operations Management Division (“OMD”). However, the OMD applies the methodology to determine strata for the City’s 59 Community **Districts**. For the WCS, the methodology was applied to the City’s 2,217 **census tracts** because the results would be likely to show less variation in the minimum and maximum housing density and income. For example, each of the 59 Community Districts contains an average of more than 50,000 households, while each of the City’s 2,217 tracts contains an average of less

than 1,500 households. The greater the number of households, the more likely it would be that there would be variation of housing density and income levels. Community Districts, being larger, were more likely to have a greater range of housing density and household income within their borders.

The data used to develop the strata were the United States Census Bureau’s Year 2000 census data.

To determine the housing density strata, data on the number of residential structures and the number of units per structure were used. The census tracts in the high housing-density strata were those in which 67 percent or more of the residential structures contain ten or more units. The low housing density strata consisted of census tracts in which 67 percent or more of the residential structures contain two or fewer units. The medium density strata included all those census tracts that were not in either the high density stratum or the low density stratum.

To determine the high, medium, and low income strata, the median household income for each of the City’s census tracts was used. The census tracts were divided evenly into three groups. Based on 2000 census data, the high income strata included all those census tracts with a median household income above \$46,193; the medium income strata consisted of census tracts with a median household income of less than \$46,193 and greater than \$30,763. The low income strata consisted of census tracts with a median household income below \$30,763. There were 739 census tracts in each of the three income groups.

As noted above, this is the methodology used by the OMD. However, the OMD applies the methodology to Community Districts, rather than census tracts. Table 2-5 shows the distribution of census tracts in the City among income and density strata.

**Table 2-5
Distribution of Census Tracts Among Density and Income Strata**

	High Income	Medium Income	Low Income	Total
High Density	167	127	342	636
Medium Density	162	435	392	989
Low Density	<u>410</u>	<u>177</u>	<u>5</u>	<u>592</u>
Total	739	739	739	2,217

Using these methods of stratification, the City’s population was divided into these nine groups. Table 2-6 shows the portion of New York City’s population in each of the nine strata.

Table 2-6
Distribution of New York City's Population by Density and Income Strata ⁽¹⁾

	High Income	Medium Income	Low Income	Total
High Density	883,319	710,418	1,753,021	3,346,758
Medium Density	444,298	1,442,180	1,129,673	3,016,151
Low Density	<u>1,171,081</u>	<u>471,531</u>	<u>2,757</u>	<u>1,645,369</u>
Total	2,498,698	2,624,129	2,885,451	8,008,278

(1) Based on Year 2000 Census Data.

This approach to defining the Density and Income Strata has certain limitations. First, the use of certain criteria to define the strata precludes the use of other criteria to analyze the composition of the waste. The use of housing density and income strata as the building blocks of the sampling plan precludes using another criterion, such as ethnicity or education, to analyze the composition of the waste.

Second, setting certain values as demarcations between strata creates a “near-boundary” problem. This problem refers to the similarity of Census tracts that are close to, but on opposite sides of the cutoff between two strata. For example, the cutoff between the high income strata and the medium income strata is \$46,193. A census tract with the median household income of \$46,190 would be classified as medium income and a census tract with a median household income of \$46,200 would be classified as high income. Although these two census tracts have almost the same median household income, they are classified as belonging to different strata. Compare these two census tracts with two census tracts within the high income strata, one with a median household income of \$46,200 and one with a median household income of \$150,000. This “near-cutoff” problem occurs in any scheme that separates classes by specific quantitative measures.

Third, the criteria are averaged over the census tract and there are inevitably variations in housing density and income within a census tract. For example, this method may characterize a given census tract as high density/high income even though portions of the population in that census tract may fall into the medium income, or low income category. This limitation is inherent in any methodology that simplifies the characteristics of a diverse population. This limitation would be more pronounced if a larger geographic area, such as a Community District, were used to determine the strata. In any classification system, these types of limitations are unavoidable and in this case were minimized to the extent possible consistent with the goals of the WCS. For these reasons we believe this approach to developing the housing density and income was reasonable.

2.1.3.2.2 Mapping the City by Housing Density and Income Strata

The next step in developing the WCS Residential Sampling Plan was to identify refuse and recycling collection routes for each stratum. To do this, a set of maps were developed. These maps showed the census tracts in each of the nine strata. The maps

were derived from The BYTES of the BIG APPLE MapPLUTO (“MapPLUTO”), a GIS dataset developed by the New York City Department of City Planning. Figure 2-1 is an example from MapPLUTO of a portion of Manhattan showing the census tract boundaries.

Figure 2-1
Lower Manhattan showing Census Tracts from MapPLUTO

The information on these maps was then combined with the boundaries for the areas used by DSNY to administer collection routes, called Sanitation Districts and Sanitation District Sections. Figure 2-2 shows the same portion of Manhattan with census tract boundaries, as well as the boundaries for Sanitation Districts and Sanitation District Sections. The dotted line indicates Sanitation District Section boundaries and the heavy dark lines indicate Sanitation District boundaries.

Figure 2-2
Lower Manhattan showing District, Section and Census Tract Boundaries

In planning the WCS, data from census tracts, Sanitation District Sections, and Sanitation Districts were used. At the census tract level, housing density and income data were used to establish the density and income strata. At the Sanitation District Section level, residential collection routes and collection tonnages were obtained from DSNY. At the Sanitation District level, data on population and collection tonnages were used to check the reasonableness of the findings.

Using U.S. Census Bureau data for the year 2000, census tracts were classified by housing density. Figures 2-3 through 2-7 present the high, medium, and low housing density census tracts for each of the five boroughs. The City's census tracts were also classified by median household income. Figures 2-8 through 2-12 show the census tracts with high, medium, and low median income. Housing density and income were combined to determine the nine density/income strata. The census tracts classified by density/income strata for each of the five boroughs are shown in grayscale Figures 2-13 through 2-17 and in color in Figures 2-18 through 2-20.

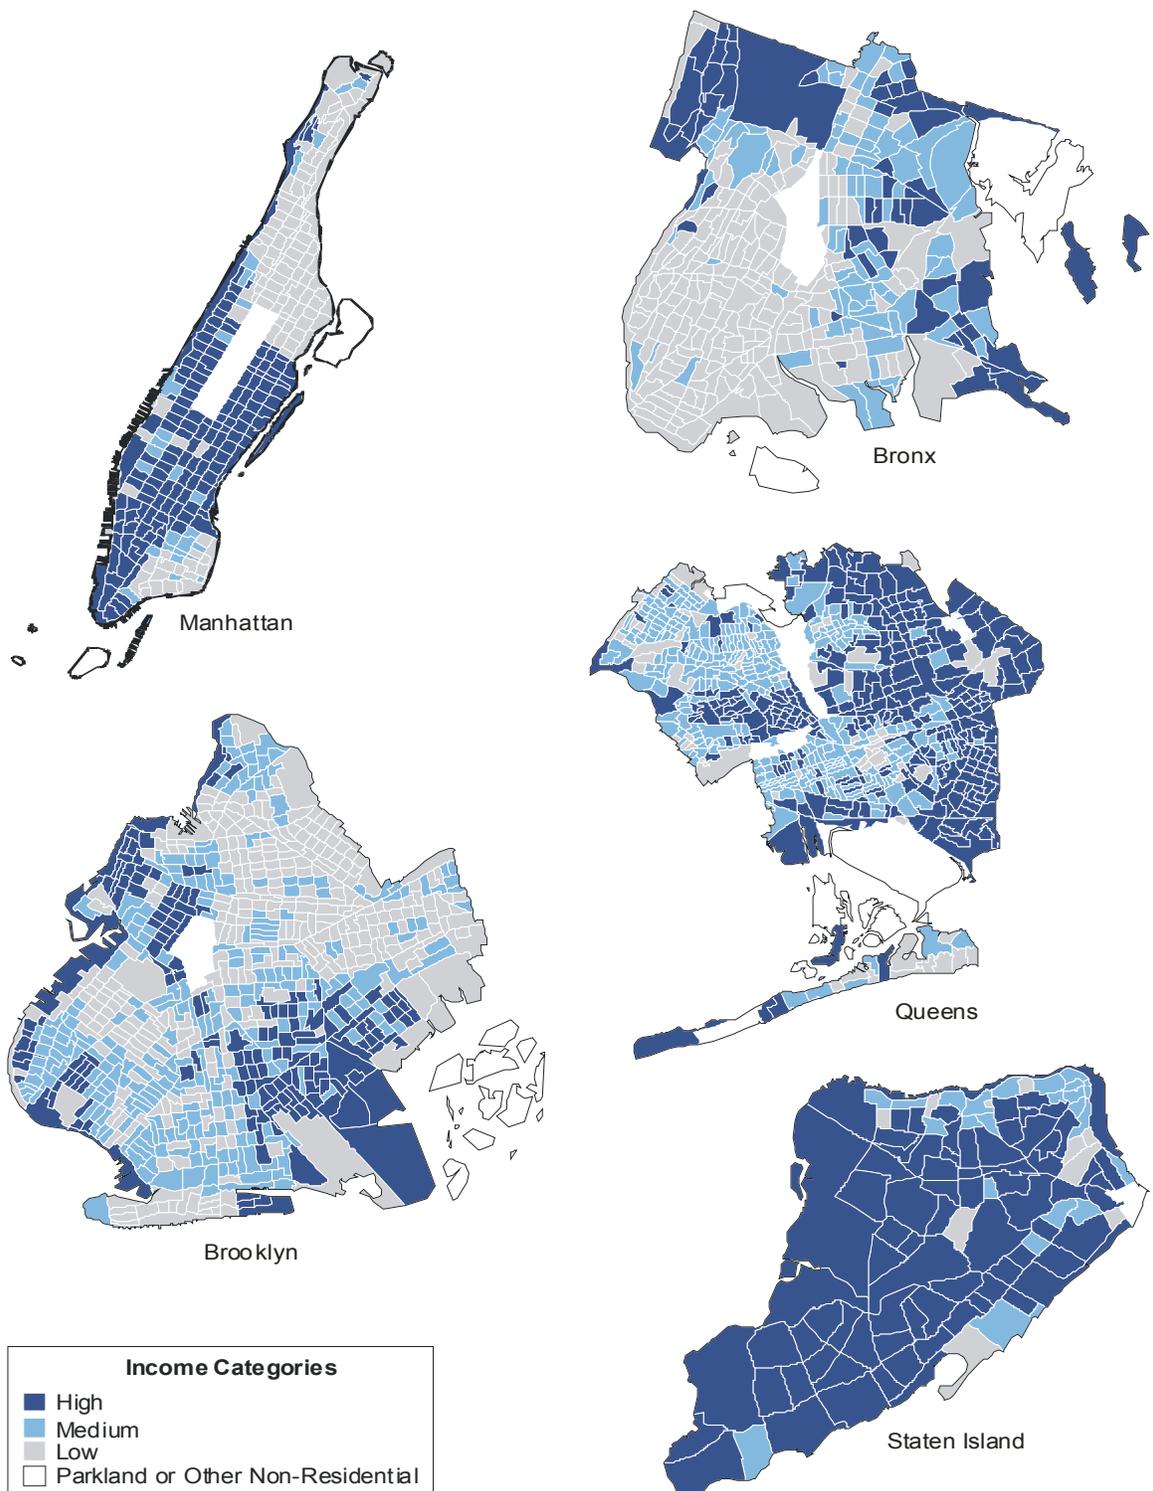

Figure 2-19
Borough Census Tracts by Income (Color)

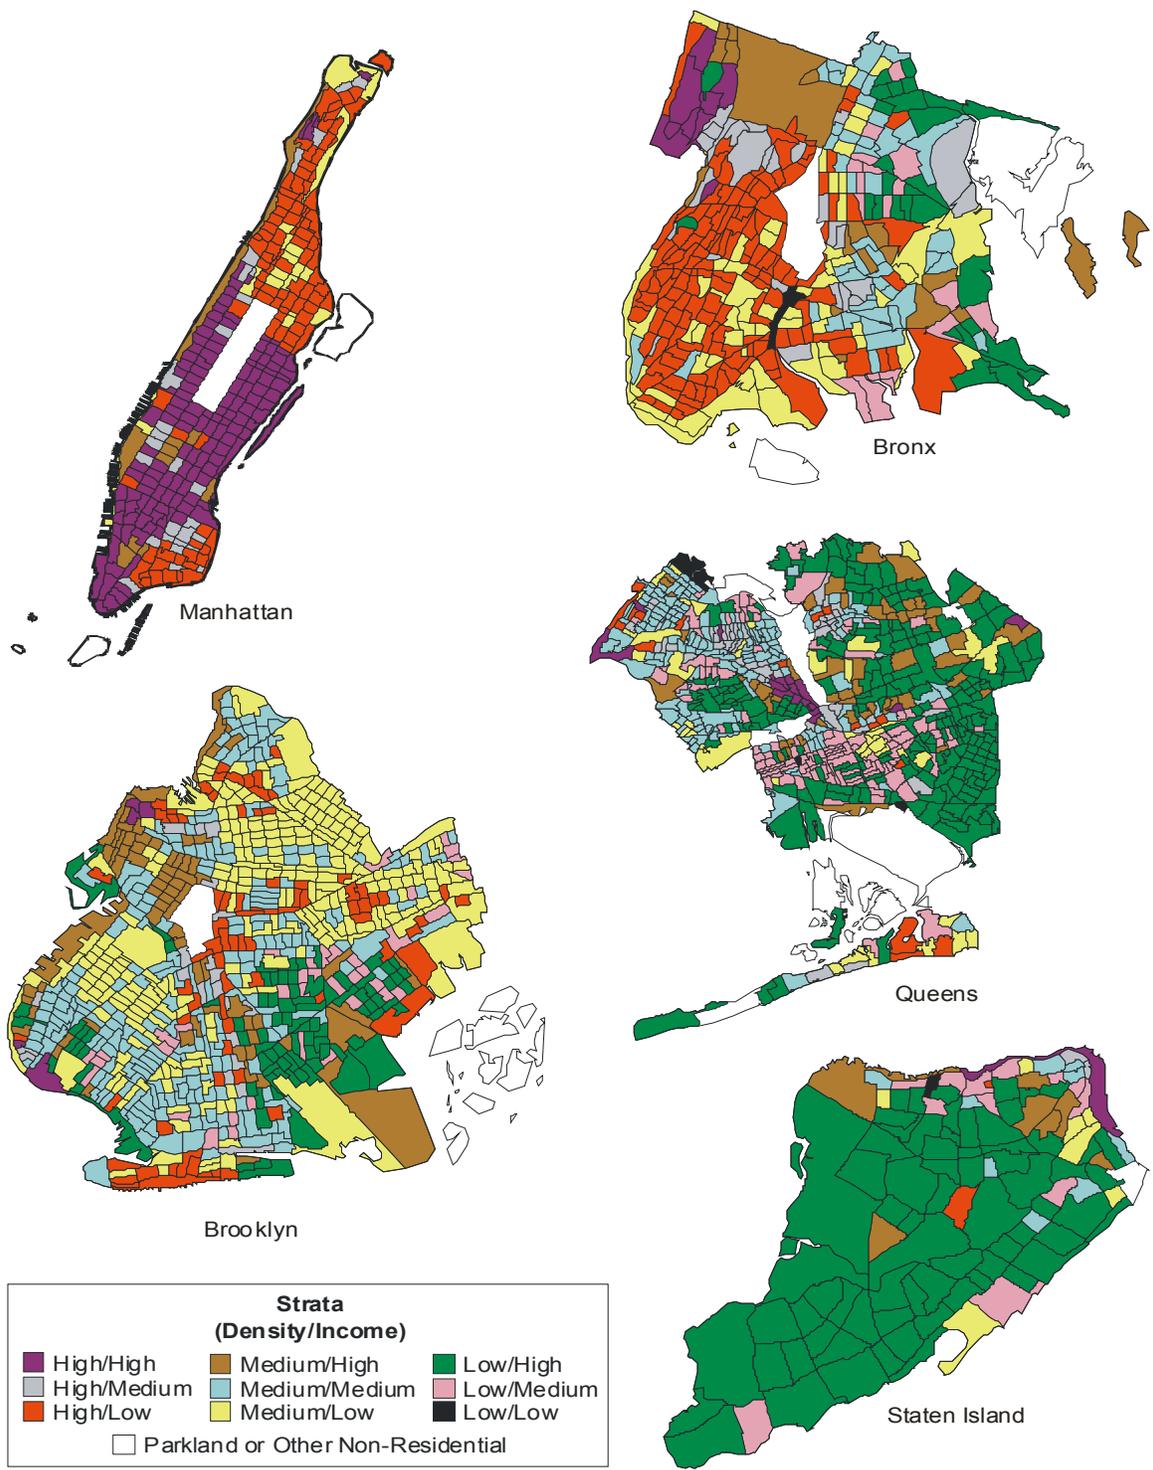

Figure 2-20
Borough Census Tracts by Housing Density and Income Strata (Color)

It is important to note that the boundaries of the Sanitation Districts, the District Sections, and the census tracts do not coincide, as shown in Figure 2-21.

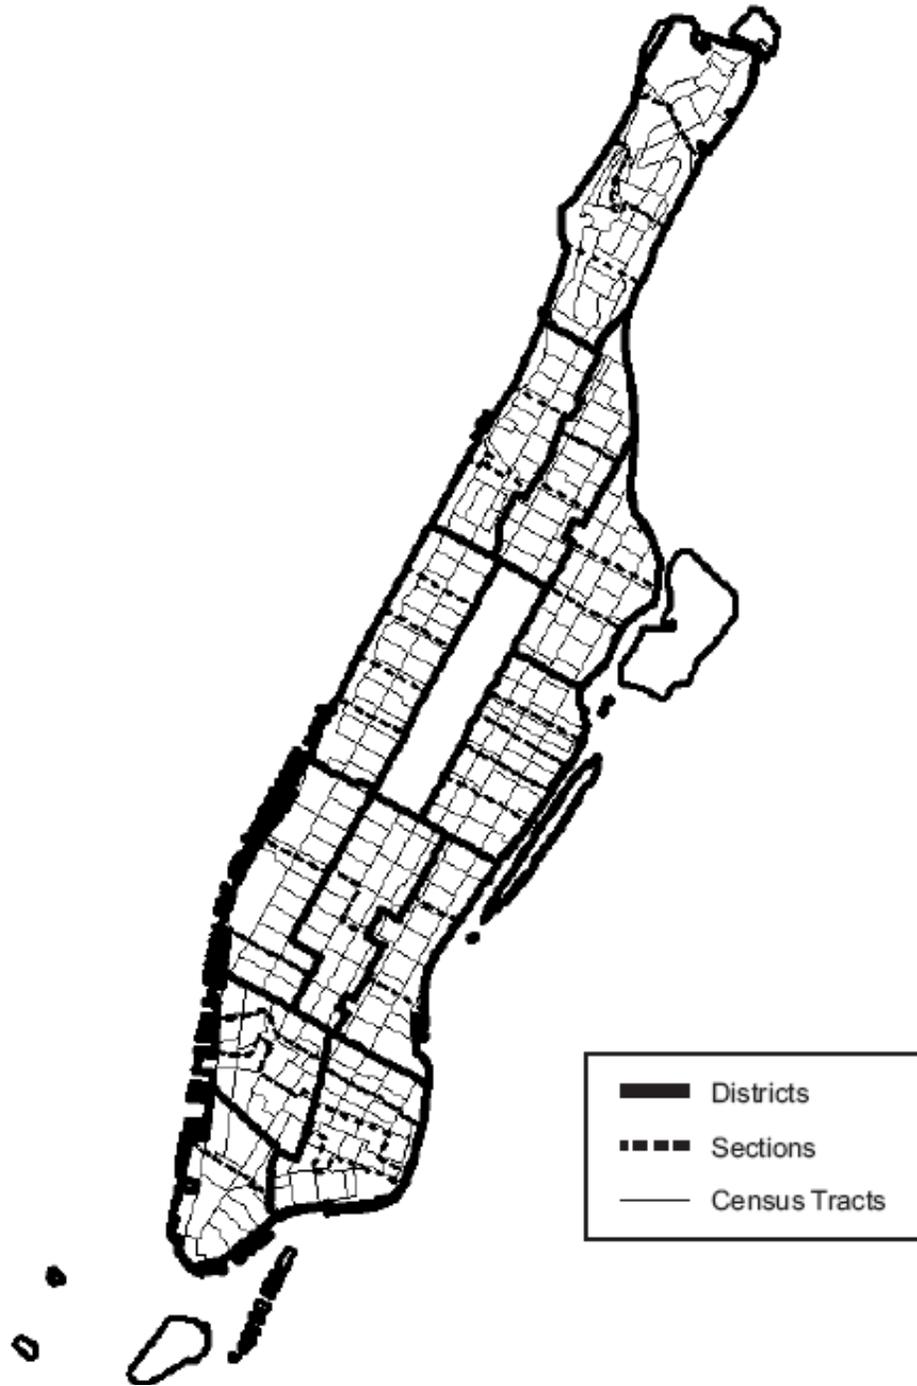

Figure 2-21
Manhattan Sanitation Districts, Sections and Census Tracts (Grayscale)

This presented a challenge because in most cases, the census tracts within a District or District Section represented multiple strata, as shown in Figure 2-22.

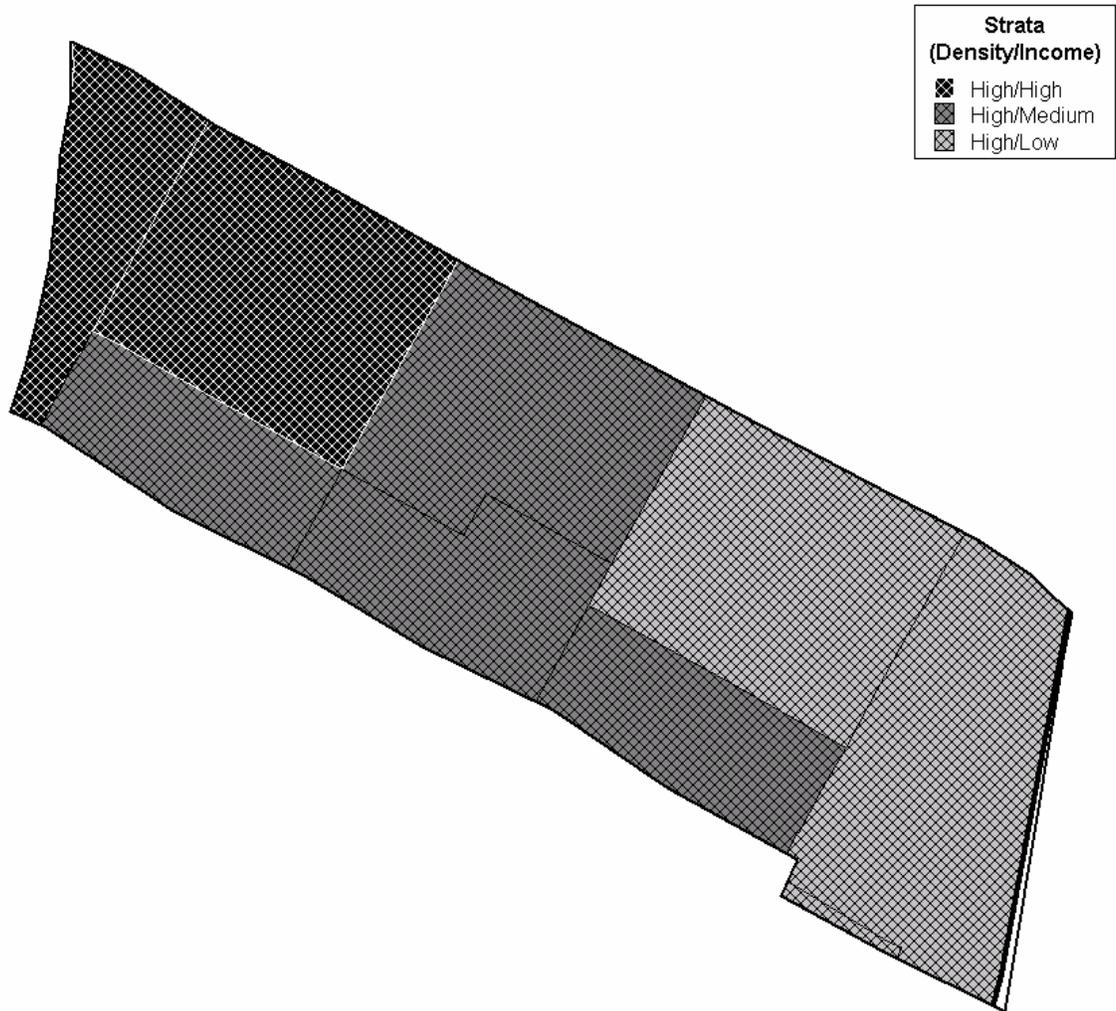

Figure 2-22
Manhattan Sanitation District 3, Section 4 with Multiple Density/Income Strata

The purpose of mapping the density/income strata was to identify refuse and recycling collection routes collecting from a single stratum. Because of the heterogeneous demographics in most of the Sanitation District Sections, it was difficult to find collection routes from a single stratum. However, there were areas where several census tracts in the same strata were adjacent to one another, as shown in Figure 2-23. These were the areas that held the most promise for finding collection routes within a single stratum.

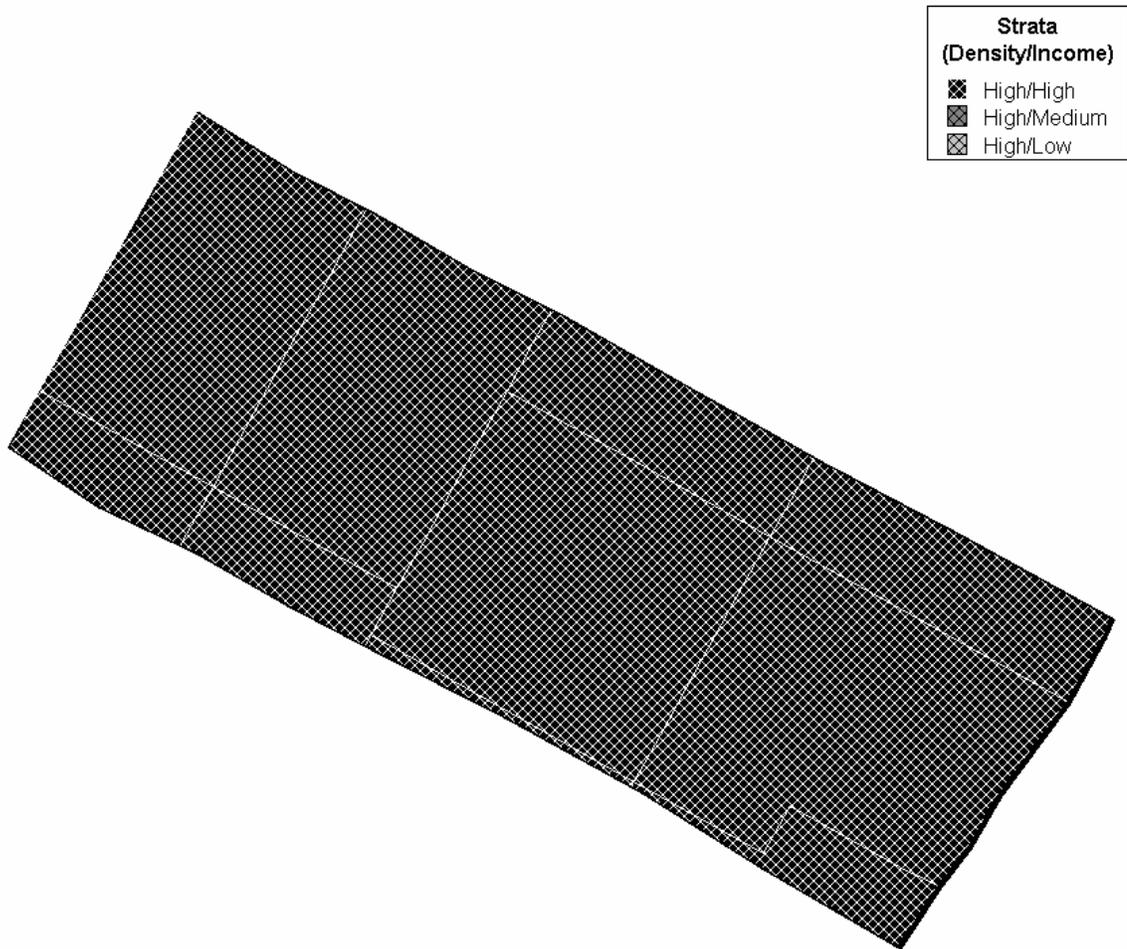

Figure 2-23
Manhattan Sanitation District 8, Section 2 with a Single Density/Income Stratum

As Figure 2-23 shows, Manhattan District 8, Section 2 consists only of the high density/high income strata. The homogeneity of strata means that all collection routes in this District Section fall within the high density/high income stratum.

2.1.3.2.3 Selecting WCS Sampling Units

The explanation of how sampling units were selected for the WCS involves the use of the four terms defined below:

- Collection Route is a set of streets and blocks used to describe the residences from which refuse or recycling will be collected and the days of the week on which collection takes place.

- **Pure Route** is a collection route that covers only census tracts from a single Housing Density/Income Stratum. Manhattan District 8, Section 2, Route 1 is an example of a pure route that includes only census tracts in the High Density/High Income stratum.
- **Route Occurrence** is a single instance of a Pure Route being collected. For example, Manhattan District 8, Section 2, Route 1 on Monday, August 15, 2005 is one Route Occurrence.
- **Universe of Route Occurrences** is the listing of all Route Occurrences from a single stratum for a specific period of time, such as a 3-week Sorting Period.

In developing the Sample Plan, it was decided to use existing collection routes, rather than create special routes. Developing special routes would have involved assigning DSNY trucks and crews to specific areas on specific days, as well as re-routing the trucks and crews that were normally assigned to those areas on those days. The cost of developing and implementing special collection routes for the WCS was determined to be prohibitive and would have severely disrupted normal DSNY collection operations citywide, causing inconvenience to many residents. Therefore, only existing collection routes were used.

Most DSNY collection routes serve areas larger than a single census tract. As the maps in Figures 2-3 through 2-20 show, the census tracts for the nine strata are scattered throughout the City. However, there are some areas where a group of census tracts from the same strata are adjacent to one another. In some of these cases, it was possible to identify pure routes. Given the small number of census tracts in the low density/low income strata, the dispersion of those census tracts, and the small number of residents in those census tracts (fewer than 3,000), it was decided to eliminate this strata from the WCS and focus resources on the remaining eight strata³.

Working with the maps of census tracts by strata, DSNY Collections Bureau developed a list of pure routes. As noted above, Manhattan District 8, Section 2, Route 1 is a pure route for the High Density/High Income stratum. Refuse is collected on this route three times per week, on Monday, Wednesday, and Friday. During the 3-week Summer Sorting Period, there were eight instances of refuse being collected on this route, or eight Route Occurrences.

For each pure route within a single Housing Density/Income stratum, a list of Route Occurrences was compiled. The Route Occurrences from all pure routes within the stratum comprised the universe of Route Occurrences from which the sampling units of refuse and recycling for that stratum were selected.

Prior to each seasonal Sorting Period, the universe of Route Occurrences was developed using a list of seasonal routes provided by DSNY. The Route Occurrences to be sampled were randomly selected from the universe of Route Occurrences using a random number

3 The low density/low income census tracts were in fact probably an artifact of mapping (i.e., large empty tracts of land surrounded by a few medium or high density areas of housing).

generator. If a Route Occurrence was selected for sampling, it remained on the list and might be selected again. If a Route Occurrence was selected twice, two sampling units would be taken from the truck collecting that route on that day. For strata with a large number of pure routes and Route Occurrences, taking multiple samples from a single route was unusual. For strata with a small number of pure routes and Route Occurrences, multiple samples from a single truck were more common. Because the sampling unit is a fixed amount of refuse (200 pounds to 300 pounds) or recycling (100 pounds to 150 pounds), a single truck can hold multiple sampling units and, if selected randomly, each sampling unit has an equal opportunity to be included in the study. For a full discussion of the statistical validity of taking multiple samples from a truck, see Volume 4, Appendix M.

Table 2-7 shows the number of randomly selected sampling units for the PWCS and each season of the WCS.

**Table 2-7
Sample Units for Each Season by Stream and Strata**

(1) Street Basket routes were not broken down by density/income strata. Street baskets were not assessed in the PWCS.

The sampling plans for both the PWCS and the WCS provide an estimate of the composition of refuse and recycling at the citywide level. However, the PWCS was specifically designed to provide a citywide composition estimate, using waste collection data from each of the City’s five boroughs as a basis for sampling. The WCS was designed to provide a composition estimate using waste collection data from eight housing density and income strata. By design, these strata encompass the entire residential population of New York City. These eight strata composition estimates were then aggregated, using waste generation data, to produce a citywide estimate of waste composition (Section 2.2.6).

The PWCS also acted as a methodological check for the full four season WCS. Table 2-8 compares the citywide estimates of the major **Material Groups** for Refuse, Paper, and MGP in the PWCS and the WCS. The similarity in results provides evidence that the sampling methodology used in the WCS waste composition research is sound. Remarkably consistent results were achieved at the citywide level across two studies, using two very different samples bases.

The WCS was not designed to produce statistically significant waste composition results by borough, only for the eight density and income strata that comprise the City’s demographic variation at a 90 percent level of confidence with + 7.5% for the major Material Groups. Using these same data, it was possible to calculate the results by borough, although the confidence intervals for these results are wider than for the strata-specific results (Volume 1, Section 4.4, Tables 1-119 through 1-123).

**Table 2-8
Comparison of PWCS and WCS Composition Estimates for Major Material Groups**

(1) The sum of values may not add to the total shown due to rounding.

2.2 Planning for Waste Generation Estimates

Generation rates refer to the average amount of Refuse, MGP, Paper and Waste set out for collection by a household (or person) over a given period of time. Generation rates were developed for the PWCS and the WCS to quantify the amount of waste and provide tonnages estimates for each of the materials in the composition figures. In addition, the WCS generation rates were calculated to weight strata generation estimates in order to develop citywide composition estimates.

2.2.1 PWCS Generation Rates Jurisdiction

The PWCS generation rates were calculated for each of the City's five boroughs. The calculation involved dividing the annual amount of waste (Refuse, MGP, and Paper) collected in each borough, from data provided by DSNY, by the population and the number of households in each borough, using U.S. Census Data.

2.2.2 WCS Generation Rates Jurisdiction

The WCS generation rates were calculated for each of the eight Density and Income Strata. To calculate generation rates for the WCS it was necessary to use information from three different jurisdictions within the City.

- The largest of these are the 59 Sanitation Districts, which are the same as the City's 59 Community Districts. Information on population and households for these districts was available from the Department of City Planning which maps U.S. Census Data onto these boundaries. This information is available on the Department of City Planning website at <http://www.nyc.gov/html/dcp/html/lucds/cdstart.shtml>.
- The second jurisdiction is the Sanitation District Section. There are 230 Sanitation District Sections, administrative jurisdictions used by DSNY. Complete information on population and households is not available at this level.
- The third jurisdiction is the census tract which is a small, relatively permanent subdivision used by the U.S. Census Bureau to present census data, such as population and households.

Table 2-9 shows the number of Sanitation Districts, District Sections, and Census Tracts by borough in the City.

**Table 2-9
Sanitation Districts, Sections and Census Tracts in New York City**

Borough	Sanitation Districts	District Sections	Census Tracts
Manhattan	12	40	296
Brooklyn	12	33	355
Bronx	18	77	783
Queens	14	66	673
Staten Island	3	16	110
Total	59	232	2,217

Although the DSNY maintains a record of collection tonnages by Sanitation District and District Section, it does not provide tonnage data at the census tract level.

2.2.3 PWCS Generation Rate Calculations

DSNY compiles weekly data on tons collected for each of the 59 Sanitation Districts. By summing the number of tons collected in a borough and dividing by that borough's population (for the per capita rate) or the number of households (for the per household rate), the weekly generation rate of that borough was calculated.

2.2.4 WCS Generation Rate Calculations

As discussed in Section 2.2, WCS generation rates were developed to weight strata composition estimates so they could be aggregated into a citywide composition estimate.

To calculate the WCS generation rates for the eight density/income strata, four types of information were used:

1. The average tons of residential Refuse, MGP, and Paper collected per week by DSNY. The DSNY provided this information for each of the City's 230 Sanitation District Sections for each season. For the purposes of this planning, the following months were used for each season:
 - Fall – September, October, November of 2004;
 - Winter – January, February, March of 2005;
 - Spring – April, May, June of 2005; and
 - Summer – July, August, September of 2005.

2. The reported population and the number of households for the 2,217 census tracts in the City. This information for the Year 2000 is available from the U.S. Census Bureau.

3. The strata assigned to each Census Tract in the City. In developing the WCS Residential sampling plan, each census tract in the City was assigned to one of nine strata, as described above⁴.
4. The reported population and number of households in the City for each of the City's 59 Sanitation Districts.

Developing the WCS generation rates by strata involved an eight-step process.

Step 1: A map of the City was prepared, showing Density/Income strata for each of the City's 2,217 census tracts. This map was prepared as a part of the development of the WCS residential sampling plan. For example, Figure 2-24 shows the Density/Income strata for each of the 296 census tracts in Manhattan.

4 The city was divided into nine house density/income strata. Only eight of the nine strata were analyzed in this study due to the limited number of areas, households, and population in the Low Density/Low Income strata.

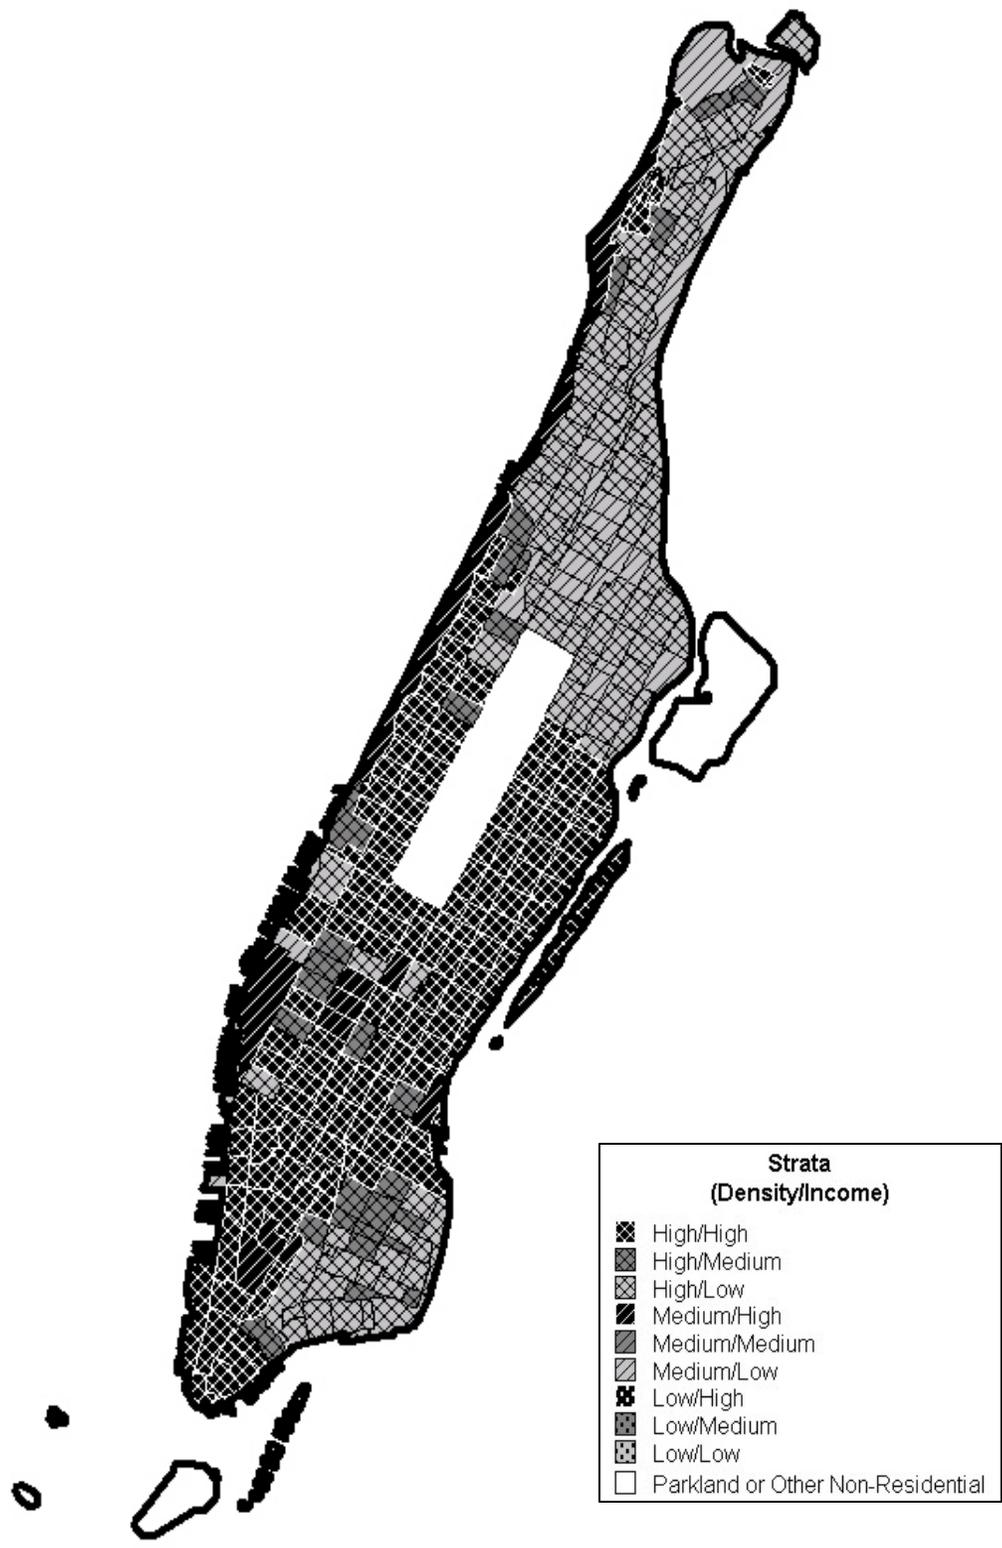

Figure 2-24
Manhattan Census Tracts by Density/Income Strata

Step 2: The Sanitation Districts and District Sections were superimposed on census tract maps. When the borders for the Sanitation Districts and Sections were placed over the census tracts, it became clear that the boundaries for census tracts and the boundaries for Sanitation Districts and District Sections are distinct from each other. For example, Manhattan District 3 contains four District Sections, as shown in Figure 2-25.

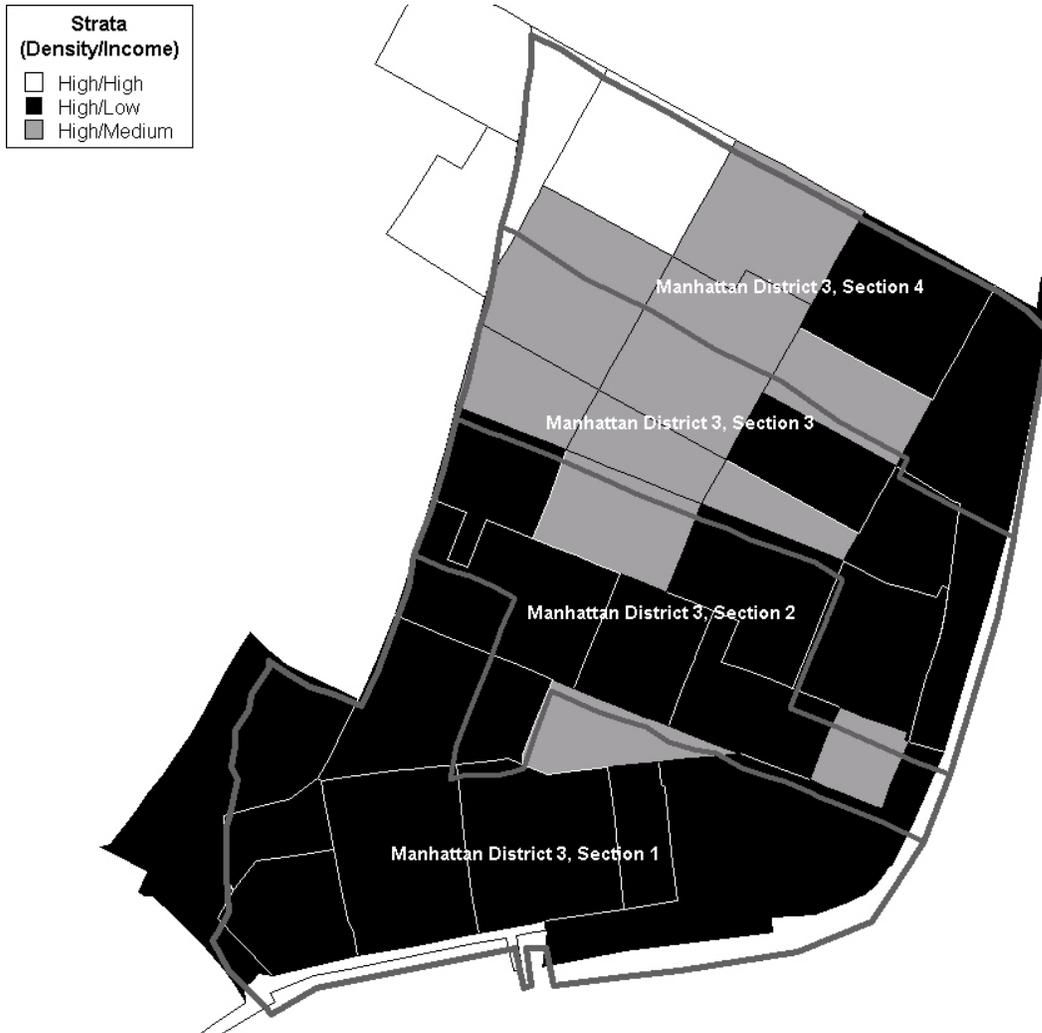

Figure 2-25
Manhattan District 3 Census Tracts by Housing Density and Income Strata (Grayscale)

One of these District Sections, Section 4, contains all or part of eight census tracts. Note that the census tracts within Manhattan District 3, Section 4 include three different density/income strata.

Step 3: The geographic center point of each census tract was determined. The census tract was then “assigned” to the District Section in which the geographic center point resided. As Figure 2-26 shows, Manhattan District 3, Section 4 includes all, or part of, eight census tracts with the geographical center point of each census tract indicated by a star. Although a significant portion of census tracts 32 and 38 are within Manhattan

District 3, Section 4, their geographical center points are in Manhattan District 3, Section 3. So census tracts 32 and 38 were assigned to Manhattan District 3, Section 3.

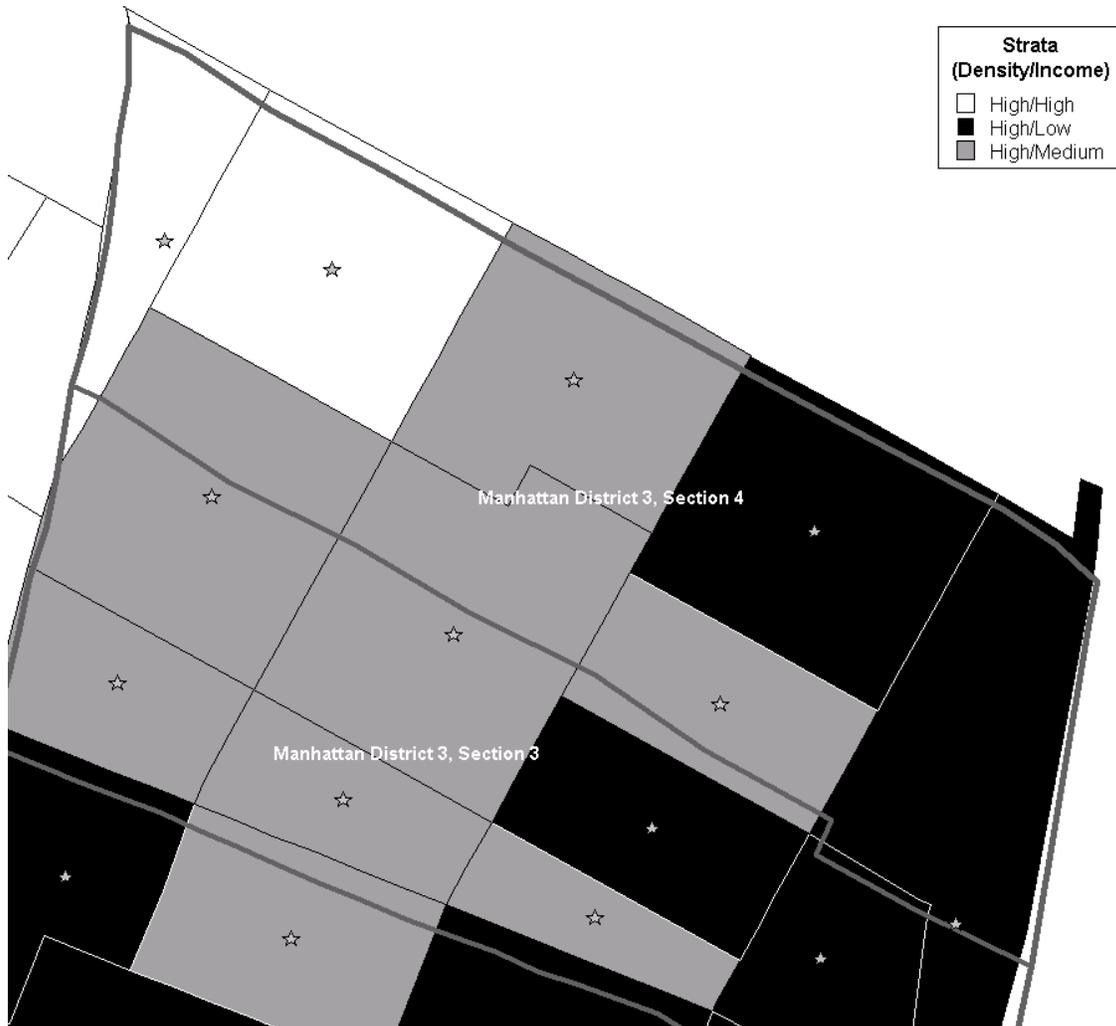

Figure 2-26
Manhattan District 3

Following this procedure, the six census tracts with their geographic centers in Manhattan District 3, Section 4 were assigned to Manhattan District 3, Section 4. They included census tracts 42, 40, 34, 28, 26.02 and 24.

Step 4: The reported number of households in the census tracts assigned to Manhattan District 3, Section 4 were added together, as shown in Table 2-10. At this point in the procedure, all households in the census tracts are included in the estimate for Manhattan District 3, Section 4, even though a portion of a census tract may be outside the Section. For example, all the households in census tract 24 are included in the estimate for Manhattan District 3, Section 4, although part of census tract 24 is in Manhattan District 3, Section 3.

Table 2-10
Estimated Households in Manhattan Sanitation District
3, Section 4

Census Tracts	Households ⁽¹⁾
42	1,880
40	4,698
34	3,967
28	3,136
26.02	1,836
24	<u>1,773</u>
Total	17,290

(1) Based on Year 2000 Census Data.

As Table 2-10 shows, the estimated number of households in Manhattan District 3, Section 4 was 17,290.

Step 5: Step 4 was followed for each Section in a given District and all the households for all the Sections in a given District were added together, as shown in Table 2-11. This was the estimate based on census tracts.

Table 2-11
Estimated Households in Manhattan Sanitation District 3

Section	Households ⁽¹⁾
1	20,816
2	13,328
3	19,930
4	<u>17,290</u>
Total	71,364

(1) Number of households based on assigning census tracts to the Section in which the geographic center point of the census tract resides.

Step 6: To check the accuracy of the estimate, the estimated number of households in the District developed for generation rate planning were compared with the number of households reported by the NYC Department of City Planning for that District.

For example, the NYC Department of City Planning reported that there were 72,681 households in Manhattan District 3. This is within 1.8 percent of the 71,364 households estimated in Table 2-11. If the two figures were within 5 percent of each other, the procedure was determined to be a reasonable method of estimating households by Section for this District.

This procedure was applied to each of the City’s 59 Sanitation Districts for both households and population. Forty-two of the City’s 59 Sanitation Districts met the “5 percent” criterion. For the other 17 Districts, further analysis was necessary.

Step 7: For the 17 Districts that did not meet the “5 percent” criterion, the analysis was continued.

This additional analysis involved assigning a percentage of the households in a given Section to an adjacent Section. If the difference between the estimated number of households in a District and the number of households reported by the NYC Department of City Planning was greater than 5 percent in a given Sanitation District, then the households in census tracts straddling District boundaries were proportioned between the two Districts based on a visual estimate of the census tract’s land area in each District. The estimated number of households was then recalculated. This procedure was repeated for other adjoining Districts until the estimated number of households was within 5 percent of the number of households in the Sanitation District, as reported by the NYC Department of City Planning⁵. For example, as shown in Figure 2-27, the initial estimate for number of households in Queens Districts 3 and 4 did not meet the 5 percent criterion. The estimated number of households for District 3 was 5.09 percent lower than the number reported by the NYC Department of City Planning. The estimated number of households for District 4 was 6.26 percent higher than the number reported by the NYC Department of City Planning.

5 Three exceptions exist. The difference between the estimated number of households and the number of households reported by DSNY was greater than 5 percent in the following Districts: (1) Brooklyn District 12, a difference of 5.98 percent; (2) Brooklyn District 6, a difference of 16.84 percent; and Manhattan District 1, a difference of 7.86 percent. Repeated attempts could not reconcile these differences in an accurate way. The estimate used, despite the fact that they exceeded the 5 percent criterion, were 56,287 households for Brooklyn District 12; 47,301 households for Brooklyn District 6; and 19,444 households for Manhattan District 1.

**Figure 2-27
Queens Districts 3 and 4**

By allocating the number of households in the Sections straddling the District boundaries proportionally to their land area and recalculating the number of households, the estimated number of households in District 3 and the number of households in District 3 reported by the NYC Department of City Planning were within 0.96 percent of each other. The estimated number of households and the number of households reported by the NYC Department of City Planning in District 4 were within 0.90 percent of each other.

After Steps 6 and 7 were carried out, an estimate of the number of households and population for every census tract, or portion of census tract in every Section in the City was available. Since each Census tract is uniquely identified as belonging to a single Density/Income strata, this means that the number of households (and population) for each strata in every Sanitation Section is available.

Step 8: A regression analysis for each of the strata was performed. As noted above, every census tract in the City was placed into one of nine strata. As a result of the previous steps, an estimate of the population and the number of households for each stratum in each Section of the City had been determined.

Of the 230 Sections in the City, there are 43 Sections which contained census tracts from only one stratum. For example, Manhattan District 8, Section 2 contained only census tracts from the High/High stratum. The remaining 187 Sections contained census tracts

from multiple strata. Figure 2-27 shows that Manhattan District 3, Section 4 has census tracts from three different Density/Income strata: High/High, High/Medium and High/Low.

A regression equation was used to determine the generation rate for each stratum. The regression equation is a statistical technique used here to estimate an average “tons per household” (or “tons per capita”) value for each stratum. A simplified example can illustrate how the regression equation was used.

Example: Assume a case in which there are only three Sections and two strata.

- Section 1 has 100 households in strata A and 400 households in strata B and discards 190 tons of waste per year.
- Section 2 has 300 households in strata A and 200 households in strata B and discards of 220 tons of waste per year.
- Section 3 has 500 households in strata A and 800 households in strata B and discards 500 tons of waste per year

In the formula used to estimate the average number of tons discarded per household for each strata, X1 is the average number of tons discarded by households in strata A and X2 is the average number of tons discarded by households in strata B.

Because households in any given Section may not discard the average amount of waste for their stratum, there will be a difference between the generation based on the estimated average generation rates and the total generation reported by DSNY. This difference is represented by the symbol ϵ (epsilon). The formula looks like this:

$$\text{Section 1 waste tons} = (100 * X1) + (400 * X2) + \epsilon = 190$$

$$\text{Section 2 waste tons} = (300 * X1) + (200 * X2) + \epsilon = 220$$

$$\text{Section 3 waste tons} = (500 * X1) + (800 * X2) + \epsilon = 500$$

This regression equation is solved through the application of a statistical technique known as “Least Square Method”. In this example, X1 = 0.49 and X2 = 0.33 (tons per household per year) are the estimates which best fit the data. The resulting estimates means that, for the two strata in the example, strata A has a generation rate of 0.49 tons per household per year and strata B has a generation rate of 0.33 tons per household per year.

In the actual analysis, generation rates for both population and households were estimated for Refuse, MGP, Paper and Waste for each of the eight strata using data from 227 of the 230 Sanitation Sections. Three Sanitation District Sections were excluded because they were non-residential areas.

2.2.5 Generation Rate Estimates

WCS generation rates were calculated on both a per capita basis and a per household basis for the eight strata. Using population, in per capita generation rates, is a widely accepted metric for reporting and comparing generation rates. However, waste is generated on a household basis and per capita generation rates do not account for differences in household size. Therefore, the WCS generation rates are reported on both a per capita and a per household basis. Table 2-12 presents the PWCS generation rates for the five boroughs and Table 2-13 presents the WCS generation rates for each of the eight strata.

**Table 2-12
PWCS Generation Rates**

Borough	Per Capita				Per Housing Unit			
	Refuse	Paper	MGP	Waste	Refuse	Paper	MGP	Waste
Manhattan	0.35	0.06	0.03	0.45	0.68	0.12	0.06	0.86
Bronx	0.39	0.03	0.03	0.45	1.06	0.08	0.08	1.21
Brooklyn	0.19	0.02	0.02	0.23	0.51	0.06	0.04	0.61
Queens	0.20	0.03	0.02	0.24	0.55	0.07	0.05	0.66
Staten Island	0.60	0.08	0.05	0.73	1.62	0.23	0.13	1.97

**Table 2-13
WCS Generation Rates**

Density/Income Strata	Per Capita				Per Housing Unit			
	Refuse	Paper	MGP	Waste	Refuse	Paper	MGP	Waste
High Density/High Income	0.34	0.09	0.04	0.47	0.53	0.14	0.06	0.74
High Density/Medium Income	0.27	0.03	0.02	0.31	0.65	0.08	0.05	0.78
High Density/Low Income	0.31	0.01	0.02	0.34	0.84	0.04	0.05	0.92
Medium Density/High Income	0.28	0.08	0.03	0.39	0.54	0.17	0.07	0.78
Medium Density/Medium Income	0.33	0.05	0.03	0.41	0.85	0.13	0.09	1.06
Medium Density/Low Income	0.35	0.02	0.02	0.40	1.02	0.06	0.07	1.15
Low Density/High Income	0.44	0.07	0.04	0.56	1.25	0.21	0.12	1.58
Low Density/Medium Income	0.36	0.02	0.03	0.42	1.20	0.09	0.11	1.40

The complete set of generation rate results is presented in Volume 1, Tables 1-12, 1-13, and 1-14 of the Final Report.

2.2.6 Generation Rates and Citywide Composition Estimates

Because the WCS was designed to estimate waste composition by housing density and income strata (and not the City as a whole), it was necessary to use the WCS generation rates to calculate citywide waste composition estimates. As noted in Steps 1 and 4 (Section 2.2.4), generation rates were calculated using actual weekly tonnages of refuse, MGP, and Paper collected and the population and households at the Sanitation District level provided by DSNY. This information was provided by Sanitation District for the entire City.

To calculate the percentage of newspaper in the waste (refuse and recycling) stream at the strata-level and citywide involved aggregating and weighting seasonal data.

1. The seasonal contribution of each stratum was calculated by dividing the annual generation of the stratum by the seasonal tonnage of that stratum. For example, the sum of the four seasons of waste generated by the High Density/High Income stratum was 31,279 tons. The amount generated during the summer was 7,357 tons. The summer contribution to this stratum’s annual generation is 23.5 percent. That is, 23.5 percent of the waste generated annually by the High Density/High Income stratum was generated in the summer. The four seasonal contributions for the High Density/High Income strata were:

Season	Tons ⁽¹⁾	Percent ⁽²⁾
Fall 2004	8,153	26.17%
Winter 2005	7,843	25.1%
Spring 2005	7,924	25.3%
Summer 2005	<u>7,357</u>	23.5%
Total	31,278⁽³⁾	

(1) Tables 1-37, 1-42, 1-47, and 1-52.

(2) Seasonal percentage contribution of annual generation.

(3) The annual amount of waste generated by the High Density/High Income strata.

This procedure was carried out for each stratum over each season.

2. To calculate composition for each material, the seasonal percentage of each material was multiplied by the seasonal contribution to the stream of waste. For example, the annual percentage of newspaper in the waste for the High Density/High Income strata, each seasonal contribution of the stratum was multiplied by the seasonal estimate for newspaper. The estimate percentage of newspaper for the High Density/High Income strata for summer was 14.51 percent. Multiplying 14.51 percent by 23.5 percent results in a summer estimate of 3.41 percent. Adding the four seasonal contributions provided an estimate of the annual percentage of newspaper in the High Density/High Income strata’s waste of 13.43 percent.

Season	Percent ⁽¹⁾	Composition ⁽²⁾	Seasonal Contribution
Fall 2004	26.17%	12.7%	3.3%
Winter 2005	25.1%	11.5%	2.9%
Spring 2005	25.3%	15.1%	3.8%
Summer 2005	23.5%	14.5%	<u>3.4%</u>
Total			13.43% ⁽³⁾

(1) Percent contribution to annual generation.

(2) Tables 1-37, 1-42, 1-47, and 1-52.

(3) The annual amount of newspaper in the waste generated by the High Density/High Income strata, Volume 1, Section 1, Table 1-21.

- To calculate citywide estimates, a similar procedure was used. The annual citywide tonnages were divided by the seasonal tonnages. For example, the sum of the four seasonal citywide waste tonnages was 258,411 tons. The citywide tonnage during the summer was 65,108 tons. The summer contribution to this stratum's annual generation is 25.2 percent. That is, 25.2 percent of the waste generated citywide for the year was generated in the summer. The four seasonal citywide tonnages were:

Season	Tons ⁽¹⁾	Percent ⁽²⁾
Fall 2004	66,026	25.5%
Winter 2005	59,681	21.1%
Spring 2005	67,569	26.2%
Summer 2005	<u>65,108</u>	25.2%
Total	258,411 ⁽³⁾	

(1) Tables 1-24, 1-25, 1-26, and 1-27.

(2) Seasonal percentage contribution of annual generation.

(3) The annual amount of waste generated citywide. Add text re: rounding.

- To calculate the citywide composition of each material, the percentage of seasonal contribution to the stream was multiplied by the seasonal percentage estimate of the material. For example, to estimate the annual citywide percentage of newspaper in waste, the seasonal contributions of waste were multiplied by the seasonal composition estimates for newspaper.

Season	Percent ⁽¹⁾	Composition ⁽²⁾	Seasonal Contribution
Fall 2004	25.5%	7.5%	1.9%
Winter 2005	23.1%	7.8%	1.8%
Spring 2005	26.2%	7.6%	2.0%
Summer 2005	25.2%	7.3%	<u>1.8%</u>
Total			7.5⁽³⁾

(1) Percent contribution to annual generation.

(2) Tables 1-24, 1-25, 1-26, and 1-27.

(3) The annual percentage of newspaper in the waste citywide, Volume 1, Section 1, Table 1-32.

It is important to understand that the tonnages and households on which these citywide composition estimates were based included the entire City, but the generation rates applied to only eight strata. Because the Low Density/Low Income strata represented a relatively small portion of the City, it was dropped from the study (Section 2.1.3.2.3).

The use of citywide data (tonnages, population and households) from DSNY and the data for eight, rather than nine, strata make the generation calculations more complex. For example, if the average weekly generation rate for the High Density/High Income strata of 7,819.49 tons (Table 1-21, Volume 1, Section 1) is multiplied by 52 weeks and divided by the number of households, 538,713 (Table 1-5, Volume 1, Section 1), the result is 0.75 tons per household per week.

However, the weekly generation rate for the High Density/High Income strata, as shown in Table 1-13 (Volume 1, Section 1) is 0.74 tons per household per week. The reason the generation rate shown in Table 1-13 is slightly lower than the generation rate calculated from Table 1-21 is that Table 1-13 used an analysis that included all nine strata while the analysis used in Table 1-21 was applied to eight strata.

NYC Waste Characterization Study
Final Report, Volume 2

**Section 3: Planning for the Street Basket
Waste Study**

Section 3 Planning for the Street Basket Waste Study

3.1 Sampling Plan for the Street Basket Waste Study

The goal of the Street Basket Waste Study was to estimate the composition of street basket waste from dedicated DSNY street basket routes. Street basket waste is collected on some DSNY collection routes that also collect residential waste, as well as institutions such as schools and churches. Dedicated street basket routes are those routes that collect only street baskets.

Because dedicated street basket routes collected only a portion of all the street baskets in the City and because street basket trucks collect from baskets multiple times daily, it was not feasible to calculate a generation rate for street baskets.

The sampling plan for street basket waste addressed the same three issues addressed in the Residential Study: (1) the number of samples to be selected; (2) the method for selecting routes; and (3) the weight of each sample.

3.1.1 Sample Number

According to the DSNY, there were about 2,700 dedicated street basket collection routes in the City during the four WCS Sorting Periods. Each of the City's five boroughs had at least one dedicated street basket route per season. Collections on these dedicated routes might occur several times a day and several days per week. The "universe" of street basket routes from which samples were selected was the product of the approximately 2,700 dedicated routes and the number of collections per week. For example, during the three-week Summer Sorting Period, there were 358 dedicated street basket routes for Manhattan. The number of times these street baskets were collected on these routes during the Sorting Period was 836. The term "route occurrence" is used to describe each individual collection event. In the Summer Sorting Period, there were 836 route occurrences.

For the approximately 2,700 dedicated routes during the WCS, there was a universe of over 7,300 route occurrences from which street basket samples could be taken over the four Sorting Periods. Table 2-14 shows the number of dedicated street basket routes in each borough for each of the four seasons of the WCS and the universe of routes from which samples of the street basket waste could be acquired.

Table 2-14

To determine the number of samples needed, R. W. Beck analyzed street basket composition data from the 2002 Seattle Litter Composition Study (the “Seattle Study”). The variability of the street basket waste in the Seattle Study indicated that 200 samples of street basket waste would be expected to achieve a 90 percent confidence level for a confidence interval of ± 7.5 percent for the four major classes of materials: paper, plastic, metal, and glass. It was decided to divide the sampling and sorting evenly across the four seasons, analyzing 50 street basket samples per season (Table 2-1 in Volume 2, Section 2).

3.1.2 Street Basket Sample Selection

Each season, samples for the Street Basket Study were randomly selected from the universe of routes shown in Table 2-14. A random number generator was used to select the routes and the list of selected routes was then given to DSNY.

3.1.3 Sample Unit Weight

New York City does not have street basket recycling, so all material collected in street basket waste is refuse. A sample weight of 200 to 300 pounds, the industry standard for refuse samples (as discussed in Section 2.1.2.3.), was used for the street basket waste samples. The weight of the street basket samples sorted during the WCS is presented in Volume 4, Appendix H, Table H-12.

**NYC Waste Characterization Study
Final Report, Volume 2**

Section 4: Implementation of the Studies

Section 4 Implementation of the Studies

4.0 Introduction

For the purposes of this discussion, the implementation of the PWCS and the WCS has been divided into three areas:

1. Sampling, in which samples of refuse, recycling, and street basket waste were acquired;
2. Sorting, in which the samples of refuse, recycling, and street basket waste were separated into material categories; and
3. Data Analysis, in which the information from the sampling and sorting procedures was compiled and analyzed.

4.1 Sampling

The implementation of the PWCS and WCS sampling plans involved the logistics of the sampling procedure, the protocol for identifying the trucks collecting sample loads, and the protocol for sample acquisition.

4.1.1 Sampling Logistics

4.1.1.1 Sampling Sites

Samples of residential refuse and recycling and street basket waste were acquired at the following four facilities under contract to DSNY to receive refuse or recycling.

- **Harlem River Yards** is a transfer station owned and operated by Waste Management, Inc. and located at 132nd Street and Saint Anne Avenue in the Bronx. Samples of residential refuse and street basket waste from Manhattan, the Bronx and Queens were acquired at this facility.
- **Varick I** is a transfer station owned and operated by Waste Management, Inc. and located at 215 Varick Street in Brooklyn. Samples of residential refuse and street basket waste from Brooklyn and Staten Island were acquired at this facility.
- **The Shepherd Avenue Facility** is a Paper processing facility owned and operated by Metropolitan Paper and located at 877 Shepherd Avenue in Brooklyn. Samples of Paper recycling from all boroughs were acquired at this facility.
- **Hugo Neu** is an MGP processing facility owned and operated by Sims Hugo Neu (formerly Hugo Neu East) on Greenpoint Avenue in Long Island City, Brooklyn. Samples of MGP from all boroughs were acquired at this facility.

After samples from these facilities were acquired, they were taken to a different location for sorting (Section 4.2.2.1).

4.1.1.2 Sampling Schedule

There were two PWCS Sorting Periods and four seasonal WCS Sorting Periods. The dates these Sorting Periods took place are shown in Figure 2-28.

Sorting Period	Date
PWCS Refuse Sorting Period	May 15 to May 28, 2004
PWCS Recycling Sorting Period	June 7 to June 12, 2004
WCS Fall Sorting Period	October 18 to November 6, 2004
WCS Winter Sorting Period	March 8 to March 29, 2005
WCS Spring Sorting Period	May 9 to May 27, 2005
WCS Summer Sorting Period	August 1 to August 27, 2005

Figure 2-28
Dates of PWCS and WCS Sorting Periods

Collection of curbside residential refuse and recycling in the City takes place between 6:00 a.m. and approximately 11:00 a.m. each day, Monday through Saturday. The Sampling Plans (as discussed in Section 2) identified the collection routes from which samples were to be acquired. DSNY determined the specific trucks that would be collecting on those routes and arranged to have them deliver their loads to one of the four sampling sites. Collection took place during the day, after which trucks returned to their garage to await relay during the night shift. The trucks delivering sample loads arrived at the transfer stations/processing facilities between the hours of 12:00 midnight and approximately 6:00 a.m. the day after the waste was collected. Waste collected on Saturday morning was delivered to the sampling sites between 12:00 midnight and 6:00 a.m. Monday morning. Samples were acquired by the Sampling Teams during these six-hour periods.

4.1.1.3 Sampling Participants

The participants involved in the acquisition of samples included:

- The staff at each of the four sampling sites, including the Facility Manager, the equipment drivers, and others;
- The Sampling Team which consisted of a Director of Sampling, four Sample Managers and four assistants;
- The Project Team's Data Management Team that received, compiled, and disseminated information on sampling;

- DSNY **BWPRR** staff that assisted in directing traffic at facilities and provided a vital communications link between DSNY, the Sampling Team, and the facility staff; and
- DSNY Collections Bureau that identified the trucks from which samples were to be acquired and provided around-the-clock information on truck breakdowns and delays. In addition, DSNY Collections Bureau Supervisors checked with the BWPRR staff and Sampling Team about missing trucks or late deliveries.

The roles that each of these parties played in the sampling procedures is described in more detail in Sections 4.1.1.4 and 4.1.2.

4.1.1.4 Truck Number Transmission and Delivery of Samples

The Sampling Plans for the PWCS and the WCS identified the collection routes from which samples of Refuse, MGP, Paper and Street Basket Waste were to be acquired. Prior to each quarterly Sorting Period, the Project Team provided DSNY with the list of the routes to be sampled during that period. This list was based on the Sampling Plans described in Sections 2.1 and 3.1. Trucks were assigned to pre-selected sample routes by the District Supervisor early in the morning of each sample collection day.

Monday through Saturday during each Sorting Period, the DSNY Collections Bureau identified the specific trucks that would be collecting from the routes identified in the Sampling Plan. The list of these trucks, by truck number and the route, were faxed by the DSNY Collections Bureau to the Data Management Team each morning between 9:00 a.m. and 11:00 a.m. This list was checked, duplicated and disseminated to the participants in the sampling procedures, including the staffs at the four facilities, the DSNY Collections Bureau, the BWPRR staff and the Sampling Team. In addition, the Sampling Team brought extra hard copies of the Truck Number Forms to the facilities each night. An example of the forms used to transmit the truck numbers is shown in Table 2-15.

**Table 2-15
Forms Used to Transmit Truck Numbers**

This is a portion of the form supplied by DSNY to transmit truck numbers:

**New York City Department of Sanitation
Residential Waste Characterization Study - Phase
Winter Sampling Summary**

COLLECTION DATE	DELIVERY DATE	BOROUGH	DISTRICT	SECTION	ROUTE	SAMPLE TYPE	TRUCK NUMBER	DELIVERY LOCATION
Friday, 3/18/2005	Saturday 3/19/2005	Queens West	3	2	1	MGP	25CN-805	Hugo Neu Schiltzer

RESIDENTIAL WASTE CHARACTERIZATION STUDY - PHASE I - SUMMER**

REFUSE ROUTES

Delivery Schedule Tuesday, August 09, 2005

Date Refuse is Collected	Monday, August 08, 2005
Vendor for Delivery	Harlem River Yard
Delivery Date	Tuesday, August 09, 2005
Delivery Hours	Midnight - 8 am
Borough of Origin	Manhattan
Number of Deliveries	7

SELECTED REFUSE ROUTES

Borough	District	Section	Route	Truck Number
Manhattan	2	2	1	25CW143
Manhattan	2	3	2	25CU316
Manhattan	3	1	4	25CU082
Manhattan	6	3	1	25CW597
Manhattan	7	3	2	25CW179
Manhattan	7	3	3	25CW595
Manhattan	8	4	2	25CW562

The trucks collecting on the selected routes were diverted by DSNY to the appropriate sampling sites. When a truck with a sample load arrived at the facility, it was identified by the facility staff, the BWPRR staff or the Sampling Team, and directed to a designated area where the sample was acquired.

On a few occasions, trucks that were scheduled to deliver sample loads did not arrive, due to mechanical break-downs or other operational problems. Typically the Sample Manager or the BWPRR staff noted the missing truck and checked with the DSNY Collections Bureau. This information would also be communicated to the Director of Sampling by cell phone. In some cases, sample trucks were delayed because of break-downs and the Sampling Team waited until the truck arrived and then acquired the sample. In other cases, the sample truck could not make delivery and a replacement sample was used.

To provide a cushion for missed truck deliveries, the Project Team took “back-up” samples each season. The “back-up” samples were only sorted if the regularly scheduled sample load could not be delivered. In the WCS, back-up samples were necessary for Refuse, MGP and Paper for each stratum and for street basket waste. Typically two or three back-up refuse samples and one or two MGP and Paper samples were kept on hand for each stream and stratum. If, at the end of the Sorting Period, back-up samples were not sorted, they were disposed, as opposed to being sorted.

4.1.2 Sample Acquisition

When a truck with a sample load arrived at the transfer station/processing facility, it was directed to a designated area where the sample was acquired. Prior to the truck tipping its load the Sample Manager selected a portion of the tipped load at random. The Sample Manager randomly selected one quarter of the tipped load: right, left, front or rear. This selected portion was communicated to the driver of a front-end loader (“FEL”) who picked up the selected portion of the load in the FEL’s bucket. The FEL buckets at the sampling sites varied in size from six to 12 cubic yards.

The FEL’s bucket was then lowered so that the Sample Manager and his/her assistant could pull material from the bucket into 96-gallon carts. As the bucket was lowered, the Sample Manager randomly selected the section of the bucket from which the sample would be taken: right, left or center. The sample was taken from this area of the FEL bucket. In most cases, the density of the refuse required a 200 to 300-pound sample to be collected in two carts. Most recycling samples required only one cart.

Sample Managers found that some randomly selected portions sometimes included **bulk items**, such as large appliances, upholstered chairs, or bed frames. The presence of bulk items was a random occurrence because the portion of the tipped load was randomly selected. Because these bulk items were too large to put into a 96-gallon cart, they were manually set aside and weighed separately. The weight of the bulk item and a description of the item were recorded on the Sample Management Form. The bulk item was then returned to the tipping floor to be discarded. The weight of all bulk items was

incorporated into total sample weight and the sample's composition. The data was recorded when the sample was sorted and weighed at the sorting site. If, for example, the randomly-selected portion of the tipped load of refuse included a wooden bed, the bed would be weighed and the refuse in the cart would be weighed. If the bed weighed 50 pounds and the refuse in the cart weighed 160 pounds, the total weight of the sample would be 210 pounds. After weighing the bed, the Sample Manager would record the weight and a brief description of the bed on the Sample Management Form. The bed would be returned to the load of refuse at the transfer station and would not be transported to the sorting site. Only the cart with 160 pounds of refuse would be taken to the Sorting Site for sorting and weighing. The wooden bed would be included in the "Furniture" material category and the weight of the bed, 50 pounds, would be assigned to that material category on the Sample Detail Form (Section 4.3.3).

In some cases, the sampling plan called for acquiring multiple sampling units from a single truck. In these cases the first sample was acquired and then the entire process repeated, using the remaining portion of the tipped load. Bulk items that had been included in previous samples were excluded for subsequent samples. The rationale for taking multiple samples from a single truck is discussed in Section 4.1.2.1.

After the sample had been acquired, each cart was weighed to be sure the total weight of each sample met the minimum weight threshold. After the weight had been confirmed, the transfer station's FEL managed the remainder of the tipped load as it normally would in the course of facility operations.

A label showing the date the sample was acquired, sample number, a sample code and the truck number was attached to each cart. The Sample Manager also completed a Sample Management Form for each sampling unit. An example of the label attached to the cart is shown in Section 4.3.1, Figure 2-42. An example of the Sample Management Form is shown in Section 4.3.2, Figure 2-43.

After all samples to be acquired that day had been weighed and labeled, they were loaded on a truck and transported by the Sample Management Team to sorting sites (Section 4.2.2.1) where they were unloaded and positioned for sorting.

Tables 2-16, 2-17, and 2-18 summarize the acquisition of samples. Table 2-16 presents the number of samples targeted and acquired for the PWCS and the WCS, Table 2-17 presents the weights targeted and acquired, and Table 2-18, lists the number of samples and the average sample weights for the PWCS and the WCS.

Weather, operational changes, and human error produced a degree of uncertainty around the acquisition of the targeted number of samples each season. Therefore, back-up samples were acquired and, in some cases, sorted, to be sure a minimum number of samples were included each season. This is the reason there is some variation in the number of samples shown each season in the following tables.

Table 2-16
Number of Samples Targeted and Acquired ⁽¹⁾

Number of Samples Targeted						
Streams	PWCS ⁽²⁾	Fall	Winter	Spring	Summer	WCS
Refuse	200	400	400	400	400	1,600
Paper	100	80	80	80	80	320
MGP	100	320	320	320	320	1,280
Street Basket	-	50	50	50	50	200
Total	400	850	850	850	850	3,400

Number of Samples Acquired						
Streams	PWCS ⁽²⁾	Fall	Winter	Spring	Summer	WCS
Refuse	200	399	409	401	400	1,609
Paper	99	80	85	80	80	325
MGP	104	320	340	320	320	1,300
Street Basket	-	50	50	50	50	200
Total	403	849	884	851	850	3,434

(1) Based on the results of the PWCS, which showed that MGP samples were more heterogeneous than Paper samples, it was decided to target more MGP samples than Paper samples for the WCS. Heterogeneity of the population, in this case MGP, requires that more samples be drawn in order to obtain the same degree of accuracy.

(2) Street Basket samples were not collected during the Preliminary Waste Characterization Study.

(1) Street Basket samples were not collected during the Preliminary Waste Characterization Study.

4.1.2.1 Statistical Validity of Multiple Samples from a Single Truck

The purpose of the WCS was to characterize the waste from eight Housing Density and Income Strata. Underlying this purpose was the desire to ascertain whether waste from each of the eight strata share, or do not share, certain characteristics. That is, Refuse or Recycling from the Medium Density/Medium Income stratum has certain average traits and we wished to know whether these traits are measurably different from the average traits of Refuse or Recycling from, for example, the High Density/High Income stratum.

The sampling unit for the WCS is 200 to 300 pounds of Refuse (or 100 to 125 pounds of recycling), not a collection route. It has been assumed that the collection trucks completing each route are essentially full and of similar size. These full trucks are a convenient way to obtain the sampling units desired, and each truck holds many such sampling units. Therefore, when a Route Occurrence is randomly selected from the universe of Route Occurrences, just one sampling unit has been selected from that route and many more sampling units are still available from that same truck.

Throughout the WCS, sample selections were made in as random a fashion as practical. Route Occurrences were randomly selected from the universe of Route Occurrences for each stratum. The sampling units were randomly selected from the trucks that delivered the waste. In these ways, each sampling unit generated in the eight strata had an equal opportunity to be sorted and analyzed.

4.2 Sorting

The next step in characterizing waste for the PWCS and WCS was sorting the samples that had been acquired.

4.2.1 Sort Categories

Sampling units of Refuse, MGP, Paper and Street Basket Waste were sorted by material. The number and types of material categories were the basic units of the analysis and the building blocks used to describe the composition of the waste.

4.2.1.1 Material Groups and Categories

The materials into which waste was sorted changed during the course of the PWCS and WCS, and these changes are described in Sections 4.2.1.3 and 4.2.1.4. The materials and procedures used in the Fall, Winter and Spring Sorting Periods are referenced here because they were used for the majority of the samples that were sorted during the WCS.

Four levels of classification were used to describe the sorted materials:

- **Material Groups** were the largest class of materials, consisting of Paper, Plastic, Glass, Metal, Organics, Appliances and Electronics, Construction and Demolition Debris, Miscellaneous Inorganics, and Household Hazardous Wastes.

- **Material Subgroups** were a subdivision of material groups. For example, within the Paper groups, there were six material subgroups: **ONP**, **OCC**, Mixed Paper, Beverage Cartons, Compostable Paper, and Other Paper.
- **Material Categories** were a subdivision of material groups and subgroups. For example, within the Mixed Paper subgroup, there were four material categories: High Grade Paper, Mixed Low Grade Paper, Phone Books/Paperbacks, and Paper Bags. Some material subgroups, such as newspaper, were not subdivided further.
- **Material Subcategories** were a subdivision of material categories. For example, the Plastics material group included a subgroup of Injection Molded Tubs. The subgroup of Injection Molded Tubs was divided into two material categories: #1-#2 Tubs and #3 through #7 Tubs. The #1-#2 Tubs were divided into two material subcategories: #1 **PET** and #2 **HDPE**.

Certain materials, such as Newspaper and Wet-cell batteries were not subdivided into all four of these classifications. Table 2-19 shows the materials in each level of classification. Table 2-19 also shows those materials (“R”) designated for recycling under New York City’s current curbside recycling program during the study period, those materials (“PR”) for which markets exist and which could be added to a future New York City curbside program, and those materials (“NR”) that are not designated for recycling under New York City’s curbside recycling program because established or emerging markets do not presently exist.

Table 2-19
Material Groups, Subgroups, Categories, and Subcategories

Material Group	Material Subgroup	Material Category	Material Subcategory	Recycling Designation ⁽¹⁾
Paper	ONP	Newspaper		R Paper
Paper	OCC	Plain OCC/Kraft Paper		R Paper

(1) The three recycling designations used here are:

R = Materials designated for recycling under New York City's current curbside recycling program during the study period.

PR = Materials from which markets exists and which may be added to a future New York City curbside recycling program.

NR = Materials not designated for recycling under New York City's current curbside recycling program for which established or emerging markets do not exist.

Bottles and cans were subdivided further in order to obtain more detailed information about the waste stream. Bottles and cans were separated into **deposit**, **non-deposit** and **potential deposit** categories, based on their classification in the current New York State Redeemable Container Law. They were also divided into single serve (twenty-four ounces or less), **multi-serve** (greater than twenty-four ounces) and non-beverage containers. The containers in each group were weighed collectively, to determine those containers' contribution to the stream as a whole, counted and re-categorized. Table 2-20 presents the materials that were sub-sorted and the criteria used for each material. The sorting of deposit and non-deposit subcategories began in the PWCS and became part of the **subsorting** procedure in the WCS. The subsorting of **single-serve**, multi-serve, and non-beverage containers began in the WCS.

Table 2-20
Materials and Criteria for Subsorting

Material	Deposit ⁽¹⁾	Non-Deposit	Potential Deposit ⁽²⁾	Single Serve	Multi-Serve	Non-Beverage
PET Bottles	X	X	X	X	X	X
HDPE Bottles: Natural		X	X	X	X	X
HDPE Bottles: Colored		X	X	X	X	X
#3 PVC Bottles		X	X	X	X	X
#4 LDPE Bottles		X	X	X	X	X
#5 PP Bottles		X	X	X	X	X
#7 Other Bottles		X	X	X	X	X
Clear Container Glass	X	X	X			
Green Container Glass	X	X	X			
Brown Container Glass	X	X	X			
Other Container Glass	X	X	X			
Aluminum Cans	X	X	X			

(1) Containers included in the New York State Redeemable Container Law.

(2) Containers under consideration for inclusion in an expanded New York State Redeemable Container Law, including iced tea bottles and cans, sport drink bottles, cans/bottles containing juice drink that is less than 70 percent pure vegetable or fruit juice.

4.2.1.2 Use of Categories for all Streams

Material groups, subgroups, categories and subcategories were used for all samples acquired in the PWCS and WCS, including residential Refuse, residential MGP, residential Paper and Street Basket Waste. Some changes were made in the categories between the PWCS and the WCS and between the Fall/Winter/Spring Sorting Periods to the Summer Sorting Period in the WCS. These changes are described below.

Because the goal of the Multi-Unit Study was to determine factors leading to recycling success, and not to estimate the composition of the waste, fewer material categories were used in that Study (Volume 3).

4.2.1.3 Changes in Categories from PWCS to WCS

Sampling units of Refuse and Recycling were sorted into 104 material categories in the PWCS. Based on the results of the PWCS, it was decided to consolidate certain material categories and expand others. The amendments to the sort categories are shown in Table 2-21. Certain materials, such as single-use cameras and disposable razors, were found so infrequently during the PWCS that it was decided to eliminate them as separate categories. On the other hand, DSNY’s interest in the composition of **durables** in the waste stream resulted in expanding or adding to these categories. Table 2-21 shows the changes in the materials from the PWCS to the Fall Sorting Period of the WCS.

**Table 2-21
Changes in Materials from PWCS to WCS**

PWCS		WCS	
Material Group	Material Categories: Subcategory	Material Group	Material Categories: Subcategory
Paper	Phone Books	Paper	Phone Books/Paperbacks ⁽¹⁾

HHW	Explosives	HHW	
HHW	Smoke Detectors	HHW	

(1) Because very small amounts of the materials in certain PWCS categories were found, the categories were aggregated for the WCS.

(2) In the WCS, bottles and cans were subsorted into various deposit types (e.g. Deposit, Non-Deposit, Potential Deposit) and then sometimes container sizes (e.g. Single Serve, Multi Serve, Non-Beverage).

(3) An interest in the reparability of durable items led to the expansion of the PWCS category into more specific categories to obtain more detailed information about the waste.

4.2.1.4 Changes in Categories from WCS Fall/Winter/Spring to Summer

During the first three Sorting Periods of the WCS, 91 material categories were used to sort Refuse, Recycling and Street Basket Waste samples. After the Spring Sorting Period, the number of material categories was increased to provide more detail about the composition of durables and **film** in the waste stream. Table 2-22 shows the changes in the material categories from the Fall/Winter/Spring Sorting Periods to the Summer Sorting Period.

Table 2-22

4.2.2 Sorting Procedures

4.2.2.1 Sorting Sites

During the PWCS, the sorting of Refuse and Recycling samples took place at the Greenpoint Marine Transfer Station (“Greenpoint MTS”) located on Greenpoint Avenue in Brooklyn. All samples were transported from the four sampling sites to Greenpoint MTS where they were sorted.

The WCS was a larger and more complex study than the PWCS and two sorting sites were used. Because of its proximity to Metropolitan Paper and Hugo Neu, the Greenpoint MTS was used to sort all samples of MGP and Paper. The North Shore Marine Transfer Station (“North Shore MTS”), located off College Point Avenue in

Queens, was used to sort samples of Refuse, Street Basket Waste, and Waste from buildings targeted for the Multi-Unit Study.

4.2.2.2 Site Layout

Each sorting site had to accommodate space for the following:

- Delivery and queuing of samples and placement of back-up samples and empty carts;
- Sort and subsort tables, bins, scale, and crew;
- Roll-off containers where waste was placed after it had been sorted, weighed, and the weights recorded; and
- Equipment storage.

Figures 2-29 and 2-30 show the general site layouts for Refuse and Recycling, respectively.

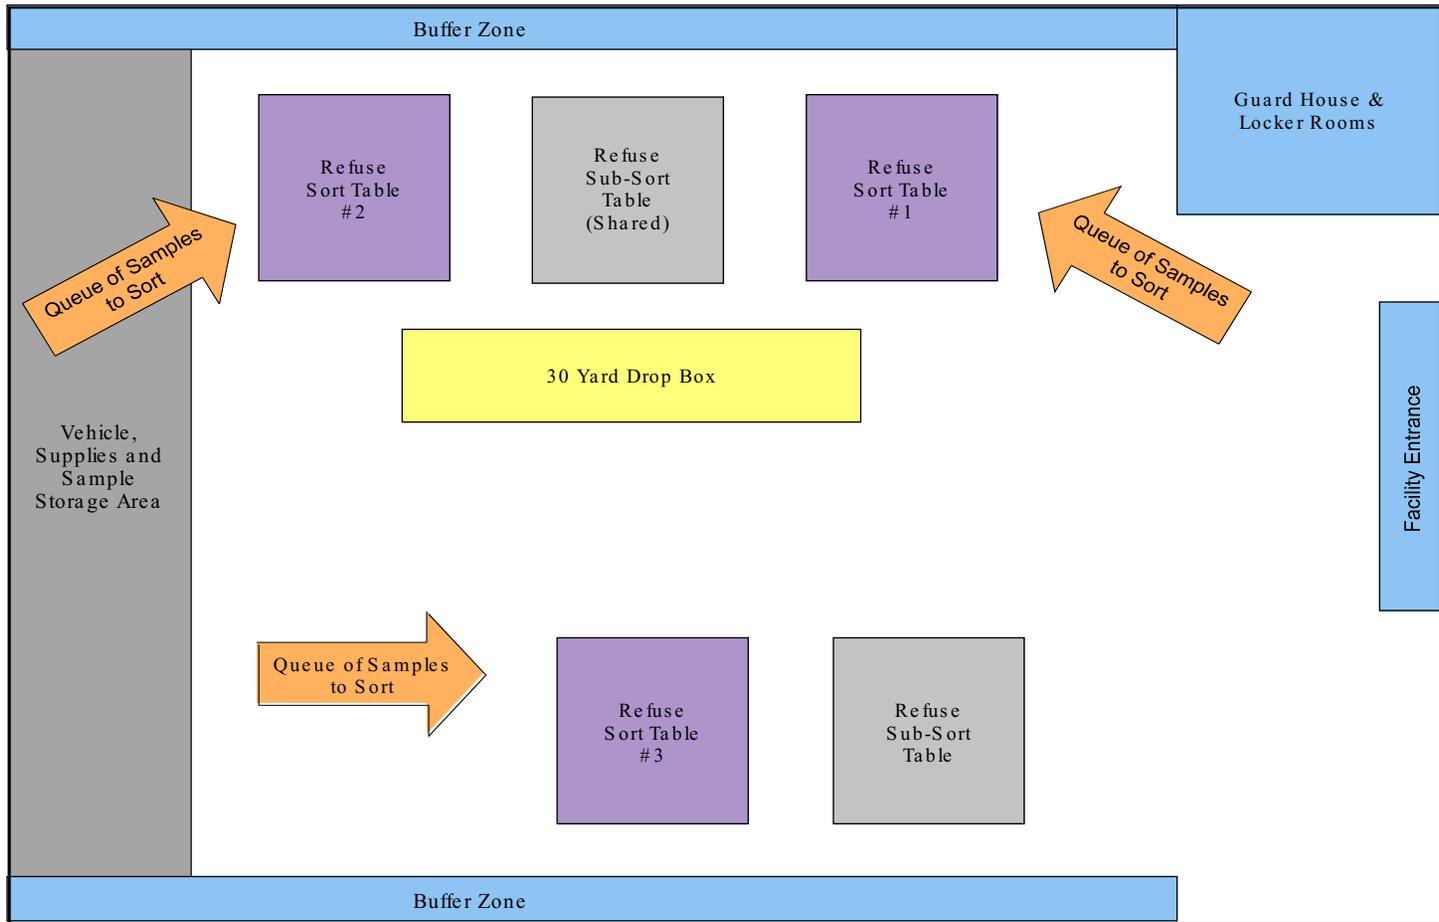

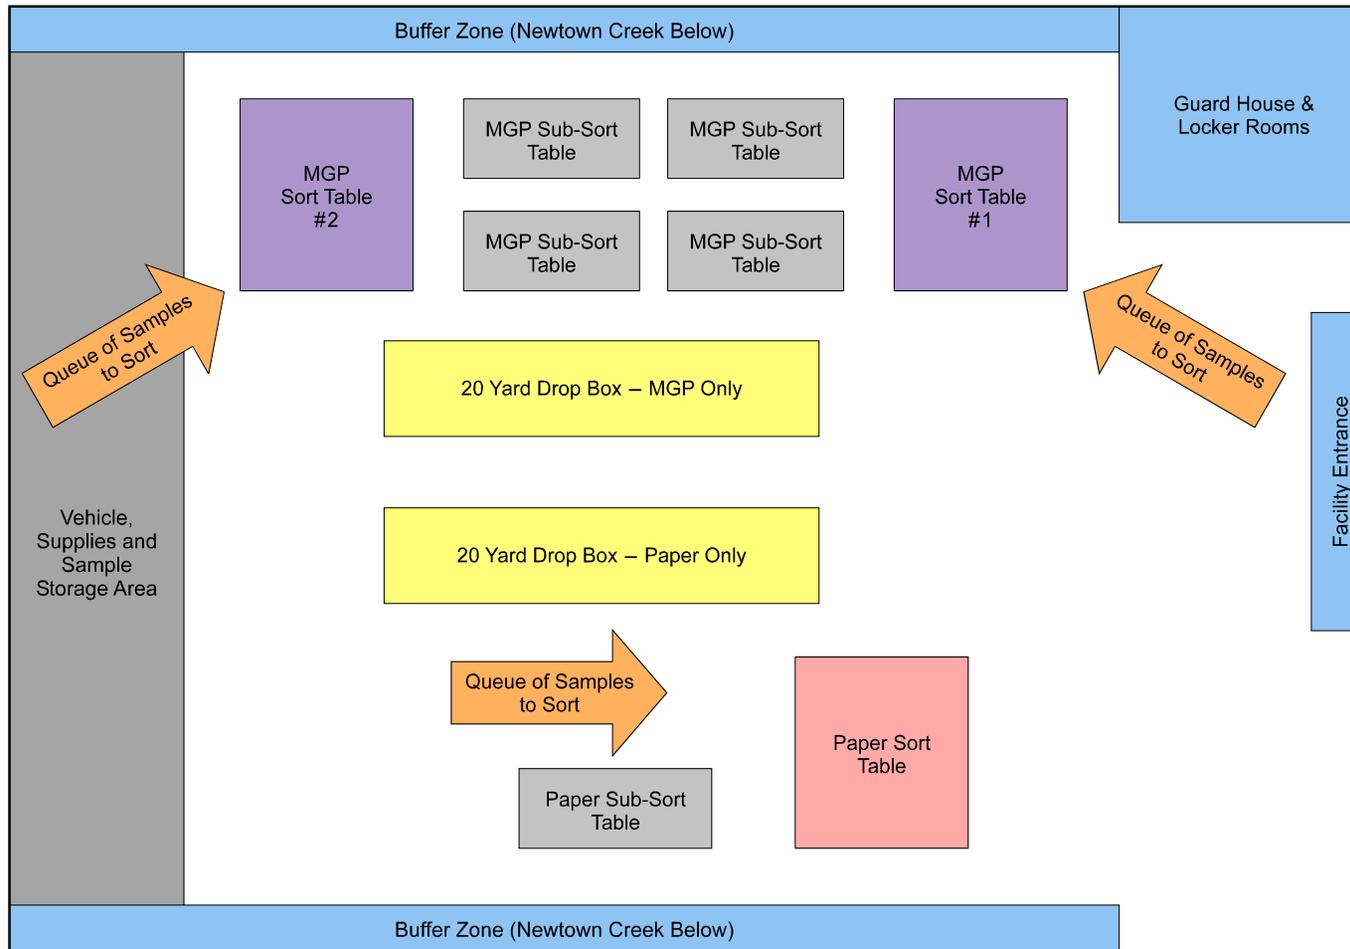

Figure 2-29
Refuse Sort Site Layout

**Figure 2-30
Recycling Sort Site Layout**

4.2.2.3 Staffing

The professional field staff consisted of the positions listed below. A more detailed description of the roles and activities of the professional staff is included in the Field Procedures and Training Manual in Volume 4, Appendix A.

Logistics Manager

The Logistics Manager had responsibility for attending to all logistical details that arose during the Sorting Period, including purchasing equipment and supplies, arranging for lunches, overseeing equipment repair, and responding to any health or medical emergencies. Many of the responsibilities involved spur-of-the-moment problems that could not be addressed by the professionals because of their sampling or sorting duties. There was one Logistics Manager during each Sorting Period.

Director of Sampling

The Director of Sampling had overall responsibility for acquiring samples during each Sorting Period. These responsibilities included staffing, staff training, oversight of equipment, relations with transfer station personnel and the BWPRR staff assigned to transfer stations, and supervision of the sampling procedures. The Director of Sampling worked from about 9:30 p.m. until all samples had been acquired the following morning.

During the Spring and Summer Sorting Periods, when the Multi-Unit Study was implemented, MUS sampling took place from about 2:00 a.m. to 10:00 a.m. To provide some relief for the Director of Sampling, if the MUS samples were late in arriving, the Logistics Manager took on the Director of Sampling duties in the morning. There was one Director of Sampling during each Sorting Period.

Sample Manager

The Sample Manager was responsible for properly acquiring, recording and delivering samples of waste to the appropriate sorting site. One or two Sample Managers were assigned by the Director of Sampling to each sampling site, depending on the number of samples to be acquired on a given night, the volume of traffic at each site, and the level of BWPRR staff support at the site. Each Sample Manager worked with an assistant (a temporary worker), who assisted with all aspects of sampling except data recording.

Director of Sorting

The Director of Sorting had overall responsibility for the proper sorting of samples during each Sorting Period at both sorting sites. These responsibilities included staffing, staff training, quality control, oversight of equipment, and supervision.

Field Supervisor

A Field Supervisor had responsibility for operations at each of the sorting sites, supervising the sorting crews, and all activities within his/her facility. The Field Supervisor worked with the Director of Sampling to check incoming samples of waste and determine the number of samples to be sorted during a given day. The Field Supervisor was also responsible for assuring a smooth flow of samples to the sort areas, thereby keeping the sorting crews productive throughout the day.

Crew Chief

The Crew Chief had responsibility for managing his/her designated sort area and the actual sorting and weighing of samples. This included coordinating with the Field Supervisor to receive and track samples and managing the sort crew during sample loading, sorting, weighing and recording of waste samples.

Data Manager

In the field, the Data Manager had responsibility for collecting, checking and verifying all data developed by the sampling and sorting operations and entering the data into the Project Database. During the PWCS and the Fall Sorting Period of the WCS, the Data Manager and her team of analysts operated from their office in Orlando, Florida. During the Winter Sorting Period, the Data Manager and one assistant operated from an on-site office in the hotel where the field personnel were housed. Temporary workers were used to input data. During the Spring and Summer Sorting Periods, the entire Data Management Team (i.e., Data Manager and five analysts) operated from the on-site office.

Data Analysts

The Data Analysts worked under the supervision of the Data Manager. Their duties included compiling and distributing the daily truck numbers, checking and verifying data forms, and entering data into the Project Database. During the Spring and Summer Sorting Period, when the Multi-Unit Study was being implemented, along with the Residential Study and the Street Basket Study, five Data Analysts worked in the on-site office.

Temporary Workers

Temporary workers were used as assistants to the Sample Managers and as sorters. Each Sample Manager had an assistant to help with the loading and unloading of equipment and acquisition of samples.

Four or five temporary workers were assigned to each sorting crew. They worked under the direct supervision of the Crew Chief. Some temporary workers at the sorting sites were also assigned work cleaning the area.

4.2.2.4 Description of Procedures

After the samples had been transported to the Greenpoint MTS and the North Shore MTS, the Field Supervisor checked each of the samples to be certain that the information on the Sample Labels was clear and consistent. Often the Field Supervisor would check with the Data Manager by cell phone to confirm information on the label. After the Samples had been checked in, the Director of Sorting and the Field Supervisor determined each sorting crew's sample allotment for that day and the Field Supervisor lined up the samples near the crew's sorting table.

The Crew Chief and crew then began sorting samples using the following procedure:

- The sample was weighed and the weight recorded on the Sample Detail Form (Figures 2-45 and 2-46), as a check against the sample weight obtained during sampling.
- The sample was placed on the sorting table and the waste was sorted into the appropriate material categories. Material was placed in the appropriately labeled three- and five-gallon bins around the sorting table.
- When most of the sample had been sorted, one or two crew members began the required sub-sorts and counts of materials at a separate table.
- After all material had been sorted, the material falling through the ½-inch screen on the sorting table, called “fines”, was swept up and placed in a bin. If, in the opinion of the Crew Chief, the fines were identifiable as a specific material, they were placed in the appropriate bin. For example, if the Crew Chief determined that 50 percent of the fines were coffee grounds, then 50 percent of the fines would be placed in the “Food Waste” bin and the remaining fines were placed in the “Fines” bin. All pieces of material that fell through the ½-inch screen from MGP samples were classified as “**Mixed Cullet**” because virtually all this material consisted of broken glass. Material swept up from the recycling sub-sort tables were classified as “Fines.”
- After the sorting was completed, the floor of the sorting area, including the area around the sorting table and the sub-sort table, was swept. Material that could be identified was placed in the appropriate bin. Unidentifiable sweepings were categorized as “Fines”. For example, a newspaper on the floor would be placed in the “Newspaper” bin.
- Next, each bin of material was weighed and the weight of the material recorded by the Crew Chief. (Tare weights for the bins were determined before the beginning of the Sorting Period by taking the weight of each empty bin. The same bins were used for the same materials at the same table for the duration of the Sorting Period.)
- After each material had been weighed and the weights recorded, the Crew Chief recorded the results of the subsorts on the Sample Detail Forms.

- After all data had been recorded, the sorted material was placed in a roll-off container for disposal.
- The empty bins were returned to their places around the sorting table and the sorting of the next sample began.

For the disposal of post-sort Refuse and the processing of post-sort Recycling, DSNY placed roll-off containers at each sorting site. Because of the large amount of post-sort Refuse, the roll-off container at the North Shore MTS, where all Refuse was sorted, was removed each day and returned empty. Two roll-off containers were placed at the Greenpoint MTS, one for post-sort MGP and one for post-sort Paper. These were removed and returned empty when the Field Supervisor notified DSNY that they needed emptying. Refuse at Greenpoint MTS (i.e., non-designated material in the Recycling) was placed in plastic bags and removed by DSNY each day or two.

4.2.2.5 Moisture and Particulate Testing

In both the PWCS and WCS, materials from randomly selected samples were sent to a laboratory for **moisture and particulates testing**. The purpose of this testing was to determine the amount of fugitive moisture and foreign matter in each of these materials. The test determined how much of the weight of a given material was accounted for by moisture or foreign matter. For each test, a two- to four-pound amount of the material (called a material testing unit or “MTU”) was double-bagged and sent to a laboratory for analysis.

The Data Manager randomly selected Refuse and Recycling samples to be tested, using a random-number generator and the list of the total number of samples to be acquired that season. The list of samples and the materials to be tested were given to each of the Field Supervisors at the beginning of the Sorting Period.

Immediately after a sample designated for testing had been sorted and weighed, a designated professional (i.e., Crew Chief or Field Supervisor) collected the MTUs from the appropriate bins.

Each MTU was removed from the appropriate sorting bin and double-bagged using small plastic bags and sealed tightly. In order to assign moisture testing data to the appropriate sample for analysis, the following information was recorded on a pre-printed MTU label:

- The Sample Identification Number (date of sampling, route and sample number);
- Moisture Sample Number (see below);
- The name of the material in the bag;
- The date the sample was sorted; and
- The type of waste (MGP, Paper, Refuse).

An example of an MTU Label is shown in Section 4.3.4, Figure 2-47. The MTUs from each sample were placed in a cardboard box for shipping.

All the MTUs prepared during the seasonal Sorting Period were recorded in the Moisture Testing Log. Table 2-23 shows the materials selected for MTU testing and the number of MTUs sent for testing for the PWCS and Table 2-24 shows the materials selected for MTU testing for the WCS.

**Table 2-23

Total Categories: 25

**Table 2-24
WCS Materials Tested for Moisture and Particulates**

<p>Paper</p> <ul style="list-style-type: none"> Newspaper Plain OCC/Kraft Paper High Grade Paper Mixed Low Grade Paper Phone Books/Paperbacks Paper Bags Polycoated Paper Containers Compostable/Soiled Paper/Waxed OCC/Kraft Single Use Paper Plates, Cups Other Non-recyclable Paper 	<p>Plastics</p> <ul style="list-style-type: none"> PET Bottles HDPE Bottles Rigid Polystyrene Containers and Packaging Other Rigid Containers/Packaging Plastic Bags Other Film Single Use Plastic Plates, Cups, Cutlery, Etc.
<p>Organics</p> <ul style="list-style-type: none"> Non-Clothing Textiles Clothing Textiles 	<p>Metals</p> <ul style="list-style-type: none"> Aluminum Cans Aluminum Foil/Containers

Total Categories: 21

The moisture and particulate testing in the laboratory was conducted in two stages. First, immediately after opening the plastic bags, the MTU was weighed. It was then placed in a drying oven at a temperature of 80 degrees Celsius for 12 to 24 hours. After drying was completed, the material was then weighed again.

Second, the dried material was gently rubbed against itself to release any foreign matter, such as pieces of glass or food waste, adhering to it. After this step, the particles of foreign matter were weighed. The resulting data from each MTU included:

- Weight of MTU prior to drying;
- Weight of MTU after drying; and
- Weight of any foreign matter.

This information was sent to the Data Manager who compiled the results for each season. The results of the moisture and particulate testing are presented in Volume 1 of the Final Report.

4.2.2.6 Table Layout

The sorting crew stood around a table on which the sample of waste was placed. Three- and five-gallon bins were placed around the table according to material group. Larger bins were used for materials that were typically abundant in samples; smaller bins were used for the other materials. For purposes of illustration, Figure 2-31 shows the table layout for a WCS Refuse sample during the Fall, Winter, and Spring Sorting Periods for the initial sort and Figures 2-32, 2-33 and 2-34 illustrate the subsorts that were part of this sorting procedure. Figures 2-35 through 2-37 show the table layout and subsorts for a Paper sample. Figures 2-38 through 2-41 show the table layout and subsorts for an MGP sample.

These diagrams show the table layout for the material categories for the Fall, Winter, and Spring Sorting Periods. During the Summer Sorting Period, six material categories were enlarged to gather more detailed information on the plastics and durables in the waste stream (Section 4.2.1.4). These changes included:

1. Plastic bags were subsorted into Shopping Bags, Dry Cleaning/Newspaper Bags, and Garbage/Recycling Bags.
2. Other plastic materials were subsorted into Personal Hygiene Plastic Products, Toys/Housewares Plastics Products, and Other Plastic Materials.
3. Mixed Metals was subsorted into Mixed Metal Hardware, Mixed Metal Toys/Housewares, and Other Mixed Metal.
4. Other Metal was subsorted into Other Aluminum, Other Non-Ferrous, and Other Ferrous.

- a. Other aluminum was subsorted into aluminum hardware, aluminum toys/housewares, and other aluminum.
- b. Other non-ferrous metal was subsorted into non-ferrous hardware, non-ferrous toys/housewares, and other non-ferrous.
- c. Other ferrous metal was subsorted into ferrous hardware, ferrous toys/housewares, and other ferrous.

These changes in the material categories for the Summer Sorting Period resulted in adjustments to the table layout and subsorts, but are not illustrated in Figures 2-31 through 2-41.

4.2.2.7 Special Procedures – Illegally Disposed Street Basket Waste

One purpose of the Street Basket Waste Study was to determine the amount of **illegally disposed** residential and commercial waste in **street basket waste**. A procedure to identify illegally disposed residential and commercial Waste in Street Baskets was conducted before the sorting of the sample took place. To determine the illegal use of street baskets for residential or commercial Refuse disposal, the following protocol was used:

- Before sorting, each street basket sample was placed on the sort table for inspection by the Crew Chief to identify suspected illegal residential or commercial waste.
- All closed opaque plastic bags the size of a shopping bag or larger were identified as potentially containing illegal material.
- The loose material found in clear plastic basket liners or opaque liners labeled with a Business Improvement District (“BID”) logo were considered legal street basket waste.
- Any closed opaque plastic bags the size of a shopping bag or larger found within a BID bag were also identified as potentially containing illegal material.
- Closed bags identified as potentially containing illegal material were opened.
- If a bag contained any of the following materials, it was classified as “residential”:
 - Addressed mail;
 - Substantial quantities of home-use products, including: health and beauty aids, detergent bottles, family-sized drink containers, or other seemingly residential material; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested home use.
- If a bag contained any of the following materials, it was classified as “commercial”:
 - Retail food preparation wastes (industrial-sized food/liquid containers, substantial quantities of identical packaging or unused products, cardboard boxes);
 - Construction materials such as pieces of dry wall or other building materials; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested office, retail, industrial, construction or food establishment waste.

Closed shopping bags not containing materials deemed residential or commercial, but suggesting street use (single use containers, newspapers, etc.) were considered legally disposed street basket waste.

For all bags identified as containing residential or commercial wastes, the following four procedures were followed:

- All such bags were individually photographed.
- The contents of each bag were recorded. The crew chief recorded this information on the Sample Detail Form.
- All such bags (regardless of size) were separated into two groups: residential bags and commercial bags. The bag **count** was recorded on the Sample Detail Form (Figure 2-46).
- In each sample, bags identified as containing residential or commercial waste were weighed in two groups: residential bags and commercial bags. The combined weights of the bags in each group (residential and commercial) were recorded on the Sample Detail Form.

In addition, each sample was examined for suspected instances of illegally disposed residential or commercial wastes not encased in closed bags as defined above – including instances of broken bags with spilling contents, as well as residential or commercial material loose in the street basket contents. These materials were photographed but not weighed and their presence noted on the Sample Detail Form (Figure 2-46).

After these procedures had been completed, all material was placed onto the sorting table and sorted according to the refuse sorting protocol.

All weights were recorded by the Crew Chief. The Sample Detail Form for the Street Basket Waste Study samples is shown in Figure 2-46. When the weighing of all material in the sample had been completed, the sorted refuse and recycling was placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew then began sorting the next sample.

4.2.2.8 Supplies

Sampling and Sorting Crews required safety equipment, as well as sampling and sorting equipment. The equipment and supplies used during the PWCS and WCS are shown in Table 2-25.

**Table 2-25
Equipment and Supplies for Sampling and Sorting**

Safety Equipment for Each Worker

Tyvek suits
Black neoprene gloves with cotton liners
Hard hats
Protective eye wear
Mesh safety vests
Dust masks

Safety Equipment for Each Sampling Team and Sorting Crew

A first-aid kit
A fire extinguisher
Flash light
Orange safety cones
Rolls of caution tape

Sampling Equipment for Each Sampling Team

A Ryder (City Van) truck (16'L x 8'W x 8'H) with hydraulic lift gate
Two-wheeled, 96-gallon capacity carts ("Toters")
An Arlyn Scale, Brand HV 200 KGL Model portable platform scale
Two rakes, two shovels and two brooms
Plastic bags
Cell phones for each member of the Sampling Team

Sorting Equipment for Each Sorting Crew

A sorting table - 4' x 8' with a 4' x 8' removable frame with 1/2" screen
One or two subsort tables - 4' x 8'
An Arlyn Scale, Brand HV 200 KGL Model portable platform scale
A magnifying glass
A magnet
Camera for Street Basket Waste
Hand rakes
Forty to sixty 32-gallon capacity plastic bins
Ten to twenty 2-gallon capacity plastic bins
A shovel, whisk broom, push broom and dust pan

Table 2-25
Equipment and Supplies for Sampling and Sorting (*continued*)

Sorting Equipment for Each Sorting Site

A folding table

Folding chairs

Office supplies (paper, clipboards, staplers, pens)

Tools (hammer, saw, level, measuring tape, crow bar)

Cleaning equipment (mops, pails, hose, sponges)

4.3 Data Recording

During the sampling and sorting of the PWCS and WCS, three types of forms were used by the field staff to record information. This information was entered into the Project Database by the Data Team, made up of the Data Manager and her staff of analysts.

4.3.1 Cart Labels

As each sample was acquired, a label was attached to each cart with information on the sample. The labels were color-coded: red for street basket, white for residential refuse and recycling, yellow for multi-unit refuse, and green for multi-unit recycling. Figure 2-42 is an example of a cart label.

4.3.2 Sample Management Forms

For each sample that was acquired, the Sample Manager completed a Sample Management Form. These were also color-coded: white for residential samples, yellow for multi-unit samples, and pink for street basket samples. Figure 2-43 is an example of the Sample Management Form used for residential waste and Figure 2-44 is an example of the Visual Bulk Item Inspection Form used for street basket waste.

4.3.3 Sample Detail Forms

After each sample was sorted, a Sample Detail Form was completed by the Crew Chief and checked by the Field Supervisor and/or the Director of Sorting. Because of the special procedures associated with the Street Basket Waste Study and the Multi-Unit Study, the Sample Detail Forms for these types of samples were slightly different than the forms for residential samples. Figures 2-45 and 2-46 are examples of the Sample Detail Forms for residential samples and street basket waste samples for the Summer Sorting Period, respectively.

4.3.4 Moisture and Particulate Testing Labels

As described in Section 4.2.2.5, certain materials in both the PWCS and the WCS were selected for moisture and particulate testing. These materials were taken from randomly selected samples and sent to a laboratory for analysis. Figure 2-47 is an example of the label attached to each material sent to the laboratory.

Moisture and Particulate Testing Label

4.3.5 Data Entry Process

The flow of data from the field to the Data Team followed the schedule below, Monday through Saturday during the Sorting Period. Times are approximate because truck deliveries, traffic conditions and other circumstances changed from day to day.

6:00 a.m.: Sample Managers returned to the on-site office with completed Sample Management Forms for residential and street basket samples, as well as information about any missed truck deliveries or samples. The forms were placed in a folder, along with a daily status report from the Director of Sampling.

9:00 a.m.: Data Team began the day by checking Sample Management Forms against the master list of samples that were to have been acquired that day. Then the Data Team began entering data from each form into the Project Database. If there were questions about any Sample Management Form, it was set aside and the Data Manager followed up with the Sample Manager who submitted the form.

9:30 a.m.: Sample Managers acquiring Multi-Unit samples arrived with their completed Sample Management Forms. These were checked and entered by the Data Team.

10:00 a.m.: Truck numbers for the samples to be delivered early the next morning were received from the DSNY Collections Bureau by fax. The Data Team entered this information on designated forms and distributed them to DSNY staff, the staff at each of the transfer station/processing facilities and to the Sample Managers.

11:30 a.m.: The Director of Sorting, who traveled between sorting sites several times a day, stopped at the on-site office and delivered the completed Sample Detail Forms for samples that had been sorted that morning. These forms would be checked and, if they were complete and legible, entered into the database. If there were questions about a form, it would be set aside for follow-up.

2:30 p.m.: The Director of Sorting would drop off more Sample Detail Forms to be checked and entered by the Data Team.

5:00 p.m.: All Field Supervisors and Crew Chiefs arrived at the on-site office with the remaining Sample Detail Forms. The Data Manager took this opportunity to check with Crew Chiefs about incomplete or illegible Sample Detail Forms. At this time, the Data Manager, Director of Sorting and the Field Supervisors discussed the sorting schedule, the number of samples and empty carts on the floor at each sorting site, and determined the number and type of samples to be sorted the following day.

4.3.6 Database Design Overview

The basic design of the Project Database consisted of two main tables into which study data was entered. The first contained summary information about each sampling unit. The second table contained detailed information about each sampling unit's composition.

The summary table included the following information for each sampling unit:

- The season in which the sampling unit was taken;
- The date the sampling unit was collected by DSNY;
- The date the sampling unit was acquired by the Sample Manager;
- The weather conditions during the time between collection of the sampling unit by DSNY and the time of acquisition by the Sample Manager;
- The name of the Sample Manager;
- The route and truck number from which the sampling unit was taken;
- The type of sampling unit (i.e., refuse, MGP, Paper, or street basket);
- The pre-sort weight of the sampling unit; and
- Information about any bulk items that were part of the sampling unit.

The detailed table contained the following information about each material in each sampling unit:

- The date the sampling unit was sorted;
- The name of the Crew Chief responsible for sorting the sampling unit;
- The route from which the sampling unit was taken;

- A second pre-sort weight of the sampling unit;
- The name of the material;
- The total weight of the material in the sampling unit; and
- If appropriate, the number of instances (i.e., count) of that material in the sampling unit.

4.3.7 Chain of Custody

The forms for each sample passed through the Chain of Custody outlined in Figure 2-48.

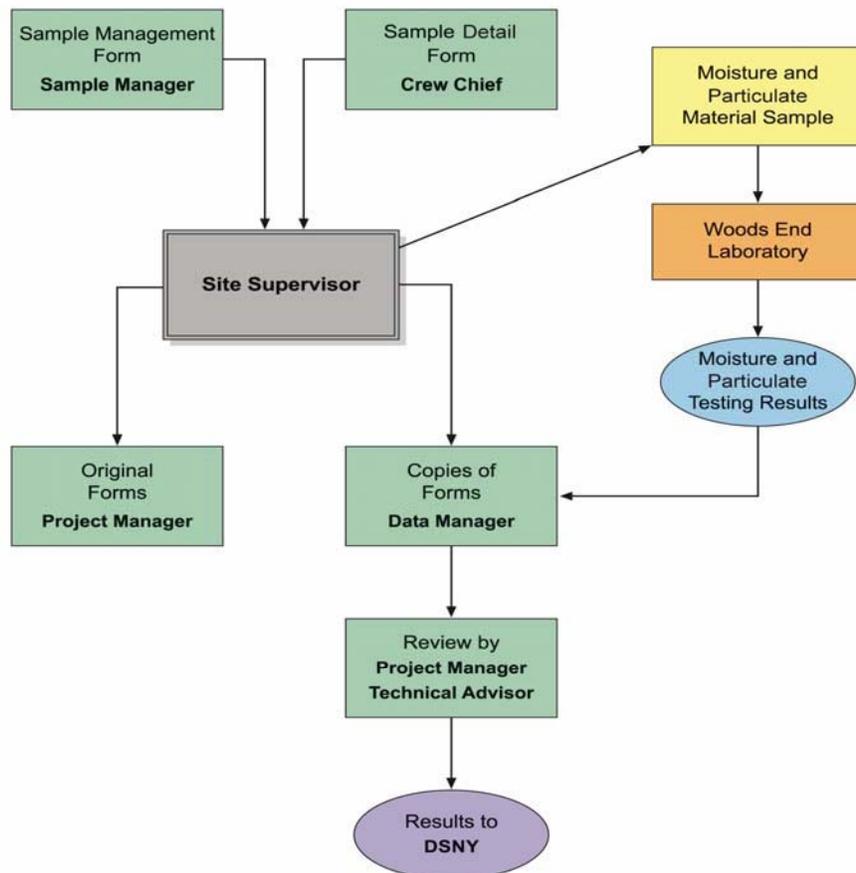

Figure 2-48
Chain of Custody

4.3.8 Quality Assurance/Quality Control Procedures

Separate quality assurance and quality control (“QA/QC”) procedures were developed for field data and for reports. Sampling data on the Sample Management Forms was checked by the Director of Sampling and then by the analyst entering the data into the database.

Sorting data on the Sample Detail Forms was checked by the Field Supervisors and/or the Director of Sorting. These were also checked by the Data Team before being entered into the database.

The Data Manager followed up on any incomplete or illegible forms with the Sample Managers or Crew Chiefs who filled them out.

The database allowed for automated checks of the data entered. The automated checks recognized possible errors, such as missing data, data entry mistakes, and mistakes in sample ID number. Paper copies of all forms were kept and stored in the Boston (MA) office of R. W. Beck. Duplicates of all forms were made and sent to R. W. Beck's Orlando (FL) office for reference and storage.

After being prepared, report documents went through two QA/QC checks. The preparer of the document sent the document to a first reviewer who checked the document and signed the QA/QC form. After the first reviewer had signed off on the document, it was passed on to a second reviewer. The document was submitted only after the second reviewer had approved the document.

4.4 Data Analysis

The analysis of the data compiled during the PWCS and WCS was conducted by the Data Team using data entered in the Project Database. The number and type of calculations are summarized below and the results are shown in Volume 1 of the Final Report.

4.4.1 Aggregation Calculations

Residential average composition data was produced by stratum for each season and each stream (Refuse, MGP and Paper) using only the samples that were categorized by the desired stratum, season, and stream.

Those 96 sets of average composition results (eight stratum in each of three stream over four seasons), were then aggregated to produce results for many combinations of strata, seasons and/or streams. For example, annual results were produced by using a weighted average of the four seasons' results, citywide results were produced by using a weighted average of the strata results, and total waste results were produced by using a weighted average of the three substreams' results. An example of the aggregation calculation is presented in Volume 2, Section 2.2.6.

Street basket results for each season were produced directly from the street basket samples.

4.4.2 Weighting Calculations

As noted in Section 4.4.1, results requiring aggregation were developed using weighted averages. The weighting factors were based on actual tonnages of waste collected during

the season of the Sorting Period. In other words, citywide results for refuse in the summer were calculated by weighting each stratum's refuse results by the percent contribution of the tonnage collected from that stratum to the tonnage collected citywide and then summing the results. An example of the weighting calculation is presented in Volume 2, Section 2.2.6.

4.4.3 Confidence Interval Calculations

The estimated waste composition results produced from the PWCS and WCS are reported with a 90 percent Confidence Level that the actual value for the entire population (“true value”) lies somewhere within an interval of values, called a Confidence Interval.

In other words, there is a 90 percent chance that the true value is between the lowest boundary and highest boundary of the Confidence Level.

The Confidence Interval for a particular material was calculated using a margin of error for the sample mean of the material. The margin of error was based on the **standard deviation** of the material category across all the sampling units, the number of sampling units obtained, and a t-value table.

Because the results of the waste composition are determined in percentages (i.e., in proportion to other numbers), mathematical transformations were used in calculating the confidence intervals. Such transformations are often useful when dealing with percentages where there are limits to the possible values (i.e., the percentages are not negative, nor are they greater than 100 percent).

The general formula for a confidence interval is:

$$\mu = \bar{X} \pm t_{\alpha} \frac{s}{\sqrt{n}}$$

where:

μ = the “true” value of the population parameter

\bar{X} = the sample average value

t_{α} = the critical value leaving $\alpha\%$ probability in each “tail” of the Student's t distribution, with n-1 degrees of freedom

s = the standard deviation of the sample

n = the sample size (number of sampling units)

The “population parameter” is the measure of interest in any particular calculation. For example, if we are trying to determine the average percentage of newspaper refuse, then “percentage of newspaper in the refuse” is the population parameter. For example:

We sort 50 sampling units in an attempt to measure the average percentage of newspaper in a given population. In our sample, the average of the 50 **observations** we obtain is

6%, and the standard deviation of our sample observations is 2%. We wish to find a 90% confidence interval for the true average percentage of newspaper in the population.

$$\mu = 6\% \pm 1.68*(2\%/7.07) = 6\% \pm 0.48\%$$

So our 90 percent confidence interval would be from 5.52 percent to 6.48 percent.

4.4.4 Reporting

The planning and results of the PWCS and WCS were documented in writing in a series of reports described below.

4.4.4.1 Operations Plans

Before each sorting season, including the PWCS, an Operations Plan was submitted to DSNY. The Operations Plan included the following sections:

- The Residential Sampling Plan for that season. For the WCS, it also described the Street Basket Sampling Plan and, in the spring and summer Operations Plans, the Sampling Plan for the Multi-Unit Study;
- The material categories to be used in sorting;
- The field procedures;
- The professional staff that would be working that season;
- The plans for staff training;
- An equipment list;
- Plans for the disposition of post-sort refuse and recycling; and
- A description of data recording and QA/QC procedures.

The five Operations Plans for the PWCS and the four seasonal WCS Sorting Periods are included in Volume 4 of the Final Report.

4.4.4.2 Quarterly Reports

At the end of each Sorting Period, a quarterly report was prepared summarizing the preparation and results of that period. The contents of the Quarterly Reports varied slightly from season to season due to differences in the scope of work each season. For example, the spring and summer Quarterly Reports included information on the Multi-Unit Study because it was implemented during those two Sorting Periods. The contents of the Quarterly Reports included:

- An Introduction;
- Planning for the Residential Study;

- Planning for the Street Basket Study;
- Sampling Logistics;
- Sorting Logistics;
- Data Recording and Analysis;
- Residential Study Results;
- Street Basket Study Results, and
- Citywide-Results At-A-Glance, a summary of results citywide.

Each Quarterly Report included 26 appendices with supplementary information, including the maps used in the sample planning, the list of all staff who worked that period, photographs of the sampling and sorting, photographs of the street basket waste, and detailed results of the data analysis.

4.4.4.2.1 Production Schedule

The Quarterly Reports were usually submitted to DSNY three to four months after the conclusion of the Sorting Period. The activities necessary to produce these reports included:

- Compiling and analyzing the sampling and sorting data;
- Obtaining data from DSNY on weekly average tonnages collected for estimating generation rates;
- Producing and labeling photographs; and
- Drafting the text for the reports.

Drafts of the four Quarterly Reports and the associated results were submitted to DSNY. Comments and corrections from DSNY were incorporated into the draft reports. In the last quarter of 2005, the four Quarterly Reports of the WCS were reviewed and adjusted for purposes of consistency and accuracy, and final Quarterly Reports were submitted to DSNY. The dates of the Sorting Period are shown in Section 4.1.1.2, Figure 2-28.

4.4.4.2.2 Revisions

The development and production of all reports required a number of revisions. These revisions were necessary due to changes in the way in which the results were presented and minor adjustments to some calculations in the drafts. The Quarterly Reports represent historical accounts of each Sorting Period and may include incorrect information. The Final Report is the definitive account of the PWCS and WCS and supersedes all previously reported results. In all cases, adjustments were very small and in no cases did they result in any change in the data at a scale meaningful for policy or planning.

4.4.4.3 Final Report

The Final Report is presented in four volumes and associated documents:

- Volume 1 – Study Results;
- Volume 2 – Methodology;
- Volume 3 – Multi-Unit Study; and
- Volume 4 – Appendices.

Glossary of Abbreviations and Definitions

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
1989/1990 WCS	The waste characterization study conducted by the New York City Department of Sanitation in 1989 and 1990.
Absolute Variability	The variability from sampling unit to sampling unit, which is measured by the Standard Deviation.
Borough	The five political/geographic areas of New York City: Manhattan, Brooklyn, Bronx, Queens, and Staten Island.
Bulk Item	As defined for the NYC WCS, any item of waste that will not fit into a 96-gallon container.
BWPRR	Bureau of Waste Prevention, Reuse and Recycling
C&D	An abbreviation of construction and demolition debris, a material group in the NYC WCS.
Capture Rate	The amount of materials set out for residential recycling collection as a percentage of designated recyclable materials in both recycling and refuse streams. This ratio measures how much of the targeted materials are actually being recycled, which is a measure of how successfully such materials are recycled.
Census Tracts	Census tracts are small, relatively permanent statistical subdivisions of a county. New York City includes 2,217 census tracts containing on average about 4,000 inhabitants.
City	New York City
Confidence Interval	A range within which the true Mean of the population is believed to lie with the given confidence level.
Confidence Level	The certainty with which the true Mean lies within the interval determined. For the NYC WCS, a 90 percent confidence level is used. A 90 percent confidence level is the industry standard for Waste Characterization Studies. Note that the use of a 90 percent level instead of a 95 percent level (the standard for scientific research) does not (a) affect the calculation of means, only the width of intervals around the means or (b) preclude the application of a 95 percent confidence level to results if such an analysis is of interest.
Contamination Rate	The percentage of material that is found in the containers set out for residential recycling collection that is not accepted in New York City's curbside recycling program.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Correlation, negative	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A negative correlation occurs when one variable increases and the other variable decreases.
Correlation, positive	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A positive correlation occurs when one variable increases and the other variable also increases.
Count	The process of counting the individual items that were subsorted.
Curbside Collection	The collection of residential refuse or recycling in bins or bags set out in proximity to residences that generate these types of waste. DSNY provides curbside refuse collection to all residents two or three times per week and recycling curbside collection once per week.
Density/Income Strata	Divisions of New York City's population based on median housing density and median household income.
Deposit (containers)	Beverage containers for which, under the New York State Redeemable Container Law, the purchaser is required to pay a deposit. The deposit may be redeemed when the empty containers are returned to a retailer or authorized redemption center.
District	The 59 areas within New York City used by the Department of Sanitation to administer the City's waste management program. These districts are co-terminus, or identical, to the 59 Community Districts.
Diversion Rate	The amount of materials set out for recycling collection as a percentage of the total residential waste collected.
DSNY	Department of Sanitation of New York City
Dual-bin Trucks	DSNY collection trucks with two compartments used for the simultaneous collection of curbside residential Paper and MGP.
Durable	An item of residential waste that is not putrescible, packaging, or unfinished material, but is a durable object, such as an appliance, piece of furniture, or other household item.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Film (Plastic)	A category of flexible plastic materials used for packaging, trash bags and other applications, typically made of polyethylene or polypropylene.
HDPE	An abbreviation for high density polyethylene; a plastic denoted by a #2 inside the chasing arrows recycling symbol.
HHW	An abbreviation for Household Hazardous Waste, one of the material groups in the NYC WCS.
H/H	An abbreviation for the high housing density and high income stratum.
H/L	An abbreviation for the high housing density and low income stratum.
H/M	An abbreviation for the high housing density and medium income stratum.
Illegally Disposed Street Basket Waste	Residential or commercial waste that is illegally disposed of in street baskets (e.g. home-use products, such as large detergent bottles, cereal boxes, or personal mail; construction materials, etc.).
L/H	An abbreviation for the low housing density and high income stratum.
L/M	An abbreviation for the low housing density and medium income stratum.
Late Week/Early Week	A criterion used in the PWCS based on the idea that the composition of the waste discarded during the latter part of a week differs significantly from the composition of waste discarded during the early part of a week.
LDPE	An abbreviation for low density polyethylene, a plastic denoted by #4 inside the “chasing arrows” recycling symbol.
Lower Boundary	For a given material, the lowest average percentage of that material expected in the population consistent with the sample, at the confidence level specified.
M/H	An abbreviation for the medium housing density and high income stratum.
M/L	An abbreviation for the medium housing density and low income stratum.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
M/M	An abbreviation for the medium housing density and medium income stratum.
Material Categories	The classification of all materials in the waste stream into categories for sorting, weighing, and counting purposes. In the NYC WCS, 91 Material Categories were used to characterize the City's waste stream.
Material Groups	Groupings of material categories used to simplify or generalize results. The Material Groups used in the NYC WCS are: Paper, Plastic, Glass, Metal, Organics, Appliances/Electronics, Construction and Demolition Debris, Miscellaneous Inorganics, and Household Hazardous Waste.
Mean	The sum of the values of all observations divided by the number of observations, also known as average. In analyzing the composition of samples of waste, refuse, recycling, and the contents of street baskets, the best estimate of the true percentage of each material in the population is the Mean percentage of that material from all of the samples.
MGP	An abbreviation for Metal, Glass, and Plastic. One of the two streams of recycling collected by the DSNY consisting of plastic bottles and jugs; glass bottles and jars; metal cans and household objects; aluminum foil, trays and cans, and gable top beverage cartons. The other stream of recycling collected by DSNY is Paper.
Mixed Cullet	Broken glass in small pieces (under 3" x 3") of mixed color.
Moisture and Particulate Test	A laboratory test that determines the amount of moisture in a sample of material and determines the amount of fugitive or foreign material adhering to the sample.
Multiserve (containers)	Beverage containers with a capacity of more than 24 ounces of liquid.
Multi-Unit Apartment Study or Multi-Unit Study (MUS)	The component of the 2004/2005 waste characterization study that examined the correlation between the physical and operational characteristics of multi-unit buildings (those buildings with 6 or more residential units) and recycling success.
Non-deposit (containers)	Beverage containers which are not designated as deposit containers under the New York State Redeemable Container Law.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
NYC	New York City
NYC WCS	New York City Waste Characterization Study
Observation	The value(s) associated with a given sampling unit.
OCC	An abbreviation for old corrugated cardboard, one of the material categories in the PWCS and the NYC WCS.
ONP	An abbreviation for old newspaper, one of the material categories in the PWCS and the NYC WCS.
Paper	The second of two streams of recyclable materials collected by DSNY consisting of newspapers; magazines; catalogues; junk mail; white office paper; mixed paper; and gray and corrugated cardboard/paperboard. The other stream of is Metals/Glass/Plastic (MGP).
PET	An abbreviation for polyethylene terephthalate, a plastic denoted by #1 inside the “chasing arrows” recycling symbol.
Population (Statistics)	The entire aggregation of items from which a sample can be drawn. In the NYC WCS, the population was all of the residential waste collected at the curb by DSNY.
PP	An abbreviation for polyethylene propylene, a plastic denoted by #5 inside the “chasing arrows” recycling symbol.
Potential Deposit	Beverage containers which are not currently designated as deposit containers under the New York State Redeemable Container Law, but which may be designated in future legislation.
PS	An abbreviation for polystyrene, a plastic denoted by #6 inside the “chasing arrows” recycling symbol.
Pure Routes	DSNY Refuse and Recycling collection routes that include only residences from a single housing density and income stratum.
PWCS	The preliminary waste characterization study conducted by the New York City Department of Sanitation in 2004.
PVC	An abbreviation for polyvinyl chloride, a plastic denoted by #3 inside the “chasing arrows” recycling symbol.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Recycling	The act of recovering items or materials that might have been discarded and, usually after processing, returning them to the stream of commerce. Also, the materials that are set out for recycling collection.
Recycling Subindicators	A set of abbreviations used to indicate; i) those materials designated for recycling under New York City’s current curbside recycling program during the study period (“R”); ii) those materials for which markets exist and which could be added to a future New York City curbside program (“PR”); and iii) those materials that are not designated for recycling under New York City’s curbside recycling program because established or emerging markets do not presently exist (“NR”).
Refuse	Items or materials that are discarded and disposed.
Relative Variability	The variability from Sampling Unit to Sampling Unit in relation to the Mean. This is calculated by dividing the Standard Deviation by the Mean.
Residential Study	The component of the 2004/2005 waste characterization study that addressed the generation and composition of the curbside residential waste.
Sample	A portion of a population used to estimate the composition of the population as a whole. The Sample is made up of multiple Sampling Units.
Sample Acquisition, or Sampling	The procedure for selecting Sampling Units from the population.
Sample Number	The number of sampling units in a sample.
Sample Weight	The weight of a sampling unit. In the WCS, each refuse sampling unit was between 200 and 300 pounds.
Sampling Unit	A single elementary unit used as the basis for estimating the composition of the population.
Section	Each of the City’s 59 Sanitation Districts is divided into 3 to 5 Sanitation District Sections within which routes are designed and tonnage data collected daily.
Single-serve (containers)	Beverage containers with a capacity of less than 24 ounces of liquid.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Sorting	The procedure for separating a heterogeneous amount of material, such as a 200 pound Sampling Units of refuse, into its constituent material categories.
Sorting Period	The days or weeks when the sampling and sorting of waste took place during the NYC WCS.
Standard Deviation	A measure of the dispersion or variability around the Mean of the weights of a group of Sampling Units of New York City waste.
Street Basket Waste Study	The component of the 2004/2005 waste characterization study that addressed the composition of the street basket waste.
Subsorts	The process of sorting a particular material into smaller constituent components (e.g. drinking containers were subsorted into deposit and non-deposit containers).
Upper Boundary	For a given material, the highest average percentage of that material expected in a population consistent with the sample, at the confidence level specified.
Waste	The combination of Refuse and Recycling
Waste Generation	The rate at which waste is set out for collection, typically reported in terms of amounts per generator per time period (e.g. pounds per capita per week).
WCS	The waste characterization study conducted over four seasons by the New York City Department of Sanitation in 2004 and 2005.

Volume 3 – Multi-Unit Apartment Study

3.1 Introduction

The purpose of the **Multi-Unit Study**¹ was to determine the structural and/or operational characteristics that promote recycling participation in multi-unit apartment buildings by identifying those building characteristics most closely associated with successful recycling, as defined herein.

Planning for the Multi-Unit Study began in November 2004, and implementation of the Multi-Unit Study began during the spring sorting period, in May 2005. The sorting of Multi-Unit samples continued in the summer sorting period, in August 2005. As noted below, the Multi-Unit Study also involved a series of building surveys that took place during June, September, and October of 2005.

3.2 Methodology

The methodology used for the Multi-Unit Study consisted of two sets of data-gathering activities, followed by an analysis of the resulting data.

3.2.1 Recycling Success

The first activity collected data related to successful recycling within the multi-unit apartment and involved an analysis of the waste from randomly selected multi-unit buildings. Five terms, describing the materials collected, were used in developing the statistical measures used to assess recycling success.

- **Designated Recyclables (“DR”)**: Items designated for recycling under NYC’s current recycling program, including bulk metal items;
- **Contamination (“C”)**: Items not designated for recycling under NYC’s current recycling program that are mistakenly set out with recycling;
- **Recycling**: Items set out for recycling collection, in a recycling bin or bag, or as bulk recycling, on the building’s recycling collection day. These items include Designated Recyclables and Contamination.
- **Refuse**: Items set out for refuse collection, in a refuse bin or bag, or as bulk refuse, on the building’s refuse collection day. Refuse properly consists of items not designated for recycling under NYC’s current recycling program; however, it may also consist of Designated Recyclables that are either mistakenly set out with Refuse or are set out with Refuse because of a choice by the resident not to recycle; and
- **Waste (“W”)**: The sum of Refuse and Recycling.

For each building, the refuse and recycling set out for collection during a single week was sampled and sorted. The results were used to determine how successful each building was at recycling overall.

3.2.1.1 Indicators of Successful Recycling

The Multi-Unit Study used five separate measurements to determine successful recycling. First, the *Diversion Rate without Contamination* is the amount of designated materials set out for recycling collection (excluding non-designated materials) as a percentage of the total waste collected. The **Diversion Rate** is the result of dividing the amount of designated recycling

¹ Terms and abbreviations defined in the glossary are printed in bold the first time they appear in each Volume.

material set out (excluding contaminants) by the total amount of waste (refuse and recycling) set out for collection. For example, for a given week, if the amount of the designated recycling materials set out for collection is 18 pounds and the total amount of waste (refuse and recycling) for that week is 70 pounds, the Diversion Rate without Contamination is 26 percent.

Second, the *Diversion Rate with Contamination* is the amount of materials set out for recycling collection (including all non-designated materials) as a percentage of the total waste collected. The Diversion Rate is the result of dividing the amount of designated recycling material set out (including contaminants) by the total amount of waste (refuse and recycling) collected. For example, for a given week, if the weight of materials in the recycling set-out is 20 pounds and the total weight of waste (refuse and recycling) for that week is 70 pounds, the Diversion Rate with Contamination is 29 percent.

Third, the *Capture Rate without Contamination* is the amount of material designated for recycling that is set out for recycling collection as a percentage of designated materials in both recycling and refuse. The **Capture Rate** is the result of dividing the amount of designated material in the recycling set-out by the sum of the designated material in both the recycling and refuse for the week. For example, if the amount of designated material in the recycling set-out is 18 pounds and there is an additional 3 pounds of designated material in the refuse, the Capture Rate without Contamination is 86 percent.

Fourth, the *Capture Rate with Contamination* is the amount of material designated for recycling (including contaminants) that is set out for recycling collection as a percentage of designated materials in both recycling and refuse. The Capture Rate is the result of dividing the amount of material in the recycling set-out by the sum of the designated material in both the recycling and refuse for the week. For example, if the amount of material in the recycling set-out is 20 pounds and there is an additional 3 pounds of designated material in the refuse, the Capture Rate with Contamination is 95 percent.

Fifth, the *Contamination Rate* is the percentage of material that is not designated for recycling by the **DSNY** that is found in the recycling set out for collection. Following the previous examples, if 2 pounds of refuse (i.e., non-designated material) is found in a recycling set-out with 20 pounds of total material, the **Contamination Rate** is 10 percent.

A description of these five rates – Diversion Rate without Contamination, Diversion Rate with Contamination, Capture Rate without Contamination, Capture Rate with Contamination and Contamination Rate – are summarized in Table 3-1.

**Table 3-1
Multi-Unit Study Recycling Success Factors**

Factor	Definition ^[1]	Example ^[2]
Diversion Rate without Contamination	DR in Recycling divided by W	18 lbs / 70 lbs = 26%
Diversion Rate with Contamination	Recycling divided by W	20 lbs / 70 lbs = 29%
Capture Rate without Contamination	DR in Recycling divided by DR in W	18 lbs / (18 lbs + 3 lbs) = 86%
Capture Rate with Contamination	Recycling divided by DR in W	20 lbs / (18 lbs + 3 lbs) = 95%
Contamination Rate	C in Recycling divided by Recycling	2 lbs / 20 lbs = 10%

[1] The following terms are used in the Definitions:

Designated Recycling ("DR") = Items designated for recycling under New York City's current recycling program

Recycling = Items set out for recycling collection on the building's recycling collection day

Refuse = Items set out for refuse collection on the building's refuse collection day

Waste ("W") = The sum of Recycling and Refuse

Contamination ("C") = Items not designated for recycling that are mistakenly set out for recycling

[2] The following values are used in the Example:

DR in Recycling = 18 lbs

DR in Refuse = 3 lbs

Recycling = 20 lbs

Refuse = 50 lbs

Waste = 70 lbs

Contamination = 2 lbs

Why calculate Diversion or Capture Rates *with* Contamination? The DSNY gathers data on Recycling and Refuse tonnages collected each day. With such tonnage data, it calculates a weekly, monthly, and annual diversion rate. Such records go back to 1992. But daily tonnage records taken from scale weights recorded when recycling trucks make deliveries do not include information on contamination rates within specific deliveries. Thus, for an accurate historical comparison, it is necessary to calculate the diversion rate by dividing Recycling by the sum of Recycling plus Refuse, without regard to contaminants.

Similarly, the capture rate has, historically, been calculated using real time tonnage data on recycling collections, out of an estimated baseline percentage of Designated Recyclables in the total Waste stream (calculated using Recycling plus Refuse tonnage data multiplied by a baseline percentage).

Calculation of diversion and capture rates with contaminants presents important data for historical comparisons and retains the value of true, rather than estimated data. Finally, the calculation of a diversion statistic that includes contamination enables fair comparison of NYC's diversion rate with those of other cities, none of whom exclude contamination from their calculations.

3.2.2 Building Characteristics

The second data-gathering procedure involved collecting information on each individual building. This was done through a series of surveys about the structural, operational and demographic characteristics in each building, supplemented with centralized data sources, particularly for certain economic data.

- “Structural” characteristics related to the physical properties of a building. Examples include the number of floors in a building, and whether the building has an elevator.

- “Operational” characteristics related to the daily operations and/or recycling infrastructure of the building. Examples include the location of the recycling area, whether the maintenance staff inspects refuse, and labeling of recycling containers and areas.
- “Demographic” characteristics related to the socioeconomic composition of the building residents and characteristics of the building itself. Examples include the education level of residents of the **Census Tract** in which the building is located and the percentage of building residents that are English-speaking.

The surveys included site visits to each targeted building, interviews with building superintendents or owners and data retrieved from several city databases.

3.2.3 Analysis

A multiple regression analysis was performed on the data from each building to identify the strength of the relationships between each of the building characteristics and the recycling success rates. These analyses resulted in information about the influence of the building characteristics on the recycling success factors. The results of the multiple regression analysis are a series of models that help to explain a portion of the variation in recycling success.

3.3 Planning

Planning for the Multi-Unit Study included two separate, but related, activities: the selection of multi-unit buildings to be analyzed and the selection of building characteristics to be used in the analysis.

3.3.1 Selection of Target Buildings

At the beginning of the Multi-Unit Study, R. W. Beck estimated that at least 125 buildings should be included in the Multi-Unit Study. This total was based on R. W. Beck’s estimate that 125 buildings would be enough buildings to provide sufficient examples of each type of building characteristic to gauge the effect of these characteristics on the recycling success of the building. For example, in order to assess the effect of functional elevators on a building’s recycling success, it would be necessary to have at least 12 buildings with functional elevators in the Multi-Unit Study. Because the buildings were to be selected at random, there was no way to know beforehand how many buildings would actually have functional elevators. However, with a sample size of 125 buildings, R. W. Beck estimated that each of the 45 building characteristics would be present in at least 10 percent of the buildings. This estimate was also based on the assumption that any characteristic that was not present in at least 10 percent of the buildings in the overall population of buildings was not crucial to the current level of recycling success.

The universe of multi-unit buildings in NYC, from which 125 buildings were to be selected, consists of approximately 46,000 apartment buildings with at least six units. Public housing and buildings with mixed residential and commercial use were excluded from the Multi-Unit Study because DSNY does not collect from commercial buildings and, in New York City Housing Authority buildings, refuse and recycling are handled differently than in other residential buildings.

The Department of City Planning’s MapPluto database was used to make the random selection of target buildings. On November 1, 2004, the Project Team randomly selected 140 multi-unit apartment buildings of six units or more from the universe of 46,000 multi-unit buildings. At that time, it was thought that 140 buildings would be more than enough to provide a sample size of 125 buildings. Unfortunately, this was not the case.

From that list of 140 buildings, DSNY eliminated 39 buildings which were no longer available (e.g., no longer existed, were no longer multi-unit apartments, etc.). Of the 101 remaining buildings, 67 were targeted for the Spring **Sorting Period**. The number of field personnel needed to acquire and sort samples limited the number of buildings that could be targeted.

During the Spring Sorting Period, it became apparent that, due to the commingling of waste from different addresses, obtaining complete, accurate and reliable data on the buildings would be more difficult than had been anticipated. Therefore, it was decided to increase the number of buildings in the sample size. On May 17, 2005, a second round of selections was made, adding 80 randomly selected buildings to the sample. This created a pool of 114 target buildings (34 buildings remaining from the first-round list and 80 new buildings from the second round list). The Summer sampling period was lengthened and ninety-four of the 114 buildings were targeted for sorting during the Summer Sorting Period.

From the total of 161 buildings targeted (67 building targeted in the Spring and 94 buildings targeted in the Summer), five buildings were eliminated because data from these buildings was incomplete or unavailable. Therefore, the total number of target buildings included for the Multi-Unit Study was 156 buildings. Table 3-2 summarizes the process of selecting the multi-unit buildings for the Multi-Unit Study.

Table 3-2
Selection of Target Buildings for the Multi-Unit Study

	Manhattan	Bronx	Brooklyn	Queens	Staten Island	Total
Universe of Buildings	14,231	5,612	17,841	7,948	552	46,184
Random Selections #1	37	12	56	35	0	140
Buildings Eliminated ⁽¹⁾	8	4	15	12	0	39
Buildings Available - Spring	29	8	41	23	0	101
Spring Buildings Selected	17	4	29	17	0	67
Random Selections #2	28	10	25	17	0	80
Buildings Available – Summer	40	14	37	23	0	114
Summer Buildings Selected	33	13	31	17	0	94
Multi-Unit Study Target Buildings ⁽²⁾	50	17	60	34	0	161
Buildings Disqualified ⁽³⁾	4	0	0	1	0	5
Total Target Buildings ⁽⁴⁾	46	17	60	33	0	156

(1) Buildings that no longer existed or were no longer multi-unit buildings, as determined by DSNY.

(2) Number of buildings from which samples were acquired and sorted.

(3) Buildings disqualified during analysis because of the commingling of waste from different addresses in collected samples.

(4) It was not possible to obtain surveys for two of the 156 target buildings. In addition, because some of the Multi-Unit Study samples were found to include waste from neighboring non-target buildings, 18 of these non-target buildings were included in the building surveys. The total number of buildings included in the analysis was 172 (see discussion in Section 3.4.4).

3.3.2 Selection of Building Characteristics

Forty-five building characteristics were selected by DSNY and the Project Team for use in the Multi-Unit Study. These characteristics were selected because it was believed that they might have an influence on the recycling success of a multi-unit building. Each of these characteristics can be described in terms of its descriptive dimension, its quantitative variation, and the means of gathering the information on the characteristic.

Each of the 45 factors described some structural, operational, or demographic characteristics of the building. Eleven of these factors describe the structural characteristics of the building, such as the number of floors or the presence of functional elevators. Twenty-six of these factors are operational characteristics, such as the location of recycling areas and the recycling area access hours. Eight of these factors are demographic, such as the average household size and the median household income of the census tract in which the building was located.

The building factors also represent three types of quantitative variables. Twenty-one of these characteristics are binary, determined by questions involving a yes-or-no answer, such as “Does the building have functional elevators?” or “Is recycling mandated by the building lease?”. Eleven of the characteristics are “continuous” in which the exact answer to the question depends on the precision of the measurement, such as the average household income or the market value of the building. Thirteen of the characteristics are discrete, meaning that they can be measured using a whole number, such as “the number of recycling sorts required by residents” or “number of floors in the building”.

Finally, information on the each of the building factors was obtained in one of three ways. Building surveyors from the Project Team visited each of the target buildings and made a visual inspection of the premises to answer questions such as, “Are the recycling containers clearly labeled?” and “Is the recycling area secure?”. This visual inspection was the most reliable means of collecting information on the buildings. The second means of gathering information was through interviews with the building superintendents. These interviews included questions such as “How many units are owner-occupied?” and “Are refuse areas inspected regularly?”. The third source of information was provided by statistical databases. The median household income in the building’s census tract obtained from the U.S. Census Bureau or the taxable value of the building obtained from the New York City Department of Finance are examples of information gathered in this way.

The full list of building characteristics, showing these categories of building factors, is shown in Exhibit 3-2.

3.3.3 Analysis of Waste

The analysis of the refuse and recycling from each building required a series of special collections, a specific protocol for acquiring samples, and specific procedure for sorting the samples.

3.3.3.1 Scheduling of Sample Collections

As noted above, 156 buildings were randomly selected for sampling and sorting during the Spring and Summer Sorting Periods. These buildings were exempted from normal collection routes for one week, during which each received individual refuse and recycling collection in a designated truck. To obtain a sample of the refuse and recycling set out for collection from each targeted building, one full week’s waste was collected. Because all targeted buildings also receive one recycling collection weekly, the recycling was also collected. To be sure that a

complete week's waste was collected from each targeted building, the recycling collection always took place on the last day of the two or three times per week collection schedule, to be reasonably sure that the recycling collected was generated over the same week that the refuse was generated.

For example, the schedule for collecting a target building with a Monday-Wednesday-Friday refuse collection schedule and recycling collection on Monday would begin with the refuse collection on Wednesday and the following Friday, and both refuse and recycling collected on the following Monday. In this way, an entire week's waste could be captured for the Multi-Unit Study. Similarly, the schedule for a building with Monday-Thursday refuse collection and Monday recycling collection would begin with refuse collection on Thursday and both refuse and recycling collected on the following Monday.

In order to maximize productivity, all special collections for the Multi-Unit Study were carried out by DSNY's dual-bin collection vehicles. On refuse-only collection days, the dual-bin vehicles contained refuse from two buildings wherever possible, with an individual building's refuse placed in each side of the truck. On refuse/recycling collection days, one side of the truck was used for refuse, and the other for recycling, for an individual building. Because all of each building's recycling setouts would be sorted and weighed, it was not necessary to keep **MGP** setouts separate from paper setouts. Because of the small volume of collections, loads were not compacted.

The loads of refuse and recycling collected from target buildings in Manhattan and the Bronx were delivered to Waste Management's Harlem River Yard Transfer Station in the Bronx. Refuse and recycling from target buildings in Brooklyn and Queens were taken to Waste Management's Varick I Transfer Station in Brooklyn. The random selection of buildings for the Multi-Unit Study did not include any multi-unit buildings from Staten Island because only one percent of the **City's** 46,000 multi-unit apartment buildings are located on Staten Island.

The schedule of samples acquired and sorted each day during the Spring and Summer Sorting Periods is shown in Exhibit 3-3. In Exhibit 3-3, and successive tables, buildings are identified by the period in which the waste from the building was sorted ("SP" for Spring and "SU" for Summer) and the numbers are based on the **Borough, District, and Section** in which the building is located. For reasons of confidentiality, addresses of individual buildings are not shown.²

3.3.3.2 Sample Weight

In planning for the Multi-Unit Study, it was decided that the sample weight of refuse should be the same as the sample weight for the **Residential Study**. The procedures for analyzing the composition of municipal solid waste were initially developed over 30 years ago and have been extensively revised and refined in the past three decades. Studies by the USEPA and academic sources (e.g., Klee, A.J and D. Carruth. "Sample Weights in Solid Waste Composition Studies." *American Society of Civil Engineers Journal of Sanitary Engineering Division*. Vol. 96. 945-954. August 1970) suggest a 200 to 300-pound sample of refuse is sufficient to characterize municipal solid waste. This sample weight is based on factors such as particle size, material components and the level of mixing that occurs during collection. These sources also suggest that, as the size of refuse samples increases beyond 200 to 300 pounds, the statistical benefits associated with the larger sample size are outweighed by the incremental increase in the cost of processing the samples. As a result, the municipal solid waste sample weight of 200 to

² Building addresses were used to locate buildings for collection and surveying only.

300 pounds has been the industry guideline for municipal solid waste composition studies in the United States for the past 15 years. The samples of refuse from the target buildings for the Multi-Unit Study use this guideline.

Paper and MGP collected for recycling differs from refuse in several ways. First, these streams target a specific set of materials and, therefore, tend to be more homogeneous than refuse. Second, particle size, particularly in the paper stream, is more uniform, compared to refuse. Because of these characteristics and based on the Project Team's experience in previous waste characterization studies, the recommended weight of recycling samples was 100 pounds to 125 pounds. However, because the recycling samples for the Multi-Unit Study were acquired at the City's refuse transfer stations, all recycling materials delivered to the transfer stations were taken by the Sampling Team to the Greenpoint Marine Transfer Station. To obtain complete information on the materials set out for recycling, all recycling materials were sorted.

3.3.3.3 Material Categories

Because the primary purpose of the analysis of the waste was to determine recycling success, rather than to determine the composition of the refuse and recycling from multi-unit apartment buildings, the protocol for sorting refuse and recycling for the Multi-Unit Study differed in several respects from the protocol used for sorting waste for the Residential Study. For the Multi-Unit Study, the sort categories only needed to be detailed enough to effectively separate recyclable from non-recyclable materials and provide a certain level of additional detail. Therefore, the number of material categories used in the Multi-Unit Study was reduced from the number of material categories used in the Residential and **Street Basket Waste Studies**. The material categories used for the Multi-Unit Study are presented in Exhibit 3-4.

3.4 Implementation

The implementation of the Multi-Unit Study included **Sample Acquisition**, sample sorting, and data management and analysis.

3.4.1 Sample Acquisition

The **Dual-bin Trucks** delivering loads of refuse and recycling to Harlem River Yard and Varick I were weighed upon arrival. Each truck was accompanied by a DSNY Supervisor. The Sample Manager first confirmed the address of the target building from which the refuse and/or recycling was collected with the Supervisor. Then the Sample Management Team acquired samples of refuse and recycling using the following procedures:

3.4.1.1 Refuse

After a truck collecting refuse from the multi-unit target building had tipped its load, the Sample Management Team randomly selected a 200 to 300-pound sample³. The Sample Manager worked with a Front-End Loader ("FEL") to select the sample randomly. As the collection truck tipped its load, the Sample Manager randomly selected an area of the tipped load and instructed the FEL operator to grab a bucket load of material from that area of the pile. When the FEL's bucket was full of material, the Sample Manager randomly selected the portion of the bucket from which the sample would be taken. The material in that portion of the bucket would then be pulled into the 96-gallon totes until a full 200 to 300-pound sample was acquired. In cases where the entire load of refuse was less than 200 pounds, the entire load of refuse was taken.

³ For a discussion of the methodology used in selecting samples from tipped loads, see Volume 2, Section 4.1 of the Final Report.

Each refuse sample was weighed by the Sample Management Team. The Sample Manager noted any bulk items (i.e., items too large to fit into a 96-gallon toter) on the Sample Management Form, which included information on the weight, description and material of each bulk item.

Next, in order to determine the total amount of refuse set out by the target building for that day, all refuse not included in the sample was weighed separately by the Sampling Team. This weight was also recorded on the Sample Management Form.

After all refuse samples scheduled to be delivered on that day had been received, the refuse samples were taken by the Sample Management Team to the North Shore Marine Transfer Station where they were sorted. Bulk items were left at the transfer station for disposal.

3.4.1.2 Recycling

The “sample” of recycling from each target building consisted of the entire load of recycling, including all bulk items. Each sample was collected by the Sample Management Team and weighed. Both 96-gallon toters and plastic bags were used for collecting and transporting the recycling. All samples of recycling were taken by the Sample Management Team to the Greenpoint Marine Transfer Station where they were sorted. Bulk items that could not easily fit in toters or bags were noted on the Sample Management Form, as described above, but were also included in the material taken to Greenpoint Marine Transfer Station. Bulk items were also tagged appropriately and included in the sort data. An example of the Sample Management Form for the Multi-Unit Study is shown as Exhibit 3-5.

3.4.1.3 Resulting Data

The data gathered from the acquisition of samples includes the weight of each sample of refuse, recycling and waste for each target building. This data is presented in Exhibit 3-6.

3.4.2 Sorting of Samples

When the samples of refuse and recycling were delivered to the sorting sites, they were sorted and weighed.

3.4.2.1 Sorting Procedures

Because the primary purpose of the Multi-Unit Study was not to determine the composition of the refuse and recycling from multi-unit apartment buildings, the procedure for sorting refuse and recycling for the Multi-Unit Study differed in several respects from the procedure used for sorting residential and street basket waste.

First, each refuse sample was inspected to determine if it had come from the targeted building. The protocol for this procedure is described in Section 3.4.2.2. Second, as shown in Exhibit 3-4, the number of material categories used for sorting samples of multi-unit apartment refuse was smaller than the number of categories used for sorting residential refuse and street basket waste. The material recycling categories used for the Multi-Unit Study were identical to those used for the residential recycling. The Sample Detail Forms used in sorting multi-unit refuse and for recycling are shown as Exhibit 3-7.

3.4.2.2 Waste from Non-Target Buildings

An unexpected aspect of the Multi-Unit Study involved the presence of waste from non-target buildings in the samples collected from target buildings. On the first night of sampling, DSNY supervisors in the field noted one building where refuse set-outs appeared to be combined with

the set-outs from the neighboring building. For this reason, a protocol was added to the multi-unit sorting of refuse samples to detect instances of waste from non-target buildings.

The protocol developed to identify samples with non-target refuse consisted of five steps:

1. Before the sample was sorted, all bags in the sample were counted.
2. All bags in the sample were carefully opened and inspected. Instances of mail, including letters, periodicals, and other types of mail, from non-targeted addresses were noted and the addresses recorded. Mail was examined for the purposes of confirming building origin only. In order to ensure confidentiality, records were not kept of resident names, and all mail was destroyed after sorting had taken place.
3. All bags were classified as,
 - a. Confirmed Target - Refuse with mail from the target building;
 - b. Confirmed Non-Target – Refuse with mail from a non-target address; and
 - c. Unconfirmed (i.e., no mail).
4. Upon completion of this protocol, all bags were sorted.
5. Loose material was considered “unconfirmed” unless it was mail with a non-target address.

Some of the reasons that waste from non-target buildings might have been present in target building waste include:

- Inadvertent collection of containers from a non-target building. These containers might have been placed next to containers from the target building and picked up by DSNY by mistake, or two different buildings might have had a common set-out location, resulting in a commingling of the waste.
- Residents from a non-target building placing bags of waste in the containers belonging to the target building. If, for example, the refuse containers from the non-target building were full, a resident of the non-target building might walk over and place their refuse in the container from a target building. Residents may also place their waste next to an adjacent building to avoid anticipated summonses.
- Residents of the target building disposing non-target waste. A resident of a target building may receive mail at another address (e.g., work address) but may dispose of it at the target address.

The information from the procedure was noted on the Bag-Tracking Form which was part of the Multi-Unit Sample Detail form. A copy of the Bag-Tracking Form is shown in Exhibit 3-8. The information on non-target refuse and recycling gathered during sorting was included in the packet of material used by building surveyors and 18 non-target buildings were surveyed and the results of these surveys were incorporated into the analysis (Section 3.4.4).

3.4.2.3 Resulting Data

The data obtained from the sorting of multi-unit waste includes the composition of the refuse, recycling and waste. This data is presented in Exhibit 3-9. The recycling success factors described above were calculated from the data in Exhibit 3-9. The resulting recycling success statistics are shown in Exhibit 3-10.

3.4.3 Data on Buildings

Information on the characteristics of the target buildings was gathered from central databases and building surveys.

3.4.3.1 Databases

Certain information on the building characteristics was gathered from four publicly-available databases.

- BYTES of the BIG APPLEtm MapPlutotm, maintained by the New York City Department of City Planning. From this database, information by address on the buildings' borough, block, lot, number of residential units, and number of floors was obtained from Access and imported into the project database. The URL address of this database is <http://www.nyc.gov/html/dcp/html/bytes/applbyte.shtml> and a printout of the first page of the web page is shown below.

BYTES of the BIG APPLE™

BYTES of the BIG APPLE is a family of software, data and geographic base map files for New York. The Department of City Planning offers these products for free download and license agreement.

[Data Files](#) | [Geographic Files](#) | [Applications](#)

Data Files: [Data Files](#) | [Geographic Files](#)

PLUTO™ © 2003-06. NYC Department of City Planning. All rights reserved.
License agreement required - please call 212-720-3505 for more information.

Extensive land use and geographic data at the tax lot level in ASCII comma-delimited files. The PLUTO files contain more than seventy fields derived from data maintained by various agencies. Tax lot data for selected tax blocks or Community Districts can be extracted using the PLUTO Select application which is included with this product.

Release	05D	User Guide	Sample
Date of Data	August 2005 - January 2006		
Price	\$250 Citywide		

PAD™ © 2005-06. NYC Department of City Planning. All rights reserved.
License agreement required - please call 212-720-3505 for more information.

The PAD (Property Address Directory) file contains additional geographic information at the tax lot level not found in the PLUTO files. This data includes alias addresses and E-911 Identification Numbers (BINs). It consists of two ASCII, comma delimited files: a street name file and an address file.

**NYC Department of Buildings
Buildings Information System**

Welcome to the Department of Buildings online query system. You can search for general information on a property in the city including recorded complaints and violations, actions, applications, and inspections. You can also search for information about tradespeople licensed by the Department. The information provided here comes directly from the Department's Building Information System. Look for additional functionality to be added in the future. If you have any questions please review these [Frequently Asked Questions](#), the [Glossary](#), or call the 311 Citizen Service Center by dialing 311 or (212) NEW YORK outside of New York City.

Using the BIS search features: When entering information in most queries, it is important to data enter complete information for fields such as Address, License Number and Job Number. Wildcard searches in most queries will not result in the retrieval of information unless specifically noted.

3.4.3.2 Building Surveys

3.4.3.2.1 Survey Teams

A series of on-site building surveys were conducted by the Project Team, supported by DSNY staff from the **BWPRR**. Shortly after the Spring and Summer Sorting Periods, Project Team members conducted surveys for the buildings that had been targeted during the preceding sorting period. The spring surveys were conducted during the weeks of June 6th and June 20th, 2005. The summer surveys took place during the weeks of September 12th and October 3rd, 2005.

During these weeks, each surveyor spent the day visiting target buildings and conducting a visual survey of the building and an interview with the building superintendent or owner. In some cases, the superintendent was not available and one or more follow-up visits were necessary. DSNY BWPRR staff provided logistical support, including driving to the buildings, helping to locate the superintendent, and in some cases, translating for the surveyor. The staffing of the building surveys is presented in Exhibit 3-11.

3.4.3.2.2 Survey Procedures

The goal of the survey was to complete the survey questionnaire which was designed around the 45 building characteristics (Exhibit 3-2). A visual inspection of each building during the site visit was conducted to provide information such as the state of maintenance and repair in the building, the location of the recycling area and the existence and quality of recycling signage. An interview with the building superintendent or owner was also conducted to obtain information such as the level of recycling enforcement, recycling area access hours and the number of recycling sorts required of residents. The surveyor also took photographs of the building's recycling and refuse areas. The building questionnaire is shown in Exhibit 3-12 and the summary of the chronology of the building surveys is presented in Exhibit 3-13. Despite these procedures and repeated efforts to meet with building superintendents, information on some buildings was incomplete because superintendents either did not know or could not be reached.

3.4.4 Data Management and Analysis

The management of sort data for the Multi-Unit Study was similar to the management of data for the Residential Study (Volume 2, Section 4 of the Final Report). Each morning, the Sample Management Forms were turned into the Data Manager who checked them for completeness and legibility. The data was then entered in the project database. Each evening, the Sample Detail Forms were turned in to the Director of Sorting and the Data Manager who checked them. Then this information was entered into the project database.

The information collected during the building surveys was sent to the Multi-Unit Study Task Manager who followed-up incomplete survey forms or ambiguous responses to survey questions. Despite repeated efforts to conduct surveys for the 156 target buildings, it was not possible to obtain surveys for two buildings. Therefore, 154 surveys from target buildings were used in the analysis.

In addition, because a number of samples from target buildings included non-target waste, the analysis included building surveys from 18 non-target buildings. Because the waste from these buildings was mixed with the waste from the target buildings, the recycling success factors for the non-target building were assumed to be the same as the recycling success factors from the target building. In all, 172 buildings were included in the analysis. Completed surveys were entered into the project database.

To initiate the analysis, data from the analysis of the waste and the results of the building surveys were aggregated by building. This aggregated data was used to conduct a multiple regression analysis. A more detailed description of the regression analysis is presented in Exhibit 3-1. The results of the analysis are presented below.

3.5 Results

The results of the Multi-Unit Study multiple regression analysis are presented in Tables 3-3 through 3-7. Each table shows the building factors that were found to be related to recycling success, the type of building factor and the coefficient. The discussions of each building factor describe the relationship between the building factor and recycling success. It should be emphasized that the results of the analysis show the relationships between the building factors and recycling success. These relationships do not necessarily imply causation. In some cases, the direction of the relationship is counterintuitive. The purpose of the discussion of each factor is to elaborate on the relationships shown by the analysis.

As discussed in Exhibit 3-1, the coefficient of each factor provides an estimate of the quantitative influence of each factor on recycling success. These estimates are subject to varying degrees of uncertainty and should be viewed as rough indications of the amount of influence.

Furthermore, the methods by which information about the factors was obtained may have some bearing on the interpretation of the results. For example, data that was obtained from published sources, such as census data, or information about the layout of the building that was directly observed by the building surveyors, may be more reliable than responses to questions by building management. Examples of potentially sensitive questions include whether the building staff regularly inspects refuse and notifies residents and whether recycling is mandated in the building.

Regression analysis involves testing the various building factors against the measure of recycling success to determine the factors have the strongest relationship to that measure. Five analyses were conducted for the Multi-Unit Study, one for each of the five measures of recycling success. However, each analysis was run many times with different combinations of building factors. The results shown in the tables below show the factors with the strongest influences. As noted, data on some buildings was incomplete. The five analyses on each of the five definitions of recycling success incorporated only buildings with information on all building characteristics. For example, in Table 3-3, complete information on the eight building factors shown in the results was available for 93 of the buildings in the Multi Unit Study. The factors are listed by “Factor Type” in the following order: Binary, Continuous, Discrete, and within each category by the size of the coefficients.

3.5.1 Diversion Rate without Contamination

Table 3-3
Building Factors Related to Diversion Rate without Contamination [1]
Results of Multiple Regression Analysis

	Building Factor	Factor Type	Coefficient ^{[2] [3]}
1	Buildings with clearly labeled recycling containers AND a clearly labeled recycling area.	Binary	4.80
2	Buildings with at least one elevator.	Binary	(4.26)
3	Buildings with visible pest problems in the recycling area(s).	Binary	(5.45)
4	Percentage of Building units reported to be occupied.	Continuous	0.20
5	Percentage of Census Tract that obtained a high school diploma or higher.	Continuous	0.19
6	Number of sorts reported to be required of Building residents.	Discrete	1.31
7	Number of Building units reported to be owner-occupied.	Discrete	0.12
8	Number of Building refuse points not co-located with recycling area(s).	Discrete	(0.98)

[1] Building factors ordered by factor type.

[2] Parameters estimated from 93 observations, i.e., 93 buildings had full information on all eight factors.

[3] Positive coefficients (figures with no parentheses) indicate that recycling success will increase if the building factor is present or is increased. Negative coefficients (figures in parentheses) indicate that recycling success will decrease if the building factor is present or is increased.

Table 3-3 shows that eight building factors were related to with “Diversion Rate without Contamination.” They are discussed below.

Table 3-3, 1: “Buildings with clearly labeled recycling containers AND clearly labeled recycling area(s)” is a binary factor that shows a positive relationship to Diversion Rate without Contamination. When recycling containers and recycling areas are clearly marked, the Diversion Rate without Contamination is expected to increase significantly. This makes intuitive sense and may be one of the key findings of the study, as it is a factor that may be influenced by building management and even DSNY more easily than many others. When clearly marked recycling containers and clearly marked recycling areas were considered separately, both showed a positive relation, but in combination, their relationship was stronger than their relationships separately.

Table 3-3, 2: “Buildings with at least one elevator” is a binary factor because it involves the answer to a “Yes-or-No” question. This factor is negatively related to with the Diversion Rate without Contamination. That is, in a building with at least one elevator, the diversion rate is expected to decrease. Or, said another way, buildings without any elevators are expected to have higher Diversion Rates without Contamination. This result is somewhat counterintuitive

because one might expect that elevators would make recycling easier. One explanation for this variable may be that recycling success is more likely to be higher in smaller buildings (i.e., those buildings without elevators) where the building superintendent may have more direct contact with residents. A more detailed discussion of this issue can be found in Exhibit 3-1.

Table 3-3, 3: “Buildings with a visible pest problem in the recycling area” is a binary factor that shows a negative relationship to Diversion Rate without Contamination. Again, this makes intuitive sense because a recycling area with a visible pest problem would probably be poorly maintained and less attractive to residents, leading to decreased recycling.

Table 3-3, 4: “Percentage of Building units reported to be occupied” is a continuous factor positively related to Diversion Rate without Contamination. It is not clear why high occupancy rates might help to boost recycling success.

Table 3-3, 5: “The percentage of the population of the census tract that obtained a high school diploma or higher” is a continuous factor because the percentage might be anywhere from 0 percent to 100 percent. The coefficient of 0.19 is positive because it suggests that for every percent increase in the population of census tract that obtained a high school diploma or higher, the Diversion Rate without Contamination should also increase. This makes intuitive sense because a more educated person might have a better understanding of the reasons for recycling and be more inclined to do so.

Table 3-3, 6: “Number of sorts reported to be required by building residents” is a discrete factor because the number of sorts that are required is a whole number. This factor shows a positive relationship to the Diversion Rate without Contamination. Although it might seem counterintuitive that residents required to sort recycling material into more bins (i.e., do more work) would achieve a higher diversion rate, it might be that the additional required sorts indicate a more serious approach to recycling in the building.

Table 3-3, 7: “Number of Building units reported to be owner-occupied” is a discrete factor that also shows a positive relationship to Diversion Rate without Contamination. It may be that the presence of owners in the building helps to foster a proprietary attitude that increases recycling. It may also indicate a more stable building population that is more familiar with building recycling rules.

Table 3-3, 8: “Number of building refuse points not co-located with recycling area(s)” is a discrete factor that shows a negative relationship to Diversion Rate without Contamination. Here co-location means that refuse and recycling can be taken to the same area of the building. If residents have to take their refuse and recycling materials to different locations in the building, this might discourage them from recycling, leading to a lower diversion rate.

3.5.2 Diversion Rate with Contamination

Table 3-4
Building Factors Related to Diversion Rate with Contamination [1]
Results of Multiple Regression Analysis

	Building Factor	Factor Type	Coefficient ^{[2] [3]}
1	Buildings with clearly labeled recycling containers AND a clearly labeled recycling area.	Binary	7.03
2	Buildings with visible pest problems in the recycling area(s).	Binary	(4.11)
3	Buildings with at least one elevator.	Binary	(4.65)
4	Percentage of Building units reported to be occupied.	Continuous	0.23
5	Percentage of Census Tract that obtained a high school diploma or higher.	Continuous	0.19
6	Number of sorts reported to be required of Building residents.	Discrete	1.72
7	Number of Building units reported to be owner-occupied.	Discrete	0.12
8	Number of Building refuse points not co-located with recycling area(s).	Discrete	(1.57)

[1] Building factors ordered by factor type.

[2] Parameters estimated from 93 observations, i.e., 93 buildings had full information on all eight factors.

[3] Positive coefficients (figures with no parentheses) indicate that recycling success will increase if the building factor is present or is increased. Negative coefficients (figures in parentheses) indicate that recycling success will decrease if the building factor is present or is increased.

Table 3-4 includes eight factors related to the Diversion Rate with Contamination. Given the similarity between this measure of recycling success and Diversion without Contamination, it should not be surprising that these are the same factors as those associated with Diversion Rate without Contamination. The factors are the same type and the relationships (positive or negative) to recycling success and the same as those in Table 3-3, however the coefficients of some of the factors are different.

3.5.3 Capture Rate without Contamination

Table 3-5
Building Factors Related to Capture Rate without Contamination [1]
Results of Multiple Regression Analysis

	Building Factor	Factor Type	Coefficient ^{[2] [3]}
1	Buildings with clearly labeled recycling containers.	Binary	4.84
2	Percentage of Building units reported to be occupied.	Continuous	0.28
3	Aggregate market value of Building (\$000) divided by number of units in the Building.	Continuous	(0.06)
4	Number of sorts reported to be required of Building residents.	Discrete	5.97
5	Number of Building units reported to be owner-occupied.	Discrete	0.19
6	Total number of violations and complaints for Building as reported by sources ^[4] .	Discrete	(0.16)

[1] Building factors ordered by factor type.

[2] Parameters estimated from 98 observations.

[3] Positive coefficients (figures with no parentheses) indicate that recycling success will increase if the building factor is present or is increased. Negative coefficients (figures in parentheses) indicate that recycling success will decrease if the building factor is present or is increased.

[4] Sources: Dept. of Housing Preservation and Dept. of Buildings.

Table 3-5 includes six factors related to Capture Rate without Contamination. These factors are discussed below:

Table 3-5, 1: “Building with clearly marked recycling containers” is a binary variable that shows a positive relationship to Capture Rate without Contamination. In Tables 3-3 and 3-4, this characteristic was combined with “Buildings with clearly labeled recycling areas. But in Table 3-5 the clear marking of recycling containers has been disaggregated from clearly marked recycling areas, suggesting that the clearly marked containers alone are enough to increase Capture Rate without Contamination significantly. It makes intuitive sense that clearly marked containers lead to more successful recycling.

Table 3-5, 2: “Percentage of Building units reported to be occupied” is a continuous factor that shows a positive relationship to Capture Rate without Contamination. This is the same factor and type of relationship shown in Tables 3-3 and 3-4. Buildings with a higher occupancy rate seem to show both a higher diversion rate and a higher capture rate. It is not clear why this is so.

Table 3-5, 3: “Aggregate market value of Building (\$000s) divided by number of units in the Building” is a continuous factor that shows a negative relationship to Capture Rate without Contamination. It is not clear why buildings with a higher market value per unit would have a lower capture rate.

Table 3-5, 4: “Number of Sorts Reported to be required by residents” is a discrete factor that shows a positive relationship to Capture Rate without Contamination. Again, this is the same factor and type of relationship shown in Tables 3-3 and 3-4. Buildings with a higher number of

sorts may have a more aggressive recycling program, leading to higher diversion and capture rates.

Table 3-5, 5: “Number of Building units reported to be owner-occupied” is a discrete factor that shows a positive relationship to Capture Rate without Contamination, just as it did in Tables 3-3 and 3-4. Buildings with more owners occupying units are expected to have more recycling success, perhaps because the greater sense of responsibility for the building among the residents. Owner-occupancy may also indicate a more stable building population that is more familiar with building recycling rules.

Table 3-5, 6: “Number of violations or complaints as reported by the City Department of Housing Preservation and Department of Buildings” is a discrete factor that shows a negative relationship to Capture Rate without Contamination. This makes intuitive sense because violations and complaints would indicate a poorly maintained building which might discourage residents from recycling.

3.5.4 Capture Rate with Contamination

Table 3-6
Building Factors Related to Capture Rate with Contamination [1]
Results of Multiple Regression Analysis

Building Factor	Factor Type	Coefficient ^{[2] [3]}
1 Buildings with clearly labeled recycling containers AND a clearly labeled recycling area.	Binary	13.57
2 Aggregate market value of Building (\$000) divided by number of units in the Building.	Continuous	(0.09)
3 Buildings with functional refuse chutes.	Binary	(10.95)
4 Number of sorts reported to be required of Building residents.	Discrete	6.80
5 Number of building refuse points co-located with recycling.	Discrete	2.11
6 Number of Building units reported to be owner-occupied.	Discrete	0.17
7 Total number of violations and complaints for Building as reported by sources ^[4] .	Discrete	(0.15)

[1] Building factors ordered by factor type.

[2] Parameters estimated from 96 observations, i.e., 96 buildings had full information on all seven factors.

[3] Positive coefficients (figures with no parentheses) indicate that recycling success will increase if the building factor is present or is increased. Negative coefficients (figures in parentheses) indicate that recycling success will decrease if the building factor is present or is increased.

[4] Sources: Dept. of Housing Preservation and Dept. of Buildings.

Table 3-6 has seven factors related to Capture Rate with Contamination. Four of these factors are identical to the factors in the Table 3-5.

Table 3-6, 1: “Buildings with clearly labeled recycling containers AND clearly labeled recycling area(s)” is a binary factor that shows a positive relationship to Capture Rate with Contamination. When recycling containers and recycling areas are clearly marked, the Capture Rate with Contamination is expected to increase significantly. This is an intuitive finding.

Table 3-6, 2: “Aggregate market value of Building (\$000s) divided by number of units in the Building” is the same factor in Table 3-5, a continuous factor with a negative relationship to Capture Rate with Contamination.

Table 3-6, 3: “Buildings with functional refuse chutes” is a binary factor that shows a negative relationship to Capture Rate with Contamination. It appears that when a building has functional refuse chutes, residents may be inclined to put all materials, refuse and recycling, into the chutes and therefore, smaller amounts of recycling materials are captured.

Table 3-6, 4: “Number of sorts reported to be required by residents” is a discrete factor that shows a positive relationship to Capture Rate with Contamination. This same factor appears in Table 3-5 and shows a positive relationship to capture rates.

Table 3-6, 5: “Number of building refuse points co-located with recycling” is a continuous factor that shows a positive relationship to Capture Rate with Contamination. This factor was also related to Diversion Rate and makes intuitive sense. When refuse and recycling areas are co-located, it makes it more convenient for residents to recycle.

Table 3-6, 6: “Percentage of Building units reported to be owner-occupied” is also a discrete factor that shows a positive relationship to Capture Rate with Contamination, just as it did in Tables 3-3, 3-4, and 3-5. Buildings with more owners occupying units appear to have more recycling success, perhaps because the greater sense of responsibility among the residents.

Table 3-6, 7: “Number of violations or complaints as reported by the City Department of Housing Preservation and Department of Buildings” is the same factor that was related to Capture Rate without Contamination, a discrete factor with a negative relationship to Capture Rate with Contamination. Again, violations and complaints would appear to indicate a poorly maintained building which might discourage residents from recycling.

3.5.5 Contamination Rate

Table 3-7
Building Factors Related to Contamination Rate [1]
Results of Multiple Regression Analysis

	Building Factor	Factor Type	Coefficient ^{[2] [3]}
1	Buildings where waste is inspected by building staff and violators notified.	Binary	13.20
2	Buildings with a messy recycling area.	Binary	12.08
3	Buildings with a clearly labeled recycling area.	Binary	(2.48)
4	Buildings where the recycling area is monitored by security camera or security personnel.	Binary	(4.64)
5	Buildings with functional refuse chutes.	Binary	(12.78)
6	Census Tract Household size.	Continuous	3.78
7	Number of Building units reported to be occupied.	Discrete	0.20
8	Number of Building units reported to be owner-occupied.	Discrete	(0.04)

[1] Building factors ordered by factor type.

[2] Parameters estimated from 91 observations, i.e., 91 buildings had full information on all eight factors.

[3] Positive coefficients (figures with no parentheses) indicate that recycling success will increase if the building factor is present or is increased. Negative coefficients (figures in parentheses) indicate that recycling success will decrease if the building factor is present or is increased.

Table 3-7 has eight factors related to the Contamination Rate. In this case, the Contamination Rate is a negative factor indicating the percentage of non-designated recycling in the material set out for recycling.

Table 3-7, 1: “Buildings where waste is inspected by the building staff and violators notified” is a binary factor with a positive relationship to the Contamination Rate. This is a difficult factor to explain. Regular inspection of waste and notification of violators would seem to suggest that the recycling program is carefully supervised and, for that reason, Contamination Rates would decrease, but they do not; instead Contamination Rates go up. It is possible that the data on which the analysis of this factor is flawed because building managers are being asked to evaluate their own performance. In other words, when asked if they inspect the trash and notify violators, they may say “yes” even if they don’t actually do it. It may also be possible that high Contamination Rates have led building managers to initiate regular inspections and, at the time of the survey, the Contamination Rates were still high.

Table 3-7, 2: “Buildings with messy recycling areas” is a binary factor with a very positive relationship to the Contamination Rate. Here “messy” means dirty, poorly maintained, or disordered. It is not surprising that buildings with unclean recycling areas would have high contamination rates in the recycling.

Table 3-7, 3: “Buildings with clearly marked recycling areas” is a binary factor with a negative relationship to the Contamination Rate. In other words, buildings with clearly marked recycling areas have lower Contamination Rates. Clearly marked recycling areas may indicate a more carefully maintained recycling program, leading to less contamination in the recycling materials.

Table 3-7, 4: “Buildings where the recycling area is monitored by security cameras or security personnel” is a binary factor with a negative relationship to the Contamination Rate. Buildings with secure recycling areas would suggest a well-run recycling program, leading to lower Contamination Rates.

Table 3-7, 5: “Buildings with functional refuse chutes” is a binary factor with a negative relationship to the Contamination Rate. The relationship between functional refuse chutes appears to be complex. As shown in Table 3-6 (#5), functional refuse chutes reduce the capture rate with contamination. At the same time, functional refuse chutes appear to reduce the Contamination Rate. One possible explanation may be that in buildings with functional refuse chutes, relatively few people recycle, but those that do, are quite careful about what they place in their recycling container. Another possibility is that residents in building with refuse chutes are using them to dispose of their refuse and not putting refuse into their recycling containers.

Table 3-7, 6: “Census Tract Household size” is a continuous factor with a positive relationship to the Contamination Rate. In other words, as household size increases the rate of contamination also increases. The explanation for this may be that in larger households, more people may be putting material in the recycling container and it is more difficult to keep recycling materials free of contamination.

Table 3-7, 7: “Number of Building units reported to be occupied” is a discrete factor with a positive relationship to the Contamination Rate. A higher percentage of the units occupied appears to increase the Contamination Rate.

Table 3-7, 8: “Number of units reported to be owner-occupied” is a discrete factor with a negative relationship to the Contamination Rate. As the percentage of owner-occupied units increases, the Contamination Rate decreases. As shown in previous tables, ownership appears to increase recycling success.

3.5.6 Summary of Binary Building Factors

Another way to view the results of the Multi-Unit Study regression analysis is to examine the recycling success for the buildings responding either “yes” or “no” to the binary building factors. Table 3-8 presents the nineteen binary building factors. The two columns under “Building Count” show the number of buildings found to have the factor, as the result of the building surveys, and the number of buildings without the factor. In the next ten columns, the average recycling success metric for the buildings with and without the building factor are shown.

For example, from the 172 building survey responses, 169 buildings either had, or did not have at least one elevator (the other 3 responses were incomplete). Of these 169 buildings, 27 buildings had at least one elevator and 142 did not. For those buildings that did have at least one elevator, the average Diversion Rate with Contamination was 16 percent. For those buildings without at least one elevator, the average Diversion Rate with Contamination was 19.5 percent. As Table 3-8 shows, the average diversion and capture rates for buildings without elevators were always higher than for buildings with at least one elevator. The Contamination Rates for these buildings was identical, whether or not they had elevators.

**Table 3-8
Summary of Average Recycling Success Statistics - Binary Building Factors**

Building Factor	Building Count ⁽¹⁾		Diversion Rate (%)				Capture Rate (%)				Contamination Rate (%)	
			With Contamination		Without Contamination		With Contamination		Without Contamination			
	Yes	No	Yes	No	Yes	No	Yes	No	Yes	No	Yes	No
At least one elevator	27	142	16.0	19.5	13.2	16.4	43.3	51.5	35.3	42.7	16.8	16.8
Accessible Recycling Area	154	15	19.9	9.6	16.7	8.0	52.5	29.1	43.5	24.1	17.3	10.4

Recycling Area Monitored	9	160	25.0	18.7	21.1	15.6	69.5	49.3	57.9	40.9	16.6	16.8
Recycling Area High Traffic	100	69	20.6	16.7	17.5	13.6	51.4	49.0	43.1	39.9	17.1	16.2
Recycling Area Open/Visible	132	36	19.8	16.1	16.5	13.6	51.9	44.4	42.9	37.4	17.4	14.5
Recycling Mandated in Lease	53	57	20.7	18.4	17.6	15.0	53.6	51.3	44.9	41.3	16.3	20.7
Recycling Mandated Other Comm. ^[2]	75	72	21.6	16.4	18.5	13.2	54.9	47.2	46.4	38.0	15.5	18.7
Staff Inspect Refuse	123	33	20.0	17.3	16.5	15.0	53.2	45.2	43.5	38.9	18.2	13.2
Recycling Area Outdoors	121	51	19.7	16.5	16.5	13.8	52.6	43.1	43.5	36.0	17.9	14.2
Recycling Area in Basement	19	153	20.5	18.6	17.8	15.4	55.6	49.1	47.8	40.4	14.3	17.1
Recycling Area on Each Floor	8	164	17.4	18.8	14.1	15.8	46.0	50.0	37.2	41.4	18.5	16.7

[1] The total number of buildings for each factor varies because some survey information was unavailable from certain buildings.

[2] Survey question relates to forms of communication other than the building lease that may mandate recycling in a particular building.

The results shown in Table 3-8 present only the results of binary factors. As Tables 3-3 through 3-7 show, the recycling success statistics were found to be related to a number of building factors (binary, continuous, and discrete).

Exhibit 3-1 Regression Methodology

E3.1.1 Introduction

The purpose of the Multi-Unit Apartment Study (“Multi-Unit Study” or “MUS”) was to identify and quantify the primary physical, operational, and demographic building characteristics that are related to recycling success. For instance, are indoor recycling areas or clearly marked recycling containers related to successful recycling in multi-unit apartment buildings? If so, to what extent would improving these areas improve recycling success? To analyze these building characteristics, a statistical procedure known as multiple regression analysis was used.

Developing a multiple regression equation involves using more than one independent variable in an equation to determine the extent to which these multiple variables explain the variation in the dependent variable. In other words, in this type of analysis, we want to analyze several building characteristics together in order to be able to distinguish each characteristic’s effect on recycling success. This discussion presents an explanation of how this procedure was used in the Multi-Unit Study, and what the results indicate.

E3.1.2 Multiple Regression

The purpose of this exhibit is to explain how the multiple regression analysis was used in the Multi-Unit Study.¹

Multiple regression equations are used to identify and quantify the influence of multiple independent variables on a single dependent variable. For the Multi-Unit Study, the independent variables (“external factors”) were formed from the 45 building characteristics. These included physical or structural characteristics such as the number of floors in the building and the presence of functioning elevators; operational characteristics, such as hours the recycling area is open and the signage on the recycling containers; and demographic characteristics, such as market value of the building’s units and the percentage of high school graduates in the building Census Tract. A full list of the building characteristics used in the analysis is presented in Exhibit 3-2.

The dependent variable in the regression analysis was “recycling success.” Five definitions of recycling success were used in the analysis: Diversion Rate Without Contamination, Diversion Rate With Contamination, Capture Rate Without Contamination, Capture Rate With Contamination, and the Contamination Rate. Therefore, five separate multiple regression equations were developed, one for each of the five definitions (see Table 3-1 in Volume 3 of the Final Report for more information about these definitions).

Since more than one external factor (building characteristic) may have an effect on the dependent variable (recycling success), the analysis simultaneously considered these various factors and combinations. All of the 45 building characteristics shown in Exhibit 3-2 were believed to have a possible effect on recycling success.

¹ Readers interested in learning more about multiple regression in general are encouraged to consult a first level college statistics textbook, such as Basic Statistics Using Excel and MegaStat, J.B. Orris (McGraw Hill Irwin), or Introductory Statistics, Wornacott and Wornacott (Wiley).

Exhibit 3-1 Regression Methodology (continued)

To begin to develop the multiple regression equation from this large set of variables, the analyst must first address two questions. First, which of the building characteristics are believed to be the most important ones, the primary “drivers” of recycling success? Second, which characteristics overlap? For example, the location of the recycling area and the presence of cameras in the recycling area both represent aspects of security. One or the other, or both, may be important in explaining recycling success. In the course of the analysis, one factor may be discarded in favor of the other, or both may be included or excluded. The analyst develops the regression equation by testing each of the building characteristics in a variety of combinations.

With 45 independent variables (i.e., building characteristics), each equation was developed through successive iterations in an attempt to ensure that (1) all those building characteristics that help to explain recycling success are included in the equation; and (2) those building characteristics that do not help to explain recycling success are excluded from the equation. The analyst may exclude characteristics either because their effect on recycling success cannot be accurately quantified as either helpful or harmful or because their effect on recycling success is already subsumed by another characteristic.

Once the analyst has decided which characteristics to include in the multiple regression equation and completed the analysis, the results not only indicate which building characteristics are related to recycling success, but also provide estimates of the quantitative relationship with building characteristic. That is, the equation indicates if a building characteristic has a large or small effect on recycling success.

E3.1.3 The Results

The results of the multiple regression analysis in Tables 3-3 through 3-7 in the Report show the building factors that were found to be related to each of the five recycling success factors. Each table shows the building factors that were found to be related to the “recycling success” factor, the type of factor, and the coefficient. The coefficient represents the amount of change, on average, in recycling success associated with a one-unit change in the independent variable (e.g., building factor), all other factors remaining constant. An explanation of one of the tables should help explain the results and Table E3-1 is reproduced here as an illustration.

**Exhibit 3-1
Regression Methodology
(continued)**

**Table E3-1
Multi-Unit Apartment Study
Building Factors Correlated to Diversion Rate without Contamination
Results of Multiple Regression Analysis**

	Building Factor	Factor Type	Coefficient ^[1]
1	Buildings with clearly labeled recycling containers AND a clearly labeled recycling area.	Binary	4.80
2	Buildings with at least one elevator.	Binary	(4.26)
3	Buildings with visible pest problems in the recycling area(s).	Binary	(5.45)
4	Percentage of Building units reported to be occupied.	Continuous	0.20
5	Percentage of Census Tract that obtained a high school diploma or higher.	Continuous	0.19
6	Percentage of Building units reported to be owner-occupied.	Continuous	0.12
7	Number of sorts reported to be required of Building residents.	Discrete	1.31
8	Number of Building refuse points not co-located with recycling area(s).	Discrete	(0.98)

[1] Parameters estimated from 93 observations.

Table E3-1 shows that there were eight building factors whose variations each help to “explain” variations in the diversion rate without contamination. Three types of building factors were included in the multiple regression analysis.

A “Binary” factor can be answered with a “yes” or “no”. “Buildings with clearly marked recycling containers” is a binary factor because the building surveyors were asked to determine if the building did, or did not, have clearly marked recycling containers. This factor is positively related to recycling success. That is, if a building has clearly marked recycling containers and recycling area(s), the regression analysis suggests that diversion rate will increase, holding all other factors constant. Here a “Yes” answer means a higher diversion rate than otherwise. On the other hand, “Buildings with visible pest problems in the recycling area” which is also a binary factor, is negatively related to recycling success. The regression analysis suggests that if a building’s recycling area has a visible pest problem, the diversion rate will go down, again, holding all other factors constant. Here a “Yes” answer means a lower diversion rate. These results make intuitive sense. Both of these characteristics are influential factors, but in opposite directions. The coefficient tells us that, of the 93 buildings on which this analysis was based, the buildings which had clearly labeled recycling containers and clearly labeled recycling areas could be expected to have a 4.8 percent improvement in the diversion rate without contamination, over buildings which have areas and containers which are poorly labeled or not labeled at all, other things being equal.

Exhibit 3-1
Regression Methodology
(continued)

“Continuous” factors are those that may have any value (e.g., 23.435). In the MUS, such variables were typically percentages and therefore ranged between “0” and “100”. For example, the percentage of the Census Tract population with a high school diploma or higher may range between 0 percent and 100 percent. In this case, the coefficient indicates that for every percentage increase in the population of the census tract that obtained a high school diploma or higher, the diversion rate without contamination would be expected to increase by 0.19 percent, all else equal.

A “Discrete” factor is one that has a limited number of possible responses. For example, the number of sorts required by building residents may be 0, 1, 2, 3, or 4. The coefficient for the number of sorts required by residents indicates that for each additional sort, the diversion rate without contamination could be expected to increase by 1.31 percent, all else equal.

Because the regression analysis includes three different types of factors, it is not a simple matter to identify the most influential building characteristic. To obtain the impact on recycling success for any given characteristic, one must know both the coefficient (included in the table above) and that characteristic’s units of measure. Having clearly labeled recycling containers and recycling areas (a binary factor) improves recycling success by about 4.8 percent (4.8×1). A similar impact could be expected on the diversion rate without recycling with an increase of 25 percent in the population in the census tract with a high school diploma or higher ($0.19 \times 25 = 4.8$).

While most of the results of the regression analysis in Section 3.5 are easily understood, some results may appear to be counterintuitive. For example, in Table E3-1, buildings with at least one elevator are negatively related to recycling, other things being equal. One might think that having an elevator would make recycling easier and more convenient. But the analysis does not support this interpretation. The analysis suggests that buildings with one or more elevators are associated with lower recycling success rates, once all other factors have been taken into account. One possibility that was considered was that the presence of an elevator might be proxy for some other characteristic, such as building size. For example, the presence of elevators might be a characteristic of large buildings and that large buildings, for whatever reasons, did not achieve high diversion rates without contamination compared to smaller buildings. However, our analysis examined the use of two characteristics of building size (number of floors and number of units) to test this hypothesis. The analysis showed that neither of these two characteristics was as indicative of (the lack of) recycling success as the presence of at least one elevator. It seems clear that the presence of at least one elevator is a proxy for some other factor that was either not included in the analysis or was included but for which complete data was not available.

While our analysis was not limited to factors within the purview of DSNY programs and/or building management, several of the important factors listed in the tables may be subject to their influence. As noted above, the building characteristics include both physical and operational characteristics, such as secure recycling areas and clearly labeled recycling containers. These are the types of characteristics that a building’s management and/or DSNY can affect to influence recycling success.

**Exhibit 3-2
Multi-Unit Building Characteristics**

	Premise	Data Source	Data Values
Building Factors			
1. Absence/presence of a central recycling location accessible on a daily basis	Daily availability of recycling increases participation	Visit	No=0, Yes=1
2. Percent of refuse discard locations with co-located recycling	Co-locating refuse and recycling increases recycling participation and reduces contamination	Visit	0-100%
3. Recycling location safety <ul style="list-style-type: none"> ■ Monitored by person or security camera ■ Inside locked/secure building ■ High-traffic area ■ Open visibility (not enclosed) ■ Bright lighting 	Safe recycling locations result in high participation and low contamination	Visit	No=0, Yes=1 No=0, Yes=1 No=0, Yes=1 No=0, Yes=1 No=0, Yes=1
4. Number of floors in the building	Multi-floor buildings without on-floor recycling locations have lower recycling rates	MapPLUTO	1-?
5. Number of residential units in the building	Minimum number of units are needed in order for hiring building staff to service central waste and recycling locations	MapPLUTO	6-?
6. Average square footage per resident	Low square footage per resident results in lower participation rates	Visit (residents) MapPLUTO (ft ²)	100-?
7. Functional trash chutes	Recycling must be as convenient, sanitary, pest/odor free, uncluttered as trash disposal	Visit	No=0, Yes=1
8. Functional recyclables chutes	Recycling must have same benefits as trash disposal Recyclables carts/bins may fill, smell	Visit	No=0, Yes=1
9. Functional elevators	Functioning elevators in multi-floor buildings increases recycling participation if on-floor locations are not offered	Dept. of Bldgs. Website and Visit ("working")	No=0, Yes=1
10. Adequate maintenance/custodial services	Inadequate funds/attention to maintenance and custodial service causes recycling service, elevator, and pest problems	Dept. of Housing Pres. & Dev. number of prior year violations	0-?

**Exhibit 3-2
Multi-Unit Building Characteristics
(continued)**

	Premise	Data Source	Data Values
11. Adequate building repair	Inadequate funds/attention to building maintenance and custodial service causes recycling service, elevator, and pest problems	Dept. of Bldgs. prior year complaints	0-?
12. Turnover of tenant population during the last year	High turnover contributes to low participation and poor quality	MISLAND Report CONEDBLK	% yearly turnover
Recycling Programmatic Factors			
13. Location of recycling participation area <ul style="list-style-type: none"> ■ Outdoors ■ Basement ■ On each floor ■ Recyclables are collected by maintenance/custodial staff outside each unit's door 	Participation improves with convenience	Visit	No=0, Yes=1 No=0, Yes=1 No=0, Yes=1 No=0, Yes=1
14. Number of units per recycling collection location	Participation improves with convenience	Visit	1-?
15. Number of recyclables sorts required of residents	High recycling participation and low contamination occur when building staff sort/separate for residents	Visit	0 (staff sort from waste) to 3 (paper, OCC, MGP)
16. Volume of available recycling containers	Participation/proper separation improve when recycling containers are properly sized so as to not overflow	Visit	cubic ft./unit
17. Labeling of recycling containers/recycling area <ul style="list-style-type: none"> ■ Recycling area clearly labeled/designated ■ Separately labeled containers for paper and MGP 	Clear signage improves participation and reduces contamination	Visit	No=0, Yes=1 No=0, Yes=1
18. Number of languages in which recycling signage is printed	Multi-language signage leads to improved participation and reduced contamination	Visit	1-?
19. General appearance of the recycling area <ul style="list-style-type: none"> ■ Pest problems observed (live or dead insects, rodents, or their droppings) 	Sanitary and clean area increases recycling participation	Visit	No=0, Yes=1

[1] All refuse and recycling samples were sorted at the North Shore and Green Point facilities, respectively.

[2] No recycling was available on the recycling collection day. Consequently, only 233 of 234 samples were sorted.

[1] All refuse and recycling samples were sorted at the North Shore and Green Point facilities, respectively.

[2] No recycling was available on the recycling collection day for 6 samples. Consequently, only 324 of 330 samples were sorted.

[3] For certain buildings, the recycling sample was sorted prior to the last refuse sample. Both of these samples were collected on the same day.

(1) The three recycling designations used here are:

R = Materials designated for recycling under New York City's current curbside recycling program during the study period.

PR = Materials from which markets exists and which may be added to a future New York City curbside recycling program.

NR = Material not designated for recycling under New York City's current curbside recycling program for which established or emerging markets do not exist.

[1] In calculating the Capture Rate, with Contamination, the following formula was used: Recycling/DR in Waste. In buildings with relatively high levels of contamination in the Recycling in comparison with the total amount of Waste, the amount of DR in the Waste Stream could be smaller than the amount of Recycling. The result would be a Capture Rate with Contamination of more than 100 percent. For example, building 30 set out Recycling that included 44 lbs of DR and 17 lbs of non-designated materials, and set out refuse with 11 lbs of DR and 66 lbs of refuse. Using the formula, Recycling/DR in Waste = 61/55 = 111%. In these cases, where the calculated Capture Rate with Contamination is greater than 100 percent, the Capture Rate with Contamination is shown as 100 percent.

[1] In calculating the Capture Rate, with Contamination, the following formula was used: Recycling/DR in Waste. In buildings with relatively high levels of contamination in the Recycling in comparison with the total amount of Waste, the amount of DR in the Waste Stream could be smaller than the amount of Recycling. The result would be a Capture Rate with Contamination of more than 100 percent. For example, building 73 set out recycling that included 367 lbs of DR and 132 lbs of non-designated materials, and set out refuse with 88 lbs of DR and 1,208 lbs of refuse. Using the formula, Recycling/DR in Waste = 499/455 =110%. In these cases, where the calculated Capture Rate with Contamination is greater than 100 percent, the Capture Rate with Contamination is shown as 100 percent.

**Exhibit 3-11
Building Survey Staffing List**

Building Surveyors	Affiliation	Survey Dates
Walt Davenport	R.W. Beck	Spring Survey, June 6 – 10, 2005
Mary Chamberlain	R.W. Beck	Spring Survey, June 6 – 10, 2005
Kerri Genden	R.W. Beck	Spring Survey, June 6 – 10, 2005
Lyndsay Hazen	Cascadia Consulting	Spring Survey, June 6 – 10, 2005
Walt Davenport	R.W. Beck	Summer Survey, Sept. 12 – 14, 2005
Andy Hayes	R.W. Beck	Summer Survey, Sept. 12 – 16, 2005
Nan Holmes	R.W. Beck	Summer Survey, Sept. 12 – 16, 2005
Dieter Eckels	Cascadia Consulting	Summer Survey, Sept. 12 – 16, 2005
Lyndsay Hazen	Cascadia Consulting	Summer Survey, Sept. 12 – 16, 2005
Nan Holmes	R.W. Beck	Summer Survey, Oct. 3 – 7, 2005
Karen Healy	R.W. Beck	Summer Survey, Oct. 3 – 7, 2005
Dieter Eckels	Cascadia Consulting	Summer Survey, Oct. 3 – 7, 2005
Lyndsay Hazen	Cascadia Consulting	Summer Survey, Oct. 3 – 7, 2005

Exhibit 3-12
Multi-Unit Building Survey Questionnaire

Address: _____ Zip Code: _____
Borough: [Brooklyn ____, Bronx ____, Queens ____, Manhattan ____]
Manager/Supr. Contact: _____ Phone: _____
Visit Date: _____ Staff Surveyor Name: _____

VISIT OBSERVATIONS

1. At least one recycling area accessible on a daily basis? Yes ____ No ____
2. Number of total recycling collection points? ____
3. Number of refuse disposal points? ____
4. Number of refuse disposal points co-located with recycling? ____
5. Functional trash chutes? Functional ____ Not Functional ____ No Chutes ____
6. Functional recycling chutes? Functional ____ Not Functional ____ No Chutes ____
7. Functional elevators? Functional ____ Not Functional ____ No Elevators ____
8. Recycling area(s) are:
 - Outdoors? Yes ____ No ____
 - Basement? Yes ____ No ____
 - On each floor? Yes ____ No ____
 - Collected by maintenance/custodial staff at each unit's door? Yes ____ No ____
9. Recycling area(s) clearly labeled or designated: Yes ____ No ____ No recycling area ____
10. Recycling containers clearly labeled for paper and MGP: Yes ____ No ____ No containers ____
11. How many languages used for recycling signage: ____ . Languages other than English _____
12. Number sorts required of residents:
 - 3 — MGP, Mixed +Paper, Corrugated Containers? Yes ____ No ____
 - 2 — MGP, Paper (including corrugated containers)? Yes ____ No ____
 - 1 — Recyclables (MGP and paper recyclables mixed together)? Yes ____ No ____
 - 0 — Maintenance/custodial staff remove recyclables from refuse? Yes ____ No ____
13. Recycling area(s) have pest problems (live or dead insects, rodents, or droppings)?
 - Yes ____ No ____ No recycling area ____
 - Refuse area(s) have pest problems (live or dead insects, rodents, or droppings)?
 - Yes ____ No ____
14. Recycling area(s) have functional ventilating fans or air fresheners
 - Yes ____ No ____ No enclosed recycling area ____
15. Recycling area(s) have more than minimal spillage and dirt/residue accumulation?
 - Yes ____ No ____ No recycling area ____

Exhibit 3-12
Multi-Unit Building Survey Questionnaire
(continued)

16. Recycling area(s) are:

Inside a locked/secure building? Yes ____ No ____

Monitored by a person or security camera? Yes ____ No ____

Located in a high-traffic area(s)? Yes ____ No ____

Open and visible (not enclosed)? Yes ____ No ____

Brightly lit? Yes ____ No ____

17. The dimensions of recycling containers are (measurement in inches):

Not applicable (e.g., chutes, or each unit provides their own bag or container): ____

Rectangular: Length ____ Width ____ Height ____ Number of containers of this size ____

Length ____ Width ____ Height ____ Number of containers of this size ____

Length ____ Width ____ Height ____ Number of containers of this size ____

Cylindrical: Diameter ____ Height ____ Number of containers of this size ____

Diameter ____ Height ____ Number of containers of this size ____

Diameter ____ Height ____ Number of containers of this size ____

Notes: _____

Exhibit 3-12
Multi-Unit Building Survey Questionnaire
(continued)

Building Address: _____

MANAGER QUESTIONS

1. How many units are occupied? _____ How many people live in this building? _____
 2. How many times per year do you remind residents of the need to recycle? _____
>0 → How do you provide this reminder (e.g., newsletter)? _____
ASK AT END → Can I see a copy? [*Number of times/year verified by observation* _____].
 3. Is recycling mandated in the lease or association documents?
Yes _____ No _____
ASK AT END → Can I see a copy? [*Verified by observation* — Yes ___, No ___]
 4. Is recycling mandated in newsletters or other informal building communications?
Yes _____ No _____
ASK AT END → Can I see a copy? [*Verified by observation* — Yes ___, No ___]
 5. Does building staff inspect refuse for recycling participation and notify violating units?
Yes _____ No, or no building staff _____
ASK AT END → Can I see a copy of a violation notice? [*Verified by observation* — Yes ___, No ___]
 6. How many hours per day are recycling areas accessible to residents? _____
 7. What percentage of unit residents are conversant in English? _____
 8. How many residential units are owner occupied? _____
- Go back to Questions 2, 3, 4, and 5 and ask to see copies.
-

Option Question

What is the average monthly rent or condo/co-op fee? \$ _____ Do residents pay separately for:

- | | | |
|------------------------|-----------|----------|
| Electric? | Yes _____ | No _____ |
| Gas? | Yes _____ | No _____ |
| Combined gas/electric? | Yes _____ | No _____ |
| Water/sewer? | Yes _____ | No _____ |
| Oil? | Yes _____ | No _____ |
-

Notes: _____

ONLY IF READILY AVAILABLE, AND AFTER SPEAKING WITH SUPER

BUILDING RESIDENT #1

1. Do you live in this building? Yes ____ No ____ [end interview]
2. How many times per year does building management remind residents to recycle? _____
3. Does building management tell residents that recycling is mandatory for your building?
Yes ____ How?
 - Verbally told when moving in ____
 - Lease or association documents ____
 - Newsletters or other informal building communications ____
 - Violation letters or notices to units that don't recycle ____No ____
4. Are recycling areas accessible to you 24 hours per day? Yes ____ No ____ No recycling area ____
5. Is there anything about your building that discourages or makes recycling difficult?

BUILDING RESIDENT #2

1. Do you live in this building? Yes ____ No ____ [end interview]
2. How many times per year does building management remind residents to recycle? _____
3. Does building management tell residents that recycling is mandatory for your building?
Yes ____ How?
 - Verbally told when moving in ____
 - Lease or association documents ____
 - Newsletters or other informal building communications ____
 - Violation letters or notices to units that don't recycle ____No ____
4. Are recycling areas accessible to you 24 hours per day? Yes ____ No ____ No recycling area ____
5. Is there anything about your building that discourages or makes recycling difficult?

O	New York City Literature Review Bibliography	O-1

Glossary of Abbreviations and Definitions

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
1989/1990 WCS	The waste characterization study conducted by the New York City Department of Sanitation in 1989 and 1990.
Absolute Variability	The variability from sampling unit to sampling unit, which is measured by the Standard Deviation.
Borough	The five political/geographic areas of New York City: Manhattan, Brooklyn, Bronx, Queens, and Staten Island.
Bulk Item	As defined for the NYC WCS, any item of waste that will not fit into a 96-gallon container.
BWPRR	Bureau of Waste Prevention, Reuse and Recycling
C&D	An abbreviation of construction and demolition debris, a material group in the NYC WCS.
Capture Rate	The amount of materials set out for residential recycling collection as a percentage of designated recyclable materials in both recycling and refuse streams. This ratio measures how much of the targeted materials are actually being recycled, which is a measure of how successfully such materials are recycled.
Census Tracts	Census tracts are small, relatively permanent statistical subdivisions of a county. New York City includes 2,217 census tracts containing on average about 4,000 inhabitants.
City	New York City
Confidence Interval	A range within which the true Mean of the population is believed to lie with the given confidence level.
Confidence Level	The certainty with which the true Mean lies within the interval determined. For the NYC WCS, a 90 percent confidence level is used. A 90 percent confidence level is the industry standard for Waste Characterization Studies. Note that the use of a 90 percent level instead of a 95 percent level (the standard for scientific research) does not (a) affect the calculation of means, only the width of intervals around the means or (b) preclude the application of a 95 percent confidence level to results if such an analysis is of interest.
Contamination Rate	The percentage of material that is found in the containers set out for residential recycling collection that is not accepted in New York City's curbside recycling program.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Correlation, negative	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A negative correlation occurs when one variable increases and the other variable decreases.
Correlation, positive	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A positive correlation occurs when one variable increases and the other variable also increases.
Count	The process of counting the individual items that were subsorted.
Curbside Collection	The collection of residential refuse or recycling in bins or bags set out in proximity to residences that generate these types of waste. DSNY provides curbside refuse collection to all residents two or three times per week and recycling curbside collection once per week.
Density/Income Strata	Divisions of New York City's population based on median housing density and median household income.
Deposit (containers)	Beverage containers for which, under the New York State Redeemable Container Law, the purchaser is required to pay a deposit. The deposit may be redeemed when the empty containers are returned to a retailer or authorized redemption center.
District	The 59 areas within New York City used by the Department of Sanitation to administer the City's waste management program. These districts are co-terminus, or identical, to the 59 Community Districts.
Diversion Rate	The amount of materials set out for recycling collection as a percentage of the total residential waste collected.
DSNY	Department of Sanitation of New York City
Dual-bin Trucks	DSNY collection trucks with two compartments used for the simultaneous collection of curbside residential Paper and MGP.
Durable	An item of residential waste that is not putrescible, packaging, or unfinished material, but is a durable object, such as an appliance, piece of furniture, or other household item.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Film (Plastic)	A category of flexible plastic materials used for packaging, trash bags and other applications, typically made of polyethylene or polypropylene.
HDPE	An abbreviation for high density polyethylene; a plastic denoted by a #2 inside the chasing arrows recycling symbol.
HHW	An abbreviation for Household Hazardous Waste, one of the material groups in the NYC WCS.
H/H	An abbreviation for the high housing density and high income stratum.
H/L	An abbreviation for the high housing density and low income stratum.
H/M	An abbreviation for the high housing density and medium income stratum.
Illegally Disposed Street Basket Waste	Residential or commercial waste that is illegally disposed of in street baskets (e.g. home-use products, such as large detergent bottles, cereal boxes, or personal mail; construction materials, etc.).
L/H	An abbreviation for the low housing density and high income stratum.
L/M	An abbreviation for the low housing density and medium income stratum.
Late Week/Early Week	A criterion used in the PWCS based on the idea that the composition of the waste discarded during the latter part of a week differs significantly from the composition of waste discarded during the early part of a week.
LDPE	An abbreviation for low density polyethylene, a plastic denoted by #4 inside the “chasing arrows” recycling symbol.
Lower Boundary	For a given material, the lowest average percentage of that material expected in the population consistent with the sample, at the confidence level specified.
M/H	An abbreviation for the medium housing density and high income stratum.
M/L	An abbreviation for the medium housing density and low income stratum.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
M/M	An abbreviation for the medium housing density and medium income stratum.
Material Categories	The classification of all materials in the waste stream into categories for sorting, weighing, and counting purposes. In the NYC WCS, 91 Material Categories were used to characterize the City's waste stream.
Material Groups	Groupings of material categories used to simplify or generalize results. The Material Groups used in the NYC WCS are: Paper, Plastic, Glass, Metal, Organics, Appliances/Electronics, Construction and Demolition Debris, Miscellaneous Inorganics, and Household Hazardous Waste.
Mean	The sum of the values of all observations divided by the number of observations, also known as average. In analyzing the composition of samples of waste, refuse, recycling, and the contents of street baskets, the best estimate of the true percentage of each material in the population is the Mean percentage of that material from all of the samples.
MGP	An abbreviation for Metal, Glass, and Plastic. One of the two streams of recycling collected by the DSNY consisting of plastic bottles and jugs; glass bottles and jars; metal cans and household objects; aluminum foil, trays and cans, and gable top beverage cartons. The other stream of recycling collected by DSNY is Paper.
Mixed Cullet	Broken glass in small pieces (under 3" x 3") of mixed color.
Moisture and Particulate Test	A laboratory test that determines the amount of moisture in a sample of material and determines the amount of fugitive or foreign material adhering to the sample.
Multiserve (containers)	Beverage containers with a capacity of more than 24 ounces of liquid.
Multi-Unit Apartment Study or Multi-Unit Study (MUS)	The component of the 2004/2005 waste characterization study that examined the correlation between the physical and operational characteristics of multi-unit buildings (those buildings with 6 or more residential units) and recycling success.
Non-deposit (containers)	Beverage containers which are not designated as deposit containers under the New York State Redeemable Container Law.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
NYC	New York City
NYC WCS	New York City Waste Characterization Study
Observation	The value(s) associated with a given sampling unit.
OCC	An abbreviation for old corrugated cardboard, one of the material categories in the PWCS and the NYC WCS.
ONP	An abbreviation for old newspaper, one of the material categories in the PWCS and the NYC WCS.
Paper	The second of two streams of recyclable materials collected by DSNY consisting of newspapers; magazines; catalogues; junk mail; white office paper; mixed paper; and gray and corrugated cardboard/paperboard. The other stream of is Metals/Glass/Plastic (MGP).
PET	An abbreviation for polyethylene terephthalate, a plastic denoted by #1 inside the “chasing arrows” recycling symbol.
Population (Statistics)	The entire aggregation of items from which a sample can be drawn. In the NYC WCS, the population was all of the residential waste collected at the curb by DSNY.
PP	An abbreviation for polyethylene propylene, a plastic denoted by #5 inside the “chasing arrows” recycling symbol.
Potential Deposit	Beverage containers which are not currently designated as deposit containers under the New York State Redeemable Container Law, but which may be designated in future legislation.
PS	An abbreviation for polystyrene, a plastic denoted by #6 inside the “chasing arrows” recycling symbol.
Pure Routes	DSNY Refuse and Recycling collection routes that include only residences from a single housing density and income stratum.
PWCS	The preliminary waste characterization study conducted by the New York City Department of Sanitation in 2004.
PVC	An abbreviation for polyvinyl chloride, a plastic denoted by #3 inside the “chasing arrows” recycling symbol.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Recycling	The act of recovering items or materials that might have been discarded and, usually after processing, returning them to the stream of commerce. Also, the materials that are set out for recycling collection.
Recycling Subindicators	A set of abbreviations used to indicate; i) those materials designated for recycling under New York City’s current curbside recycling program during the study period (“R”); ii) those materials for which markets exist and which could be added to a future New York City curbside program (“PR”); and iii) those materials that are not designated for recycling under New York City’s curbside recycling program because established or emerging markets do not presently exist (“NR”).
Refuse	Items or materials that are discarded and disposed.
Relative Variability	The variability from Sampling Unit to Sampling Unit in relation to the Mean. This is calculated by dividing the Standard Deviation by the Mean.
Residential Study	The component of the 2004/2005 waste characterization study that addressed the generation and composition of the curbside residential waste.
Sample	A portion of a population used to estimate the composition of the population as a whole. The Sample is made up of multiple Sampling Units.
Sample Acquisition, or Sampling	The procedure for selecting Sampling Units from the population.
Sample Number	The number of sampling units in a sample.
Sample Weight	The weight of a sampling unit. In the WCS, each refuse sampling unit was between 200 and 300 pounds.
Sampling Unit	A single elementary unit used as the basis for estimating the composition of the population.
Section	Each of the City’s 59 Sanitation Districts is divided into 3 to 5 Sanitation District Sections within which routes are designed and tonnage data collected daily.
Single-serve (containers)	Beverage containers with a capacity of less than 24 ounces of liquid.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Sorting	The procedure for separating a heterogeneous amount of material, such as a 200 pound Sampling Units of refuse, into its constituent material categories.
Sorting Period	The days or weeks when the sampling and sorting of waste took place during the NYC WCS.
Standard Deviation	A measure of the dispersion or variability around the Mean of the weights of a group of Sampling Units of New York City waste.
Street Basket Waste Study	The component of the 2004/2005 waste characterization study that addressed the composition of the street basket waste.
Subsorts	The process of sorting a particular material into smaller constituent components (e.g. drinking containers were subsorted into deposit and non-deposit containers).
Upper Boundary	For a given material, the highest average percentage of that material expected in a population consistent with the sample, at the confidence level specified.
Waste	The combination of Refuse and Recycling
Waste Generation	The rate at which waste is set out for collection, typically reported in terms of amounts per generator per time period (e.g. pounds per capita per week).
WCS	The waste characterization study conducted over four seasons by the New York City Department of Sanitation in 2004 and 2005.

Final Report, Volume 4**

Appendix A: Field Procedures and Training Manual

[This page intentionally left blank.]

Appendix A Field Procedures and Training Manual

Introduction

The purpose of this manual is to describe the field procedures used in the Preliminary Waste Characterization Study ("PWCS") and the Waste Characterization Study ("WCS") for the Department of Sanitation of New York City ("DSNY").

Although R. W. Beck, Inc. ("R. W. Beck") and its subcontractors, Cascadia Consulting, Inc., Organics Recycling, Inc. and Camp Dresser McKee, have conducted numerous waste characterization studies, the magnitude and complexity of the PWCS and WCS called for a special level of organization and procedures and these are described below.

This Manual is based on R.W. Beck's experience during the PWCS and WCS, incorporating various changes in field procedures and training that were made during these studies. Before each sorting period, an Operations Plan was submitted to DSNY and these plans are presented in Appendices C (Volume 4) of the Report.

The Manual includes an overview of the Field Activities, a description of the roles of the key field personnel, a discussion of the field training program, an explanation of the sampling and sorting procedures, and a series of discussions and recommendations related to "Lessons Learned" during the PWCS and WCS.

Overview of Field Activities

The PWCS and WCS consisted of six sorting periods between May, 2004 and August, 2005. During each sorting period, a group of professional staff supervised the work of acquiring samples of waste, sorting these samples, and recording the resulting data. Table A-1 shows the dates and streams of waste sampled and sorted during each sorting period.

**Table A-1
PWCS and WCS Sampling and Sorting periods**

Sorting Period	Dates	Streams Sorted ⁽¹⁾
PWCS	May 15 – 28, 2004	Refuse
PWCS	June 7-12, 2004	MGP, Paper
WCS – Fall	October 18 – November 6, 2004	Refuse, SBW, MGP, Paper
WCS – Winter	March 8 – 29, 2005	Refuse, SBW, MGP, Paper
WCS – Spring	May 9 – 27, 2005	Refuse, SBW, MGP, Paper, MUR, MURE
WCS – Summer	August 1– 27, 2005	Refuse, SBW, MGP, Paper, MUR, MURE

(1) The streams of waste included residential refuse ("Refuse"); metal, glass and plastic recycling ("MGP"); paper recycling ("Paper"); street basket waste ("SBW"); refuse from multi-unit apartment buildings ("MUR"); Recycling from multi-unit apartment buildings ("MURE").

During these periods, all field personnel worked a six-day week to match the DSNY's weekly waste collection schedule. The refuse and recycling sampling was carried out between midnight to early morning at four transfer stations. The sampling for the Multi-Unit Study took place between about 2:00 a.m. and mid-morning. Sorting took place between 7:00 a.m. and the late afternoon.

The Multi-Unit Study also required a series of building surveys and the field work related to these surveys is discussed in some detail in Volume 3 of the Final Report.

Key Professional Staff

During each seasonal sorting period, all personnel worked a six-day week to match the DSNY work week. For the PWCS and WCS, the key professional field personnel included:

- A Logistics Manager;
- A Director of Sampling;
- Sample Managers;
- A Director of Sorting;
- Two Field Supervisors;
- Crew Chiefs; and
- A Data Manager.

The roles of these key personnel during field activities are described below.

Logistics Manager

The Logistics Manager ("LM") had the responsibility attending to all logistical details that arose during the sorting period, including purchasing equipment and supplies, arranging for lunches, overseeing equipment repair, and responding to any health or medical emergencies. Many of the responsibilities involved spur-of-the-moment problems that could not be addressed by the professionals because of their sampling or sorting duties.

Daily Activities

As suggested above, the daily activities of the LM were rarely routine. Usually, the day began by purchasing supplies and equipment requested by the Sample Managers and Crew Chiefs the previous evening. These supplies included safety and sorting equipment, office supplies, and water and snacks for the sorting crews. Supplies were provided to personnel at the North Shore Transfer Station, the Greenpoint Transfer Station, and the Data Center at the hotel.

Repairs to sorting tables or scales were taken care of by the LM. When the rental trucks used for sampling malfunctioned or required attention, the LM delivered them to the garage for repairs. The LM arranged for lunches at both sorting sites and arranged for the shipping of samples to the laboratory for moisture and particulate testing. Occasionally,

the LM filled in as a Crew Chief or Sample Manager when existing personnel were indisposed or the schedule was tight. In general, the LM dealt with emergencies, unmet needs, and unforeseen circumstances.

Other Responsibilities

The LM had certain seasonal responsibilities as well. These included helping to arrange for temporary workers before the beginning of each sorting period. Before the Winter Sorting Period, the LM arranged for tents and heaters at both sorting sites and ensured that they were properly maintained during the sorting period.

Director of Sampling

The Director of Sampling (“DSAM”) had the overall responsibility of acquiring samples during each sorting period. These responsibilities included staffing, staff training, oversight of equipment, relations with transfer station personnel, and supervision of the sampling procedures. Like the Sample Managers, the DSAM worked from about 9:30 p.m. until all samples had been acquired the following morning.

During the spring and summer sorting periods, when the Multi-Unit Study (“MUS”) was implemented, MUS sampling took place from about 2:00 a.m. to 10:00 a.m. To provide some relief for the DSAM if the MUS samples were late in arriving, the LM sometimes took on the DSAM’s duties in the morning.

Daily Activities

The DSAM’s daily shift began with a meeting of all Sample Managers between 9:30 p.m. and 10:00 p.m. each evening to inform Sample Managers of any changes in schedule, distribute truck assignments, and make any other announcements. During the night, the DSAM traveled among the sampling sites, often providing help at sites where the largest number of samples were being acquired. The DSAM was also the primary contact with DSNY staff stationed at the Harlem River Yard and Hugo Neu transfer stations. All emergencies were relayed to the DSAM who had the responsibility of ensuring they were taken care of. When all samples had been acquired for the day, the DSAM’s final responsibility was to file a status report with the Project Manager on that night’s activities.

Other Responsibilities

Before each sorting period, the DSAM helped to select and recruit Sample Managers and worked with the Project Manager and Data Manager to set up the sampling schedule. After each sorting period, the DSAM provided a list of the temporary workers to be asked to return and made recommendations on changes in procedures, staffing, and equipment and supplies for the coming sorting period.

Sample Manager

The Sample Manager (“SM”) was responsible for properly acquiring, recording and delivering samples of waste to the appropriate sorting site. Throughout the PWCS/WCS, four sampling sites were used: (1) Waste Management’s Harlem River Yard transfer station; (2) Waste Management’s Varick I transfer station; (3) Hugo Neu Long Island

City transfer station; and (4) Metropolitan Paper's Brooklyn transfer station. One or two SMs were assigned by the DSAM to each sampling site, depending on the number of samples to be acquired on a given night, the volume of traffic at each site, and the level of DSNY staff support at the site. Each SM worked with an assistant, a temporary worker assigned by the DSAM, who helped with all aspects of sampling except data recording.

Daily Activities

The SM's day began with a meeting with the DSAM between 9:30 p.m. and 10:00 p.m. each evening to learn about any changes in schedule or other announcements and get that night's truck assignments. The SM then drove to one of the sorting sites where the rental trucks were parked, met his/her assistant, loaded the truck with the scale, rakes, the requisite number of toters and other equipment, and drove to his/her assigned sampling site.

The SM and his/her assistant typically arrived at the transfer station/sampling site between 11:00 p.m. and 11:30 p.m. Upon arrival, the SM checked in with the Facility Manager and/or the DSNY staff assigned to that facility. The SM distributed copies of the truck number assignments for that day to the facility staff and DSNY staff. The Sampling Team was then assigned an area of the facility to stage the toters, scale and other equipment. After unloading the equipment and completing necessary paperwork, the SM waited for the first truck to arrive.

As each DSNY collection truck arrived, the truck number was checked by the DSNY staff and/or the SM or the facility staff to determine if the truck number corresponded to the truck number provided by DSNY for sample trucks. If a sample was to be acquired from that truck, the driver was notified and the truck sent to specific area in the facility where the driver tipped its load.

Once the sample truck's load had been tipped, the sample was acquired according to the sampling protocol described in Volume 2, Section 4. The toters with the acquired samples were then loaded on to the sampling team's rental truck. As the end of the shift approached, usually between 6:00 a.m. and 7:00 a.m., the SM would contact the DSNY staff or the DSAM to check on any missing sample trucks. Missing trucks were trucks that had broken down, had tipped their loads early, or tipped their loads at an incorrect location. In the case of a truck break-down, the DSAM worked closely with the DSNY staff to determine if the sampling team should wait for the truck to be repaired and sent on to the transfer station, or if the truck would not be coming. The sampling procedures included the provision of back-up samples to replace samples not acquired due to truck break-downs or other reasons.

At the end of the shift, when all samples had been acquired, the SM and assistant drove the samples back to the sorting sites. Samples of refuse were delivered to the North Shore MTS and samples of recycling were delivered to the Greenpoint MTS. Upon arrival at the MTS, the SM and his/her assistant unloaded all samples, stowed the equipment and parked the truck. The SM checked in with the DSAM to report any unusual circumstances, including samples not acquired, equipment or truck malfunctions, or other incidents.

Director of Sorting

The Director of Sorting (“DSORT”) had the overall responsibility of the proper sorting of samples during each sorting period. These responsibilities included staffing, staff training, quality control, oversight of equipment, and supervision of the Field Supervisors and the Crew Chiefs. The DSORT, along with other personnel involved in sorting, began the day about 6:30 a.m. and typically finished in the late afternoon.

Daily Activities

The DSORT began the day meeting with the Field Supervisors to determine the number of samples to be sorted that day. The number of samples to be sorted was determined jointly by the Project Manager, Data Manager, the DSORT, and the Field Supervisor. Before the sorting period began, a provisional sorting schedule was drafted. However, during the course of the sorting period, this provisional schedule would be modified almost every day, due to unforeseen circumstances, such as illnesses, absences among the sorters, missed samples, as well as the efficiency of the sorting crews.

During the day, the DSORT would move between the two sorting sites, checking on the crews’ productivity, assessing equipment needs, and assisting Field Supervisors and Crew Chiefs in their duties. The DSORT would recommend changes in sorting procedures or personnel, if he believed it would increase productivity without compromising the sorting protocol (Volume 2, Section 4).

As samples were sorted and weighed, the DSORT would make sure that empty totes were properly staged for the SMs. The DSORT worked closely with the Field Supervisors and Crew Chiefs throughout the day.

As noted above, back-up samples were acquired in case samples were lost through sampling or sorting errors. The final protocol for back-up samples called for at least two extra samples for each density/income stratum and two for street basket waste. This was a total of at least 18 samples. The management of back-up samples was one of the duties of the DSORT, as well as other supervisors.

At the end of the day, the DSORT would return to the Data Center with the Field Supervisors and Crew Chiefs to check the Sample Detail Forms before they were turned over to the Data Manager and her staff. Once the paperwork had been completed, the DSORT, in consultation with the Field Supervisors, Data Manager and Project Manager, confirmed the number of samples that would be sorted during the following day.

Other Responsibilities

Before each sorting period began, the DSORT would work with the Project Manager to identify the Field Supervisors and Crews Chiefs during that period. The DSORT would work with the Logistics Manager to address special equipment needs, such as the tents and heaters used during the winter sorting period, or the additional sorting tables needed for the Multi-Unit Study.

Field Supervisor

The Field Supervisor (“FS”) had overall responsibility for operation of the sorting sites. Both the Greenpoint Marine Transfer Station and the North Shore Marine Transfer

Station were used as sorting sites. The FS supervised the sorting crews and all activities within his/her facility. The FS worked with the DSORT to check incoming samples of waste and determine the number of samples to be sorted during a given day. The FS was also responsible for ensuring a smooth flow of samples to the sort areas, thereby keeping the sorting crews productive throughout the day.

Daily Activities

The FS was responsible for ensuring that the Crew Chiefs (“CCs”) had the labor necessary to complete the target samples and to communicate with the CCs to determine if any modifications or substitutions needed to be made with the sort crew. (Direct supervision of the sort crew was left to the Crew Chief.)

The FS was responsible for making sure that all aspects of selecting samples, transporting samples to the sort area, and removal of sorted material were handled as efficiently as possible. The FS was in continual communication with the Crew Chiefs to ensure the sorting crews had ample material to sort, as well as the necessary tools and supplies. The FS was ultimately responsible for adherence to the Health and Safety Plan, and the communication of the contents of the Plan to the Crew Chiefs and the sorting crews.

Along with the Director of Sorting, the FS was responsible for setting up the training program for professional staff and temporary workers. The FS was also responsible for seeing that roll-off containers for the disposal of sorted material were in place, and accessible for removal. The FS coordinated the removal of full roll-off containers with DSNY.

After the sorting began, the FS monitored the progress of the sorting teams and addressed obstacles that were impeding the sort process. Overcoming these obstacles might include arranging for the purchasing of additional supplies, requesting changes in sorting team personnel, changing times of operations, and managing health and safety issues that arose.

The FS also made periodic quality control checks to ensure accuracy and consistency among all sorting crews. These checks consisted of examining bins to see that only the proper materials were in each bin and that material was not being dropped on the floor. The FSs at the sorting sites worked with each other to ensure consistency between the two sites. For example, in cases where there was a question about a specific material or product, the two FSs and the DSORT would check with DSNY and then ensure that a consistent procedure was put in place at both sorting sites.

The FS assisted the CC with sub-sorts, the street basket illegal waste protocol (see below) and moisture sampling. Each Friday, the FS signed sorters’ timesheets and handed out paychecks. The FS communicated regularly with the DSORT, the DSAM and Data Manager about missed samples and the need to sort back-up samples.

At the end of the day, the FS was responsible for seeing that the sorting site was swept clean and set up for the next day’s sorting. The FS also checked the completed Sample Detail Forms to see that they were complete and legible, before they were turned over to the Data Manager.

Other Responsibilities

Before each sorting period, the FS worked with the DSORT and the Project Manager to select and recruit Crew Chiefs. The FS was also consulted on all issues pertaining to his/her sorting site, including the configuration of tables, staffing, and schedule. The FS also worked with DSNY on special activities such as tours of the sorting site, the project video and the stockpiling of durable bulk items for analysis. At the end of each sorting period, the FS and DSORT would identify outstanding temporary workers who would be asked to return the following sorting period.

Crew Chief

The Crew Chief (“CC”) had the overall responsibility of managing his/her designated sort area and the actual sorting and weighing of waste samples. This included coordinating with the Field Supervisor (FS) to receive and track samples and managing the sort crew during sample loading, sorting, weighing, and recording of waste samples.

Daily Activities

The CC was responsible for ensuring that the sorting area was safe, efficient and supplied with the necessary equipment. This included setting up the sort table, material bins, and scale in a logical layout and having daily supplies of health and safety gear and miscellaneous sort equipment on hand.

The CC was responsible for all aspects of the direct supervision of the sorting team, including reinforcing safety training, sorter training, and communicating labor needs to the FS and DSORT. The CC was also responsible, along with the FS, for scheduling breaks and lunches, communicating the estimated schedule to the sorting team, motivating the sorting team, setting realistic goals for the team, and refining the sort team as needed to ensure the successful completion of the target samples.

The CC was directly responsible for ensuring that each sample was sorted efficiently and correctly, with a minimal amount of downtime. This entailed ensuring that material was correctly sorted into the proper bins, that the bins were properly weighed and the weights recorded, that the sorted material was disposed correctly in roll-off containers, and that the next sample was pre-weighed and prepared for sorting. The CC supervised all weighing of sorted material, including a final inspection of each bin prior to recording the weight. The CC continually inspected each bin during the sort to ensure the sorters were identifying and separating the material correctly.

The CC was responsible for data tracking and recording during the sorting process. This included coordinating with the FS to track incoming samples, tracking the weight of each sample to be sorted during the pre-weighing process, recording the container tare weights on the first and last day of the sorting period, recording all weights of sorted material bins for each sample, accurately and completely filling out the Sample Detail Forms for each sample and returning the forms to the FS at the end of the day.

The CC was directly responsible for the health and safety of the sort team. This included knowledge of the firm’s Health and Safety Plan, oversight of all sorters to ensure proper and consistent use of safety equipment, training of the sort crew in proper waste handling

techniques, and awareness of the facility safety requirements and procedures to follow in case of an emergency.

Data Manager

In the field, the Data Manager had the responsibility of collecting, checking, and verifying all data developed by the sampling and sorting operations and entering the data into the project database. During the PWCS and the Fall Sorting Period of the WCS, the Data Manager and her team of analysts operated from their office in Orlando, Florida. During the winter sorting period, the Data Manager and one assistant operated from an on-site office in the hotel where the field personnel were housed. Temporary workers were used to input data. During the spring and summer sorting periods, the entire Data Management Team (i.e., Data Manager and five analysts) operated from the on-site office.

Daily Activities

The Data Manager supervised all activities of the Data Management Team from 9:00 a.m. to 6:00 p.m. six days per week.

Truck Number Protocol

Typically, the first responsibility of the day for the Data Manager was to receive, compile, and distribute truck numbers. Six mornings a week, DSNY faxed the numbers of trucks collecting residential refuse, street basket waste, and recycling from the routes selected for sampling on that day. The Data Management Team transferred these truck numbers to several forms. Copies of the truck numbers for that day were:

- Faxed to the DSNY staff;
- Faxed to facility staff at the transfer stations;
- Given to the DSAM who handed them to SMs at the evening meeting; and
- Retained by the Data Management Team for their records.

Occasionally, DSNY made changes in the truck numbers during the day. These changes were reported by telephone to the Data Manager who revised and redistributed the forms.

A separate procedure was used for communicating the numbers for trucks collecting waste for the MUS. Refuse and recycling for the MUS was collected in DSNY trucks specifically designated to pick up this waste from individual buildings. These special collections took place between 6:00 a.m. and 8:00 a.m. each morning. DSNY did not determine the truck numbers for these special collections until midnight of the day the collections were to take place. When the truck numbers were determined, the DSNY Collections Bureau reported the number by telephone to the BWPRR staff assisting at the Hugo Neu Transfer Station. The BWPRR staff then relayed the truck numbers to the DSAM, who in turn relayed it to the SMs responsible for acquiring MUS samples and to the Data Manager.

Other Responsibilities

The Data Management Team received and checked the Sample Management Forms and Sample Detail Forms for completeness and legibility before transferring the data from the forms to the project database. Running totals were continually checked against the Sample Management Plan for that season. The Data Management Team was constantly in touch with other members of the Project Team to report progress, check data, and confirm target samples.

The Data Manager also selected and monitored the acquisition of back-up samples. These were necessary to protect against the loss of samples from missed deliveries of samples or errors in sorting. She also selected random samples to be tested for moisture and particulates. In addition, photographs of illegal Street Basket Waste (see below) and sampling and sorting Operations Plans were stored electronically by the Data Management Team.

Field Training

The training of both professional staff and temporary workers took place at the beginning of each sorting period. Although almost all of the professional staff had prior experience in waste characterization studies, it was necessary to provide training to familiarize them with those aspects of the procedures which were unique to the PWCS/WCS.

Training Schedule

The training of Sample Managers took place before the first samples were taken. Training included an explanation of the sampling procedures the day before sampling began, as well as “on-the-job” training during the first few nights of sampling during each sorting period. The temporary workers assigned as assistants to the Sample Managers were also trained on the job under the direction of the Sample Managers and the Director of Sampling.

The training of Crew Chiefs took place during or before the first day of sorting during each sorting period. Temporary workers assigned as sorters began their training during the first day of sorting.

Trainers

The training of Sample Managers and their assistants was conducted by the Director of Sampling, the Logistics Manager, and the Project Manager. The training of Crew Chiefs and Sorters was conducted by the Project’s Technical Advisor, the Director of Sorting and the Field Supervisors.

Field Training Content

The content of the training sessions included both health and safety training and procedural training. As the project progressed and new streams of material were introduced or new facets of the WCS were implemented, the training was modified.

Health and Safety

The first priority in the training of professional staff and temporary workers was an emphasis on health and safety. The R. W. Beck Health and Safety Plan was issued to all professional personnel and used as an outline for the safety training.

The health and safety training of SMs and their assistants included the following elements:

- Use of personal safety equipment, including hard hats, protective gloves, dust masks, Tyvek® suits, steel-toed boots, protective eyewear.
- Use of other safety equipment, including fire extinguishers (provided in each truck) and first aid kits.
- A discussion of driving safety in the rental trucks on New York City streets and highways.
- The operation of truck lift gates and emergency lights.
- Waste handling, with particular attention to the safe practices for moving waste from front-end loaders into toters and lifting heavy objects (e.g., bulk items and toters).
- Issues of fatigue and hydration.
- Safety practices of the facilities in which samples were being acquired, including the wearing of hard hats, safety vests, and steel-toed boots.
- Procedures to follow in case of illness, accidents, and other emergencies.

The health and safety training of Crew Chiefs included the following elements:

- Use of personal safety equipment, including hard hats, protective gloves, dust masks, Tyvek® suits, steel-toed boots, protective eyewear.
- Waste handling, including the proper handling of waste with hand rakes and lifting heavy objects (e.g., bulk items and toters).
- Issues of hydration and fatigue.
- Procedures to follow in case of illness, accidents, and other emergencies.

The health and safety training that took place at the beginning of each sorting period was reinforced through reminders during the period itself.

Sampling Training

In addition to the health and safety training, the training of SMs and their assistants consisted of the following elements:

- An explanation of the purpose and structure of the WCS, including the importance of acquiring samples.
- An introduction to the other members of the Project Team and their roles.
- An orientation, to familiarize the SMs with the location of the transfer stations where the samples would be acquired. To help SMs understand the most efficient routes to

get to the transfer stations, all SMs were given written directions and driven to each location.

- An explanation and demonstration of the sampling procedure (see below), including the care and operation of the scales.
- An explanation of selecting random samples from loads of refuse and recycling.
- An explanation of the Sample Management Form and the data tags attached to each toter.
- A discussion of the expectations for assistants and how to handle absences, illness and other personnel problems.
- “On the job” training during the first night or two of sampling. SMs who had not had previous WCS sampling experience were accompanied to the transfer station by the DSAM, the Project Manager, or other experienced staff member.

Sort Training

In addition to the health and safety training, the training of CCs and sorters consisted of the following elements.

- An explanation of the purpose and structure of the WCS, including the importance of sorting samples according to the appropriate protocols.
- An orientation to the sorting site and the sorting areas.
- An illustrated lecture on the material categories and the bins for each material.
- An explanation of the subsorting and count procedures.
- An explanation of the work flow:
 - Pre-weighing of samples
 - Placing the sample on the sort table
 - Proper sorting
 - Subsorting/counting
 - Collecting fines
 - Weighing out
 - Disposal of residue
- A demonstration by the professional staff how a sample was to be sorted.
- “On the job” training in which each crew sorted a sample with close supervision by the Technical Advisor, the DSORT, and the FSs. By the end of the first day, most crews were familiar with the procedures and were increasing their productivity.

Cross-Training

Because the random selection of sample routes results in differences in the daily acquisition of samples, there was occasionally an imbalance in the number of samples to be sorted. For example, on a day when a large number of refuse samples were acquired,

the refuse sorting crews at North Shore MTS might be pressed to sort them in a timely manner without help. On these occasions, cross-training was conducted.

Two types of cross-training were provided. First, at each sorting site, sorting crews became adept at sorting specific types of samples. At the North Shore MTS, where refuse was sorted, certain crews specialized in sorting street basket waste which had a protocol which was slightly different from the protocol for residential refuse. At Greenpoint MTS, where recycling was sorted, certain crews focused on the sorting of MGP, other crews specialized in sorting Paper samples. Under the direction of the DSORT and the FS, these crews were often cross-trained to allow greater flexibility in setting daily schedules and taking care of production bottlenecks.

Second, on a few occasions when the number of refuse samples to be sorted was unusually large, a recycling sorting crew from the Greenpoint MTS was moved to North Shore MTS and cross-trained to sort refuse. The cross-training was done relatively quickly because all crews understood health and safety procedures and basic sorting procedures.

Field Procedures

Sampling Procedures

Refuse Sampling

The samples of residential refuse were acquired at one of two private transfers stations owned by Waste Management, Inc. (“WMI”) and under a contract with DSNY to receive residential curbside refuse. The two transfer stations were WMI’s Varick I transfer station and Harlem River Yard transfer station. DSNY diverted the trucks that had been selected for sampling to one of these two transfer stations. The drivers of the trucks, as well as the scale-house operators at the transfer stations, had been notified ahead of time that the truck was to be sampled.

As a selected truck arrived at the transfer station, the Sample Manager was notified. After the truck had tipped its load, a front-end loader (“FEL”) from the transfer station took a randomly selected portion of the tipped load selected by the Sample Manager. The Sample Manager randomly chose a portion of the tipped load (e.g., front, back, left or right) before the FEL began to grab the sample. The protocol for selecting random samples from tipped loads is discussed in detail in Volume 2, Section 4.1 of the Report.

The FEL operator then lowered the FEL bucket and the Sample Manager and his/her assistant pulled a sample of the refuse from the FEL bucket into one or two 96-gallon toters.

In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, it is estimated that two toters of refuse should contain one 200 to 250 pound sample of waste. After the toters had been weighed, each toter was labeled with the date, sample number, a sample code, and the truck number. In addition, the Sample Manager completed a Sample Management Form which was turned in to the Data Management Center at the end of the shift. After the

refuse sample was acquired, the FEL operator managed the remainder of the tipped load as he normally would in the course of facility operations.

After the samples were weighed and labeled, they were loaded into a Project Team rental truck and transported to the North Shore Marine Transfer Station where they were unloaded and positioned for sorting.

Typically, some samples contained bulky items that did not fit into 96-gallon totes. When this occurred, the bulky items were manually set aside. The Sample Manager then weighed the item and recorded the weight and a description of the item on the Sample Management Form. This information was included when the remainder of the sample was sorted and weighed at the sorting site.

Recycling Sampling

The samples of residential recycling (Paper and MGP), were acquired at one of two processors under contract with the DSNY to receive residential curbside recycling. MGP samples were acquired at Hugo Neu's facility in Long Island City. The Paper samples were acquired at the Metropolitan Paper Facility in Brooklyn. The Project Team was assisted by DSNY staff who checked incoming trucks, directed traffic, and provided information on missing or late trucks.

DSNY arranged to divert the recycling collection trucks that had been selected for sampling to these two processors. The drivers of the trucks, as well as the scale-house operators at the transfer stations, received faxed lists of the collection truck numbers from the Data Management Team the morning before the samples arrived. The facility staff was given a duplicate list by the SM when he/she arrived at the facility each evening.

The procedure for acquiring samples was identical to the procedure used to acquire Refuse samples. However, the Project Team's experience in other projects indicated that 100 to 125 pound samples of recycling material required only one tote.

The samples of Paper and MGP were taken to the Greenpoint Marine Transfer Station where they were sorted. Many MGP samples contained bulky items that did not fit into 96-gallon totes. When this occurred, the bulky items were manually set aside. The Sample Manager weighed the item and recorded the weight and a description of the item on the Sample Management Form. This information was included when the remainder of the sample was sorted and weighed at the sorting site.

Sorting Procedures

Residential Refuse Sorting

After the samples of refuse had been transported to the North Shore MTS, the Field Supervisor checked each of the samples to be certain that the information on the Sample Labels was clear and consistent. Often the FS would check with the Data Manager by cell phone to confirm information on the label. After the Samples had been checked in, the Field Supervisor determined each sorting crew's sample allotment for that day and lined up the samples next to the crew's sorting table.

The Crew Chief and crew then began sorting samples using the following procedure:

- The sample was weighed and the weight recorded, to check against the sample weight obtained during sampling.
- The sample was placed on the sorting table and the refuse was sorted into the appropriate material categories. Material was placed in the appropriately-labeled bins around the sorting table.
- When most of the samples had been sorted, one or two crew members began the required subsorts and counts of materials at a separate table.
- After all material had been sorted, the material falling through the ½-inch screen on the sorting table, called “fines”, was swept up and placed in a bin. If, in the opinion of the CC, the fines were identifiable as a specific material, they were placed in the appropriate bin. For example, if the CC determined that 50 percent of the fines were coffee grounds, then 50 percent of the fines would be placed in the “Food Waste” bin and the remaining fines were placed in the “Fines” bin.
- The sorting area, including the sorting table and the subsort table, was swept. Material that could be identified was placed in the appropriate bin. Unidentifiable sweepings were categorized as “Fines.” For example, a newspaper on the floor would be placed in the “Newspaper” bin.
- Next, each bin of material was weighed and the weight of the material recorded by the CC. (Tare weights for the bins were determined before the beginning of the sorting period by taking the average weight of five bins.)
- After each material had been weighed, the sorted material was placed in a roll-off container for disposal.
- The empty bins were placed around the sorting table and the sorting of the next sample began.

Protocol for Illegal Materials in Street Basket Waste

The sorting procedure described above was also used for all Street Basket Waste. However, before the sorting of the Street Basket Waste began, a procedure to identify illegally disposed residential and commercial waste in the Street Basket sample took place. To determine the illegal use of street baskets for residential or commercial refuse disposal, the following protocol was used:

- Before sorting, each 200 to 250 pound street basket sample was placed on the sort table for inspection by the Crew Chief to identify suspected illegal residential or commercial waste.
- All closed opaque plastic bags the size of a shopping bag or larger were identified as potentially containing illegal material.
- The loose material found in clear plastic basket liners or opaque liners labeled with a Business Improvement District (“BID”) logo were considered legal street basket waste.

- Any closed opaque plastic bags the size of a shopping bag or larger found within a BID bag were also identified as potentially containing illegal material.

Closed bags identified as potentially containing illegal material were opened.

- If a bag contained any of the following materials, it was be classified as “residential”:
 - Addressed mail;
 - Substantial quantities of home-use products, including: health and beauty aids, detergent bottles, family-sized drink containers, or other seemingly residential material; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested home use.
- If a bag contained any of the following materials, it was classified as “commercial”:
 - Retail food preparation wastes (industrial-sized food/liquid containers, substantial quantities of identical packaging or unused products, cardboard boxes);
 - Construction materials such as pieces of dry wall or other building materials; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested office, retail, industrial, construction or food establishment waste.

Closed shopping bags not containing materials deemed residential or commercial, but suggesting street use (single use containers, newspapers, etc.) were considered legally disposed street basket waste.

For all bags identified as containing residential or commercial wastes, the following four procedures were followed:

- All such bags were individually photographed.
- The contents of each bag were recorded. The crew chief recorded this information on the Sample Detail Form.
- All such bags (regardless of size) were separated into two groups: residential bags, and commercial bags. The bag count was recorded on the Sample Detail Form.
- In each sample, bags identified as containing residential or commercial waste were weighed in two groups: residential bags, and commercial bags. The combined weights of the bags in each group (residential and commercial) were recorded on the Sample Detail Form.

In addition, each sample was examined for suspected instances of illegally disposed residential or commercial wastes not encased in closed bags as defined above – including instances of broken bags with spilling contents, as well as residential or commercial material loose in the street basket contents. These materials were photographed but not weighed and their presence noted on the Sample Detail Form.

After these procedures had been completed, all material was placed onto the sorting table and sorted according to the refuse sorting protocol.

All weights were recorded by the Crew Chief. In most cases, the tare weight of the containers was put into the scale so that only the net weight of the sorted material was recorded. When the weighing of all material in the sample had been completed, the sorted refuse and recycling was placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew then began sorting the next sample.

Multi-Unit Sorting

The procedure used for sorting waste for the Multi-Unit Study was similar to the procedure for sorting residential waste, with two exceptions. First, because the purpose of the Multi-Unit Study was to correlate building characteristics with recycling success, and not to characterize the building's waste, the list of material categories was modified. The same categories for MGP and Paper were used for the sorting of both residential and multi-unit samples. However, fewer non-recyclable categories were used in sorting multi-unit samples to expedite sorting.

Second, a special protocol was used to identify multi-unit refuse from non-target buildings. The material categories used in sorting multi-unit refuse and recycling, and the protocol used to identify refuse from non-target buildings is presented in Volume 3 (Multi-Unit Study) of the Report.

Residential Recycling Sorting

The sorting of residential recycling took place at the Greenpoint MTS. The procedures used for sorting were identical to the procedures used for sorting residential refuse, with the following three exceptions:

- Samples of MGP and Paper, which were acquired separately, were sorted separately. Typically, MGP samples took longer to sort than Paper samples because MGP often included bulk items and MGP sorting involved subsorting and counting containers.
- Material from MGP samples that fell through the ½-inch screen on the sorting table was categorized as “Mixed Cullet” because virtually all this material was broken glass. (In refuse sorting, this material was categorized as “Fines”.) All material swept from the floor and the subsort tables was categorized as “Fines” unless, in the judgment of the CC, the material could be identified. In that case, it was placed in the appropriate bin and weighed.
- Sorted Paper and MGP was placed in roll-off containers and returned to the processors, rather than being disposed.

Moisture and Particulate Testing

Another field procedure was to collect material for moisture and particulate testing. During each sorting period, samples of refuse and recycling were randomly selected by the Data Management Team for moisture and particulate testing. The purpose of the test was to estimate how much of the weight of certain materials was made up of moisture and fugitive particulates that had migrated to the materials during compaction in the collection truck. For example, newspaper might have become soaked with moisture from food waste or small pieces of glass might adhere to clothing during compaction.

To determine the amount of moisture and particulates in the waste, 21 materials were targeted for testing. In each randomly-selected sample, 3 to 5 pounds of each target material was collected and double-bagged. These packets of materials were called Moisture Testing Units (“MTUs”). Usually, the work of collecting and bagging MTUs was done by the FS or LM with assistance from one or more sorters. Each sample might have had as many as 21 MTUs, although most samples did not include all of the targeted materials.

All MTUs were sent to a laboratory for testing and the results were reported to the Data Management Team for further analysis. A total of 641 MTUs were tested during the PWCS and 511 MTUs were tested during the four-season WCS. The full protocol for moisture and particulate testing is presented in Volume 2, Section 4.2.2.5 of the Report and the results of the testing are included in Volume 1, Section 7 of the Report.

Changes in Training and Procedures

During the 15 months between the first PWCS sorting period and the final WCS sorting period, numerous changes in training and field procedures took place as experience and circumstances dictated. Most of these changes were minor adjustments in field operations that had little or no impact on the overall outcome of the Study. However, five changes were particularly significant and these are discussed below.

- Allocated more time for set-up and training. During the PWCS, the professional staff arrived on-site on the evening before the first day of sorting and training took place that night. Early the next morning the sorting sites were set up and training began. Our experience during the PWCS led us to allocate a full day for set-up and training before the first day of sorting. Set-up activities included repairing or building sorting tables, placing labels on bins, taking tare weights of bins, and checking scales and other equipment. This additional time proved to be an excellent investment in terms of overall productivity.
- Moving the Data Management Team on-site. The Data Management Team operated from R.W. Beck’s Orlando office during the PWCS. It was decided to move them on-site during the Fall of 2004 for the first WCS sorting period to provide more efficient exchange of information and greater flexibility. As the magnitude of the field operations increased, and with the implementation of the Multi-Unit Study, this change had great benefits.
- Change in the MGP Sampling Protocol. During the second PWCS sorting period when samples of MGP were being acquired, the Project Team became aware that the number and size of bulk items in some of the MGP samples had the potential to skew the results. Therefore, the sampling protocol was revised to minimize the potential “skewing” effect of bulk items. This change in protocol is discussed in detail in Volume 4, N of the Report. This change led to changes in training for Sample Managers.
- Modification to the Street Basket Sorting Protocol. At the beginning of the Fall Sorting Period, the protocol for sorting street basket waste was almost identical to the protocol for sorting residential refuse. However, it was quickly determined that modifications needed to be made to account for illegally disposed residential or

commercial waste in street baskets. The Project Team, in consultation with DSNY, developed a new component of the protocol which is described above. This change led to changes in the training and supervision of crews sorting street basket waste.

- Modification to the Multi-Unit Sorting Protocol. Before the beginning of the Spring Sorting Period, as the implementation of the Multi-Unit Study began, the protocol for sorting multi-unit refuse was established. However, quite early in the sorting period it became apparent that waste from non-target buildings was being found in the target building samples. To gain a better understanding of how much waste from non-target buildings was being collected, the multi-unit refuse sorting protocol was modified. This change led to additional staffing and training for the crews sorting multi-unit refuse. This change in protocol is discussed in more detail in Volume 3 of the Report.

Lessons Learned

The experience of the Project Team and DSNY during the PWCS and the WCS confirmed or altered ways in which these studies were conducted. As noted above, there were a number of changes in field operations during the PWCS and WCS. Some of these changes were necessary to accommodate the implementation of new facets of the Study and some were modifications in procedures suggested by the field staff based on their experience. These changes led to the development of new procedures, or the modification of procedures already in place. At the same time, certain activities that took place throughout the project proved to be extremely valuable. The most important lessons learned are described below.

1. Orientation visits to transfer stations

Before any field operation began, the Project Manager and Logistics Manager toured the four transfer stations that were to be used as sampling sites and the two Marine Transfer Stations that were to be used as sorting sites. This tour had several benefits. First, it introduced the Project Team to the Facility personnel with whom we would be working. Given the complexity of the sampling operation in particular, these personal introductions were very important. Second, the tour gave the Project Team a very clear idea of the physical limitations of each facility, allowing us to set realistic expectations about field operations. Third, at one transfer station the Project Team actually conducted an example of taking a sample to show the facility personnel what was involved. This gave the Project Team the confidence that the sampling protocol developed was reasonable. It is recommended that this type of orientation take place before the beginning of any major waste characterization study.

2. The PWCS

Although it had a distinctly different purpose and scope than the WCS and the Project Team's professional staff was very experienced in waste characterization studies, the PWCS provided an invaluable learning experience for our field personnel. From acquiring samples to collecting data to sorting material, the PWCS gave the Project Team excellent hands-on experience, useful knowledge of working and living in New York City, and helped to develop a strong working relationship with the DSNY staff. While it

may not be possible to arrange a small-scale study before the next major waste characterization project, it is recommended that a two- or three-day “scrimmage” be arranged before the official start of a major waste characterization study.

3. Changes in the Material Categories

The number of material categories used as the basis of the sorting protocol for both the PWCS and the WCS was larger than any previous waste characterization study with which the Project Team was familiar. Furthermore, during the WCS there were a number of changes in the material categories which called for changes in the sorting procedures. Some of these changes, such as the elimination of the sub-sorting of shoes, actually reduced the complexity of the sorting procedures. Other changes, such as the sub-sorting of single-serve and multi-serve bottles, increased the complexity of the sorting procedures. Not only did these changes affect the sorting operation, but it had repercussions in data management and reporting. More specifically, these changes led to inconsistencies in categories among seasons, making the reporting of results more complicated.

In addition, there were often items in the samples that appeared to fall outside or between the existing categories and these needed to be discussed and assigned. The recommendation as to how to assign these items was typically made by the Director of Sampling, the Field Supervisors, and the Project Team’s Technical Advisor. The final decision was made by DSNY.

While changes in material categories in the middle of a study may be necessary to recognize new items appearing in the samples or to adjust for “lessons learned” during a previous sorting season, it is recommended that that changes in the material categories be kept to a minimum, to provide consistency in field operations and reporting.

4. Expanded set-up and training time of Field Staff

As noted above, virtually all of the Project Team’s professional staff had previous experience with waste characterization work. Nevertheless, after the WCS fall sorting season, it was generally agreed among the field staff that more training at the beginning of each season was necessary for three reasons. First, given the magnitude of the project (the number of samples and the large number of materials, see above), it was felt that extra attention to the sampling, sorting and weighing procedures was required and this was best dealt with before the official sorting of samples began. Second, because sorting was taking place at two sites several miles apart, it was important to develop a consistent set of procedures. Third, the Field Supervisors and Crew Chiefs came from four different firms and staff changed from season to season. Fourth, in addition to training, extra time was needed to set up the sorting sites properly. This included repairing or building sorting tables, labeling bins, and checking equipment.

During the fall sorting period, set-up and training took place on the first day of the period. In the subsequent seasonal sorting period, field personnel arrived a full day before the sorting was to begin and training took place at that time. It is strongly recommended that adequate time for staff training be incorporated into each seasonal schedule.

5. Management of Back-Up Samples

During the WCS, the Project Team became more experienced in acquiring and managing back-up samples. Back-up samples are necessary because the WCS sampling plan calls for sorting a specific number of samples from each stream and each strata each season. There are a number of reasons why samples selected in the Sampling Plan may not be sorted, including DSNY trucks breaking down or tipping their loads early, errors acquiring samples (e.g., taking a sample from the wrong truck), or errors in sorting (e.g., accidentally disposing of material before it has been weighed). To replace samples lost because of these types of errors, it is important to plan to have back-up samples available.

A single back-up sample for each strata and stream requires a total of 25 samples (Refuse, MGP, and Paper for eight strata, plus street basket). Attention must be paid to the timing of the acquisition and disposal of the back-up samples. Acquiring and keeping the back-up samples too early may mean that the material that finally reaches the table might be three weeks old. Waiting too long to acquire a back-up sample might mean that the sample from that stratum is unavailable. For example, the last available refuse sample from the Medium Density/High Income strata might be lost because of a truck break-down. It is recommended that the management of back-up samples be an integral part of the Sampling Plan for each season.

6. Rotation of professional staff

The intensity of the sampling and sorting operations and the six-day per week schedule resulted in concerns about fatigue toward the end of the fall sorting period. Therefore, the Project Team arranged for one day off for professional staff members who requested it, usually during the middle week of the sorting period. This was a welcome break for the staff members and helped to keep efficiency high during the final days of the sorting period. It is recommended that staff working a six-day per week schedule for a three-week (or more) sorting period be given the opportunity to have a day off.

7. Development of the Street Basket Waste Sorting Protocol during the fall sorting period

The Street Basket Waste Study, which began during the fall sorting period, called for two types of sorting procedures. First, the composition of the street basket waste needed to be determined. The procedures used for residential refuse were adopted for street basket waste, making the shift between the two streams relatively straight-forward. Second, a special protocol had to be developed to identify suspected illegal waste in the street basket samples. Unfortunately, the protocol could not be developed until samples of street basket waste were examined. The complete street basket protocol could not be set until part way through the sorting period. This meant that, during the fall sorting period, there were some street basket samples that were not sorted according to the final protocol. It is recommended that if streams of waste call for new protocols, that those protocols be developed before the sorting period begins. For example, it might have been possible to gather samples of street basket waste, examine them, and develop the protocol prior to the beginning of the sorting period.

8. Moving the Data Management Team on-site

During the PWCS and the fall sort, the Data Management Team worked in the Project Team's Orlando (FL) office. Data was sent via courier to Orlando where it was checked and entered into the project database. After the fall sorting period, it was decided to move the Data Manager to New York and an on-site office was set up in the hotel in which the Project Team was housed. For the winter sorting period, temporary workers were used for data entry. However, the training of the temporary workers was sometimes problematic and it was decided to bring the entire Data Management Team to New York for the subsequent sorting period.

In the spring and summer sorting periods, the Data Management Team worked in the on-site office, under the direction of the Data Manager. This arrangement proved to be the most efficient and effective method to collect, check and enter the sampling and sorting data. It is recommended that, for a study as large and complex as the WCS, the field data be managed on-site.

9. Improvements in Data Management and Documentation

Throughout the WCS, forms, labels, and reports were continually revised to make data entry clearer and more logical. Some revisions were necessary as material categories changed or new facets of the study, such as the Multi-Unit Study, were implemented. Other changes came about through suggestions by the DSNY or the professional staff. For example, initially totes with samples of waste were identified using black markers on duct tape. However, these labels sometimes came loose or the writing became smudged and difficult to read. Eventually, a system using plastic envelopes with paper labels inside were used. These labels were clearer and more resistant to damage or loss. Other improvements in data management and documentation included:

- Empty totes were tracked on a daily basis to ensure that totes would be available for sample acquisition each night.
- Printed stickers with sample information were produced to aid the process of completing Sample Detail Forms.
- Back-up samples were tracked and, once all samples from a strata had been sorted, the back-up samples were disposed.
- The DSAM provided a daily incident report.

It is recommended that the Project Team continually seek more efficient ways to gather and relay information.

10. Development of the Multi-Unit Sampling and Sorting Protocol

During the spring and summer sorting periods, the Multi-Unit Study ("MUS") began. The Sampling and Sorting protocols were established before the study began. Once the sorting period had begun, it became clear that the issue of waste from target buildings getting mixed with non-target building waste (i.e., non-target buildings were those not selected to be analyzed in the MUS) was more serious than had been anticipated. Therefore, the multi-unit sorting protocol was modified to account for this problem. The full MUS sorting protocol is presented in Volume 3 of the Report. It is recommended that

the Project Team and DSNY remain flexible to allow for changes in protocols as unforeseen circumstances dictate such changes.

11. Use of Tents, Lights, and Heaters during the Winter Sorting Period

In preparation for the winter sorting period, it was decided to use tents and heaters to protect sorting crews at both sorting sites. Even though the sorting operations took place in Marine Transfer Stations, these facilities are relatively open to the wind and the cold. The tents, lights and heaters were set up prior to the first day of sorting and remained up during the entire sorting period. Although the weather on most days was cold and windy enough to warrant the use of the tents and heaters, a few days were relatively warm. Nevertheless, it is recommend that, because of the uncertainty of winter weather in New York City, that tents, lights and heaters be used for winter sorting.

12. Providing Incentives to Temporary Workers

Although the temporary workers employed through ORI and Active Temporaries, Ltd. were largely hard-working and capable, we found that the six-day sorting schedule was taxing, especially because the workers got paid on Friday and, at first, many sorters did not return for work on Saturday. An incentive pay system designed to encourage sorters to work for the entire six-day week was implemented. While the system used was not optimal, it is recommended that in the future, a system of incentives be developed to encourage and reward diligent and high-quality work by temporary employees.

13. Refinement of Multi-Unit Building Surveying

In addition to the sampling and sorting of refuse and recycling, the MUS involved a series of building surveys designed to gather information about the physical and operational characteristics of the target buildings. The surveys were conducted by a group of Project Team members supported by the BWPRR staff and took place within a month after the buildings' waste had been sorted. In addition to the data on waste collected during the sorting period, some demographic and operation information was collected from City databases. All this information was potentially useful to surveyors going out into the field. However, initially all the information had not been collected and organized in time to give to surveyors. During the second round of MUS building surveys, after the summer sorting period, profiles of each building were developed and this helped consolidate the relevant information for the surveyors. It is recommended that, if this type of survey is conducted again, all information be collected, organized and distributed prior to the field work.

14. Communications Planning

The WCS made significant demands on all participants to communicate clearly and comprehensively about a range of issues, from the need for additional supplies to changes in the sampling and sorting protocols, to safety reminders, to the clarification of data forms. By the summer sorting period, the project was on a 21-hour daily schedule in facilities in Brooklyn, Queens, and the Bronx. The Project Team developed a communications network to get information where it needed to be, however in retrospect,

a more formal approach would have been helpful. It is recommended that a formal communications plan become part of a large-scale WCS in the future.

15. Logistics

As the WCS progressed there were a number of small, but important changes that improved the work of the professional staff and temporary workers. These included:

- The use of the E-Z Pass for rental vehicles that regularly used bridges and/or tunnels.
- The 96-gallon totes worked very well for collecting and transporting waste samples. They were durable and easy to handle. Most lasted the entire 16-months of the PWCS and WCS. It is recommended that stackable totes be used.
- All directions obtained through MapQuest.com had to be tested in the field and were often found to be inaccurate.
- Clipboards with compartments were invaluable to Sample Managers, especially those who had to record data outside in inclement weather.
- The use of colored 4" x 6" placards in plastic sleeves to record sample information on each tote increased the efficiency of the sampling operation and improved data management.
- Cell phones were essential for all field personnel.
- The use of an electric power washer was essential in cleaning totes and sorting bins at the end of each season of sorting.

Most of these suggestions were generated by field personnel and it is recommended that all members of the field team be encouraged to suggest ideas to improve the efficiency and quality of the field operations.

Final Report, Volume 4**

Appendix C1: Operations Plan PWCS 2004

DEPARTMENT OF SANITATION OF NEW YORK CITY PRELIMINARY WASTE CHARACTERIZATION STUDY

PWCS Operations Plan

Introduction

The Department of Sanitation of New York City (“DSNY”) has asked the R. W. Beck Project Team (“R. W. Beck”) to develop an estimate of the composition of New York City’s (the “City”) refuse and recyclables. By “composition”, we mean the percentage, by weight, of paper, plastic, metals, glass, yard waste, and other materials in the City’s waste. R.W. Beck proposes to develop this estimate of composition by sorting samples of the City’s refuse and recyclables.

The first part of this estimate is a Preliminary Waste Characterization Study (“PWCS”) which is designed to provide a “snapshot” of the residential curbside refuse and recyclables. The plan presented below describes how the PWCS will be developed and carried out.

Sampling Plan

The first step in the PWCS is to develop a sampling plan which will be the basis for an accurate estimate of the City’s refuse and recyclables composition. The accuracy of this estimate (i.e., how close the composition from the samples matches the composition of the entire City) will depend on a number of factors, including how carefully the Study is done, the size of the samples being sorted, the number of samples that are sorted, and the method for selecting the samples.

Refuse Sampling

The Refuse Sampling Plan (“RSP”) is divided into four parts.

Sample Weight

The weight of each sample of refuse will be between 200 pounds and 250 pounds, based on current industry practice and studies by the USEPA and academic studies (e.g., Klee).

Sample Number

In a waste characterization study, the number of samples that are sorted affects the accuracy of the estimate. For example, if only one 200-pound sample of the City’s refuse were sorted, it is very unlikely that the estimate resulting from sorting that single sample would match the composition of the City’s entire curbside refuse. On the other hand, if hundreds of thousands of 200-pound samples were sorted – enough samples so that every ounce of the City refuse and recyclables were sorted – the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate. So, how many samples should be sorted?

Before we answer the question about the number of samples, we should understand the nature of the material that will be sorted. If the material being sorted (i.e., the refuse) were consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few samples to develop an estimate if there were only two materials in the refuse stream and they were always found in the same proportion in every sample. Of course this is not the case. Refuse, and to a lesser degree, recyclables are extremely variable. The percentage of each type of waste material can vary considerably among samples. Even from the same household, the type of waste can vary depending on when the sample is collected. For example, during the autumn, one would expect to find large amounts of leaves, but in the winter there will be few leaves or none. On the other hand, food waste will be found throughout the year. Because of the potential for variability between samples, a different number of samples may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently than leaves, fewer samples would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

Typically, an estimate of the composition of waste is presented as three numbers: (1) the Sample Mean; (2) the Confidence Level; and (2) the Confidence Interval. The Sample Mean is the average percentage of a given material found in the samples sorted. For example, after sorting thirty samples of refuse, we will have a list of thirty percentages of paper waste. If the average of the thirty percentages of paper is 35 percent, then the Sample Mean of paper is 35 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sample taken. The Sample Mean is, after all, simply the average value of the samples; it is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tell us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's mean value. The higher the Confidence Level, the greater our certainty that the mean of the entire population is contained within the Confidence Interval. For example, if the Confidence Interval around the Sample Mean – 33 percent to 37 percent for paper – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of paper waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted standard.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population Mean. For example, our Sample Mean of 35 percent for paper waste may have a Confidence Interval of ± 7 percent, at a 90 percent Confidence Level. That is, based on our number of samples and results obtained, we would expect that 90 percent of the time, the amount of paper waste in the refuse of the entire population would be between 28 percent and 42 percent. Or, put another way, if we could

actually go out and determine the exact percentage of paper waste in our population, we are 90 percent certain that the value would be between 28 percent and 42 percent. If we wanted a more accurate estimate, we would have to sort more samples.

In recommending the number of samples of refuse and recyclables to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard Waste is much more variable than food waste. Therefore, for a given number of samples, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred samples of refuse may provide a Confidence Interval of ± 8 percent for paper, but a ± 30 percent for yard waste. To achieve a ± 8 percent for yard waste would require significantly more samples and be prohibitively expensive.

In practical terms, “variability” simply means the variation we are likely to find between samples. If we sort through 10 samples and each sample has between 28 percent to 32 percent of a given waste type, we can be pretty certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same 10 samples and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, you can see that we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy is high. Below that point, significant increases in accuracy can be achieved with relatively little cost.

R. W. Beck is recommending that at least 200 samples of refuse be sorted in the PWCS. The tables in Attachment 1 show the Confidence Level and Confidence Intervals from seven recent studies for seven categories of materials. It should be emphasized that the seven studies were not identical. There were differences among the seven waste streams and the goals of each of the clients. However, the general pattern is clear: the more samples that were sorted, the greater the accuracy of the estimate.

Because recyclables are a smaller, more homogeneous stream of materials, R. W. Beck is recommending that at least 100 samples of recyclable paper and 100 samples of recyclable metal, glass, and plastic (“MGP”) be sorted. The type of information shown in Table 1 for refuse is not available for recyclables because very few of R. W. Beck’s clients have requested a recyclables sort. Our recommendation is based on our experience in sorting refuse and our knowledge of the difference between the refuse and recyclables.

Sample Selection

In selecting samples from the City’s curbside refuse for the PWCS, R. W. Beck and the DSNY agreed to use two criteria. First, the samples selected from each of the City’s five boroughs would reflect the contribution of that borough to the City’s waste stream as a whole. Second, the DSNY and R. W. Beck agreed that refuse collected early in the week might be both quantitatively and qualitatively different from refuse collected late in the week. The first day of

collection in the week will include refuse generated during the weekend and any weekdays before the collection day. To test this, it was decided to make a distinction between early week (“EW”) samples and late week (“LW”) samples.

That is, for sections of the City that receive 3-day a week collection (i.e., Monday-Wednesday-Friday or Tuesday-Thursday-Saturday), the EW samples would be taken from the Monday and Tuesday routes and the LW samples would be taken from the Wednesday, Thursday, Friday, and Saturday routes. For sections of the City that receive 2-day a week collection (i.e., Monday-Wednesday, Tuesday-Thursday, or Wednesday-Saturday), the EW samples would be taken from the Monday, Tuesday and Wednesday routes and the LW samples would be taken from the Thursday, Friday, and Saturday routes.

To estimate the number of samples from each borough, the average amount of refuse collected from each borough each week in the City between July, 2004 and February, 2004 was used. These averages are shown in Table 1.

Table 1
Refuse Collected – July 2003 to February 2004

	Avg. Tons Collected ⁽¹⁾	% of Avg. Refuse Collected	Number of Samples
Bronx	9,032	16%	31
Brooklyn	18,100	31%	63
Manhattan	10,431	18%	37
Queens	16,021	28%	54
Staten Island	4,328	7%	15
Total	57,912	100%	200

(1) Source: DSNY

The Sampling Plan calls for the total number of samples from each borough to be those shown in Table 1.

To determine how many EW sample and how many LW samples would be acquired for the PSCS involved a three-step process. First, the average weekly tonnages collected for each day of the week in each borough was obtained from by the DSNY. Second, the percentage of waste from the first days of the week were determined.

For example, Manhattan has three-day a week refuse collection. The Manhattan routes are either Monday-Wednesday-Friday or Tuesday-Thursday-Saturday. Therefore, the first collection days in Manhattan are Monday and Tuesday. Based on data provided by the DSNY, it is estimated that 42 percent of Manhattan’s refuse is collected on Monday and Tuesday (EW) and 58 percent is collected on the other four days of the week (LW).

On the other hand, Staten Island has two-day a week refuse collection and the first collection days on Staten Island are Monday, Tuesday, and Wednesday. DSNY data shows that EW collection represents 58 percent of the average collected per week and the LW collection represents 42 percent. Because both the Bronx and Brooklyn have a combination of 2-day a week and 3-day a week collection, the estimates had to be adjusted accordingly. The EW and LW percentages were then applied to the total number of samples from each borough, as shown in Table 1, to determine the number of EW and LW samples to be acquired for the PWCS. Table 2 shows the EW and LW percentages for each borough and the resulting number of EW and LW samples.

Table 2
Early Week and Late Week Percentages⁽¹⁾

	EW Percent	LW Percent	EW Samples	LW Samples
Bronx	43%	55%	13	18
Brooklyn	41%	59%	26	37
Manhattan	42%	58%	16	21
Queens	57%	43%	31	23
Staten Island	58%	42%	9	6
Total			95	105

(1) Based on the average weekly tonnages from March 15 to April 11, 2004. Source: DSNY

To be sure that every pound of waste in the City has an equal opportunity to be sampled, R. W. Beck determined that only one sample per collection vehicle will be used.

To select the EW and LW samples from each borough, R. W. Beck obtained a list of the total number of routes on each day in each borough from the DSNY. From each list of routes, the appropriate number of samples was randomly selected. For example, to obtain the 21 LW routes for Manhattan, 21 routes were randomly selected from the 110 refuse collection routes on Friday in Manhattan. An identical process was used to determine the selected routes/samples for each borough.

Sample Collection

The samples will be acquired at one of two private transfers stations owned by Waste Management, Inc. (“WMI”) and under contract with the DSNY to receive residential curbside refuse. The two transfer stations are WMI’s Varick Road transfer station and Harlem River Yard transfer station. The DSNY has agreed to divert the trucks that have been selected for sampling to one of these two transfer stations. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

When a selected truck arrives at the transfer station, an R. W. Beck Sample Manager will be notified. When the truck has tipped its load a front-end loader (“FEL”) from the transfer station will take a randomly selected portion of the tipped load dump into two or three 96-gallon totes. The random selection of the portion of the tipped load to be sampled will be made by the Sample Manager before the FEL begins to grab the sample.

The FEL will dump the selected portion of the load into totes that have been positioned by the Sample Manager and Assistant in an area designated by WMI. Once the refuse has been dumped into the totes, the FEL will manage the remainder of the tipped load as it normally would.

The Sample Manager and assistant will then weigh each toter to be sure that the sample of refuse weighs 200 pounds to 250 pounds. In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, we estimate that, typically, two totes of refuse should contain one sample of waste. After the totes have been weighed, each toter will be marked with the date, Sample number, a Sample Code, the truck number. In addition, each sample will have a Sample Management Form which will be taped to the totes.

After the samples are weighed and labeled, they will be loaded on an R. W. Beck truck and transported to the Greenpoint Marine Transfer Station where they will be unloaded and positioned for sorting.

It is likely that some samples will contain bulky items that do not fit into 96-gallon totes. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

Recyclables Sampling

It is anticipated that the sampling of recyclables will be similar to the sampling of refuse, but this protocol has not been fully developed at this time. A Recyclable Sampling Plan will be completed and submitted to the DSNY before any sorting of recyclables takes place.

Material Categories

Refuse Categories

The list of material categories to be used in the refuse sorting will be available on the first day of sorting.

Recyclables Categories

The list of material categories to be used in the recyclable sorting has not been completed at this time. It will be included with the Recyclables Sampling Plan before any sorting of recyclables takes place.

Field Procedures

Health and Safety Plan

R. W. Beck's current Health and Safety Plan ("HASP") is attached to this document as Attachment 2.

Sorting Procedures

Once the samples of refuse have been transported by the Sample Manager from private transfer stations to the Sorting Site (the Greenpoint Marine Transfer Station), the Site Supervisor will check in each of the samples, being sure that the Sample Management Forms and Sample labels are consistent.

After the Samples have been checked in, each Crew Chief and crew will begin sorting samples. The refuse will be sorted into 87 material categories. When all material has been sorted, the material falling through the ½" screen on the sorting table, called "fines", will be swept up and included as one of the material categories. All sorted materials will then be weighed. All weights will be recorded by the R. W. Beck Crew Chief. The tare weight of the containers will be put into the scale so that only the net weight of the sorted material is recorded. When the weighing of all material in the sample has been completed, the sorted refuse will be placed in a roll-off container and disposed.

The Crew Chief and crew will then begin sorting the next sample. Each crew is expected to sort and weigh an average of 10 samples per day. This average is based on our experience in previous waste characterization studies.

Staffing

The professional staff for the Refuse Sorting of the PWCS will include:

- Tom Jones – Project Manager: Mr. Jones has been with R. W. Beck for the past 16 years and is currently a Senior Director of the firm. His work has included waste characterization studies, solid waste facility financings, and planning/implementation work.
- Tanya Tarnecki – Site Supervisor: Ms. Tarnecki manages several waste management projects for Cascadia Consulting, including data collection and reporting waste characterization projects in King County, Washington, San Bernadino and Orange County, California.
- Brian Scott, E.I.T. – Sample Manager: Mr. Scott, a Project Engineer, applies his engineering knowledge to both mechanical and civil engineering-based projects, with

emphasis on solid waste projects. Mr. Scott has conducted environmental compliance assessments and technical reviews and received waste characterization training in R. W. Beck Georgia Waste Characterization Study.

- John Buri – Sample Manager: Mr. Buri’s areas of specialty include rural economic and policy initiatives, human resource management and government information systems. He received waste characterization training in R. W. Beck Georgia Waste Characterization Study.
- Sean Perera, E.I.T. - Crew Chief: Mr. Perera, a Civil/Environmental Engineer, joined R. W. Beck’s National Water/Waste Practice in 2000 as a Consulting Engineer. His primary responsibilities include solid waste system design, solid waste management planning, management and consulting services for procurement and construction activities. He has participated in several waste characterization studies as both a Crew Chief and Field Supervisor.
- Rory Tipton, E.I.T.– Crew Chief: Mr. Tipton has more than two years of civil engineering experience working as a project engineer on solid waste projects. He has been responsible for engineering design, documentation, cost estimating, and production coordination for projects of varying size and complexity. He received waste characterization training in R. W. Beck Georgia Waste Characterization Study.
- John Culbertson – Technical Advisor: Mr. Culbertson is a Project Manager in the Environmental Services Group with 11 years of experience in environmental and information management consulting. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and solid waste system financial and strategic analysis.
- Deborah McDonough, E.I.T. – Data Manager: Ms. McDonough, an Engineer with R. W. Beck since 2001, is responsible for conducting transmission analyses and specializes in designing software programs, data management applications, and interactive graphical tools for use in projects associated with solid waste composition studies, locational marginal pricing, transmission power flow studies, transmission constraint analysis, and rate analyses. She is also Project Manager of the Georgia State Waste Characterization Study.

The professional staff for the Recyclables Sorting of the PWCS will include:

- Tom Jones – Project Manager: (see above)
- Sean Perera – Site Supervisor (see above)
- Timothy Buwalda – Sample Manager: Mr. Buwalda is a Senior Engineer with more than 13 years of experience, specializing in waste reduction and materials recovery. His background includes comprehensive solid waste management and recycling experience in both municipal and private settings.
- Michael Giampetro, P.E. – Crew Chief: Mr. Giampetro, a Senior Engineer, has been responsible for on-site assignments for both domestic and international projects. His

experience includes workflow planning, material planning, finite element analysis (“FEA”), and combustion turbine performance testing. He received waste characterization training in R. W. Beck Georgia Waste Characterization Study.

- Whitney Rusert – Crew Chief: Ms. Rusert, an Analyst with R. W. Beck, has had recent training on crew chiefting techniques at the Georgia Waste Characterization Study. She has past work experience in specialty plastics. Ms. Rusert is also assisting in several solid waste projects which are currently underway.
- Jon Hoyle – Crew Chief: Mr. Hoyle, an Analyst/Project Manager, has an acute knowledge of accounting, finance, and operations as they pertain to the utility industry. Mr. Hoyle also has a background in information technology and is proficient in data management and manipulation, computer modeling, and information systems management.
- John Culbertson – Technical Advisor: (see above)
- Deborah McDonough – Data Manager: (see above)

Staff Training

The first day of each sorting period will be devoted to staff training. The training for the Refuse Sort will be conducted by John Culbertson, the Technical Advisor and Charlie Scott of Cascadia Consulting. The individuals in charge of training for the recyclables sort have not yet been determined.

Training will include an introduction to the Study, a discussion of health and safety policies and practices, and an explanation of sorting and weighing procedures. The first couple of samples to be sorted will be used as means of teaching material categories, proper sorting technique, and safe practices.

Equipment

The safety equipment for each sorter is described in the HASP. Other equipment being used include:

- Sample acquisition: 96-gallon totes, a battery-operated H&V scale, brooms, shovels, rakes, and trucks with lift gates;
- Sample sorting: A sorting table, bins for sorted materials, a battery-operated H&V scale, hand rakes and small brooms;
- Post-Sort Disposal and Recycling;
- Post-Sort Disposal of Refuse; and
- The DSNY has agreed to provide roll-off containers for disposing of the sorted refuse and to remove the containers when they are full.

Post-Sort Recycling

The DSNY has agreed to provide roll-off containers for disposing of the sorted recyclables and to remove the containers when they are full.

Data Recording and QA/QC

Three types of data developed during the PWCS. The first type will be the Sample Management Form. As each sample is acquired, as described in the Sampling Plan above, information on the borough of origin, route, and truck number, will be recorded on a Sample Management Form filled out by the Sample Manager. The Sample Management Form will include the following information:

- The date on which the sample was acquired;
- The name of the transfer station from which the sample was acquired;
- The name of the Sample Manager and assistant;
- The Sample Number, which is the number of the sample acquired on that day;
- The count of the toters (i.e., 1 of 3);
- The Sample Code, which shows the borough, district, section and route of the truck from which the sample was taken. For example, Manhattan 1, Sec. 12, Rt. 3 indicates that the truck route from which this sample was taken was in Manhattan District 1, Section 1, Route 3;
- The truck number, which will be provided by DSNY when they assign a truck to the selected route;
- The weight of each toter in the sample; and
- The weight and description of any bulky waste items that are part of the sample. These will not be transported to the Sorting Site.

A copy of the Sample Management Form will be affixed to the sample when it is transported from the private transfer station to the Sorting Site. It will remain with the documentation for that sample.

The second type of data will be the material weight data recorded by the Crew Chief when the sorting of each sample is completed. This form, called the Sample Sort Form, will include the net weight of each category of waste that has been sorted and, in the case of some materials, a count of the items in the category (e.g., shoes).

When the sample has been sorted the Crew Chief and the Site Supervisor will review the forms for completeness and accuracy and sign them. At the end of the day, the Crew Chiefs, Site Supervisor, and Project Manager will review all the forms again and note any unusual samples or circumstances that may have affected the data.

The forms will then be faxed to the Data Manager who will have the data entered into an Access database. The Data Manager will check the data for completeness and accuracy. Once this procedure has been completed, the Data Manager will confer with the Project Manager and if they are satisfied that the data for that day of sampling is complete, it will be posted on the project website where the DSNY Project Manager can view the data.

The third type of data will be the results of the moisture and contamination testing that will be conducted by the Woods End Laboratory (“Woods End”). This data will be sent directly from Woods End to the Project Manager and Data Manager. The Data Manager will enter it into the database as it is received. The QA/QC procedure for this data is still being worked out with Woods End. When the procedure is completely defined, a copy of the procedure will be provided to the DSNY Project Manager.

This procedure for recording and checking the data will be reviewed during the PWCS and, if R. W. Beck believes that changes will make the procedures more efficient, without compromising completeness and accuracy, or more accurate and complete, we will recommend these changes to the DSNY.

**NYC Waste Characterization Study
Final Report, Volume 4**

Appendix C2: Operations Plan WCS Fall 2004

**DEPARTMENT OF SANITATION OF NEW YORK CITY
WASTE CHARACTERIZATION STUDY
PHASE I**

Phase I Operations Plan

I. Introduction

The following Operations Plan is submitted to the Department of Sanitation of New York City (“DSNY”) for the Phase I Waste Characterization Study (“Phase I Study”) under Contract #82702BR00015. The Phase I Study includes three components:

A. Residential Study

The purpose of the Residential Study is to characterize New York City’s (the “City’s”) residential refuse and recycling materials by income and housing density strata, accounting for seasonal variation over a twelve-month period. The Study will involve taking samples of residential refuse and recycling materials, sorting and weighing them to develop an estimate of composition of these materials. The Residential Study will also develop an estimate of generation (pounds/household/strata). The Sampling Plan, Material Categories, Field Procedures, and Data Management for the Residential Study are discussed below.

B. Street Basket Study

The purpose of the Street Basket Study is to characterize the City’s street basket refuse based on dedicated street basket collection routes. The Street Basket Study will involve taking samples of street basket refuse, sorting and weighing them to develop an estimate of composition of these materials. The Street Basket Study will also develop an estimate of generation (pounds/street basket) for street baskets on dedicated routes. The Sampling Plan for the Street Basket Study is discussed below. The Material Categories, Field Procedures, and Data Management for the Street Basket Study will be similar to those for the Residential Study.

C. Multi-Unit Apartment Study

The purpose of the Multi-Unit Apartment Study is to identify the physical and operational characteristics of multi-unit apartment buildings that are correlated to successful recycling. The Multi-Unit Apartment Study will involve selecting 125 multi-unit apartment buildings at random and gathering information on key physical and operational characteristics. We will also develop a definition of successful recycling, including the recycling and capture rates and levels of contamination. During the winter, spring and summer sorting periods, samples of refuse and recycling materials from the 125 buildings will be sorted and weighed to establish the level of successful recycling for each building. Finally, we will develop correlations between building characteristics and the recycling success rate. The protocol for the Multi-Unit Apartment Building Study is currently being developed and will be submitted to the DSNY before any sorting begins. We anticipate that the Material Categories, Field Procedures, and Data

Management for the Multi-Unit Apartment Study will be similar to those for the Residential and Street Basket Studies.

The Phase I Study will be conducted by the R. W. Beck Project Team (“R. W. Beck”) working with the DSNY. The plan presented below describes how the Phase I Study will be developed and carried out.

II. Sampling Plans

Each of the three components of the Phase I Study will involve characterizing refuse and recycling materials. This characterization will be accomplished by sorting samples of refuse and recyclables. The first step in this process is the selection of samples. A sampling plan, which describes the steps taken to obtain a sample for each of the three components, is presented below.

A. Residential Sampling Plan

The residential sampling plan involves designing a process for selecting samples of residential curbside refuse and recycling materials (i.e., paper and metal, glass and plastic (“MGP”)). The process includes the following six steps:

1. Determining the income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process;
5. Developing the sample collection process; and
6. Developing refuse and recycling generation estimates.

Because the purpose of the Residential Study was to characterize the residential waste by income and density strata, the first step in the sampling plan was to determine and define these strata and identify them within the City.

i. Income/Density Strata

An income/housing density matrix was developed using U.S. Census data for the year 2000 for each of the 2,217 census tracts in New York City. Three income levels, based on median household income, and three housing density levels were used to create a nine-box matrix.

The income levels used were defined as:

- Low Income = Median household income below \$30,763.00;
- Medium Income = Median household income between \$30,763 and \$46,193; and
- High Income = Median household income above \$46,193.

The housing density criteria were based on the number of structures within each census tract. The three housing density levels were defined as:

- Low Density = Census tracts in which 67 percent of the structures contain two or fewer units;
- Medium Density = All census tracts that are not in the High or Low categories; and
- High Density = Census tracts in which 67 percent of the structures contain ten or more units.

The resulting income/density matrix separated the City’s census tracts by income and density, as shown in Table 1.

**Table 1
Number of Census Tracts in Each Income/Density Stratum**

	<u>Low Income</u>	<u>Medium Income</u>	<u>High Income</u>	<u>Total</u>
Low Density	5	177	410	636
Medium Density	392	435	162	636
High Density	<u>342</u>	<u>127</u>	<u>167</u>	<u>636</u>
Total	739	739	739	2,217

Because so few census tracts are in the Low/Low stratum, it was decided to eliminate this stratum from the study and focus the study on the remaining eight strata.

Next, a map of the City was developed in which each of the nine strata was color-coded.

To identify the universe of existing refuse and recycling collection routes the DSNY provide a list of existing routes that fell entirely within contiguous census tracts of the same strata. The number of existing routes for each stratum is shown in Table 3 below.

The next step was to determine the number of samples that would be sorted.

ii. Sample Size

In a waste characterization study, the number of samples that are sorted affects the accuracy of the estimate. For example, if only one 200-pound sample of the City’s refuse were sorted, it is very unlikely that the estimate resulting from sorting that single sample would match the composition of the City’s entire curbside refuse. On the other hand, if hundreds of thousands of 200 pound samples were sorted – enough samples so that every ounce of the City refuse were sorted – the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate. So, how many samples should be sorted?

Before we answer the question about the number of samples, we should understand the nature of the materials that will be sorted. If the materials being sorted (i.e., the refuse and recycling materials) were consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few samples to develop an estimate, if there were only two materials in the refuse stream and they were always found in the same proportion in every sample. Of course this is not the case. Refuse, and to a lesser degree, recyclables, are extremely variable. The percentage of each type of waste material can vary considerably among samples. Even from the same household, the type of waste can vary depending on when the

sample is collected. For example, during the autumn, one would expect to find large amounts of leaves, but in the winter there will be few leaves or none. On the other hand, food waste will be found throughout the year. Because of the potential for variability between samples, a different number of samples may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently than leaves, fewer samples would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

Typically, an estimate of the composition of waste is presented as three numbers: (1) the Sample Mean; (2) the Confidence Level; and (3) the Confidence Interval. The Sample Mean is the average percentage of a given material found in the samples sorted. For example, after sorting 30 samples of refuse, we will have a list of 30 percentages of paper waste. If the average of the 30 percentages of paper is 35 percent, then the Sample Mean of paper is 35 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sample taken. The Sample Mean is, after all, simply the average value of the samples; it is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tell us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's mean value. For example, if the Confidence Interval around the Sample Mean – 33 percent to 37 percent for paper – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of paper waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted standard.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population Mean. For example, our Sample Mean of 35 percent for paper waste may have a Confidence Interval of ± 7 percent, at a 90 percent Confidence Level. That is, based on the number of samples that have been sorted and results obtained, we would expect that 90 percent of the time, the amount of paper waste in the refuse of the entire population would be between 28 percent and 42 percent. Or, put another way, if we could actually go out and determine the exact percentage of paper waste in our population, we are 90 percent certain that the value would be between 28 percent and 42 percent. If we wanted a more accurate estimate, we would have to sort more samples.

In recommending the number of samples of refuse and recyclables to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard Waste is much more variable than food waste. Therefore, for a given number of samples, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred samples of refuse may provide a Confidence Interval of ± 8 percent for paper, but ± 30 percent for yard waste. To achieve ± 8 percent for yard waste would require significantly more samples and would probably be prohibitively expensive.

In practical terms, “variability” simply means the variation we are likely to find between samples. If we sort through ten samples and each sample has between 28 percent to 32 percent of a given waste type, we can be pretty certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same ten samples and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, you can see that we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy is high. Below that point, significant increases in accuracy can be achieved with relatively little cost.

In determining the number of samples to be sorted for the Phase I Residential Study, an accuracy goal ± 7.5 percent Confidence Interval for the major material groups at a 90 percent Confidence Level was requested by DSNY. In addition to this accuracy goal, R. W. Beck considered the eight income/density strata to be characterized and the need to account of seasonality in the waste stream. Also, R. W. Beck reviewed the Preliminary Waste Characterization Study (“PWCS”) to note the variability exhibited in the PWCS results.

R. W. Beck is recommending that at least 200 samples of refuse be sorted for each strata, 50 samples per strata each season.

The results of the PWCS showed relatively little variability in Paper Recycling, but significant variability in the MGP. Therefore, R. W. Beck is recommending that 40 Paper Recycling samples per strata be sorted, 80 per season and 160 MGP samples per strata be sorted, 320 samples per season. Table 2 shows the number of samples recommended for the Phase I Residential Study.

Table 2
Sample Size for the Phase I Residential Study

	Samples per Strata	Samples per Season	Samples per Strata/Season	Total
Residential Refuse	200	400	50	1,600
Residential Paper Recycling	40	80	10	320
Residential MGP	<u>160</u>	<u>320</u>	<u>80</u>	<u>1,280</u>
Total	400	800	140	3,200

iii. Sample Weight

Based on current industry practice and studies by the USEPA and academic studies (e.g., Klee), it was determined that the weight of each sample of refuse would be between 200 pounds and 250 pounds.

Because recycling paper and MGP are generally less variable than refuse samples (i.e., contain fewer types of materials), and based on the results of the PWCS, it was determined that the weight of each sample of recycling paper and MGP would be between 100 and 125 pounds.

iv. Sample Selection

In selecting samples from the City's curbside refuse for the Phase I Residential Study, R. W. Beck and the DSNY agreed to use existing refuse and recycling collection routes that were entirely within census tracts for each of the eight income/density strata. Using an analysis of the census tracts and information on the existing collection routes provided by DSNY, the universe of available routes was developed. Table 3 shows the number of available collection routes for each of the eight income/density strata.

Table 3
Existing Collection Routes for Each Income/Density Strata

	<u>MGP</u>	<u>Paper</u>	<u>Refuse</u>
High Income/High Density Strata	31	66	194
High Income/Medium Density Strata	8	4	73
High Income/Low Density Strata	8	8	28
Medium Income/High Density Strata	116	116	269
Medium Income/Medium Density Strata	9	9	14
Medium Income/Low Density Strata	3	4	12
Low Income/High Density Strata	22	22	106
Low Income/Medium Density Strata	<u>21</u>	<u>20</u>	<u>51</u>
Total	218	249	747

From this universe of existing routes, sample routes were randomly chosen. Because certain strata had relatively few existing routes, sampling by replacement was used, meaning that it was possible that more than one sample might be taken from any one truck. However, all samples were selected randomly.

v. Sample Collection

a. Refuse Sample Collection

The samples of residential refuse will be acquired at one of two private transfers stations owned by Waste Management, Inc. ("WMI") and under contract with the DSNY to receive residential curbside refuse. The two transfer stations are WMI's Varick Street transfer station and Harlem River Yard transfer station. The DSNY has agreed to divert the trucks that have been selected for sampling to one of these two transfer stations. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

As a selected truck arrives at the transfer station, the R. W. Beck Sample Manager will be notified. When the truck has tipped its load a front-end loader ("FEL") from the transfer station will take a randomly selected portion of the tipped load dump into two or three 96-gallon totes. The random selection of the portion of the tipped load to be sampled will be made by the Sample Manager before the FEL begins to grab the sample.

The FEL will dump the selected portion of the load into totes that have been positioned by the Sample Manager and Assistant in an area designated by WMI. Once the refuse has been dumped into the totes, the FEL will manage the remainder of the tipped load as it normally would.

The Sample Manager and assistant will then weigh each toter to be sure that the sample of refuse weighs 200 pounds to 250 pounds. In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, we estimate that, typically, two totes of refuse should contain one sample of waste. After the totes have been weighed, each toter will be marked with the date, Sample number, a Sample Code, and the truck number. In addition, each sample will have a Sample Management Form which will be taped to the totes.

After the samples are weighed and labeled, they will be loaded on an R. W. Beck truck and transported to the North Shore Marine Transfer Station where they will be unloaded and positioned for sorting.

It is likely that some samples will contain bulky items that do not fit into 96-gallon totes. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

b. Recycling Sampling

The samples of residential recycling Paper and MGP will be acquired at one of two processors under contract with the DSNY to receive residential curbside recycling. The two processors are Hugo Neu Schnitzer's East facility in Long Island City for MGP and Metropolitan Paper for Paper Recycling. The DSNY has agreed to divert the recycling collection trucks that have been selected for sampling to these two processors. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

The procedure for acquiring samples will be identical to the procedure used at the private transfer stations, described above. However, based on our experience in other projects, the PWCS indicates that 100 to 125 samples of recycling material will, in most cases, require only one toter. The samples of Paper Recycling and MGP will be taken to the Greenpoint Marine Transfer Station where it will be sorted. It is likely that of the MGP samples will contain bulky items that do not fit into 96-gallon totes. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

vi. Waste Generation

Developing an estimate of average waste residential waste generation by strata will involve two steps. First, the Sample Manager will obtain the net weight of each truck selected for sampling. This information will be available from the facility scale house where all collection vehicles are weighed coming in and out of the facility.

Second, the number of housing units on the routes used for sampling will be obtained through the City's MapPluto database. By dividing the net weight of each truck by the number of households on that truck's route, an estimate of pounds per household will be calculated.

B. Street Basket Sampling Plan

The Street Basket sampling plan involves designing a process for selecting representative samples of street basket waste. The process includes the following six steps:

1. Determining the universe of street basket waste income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process;
5. Developing the sample collection process; and
6. Developing a street basket waste generation estimate.

Because the purpose of the Street Basket Study is to characterize street basket waste, the first step in the sampling plan was to determine what universe of street basket waste would be used for drawing samples.

i. The Universe of Street Basket Waste

The DSNY and R. W. Beck agreed to use the total number of dedicated street basket collection routes as the universe from which random samples of street basket refuse would be taken. Dedicated routes are those routes that collect only street basket waste. Routes that collect residential refuse as well as street basket refuse are excluded from this study. There are dedicated routes in all five of the City's boroughs. The DSNY provided a list of 107 dedicated routes with 644 loads.

ii. Sample Size

The results of the *Seattle Litter Composition Study* were reviewed to determine the variability of street basket waste. Based on this review, it was estimated that 200 samples of street basket waste would be expected to achieve a confidence interval of ± 7.5 percent for the major material groups – paper, plastic, metal, and glass. Each season 50 samples of street basket waste will be sorted.

iii. Sample Weight

The weight of samples will be the same as the weight of samples for residential refuse, for the reasons discussed in Section II. A. iii.

iv. Sample Selection

From the universe of 644 loads of street basket waste, 50 loads were randomly selected, using Excel's random number function. These loads were sent to DSNY to confirm that the routes were still available.

v. Sample Collection

Samples of street basket waste will be collected using procedures identical to those for collecting residential refuse.

vi. Generation Estimate

Developing an estimate of street basket generation will involve two steps. First, the Sample Manager will obtain the net weight of each truck selected for street basket waste sampling. This information will be available from the facility scale house where all collection vehicles are weighed coming in and out of the facility.

Second, the number of baskets on each dedicated street basket collection routes will be provided by DSNY. By dividing the net weight of each truck by the number of street baskets on that truck's route, an estimate of pounds per street basket will be calculated.

III. Material Categories

A. Refuse Categories

The list of material categories to be used in the refuse and street basket sorting was approved by DSNY.

B. Recyclables Categories

The list of material categories to be used in the refuse sorting was approved by DSNY.

C. Street Basket Categories

The material categories for street basket waste will be identical to the categories for refuse. In addition, sorting will seek to identify instances of illegally disposed residential or commercial waste.

IV. Field Procedures

A. Health and Safety Plan

R. W. Beck's current Health and Safety Plan ("HASP") has been submitted to the DSNY previously.

B. Sorting Procedures

Once the samples of refuse and recycling have been transported by the Sample Managers from private transfer stations or recycling processors to the sorting sites, the Field Supervisor at each sorting site will check in each of the samples to be certain that the Sample Management Forms and Sample labels are clear and consistent.

After the Samples have been checked in, each Crew Chief and crew will begin sorting samples. The refuse will be sorted into the material categories approved by DSNY. When all material has been sorted, the material falling through the ½” screen on the sorting table, called “fines”, will be swept up and included as one of the material categories. All sorted materials will then be weighed. All weights will be recorded by the R. W. Beck Crew Chief. The tare weight of the containers will be put into the scale so that only the net weight of the sorted material is recorded. When the weighing of all material in the sample has been completed, the sorted refuse and recycling will be placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew will then begin sorting the next sample. Each crew is expected to sort and weigh approximately nine samples of refuse and MGP per day, and 15 samples of Paper Recycling per day. This average is based on our experience in the PWCS.

C. Staffing

The professional staff for the Refuse Sorting for of the Phase I Study will include:

- Tom Jones, Project Manager: Mr. Jones has been with R. W. Beck for the past 16 years and is currently a Senior Director of the firm. His work has included waste characterization studies, solid waste facility financings, and planning/implementation work.
- Deborah McDonough, E.I.T. – Data Manager: Ms. McDonough, an Engineer with R. W. Beck since 2001, is responsible for conducting transmission analyses and specializes in designing software programs, data management applications, and interactive graphical tools for use in projects associated with solid waste composition studies, locational marginal pricing, transmission power flow studies, transmission constraint analysis, and rate analyses. She is also Project Manager of the Georgia State Waste Characterization Study.
- John Culbertson, Technical Advisor: Mr. Culbertson is a Project Manager in R. W. Beck’s Environmental Services Group with 11 years of experience in environmental and information management consulting. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and solid waste system financial and strategic analysis.
- Mack Rugg, Residential Study Task Manager: Mr. Rugg is an employee of Camp Dresser McKee and an acknowledged expert in the field of waste characterization. He has managed numerous waste studies, including a current project in Bergen County, New Jersey.
- Tanya Tarnecki, Street Basket Task Manager: Ms. Tarnecki manages several waste management projects for Cascadia Consulting, including data collection and reporting waste characterization projects in King County, Washington; and San Bernadino and Orange County, California.

- **Tim Buwalda, Multi-Unit Task Manager:** Mr. Buwalda is a Senior Engineer with R. W. Beck with more than 13 years of experience, specializing in waste reduction and materials recovery. His background includes comprehensive solid waste management and recycling experience in both municipal and private settings.
- **Ron Perkins, Director of Sampling:** Mr. Perkins is a Senior Consultant with R. W. Beck and has 35 years experience in solid waste management internationally, including waste characterization and development of strategic plans for cost effective and sustainable waste reduction and recycling systems.
- **Walt Davenport, Director of Sorting:** Mr. Davenport has over 30 of experience in the solid waste profession as a private sector hauler/recycler and consultant. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and processing efficiency. He has managed numerous waste composition studies including PA Statewide, Alameda County, CA, and Montgomery County, MD Waste Composition studies.
- **Sean Perera, Logistics Manager:** Mr. Perera, a Civil/Environmental Engineer, joined R. W. Beck's National Water/Waste Practice in 2000 as a Consulting Engineer. His primary responsibilities include solid waste system design, solid waste management planning, management and consulting services for procurement and construction activities. He has participated in several waste characterization studies as both a Crew Chief and Field Supervision.
- **Tanya Tarnecki, Greenpoint Field Supervisor:** (see above)
- **Rory Tipton, E.I.T., North Shore Field Supervisor:** Mr. Tipton has more than two years of civil engineering experience working as a project engineer on solid waste projects. He has been responsible for engineering design, documentation, cost estimating, and production coordination for projects of varying size and complexity. He received waste characterization training in R. W. Beck's Georgia Waste Characterization Study.
- **Mike Rogers, Greenpoint Crew Chief #1:** Mr. Rogers is a special employee of R. W. Beck and has sorted waste professionally for the past 13 years. He has had hazardous materials training.
- **Karen Vickers, Greenpoint Crew Chief #2:** Ms. Vickers has ten years of experience in solid waste management and waste reduction project planning, educational outreach, and special events planning on the state and local government levels in the Southeast region. Previously, Ms. Vickers was employed as the Program Education Specialist for the Athens Clarke County Solid Waste Department, Recycling Division, in Athens, Georgia, as the State Recycling Coordinator for the Georgia Department of Community Affairs, and as a Recycling Coordinator for the City of Delray Beach, Florida. Ms. Vickers currently serves as the Vice President of the Georgia Recycling Coalition, and holds Faculty member status with the Solid Waste Association of North America.
- **Katie Atkins, North Shore Crew Chief #1:** Ms. Atkins brings over ten years of experience teaching and developing environmental trainings. She specializes in conducting waste audits for schools and businesses and assists with Cascadia's waste composition field work.

- Randy Bowen, North Shore Crew Chief #2: Mr. Bowen has over 30 years of experience in the solid waste profession as a hauler/recycler and consultant. Mr. Bowen has worked as a manager in both the public and private sector and as a recycling business owner. Mr. Bowen's project experience includes: numerous waste classification/characterization studies, collection route auditing, composting, special events recycling, and project management.
- Mike Lennon, North Shore Crew Chief #3: Mr. Lennon provides in-the-field expertise for several of Cascadia's composition studies including a study of Tacoma, Washington school district waste and two materials sorts for a San Jose Material Recovery Facility.
- Steve Baumgart, Sample Manager #1 – MGP: Mr. Baumgart has over 12 years of experience at R. W. Beck working on solid waste management projects. He has managed and supported design teams in the development, planning and design of existing transfer/recycling station facilities. He has also worked with solid waste facility owners and operators in preparing facility master plans, permit applications, conceptual and final designs, program implementation scheduling, cost estimating, construction oversight, and independent engineering reviews.
- Ramone Swan, Sample Manager #2 – Refuse: Mr. Swan is an employee of Organics Resources, Inc. ("ORI").
- Karin Olesky, Sample Manager #3 – Paper: Ms. Olesky supports Cascadia projects through field work and data collection. For her master's thesis, she recently completed a year-long project to map the University of Washington's food services purchasing and initiated a food waste composting program.
- Dieter Eckels, Sample Manager #4 – Refuse: Mr. Eckels conducts data collection, research, and analysis in support of a number of Cascadia waste characterization projects including the 2003 and 2004 California Statewide Waste Composition Studies. His background includes collection system design for the University of Washington's program to re-use on-site cooking oil as bio-diesel for the campus fleet.
- Susan Jarosch, Traffic Manager #1: Ms. Jarosch is an Environmental Engineer who practices solid waste management consulting within R. W. Beck. Her project engineering experience includes landfill gas collection and leachate recirculation system development, landfill permitting, and other solid waste management construction and documentation. She also has experience as a crew chief for the New York Waste Characterization Study conducted earlier this year.
- Paul Johnson, Traffic Manager #2: Mr. Johnson joined R. W. Beck as a Civil Engineer in 2002. He is experienced in environmental disciplines such as petroleum contaminated soil excavation, solid waste disposal area closure, and landfill inspection and monitoring. He has completed the OSHA 40-hour Hazardous Waste Training Course and is trained to collect water, soil, and gas samples.

D. Staff Training

The first day of the Fall Sorting Period will be devoted to staff training. The training will be conducted by John Culbertson, the Technical Advisor, and Walt Davenport, the Director of

Sorting. Training for the Sample Managers will be conducted by Tom Jones, Project Manager, and Ron Perkins, Director of Sampling.

Training will include an introduction to the Phase I Study, a discussion of health and safety policies and practices, and an explanation of sampling, sorting and weighing procedures. The first couple of samples to be sorted will be used as means of teaching material categories, proper sorting technique, and safe practices.

E. Equipment

The safety equipment for each sorter is described in the HASP. Other equipment being used includes:

- Sample acquisition: 96-gallon toters, a battery-operated H&V scale, brooms, shovels, rakes, and trucks with lift gates. All members of the Sampling teams will be equipped with hard hats, reflective vests, safety goggles, and gloves.
- Sample sorting: A sorting table, bins for sorted materials, a battery-operated H&V scale, hand rakes and small brooms. All members of the sorting crews will be equipped with Tyvek suits, safety goggles, and protective gloves.

F. Post-Sort Disposal and Recycling

i. Post-Sort Disposal of Refuse

The DSNY has agreed to provide roll-off containers for disposing of the sorted refuse and to remove the containers when they are full.

ii. Post-Sort Recycling

The DSNY has agreed to provide roll-off containers for disposing of the sorted recyclables and to remove the containers when they are full.

V. Data Recording and QA/QC

Three types of data will be developed during the Phase I Study. The first type will be the Sample Management Form. As each sample is acquired, as described in the Sampling Plan above, information on the borough of origin, route, and truck number, will be recorded on a Sample Management Form filled out by the Sample Manager. The Sample Management Form will include the following information:

- The date on which the sample was acquired;
- The name of the transfer station from which the sample was acquired;
- The name of the Sample Manager and assistant;
- The Sample Number, which is the number of the sample acquired on that day;
- The count of the toters (i.e., 1 of 3);
- The Sample Code, which shows the borough, district, section and route of the truck from which the sample was taken. For example, Manhattan 1, Sec.12, Route 3 indicates that the

truck route from which this sample was taken was in Manhattan District 1, Section 1, Route 3;

- The truck number, which will be provided by DSNY when they assign a truck to the selected route;
- The weight of each toter in the sample; and
- The weight and description of any bulky waste items that are part of the sample. These will not be transported to the Sorting Site.

A copy of the Sample Management Form will be affixed to the sample when it is transported from the private transfer station to the Sorting Site. It will remain with the documentation for that sample.

The second type of data will be the material weight data recorded by the Crew Chief when the sorting of each sample is completed. This form, called the Sample Sort Form, will include the net weight of each category of waste that has been sorted and, in the case of some materials, a count of the items in the category (e.g., small appliances).

When the sample has been sorted the Crew Chief and the Field Supervisor will review the forms for completeness and accuracy and sign them. At the end of the day, the Crew Chiefs, Field Supervisor, and Project Manager will review all the forms again and note any unusual samples or circumstances that may have affected the data.

The forms will then be sent overnight to the Data Manager who will have the data entered into an Access database. The Data Manager and her staff will check the data for completeness and accuracy. Once this procedure has been completed, the Data Manager will confer with the Project Manager and if they are satisfied that the data for that day of sampling is complete, it will be provided to the DSNY Project Manager.

The third type of data will be the results of the moisture and particulate testing that will be conducted by the Woods End Laboratory (“Woods End”). Small (three to five-pound) portions of selected materials will be double-bagged and sent by courier to Woods End for analysis. The data resulting from this analysis will be sent directly from Woods End to the Project Manager and Data Manager. The Data Manager will enter it into the database as it is received.

This procedure for recording and checking the data will be reviewed during the Phase I Study and, if R. W. Beck believes that changes will make the procedures more efficient, without compromising completeness and accuracy, or more accurate and complete, we will recommend these changes to the DSNY.

**DEPARTMENT OF SANITATION OF NEW YORK CITY
WASTE CHARACTERIZATION STUDY
PHASE I**

Phase I Operations Plan

WINTER SORTING PERIOD

I. Introduction

The following Operations Plan is submitted to the Department of Sanitation of New York City (“DSNY”) for the Phase I Waste Characterization Study (“Phase I Study”) under Contract #82702BR00015. The focus of this Operations Plan is the Winter Sort.

The Phase I Study includes three components:

A. Residential Study

The purpose of the Residential Study is to characterize New York City’s (the “City’s”) residential refuse and recycling materials by income and housing density strata, accounting for seasonal variation over a twelve-month period. The Study will involve taking samples of residential refuse and recycling materials, sorting and weighing them to develop an estimate of composition of these materials. The Residential Study will also develop an estimate of generation (pounds/household/strata). The Sampling Plan, Material Categories, Field Procedures, and Data Management for the Residential Study are discussed below.

B. Street Basket Study

The purpose of the Street Basket Study is to characterize the City’s street basket refuse based on dedicated street basket collection routes. The Street Basket Study will involve taking samples of street basket refuse, sorting and weighing them to develop an estimate of composition of these materials. The Street Basket Study will also develop an estimate of generation (pounds/street basket) for street baskets on dedicated routes. The Sampling Plan for the Street Basket Study is discussed below. The Material Categories, Field Procedures, and Data Management for the Street Basket Study will be similar to those for the Residential Study.

C. Multi-Unit Apartment Study

The purpose of the Multi-Unit Apartment Study is to identify the physical and operational characteristics of multi-unit apartment buildings that are correlated to successful recycling. The Multi-Unit Apartment Study will involve selecting 125 multi-unit apartment buildings at random and gathering information on key physical and operational characteristics. We will also develop a definition of successful recycling, incorporating recycling and capture rates and levels of contamination. During the spring and summer sorting periods, samples of refuse and recycling materials from the 125 buildings will be sorted and weighed to establish the level of successful recycling for each building. Finally, we will develop correlations between building

characteristics and the recycling success rate. The protocol for the Multi-Unit Apartment Building Study is currently being developed and will be submitted to the DSNY before any sorting begins. We anticipate that the Material Categories, Field Procedures, and Data Management for the Multi-Unit Apartment Study will be similar to those for the Residential and Street Basket Studies.

The Phase I Study will be conducted by the R. W. Beck Project Team (“R. W. Beck”) working with the DSNY. The plan presented below describes how the Phase I Study will be developed and carried out during the winter sorting period.

II. Sampling Plans

Each of the three components of the Phase I Study will involve characterizing refuse and recycling materials. This characterization will be accomplished by sorting samples of refuse and recyclables. The first step in this process is the selection of samples. A sampling plan, which describes the steps taken to obtain a sample for each of the three components, is presented below.

A. Residential Sampling Plan

The residential sampling plan involves designing a process for selecting samples of residential curbside refuse and recycling materials (i.e., paper and metal, glass and plastic (“MGP”)). The process includes the following six steps:

1. Determining the income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process;
5. Developing the sample collection process; and
6. Developing refuse and recycling generation estimates.

Because the purpose of the Residential Study is to characterize the residential waste by income and density strata, the first step in the sampling plan was to determine define these strata and identify them within the City.

i. Income/Density Strata

An income/housing density matrix was developed using U.S. Census data for the year 2000 for each of the 2,217 census tracts in New York City. Three income levels, based on median household income, and three housing density levels were used to create a nine-box matrix.

The income levels used were defined as:

- Low Income = Median household income below \$30,763;
- Medium Income = Median household income between \$30,763 and \$46,193; and
- High Income = Median household income above \$46,193.

The housing density criteria were based on the number of structures within each census tract. The three housing density levels were defined as:

- Low Density = Census tracts in which 67 percent of the structures contain 2 or fewer units;
- Medium Density = All census tracts that are not in the High or Low categories; and
- High Density = Census tracts in which 67 percent of the structures contain 10 or more units.

The resulting income/density matrix separated the City’s census tracts by income and density, as shown in Table 1.

Table 1
Number of Census Tracts in Each Income/Density Stratum

	Low Income	Medium Income	High Income	Total
Low Density	5	177	410	636
Medium Density	392	435	162	636
High Density	<u>342</u>	<u>127</u>	<u>167</u>	<u>636</u>
Total	739	739	739	2,217

Because so few census tracts are in the Low/Low stratum, it was decided to eliminate this stratum from the study and focus the study on the remaining eight strata.

Next, a map of the City was developed in which each of the nine strata was color-coded. This map is shown in Appendix A.

To identify the universe of existing refuse and recycling collection routes, the DSNY provide a list of existing routes that fell entirely within contiguous census tracts of the same strata. The number of existing routes for each stratum is shown in Table 3 below.

The next step was to determine the number of samples that would be sorted.

ii. Sample Size

In a waste characterization study, the number of samples that are sorted affects the accuracy of the estimate. For example, if only one 200 pound sample of the City’s refuse were sorted, it is very unlikely that the estimate resulting from sorting that single sample would match the composition of the City’s entire curbside refuse. On the other hand, if hundreds of thousands of 200 pound samples were sorted – enough samples so that every ounce of the City refuse were sorted – the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate. So, how many samples should be sorted?

Before we answer the question about the number of samples, we should understand the nature of the materials that will be sorted. If the materials being sorted (i.e., the refuse and recycling materials) were consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few samples to develop an estimate, if there were only two materials in the refuse stream and they were always found in the same proportion in every sample. Of course this is not the case. Refuse, and to a lesser degree, recyclables, are extremely variable. The percentage of each type of waste material can vary considerably among samples. Even from the same household, the type of waste can vary depending on when the sample is collected. For example, during the autumn, one would expect to find large amounts of leaves, but in the winter there will be few leaves or none. On the other hand, food waste will be found throughout the year. Because of the potential for variability between samples, a different number of samples may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently than leaves, fewer samples would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

Typically, an estimate of the composition of waste is presented as three numbers: (1) the Sample Mean; (2) the Confidence Level; and (3) the Confidence Interval. The Sample Mean is the average percentage of a given material found in the samples sorted. For example, after sorting thirty samples of refuse, we will have a list of thirty percentages of paper waste. If the average of the thirty percentages of paper is 35 percent, then the Sample Mean of paper is 35 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sample taken. The Sample Mean is, after all, simply the average value of the samples; it is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tell us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's mean value. For example, if the Confidence Interval around the Sample Mean - 33 percent to 37 percent for paper – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of paper waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted standard.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population Mean. For example, our Sample Mean of 35 percent for paper waste may have a Confidence Interval of ± 7 percent, at a 90 percent Confidence Level. That is, based on the number of samples that have been sorted and results obtained, we would expect that 90 percent of the time, the amount of paper waste in the refuse of the entire population would be between 28 percent and 42 percent. Or, put another way, if we could actually go out and determine the exact percentage of paper waste in our

population, we are 90 percent certain that the value would be between 28 percent and 42 percent. If we wanted a more accurate estimate, we would have to sort more samples.

In recommending the number of samples of refuse and recyclables to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard waste is much more variable than food waste. Therefore, for a given number of samples, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred samples of refuse may provide a Confidence Interval of ± 8 percent for paper, but a ± 30 percent for yard waste. To achieve a ± 8 percent for yard waste would require significantly more samples and would probably be prohibitively expensive.

In practical terms, “variability” simply means the variation we are likely to find between samples. If we sort through 10 samples and each sample has between 28 percent to 32 percent of a given waste type, we can be pretty certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same 10 samples and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, you can see that we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy is high. Below that point, significant increases in accuracy can be achieved with relatively little cost.

In determining the number of samples to be sorted for the Phase I Residential Study, an accuracy goal ± 7.5 percent Confidence Interval for the major material groups at a 90 percent Confidence Level was requested by DSNY. In addition to this accuracy goal, R. W. Beck considered the eight income/density strata to be characterized and the need to account of seasonality in the waste stream. Also, R. W. Beck reviewed the Preliminary Waste Characterization Study (“PWCS”) to note the variability exhibited in the PWCS results.

R. W. Beck is recommending that at least 200 samples of refuse be sorted for each strata, 50 samples per strata each season.

The results of the PWCS showed relatively little variability in Paper Recycling, but significant variability in the MGP. Therefore, R. W. Beck is recommending that 40 Paper Recycling samples per strata be sorted, 80 per season and 160 MGP samples per strata be sorted, 320 samples per season. Table 2 shows the number of samples recommended for the Phase I Residential Study.

Table 2
Sample Size for the Phase I Residential Study

	Samples per Strata	Samples per Season	Samples per Strata/Season	Total
Residential Refuse	200	400	50	1,600
Residential Paper Recycling	40	80	10	320
Residential MGP	<u>160</u>	<u>320</u>	<u>80</u>	<u>1,280</u>
Total	400	800	140	3,200

iii. Sample Weight

Based on current industry practice and studies by the USEPA and academic studies (e.g., Klee), it was determined that the weight of each sample of refuse would be between 200 pounds and 250 pounds.

Because recycling paper and MGP tend are generally less variable than refuse samples (i.e., contain fewer types of materials), and based on the results of the PWCS, it was determined that the weight of each sample of recycling paper and MGP would be between 100 pounds and 125 pounds.

iv. Sample Selection

In selecting samples from the City’s curbside refuse for the Phase I Residential Study, R. W. Beck and DSNY agreed to use existing refuse and recycling collection routes that were entirely within census tracts for each of the eight income/density strata. An analysis of the census tracts and information on the existing collection routes provided by DSNY, the universe of available routes was developed. Table 3 shows the number of available collection routes for each of the eight income/density strata.

Table 3
Pure Routes and Universe of Routes for Sampling

Strata	Refuse		MGP		Paper		Total	
	Pure	Universe	Pure	Universe	Pure	Universe	Pure	Universe
High Density/ High Income	43	564	18	90	36	198	97	852
High Density/ Low Income	20	219	6	24	3	12	29	255
High Density/ Medium Income	15	84	5	21	5	21	25	126
Low Density/ High Income	67	792	49	345	49	345	165	1,482
Low Density/ Medium Income	8	42	9	27	9	27	26	96
Medium Density/ High Income	2	36	1	9	2	12	5	57
Medium Density/ Low Income	25	294	12	66	12	66	49	426
Medium Density/ Medium Income	13	147	9	60	9	57	31	264
Total	193	2,178	109	642	125	738	427	3,558

From this universe of existing routes, sample routes were randomly chosen. Because certain strata had relatively few existing routes, sampling by replacement was used, meaning that it was possible that more than one sample might be taken from any one truck. However, all samples were selected randomly. The tables with those randomly selected routes (refuse, recycling, and street basket) for the winter sorting period are included as Appendix B.

v. Sample Collection

a. Refuse Sample Collection

The samples of residential refuse will be acquired at one of two private transfers stations owned by Waste Management, Inc. (“WMI”) and under contract with DSNY to receive residential curbside refuse. The two transfer stations are WMI’s Varick Street transfer station and Harlem River Yard transfer station. DSNY has agreed to divert the trucks that have been selected for sampling to one of these two transfer stations. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

As a selected truck arrives at the transfer station, the R. W. Beck Sample Manager will be notified. When the truck has tipped its load a front-end loader (“FEL”) from the transfer station will take a randomly selected portion of the tipped load dump into two or three 96-gallon toters. The random selection of the portion of the tipped load to be sampled will be made by the Sample Manager before the FEL begins to grab the sample.

The FEL will dump the selected portion of the load into toters that have been positioned by the Sample Manager and Assistant in an area designated by WMI. Once the refuse has been dumped into the toters, the FEL will manage the remainder of the tipped load as it normally would.

The Sample Manager and assistant will then weigh each toter to be sure that the sample of refuse weighs 200 pounds to 250 pounds. In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, we estimate that, typically, two toters of refuse should contain one sample of waste. After the toters have been weighed, each toter will be marked with the date, Sample number, a Sample Code, and the truck number. In addition, each sample will have a Sample Management Form which will be taped to the toters. The Sample Management Form is included as Appendix C.

After the samples are weighed and labeled, they will be loaded on an R. W. Beck truck and transported to the North Shore Marine Transfer Station where they will be unloaded and positioned for sorting.

It is likely that some samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

b. Recycling Sampling

The samples of residential recycling Paper and MGP will be acquired at one of two processors under contract with the DSNY to receive residential curbside recycling. The two processors are Hugo Neu Schnitzer East’s facility in Long Island City for MGP and Metropolitan Paper for Paper Recycling. DSNY has agreed to divert the recycling collection trucks that have been selected for sampling to these two processors. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

The procedure for acquiring samples will be identical to the procedure used as the private transfer stations described above. However, our experience in other projects, the PWCS, and the Fall Sort indicates that 100 to 125 samples of recycling material will, in most cases, require only one toter. The samples of Paper Recycling and MGP will be taken to the Greenpoint Marine Transfer Station where they will be sorted. It is likely that the MGP samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of

the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

vi. Waste Generation

One facet of the Phase I Study is to develop generation rates for residential waste for the City. Generation rates refer to the average amount of refuse, MGP, and paper set out for collection by a household or person over a given period of time. Because the Residential Study examines the City's waste by housing-density and income strata, the generation rates were estimated by strata. Each stratum's generation rate is actually an average of individual generation rates of each household that comprise that stratum. In other words, we do not believe that each household in a given strata generates an identical amount of refuse, MGP, and paper. Rather, we believe that each stratum may have a unique average generation rate when we combine the individual households that comprise that stratum.

Residential Generation Rates

Information regarding tons collected is available at the District and Section levels. The City has 59 Community Districts and, within these Districts, 230 Sections. Information regarding population, number of households, and strata is available on the Census Tract level. The methodology used to estimate generation rates requires integrating the information available for the Census Tracts and the Section.

Using the New York City Department of City Planning's Land Use and Geographic Database for the five boroughs of New York City ("MapPluto"), we are able to assign Census Tracts to each Section. Because Census Tracts do not conform to Section boundaries, some Census Tracts belong to only one Section while others may be in two or more Sections. In cases where Census Tracts "bleed" over Section boundaries, it was initially assumed that Census Tracts reaching outside a given Section would be balanced by Census Tracts in adjacent Sections bleeding into that Section. The object was to split Census Tracts among Sections to appropriately account for the correct strata-composition of a given Section.

Since we know the number of households in each Census Tract, we can estimate the number of households in each Section by multiplying the households in each Census Tract by the number of Census Tracts assigned to a given Section. For example, MapPluto tells us that Manhattan District 6, Section 3 has seven Census Tracts. We know that the total number of households in these seven Census Tracts is 26,296. We can check our work by comparing the sum of the households for all Sections in a District against the District totals. The sum of the estimated number of households in Section 3 of Manhattan District 6 is 91,252. The total number of households in Manhattan District 6, as reported by DSNY, is 91,189. These two figures are less than 1 percent of each other and indicate that our estimate of the number of households is reasonable.

For Districts where there was a significant discrepancy between the estimated number of households and the number of households reported, we mapped the Section and Census Tracts and adjusted the number of households per Section. For example, if a significant area of the Census Tract lay outside the Section to which it had been assigned, the number of households

assigned to the Section was adjusted. The number of households was again checked to see that our estimates were within 5 percent of the actual District totals.

Each Census Tract assigned to a Section had been placed in one of nine strata. We allocated the number of households in each Census to the appropriate strata for each Section. For example, MapPluto shows that the seven Census Tracts in Manhattan District 6, Section 3 are all in the High/High strata. Therefore, we can characterize Manhattan District 6 Section 3 as the High/High strata. It should be emphasized however that the generation rates for these Sections would not all be identical. They are individual instances of this strata's average generation rate. We can average them, weighted by the number of households in each Section, to estimate the strata's average generation rate. Of the 230 Sections in the City, 43 sections contained census tracts from the same strata.

In the remaining 187 Sections, the strata of the census tracts were mixed. For example, in Manhattan District 2 Section 1, MapPluto assigned eight census tracts from four different strata.

To calculate the generation rates we began by assuming that the population in each strata all discard exactly the average value (for their strata) that we seek. We know that this assumption is not exactly true (there is likely to be variation within each stratum regarding the amount of waste generated). Thus, we know that there will be some remaining discrepancy ("ε") between our calculated tonnages for each Section and the actual tonnages observed.

The regression therefore seeks to estimate a single "tons per person" value for each stratum such that, when multiplied by the population of each stratum in a given Section, it closely approximates the known total tonnage for that Section. All Sections are included in this analysis, whether comprised of a single or multiple strata.

Example: Consider a simplified case where there are only 3 Sections and 2 strata.

In Section 1, there are 100 people in stratum A and 400 people in stratum B. Section 1 discards 190 tons of waste.

In Section 2, there are 300 people in stratum A and 200 people in stratum B. Section 2 discards 220 tons of waste.

In Section 3, there are 500 people in stratum A and 800 people in stratum B. Section 2 discards 500 tons of waste.

The regression analysis seeks to estimate the per-person average waste values for strata A and B using the following:

$$100*X1 + 400*X2 + \epsilon = 190$$

$$300*X1 + 200*X2 + \epsilon = 220$$

$$500*X1 + 800*X2 + \epsilon = 500$$

In this case, $X1 = 0.49$ and $X2 = 0.33$ (tons per-person) are the estimates which best fit the given data.

In the actual analysis, we had data for 227 Sections upon which the estimates for the 9 strata were determined.

The documents supporting this approach and the results for the Fall Sort are presented in the Fall Sorting Period Report. This methodology will be used to develop residential generation rates for the Winter Sort.

Street Basket Generation Rates

To develop generation rates for the Street Basket Waste Study, we will use the net weight of the vehicles on the dedicated street basket collection routes from which samples were taken. This net weight will be divided by the number of baskets on the dedicated route to produce an average weight per street basket.

One complication in developing these generation rates is that certain street baskets are collected on more than one route. This route overlap makes it difficult to determine exactly how much time has elapsed since the basket was last collected. We are currently addressing this problem with DSNY and will report Street Basket Generation Rates when we have resolved this issue.

B. Street Basket Sampling Plan

The Street Basket sampling plan involves designing a process for selecting representative samples of street basket waste. The process includes the following six steps:

1. Determining the universe of street basket waste income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process;
5. Developing the sample collection process; and
6. Developing a street basket waste generation estimate

Because the purpose of the Street Basket Study is to characterize street basket waste, the first step in the sampling plan was to determine what universe of street basket waste would be used for drawing samples.

i. The Universe of Street Basket Waste

DSNY and R. W. Beck agreed to use the total number of dedicated street basket collection routes as the universe from which random samples of street basket refuse would be taken. Dedicated routes are those routes that collect only street basket waste. Routes that collect residential refuse as well as street basket refuse are excluded from this study. There are dedicated routes in all five of the City's boroughs. DSNY provided a list of 107 dedicated routes with 644 loads.

ii. Sample Size

The results of the *Seattle Litter Composition Study* were reviewed to determine the variability of street basket waste. Based on this review, it was estimated that 200 samples of street basket waste would be expected to achieve a confidence interval of ± 7.5 percent for the major material

groups – paper, plastic, metal, and glass. Each season 50 samples of street basket waste will be sorted.

iii. Sample Weight

The weight of samples will be the same as the weight of samples for residential refuse, for the reasons discussed in Section II. A. iii.

iv. Sample Selection

From the universe of 644 loads of street basket waste, 50 loads were randomly selected, using Excel's random number function. These loads were sent to DSNY to confirm that the routes were still available.

v. Sample Collection

Samples of street basket waste will be collected using procedures identical to those for collecting residential refuse.

III. Material Categories

A. Refuse Categories

The list of material categories to be used in the refuse and street basket sorting is presented in Appendix D.

B. Recyclables Categories

The list of material categories to be used in the recycling sorting is the same as the list of materials for refuse sorting and is presented in Appendix D.

C. Street Basket Categories

The material categories for street basket waste will be identical to the categories for refuse. In addition, sorting will seek to identify instances of illegally disposed residential or commercial waste.

IV. Field Procedures

A. Health and Safety Plan

R. W. Beck's current Health and Safety Plan ("HASP") has been submitted to DSNY previously and is included in Appendix E.

B. Sorting Procedures

Once the samples of refuse and recycling have been transported by the Sample Managers from private transfer stations or recycling processors to the sorting sites, the Field Supervisor at each sorting site will check in each of the samples to be certain that the Sample Management Forms and Sample labels are clear and consistent.

After the Samples have been checked in, each Crew Chief and crew will begin sorting samples. The refuse will be sorted into the material categories using the Sample Detail Form, shown in Appendix C. When all material has been sorted, the material falling through the ½-inch screen on the sorting table, called “fines”, will be swept up and included as one of the material categories. All sorted materials will then be weighed.

Protocol for Identifying and Accounting for Illegal Materials in Street Basket Waste

To determine the level illegal use of street baskets for residential or commercial refuse disposal, the following protocol will be used:

- Before sorting, each 200 to 300-pound street basket sample will be placed on the sort table for inspection by an R. W. Beck Crew Chief trained by DSNY staff to identify suspected illegal residential or commercial waste.
- All closed opaque plastic bags the size of a shopping bag or larger will be identified as potentially containing illegal material.
- The loose material found in clear plastic basket liners or opaque liners labeled with a Business Improvement District (“BID”) logo will be considered legal street basket waste.
- Any closed opaque plastic bags the size of a shopping bag or larger found within a BID bag will also be identified as potentially containing illegal material.
- Closed bags identified as potentially containing illegal material will be opened.
 - If a bag contains any of the following materials, it will be classified as “residential”:
 - Addressed mail;
 - Substantial quantities of home-use products, including: health and beauty aids, detergent bottles, family sized drink containers, or other seemingly residential material; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggest home use.
 - If a bag contains any of the following materials, it will be classified as “commercial”:
 - Retail food preparation wastes (industrial sized food/liquid containers; substantial quantities of identical packaging or unused products, cardboard boxes);
 - Construction materials such as pieces of dry wall or other building materials; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested office, retail, industrial, construction or food establishment waste.

Closed shopping bags not containing materials deemed residential or commercial, but suggesting street use (single use containers, newspapers, etc.) will be considered legally disposed street basket waste.

For all bags identified as containing residential or commercial wastes, the following four procedures will be followed.

- All such bags will be individually photographed.
- Each bag will have a written record describing its contents. The crew chief will record this information on the Sample Detail Form.
- All such bags will be counted (regardless of size) in two groups: residential bags, and commercial bags. The bag counts will be recorded on the Sample Detail Form.
- In each sample, bags identified as containing residential or commercial waste will be weighed in two groups: residential bags, and commercial bags. The combined weights of the bags in each group (residential and commercial) will be recorded on the Sample Detail Form.

In addition, each sample will be examined for suspected instances of illegally disposed residential or commercial wastes not encased in closed bags as defined above – including instances of broken bags with spilling contents, as well as residential or commercial material loose in the street basket contents. These materials will be photographed but not weighed and their presence noted on the Sample Detail Form. .

After these procedures have been completed, all material will be placed onto the sorting table and sorted according to the refuse sorting protocol.

All weights will be recorded by the R. W. Beck Crew Chief. The tare weight of the containers will be put into the scale so that only the net weight of the sorted material is recorded. When the weighing of all material in the sample has been completed, the sorted refuse and recycling will be placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew will then begin sorting the next sample. Each crew is expected to sort and weigh an approximately nine samples of refuse and MGP per day, and 15 samples of Paper Recycling per day. This average is based on our experience in the PWCS.

Moisture and Particulate Testing

Samples of refuse and recycling will be randomly selected for moisture and particulate testing. The purpose of the test is to estimate how much of the weight of certain materials is made up of moisture and fugitive particulates that migrate to the materials during compaction in the collection truck. Eighteen materials have been identified for testing. In each randomly-selected sample 3 to 5 pounds of each material will be collected and double-bagged. Each 3 to 5 pounds of material is called a Moisture Testing Unit (“MTU”). Therefore, each sample may have as many as 18 MTUs, although some samples may not include some of the targeted materials.

All MTUs will be sent to Woods End Laboratory for testing and results reported to the Project’s data management team for analysis. During the Winter Sort, 12 samples will be randomly selected for testing.

A total of 500 MTUs will be tested during the Phase I study and the analysis of the results will be reported after the fourth season of sorting.

C. Staffing

The professional staff for the Winter Sorting Period will include:

- Tom Jones, Project Manager: Mr. Jones has been with R. W. Beck for the past 16 years and is currently a Senior Director of the firm. His work has included waste characterization studies, solid waste facility financings, and planning/implementation work.
- Deborah McDonough, E.I.T. – Data Manager: Ms. McDonough, an Engineer with R. W. Beck since 2001, is responsible for conducting transmission analyses and specializes in designing software programs, data management applications, and interactive graphical tools for use in projects associated with solid waste composition studies, locational marginal pricing, transmission power flow studies, transmission constraint analysis, and rate analyses. She is also Project Manager of the Georgia State Waste Characterization Study. Ms. McDonough has been the Data Manager since the beginning of the Project.
- Joe Naviera, Assistant Data Manager: Mr. Naveira has an AS degree in Database Technology and recently joined R. W. Beck as a Data Administrator. He has assisted in the maintenance and development of databases for multiple clients, including the New York Department of Sanitation and R. W. Beck’s disaster relief project throughout Florida.
- John Culbertson, Technical Advisor: Mr. Culbertson is a Project Manager in R. W. Beck’s Environmental Services Group with 11 years of experience in environmental and information management consulting. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and solid waste system financial and strategic analysis.
- Mack Rugg, Residential Study Task Manager: Mr. Rugg is an employee of Camp Dresser McKee and an acknowledge expert in the field of waste characterization. He has managed numerous waste studies, including a current project in Bergen County, New Jersey.
- Tanya Tarnecki, Street Basket Task Manager: Ms. Tarnecki manages several waste management projects for Cascadia Consulting, including data collection and reporting waste characterization projects in King County, Washington; and San Bernadino and Orange County, California.
- Tim Buwalda, Multi-Unit Apartment Task Manager: Mr. Buwalda is a Senior Engineer with R. W. Beck with more than 13 years of experience, specializing in waste reduction and materials recovery. His background includes comprehensive solid waste management and recycling experience in both municipal and private settings.
- Steve Baumgart, Director of Sampling: Mr. Baumgart has over 12 years of experience at R. W. Beck working on solid waste management projects. He has managed and supported design teams in the development, planning and design of existing transfer/recycling station facilities. He has also worked with solid waste facility owners and operators in preparing

facility master plans, permit applications, conceptual and final designs, program implementation scheduling, cost estimating, construction oversight, and independent engineering reviews. Mr. Baumgart was a Sample Manager during the Fall Sorting Period.

- **Walt Davenport, Director of Sorting:** Mr. Davenport has over 30 years of experience in the solid waste profession as a private sector hauler/recycler and consultant. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and processing efficiency. He has managed numerous waste composition studies including PA Statewide, Alameda County, CA, and Montgomery County, MD Waste Composition studies.
- **Tanya Tarnecki, Greenpoint Field Supervisor:** (see above)
- **Rory Tipton, E.I.T., North Shore Field Supervisor:** Mr. Tipton has more than two years of civil engineering experience working as a project engineer on solid waste projects. He has been responsible for engineering design, documentation, cost estimating, and production coordination for projects of varying size and complexity. He received waste characterization training in R. W. Beck's Georgia Waste Characterization Study.
- **Brian Holt, Greenpoint Crew Chief:** Mr. Holt has recently joined R.W. Beck and has been supervising crews for the firm's disaster recovery program in Florida.
- **Karen Vickers, Greenpoint Crew Chief #2:** Ms. Vickers has 10 years of experience in solid waste management and waste reduction project planning, educational outreach, and special events planning on the state and local government levels in the Southeast region. Previously, Ms. Vickers was employed as the Program Education Specialist for the Athens Clarke County Solid Waste Department, Recycling Division, in Athens, Georgia, as the State Recycling Coordinator for the Georgia Department of Community Affairs, and as a Recycling Coordinator for the City of Delray Beach, Florida. Ms. Vickers currently serves as the Vice President of the Georgia Recycling Coalition, and holds Faculty member status with the Solid Waste Association of North America.
- **Katie Kennedy, North Shore Crew Chief:** Ms. Kennedy performs research and analysis in support of waste composition and recycling analysis. Her recent field work including leading sorting crews for the Tacoma School District and the Sunshine Canyon Waste Composition Studies.
- **Randy Bowen, North Shore Crew Chief:** Mr. Bowen has over 30 years of experience in the solid waste profession as a hauler/recycler and consultant. Mr. Bowen has worked as a manager in both the public and private sector and as a recycling business owner. Mr. Bowen's project experience includes: numerous waste classification/characterization studies, collection route auditing, composting, special events recycling, and project management. Mr. Bowen was a Crew Chief during the PWCS and the Fall Sorting Period.
- **Colleen Thumlert, North Shore Crew Chief:** Ms. Thumlert has more than twelve years of teaching and developing environmental training programs. She specializes in developing

waste audits for schools and businesses and assists with Cascadia's waste composition and survey field work.

- Marley Shoaf, North Shore Crew Chief: Ms. Shoaf performs waste and recycling audits of Seattle area businesses and facilitates stakeholder groups on environmental health topics, such as fish consumption and removal of toxic chemicals from school science labs. .
- Susan Evans, North Shore Crew Chief: Ms. Evans teaches for the King County Master Recycler Composter Program. Her other project work volunteer coordination and outreach focused on waste prevention and recycling.
- Hilliary Smith, Sample Manager: Ms. Smith developed the paper waste management policies for Bowdoin College. She teaches waste reduction, recycling, and environmental stewardship at Island Wood on Bainbridge Island, Washington.
- Sasha Evans, Sample Manager: Ms. Evans manages waste generation studies, rate studies, and California regulatory compliance projects. Her work includes the development and implementation of recycling programs, recycling ordinances, permits documents, and solid waste planning.
- Teresa Lewandowski, Sample Manager: Ms. Lewandowski performs analysis for the annual diversion and disposal reporting to the California Integrated Waste Management Board. She also works on waste generation studies, technical reports, business surveys, and on-site waste audits.
- Ramone Swan, Sample Manager: Mr. Swan is an employee of Organics Resources, Inc. ("ORI") and was a Sample Manager during the Fall Sorting Period.
- Bernice Siebuhr, Sample Manager: Ms. Siebuhr is an analyst for R. W. Beck's Electrical Facilities Practice and has worked with a variety of clients in Georgia and Florida. She also did field work for the firm's disaster recovery program.
- Dieter Eckels, Sample Manager: Mr. Eckels conducts data collection, research, and analysis in support of a number of Cascadia waste characterization projects including the 2003 and 2004 California Statewide Waste Composition Studies. His background includes collection system design for the University of Washington's program to re-use on-site cooking oil as bio-diesel for the campus fleet. Mr. Eckles was a Sample Manager for the Fall Sorting Period.
- Paul Johnson, Sample Manager: Mr. Johnson joined R. W. Beck as a Civil Engineer in 2002. He is experienced in environmental disciplines such as petroleum contaminated soil excavation, solid waste disposal area closure, and landfill inspection and monitoring. He has completed the OSHA 40-hour Hazardous Waste Training Course and is trained to collect water, soil, and gas samples. Mr. Johnson was a Sample Manager during the Fall Sorting Period. .

D. Staff Training

Monday, February 28 and Tuesday, March 1, 2005 will be devoted to staff training. The training of Crew Chiefs will be conducted by John Culbertson, the Technical Advisor and Walt Davenport, the Director of Sorting. Training for the Sample Managers will be conducted by Tom Jones, Project Manager, and Steve Baumgart, Director of Sampling.

Training will include an introduction to the Phase I Study, a discussion of health and safety policies and practices, and an explanation of sampling, sorting and weighing procedures. The first couple of samples to be sorted will be used as means of teaching material categories, proper sorting technique, and safe practices.

E. Equipment

The safety equipment for each sorter is described in Appendix F, the HASP. Other equipment being used includes:

- Sample acquisition: 96-gallon toters, a battery-operated H&V scale, brooms, shovels, rakes, and trucks with lift gates. All members of the Sampling teams will be equipped with hard hats, reflective vests, safety goggles, and gloves.
- Sample sorting: A sorting table, bins for sorted materials, a battery-operated H&V scale, hand rakes and small brooms. All members of the sorting crews will be equipped with Tyvek suits, safety goggles, and protective gloves.
- In recognition of the potential for snow and cold weather during the winter sorting period, we have made arrangements for tents, propane heaters, and lights at both the Greenpoint and North Shore transfer stations to protect sorting crews. All workers have been told to wear warm clothing and supervisors will be reminded to check on and treat any workers that appear to be suffering from cold or fatigue.

F. Post-Sort Disposal and Recycling

i. Post-Sort Disposal of Refuse

DSNY has agreed to provide roll-off containers for disposing of the sorted refuse and to remove the containers when they are full.

ii. Post-Sort Recycling

DSNY has agreed to provide roll-off containers for disposing of the sorted recyclables and to remove the containers when they are full.

V. Data Recording and QA/QC

Three types of data will be developed during the Phase I Study. The first type will be the Sample Management Form. As each sample is acquired, as described in the Sampling Plan above, information on the borough of origin, route, and truck number, will be recorded on a Sample Management Form filled out by the Sample Manager. The Sample Management Form will include the following information:

- The date on which the sample was acquired;
- The name of the transfer station from which the sample was acquired;
- The name of the Sample Manager and assistant;
- The Sample Number, which is the number of the sample acquired on that day;
- The count of the toters (i.e., 1 of 3);
- The Sample Code, which shows the borough, district, section and route of the truck from which the sample was taken. For example, Manhattan 1, Sec.12, Route. 3 indicates that the truck route from which this sample was taken was in Manhattan District 1, Section 1, Route 3;
- The truck number, which will be provided by DSNY when they assign a truck to the selected route;
- The weight of each toter in the sample; and
- The weight and description of any bulky waste items that are part of the sample. These will not be transported to the Sorting Site.

A copy of the Sample Management Form will be affixed to the sample when it is transported from the private transfer station to the Sorting Site. It will remain with the documentation for that sample.

The second type of data will be the material weight data recorded by the Crew Chief when the sorting of each sample is completed. This form, called the Sample Sort Form, will include the net weight of each category of waste that has been sorted and, in the case of some materials, a count of the items in the category (e.g., small appliances).

When the sample has been sorted the Crew Chief and the Field Supervisor will review the forms for completeness and accuracy and sign them. At the end of the day, the Crew Chiefs, Field Supervisor, and Project Manager will review all the forms again and note any unusual samples or circumstances that may have affected the data.

The forms will be put into the project's Access database by the Data Manager and her staff on-site. The Data Manager and her staff will check the data for completeness and accuracy. Once this procedure has been completed, the Data Manager will confer with the Project Manager and if they are satisfied that the data for that day of sampling is complete, it will be provided to the DSNY Project Manager.

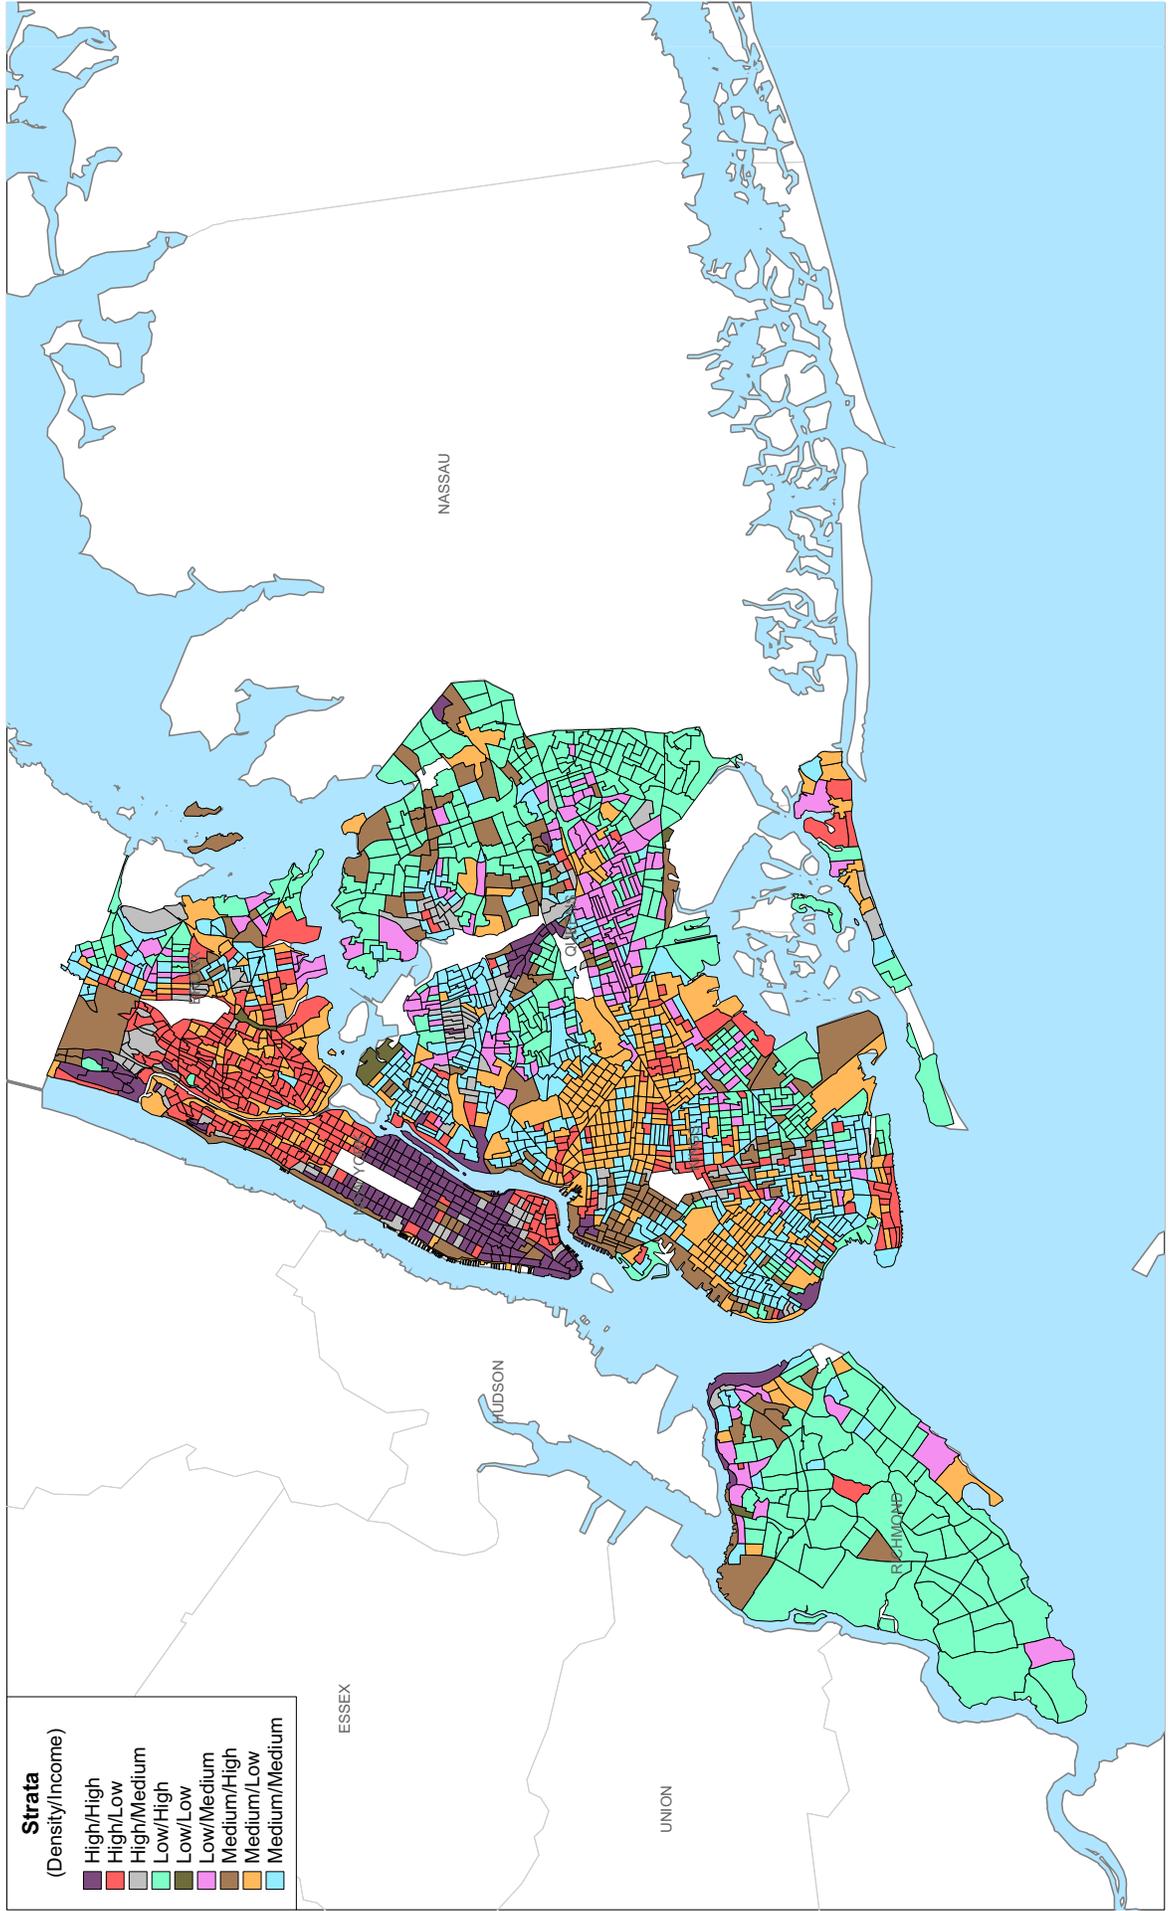

The third type of data will be the results of the moisture and particulate testing that will be conducted by the Woods End Laboratory ("Woods End"). Small (3 pound to 5 pound) portions of selected materials will be double-bagged and sent by courier to Woods End for analysis. This data resulting from the analysis will be sent directly from Woods End to the Project Manager and Data Manager. The Data Manager will enter it into the database as it is received.

This procedure for recording and checking the data will be reviewed during the Phase I Study and, if R. W. Beck believes that changes will make the procedures more efficient, without compromising completeness and accuracy, or more accurate and complete, we will recommend these changes to DSNY.

Material Category Definitions

[This page intentionally left blank.]

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Mat. Grp	#	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Paper	1	Newspaper	Printed ground wood newsprint (Advertising "slicks" - glossy paper - if found mixed with newspaper; otherwise, ad slicks are included with mixed low grade.).				✓
	2	Plain OCC/Kraft Paper	Old unwaxed/uncoated corrugated container boxes, and Kraft paper other than paper bags				✓
	3	High Grade Paper	White and lightly colored bond, rag, or stationary grade paper. This includes white or lightly colored sulfite/sulfate bond, copy papers, notebook paper, envelopes, Continuous-feed sulfite/sulfate computer printouts and forms of all types.				✓
	4	Mixed Low Grade Paper	Includes junk mail, magazines, colored papers, bleached Kraft other than bags, boxboard, mailing tubes, carbonless copy paper, ground wood computer printouts				✓
	5	Phone Books/Paperbacks	Paperback books and telephone directories				✓
	6	Paper Bags	White, brown or other colored paper bags				✓
	7	Polycoated Paper Containers	Beverage containers made of bleached and unbleached paperboard coated with HDPE film. This includes polycoated milk and juice containers, and aseptic juice containers, including those with plastic spouts attached. Excludes juice concentrate cans, ice cream containers.				✓
	8	Compostable/Soiled Paper/Waxed OCC/Kraft	Waxed papers and cardboards; other papers that were soiled with food during use (e.g., pizza box inserts); paper towels, wipes and napkins. Excludes paper plates, platters, cups, and bowls.				✓
	9	Single Use Paper Plates, Cups	Paper plates, platters, cups and bowls				✓
	10	Other Nonrecyclable Paper	Polycoated frozen food and ice cream containers/packaging and other polycoated papers (excluding cups, plates, bowls and platters; milk/juice cartons, and aseptic packaging); paper with other materials attached (e.g. orange juice cans, nut cans, ajax/comet containers)				✓
Plastic	11	PET Bottles	#1 Polyethylene terephthalate translucent bottles and jars.	D/N/P	✓	✓	✓
	12	HDPE Bottles: Natural	High-density translucent polyethylene (#2) milk, juice, beverage, oil, vinegar, distilled water bottles with necks and jars	N/P	✓	✓	✓
	13	HDPE Bottles: Colored	High-density colored polyethylene (#2) bottles. Liquid detergent bottles, some hair care bottles with necks and jars	N/P	✓	✓	✓
	14	#1 PET Tubs/Trays/Other Containers	Wide mouth tubs and trays without a neck, such as yogurt, cottage cheese, and margarine embossed with #1.				
	15	#2 HDPE Tubs/Trays/Other Containers	Wide mouth tubs and trays without a neck, such as yogurt, cottage cheese, and margarine embossed with #2.				
	16	#3 PVC Bottles	Plastic bottles displaying a #3	N/P	✓	✓	
	17	#4 LDPE Bottles	Plastic bottles displaying a #4	N/P	✓	✓	
	18	#5 PP Bottles	Plastic bottles displaying a #5	N/P	✓	✓	
	19	#7 Other Bottles	Plastic bottles displaying a #7	N/P	✓	✓	
	20	#3 PVC Tubs	#3 injection molded tubs				
	21	#4 LDPE Tubs	#4 injection molded tubs				
	22	#5 PP Tubs	#5 injection molded tubs				
	23	#7 Other Tubs	#7 injection molded tubs				
	24	Soda Crates and Bottle Carriers	Self Explanatory				
	25	Other PVC	Plumbing pipe, identifiable PVC packaging other than PVC bottles/tubs				
	26	Rigid Polystyrene Containers and Packaging	#6 clear trays, salad containers/trays, clamshells, cookie tray inserts, dairy tubs, CD Boxes				✓
	27	Expanded Polystyrene Containers and Packaging	Includes packaging and finished products made of expanded polystyrene. Excludes styrofoam plates, cups, bowls, takeout clamshells, and platters.				

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Plastic - Cont.	28	Other Rigid Containers/Packaging	Packaging that is not identifiable as #1-6, including containers of all types, toothpaste tubes, and plastic spoons. Also: thermaformed/press molded rigid plastics with 1,2,3,4,5 or 7 IPC code.				✓
	29	Plastic Bags	Plastic bags, including labeled grocery and merchandise, dry cleaner, and newspaper polyethylene film bags. Does not include garbage bags, baggies or ziploc bags; or bags heavily soiled with food.				✓
	30	Other Film	Film packaging not defined above, or: was contaminated with food, liquid or grit during use; is woven together (e.g., grain bags); contains multiple layers of film or other materials that have been fused together (e.g., potato chip bags); garbage bags.				✓
	31	Single Use Plastic Plates, Cups, Cutlery, Etc.	Plastic spoons, forks, knives, plates, cups, bowls, and platters of various resins, including styrofoam. Cup lids. Takeout clamshells. Plastic straws.				✓
	32	Other Plastics Materials	Items that are predominately plastic with other materials attached - pens, lighters, toys, and 3-ring binders, single use cameras, disposable razors. Finished plastic products made entirely of plastic such as toys, toothbrushes, vinyl hose -- not including plastic crates and soda bottle carriers.				
Glass	33	Clear Container Glass	Manually sortable CLEAR glass that is greater than 3" x 3"; Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	34	Green Container Glass	Manually sortable GREEN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	35	Brown Container Glass	Manually sortable BROWN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	36	Mixed Cullet	Clear, green or brown glass not manually sortable (under 3" x 3"); glass shards.				
	37	Other Container Glass	Manually sortable BLUE, RED, or YELLOW glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	38	Other Glass	Window glass, mirrors, light bulbs (except fluorescent tubes), glassware, glass ash trays, etc.				
Metal	39	Aluminum Cans	Aluminum beverage cans (UBC) and bi-metal cans made mostly of aluminum. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend)	D/N/P		✓	✓
	40	Aluminum Foil/Containers	Aluminum food containers, trays, and foil.				✓
	41	Other Aluminum	Aluminum products and scrap that are 50% or more aluminum, such as window frames, cookware. Does not include aluminum appliances.				
	42	Other Non-Ferrous	Non-aluminum metals not derived from iron, to which a magnet will not adhere, and which are not significantly contaminated with other metals or materials.				
	43	Tin Food Cans	Tinned steel food containers, including bi-metal cans mostly of steel.				
	44	Empty Aerosol Cans	Empty, mixed material/metal aerosol cans. (Aerosols that still contain product are sorted according to that material-for instance, solvent-based paint.)				
	45	Other Ferrous	Ferrous and alloyed ferrous scrap metals to which a magnet adheres and which are not significantly contaminated with other metals or materials. Does not include ferrous appliances.				

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Metal - Cont.	46	Mixed Metals	Items that are predominately metal with other materials attached such as motors, insulated wire, and finished products containing a mixture of metals, or metals and other materials, that are not classified in the "appliances" section below.				
	47	Leaves And Grass	Non-woody plant materials from a yard or garden area, including grass clippings, leaves, weeds, and garden wastes.				
Organics	48	Prunings	Cut prunings, 6" or less in diameter, from bushes, shrubs, and trees.				
	49	Stumps/Limbs	Compostable prunings or stumps 6" or greater in diameter.				
	50	Food	Food wastes and scraps, including bone, rinds, etc. Excludes the weight of food containers, except when container weight is not appreciable compared to the food inside.				
	51	Wood Furniture/Furniture Pieces	Furniture or furniture pieces made of wood.				
	52	Non-C&D Untreated Wood	Untreated wood products not associated with C&D activities, popsicle sticks, chopsticks, wooden spoons, and other miscellaneous household wood products. Does not include furniture.				
	53	Non-Clothing Textiles	Non-clothing fabrics made of rag stock fabric materials including natural and synthetic textiles such as cotton, wool, silk, woven nylon, rayon, and polyester. Includes handbags, linens, draperies, tablecloths, nylon rope, stuffed toys.				✓
	54	Clothing Textiles	Clothing textiles, not including shoes.				✓
	55	Carpet/Upholstery	General category of flooring applications and non-rag stock textiles consisting of various natural or synthetic fibers bonded to some type of backing material.				
	56	Disposable Diapers and Sanitary Products	Diapers and sanitary products made from a combination of fibers, synthetic, and/or natural, and made for the purpose of single use. This includes disposable baby diapers, adult protective undergarments, and feminine hygiene products.				
	57	Animal By-Products	Animal carcasses not resulting from food storage or preparation, animal wastes, and kitty litter.				
	58	Rubber Products	Finished products and scrap materials made of natural and synthetic rubber, such as bath mats, inner tubes, rubber hoses, foam rubber, tire pieces, latex gloves. Does not include shoes and boots that are predominantly rubber.				
	59	Shoes	Shoes, sneakers or boots.				
	60	Other Leather Products	Leather jackets, belts, bags, purses, and other non-shoe leather products.				
	61	Fines	Fines smaller than 1/2 inch screen				
	62	Upholstered or Other Organic-Type Furniture	Crushed upholstered furniture (if an equal mix of wood, and other organic materials not classified above.) Does not include mostly wood furniture or items that would be included under "Textiles")				
	63	Miscellaneous Organics	Wax, bar soap, cigarette butts, briquettes, and fireplace, burn barrel and fire pit ash, vacuum cleaner bags and contents.				
App. And Elec.	64	Small Appliances: Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would stick.				
	65	Small Appliances: Non-Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would NOT stick.				
	66	Small Appliances: Plastic	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are less than 50% metal.				
	67	Audio/Visual Equipment: Cell Phones	Cell phones				✓
	68	Audio/Visual Equipment: Other	Telephones, Stereos, radios, tape decks, VCRs, etc.				

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
App. And Elec. Cont.	69	Computer Monitors	Items other than televisions containing a cathode ray tube (CRT) such as computer monitors and laptops.				
	70	Televisions	Television sets containing a cathode ray tube (CRT).				
	71	Other Computer Equipment	Computer items not containing CRTs such as processors, mice and mouse pads, keyboards, disk drives, calculators, etc.				
C & D Debris	73	Untreated Dimension Lumber, Pallets, Crates	Untreated, milled lumber commonly used in construction for framing and related uses. Pallets and wooden crates.				
	74	Treated/Contaminated Wood	Lumber and wood products that have been painted or treated so as to render them difficult to compost (with generally 50% or more of the surface area treated). This includes painted and chemically treated lumber, plywood, strandboard, and particleboard.				
	75	Gypsum Scrap	Calcium sulfate dehydrate sandwiched between heavy layers of Kraft-type paper. Also known as drywall.				
	76	Rock/Concrete/Bricks	Rock gravel larger than 2" diameter, Portland cement mixtures (set or unset), and fired-clay bricks.				
	77	Other Construction Debris	Construction debris (other than wood) that cannot be classified elsewhere, and mixed fine building material scraps. For example, floor sweepings from construction activities containing sawdust, nails, wire, etc. Also: asphaltic roofing and fiberglass insulation.				
Misc.	78	Miscellaneous Inorganics	Other inorganic materials not classified elsewhere.				
	79	Ceramics	Whole or fragmented ceramic or porcelain products larger than 1/2 inch screen				
HHW	80	Oil Filters	Metal oil filters used in cars and other automobiles.				
	81	Antifreeze	Self Explanatory				
	82	Wet-Cell Batteries	Wet-cell batteries of various sizes and types as commonly used in automobiles.				
	83	Gasoline/Kerosene/Motor Oil/Diesel Fuel	Gasoline, diesel fuel, and fuel oils. Lubricating oils, primarily used in vehicles but including other types with similar characteristics.				
	84	Latex Paints/Water-Based Adhesives/Glues	Water-based paints and similar products.				
	85	Oil-Based Paints/Solvent-Based Adhesives/Glues	Solvent-based paints, varnishes, glues and similar products. Various solvents, including chlorinated and flammable solvents, paint strippers, solvents contaminated with other products such as paints, degreasers and some other cleaners if the primary ingredient.				
	86	Pesticides/Herbicides/Rodenticides	Variety of poisons with the purpose of discouraging or killing insects, weeds, vermin, or microorganisms. Fungicides and wood preservatives, such as pentachlorophenol, are also included.				
	87	Dry-Cell Batteries	Dry-cell batteries of various sizes and types as commonly used in households. Includes cell phone and button cell batteries.				
	88	Fluorescent Tubes	Fluorescent light tubes and compact fluorescent bulbs (CFL).				
	89	Mercury-Laden Wastes	Thermostats, thermometers, and other items containing mercury.				
	90	Compressed Gas Cylinders, Fire Extinguishers	Self Explanatory				
	91	Home Medical Products	Syringes, IV bags, medical tubing, and other home medical products and supplies.				
	92	Other Potentially Harmful Wastes	Explosives, Smoke detectors, Asbestos, Caustic acids and bases whose primary purpose is to clean surfaces, unclog drains, or perform other actions; photography chemicals, chemistry sets. Household disinfectants. Pool chemicals.				

**Appendix E
R. W. Beck Health
and Safety Plan**

[This page intentionally left blank.]

R.W. BECK, Inc.
Health and Safety Plan for Waste Composition Field Sorting

Date: April 29, 2004

Introduction

Corporate Safety Policy

R.W. Beck, Inc. believes that the health and safety of its employees is of paramount importance. The issue of health and safety is particularly important in conducting solid waste composition field sorting. The terms “waste sort,” “waste composition study,” “waste characterization study,” and the like may be used interchangeably, and all relate to any project that requires the manual handling of municipal solid waste (“MSW”) and subsequent sorting and weighing MSW to determine the percentage of different components in the MSW stream.

To address this issue, the following Health and Safety Plan (“HASP”) has been developed to provide guidelines to Project Managers, Field Supervisors, Crew Chiefs, and other field workers (“Field Personnel”) involved in R.W. Beck’s waste characterization studies. This Plan has also been prepared for distribution to third parties, such as R. W. Beck’s clients who are commissioning the waste composition study, solid waste management facility managers who may be hosting a waste composition study, and subconsultants retained by the firm to assist with the performance of any of the on-site activities of a waste composition study.

Objectives of the Plan

R.W. Beck’s HASP for Waste Characterization Field Sorting has the following four objectives:

- To align R. W. Beck’s health and safety efforts with policies and procedures that are already in place at the solid waste management facilities that host waste composition studies,
- To describe the roles and responsibilities of professional staff regarding health and safety,
- To describe the personal and site safety equipment that must be provided at all waste sorting sites,
- To provide field personnel with a description of the safety procedures to be followed in waste sorting,
- To describe the training and monitoring that R. W. Beck field personnel, subconsultants, and temporary workers must undergo before engaging in waste sorting activities.

Host Facility Health and Safety Coordination

Facilities at which R.W. Beck will sort waste may be owned and operated by third parties that have their own health and safety plans and procedures. It is important that, as guests at the facility, R.W. Beck's workers understand and adhere to the facility's health and safety plan. Adherence to the facility plan may include:

- Confining our waste sorting activities to the areas designated by the facility's owner/operator
- Wearing safety equipment required by the facility's owner/operator, and
- Understanding emergency plans and procedures.

It is important that the Field Supervisor or Project Manager work closely with the facility's owner/operator to integrate operations, including training staff regarding health and safety planning. Specific hold harmless or indemnification requirements by the Host Facility should be reviewed in accordance with the firm's Authorization Policy.

Staff Roles and Responsibilities

Every waste characterization study is unique in some way. Differences in the scope of work, size of the project, and sorting sites, for example, will require different configurations of staffing. However, for the purposes of this Health and Safety Plan, the responsibilities of four types of professionals are described here: (1) Safety Manager, (2) Project Manager, (3) Field Supervisor, and (4) Crew Chief. Some of these roles may overlap in practice. Their roles and responsibilities in the safety effort are described below.

Safety Manager

The Safety Manager is an R. W. Beck employee who is responsible for overseeing the health and safety policies and practices for all waste characterization projects across the firm. This responsibility includes seeing that the HASP is up-to-date, that an appropriate level of safety training for professional staff and temporary workers is maintained, that the most appropriate safety equipment is available to sorting crews, and that issues relating to the health and safety on waste characterization projects have been addressed. The Safety Manager is also responsible for communicating significant HASP changes or updates, newly acquired waste composition-related projects, and any health or safety-related events that occur while performing a waste composition study to R. W. Beck's Risk Management Department so that the firm can comprehensively and accurately monitor the success of the Plan.

Project Manager

The Project Manager of a waste characterization study has overall responsibility for the safety and health of all members of his Project Team. Although he/she will delegate some

of these responsibilities to the Field Supervisor and Crew Chief(s), the Project Manager remains the primary responsible party. The Project Manager must be an R. W. Beck employee.

The Project Manager is responsible for developing a project budget, schedule, and scope of work that provides the time and funds for conducting a safe waste sort. Proper safety equipment (see Section ___ - Safety Equipment) must be obtained and issued to workers, and the training of the professional staff and temporary workers must take place before any actual sorting begins. This training is discussed in more detail below. The Project Manager must instill in his/her Project Team an attitude of prudence and care in carrying out the sort.

The Project Manager is also responsible for coordinating with host facility management regarding risk management issues such as waivers, indemnification, and/or adding the host facility as an additional insured to Beck's insurance policy(s), if required.

The Project Manager is not required to participate in any phases of the on-site waste sorting. However, when less experienced Field Supervisors or Crew Chiefs may be involved, the Project Manager should use professional judgment in deciding whether to observe and/or participate on the initial day of field sorting to assure that health and safety practices are being followed, and to communicate to the client, host facility manager, or other parties in the event of any problems. The Project Manager is also responsible for performing periodic observations, as appropriate, to assure that HASP standards are met.

Field Supervisor

The Field Supervisor is generally the most experienced and knowledgeable member of the field sorting team. The Field Supervisor will be the primary contact with the sorting site owner/operator, coordinating sorting activities with other site activities, and supporting any incidents that may occur.

The Field Supervisor has overall responsibility for the sorting site, including the designation of the area where the sorting will take place. In addition to securing the sorting site (i.e. identifying and marking the boundaries of the sorting site), the Field Supervisor should ensure that the sort workers are protected from other equipment and activities on the site. Typically, the Field Supervisor will oversee the selection, delivery, and queuing of samples. The Field Supervisor has the authority to reject any samples and/or immediately terminate any staff who have not following appropriate health and safety practices.

Crew Chief

The Crew Chief is the individual most directly responsible for the health and safety of the individuals sorting waste. The Crew Chief does not have to be an R. W. Beck employee.

He/She should take a leading role in pre-sort training, be sure that sorting workers have proper personal protective equipment, and that safe sorting procedures are followed throughout the project. As the supervisor working most closely with sorters, the Crew Chief must be alert to unsafe practices (e.g. shoving a hand into the middle of a pile of waste) and warn workers about these practices when they occur. The Crew Chief may be the first person to see an accident and must take appropriate action immediately. The Crew Chief has the authority to immediately terminate sort employees not following appropriate health and safety practices.

Sorter

Sort laborers for waste composition studies may be acquired from multiple organizations, including temporary staffing companies, subconsultants, college or high school internship programs, prison labor programs, professional solid waste trade association membership, and volunteers from numerous other sources (including the client organization and from within R. W. Beck during waste sort training). Regardless of the labor source, sorters are responsible for observing the training provided at the outset of a sort, adhering to the proper health and safety practices throughout the sort, wearing the appropriate personal protective equipment while engaged in sorting, and following the directions provided by the Crew Chief and Field Supervisor at all times. Any sorter not following directions may be terminated immediately without cause.

All MSW site employees, regardless of their level of authority, have the responsibility to report unsafe conditions immediately to their supervisor or to the clients on-site representative.

Safety Equipment

Personal Protection Equipment (“PPE”)

The selection of Personal Protective Equipment is based upon a thorough analysis of anticipated and actual hazards on the MSW site.

PPE is broken down into two classes: (1) PPE that must be worn at all times during any sorting of MSW, and (2) PPE that may be required in addition to the required PPE, depending on local host facility requirements and/or work conditions.

The following safety equipment may be provided for each member of the sorting crew (both professional staff and temporary workers), depending on the host facility requirements and comfort.

- Protective coveralls
- Protective eyewear
- Ear plugs
- Dust mask

- Hard hat
- Reflective vest
- Puncture-resistant gloves, and
- Back-support belts
- Would traffic vests be appropriate in some cases?

We require all workers to wear a sturdy work boot, although we do not supply these. A more detailed description of the personal safety equipment is presented in Appendix A. At a minimum, the following equipment must be worn at all times by all members of the sorting crew.

- Protective coveralls
- Protective eyewear
- Puncture-resistant gloves
- Boots

Other PPE may be required depending on the policy of the facility operator or the judgment of the Crew Chief and/or Field Supervisor.

Site Safety Equipment

In addition to the personal safety equipment provided to each worker, each sorting site will have the following equipment,

- A Industrial First Aid Kit;
- An Eye-Wash kit or five eye wash bottles per crew person;
- Moist towelettes;
- Traffic cones;
- Yellow caution tape;
- A fire extinguisher;
- A cell phone or facility-maintained two-way radio ;
- Insect Repellent;
- Ice chest with drinks;
- Tent, if appropriate, and
- Heaters, if necessary.
- Emergency notification information

A more detailed description of the site safety equipment is provided in Appendix B.

Field Sorting Safety Procedures

Site Layout

Waste sorting may take place at a variety of venues – landfills, transfer stations, or other facilities. Before any sorting takes place, an R.W. Beck supervisor must inspect the site for the following::

1. Sorting activities will be well away from other activities, such as equipment and vehicle operations, that might endanger or impede waste sorting work.
2. There is adequate room to carry out the sorting activities, including the receiving and queuing samples and the disposal and recycling of sorted waste. This includes safety precautions in the refuse trucks being used.
3. If the site is outside and extreme weather may be encountered, provisions should be made for a tent or other temporary shelter to be erected.
4. Arrangements for toilet facilities and a “break” area have been made, and;
5. Access to the site by a vehicle moving the sorting equipment and crew on and off the site is available. Or: Transportation of equipment and sort personnel to and from the site is available.

Once a suitable site has been located, the Project Manager or the Field Supervisor will schedule the sort at a time agreed to by the Client and the site owner/operator. When the schedule has been determined, arrangements will be made to deliver sorting and safety equipment to the site.

If the Sorting Site is close to operational activities at the facility, it should be marked with traffic cones or high visibility warning tape so that it is clear to all Field Personnel, subconsultants, temporary workers, and facility workers exactly what area is designated for the sorting activities. It must be made clear that all areas which are not designated for sorting activities are strictly off-limits. See Appendix C for a typical sorting site layout.

MSW Facility Safety Procedures

If the sorting site is located at a facility that disposes, transfers, or otherwise processes MSW, R.W. Beck’s Project Manager or Field Supervisor should meet with the Site Owner/Operator to coordinate the safety procedures at the site with R.W. Beck’s safety procedures. For example, the site may require the wearing of reflective vests and this must become a requirement for the sorting crew on this project. This meeting must take place before any sorting commences.

The Site Manager should outline the facility’s health and safety plan and explain the facility’s emergency procedures. The location of the nearest hospital, emergency services, and poison control offices should be obtained from the Site Owner/Operator.

R.W. Beck's Supervisor should provide the Site Owner/Operator with a copy of our Health and Safety Plan, explain our safety procedures, and provide documentation of safety training for the Field Personnel, subconsultants, and temporary workers on the waste sort. During this exchange of information, any potential conflicts in approach or procedures should be resolved and both parties should be clear regarding safety and health issues.

The Project Manager should be prepared to sign an indemnification form, and possibly to add the host landfill as an additional insured on R. W. Beck's general liability policy.

Communications

It is important that supervisory staff be able to communicate with each other at all times. If one of the professional staff must leave the site for some reason, he/she should make it clear where they are going, when they will return, and what steps should be taken in case of an emergency. If, for example, the Crew Chief must leave the site, the Field Supervisor should take over the Crew Chief's duties at the sorting table. Either the Field Supervisor or Crew Chief, or both, should have a working cell phone or a facility-managed two-way radio (a standard item in the Site Safety Equipment) in case of an emergency.

Site Control

The integrity of the sorting site must be maintained at all times. Where appropriate, the area boundaries should be marked. Workers should understand that they must remain within the sort site and that other are on the site are prohibited. Both the Field Supervisor and the Crew Chief are responsible to see that sorting activities and workers stay within the sorting area.

There should be no smoking, eating, or drinking during sorting activities. Food and non-alcoholic liquids must be consumed away from the sorting area. Drinks should be taken in single-use disposable cups or from the original single serve containers. Personal hygiene practices such a hand washing and removal of contaminated coveralls should be conducted prior to eating, drinking or smoking.

Ergonomics

Waste sorts often involve moving and lifting containers of waste that may weigh 100 lbs or more. To prevent back strain and pulled muscles, staff must be trained in proper lifting techniques as part of the pre-sort training. When heavy containers must be moved or lifted, the Crew Chief should assign an appropriate number of workers and material handling equipment to the job.

Environmental Conditions

Extreme Heat

The risk of heat stress can be significant in summer sorts where the temperature and humidity are high. In these conditions, Crew Chiefs should monitor workers for signs of fatigue and listlessness. Breaks in the work schedule, plenty of fluids, and clothing which allows sweat to evaporate can all help to alleviate the dangers of heat stress.

Extreme Cold

Winter sorts may take place at sites with very low temperatures and high winds. Protection from the cold should include proper clothing, walls on the tent to lessen the effects of wind, and electric or gas heaters (properly ventilated). Crew Chiefs should be alert for indications of cold-effects, such as shivering and fatigue.

Fatigue

Most projects have tight schedules and the uncertainties associated with the delivery of solid waste to a landfill or transfer station can interrupt this schedule. As a result, there is usually pressure to work as long and as quickly as possible. This, in turn, can lead to carelessness and worker fatigue. Regular breaks in sorting should be built into the schedule to provide for rest and recuperation. Typically these breaks include 15 minute breaks in the morning and afternoon and a 30-60 lunch break. If sorting goes beyond 8 hours, additional breaks should be scheduled. The judgment of the Crew Chief is critical. Workers showing signs of fatigue should be given an opportunity to rest, especially if they are becoming careless or tired.

Injury Prevention

Three of the most common sources of potential injury in waste sorting are:

- Careless handling of waste,
- Lifting heavy objects, including containers of materials, and
- Walking into areas where heavy equipment is operating.

Risks associated with handling mixed solid waste can include contact with hazardous materials, sharps, and other potentially dangerous objects. Controls against injury associated with those risks are:

- (1) Wear proper safety equipment at all times and
- (2) Know what you are picking up. Never reach into the middle of a pile of waste to pull out material. Always select only material or objects you can see. Hand rakes can be used to spread out a pile of waste; hands or arms should never be used. Using the puncture-resistant gloves provided to the crew, sorters can more safely remove needles, broken glass, and sharpened metal from a pile of waste, if the sorter sees what he/she is removing and handles it with care.

Unidentifiable Liquids, Powders, or Medical Waste

Unidentifiable liquids or powders should be treated as hazardous. If there is any question about any material or object, the sorter should immediately stop sorting and notify the Crew Chief. If, at any time, the Crew Chief believes that the sample being sorted includes institutional medical waste or a significant amount of hazardous materials, the crew should stop sorting. The Crew Chief and Field Supervisor should confer and determine if that sample should be discarded without further sorting. The sorting of institutional medical waste and commercial hazardous waste is not performed by R. W. Beck, and the responsibility for handling this material shall be solely with the host facility in the event such material is encountered. It is the responsibility of the Field Supervisor to alert the host facility management.

Lifting Controls

The Crew Chief direct lifting activities at all times. Specifically, the Crew Chief should be sure workers asked to move or lift heavy containers of waste have help available from other members of the crew. Items that cannot be lifted safely by multiple sort laborers shall not be manually weighed and shall be removed by other means. If back injuries or muscle pulls do occur, the Crew Chief should have the worker rest and decide if the injury is severe enough to warrant medical attention.

Both the Field Supervisor and the Crew Chief must see that the sorting area is clearly marked and that the sorting crew understands where the boundaries are. Moving through the area outside the sorting area should be done only with the permission and guidance of the Crew Chief.

Bloodborne Pathogens

Injuries involving cuts and puncture wounds can potentially offer an entry-point for bloodborne pathogens, such as those carrying Hepatitis and HIV. Every cut and puncture wound should be treated and the following steps should be taken by the Crew Chief or Field Supervisor:

- Using sterile gloves, immediately clean the wound with antiseptic and wrap in gauze;
- Place the needle or object causing the wound in a plastic bag;
- If, in the judgment of the Crew Chief and Field Supervisor, the wound caused by a hypodermic needle or a metal object, poses a health or safety risk to the worker, the worker will be taken to the nearest hospital or clinic for evaluation and treatment;
- Notify the Site owner/operator, the Employment Agency (if the patient is a temporary worker), and the Project Manager, who in turn should alert the Safety Manager; and the R.W. Beck Risk Manager.
- Document the incident on an accident report form and submit the completed form to the Safety Manager.

Similar steps should be taken if the worker has been exposed to potentially hazardous material and shows abnormal or unusual symptoms.

Accident Reporting & Investigation

As a part of the Site Training of the crew, the Field Supervisor should educate workers so they are familiar with the Emergency Contact Information Sheet (see Appendix D) and that it is clearly posted in the sorting area.

All accidents must be reported in writing by the Crew Chief or Field Supervisor, using the Accident Report Form shown in Appendix E. A copy of the completed form should be provided to the Site Owner/Operator, the Employment Agency (if the patient is a temporary worker), the Project Manager, who in turn notifies the Safety Manager.

It is the responsibility of the Safety Manager to maintain a file of completed accident report forms and to see that the “lessons learned” for accidents are incorporated into the HASP. Root cause analysis should be the goal of all accident/incident investigations.

Health and Safety Training

All members of a crew responsible for sorting waste must undergo, at a minimum, the training outlined below.

Professional Staff Training

R.W. Beck’s professional staff should, at a minimum, have 8 hours of pre-sort training and serve a 2-day apprenticeship before taking on the role of Crew Chief. The pre-sort training must include review and understanding of the HASP and viewing R.W. Beck’s safety videos. Training related to other aspects of the sort, such as material identification can also be done during this 8-hour period. Professional staff should have a current tetanus booster.

A Crew Chief should work for at least one full week before being considered for the position of Field Supervisor.

Sorter Training

Before any waste sorting takes place, the Crew Chief and/or Field Supervisor must review relevant sections of the R.W. Beck HASP with temporary workers, be sure that all safety procedures are clear, and that all questions from the sorters have been answered. A Sorter Training Acknowledgment Form is presented in Appendix E.

Next, a “test sort” should be run at a very slow pace to be certain that all safety equipment is being worn properly and that sorters understand the safe and proper way to sort samples of waste.

At the beginning of each day of the sort, the Crew Chief should take a few minutes to check that all safety equipment is being worn and is in good shape. The Crew Chief should also remind the crew about safe sorting and go over the lessons learned from any accidents, or near accidents that have occurred.

Appendix A: Personal Protection Equipment

Personal Protection Equipment (“PPE”) will be supplied to all workers sorting waste to protect them from the various hazards that might be encountered in carrying out their work. Some of the PPE is mandatory and must be worn at all times by all workers. Other PPE may be worn depending on the weather, site conditions, policy of the sorting site, and judgment of the Crew Chief and Field Supervisor.

The mandatory PPE include:

- Protective coveralls – Tyvek or cotton coveralls must be worn at all times to protect worker’s clothing from accidental spills, offer an added layer of warmth in cold weather conditions, and provide added visibility to worker’s on the site.
- Puncture-resistant gloves – Rubber, plastic, or leather gloves must be worn while sorting waste. They are designed to protect sorters from accidental cuts or punctures from needles, broken glass, and sharpened metal. A latex or cotton inner glove will also be provided.
 - Our preferred gloves are MAPA Stanzoil Heavy-Duty Neoprene Gloves
 - Also, recommended are Wells Lamont Puncture- and cut-resistant gloves and Wells Lamont Drivers gloves.
- Protective Eyewear – to provide splash/spatter protection for the sorters
 - Our preferred eyewear protection is the Uvex Astro 3001 for “over the glasses” style for sorters who need to wear their own glasses and Crews Klondike for others.
- Sturdy work boots in good repair

PPE which may be worn, at the discretion of the Crew Chief or Field Supervisor include:

- Back-support belts
- Dust Masks – a dust mask should provide protection from dust and MSW particulates.

- Our preferred dust mask is the 3M 3-panel disposable Respirator
- Also recommended are the AOSafety “Pleats Plus” and the Wilson Saf-T-FIT N95 Respirators.
- Ear plugs
- Hard hat
- Reflective vest
- Steel-toed boots

All pieces of equipment listed above will be available to all crew members at any time.

Appendix B: Site Safety Equipment

Site Safety Equipment (“SSE”) will be available at all times on the sorting site to protect workers from hazards and provide emergency first aid. The standard SSE includes:

- A Industrial First Aid Kit – an OSHA-rated 25-person first aid kit or better
- An Eye-Wash kit or five eye wash bottles per crew.
- Moist towelettes
- Traffic cones – four cones to help demarcate the sorting area
- Yellow caution tape – to mark the sorting area.
- A fire extinguisher – a multi-purpose extinguisher that can be used on ordinary combustibles, flammable liquids, and electrically energized fires.
- A cell phone or facility-managed two-way radio
- Insect Repellent
- Ice chest with drinks

If site conditions and weather warrant, a tent will be provided to protect against sun, rain, and wind. Side flaps may also be installed if the weather is cold and/or windy. For very cold conditions, a gas or electric heater may be used. If a gas heater is used, adequate ventilation must be arranged.

Appendix E: Sorter Training Acknowledgment Form

A critical element of training personnel to sort refuse is health and safety training. Before any work can begin, all sorting personnel are trained in safe procedures for handling and sorting waste. This training includes the following topics.

- Purpose of the waste sort
- Site layout – Landfill hazards
- Introduction to professional staff roles and responsibilities
- Sorters responsibilities
 - Punctuality
 - Rest
 - No drugs or alcohol
 - No smoking
 - Prescribed medications
- Sort Safety Procedures
 - Waste handling
 - Use of Personal Protective Equipment
 - Site Safety Equipment
 - Designated work and break areas
- Ergonomics
 - Safe lifting to avoid back stress
- Environmental Conditions
 - Heat Stress
 - Cold
 - Fatigue
- Injury Prevention
- Hazardous Wastes
- Bloodborne Pathogens
- Emergency Procedures
- Accident Reporting
- Training Sort

Acknowledgement

I acknowledge that the professional staff from R.W. Beck has discussed and explained the topics listed above, addressed any question I have about these topics, and conducted a training sort to demonstrate the safe handling and sorting of waste.

**DEPARTMENT OF SANITATION OF NEW YORK CITY
WASTE CHARACTERIZATION STUDY
PHASE I**

Phase I Operations Plan

SPRING SORTING PERIOD

I. Introduction

The following Operations Plan is submitted to the Department of Sanitation of New York City (“DSNY”) for the Phase I Waste Characterization Study (“Phase I Study”) under Contract #82702BR00015. The focus of this Operations Plan is the Spring Sorting Period which is scheduled to take place from Monday, May 9 through Tuesday, May 31, 2005.

The Phase I Study includes three components:

A. Residential Study

The purpose of the Residential Study is to characterize New York City’s (the “City’s”) residential refuse and recycling materials by income and housing density strata, accounting for seasonal variation over a twelve-month period. The Study will involve taking samples of residential refuse and recycling materials, sorting and weighing them to develop an estimate of composition of these materials. The Residential Study will also develop an estimate of generation (pounds/household/strata). The Sampling Plan, Material Categories, Field Procedures, and Data Management for the Residential Study are discussed below.

B. Street Basket Study

The purpose of the Street Basket Study is to characterize the City’s street basket refuse based on dedicated street basket collection routes. The Street Basket Study will involve taking samples of street basket refuse, sorting and weighing them to develop an estimate of composition of these materials. The Street Basket Study will also develop an estimate of generation (pounds/street basket) for street baskets on dedicated routes. The Sampling Plan for the Street Basket Study is discussed below. The Material Categories, Field Procedures, and Data Management for the Street Basket Study will be similar to those for the Residential Study.

C. Multi-Unit Apartment Study

The purpose of the Multi-Unit Apartment Study is to identify the physical and operational characteristics of multi-unit apartment buildings that are correlated to successful recycling. The Multi-Unit Apartment Study will involve selecting 125 multi-unit apartment buildings at random and gathering information on key physical and operational characteristics. A definition of successful recycling, incorporating diversion and capture rates and levels of contamination, will be developed as part of the Study. During the Spring and Summer Sorting Periods, samples of refuse and recycling materials from the 125 buildings will be sorted and weighed to establish the

level of successful recycling for each building. Finally, correlations between building characteristics and the recycling success rate will be developed. The full protocol for the Multi-Unit Apartment Building Study will be submitted to the DSNY before any sorting begins. We anticipate that the Material Categories, Field Procedures, and Data Management for the Multi-Unit Apartment Study will be similar to those for the Residential and Street Basket Studies.

The Phase I Study will be conducted by the R. W. Beck Project Team (“R. W. Beck”) working with the DSNY. The plan presented below describes how the Phase I Study will be developed and carried out during the Spring Sorting Period.

II. Sampling Plans

Each of the three components of the Phase I Study will involve characterizing refuse and recycling materials. This characterization will be accomplished by sorting samples of refuse and recyclables. The first step in this process is the selection of samples. A sampling plan, which describes the steps taken to obtain a sample for each of the three components, is presented below.

A. Residential Sampling Plan

The residential sampling plan involves designing a process for selecting samples of residential curbside refuse and recycling materials (i.e., paper and metal, glass and plastic (“MGP”)). The process includes the following six steps:

1. Determining the income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process;
5. Developing the sample collection process; and
6. Developing refuse and recycling generation estimates.

Because the purpose of the Residential Study is to characterize the residential waste by income and density strata, the first step in the sampling plan was to determine define these strata and identify them within the City.

i. Income/Density Strata

An income/housing density matrix was developed using U.S. Census data for the year 2000 for each of the 2,217 census tracts in New York City. Three income levels, based on median household income, and three housing density levels were used to create a nine-box matrix.

The income levels used were defined as:

- Low Income = Median household income below \$30,763;
- Medium Income = Median household income between \$30,763 and \$46,193; and
- High Income = Median household income above \$46,193.

The housing density criteria were based on the number of structures within each census tract. The three housing density levels were defined as:

- Low Density = Census tracts in which 67 percent of the structures contain 2 or fewer units;
- Medium Density = All census tracts that are not in the High or Low categories; and
- High Density = Census tracts in which 67 percent of the structures contain 10 or more units.

The resulting income/density matrix separated the City’s census tracts by income and density, as shown in Table 1.

Table 1
Number of Census Tracts in Each Income/Density Stratum

	Low Income	Medium Income	High Income	Total
Low Density	5	177	410	636
Medium Density	392	435	162	636
High Density	<u>342</u>	<u>127</u>	<u>167</u>	<u>636</u>
Total	739	739	739	2,217

Because so few census tracts are in the Low/Low stratum, it was decided to eliminate this stratum from the study and focus the study on the remaining eight strata.

Next, a map of the City was developed in which each of the nine strata was color-coded. This map is shown in Appendix A.

To identify the universe of existing refuse and recycling collection routes, the DSNY provide a list of existing routes that fell entirely within contiguous census tracts of the same strata. The number of existing routes for each stratum is shown in Table 3 below.

The next step was to determine the number of samples that would be sorted.

ii. Sample Size

In a waste characterization study, the number of samples that are sorted affects the accuracy of the estimate. For example, if only one 200 pound sample of the City’s refuse were sorted, it is very unlikely that the estimate resulting from sorting that single sample would match the composition of the City’s entire curbside refuse. On the other hand, if hundreds of thousands of 200 pound samples were sorted – enough samples so that every ounce of the City refuse were sorted – the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate. So, how many samples should be sorted?

Before we answer the question about the number of samples, we should understand the nature of the materials that will be sorted. If the materials being sorted (i.e., the refuse and recycling materials) were consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few samples to develop an estimate, if there were only two materials in the refuse stream and they were always found in the same proportion in every sample. Of course this is not the case. Refuse, and to a lesser degree, recyclables, are extremely variable. The percentage of each type of waste material can vary considerably among samples. Even from the same household, the type of waste can vary depending on when the sample is collected. For example, during the autumn, one would expect to find large amounts of leaves, but in the winter there will be few leaves or none. On the other hand, food waste will be found throughout the year. Because of the potential for variability between samples, a different number of samples may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently than leaves, fewer samples would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

Typically, an estimate of the composition of waste is presented as three numbers: (1) the Sample Mean; (2) the Confidence Level; and (3) the Confidence Interval. The Sample Mean is the average percentage of a given material found in the samples sorted. For example, after sorting thirty samples of refuse, we will have a list of thirty percentages of paper waste. If the average of the thirty percentages of paper is 35 percent, then the Sample Mean of paper is 35 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sample taken. The Sample Mean is, after all, simply the average value of the samples; it is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tell us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's mean value. For example, if the Confidence Interval around the Sample Mean - 33 percent to 37 percent for paper – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of paper waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted standard.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population Mean. For example, our Sample Mean of 35 percent for paper waste may have a Confidence Interval of ± 7 percent, at a 90 percent Confidence Level. That is, based on the number of samples that have been sorted and results obtained, we would expect that 90 percent of the time, the amount of paper waste in the refuse of the entire population would be between 28 percent and 42 percent. Or, put another way, if we could actually go out and determine the exact percentage of paper waste in our

population, we are 90 percent certain that the value would be between 28 percent and 42 percent. If we wanted a more accurate estimate, we would have to sort more samples.

In recommending the number of samples of refuse and recyclables to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard waste is much more variable than food waste. Therefore, for a given number of samples, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred samples of refuse may provide a Confidence Interval of ± 8 percent for paper, but a ± 30 percent for yard waste. To achieve a ± 8 percent for yard waste would require significantly more samples and would probably be prohibitively expensive.

In practical terms, “variability” simply means the variation we are likely to find between samples. If we sort through 10 samples and each sample has between 28 percent to 32 percent of a given waste type, we can be pretty certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same 10 samples and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, you can see that we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy is high. Below that point, significant increases in accuracy can be achieved with relatively little cost.

In determining the number of samples to be sorted for the Phase I Residential Study, an accuracy goal ± 7.5 percent Confidence Interval for the major material groups at a 90 percent Confidence Level was requested by DSNY. In addition to this accuracy goal, R. W. Beck considered the eight income/density strata to be characterized and the need to account of seasonality in the waste stream. Also, R. W. Beck reviewed the Preliminary Waste Characterization Study (“PWCS”) to note the variability exhibited in the PWCS results.

R. W. Beck is recommending that at least 200 samples of refuse be sorted for each strata, 50 samples per strata each season.

The results of the PWCS and the Fall Sort for Phase I showed relatively little variability in Paper Recycling, but significant variability in the MGP. Therefore, R. W. Beck is recommending that 40 Paper Recycling samples per strata be sorted, 80 per season and 160 MGP samples per strata be sorted, 320 samples per season. Table 2 shows the number of samples recommended for the Phase I Residential Study.

Table 2
Sample Size for the Phase I Residential Study

	Samples per Strata	Samples per Season	Samples per Strata/Season	Total
Residential Refuse	200	400	50	1,600
Residential Paper Recycling	40	80	10	320
Residential MGP	<u>160</u>	<u>320</u>	<u>80</u>	<u>1,280</u>
Total	400	800	140	3,200

iii. Sample Weight

Based on current industry practice and studies by the USEPA and academic studies (e.g., Klee), it was determined that the weight of each sample of refuse would be between 200 pounds and 250 pounds.

Because recycling paper and MGP tend are generally less variable than refuse samples (i.e., contain fewer types of materials), and based on the results of the PWCS, it was determined that the weight of each sample of recycling paper and MGP would be between 100 pounds and 125 pounds.

iv. Sample Selection

In selecting samples from the City’s curbside refuse for the Phase I Residential Study, R. W. Beck and DSNY agreed to use existing refuse and recycling collection routes that were entirely within census tracts for each of the eight income/density strata. An analysis of the census tracts and information on the existing collection routes provided by DSNY, the universe of available routes was developed. Table 3 shows the number of available collection routes for each of the eight income/density strata.

Table 3
Pure Routes and Universe of Routes for Sampling ⁽¹⁾

Strata	Refuse		MGP		Paper		Total	
	Pure	Universe	Pure	Universe	Pure	Universe	Pure	Universe
High Density/ High Income	43	564	18	90	36	198	97	852
High Density/ Low Income	20	219	6	24	3	12	29	255
High Density/ Medium Income	15	84	5	21	5	21	25	126
Low Density/ High Income	67	792	49	345	49	345	165	1,482
Low Density/ Medium Income	8	42	9	27	9	27	26	96
Medium Density/ High Income	2	36	1	9	2	12	5	57
Medium Density/ Low Income	25	294	12	66	12	66	49	426
Medium Density/ Medium Income	13	147	9	60	9	57	31	264
Total	193	2,178	109	642	125	738	427	3,558

(1) Pure Routes are existing DSNY collection routes which are wholly contained in a single density/income stratum. The universe of routes is the total number of times the pure route is collected during the three-week Sorting Period.

From this universe of existing routes, sample routes were randomly chosen. Because certain strata had relatively few existing routes, sampling by replacement was used, meaning that it was possible that more than one sample might be taken from any one truck. However, all samples were selected randomly. The tables with those randomly selected routes (refuse, recycling, and street basket) for the Spring Sorting Period are included as Appendix B.

v. Sample Collection

a. Refuse Sample Collection

The samples of residential refuse will be acquired at one of two private transfers stations owned by Waste Management, Inc. (“WMI”) and under contract with DSNY to receive residential curbside refuse. The two transfer stations are WMI’s Varick Street transfer station and Harlem River Yard transfer station. DSNY has agreed to divert the trucks that have been selected for sampling to one of these two transfer stations. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

As a selected truck arrives at the transfer station, the R. W. Beck Sample Manager will be notified. When the truck has tipped its load a front-end loader (“FEL”) from the transfer station will take a randomly selected portion of the tipped load dump into two or three 96-gallon toters. The random selection of the portion of the tipped load to be sampled will be made by the Sample Manager before the FEL begins to grab the sample.

The FEL will dump the selected portion of the load into toters that have been positioned by the Sample Manager and Assistant in an area designated by WMI. Once the refuse has been dumped into the toters, the FEL will manage the remainder of the tipped load as it normally would.

The Sample Manager and assistant will then weigh each toter to be sure that the sample of refuse weighs 200 pounds to 250 pounds. In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, we estimate that, typically, two toters of refuse should contain one sample of waste. After the toters have been weighed, each toter will be marked with the date, Sample number, a Sample Code, and the truck number. In addition, each sample will have a Sample Management Form which will be taped to the toters. The Sample Management Form is included as Appendix C.

After the samples are weighed and labeled, they will be loaded on an R. W. Beck truck and transported to the North Shore Marine Transfer Station where they will be unloaded and positioned for sorting.

It is likely that some samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

b. Recycling Sampling

The samples of residential recycling Paper and MGP will be acquired at one of two processors under contract with the DSNY to receive residential curbside recycling. The two processors are Hugo Neu Schnitzer East’s facility in Long Island City for MGP and Metropolitan Paper for Paper Recycling. DSNY has agreed to divert the recycling collection trucks that have been selected for sampling to these two processors. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

The procedure for acquiring samples will be identical to the procedure used as the private transfer stations described above. However, our experience in other projects, the PWCS, and the Fall Sort indicates that 100 to 125 samples of recycling material will, in most cases, require only one toter. The samples of Paper Recycling and MGP will be taken to the Greenpoint Marine Transfer Station where they will be sorted. It is likely that the MGP samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of

the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

vi. Waste Generation

One facet of the Phase I Study is to develop generation rates for residential waste for the City. Generation rates refer to the average amount of refuse, MGP, and paper set out for collection by a household or person over a given period of time. Because the Residential Study examines the City's waste by housing-density and income strata, the generation rates were estimated by strata. Each stratum's generation rate is actually an average of individual generation rates of each household that comprise that stratum. In other words, we do not believe that each household in a given strata generates an identical amount of refuse, MGP, and paper. Rather, we believe that each stratum may have a unique average generation rate when we combine the individual households that comprise that stratum.

Residential Generation Rates

Information regarding tons collected is available at the District and Section levels. The City has 59 Community Districts and, within these Districts, 230 Sections. Information regarding population, number of households, and strata is available on the Census Tract level. The methodology used to estimate generation rates requires integrating the information available for the Census Tracts and the Section.

Using the New York City Department of City Planning's Land Use and Geographic Database for the five boroughs of New York City ("MapPluto"), we are able to assign Census Tracts to each Section. Because Census Tracts do not conform to Section boundaries, some Census Tracts belong to only one Section while others may be in two or more Sections. In cases where Census Tracts "bleed" over Section boundaries, it was initially assumed that Census Tracts reaching outside a given Section would be balanced by Census Tracts in adjacent Sections bleeding into that Section. The object was to split Census Tracts among Sections to appropriately account for the correct strata-composition of a given Section.

Since we know the number of households in each Census Tract, we can estimate the number of households in each Section by multiplying the households in each Census Tract by the number of Census Tracts assigned to a given Section. For example, MapPluto tells us that Manhattan District 6, Section 3 has seven Census Tracts. We know that the total number of households in these seven Census Tracts is 26,296. We can check our work by comparing the sum of the households for all Sections in a District against the District totals. The sum of the estimated number of households in Section 3 of Manhattan District 6 is 91,252. The total number of households in Manhattan District 6, as reported by DSNY, is 91,189. These two figures are less than 1 percent of each other and indicate that our estimate of the number of households is reasonable.

For Districts where there was a significant discrepancy between the estimated number of households and the number of households reported, we mapped the Section and Census Tracts and adjusted the number of households per Section. For example, if a significant area of the Census Tract lay outside the Section to which it had been assigned, the number of households

assigned to the Section was adjusted. The number of households was again checked to see that our estimates were within 5 percent of the actual District totals.

Each Census Tract assigned to a Section had been placed in one of nine strata. We allocated the number of households in each Census to the appropriate strata for each Section. For example, MapPluto shows that the seven Census Tracts in Manhattan District 6, Section 3 are all in the High/High strata. Therefore, we can characterize Manhattan District 6 Section 3 as the High/High strata. It should be emphasized however that the generation rates for these Sections would not all be identical. They are individual instances of this strata's average generation rate. We can average them, weighted by the number of households in each Section, to estimate the strata's average generation rate. Of the 230 Sections in the City, 43 sections contained census tracts from the same strata.

In the remaining 187 Sections, the strata of the census tracts were mixed. For example, in Manhattan District 2 Section 1, MapPluto assigned eight census tracts from four different strata.

To calculate the generation rates we began by assuming that the population in each strata all discard exactly the average value (for their strata) that we seek. We know that this assumption is not exactly true (there is likely to be variation within each stratum regarding the amount of waste generated). Thus, we know that there will be some remaining discrepancy ("ε") between our calculated tonnages for each Section and the actual tonnages observed.

The regression therefore seeks to estimate a single "tons per person" value for each stratum such that, when multiplied by the population of each stratum in a given Section, it closely approximates the known total tonnage for that Section. All Sections are included in this analysis, whether comprised of a single or multiple strata.

Example: Consider a simplified case where there are only 3 Sections and 2 strata.

In Section 1, there are 100 people in stratum A and 400 people in stratum B. Section 1 discards 190 tons of waste.

In Section 2, there are 300 people in stratum A and 200 people in stratum B. Section 2 discards 220 tons of waste.

In Section 3, there are 500 people in stratum A and 800 people in stratum B. Section 2 discards 500 tons of waste.

The regression analysis seeks to estimate the per-person average waste values for strata A and B using the following:

$$100*X1 + 400*X2 + \epsilon = 190$$

$$300*X1 + 200*X2 + \epsilon = 220$$

$$500*X1 + 800*X2 + \epsilon = 500$$

In this case, $X1 = 0.49$ and $X2 = 0.33$ (tons per-person) are the estimates which best fit the given data.

In the actual analysis, we had data for 227 Sections upon which the estimates for the 9 strata were determined.

The documents supporting this approach and the results for the Fall Sort and Winter Sort are presented in the Fall and Winter Sorting Period Reports. This methodology will be used to develop residential generation rates for the Spring Sort.

B. Street Basket Sampling Plan

The Street Basket sampling plan involves designing a process for selecting representative samples of street basket waste. The process includes the following five steps:

1. Determining the universe of street basket waste income/density strata;
2. Determining the sample size;
3. Determining the sample weight;
4. Designing the sample selection process; and
5. Developing the sample collection process.

Because the purpose of the Street Basket Study is to characterize street basket waste, the first step in the sampling plan was to determine what universe of street basket waste would be used for drawing samples.

i. The Universe of Street Basket Waste

DSNY and R. W. Beck agreed to use the total number of dedicated street basket collection routes as the universe from which random samples of street basket refuse would be taken. Dedicated routes are those routes that collect only street basket waste. Routes that collect residential refuse as well as street basket refuse are excluded from this study. There are dedicated routes in all five of the City's boroughs.

ii. Sample Size

The results of the *Seattle Litter Composition Study* were reviewed to determine the variability of street basket waste. Based on this review, it was estimated that 200 samples of street basket waste would be expected to achieve a confidence interval of ± 7.5 percent for the major material groups – paper, plastic, metal, and glass. Each season 50 samples of street basket waste will be sorted.

iii. Sample Weight

The weight of samples will be the same as the weight of samples for residential refuse, for the reasons discussed in Section II. A. iii.

iv. Sample Selection

From the universe of dedicated street basket routes, 55 routes (50 target routes and 5 back-up routes) have been randomly selected, using Excel's random number function. These routes were sent to DSNY.

v. Sample Collection

Samples of street basket waste will be collected from 50 routes, using procedures identical to those for collecting residential refuse.

C. Multi-Unit Study Sampling Plan

The Multi-Unit Sampling Plan involves selecting buildings for the Multi-Unit Study and determining the most appropriate procedure for sampling the refuse and recycling. The development of the plan involved – steps.

1. Determining the Universe of multi-unit buildings
2. Determining the sample size
3. Determining the sample weight
4. Designing the sample selection process
5. Developing the sample collection process

Because purpose of the Multi-Unit Study is to correlate recycling success with selected physical and operational building characteristics, the first step in the sampling plan was to determine the universe of multi-unit buildings.

i. The Universe of Multi-Unit Buildings

The buildings for the Multi-Unit Study were selected from among the multi-unit buildings of six units or more in the New York City Department of City Planning, MapPluto database.

ii. Determining Sample Size

The Multi-Unit Sampling Plan will involve selecting refuse and recycling samples from 125 randomly-selected buildings. Six-seven of these buildings have been targeted for the Spring Sorting Period.

The sample size of 125 buildings was determined by the physical and operational characteristics that were being used in the Multi-Unit Study. It was decided that any characteristic that existed in at least 10 percent of all buildings in the City should be able to be adequately sampled by the Study. If a characteristic were in fewer than 10 percent of all buildings, that characteristic could not be adequately examined.

Based on this 10-percent minimum, a sample size of 125 buildings was set. If one of the characteristics we selected was in 10 percent of all buildings in New York City, with a sample size of 125 buildings, the expectation would be that roughly 10 to 12 of those buildings would have that characteristic. This would be enough buildings to test for the characteristic. For

characteristics that were more common, of course, more buildings would be expected to have that characteristic. The list of multi-unit collections for the Spring Sort are shown in Appendix B.

iii. Determining Sample Weight

The weight of the Multi-Unit samples will be the same as the weight of samples for the residential refuse, for the reasons discussed in Section II.A.iii. Because “recycling success” was being measured, it was decided to sort all recyclables. In effect, the recycling sample weight will consist of all materials set out for recycling.

iv. Determining Sample Selection Process

To measure and compare recycling success, it was necessary to have a profile of refuse disposal and recycling for each building in the Multi-Unit Study. To develop this profile, it was decided to sample and sort refuse and recycling over one week. For buildings with three-day per week refuse collection, refuse samples from each of the three days will be acquired. For buildings with two-day per week refuse collection, refuse samples from both collection days will be acquired. All residences have recycling picked up one day per week and this day always coincides with a refuse collection day.

Furthermore, it was decided that the recycling sample would be acquired on the last refuse collection day of a collection cycle. For example, if a building had Monday-Wednesday-Friday refuse collection and recycling collection on Monday, the refuse samples would be acquired on Wednesday and Friday and both refuse and recycling would be collected on the following Monday. In this way, all materials placed on the curb for collection during a week from each building would be examined in the Study.

v. Determining the Sample Collection Process

DSNY has arranged special a collection for buildings in the Multi-Unit Study. Dual-bin collection trucks will be used to collect both refuse and recycling. Each administrative borough in the city will send trucks collect from the buildings in their service area. The dual-bin collection trucks may collect refuse from one or two buildings, or may collect both refuse and recycling from a single building.

All trucks collecting waste from buildings from Queens or Brooklyn will deliver their loads to the Varick Street transfer station. Truck collecting waste from Manhattan or the Bronx will deliver their loads to Harlem River Yards.

The sampling team will collect multi-unit refuse samples using a procedure similar to that used for collecting samples of residential refuse and street basket waste. However, for multi-unit samples with bulk items, the bulk items will be weighed and the weight recorded, but the sample will contain a minimum of 200 pounds of bagged or loose refuse.

As noted above, the sampling team will collect all recycling delivered from each building, including all bulk items. A more detailed discussion of the multi-unit sampling protocol is included in Appendix C, along with a multi-unit sample management form.

III. Material Categories

A. Refuse Categories

The list of material categories to be used in the refuse and street basket sorting is presented in Appendix D.

B. Recyclables Categories

The list of material categories to be used in the recycling sorting is the same as the list of materials for refuse sorting and is presented in Appendix D.

C. Street Basket Categories

The material categories for street basket waste will be identical to the categories for refuse. In addition, sorting will seek to identify instances of illegally disposed residential or commercial waste.

D. Multi-Unit Categories

Although the material categories used for the multi-unit study will be the same as those used for the residential refuse and recycling studies, some of these categories will be collapsed into fewer sorting categories, as shown on the Multi-Unit Sample Detail Form in Appendix E.

IV. Field Procedures

A. Health and Safety Plan

R. W. Beck's current Health and Safety Plan ("HASP") has been submitted to DSNY previously and is included in Appendix F.

B. Sorting Procedures

Once the samples of refuse and recycling have been transported by the Sample Managers from private transfer stations or recycling processors to the sorting sites, the Field Supervisor at each sorting site will check in each of the samples to be certain that the Sample Management Forms and Sample labels are clear and consistent.

After the Samples have been checked in, each Crew Chief and crew will begin sorting samples. The refuse will be sorted into the material categories using the Sample Detail Form, shown in Appendix E. When all material has been sorted, the material falling through the ½-inch screen on the sorting table, called "fines", will be swept up and included as one of the material categories. All sorted materials will then be weighed.

Protocol for Identifying and Accounting for Illegal Materials in Street Basket Waste

To determine the level illegal use of street baskets for residential or commercial refuse disposal, the following protocol will be used:

- Before sorting, each 200 to 300-pound street basket sample will be placed on the sort table for inspection by an R. W. Beck Crew Chief trained by DSNY staff to identify suspected illegal residential or commercial waste.
- All closed opaque plastic bags the size of a shopping bag or larger will be identified as potentially containing illegal material.
- The loose material found in clear plastic basket liners or opaque liners labeled with a Business Improvement District (“BID”) logo will be considered legal street basket waste.
- Any closed opaque plastic bags the size of a shopping bag or larger found within a BID bag will also be identified as potentially containing illegal material.
- Closed bags identified as potentially containing illegal material will be opened.
 - If a bag contains any of the following materials, it will be classified as “residential”:
 - Addressed mail;
 - Substantial quantities of home-use products, including: health and beauty aids, detergent bottles, family sized drink containers, or other seemingly residential material; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggest home use.
 - If a bag contains any of the following materials, it will be classified as “commercial”:
 - Retail food preparation wastes (industrial sized food/liquid containers; substantial quantities of identical packaging or unused products, cardboard boxes);
 - Construction materials such as pieces of dry wall or other building materials; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggested office, retail, industrial, construction or food establishment waste.

Closed shopping bags not containing materials deemed residential or commercial, but suggesting street use (single use containers, newspapers, etc.) will be considered legally disposed street basket waste.

For all bags identified as containing residential or commercial wastes, the following four procedures will be followed:

- All such bags will be individually photographed.
- Each bag will have a written record describing its contents. The crew chief will record this information on the Sample Detail Form.

- All such bags will be counted (regardless of size) in two groups: residential bags, and commercial bags. The bag counts will be recorded on the Sample Detail Form.
- In each sample, bags identified as containing residential or commercial waste will be weighed in two groups: residential bags, and commercial bags. The combined weights of the bags in each group (residential and commercial) will be recorded on the Sample Detail Form.

In addition, each sample will be examined for suspected instances of illegally disposed residential or commercial wastes not encased in closed bags as defined above – including instances of broken bags with spilling contents, as well as residential or commercial material loose in the street basket contents. These materials will be photographed but not weighed and their presence noted on the Sample Detail Form (as shown in Appendix E).

After these procedures have been completed, all material will be placed onto the sorting table and sorted according to the refuse sorting protocol.

All weights will be recorded by the R. W. Beck Crew Chief. The tare weight of the containers will be put into the scale so that only the net weight of the sorted material is recorded. When the weighing of all material in the sample has been completed, the sorted refuse and recycling will be placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew will then begin sorting the next sample. Each crew is expected to sort and weigh an approximately nine samples of refuse and MGP per day, and 15 samples of Paper Recycling per day. This average is based on our experience in the PWCS.

Multi-Unit Sorting

Because the purpose of the multi-unit study was to correlate building characteristics with recycling success, and not characterize the building's waste, a different protocol will be used to sort the multi-unit refuse and recycling. The Multi-Unit Sample Detail Form illustrates this protocol and is included as Appendix E.

Moisture and Particulate Testing

Samples of refuse and recycling will be randomly selected for moisture and particulate testing. The purpose of the test is to estimate how much of the weight of certain materials is made up of moisture and fugitive particulates that migrate to the materials during compaction in the collection truck. Eighteen materials have been identified for testing. In each randomly-selected sample 3 to 5 pounds of each material will be collected and double-bagged. Each 3 to 5 pounds of material is called a Moisture Testing Unit ("MTU"). Therefore, each sample may have as many as 18 MTUs, although some samples may not include some of the targeted materials.

All MTUs will be sent to Woods End Laboratory for testing and results reported to the Project's data management team for analysis. During the Spring Sort, 12 samples will be randomly selected for testing.

A total of 500 MTUs will be tested during the Phase I study and the analysis of the results will be reported after the fourth season of sorting.

C. Staffing

The professional staff for the Spring Sorting Period will include:

- Tom Jones, Project Manager: Mr. Jones has been with R. W. Beck for the past 16 years and is currently a Senior Director of the firm. His work has included waste characterization studies, solid waste facility financings, and planning/implementation work.
- Deborah McDonough, E.I.T. – Data Manager: Ms. McDonough, an Engineer with R. W. Beck since 2001, is responsible for conducting transmission analyses and specializes in designing software programs, data management applications, and interactive graphical tools for use in projects associated with solid waste composition studies, locational marginal pricing, transmission power flow studies, transmission constraint analysis, and rate analyses. She is also Project Manager of the Georgia State Waste Characterization Study. Ms. McDonough has been the Data Manager since the beginning of the Project.
- Joe Naviera, Assistant Data Manager: Mr. Naveira has an AS degree in Database Technology and recently joined R. W. Beck as a Data Administrator. He has assisted in the maintenance and development of databases for multiple clients, including the New York Department of Sanitation and R. W. Beck’s disaster relief project throughout Florida.
- John Culbertson, Technical Advisor: Mr. Culbertson is a Project Manager in R. W. Beck’s Environmental Services Group with 11 years of experience in environmental and information management consulting. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and solid waste system financial and strategic analysis.
- Mack Rugg, Residential Study Task Manager: Mr. Rugg is an employee of Camp Dresser McKee and an acknowledge expert in the field of waste characterization. He has managed numerous waste studies, including a current project in Bergen County, New Jersey.
- Tanya Tarnecki, Street Basket Task Manager: Ms. Tarnecki manages several waste management projects for Cascadia Consulting, including data collection and reporting waste characterization projects in King County, Washington; and San Bernadino and Orange County, California.
- Tim Buwalda, Multi-Unit Apartment Task Manager: Mr. Buwalda is a Senior Engineer with R. W. Beck with more than 13 years of experience, specializing in waste reduction and materials recovery. His background includes comprehensive solid waste management and recycling experience in both municipal and private settings.
- Walt Davenport, Director of Sorting: Mr. Davenport has over 30 years of experience in the solid waste profession as a private sector hauler/recycler and consultant. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and processing efficiency. He has managed numerous waste composition studies including PA Statewide, Alameda County, CA, and Montgomery County, MD Waste Composition studies.

- Tanya Tarnecki, Greenpoint Field Supervisor: (see above)
- Brian Holt, Greenpoint Crew Chief: Mr. Holt has recently joined R.W. Beck and has been supervising crews for the firm's disaster recovery program in Florida.
- Karen Vickers, Greenpoint Field Supervisor: Ms. Vickers has 10 years of experience in solid waste management and waste reduction project planning, educational outreach, and special events planning on the state and local government levels in the Southeast region. Previously, Ms. Vickers was employed as the Program Education Specialist for the Athens Clarke County Solid Waste Department, Recycling Division, in Athens, Georgia, as the State Recycling Coordinator for the Georgia Department of Community Affairs, and as a Recycling Coordinator for the City of Delray Beach, Florida. Ms. Vickers currently serves as the Vice President of the Georgia Recycling Coalition, and holds Faculty member status with the Solid Waste Association of North America. She worked as a Crew Chief in the Fall and Winter Sorts.
- Katie Kennedy, North Shore Crew Chief: Ms. Kennedy performs research and analysis in support of waste composition and recycling analysis. Her recent field work including leading sorting crews for the Tacoma School District and the Sunshine Canyon Waste Composition Studies.
- Marley Shoaf, North Shore Crew Chief: Ms. Shoaf performs waste and recycling audits of Seattle area businesses and facilitates stakeholder groups on environmental health topics, such as fish consumption and removal of toxic chemicals from school science labs.
- Susan Evans, North Shore Crew Chief: Ms. Evans teaches for the King County Master Recycler Composter Program. Her other project work volunteer coordination and outreach focused on waste prevention and recycling.
- Hilliary Smith, Sample Manager: Ms. Smith developed the paper waste management policies for Bowdoin College. She teaches waste reduction, recycling, and environmental stewardship at Island Wood on Bainbridge Island, Washington.
- Sasha Evans, Sample Manager: Ms. Evans manages waste generation studies, rate studies, and California regulatory compliance projects. Her work includes the development and implementation of recycling programs, recycling ordinances, permits documents, and solid waste planning.
- Teresa Lewandowski, Sample Manager: Ms. Lewandowski performs analysis for the annual diversion and disposal reporting to the California Integrated Waste Management Board. She also works on waste generation studies, technical reports, business surveys, and on-site waste audits.
- Ramon Swann, Sample Manager: Mr. Swan is an employee of Organics Resources, Inc. ("ORI") and was a Sample Manager during the Fall and Winter Sorting Periods.

- Bernice Siebuhr, Sample Manager: Ms. Siebuhr is an analyst for R. W. Beck's Electrical Facilities Practice and has worked with a variety of clients in Georgia and Florida. She also did field work for the firm's disaster recovery program.
- Dieter Eckels, Sample Manager: Mr. Eckels conducts data collection, research, and analysis in support of a number of Cascadia waste characterization projects including the 2003 and 2004 California Statewide Waste Composition Studies. His background includes collection system design for the University of Washington's program to re-use on-site cooking oil as bio-diesel for the campus fleet. Mr. Eckels was a Sample Manager for the Fall Sorting Period.
- Lyndsay Hazen, North Shore Crew Chief: Ms. Hazen provides research and analysis in support of waste composition and recycling research projects at Cascadia. Her previous experience includes work with the University of Vermont's Department of Solid Waste and Recycling, and organizing waste audits in the schools dormitories.
- Alan Her, Sample Manager: Mr. Her assists with Cascadia's field research data collection. His previous research experience includes the design, data collection, and analysis for a study detailing the nesting begging calls of red-winged blackbirds.

During the Spring Sort, other professional staff may join those listed above.

D. Staff Training

Monday, May 9, 2005 will be devoted to staff training. The training of Crew Chiefs will be conducted by Walt Davenport, the Director of Sorting. Training for the Sample Managers will be conducted by Tom Jones, Project Manager, and Dieter Eckels, Director of Sampling.

Training will include an introduction to the Phase I Study, a discussion of health and safety policies and practices, and an explanation of sampling, sorting and weighing procedures. The first couple of samples to be sorted will be used as means of teaching material categories, proper sorting technique, and safe practices.

E. Equipment

The safety equipment for each sorter is described in Appendix F, the HASP. Other equipment being used includes:

- Sample acquisition: 96-gallon toters, a battery-operated H&V scale, brooms, shovels, rakes, and trucks with lift gates. All members of the Sampling teams will be equipped with hard hats, reflective vests, safety goggles, and gloves.
- Sample sorting: A sorting table, bins for sorted materials, a battery-operated H&V scale, hand rakes and small brooms. All members of the sorting crews will be equipped with Tyvek suits, safety goggles, and protective gloves.

F. Post-Sort Disposal and Recycling

i. Post-Sort Disposal of Refuse

DSNY has agreed to provide roll-off containers for disposing of the sorted refuse and to remove the containers when they are full.

ii. Post-Sort Recycling

DSNY has agreed to provide roll-off containers for disposing of the sorted recyclables and to remove the containers when they are full.

V. Data Recording and QA/QC

Three types of data will be developed during the Phase I Study. The first type will be the Sample Management Form. As each sample is acquired, as described in the Sampling Plan above, information on the borough of origin, route, and truck number, will be recorded on a Sample Management Form filled out by the Sample Manager. The Sample Management Form will include the following information:

- The date on which the sample was acquired;
- The name of the transfer station from which the sample was acquired;
- The name of the Sample Manager and assistant;
- The Sample Number, which is the number of the sample acquired on that day;
- The count of the toters (i.e., 1 of 3);
- The Sample Code, which shows the borough, district, section and route of the truck from which the sample was taken. For example, Manhattan 1, Sec.12, Route. 3 indicates that the truck route from which this sample was taken was in Manhattan District 1, Section 1, Route 3;
- The truck number, which will be provided by DSNY when they assign a truck to the selected route;
- The weight of each toter in the sample; and
- The weight and description of any bulky waste items that are part of the sample. These will not be transported to the Sorting Site.

A copy of the Sample Management Form will be affixed to the sample when it is transported from the private transfer station to the Sorting Site. It will remain with the documentation for that sample.

The second type of data will be the material weight data recorded by the Crew Chief when the sorting of each sample is completed. This form, called the Sample Sort Form, will include the net weight of each category of waste that has been sorted and, in the case of some materials, a count of the items in the category (e.g., small appliances).

When the sample has been sorted the Crew Chief and the Field Supervisor will review the forms for completeness and accuracy and sign them. At the end of the day, the Crew Chiefs, Field Supervisor, and Project Manager will review all the forms again and note any unusual samples or circumstances that may have affected the data.

The forms will be put into the project's Access database by the Data Manager and her staff on-site. The Data Manager and her staff will check the data for completeness and accuracy. Once this procedure has been completed, the Data Manager will confer with the Project Manager and if they are satisfied that the data for that day of sampling is complete, it will be provided to the DSNY Project Manager.

The third type of data will be the results of the moisture and particulate testing that will be conducted by the Woods End Laboratory ("Woods End"). Small (3 pound to 5 pound) portions of selected materials will be double-bagged and sent by courier to Woods End for analysis. This data resulting from the analysis will be sent directly from Woods End to the Project Manager and Data Manager. The Data Manager will enter it into the database as it is received.

This procedure for recording and checking the data will be reviewed during the Phase I Study and, if R. W. Beck believes that changes will make the procedures more efficient, without compromising completeness and accuracy, or more accurate and complete, we will recommend these changes to DSNY.

Appendix C

Sample Management Forms

**New York Waste Characterization Study
Phase I – Multi-Unit Apartment Study**

Sampling Protocol

The following protocol describes the procedures for taking samples of refuse and recycling materials for the Multi-Unit Study (“MUS”).

During the Spring Sorting Period, 67 buildings have been targeted for sampling. The DSNY will arrange special collections for each of the 67 buildings which will provide one-week’s refuse and recycling from each building. We will acquire two or three refuse samples (depending on the building’s normal collection schedule) and one recycling sample from each building.

A different protocol will be used to collect samples of refuse and recycling.

MUS samples will be collected by the RW Beck Sampling Teams six days per week (Monday through Saturday) from 5:00am to 4:00pm at Harlem River Yards (“HRY”) and Varick.

The R.W. Beck Sampling Team (the “Sampling Team”) will receive the numbers of the DSNY trucks delivering Multi-Unit refuse and recycling from the BWRRR Staff on site. The protocol for receiving and distributing truck ID number has already been approved.

The DSNY will deliver their loads in dual-bin trucks, and, in most cases, refuse from two buildings will be delivered in single truck (one building’s refuse in each bin). In other cases, the dual-bin truck may include refuse and recycling from a single building or, in rare cases, only refuse from a single building. The Sample Manager must get the address of the building(s) from which the refuse and/or recycling has come from the truck driver. If refuse from two buildings are delivered, the Sample Manger must find out the correct address for each compartment of refuse.

Collection of MUS Refuse Samples

Each day, the R.W. Beck Sampling Teams will be given the numbers of the DSNY trucks that are scheduled to deliver refuse samples. The DSNY trucks will deliver their loads in dual-bin trucks and, in most cases, refuse from two buildings will be in a single truck (one building’s refuse in each bin). In other cases, the dual-bin truck will include both refuse and recycling from a single building.

The DSNY driver will empty one bin on to the tipping floor of the transfer station. From the DSNY driver, the Sample Manager must get the address of the building from which the waste on the floor was collected. Once the load from the first buildings has been tipped, a front-end loader from the transfer station will pick-up a portion of the tipped load that has been designated by the Sample Manager. The Sample Manager and his/her assistant will then pull 215lbs to 250lbs of refuse from the FEL bucket into 1 or 2 toters. The toters should be weighed to be sure that the minimum weight (215lbs) has been collected. The toters should then be marked (see below) and, when all refuse samples are collected, they should be taken to North Shore MTS.

If the portion of the tipped load selected by the Sample Manager includes one or more bulky items (e.g. a sofa or chair), that item must be weighed and the weight recorded on the Sample Management form. The bulky item should be left at the transfer station and not taken to the North Shore MTS. The refuse sample should consist of at least 215lbs of refuse – no bulky items.

Refuse Sample Labels

Each refuse sample should have the following information marked on each toter in the sample:

- Date on the sample was collected
- Address of the building from which the sample was taken
- Note that the sample is refuse
- The truck number from which the sample was taken
- The number of toters comprising the sample (e.g. “1 of 1” or 1 of 2”)

The labels should be accurate, complete, and legible. PLEASE PRINT.

Collection of MUS Recycling Samples

The recycling material from each building in the MUS will be delivered in the same dual-bin truck that delivers that building’s refuse for that day. However, the procedure for collecting the recycling materials will be quite different.

The Sampling Team must take all recycling material that is delivered from each building. Once the truck has tipped its load of recycling materials, any bulk items (e.g. refrigerators, stoves) must be weighed, the weight noted on the Sample Management Form, and set aside.

The remaining paper, bottles and cans should be placed in special plastic bags. Broken glass or sharp metal items may be placed in a toter. Each bag or toter should be labeled (see below), weighed and the weight noted on the Sample Management Form. The entire amount of recycling material from a building is the recycling sample.

The bags and toters of recycling samples, as well as the bulk items, should be loaded into the Ryder truck, and taken to Greenpoint MTS.

Each recycling sample should have the following information marked on each bag, toter, and bulk item in the sample:

- Date on the sample was collected
- Address of the building from which the sample was taken
- Note that the sample is recycling
- The truck number from which the sample was taken

The labels should be accurate, complete, and legible. PLEASE PRINT.

Truck Weights

In order to estimate the level of recycling, the net weight of all materials delivered by DSNY must be determined. Below, are the three possible cases and how the estimates should be calculated. In all cases, the Sample Manager must obtain the gross weight of the truck entering the transfer station and the weight of the empty truck after it has tipped its load.

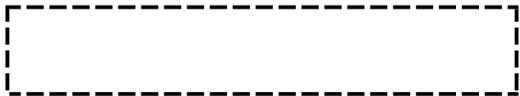

- Dual-bin truck with refuse from one building: The difference between the gross weight of the truck entering the transfer station and the weight of the empty truck will be the net weight of the refuse in the truck.

Dual-bin truck with refuse from two buildings: The DSNY driver will tip the contents of one compartment. Go out and have the truck re-weighed with only one compartment full. The Sample Manager will take a sample from the tipped load. When the truck returns, the driver will tip the contents of the second compartment and weigh out. The Sample Manager will take a sample from the second compartment. The Sample Manager will then obtain three weights for this truck: (1) the gross weight of the full truck, (2) the weight of the truck with one compartment full, and (3) the weight of the empty truck. To calculate the net weight of the refuse in the first compartment, subtract weight (2) from weight (1). To calculate the net weight of the refuse from the second compartment, subtract weight (3) from weight (2).

Dual-bin truck with refuse and recycling from a single building: The DSNY driver may tip either compartment. If the compartment contains refuse, the Sample Manager will take a sample. The DSNY driver will then tip the second compartment and the Sampling Team will take all recycling materials including bulky items and weigh them. The Sample Manager will then have three weights for this truck: (1) the gross weight of the full truck, (2) the total weight of the recycling materials, and (3) the weight of the empty truck. To calculate the net weight of the refuse in the first compartment, subtract the combined weights of (2) and (3) from weight (1).

An example of the Sample Management Form is attached.

Materials Category List

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Mat. Grp	#	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Paper	1	Newspaper	Printed ground wood newsprint (Advertising "slicks" - glossy paper - if found mixed with newspaper; otherwise, ad slicks are included with mixed low grade.).				✓
	2	Plain OCC/Kraft Paper	Old unwaxed/uncoated corrugated container boxes, and Kraft paper other than paper bags				✓
	3	High Grade Paper	White and lightly colored bond, rag, or stationary grade paper. This includes white or lightly colored sulfite/sulfate bond, copy papers, notebook paper, envelopes, Continuous-feed sulfite/sulfate computer printouts and forms of all types.				✓
	4	Mixed Low Grade Paper	Includes junk mail, magazines, colored papers, bleached Kraft other than bags, boxboard, mailing tubes, carbonless copy paper, ground wood computer printouts				✓
	5	Phone Books/Paperbacks	Paperback books and telephone directories				✓
	6	Paper Bags	White, brown or other colored paper bags				✓
	7	Polycoated Paper Containers	Beverage containers made of bleached and unbleached paperboard coated with HDPE film. This includes polycoated milk and juice containers, and aseptic juice containers, including those with plastic spouts attached. Excludes juice concentrate cans, ice cream containers.				✓
	8	Compostable/Soiled Paper/Waxed OCC/Kraft	Waxed papers and cardboards; other papers that were soiled with food during use (e.g., pizza box inserts); paper towels, wipes and napkins. Excludes paper plates, platters, cups, and bowls.				✓
	9	Single Use Paper Plates, Cups	Paper plates, platters, cups and bowls				✓
	10	Other Nonrecyclable Paper	Polycoated frozen food and ice cream containers/packaging and other polycoated papers (excluding cups, plates, bowls and platters; milk/juice cartons, and aseptic packaging); paper with other materials attached (e.g. orange juice cans, nut cans, ajax/comet containers)				✓
Plastic	11	PET Bottles	#1 Polyethylene terephthalate translucent bottles and jars.	D/N/P	✓	✓	✓
	12	HDPE Bottles: Natural	High-density translucent polyethylene (#2) milk, juice, beverage, oil, vinegar, distilled water bottles with necks and jars	N/P	✓	✓	✓
	13	HDPE Bottles: Colored	High-density colored polyethylene (#2) bottles. Liquid detergent bottles, some hair care bottles with necks and jars	N/P	✓	✓	✓
	14	#1 PET Tubs/Trays/Other Containers	Wide mouth tubs and trays without a neck, such as yogurt, cottage cheese, and margarine embossed with #1.				
	15	#2 HDPE Tubs/Trays/Other Containers	Wide mouth tubs and trays without a neck, such as yogurt, cottage cheese, and margarine embossed with #2.				
	16	#3 PVC Bottles	Plastic bottles displaying a #3	N/P	✓	✓	
	17	#4 LDPE Bottles	Plastic bottles displaying a #4	N/P	✓	✓	
	18	#5 PP Bottles	Plastic bottles displaying a #5	N/P	✓	✓	
	19	#7 Other Bottles	Plastic bottles displaying a #7	N/P	✓	✓	
	20	#3 PVC Tubs	#3 injection molded tubs				
	21	#4 LDPE Tubs	#4 injection molded tubs				
	22	#5 PP Tubs	#5 injection molded tubs				
	23	#7 Other Tubs	#7 injection molded tubs				
	24	Soda Crates and Bottle Carriers	Self Explanatory				
	25	Other PVC	Plumbing pipe, identifiable PVC packaging other than PVC bottles/tubs				
	26	Rigid Polystyrene Containers and Packaging	#6 clear trays, salad containers/trays, clamshells, cookie tray inserts, dairy tubs, CD Boxes				✓
	27	Expanded Polystyrene Containers and Packaging	Includes packaging and finished products made of expanded polystyrene. Excludes styrofoam plates, cups, bowls, takeout clamshells, and platters.				

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Plastic - Cont.	28	Other Rigid Containers/Packaging	Packaging that is not identifiable as #1-6, including containers of all types, toothpaste tubes, and plastic spoons. Also: thermaformed/press molded rigid plastics with 1,2,3,4,5 or 7 IPC code.				✓
	29	Plastic Bags	Plastic bags, including labeled grocery and merchandise, dry cleaner, and newspaper polyethylene film bags. Does not include garbage bags, baggies or ziploc bags; or bags heavily soiled with food.				✓
	30	Other Film	Film packaging not defined above, or: was contaminated with food, liquid or grit during use; is woven together (e.g., grain bags); contains multiple layers of film or other materials that have been fused together (e.g., potato chip bags); garbage bags.				✓
	31	Single Use Plastic Plates, Cups, Cutlery, Etc.	Plastic spoons, forks, knives, plates, cups, bowls, and platters of various resins, including styrofoam. Cup lids. Takeout clamshells. Plastic straws.				✓
	32	Other Plastics Materials	Items that are predominately plastic with other materials attached - pens, lighters, toys, and 3-ring binders, single use cameras, disposable razors. Finished plastic products made entirely of plastic such as toys, toothbrushes, vinyl hose -- not including plastic crates and soda bottle carriers.				
Glass	33	Clear Container Glass	Manually sortable CLEAR glass that is greater than 3" x 3"; Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	34	Green Container Glass	Manually sortable GREEN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	35	Brown Container Glass	Manually sortable BROWN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	36	Mixed Cullet	Clear, green or brown glass not manually sortable (under 3" x 3"); glass shards.				
	37	Other Container Glass	Manually sortable BLUE, RED, or YELLOW glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend).	D/N/P		✓	
	38	Other Glass	Window glass, mirrors, light bulbs (except fluorescent tubes), glassware, glass ash trays, etc.				
Metal	39	Aluminum Cans	Aluminum beverage cans (UBC) and bi-metal cans made mostly of aluminum. Subsort and count: Deposit, Potential Deposit, Nondeposit (see legend)	D/N/P		✓	✓
	40	Aluminum Foil/Containers	Aluminum food containers, trays, and foil.				✓
	41	Other Aluminum	Aluminum products and scrap that are 50% or more aluminum, such as window frames, cookware. Does not include aluminum appliances.				
	42	Other Non-Ferrous	Non-aluminum metals not derived from iron, to which a magnet will not adhere, and which are not significantly contaminated with other metals or materials.				
	43	Tin Food Cans	Tinned steel food containers, including bi-metal cans mostly of steel.				
	44	Empty Aerosol Cans	Empty, mixed material/metal aerosol cans. (Aerosols that still contain product are sorted according to that material-for instance, solvent-based paint.)				
	45	Other Ferrous	Ferrous and alloyed ferrous scrap metals to which a magnet adheres and which are not significantly contaminated with other metals or materials. Does not include ferrous appliances.				

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Mat. Grp	#	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
Metal - Cont.	46	Mixed Metals	Items that are predominately metal with other materials attached such as motors, insulated wire, and finished products containing a mixture of metals, or metals and other materials, that are not classified in the "appliances" section below.				
	47	Leaves And Grass	Non-woody plant materials from a yard or garden area, including grass clippings, leaves, weeds, and garden wastes.				
Organics	48	Prunings	Cut prunings, 6" or less in diameter, from bushes, shrubs, and trees.				
	49	Stumps/Limbs	Compostable prunings or stumps 6" or greater in diameter.				
	50	Food	Food wastes and scraps, including bone, rinds, etc. Excludes the weight of food containers, except when container weight is not appreciable compared to the food inside.				
	51	Wood Furniture/Furniture Pieces	Furniture or furniture pieces made of wood.				
	52	Non-C&D Untreated Wood	Untreated wood products not associated with C&D activities, popsicle sticks, chopsticks, wooden spoons, and other miscellaneous household wood products. Does not include furniture.				
	53	Non-Clothing Textiles	Non-clothing fabrics made of rag stock fabric materials including natural and synthetic textiles such as cotton, wool, silk, woven nylon, rayon, and polyester. Includes handbags, linens, draperies, tablecloths, nylon rope, stuffed toys.				✓
	54	Clothing Textiles	Clothing textiles, not including shoes.				✓
	55	Carpet/Upholstery	General category of flooring applications and non-rag stock textiles consisting of various natural or synthetic fibers bonded to some type of backing material.				
	56	Disposable Diapers and Sanitary Products	Diapers and sanitary products made from a combination of fibers, synthetic, and/or natural, and made for the purpose of single use. This includes disposable baby diapers, adult protective undergarments, and feminine hygiene products.				
	57	Animal By-Products	Animal carcasses not resulting from food storage or preparation, animal wastes, and kitty litter.				
	58	Rubber Products	Finished products and scrap materials made of natural and synthetic rubber, such as bath mats, inner tubes, rubber hoses, foam rubber, tire pieces, latex gloves. Does not include shoes and boots that are predominantly rubber.				
	59	Shoes	Shoes, sneakers or boots.				
	60	Other Leather Products	Leather jackets, belts, bags, purses, and other non-shoe leather products.				
	61	Fines	Fines smaller than 1/2 inch screen				
	62	Upholstered or Other Organic-Type Furniture	Crushed upholstered furniture (if an equal mix of wood, and other organic materials not classified above.) Does not include mostly wood furniture or items that would be included under "Textiles")				
63	Miscellaneous Organics	Wax, bar soap, cigarette butts, briquettes, and fireplace, burn barrel and fire pit ash, vacuum cleaner bags and contents.					
App. And Elec.	64	Small Appliances: Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would stick.				
	65	Small Appliances: Non-Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would NOT stick.				
	66	Small Appliances: Plastic	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are less than 50% metal.				
	67	Audio/Visual Equipment: Cell Phones	Cell phones			✓	
	68	Audio/Visual Equipment: Other	Telephones, Stereos, radios, tape decks, VCRs, etc.				

D - Deposit, N - Non-deposit, P - Potentially Deposit

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I
MATERIAL CATEGORIES**

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P Samp.
App. And Elec. - Cont.	69	Computer Monitors	Items other than televisions containing a cathode ray tube (CRT) such as computer monitors and laptops.				
	70	Televisions	Television sets containing a cathode ray tube (CRT).				
	71	Other Computer Equipment	Computer items not containing CRTs such as processors, mice and mouse pads, keyboards, disk drives, calculators, etc.				
C & D Debris	73	Untreated Dimension Lumber, Pallets, Crates	Untreated, milled lumber commonly used in construction for framing and related uses. Pallets and wooden crates.				
	74	Treated/Contaminated Wood	Lumber and wood products that have been painted or treated so as to render them difficult to compost (with generally 50% or more of the surface area treated). This includes painted and chemically treated lumber, plywood, strandboard, and particleboard.				
	75	Gypsum Scrap	Calcium sulfate dehydrate sandwiched between heavy layers of Kraft-type paper. Also known as drywall.				
	76	Rock/Concrete/Bricks	Rock gravel larger than 2" diameter, Portland cement mixtures (set or unset), and fired-clay bricks.				
	77	Other Construction Debris	Construction debris (other than wood) that cannot be classified elsewhere, and mixed fine building material scraps. For example, floor sweepings from construction activities containing sawdust, nails, wire, etc. Also: asphaltic roofing and fiberglass insulation.				
Misc.	78	Miscellaneous Inorganics	Other inorganic materials not classified elsewhere.				
	79	Ceramics	Whole or fragmented ceramic or porcelain products larger than 1/2 inch screen				
HHW	80	Oil Filters	Metal oil filters used in cars and other automobiles.				
	81	Antifreeze	Self Explanatory				
	82	Wet-Cell Batteries	Wet-cell batteries of various sizes and types as commonly used in automobiles.				
	83	Gasoline/Kerosene/Motor Oil/Diesel Fuel	Gasoline, diesel fuel, and fuel oils. Lubricating oils, primarily used in vehicles but including other types with similar characteristics.				
	84	Latex Paints/Water-Based Adhesives/Glues	Water-based paints and similar products.				
	85	Oil-Based Paints/Solvent-Based Adhesives/Glues	Solvent-based paints, varnishes, glues and similar products. Various solvents, including chlorinated and flammable solvents, paint strippers, solvents contaminated with other products such as paints, degreasers and some other cleaners if the primary ingredient.				
	86	Pesticides/Herbicides/Rodenticides	Variety of poisons with the purpose of discouraging or killing insects, weeds, vermin, or microorganisms. Fungicides and wood preservatives, such as pentachlorophenol, are also included.				
	87	Dry-Cell Batteries	Dry-cell batteries of various sizes and types as commonly used in households. Includes cell phone and button cell batteries.				
	88	Fluorescent Tubes	Fluorescent light tubes and compact fluorescent bulbs (CFL).				
	89	Mercury-Laden Wastes	Thermostats, thermometers, and other items containing mercury.				
	90	Compressed Gas Cylinders, Fire Extinguishers	Self Explanatory				
	91	Home Medical Products	Syringes, IV bags, medical tubing, and other home medical products and supplies.				
	92	Other Potentially Harmful Wastes	Explosives, Smoke detectors, Asbestos, Caustic acids and bases whose primary purpose is to clean surfaces, unclog drains, or perform other actions; photography chemicals, chemistry sets. Household disinfectants. Pool chemicals.

Appendix F

R. W. Beck Health and Safety Plan

R.W. BECK, Inc.
Health and Safety Plan for Waste Composition Field Sorting

Date: April 29, 2004

Introduction

Corporate Safety Policy

R.W. Beck, Inc. believes that the health and safety of its employees is of paramount importance. The issue of health and safety is particularly important in conducting solid waste composition field sorting. The terms “waste sort,” “waste composition study,” “waste characterization study,” and the like may be used interchangeably, and all relate to any project that requires the manual handling of municipal solid waste (“MSW”) and subsequent sorting and weighing MSW to determine the percentage of different components in the MSW stream.

To address this issue, the following Health and Safety Plan (“HASP”) has been developed to provide guidelines to Project Managers, Field Supervisors, Crew Chiefs, and other field workers (“Field Personnel”) involved in R.W. Beck’s waste characterization studies. This Plan has also been prepared for distribution to third parties, such as R. W. Beck’s clients who are commissioning the waste composition study, solid waste management facility managers who may be hosting a waste composition study, and subconsultants retained by the firm to assist with the performance of any of the on-site activities of a waste composition study.

Objectives of the Plan

R.W. Beck’s HASP for Waste Characterization Field Sorting has the following four objectives:

- To align R. W. Beck’s health and safety efforts with policies and procedures that are already in place at the solid waste management facilities that host waste composition studies,
- To describe the roles and responsibilities of professional staff regarding health and safety,
- To describe the personal and site safety equipment that must be provided at all waste sorting sites,
- To provide field personnel with a description of the safety procedures to be followed in waste sorting,
- To describe the training and monitoring that R. W. Beck field personnel, subconsultants, and temporary workers must undergo before engaging in waste sorting activities.

Host Facility Health and Safety Coordination

Facilities at which R.W. Beck will sort waste may be owned and operated by third parties that have their own health and safety plans and procedures. It is important that, as guests at the facility, R.W. Beck's workers understand and adhere to the facility's health and safety plan. Adherence to the facility plan may include:

- Confining our waste sorting activities to the areas designated by the facility's owner/operator
- Wearing safety equipment required by the facility's owner/operator, and
- Understanding emergency plans and procedures.

It is important that the Field Supervisor or Project Manager work closely with the facility's owner/operator to integrate operations, including training staff regarding health and safety planning. Specific hold harmless or indemnification requirements by the Host Facility should be reviewed in accordance with the firm's Authorization Policy.

Staff Roles and Responsibilities

Every waste characterization study is unique in some way. Differences in the scope of work, size of the project, and sorting sites, for example, will require different configurations of staffing. However, for the purposes of this Health and Safety Plan, the responsibilities of four types of professionals are described here: (1) Safety Manager, (2) Project Manager, (3) Field Supervisor, and (4) Crew Chief. Some of these roles may overlap in practice. Their roles and responsibilities in the safety effort are described below.

Safety Manager

The Safety Manager is an R. W. Beck employee who is responsible for overseeing the health and safety policies and practices for all waste characterization projects across the firm. This responsibility includes seeing that the HASP is up-to-date, that an appropriate level of safety training for professional staff and temporary workers is maintained, that the most appropriate safety equipment is available to sorting crews, and that issues relating to the health and safety on waste characterization projects have been addressed. The Safety Manager is also responsible for communicating significant HASP changes or updates, newly acquired waste composition-related projects, and any health or safety-related events that occur while performing a waste composition study to R. W. Beck's Risk Management Department so that the firm can comprehensively and accurately monitor the success of the Plan.

Project Manager

The Project Manager of a waste characterization study has overall responsibility for the safety and health of all members of his Project Team. Although he/she will delegate some

of these responsibilities to the Field Supervisor and Crew Chief(s), the Project Manager remains the primary responsible party. The Project Manager must be an R. W. Beck employee.

The Project Manager is responsible for developing a project budget, schedule, and scope of work that provides the time and funds for conducting a safe waste sort. Proper safety equipment (see Section ___ - Safety Equipment) must be obtained and issued to workers, and the training of the professional staff and temporary workers must take place before any actual sorting begins. This training is discussed in more detail below. The Project Manager must instill in his/her Project Team an attitude of prudence and care in carrying out the sort.

The Project Manager is also responsible for coordinating with host facility management regarding risk management issues such as waivers, indemnification, and/or adding the host facility as an additional insured to Beck's insurance policy(s), if required.

The Project Manager is not required to participate in any phases of the on-site waste sorting. However, when less experienced Field Supervisors or Crew Chiefs may be involved, the Project Manager should use professional judgment in deciding whether to observe and/or participate on the initial day of field sorting to assure that health and safety practices are being followed, and to communicate to the client, host facility manager, or other parties in the event of any problems. The Project Manager is also responsible for performing periodic observations, as appropriate, to assure that HASP standards are met.

Field Supervisor

The Field Supervisor is generally the most experienced and knowledgeable member of the field sorting team. The Field Supervisor will be the primary contact with the sorting site owner/operator, coordinating sorting activities with other site activities, and supporting any incidents that may occur.

The Field Supervisor has overall responsibility for the sorting site, including the designation of the area where the sorting will take place. In addition to securing the sorting site (i.e. identifying and marking the boundaries of the sorting site), the Field Supervisor should ensure that the sort workers are protected from other equipment and activities on the site. Typically, the Field Supervisor will oversee the selection, delivery, and queuing of samples. The Field Supervisor has the authority to reject any samples and/or immediately terminate any staff who have not following appropriate health and safety practices.

Crew Chief

The Crew Chief is the individual most directly responsible for the health and safety of the individuals sorting waste. The Crew Chief does not have to be an R. W. Beck employee.

He/She should take a leading role in pre-sort training, be sure that sorting workers have proper personal protective equipment, and that safe sorting procedures are followed throughout the project. As the supervisor working most closely with sorters, the Crew Chief must be alert to unsafe practices (e.g. shoving a hand into the middle of a pile of waste) and warn workers about these practices when they occur. The Crew Chief may be the first person to see an accident and must take appropriate action immediately. The Crew Chief has the authority to immediately terminate sort employees not following appropriate health and safety practices.

Sorter

Sort laborers for waste composition studies may be acquired from multiple organizations, including temporary staffing companies, subconsultants, college or high school internship programs, prison labor programs, professional solid waste trade association membership, and volunteers from numerous other sources (including the client organization and from within R. W. Beck during waste sort training). Regardless of the labor source, sorters are responsible for observing the training provided at the outset of a sort, adhering to the proper health and safety practices throughout the sort, wearing the appropriate personal protective equipment while engaged in sorting, and following the directions provided by the Crew Chief and Field Supervisor at all times. Any sorter not following directions may be terminated immediately without cause.

All MSW site employees, regardless of their level of authority, have the responsibility to report unsafe conditions immediately to their supervisor or to the clients on-site representative.

Safety Equipment

Personal Protection Equipment (“PPE”)

The selection of Personal Protective Equipment is based upon a thorough analysis of anticipated and actual hazards on the MSW site.

PPE is broken down into two classes: (1) PPE that must be worn at all times during any sorting of MSW, and (2) PPE that may be required in addition to the required PPE, depending on local host facility requirements and/or work conditions.

The following safety equipment may be provided for each member of the sorting crew (both professional staff and temporary workers), depending on the host facility requirements and comfort.

- Protective coveralls
- Protective eyewear
- Ear plugs
- Dust mask

- Hard hat
- Reflective vest
- Puncture-resistant gloves, and
- Back-support belts
- Would traffic vests be appropriate in some cases?

We require all workers to wear a sturdy work boot, although we do not supply these. A more detailed description of the personal safety equipment is presented in Appendix A. At a minimum, the following equipment must be worn at all times by all members of the sorting crew.

- Protective coveralls
- Protective eyewear
- Puncture-resistant gloves
- Boots

Other PPE may be required depending on the policy of the facility operator or the judgment of the Crew Chief and/or Field Supervisor.

Site Safety Equipment

In addition to the personal safety equipment provided to each worker, each sorting site will have the following equipment,

- A Industrial First Aid Kit;
- An Eye-Wash kit or five eye wash bottles per crew person;
- Moist towelettes;
- Traffic cones;
- Yellow caution tape;
- A fire extinguisher;
- A cell phone or facility-maintained two-way radio ;
- Insect Repellent;
- Ice chest with drinks;
- Tent, if appropriate, and
- Heaters, if necessary.
- Emergency notification information

A more detailed description of the site safety equipment is provided in Appendix B.

Field Sorting Safety Procedures

Site Layout

Waste sorting may take place at a variety of venues – landfills, transfer stations, or other facilities. Before any sorting takes place, an R.W. Beck supervisor must inspect the site for the following::

1. Sorting activities will be well away from other activities, such as equipment and vehicle operations, that might endanger or impede waste sorting work.
2. There is adequate room to carry out the sorting activities, including the receiving and queuing samples and the disposal and recycling of sorted waste. This includes safety precautions in the refuse trucks being used.
3. If the site is outside and extreme weather may be encountered, provisions should be made for a tent or other temporary shelter to be erected.
4. Arrangements for toilet facilities and a “break” area have been made, and;
5. Access to the site by a vehicle moving the sorting equipment and crew on and off the site is available. Or: Transportation of equipment and sort personnel to and from the site is available.

Once a suitable site has been located, the Project Manager or the Field Supervisor will schedule the sort at a time agreed to by the Client and the site owner/operator. When the schedule has been determined, arrangements will be made to deliver sorting and safety equipment to the site.

If the Sorting Site is close to operational activities at the facility, it should be marked with traffic cones or high visibility warning tape so that it is clear to all Field Personnel, subconsultants, temporary workers, and facility workers exactly what area is designated for the sorting activities. It must be made clear that all areas which are not designated for sorting activities are strictly off-limits. See Appendix C for a typical sorting site layout.

MSW Facility Safety Procedures

If the sorting site is located at a facility that disposes, transfers, or otherwise processes MSW, R.W. Beck’s Project Manager or Field Supervisor should meet with the Site Owner/Operator to coordinate the safety procedures at the site with R.W. Beck’s safety procedures. For example, the site may require the wearing of reflective vests and this must become a requirement for the sorting crew on this project. This meeting must take place before any sorting commences.

The Site Manager should outline the facility's health and safety plan and explain the facility's emergency procedures. The location of the nearest hospital, emergency services, and poison control offices should be obtained from the Site Owner/Operator.

R.W. Beck's Supervisor should provide the Site Owner/Operator with a copy of our Health and Safety Plan, explain our safety procedures, and provide documentation of safety training for the Field Personnel, subconsultants, and temporary workers on the waste sort. During this exchange of information, any potential conflicts in approach or procedures should be resolved and both parties should be clear regarding safety and health issues.

The Project Manager should be prepared to sign an indemnification form, and possibly to add the host landfill as an additional insured on R. W. Beck's general liability policy.

Communications

It is important that supervisory staff be able to communicate with each other at all times. If one of the professional staff must leave the site for some reason, he/she should make it clear where they are going, when they will return, and what steps should be taken in case of an emergency. If, for example, the Crew Chief must leave the site, the Field Supervisor should take over the Crew Chief's duties at the sorting table. Either the Field Supervisor or Crew Chief, or both, should have a working cell phone or a facility-managed two-way radio (a standard item in the Site Safety Equipment) in case of an emergency.

Site Control

The integrity of the sorting site must be maintained at all times. Where appropriate, the area boundaries should be marked. Workers should understand that they must remain within the sort site and that other are on the site are prohibited. Both the Field Supervisor and the Crew Chief are responsible to see that sorting activities and workers stay within the sorting area.

There should be no smoking, eating, or drinking during sorting activities. Food and non-alcoholic liquids must be consumed away from the sorting area. Drinks should be taken in single-use disposable cups or from the original single serve containers. Personal hygiene practices such a hand washing and removal of contaminated coveralls should be conducted prior to eating, drinking or smoking.

Ergonomics

Waste sorts often involve moving and lifting containers of waste that may weigh 100 lbs or more. To prevent back strain and pulled muscles, staff must be trained in proper lifting techniques as part of the pre-sort training. When heavy containers must be moved or

lifted, the Crew Chief should assign an appropriate number of workers and material handling equipment to the job.

Environmental Conditions

Extreme Heat

The risk of heat stress can be significant in summer sorts where the temperature and humidity are high. In these conditions, Crew Chiefs should monitor workers for signs of fatigue and listlessness. Breaks in the work schedule, plenty of fluids, and clothing which allows sweat to evaporate can all help to alleviate the dangers of heat stress.

Extreme Cold

Winter sorts may take place at sites with very low temperatures and high winds. Protection from the cold should include proper clothing, walls on the tent to lessen the effects of wind, and electric or gas heaters (properly ventilated). Crew Chiefs should be alert for indications of cold-effects, such as shivering and fatigue.

Fatigue

Most projects have tight schedules and the uncertainties associated with the delivery of solid waste to a landfill or transfer station can interrupt this schedule. As a result, there is usually pressure to work as long and as quickly as possible. This, in turn, can lead to carelessness and worker fatigue. Regular breaks in sorting should be built into the schedule to provide for rest and recuperation. Typically these breaks include 15 minute breaks in the morning and afternoon and a 30-60 lunch break. If sorting goes beyond 8 hours, additional breaks should be scheduled. The judgment of the Crew Chief is critical. Workers showing signs of fatigue should be given an opportunity to rest, especially if they are becoming careless or tired.

Injury Prevention

Three of the most common sources of potential injury in waste sorting are:

- Careless handling of waste,
- Lifting heavy objects, including containers of materials, and
- Walking into areas where heavy equipment is operating.

Risks associated with handling mixed solid waste can include contact with hazardous materials, sharps, and other potentially dangerous objects. Controls against injury associated with those risks are:

- (1) Wear proper safety equipment at all times and
- (2) Know what you are picking up. Never reach into the middle of a pile of waste to pull out material. Always select only material or objects you can see. Hand rakes can be used

to spread out a pile of waste; hands or arms should never be used. Using the puncture-resistant gloves provided to the crew, sorters can more safely remove needles, broken glass, and sharpened metal from a pile of waste, if the sorter sees what he/she is removing and handles it with care.

Unidentifiable Liquids, Powders, or Medical Waste

Unidentifiable liquids or powders should be treated as hazardous. If there is any question about any material or object, the sorter should immediately stop sorting and notify the Crew Chief. If, at any time, the Crew Chief believes that the sample being sorted includes institutional medical waste or a significant amount of hazardous materials, the crew should stop sorting. The Crew Chief and Field Supervisor should confer and determine if that sample should be discarded without further sorting. The sorting of institutional medical waste and commercial hazardous waste is not performed by R. W. Beck, and the responsibility for handling this material shall be solely with the host facility in the event such material is encountered. It is the responsibility of the Field Supervisor to alert the host facility management.

Lifting Controls

The Crew Chief direct lifting activities at all times. Specifically, the Crew Chief should be sure workers asked to move or lift heavy containers of waste have help available from other members of the crew. Items that cannot be lifted safely by multiple sort laborers shall not be manually weighed and shall be removed by other means. If back injuries or muscle pulls do occur, the Crew Chief should have the worker rest and decide if the injury is severe enough to warrant medical attention.

Both the Field Supervisor and the Crew Chief must see that the sorting area is clearly marked and that the sorting crew understands where the boundaries are. Moving through the area outside the sorting area should be done only with the permission and guidance of the Crew Chief.

Bloodborne Pathogens

Injuries involving cuts and puncture wounds can potentially offer an entry-point for bloodborne pathogens, such as those carrying Hepatitis and HIV. Every cut and puncture wound should be treated and the following steps should be taken by the Crew Chief or Field Supervisor:

- Using sterile gloves, immediately clean the wound with antiseptic and wrap in gauze;
- Place the needle or object causing the wound in a plastic bag;
- If, in the judgment of the Crew Chief and Field Supervisor, the wound caused by a hypodermic needle or a metal object, poses a health or safety risk to the worker, the worker will be taken to the nearest hospital or clinic for evaluation and treatment;

- Notify the Site owner/operator, the Employment Agency (if the patient is a temporary worker), and the Project Manager, who in turn should alert the Safety Manager; and the R.W. Beck Risk Manager.
- Document the incident on an accident report form and submit the completed form to the Safety Manager.

Similar steps should be taken if the worker has been exposed to potentially hazardous material and shows abnormal or unusual symptoms.

Accident Reporting & Investigation

As a part of the Site Training of the crew, the Field Supervisor should educate workers so they are familiar with the Emergency Contact Information Sheet (see Appendix D) and that it is clearly posted in the sorting area.

All accidents must be reported in writing by the Crew Chief or Field Supervisor, using the Accident Report Form shown in Appendix E. A copy of the completed form should be provided to the Site Owner/Operator, the Employment Agency (if the patient is a temporary worker), the Project Manager, who in turn notifies the Safety Manager.

It is the responsibility of the Safety Manager to maintain a file of completed accident report forms and to see that the “lessons learned” for accidents are incorporated into the HASP. Root cause analysis should be the goal of all accident/incident investigations.

Health and Safety Training

All members of a crew responsible for sorting waste must undergo, at a minimum, the training outlined below.

Professional Staff Training

R.W. Beck’s professional staff should, at a minimum, have 8 hours of pre-sort training and serve a 2-day apprenticeship before taking on the role of Crew Chief. The pre-sort training must include review and understanding of the HASP and viewing R.W. Beck’s safety videos. Training related to other aspects of the sort, such as material identification can also be done during this 8-hour period. Professional staff should have a current tetanus booster.

A Crew Chief should work for at least one full week before being considered for the position of Field Supervisor.

Sorter Training

Before any waste sorting takes place, the Crew Chief and/or Field Supervisor must review relevant sections of the R.W. Beck HASP with temporary workers, be sure that all

safety procedures are clear, and that all questions from the sorters have been answered. A Sorter Training Acknowledgment Form is presented in Appendix E.

Next, a “test sort” should be run at a very slow pace to be certain that all safety equipment is being worn properly and that sorters understand the safe and proper way to sort samples of waste.

At the beginning of each day of the sort, the Crew Chief should take a few minutes to check that all safety equipment is being worn and is in good shape. The Crew Chief should also remind the crew about safe sorting and go over the lessons learned from any accidents, or near accidents that have occurred.

Appendix A: Personal Protection Equipment

Personal Protection Equipment (“PPE”) will be supplied to all workers sorting waste to protect them from the various hazards that might be encountered in carrying out their work. Some of the PPE is mandatory and must be worn at all times by all workers. Other PPE may be worn depending on the weather, site conditions, policy of the sorting site, and judgment of the Crew Chief and Field Supervisor.

The mandatory PPE include:

- Protective coveralls – Tyvek or cotton coveralls must be worn at all times to protect worker’s clothing from accidental spills, offer an added layer of warmth in cold weather conditions, and provide added visibility to worker’s on the site.
- Puncture-resistant gloves – Rubber, plastic, or leather gloves must be worn while sorting waste. They are designed to protect sorters from accidental cuts or punctures from needles, broken glass, and sharpened metal. A latex or cotton inner glove will also be provided.
 - Our preferred gloves are MAPA Stanzoil Heavy-Duty Neoprene Gloves
 - Also, recommended are Wells Lamont Puncture- and cut-resistant gloves and Wells Lamont Drivers gloves.
- Protective Eyewear – to provide splash/spatter protection for the sorters
 - Our preferred eyewear protection is the Uvex Astro 3001 for “over the glasses” style for sorters who need to wear their own glasses and Crews Klondike for others.
- Sturdy work boots in good repair

PPE which may be worn, at the discretion of the Crew Chief or Field Supervisor include:

- Back-support belts

- Dust Masks – a dust mask should provide protection from dust and MSW particulates.
 - Our preferred dust mask is the 3M 3-panel disposable Respirator
 - Also recommended are the AOSafety “Pleats Plus” and the Wilson Saf-T-FIT N95 Respirators.
- Ear plugs
- Hard hat
- Reflective vest
- Steel-toed boots

All pieces of equipment listed above will be available to all crew members at any time.

Appendix B: Site Safety Equipment

Site Safety Equipment (“SSE”) will be available at all times on the sorting site to protect workers from hazards and provide emergency first aid. The standard SSE includes:

- A Industrial First Aid Kit – an OSHA-rated 25-person first aid kit or better
- An Eye-Wash kit or five eye wash bottles per crew.
- Moist towelettes
- Traffic cones – four cones to help demarcate the sorting area
- Yellow caution tape – to mark the sorting area.
- A fire extinguisher – a multi-purpose extinguisher that can be used on ordinary combustibles, flammable liquids, and electrically energized fires.
- A cell phone or facility-managed two-way radio
- Insect Repellent
- Ice chest with drinks

If site conditions and weather warrant, a tent will be provided to protect against sun, rain, and wind. Side flaps may also be installed if the weather is cold and/or windy. For very cold conditions, a gas or electric heater may be used. If a gas heater is used, adequate ventilation must be arranged.

Appendix E: Sorter Training Acknowledgment Form

A critical element of training personnel to sort refuse is health and safety training. Before any work can begin, all sorting personnel are trained in safe procedures for handling and sorting waste. This training includes the following topics.

- Purpose of the waste sort
- Site layout – Landfill hazards
- Introduction to professional staff roles and responsibilities
- Sorters responsibilities
 - Punctuality
 - Rest
 - No drugs or alcohol
 - No smoking
 - Prescribed medications

- Sort Safety Procedures
 - Waste handling
 - Use of Personal Protective Equipment
 - Site Safety Equipment
 - Designated work and break areas
- Ergonomics
 - Safe lifting to avoid back stress
- Environmental Conditions
 - Heat Stress
 - Cold
 - Fatigue
- Injury Prevention
- Hazardous Wastes
- Bloodborne Pathogens
- Emergency Procedures
- Accident Reporting
- Training Sort

Acknowledgement

I acknowledge that the professional staff from R.W. Beck has discussed and explained the topics listed above, addressed any question I have about these topics, and conducted a training sort to demonstrate the safe handling and sorting of waste.

New York City Department of Sanitation

August 2005

[This page intentionally left blank.]

**DEPARTMENT OF SANITATION OF NEW YORK CITY
WASTE CHARACTERIZATION STUDY
PHASE I**

Phase I Operations Plan

SUMMER SORTING PERIOD

I. Introduction

The following Operations Plan is submitted to the Department of Sanitation of New York City (“DSNY”) for the Phase I Waste Characterization Study (“Phase I Study”) under Contract #82702BR00015. The focus of this Operations Plan is the Summer Sorting Period which is scheduled to take place from Wednesday, August 3 through Saturday, August 27, 2005.

The Phase I Study includes three components:

A. Residential Study

The purpose of the Residential Study is to characterize New York City’s (the “City’s”) residential refuse and recycling materials by income and housing density strata, accounting for seasonal variation over a twelve-month period. The Study will involve taking samples of residential refuse and recycling materials, sorting and weighing them to develop an estimate of composition of these materials. The Residential Study will also develop an estimate of generation (pounds/household/strata). The Sampling Plan, Material Categories, Field Procedures, and Data Management for the Residential Study are discussed below.

B. Street Basket Study

The purpose of the Street Basket Study is to characterize the City’s street basket refuse based on dedicated street basket collection routes. The Street Basket Study will involve taking samples of street basket refuse, sorting and weighing them to develop an estimate of composition of these materials. The Street Basket Study will also develop an estimate of generation (pounds/street basket) for street baskets on dedicated routes. The Sampling Plan for the Street Basket Study is discussed below. The Material Categories, Field Procedures, and Data Management for the Street Basket Study will be similar to those for the Residential Study.

C. Multi-Unit Apartment Study

The purpose of the Multi-Unit Apartment Study is to identify the physical and operational characteristics of multi-unit apartment buildings that are correlated to successful recycling. The Multi-Unit Apartment Study will involve selecting 125 multi-unit apartment buildings at random and gathering information on key physical and operational characteristics. A definition of successful recycling, incorporating diversion and capture rates and levels of contamination, will be developed as part of the Study. By the end of the Summer Sorting Period, samples of refuse and recycling materials from the 125 buildings will be sorted and weighed to establish the level

of successful recycling for each building. Finally, correlations between building characteristics and the recycling success rate will be developed. The full protocol for the Multi-Unit Apartment Building Study will be submitted to the DSNY before any sorting begins. We anticipate that the Material Categories, Field Procedures, and Data Management for the Multi-Unit Apartment Study will be similar to those for the Residential and Street Basket Studies.

The Phase I Study will be conducted by the R. W. Beck Project Team (“R. W. Beck”) working with the DSNY. The plan presented below describes how the Phase I Study will be developed and carried out during the Summer Sorting Period.

II. Sampling Plans

Each of the three components of the Phase I Study will involve characterizing refuse and recycling materials. This characterization will be accomplished by sorting samples of refuse and recyclables. The first step in this process is the selection of samples. A sampling plan, which describes the steps taken to obtain a sample for each of the three components, is presented below.

A. Residential Sampling Plan

The residential sampling plan involves designing a process for selecting samples of residential curbside refuse and recycling materials (i.e., paper and metal, glass and plastic (“MGP”)). The process includes the following six steps:

- i. Determining the income/density strata;
- ii. Determining the sample size;
- iii. Determining the sample weight;
- iv. Designing the sample selection process;
- v. Developing the sample collection process; and
- vi. Developing refuse and recycling generation estimates.

Because the purpose of the Residential Study is to characterize the residential waste by income and density strata, the first step in the sampling plan was to determine/define these strata and identify them within the City.

i. Income/Density Strata

An income/housing density matrix was developed using U.S. Census data for the year 2000 for each of the 2,217 census tracts in New York City. Three income levels, based on median household income, and three housing density levels were used to create a nine-box matrix.

The income levels used were defined as:

- Low Income = Median household income below \$30,763;
- Medium Income = Median household income between \$30,763 and \$46,193; and
- High Income = Median household income above \$46,193.

The housing density criteria were based on the number of structures within each census tract. The three housing density levels were defined as:

- Low Density = Census tracts in which 67 percent of the structures contain two or fewer units;
- Medium Density = All census tracts that are not in the High or Low categories; and
- High Density = Census tracts in which 67 percent of the structures contain ten or more units.

The resulting income/density matrix separated the City’s census tracts by income and density, as shown in Table 1.

Table 1
Number of Census Tracts in Each Income/Density Stratum

	Low Income	Medium Income	High Income	Total
Low Density	5	177	410	636
Medium Density	392	435	162	636
High Density	<u>342</u>	<u>127</u>	<u>167</u>	<u>636</u>
Total	739	739	739	2,217

Because so few census tracts are in the Low/Low stratum, it was decided to eliminate this stratum from the study and focus the study on the remaining eight strata.

Next, a map of the City was developed in which each of the nine strata was color-coded. This map is shown in Appendix A.

To identify the universe of existing refuse and recycling collection routes, the DSNY provide a list of existing routes that fell entirely within contiguous census tracts of the same strata. The number of existing routes for each stratum is shown in Table 3 below.

The next step was to determine the number of samples that would be sorted.

ii. Sample Size

In a waste characterization study, the number of samples that are sorted affects the accuracy of the estimate. For example, if only one 200 pound sample of the City’s refuse were sorted, it is very unlikely that the estimate resulting from sorting that single sample would match the composition of the City’s entire curbside refuse. On the other hand, if hundreds of thousands of 200 pound samples were sorted – enough samples so that every ounce of the City refuse were

sorted – the resulting estimate would be very accurate indeed. In fact, it would be perfectly accurate. So, how many samples should be sorted?

Before we answer the question about the number of samples, we should understand the nature of the materials that will be sorted. If the materials being sorted (i.e., the refuse and recycling materials) were consistently and homogeneously discarded by households, it would be relatively easy to arrive at an estimate. It would take very few samples to develop an estimate, if there were only two materials in the refuse stream and they were always found in the same proportion in every sample. Of course this is not the case. Refuse, and to a lesser degree, recyclables, are extremely variable. The percentage of each type of waste material can vary considerably among samples. Even from the same household, the type of waste can vary depending on when the sample is collected. For example, during the autumn, one would expect to find large amounts of leaves, but in the winter there will be few leaves or none. On the other hand, food waste will be found throughout the year. Because of the potential for variability between samples, a different number of samples may be required to obtain an accurate estimate for different types of waste. Continuing the example, since food waste is likely to be found more consistently than leaves, fewer samples would be required to obtain an accurate estimate of the food waste percentage in the refuse stream.

Typically, an estimate of the composition of waste is presented as three numbers: (1) the Sample Mean; (2) the Confidence Level; and (3) the Confidence Interval. The Sample Mean is the average percentage of a given material found in the samples sorted. For example, after sorting thirty samples of refuse, we will have a list of thirty percentages of paper waste. If the average of the thirty percentages of paper is 35 percent, then the Sample Mean of paper is 35 percent.

The Confidence Level and the Confidence Interval are intertwined concepts. Together, they allow statements to be made about the entire population from the sample taken. The Sample Mean is, after all, simply the average value of the samples; it is unlikely that the percentage of a given type of waste for the entire population matches the Sample Mean exactly. The Confidence Level and the Confidence Interval provide a way to convey how much the Sample Mean tell us about the entire population.

The Confidence Level indicates the degree of certainty that the Confidence Interval contains the population's mean value. For example, if the Confidence Interval around the Sample Mean – 33 percent to 37 percent for paper – is based on a Confidence Level of 90 percent, we can be 90 percent confident that the population's percentage of paper waste is contained in that interval. The purpose of the Confidence Level is to provide an indication of the accuracy of the sampling results. In waste characterization studies, a 90 percent Confidence Level is a widely accepted standard.

The third number used in describing the composition of the refuse is the Confidence Interval. This is an expression of the uncertainty regarding the population Mean. For example, our Sample Mean of 35 percent for paper waste may have a Confidence Interval of ± 7 percent, at a 90 percent Confidence Level. That is, based on the number of samples that have been sorted and results obtained, we would expect that 90 percent of the time, the amount of paper waste in the refuse of the entire population would be between 28 percent and 42 percent. Or, put another

way, if we could actually go out and determine the exact percentage of paper waste in our population, we are 90 percent certain that the value would be between 28 percent and 42 percent. If we wanted a more accurate estimate, we would have to sort more samples.

In recommending the number of samples of refuse and recyclables to sort, R. W. Beck considered not only the level of accuracy of the estimate, but the cost of providing this estimate and the variability of materials being sorted. As noted above, the variability of some material in the refuse is greater than other materials. Yard waste is much more variable than food waste. Therefore, for a given number of samples, the estimate of some materials will be more accurate than the estimate for others. Sorting a few hundred samples of refuse may provide a Confidence Interval of ± 8 percent for paper, but a ± 30 percent for yard waste. To achieve a ± 8 percent for yard waste would require significantly more samples and would probably be prohibitively expensive.

In practical terms, “variability” simply means the variation we are likely to find between samples. If we sort through ten samples and each sample has between 28 percent to 32 percent of a given waste type, we can be pretty certain that the percentage of this waste type for the population as a whole lies in this general range. But if we sort through these same ten samples and find results of 1 percent, 80 percent, 20 percent, 65 percent, and so forth, you can see that we are much less certain about the percentage of this waste type in the entire population.

There is a point of diminishing returns for waste sampling. After that point, the cost of achieving small increases in accuracy is high. Below that point, significant increases in accuracy can be achieved with relatively little cost.

In determining the number of samples to be sorted for the Phase I Residential Study, an accuracy goal ± 7.5 percent Confidence Interval for the major material groups at a 90 percent Confidence Level was requested by DSNY. In addition to this accuracy goal, R. W. Beck considered the eight income/density strata to be characterized and the need to account of seasonality in the waste stream. Also, R. W. Beck reviewed the Preliminary Waste Characterization Study (“PWCS”) to note the variability exhibited in the PWCS results.

R. W. Beck is recommending that at least 200 samples of refuse be sorted for each strata, 50 samples per strata each season.

The results of the PWCS and the Fall, Winter and Spring Sorts for Phase I showed relatively little variability in Paper Recycling, but significant variability in the MGP. Therefore, R. W. Beck is recommending that 40 Paper Recycling samples per strata be sorted, 80 per season and 160 MGP samples per strata be sorted, 320 samples per season. Table 2 shows the number of samples recommended for the Phase I Residential Study.

Table 2
Sample Size for the Phase I Residential Study

	Samples per Strata	Samples per Season	Samples per Strata/Season	Total
Residential Refuse	200	400	50	1,600
Residential Paper Recycling	40	80	10	320
Residential MGP	<u>160</u>	<u>320</u>	<u>80</u>	<u>1,280</u>
Total	400	800	140	3,200

iii. Sample Weight

Based on current industry practice and studies by the USEPA and academic studies (e.g., Klee), it was determined that the weight of each sample of refuse would be between 200 pounds and 250 pounds.

Because recycling paper and MGP tend are generally less variable than refuse samples (i.e., contain fewer types of materials), and based on the results of the PWCS, it was determined that the weight of each sample of recycling paper and MGP would be between 100 pounds and 125 pounds.

iv. Sample Selection

In selecting samples from the City’s curbside refuse for the Phase I Residential Study, R. W. Beck and DSNY agreed to use existing refuse and recycling collection routes that were entirely within census tracts for each of the eight income/density strata. An analysis of the census tracts and information on the existing collection routes provided by DSNY, the universe of available routes was developed. Table 3 shows the number of available collection routes for each of the eight income/density strata.

Table 3
Pure Routes and Universe of Routes for Summer Sort Sampling ⁽¹⁾

Strata	Refuse		MGP		Paper		Total	
	Pure	Universe	Pure	Universe	Pure	Universe	Pure	Universe
High Density / High Income	38	499	20	88	39	184	97	771
High Density / Medium Income-	26	343	9	54	9	54	44	451
High Density / Low Income	22	273	7	30	4	21	33	324
Medium Density / High Income	3	37	2	9	2	14	7	60
Medium Density / Medium Income	14	186	9	58	9	53	32	297
Medium Density / Low Income	26	330	13	69	12	63	51	462
Low Density / High Income	77	996	55	393	55	393	187	1,782
Low Density / Medium Income	21	274	18	118	18	118	57	510
Total	227	2,938	133	819	148	900	508	4,657

(1) Pure Routes are existing DSNY collection routes which are wholly contained in a single density/income stratum. The universe of routes is the total number of times the pure route is collected during the three-week Sorting Period.

From this universe of existing routes, sample routes were randomly chosen. Because certain strata had relatively few existing routes, sampling by replacement was used, meaning that it was possible that more than one sample might be taken from any one truck. However, all samples were selected randomly. The tables with those randomly selected routes (refuse, recycling, and street basket) for the Summer Sorting Period are included as Appendix B.

v. Sample Collection

a. Refuse Sample Collection

The samples of residential refuse will be acquired at one of two private transfers stations owned by Waste Management, Inc. (“WMI”) and under contract with DSNY to receive residential curbside refuse. The two transfer stations are WMI’s Varick Street transfer station and Harlem River Yard transfer station. DSNY has agreed to divert the trucks that have been selected for sampling to one of these two transfer stations. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

As a selected truck arrives at the transfer station, the R. W. Beck Sample Manager will be notified. When the truck has tipped its load a front-end loader (“FEL”) from the transfer station will take a randomly selected portion of the tipped load dump into two or three 96-gallon toters. The random selection of the portion of the tipped load to be sampled will be made by the Sample Manager before the FEL begins to grab the sample.

The FEL will dump the selected portion of the load into toters that have been positioned by the Sample Manager and Assistant in an area designated by WMI. Once the refuse has been dumped into the toters, the FEL will manage the remainder of the tipped load as it normally would.

The Sample Manager and assistant will then weigh each toter to be sure that the sample of refuse weighs 200 pounds to 250 pounds. In a test conducted on May 7, 2004, it was found that a single 96-gallon toter held approximately 150 pounds of refuse. Therefore, we estimate that, typically, two toters of refuse should contain one sample of waste. After the toters have been weighed, each toter will be marked with the date, Sample number, a Sample Code, and the truck number. In addition, each sample will have a Sample Management Form which will be taped to the toters. The Sample Management Form is included as Appendix C.

After the samples are weighed and labeled, they will be loaded on an R. W. Beck truck and transported to the North Shore Marine Transfer Station where they will be unloaded and positioned for sorting.

It is likely that some samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

b. Recycling Sampling

The samples of residential recycling Paper and MGP will be acquired at one of two processors under contract with the DSNY to receive residential curbside recycling. The two processors are Hugo Neu Schnitzer East’s facility in Long Island City for MGP and Metropolitan Paper for Paper Recycling. DSNY has agreed to divert the recycling collection trucks that have been selected for sampling to these two processors. The drivers of these trucks as well as the scale-house operator at the transfer station will have been notified ahead of time that the truck is to be sampled.

The procedure for acquiring samples will be identical to the procedure used as the private transfer stations described above. However, our experience in other projects, the PWCS, and the Fall Sort indicates that 100 to 125 samples of recycling material will, in most cases, require only one toter. The samples of Paper Recycling and MGP will be taken to the Greenpoint Marine Transfer Station where they will be sorted. It is likely that the MGP samples will contain bulky items that do not fit into 96-gallon toters. When this occurs, the bulky items will be manually set aside. The Sample Manager will weigh the item and record the weight and a description of the item on the Sample Management Form. This information will be included when the remainder of the sample is sorted and weighed at the sorting site.

vi. Waste Generation

One facet of the Phase I Study is to develop generation rates for residential waste for the City. Generation rates refer to the average amount of refuse, MGP, and paper set out for collection by a household or person over a given period of time. Because the Residential Study examines the City's waste by housing-density and income strata, the generation rates were estimated by strata. Each stratum's generation rate is actually an average of individual generation rates of each household that comprise that stratum. In other words, we do not believe that each household in a given strata generates an identical amount of refuse, MGP, and paper. Rather, we believe that each stratum may have a unique average generation rate when we combine the individual households that comprise that stratum.

Residential Generation Rates

Information regarding tons collected is available at the District and Section levels. The City has 59 Community Districts and, within these Districts, 230 Sections. Information regarding population, number of households, and strata is available on the Census Tract level. The methodology used to estimate generation rates requires integrating the information available for the Census Tracts and the Section.

Using the New York City Department of City Planning's Land Use and Geographic Database for the five boroughs of New York City ("MapPluto"), we are able to assign Census Tracts to each Section. Because Census Tracts do not conform to Section boundaries, some Census Tracts belong to only one Section while others may be in two or more Sections. In cases where Census Tracts "bleed" over Section boundaries, it was initially assumed that Census Tracts reaching outside a given Section would be balanced by Census Tracts in adjacent Sections bleeding into that Section. The object was to split Census Tracts among Sections to appropriately account for the correct strata-composition of a given Section.

Since we know the number of households in each Census Tract, we can estimate the number of households in each Section by multiplying the households in each Census Tract by the number of Census Tracts assigned to a given Section. For example, MapPluto tells us that Manhattan District 6, Section 3 has seven Census Tracts. We know that the total number of households in these seven Census Tracts is 26,296. We can check our work by comparing the sum of the households for all Sections in a District against the District totals. The sum of the estimated number of households in Section 3 of Manhattan District 6 is 91,252. The total number of households in Manhattan District 6, as reported by DSNY, is 91,189. These two figures are less than 1 percent of each other and indicate that our estimate of the number of households is reasonable.

For Districts where there was a significant discrepancy between the estimated number of households and the number of households reported, we mapped the Section and Census Tracts and adjusted the number of households per Section. For example, if a significant area of the Census Tract lay outside the Section to which it had been assigned, the number of households assigned to the Section was adjusted. The number of households was again checked to see that our estimates were within 5 percent of the actual District totals.

Each Census Tract assigned to a Section had been placed in one of nine strata. We allocated the number of households in each Census to the appropriate strata for each Section. For example, MapPluto shows that the seven Census Tracts in Manhattan District 6, Section 3 are all in the High/High strata. Therefore, we can characterize Manhattan District 6, Section 3 as the High/High strata. It should be emphasized however that the generation rates for these Sections would not all be identical. They are individual instances of this strata's average generation rate. We can average them, weighted by the number of households in each Section, to estimate the strata's average generation rate. Of the 230 Sections in the City, 43 sections contained census tracts from the same strata.

In the remaining 187 Sections, the strata of the census tracts were mixed. For example, in Manhattan District 2, Section 1, MapPluto assigned eight census tracts from four different strata.

To calculate the generation rates we began by assuming that the population in each strata all discard exactly the average value (for their strata) that we seek. We know that this assumption is not exactly true (there is likely to be variation within each stratum regarding the amount of waste generated). Thus, we know that there will be some remaining discrepancy ("ε") between our calculated tonnages for each Section and the actual tonnages observed.

The regression therefore seeks to estimate a single "tons per person" value for each stratum such that, when multiplied by the population of each stratum in a given Section, it closely approximates the known total tonnage for that Section. All Sections are included in this analysis, whether comprised of a single or multiple strata.

Example: Consider a simplified case where there are only three Sections and two strata.

In Section 1, there are 100 people in stratum A and 400 people in stratum B. Section 1 discards 190 tons of waste.

In Section 2, there are 300 people in stratum A and 200 people in stratum B. Section 2 discards 220 tons of waste.

In Section 3, there are 500 people in stratum A and 800 people in stratum B. Section 2 discards 500 tons of waste.

The regression analysis seeks to estimate the per-person average waste values for strata A and B using the following:

$$100 * X1 + 400 * X2 + \epsilon = 190$$

$$300 * X1 + 200 * X2 + \epsilon = 220$$

$$500 * X1 + 800 * X2 + \epsilon = 500$$

In this case, $X1 = 0.49$ and $X2 = 0.33$ (tons per-person) are the estimates which best fit the given data.

In the actual analysis, we had data for 227 Sections upon which the estimates for the nine strata were determined.

The documents supporting this approach and the results for the Fall, Winter and Spring Sorts are presented in the Fall, Winter and Spring Sorting Period Reports. This methodology will be used to develop residential generation rates for the Summer Sort.

B. Street Basket Sampling Plan

The Street Basket sampling plan involves designing a process for selecting representative samples of street basket waste. The process includes the following five steps:

- i. Determining the universe of street basket waste income/density strata;
- ii. Determining the sample size;
- iii. Determining the sample weight;
- iv. Designing the sample selection process; and
- v. Developing the sample collection process.

Because the purpose of the Street Basket Study is to characterize street basket waste, the first step in the sampling plan was to determine what universe of street basket waste would be used for drawing samples.

i. The Universe of Street Basket Waste

DSNY and R. W. Beck agreed to use the total number of dedicated street basket collection routes as the universe from which random samples of street basket refuse would be taken. Dedicated routes are those routes that collect only street basket waste. Routes that collect residential refuse as well as street basket refuse are excluded from this study. There are dedicated routes in all five of the City's boroughs.

ii. Sample Size

The results of the *Seattle Litter Composition Study* were reviewed to determine the variability of street basket waste. Based on this review, it was estimated that 200 samples of street basket waste would be expected to achieve a confidence interval of ± 7.5 percent for the major material groups – paper, plastic, metal, and glass. Each season 50 samples of street basket waste will be sorted.

iii. Sample Weight

The weight of samples will be the same as the weight of samples for residential refuse, for the reasons discussed in Section II. A. iii.

iv. Sample Selection

From the universe of dedicated street basket routes, 55 routes (50 target routes and 5 back-up routes) have been randomly selected, using Excel's random number function. These routes were sent to DSNY.

v. Sample Collection

Samples of street basket waste will be collected from 50 routes, using procedures identical to those for collecting residential refuse.

C. Multi-Unit Study Sampling Plan

The Multi-Unit Sampling Plan involves selecting buildings for the Multi-Unit Study and determining the most appropriate procedure for sampling the refuse and recycling. The development of the plan involved five steps.

- i. Determining the universe of multi-unit buildings;
- ii. Determining the sample size;
- iii. Determining the sample weight;
- iv. Designing the sample selection process; and
- v. Developing the sample collection process.

Because the purpose of the Multi-Unit Study is to correlate recycling success with selected physical and operational building characteristics, the first step in the sampling plan was to determine the universe of multi-unit buildings.

i. The Universe of Multi-Unit Buildings

The buildings for the Multi-Unit Study were selected from among the multi-unit buildings of six units or more in the New York City Department of City Planning, MapPluto database. Public Housing and buildings with mixed residential and commercial use have been excluded from this Study.

ii. Determining Sample Size

The Multi-Unit Sampling Plan will involve selecting refuse and recycling samples from 125 randomly-selected buildings. Ninety-four of these buildings have been targeted for the Summer Sorting Period.

The sample size of 125 buildings was determined by the physical and operational characteristics that were being used in the Multi-Unit Study. It was decided that any characteristic that existed in at least 10 percent of all buildings in the City should be able to be adequately sampled by the Study. If a characteristic were in fewer than 10 percent of all buildings, that characteristic could not be adequately examined.

Based on this 10 percent minimum, a sample size of 125 buildings was set. If one of the characteristics we selected was in 10 percent of all buildings in New York City, with a sample size of 125 buildings, the expectation would be that roughly ten to twelve of those buildings would have that characteristic. This would be enough buildings to test for the characteristic. For characteristics that were more common, of course, more buildings would be expected to have that characteristic. The list of multi-unit collections for the Summer Sort are shown in Appendix B.

iii. Determining Sample Weight

The weight of the Multi-Unit samples will be the same as the weight of samples for the residential refuse, for the reasons discussed in Section II. A. iii. Because “recycling success”

was being measured, it was decided to sort all recyclables. In effect, the recycling sample weight will consist of all materials set out for recycling.

iv. Determining Sample Selection Process

To measure and compare recycling success, it was necessary to have a profile of refuse disposal and recycling for each building in the Multi-Unit Study. To develop this profile, it was decided to sample and sort refuse and recycling over one week. For buildings with three-day per week refuse collection, refuse samples from each of the three days will be acquired. For buildings with two-day per week refuse collection, refuse samples from both collection days will be acquired. All residences have recycling picked up one day per week and this day always coincides with a refuse collection day.

Furthermore, it was decided that the recycling sample would be acquired on the last refuse collection day of a collection cycle. For example, if a building had Monday-Wednesday-Friday refuse collection and recycling collection on Monday, the refuse samples would be acquired on Wednesday and Friday and both refuse and recycling would be collected on the following Monday. In this way, all materials placed on the curb for collection during a week from each building would be examined in the Study.

v. Determining the Sample Collection Process

DSNY has arranged a special collection for buildings in the Multi-Unit Study. Dual-bin collection trucks will be used to collect both refuse and recycling. Each administrative borough in the City will send trucks collecting from the buildings in their service area. The dual-bin collection trucks may collect refuse from one or two buildings, or may collect both refuse and recycling from a single building.

All trucks collecting waste from buildings from Queens or Brooklyn will deliver their loads to the Varick Street transfer station. Trucks collecting waste from Manhattan or the Bronx will deliver their loads to Harlem River Yards.

The sampling team will collect multi-unit refuse samples using a procedure similar to that used for collecting samples of residential refuse and street basket waste. However, for multi-unit samples with bulk items, the bulk items will be weighed and the weight recorded, but the sample will contain a minimum of 200 pounds of bagged or loose refuse.

As noted above, the sampling team will collect all recycling delivered from each building, including all bulk items. A more detailed discussion of the multi-unit sampling protocol is included in Appendix C, along with a multi-unit sample management form.

III. Material Categories

A. Refuse Categories

The list of material categories to be used in the refuse and street basket sorting is presented in Appendix D.

B. Recyclables Categories

The list of material categories to be used in the recycling sorting is the same as the list of materials for refuse sorting and is presented in Appendix D.

C. Street Basket Categories

The material categories for street basket waste will be identical to the categories for refuse. In addition, sorting will seek to identify instances of illegally disposed residential or commercial waste.

D. Multi-Unit Categories

Although the material categories used for the multi-unit study will be the same as those used for the residential refuse and recycling studies, some of these categories will be collapsed into fewer sorting categories, as shown on the Multi-Unit Sample Detail Form in Appendix E.

IV. Field Procedures

A. Health and Safety Plan

R. W. Beck's current Health and Safety Plan ("HASP") has been submitted to DSNY previously and is included in Appendix F.

B. Sorting Procedures

Once the samples of refuse and recycling have been transported by the Sample Managers from private transfer stations or recycling processors to the sorting sites, the Field Supervisor at each sorting site will check in each of the samples to be certain that the Sample Management Forms and Sample labels are clear and consistent.

After the Samples have been checked in, each Crew Chief and crew will begin sorting samples. The refuse will be sorted into the material categories using the Sample Detail Form, shown in Appendix E. When all material has been sorted, the material falling through the ½-inch screen on the sorting table, called "fines", will be swept up and included as one of the material categories. All sorted materials will then be weighed.

Protocol for Identifying and Accounting for Illegal Materials in Street Basket Waste

To determine the level of illegal use of street baskets for residential or commercial refuse disposal, the following protocol will be used:

- Before sorting, each 200 to 300-pound street basket sample will be placed on the sort table for inspection by an R. W. Beck Crew Chief trained by DSNY staff to identify suspected illegal residential or commercial waste.
- All closed opaque plastic bags the size of a shopping bag or larger will be identified as potentially containing illegal material.
- The loose material found in clear plastic basket liners or opaque liners labeled with a Business Improvement District ("BID") logo will be considered legal street basket waste.

- Any closed opaque plastic bags the size of a shopping bag or larger found within a BID bag will also be identified as potentially containing illegal material.
- Closed bags identified as potentially containing illegal material will be opened.
 - If a bag contains any of the following materials, it will be classified as “residential”:
 - Addressed mail;
 - Substantial quantities of home-use products, including: health and beauty aids, detergent bottles, family sized drink containers, or other seemingly residential material; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggest home use.
 - If a bag contains any of the following materials, it will be classified as “commercial”:
 - Retail food preparation wastes (industrial sized food/liquid containers, substantial quantities of identical packaging or unused products, cardboard boxes);
 - Construction materials such as pieces of dry wall or other building materials; and
 - Other case-dependent contents that, in the opinion of the Crew Chief, suggest office, retail, industrial, construction or food establishment waste.

Closed shopping bags not containing materials deemed residential or commercial, but suggesting street use (single use containers, newspapers, etc.) will be considered legally disposed street basket waste.

For all bags identified as containing residential or commercial wastes, the following four procedures will be followed:

- All such bags will be individually photographed.
- Each bag will have a written record describing its contents. The Crew Chief will record this information on the Sample Detail Form.
- All such bags will be counted (regardless of size) in two groups: residential bags and commercial bags. The bag counts will be recorded on the Sample Detail Form.
- In each sample, bags identified as containing residential or commercial waste will be weighed in two groups: residential bags and commercial bags. The combined weights of the bags in each group (residential and commercial) will be recorded on the Sample Detail Form.

In addition, each sample will be examined for suspected instances of illegally disposed residential or commercial wastes not encased in closed bags as defined above – including instances of broken bags with spilling contents, as well as residential or commercial material loose in the street basket contents. These materials will be photographed but not weighed and their presence noted on the Sample Detail Form (as shown in Appendix E).

After these procedures have been completed, all material will be placed onto the sorting table and sorted according to the refuse sorting protocol.

All weights will be recorded by the R. W. Beck Crew Chief. The tare weight of the containers will be put into the scale so that only the net weight of the sorted material is recorded. When the weighing of all material in the sample has been completed, the sorted refuse and recycling will be placed in an appropriate roll-off container and returned to the transfer station or processor.

The Crew Chief and crew will then begin sorting the next sample. Each crew is expected to sort and weigh approximately nine samples of refuse and MGP per day, and 15 samples of Paper Recycling per day. This average is based on our experience in the PWCS.

Multi-Unit Sorting

Because the purpose of the multi-unit study was to correlate building characteristics with recycling success, and not characterize the building's waste, a different protocol will be used to sort the multi-unit refuse and recycling. The Multi-Unit Sample Detail Form illustrates this protocol and is included as Appendix E.

Moisture and Particulate Testing

Samples of refuse and recycling will be randomly selected for moisture and particulate testing. The purpose of the test is to estimate how much of the weight of certain materials is made up of moisture and fugitive particulates that migrate to the materials during compaction in the collection truck. Eighteen materials have been identified for testing. In each randomly-selected sample three to five pounds of each material will be collected and double-bagged. Each three to five pounds of material is called a Moisture Testing Unit ("MTU"). Therefore, each sample may have as many as 18 MTUs, although some samples may not include some of the targeted materials.

All MTUs will be sent to Woods End Laboratory for testing and results reported to the Project's data management team for analysis. During the Summer Sort, twelve samples will be randomly selected for testing.

A total of 500 MTUs will be tested during the Phase I study and the analysis of the results will be reported after the fourth season of sorting.

C. Staffing

The professional staff for the Summer Sorting Period will include:

- Tom Jones, Project Manager: Mr. Jones has been with R. W. Beck for the past 16 years and is currently a Senior Director of the firm. His work has included waste characterization studies, solid waste facility financings, and planning/implementation work.
- Deborah McDonough, E.I.T. – Data Manager: Ms. McDonough, an Engineer with R. W. Beck since 2001, is responsible for conducting transmission analyses and specializes in designing software programs, data management applications, and interactive graphical tools for use in projects associated with solid waste composition studies, locational marginal pricing, transmission power flow studies, transmission constraint analysis, and rate

analyses. She is also Project Manager of the Georgia State Waste Characterization Study. Ms. McDonough has been the Data Manager since the beginning of the Project.

- Joe Naviera, Data Analyst: Mr. Naveira has an AS degree in Database Technology and recently joined R. W. Beck as a Data Administrator. He has assisted in the maintenance and development of databases for multiple clients, including the New York Department of Sanitation and R. W. Beck's Disaster Relief project throughout Florida.
- Navid Nowakhtar, Data Manager: Mr. Nowakhtar has a BS degree in Computer Engineering and has been with R. W. Beck as an Analyst since 2001, working primarily in the areas of spreadsheet programming, modeling, power supply planning projects for municipal electric authorities, statistics analysis and solid waste consulting support. Working in both the Energy and Solid Waste practices, he has been involved with database development and data management for R. W. Beck's City of Orlando and Lake County Disaster Recovery projects. He has also developed databases for use with locational marginal pricing studies, and regularly maintains a proprietary database for R. W. Beck's Public Relations Department.
- Jonathan Nunes, Task Manager: Mr. Nunes is a Senior Economist and has been with R. W. Beck since 1993. In addition to participating in various power supply planning activities, he has assisted in several strategic planning activities undertaken by municipal joint-action agencies and contributed to internal and external planning efforts using analytical tools developed in the fields of systems thinking and systems dynamics.
- Kyle Hoyle, Data Analyst: Mr. Hoyle joins the Project as an intern from the University of Florida, Gainesville, where he is pursuing a degree in Business Administration. Along with assisting in research and analysis for this project, he has been involved in the Georgia State Waste Characterization Study.
- James Jian, Data Analyst: Mr. Jian recently joined R. W. Beck with a background as a data administrator working at Oracle and Disney. He holds an AS degree in computer programming analysis and Oracle database technology. Mr. Jian has assisted in the development and maintenance of databases for the New York Department of Sanitation, and for a report prepared for the Georgia State Waste Characterization Study.
- Mack Rugg, Technical Advisor: Mr. Rugg is an employee of CDM and an acknowledged expert in the field of waste characterization. He has managed numerous waste studies, including a recent project in Bergen County, New Jersey.
- Sean Perera, Logistics Manager: Mr. Perera joined R. W. Beck in 2001 and is a member of the Water and Waste Resources Practice. He has held numerous roles throughout the life of the Project, acting at various times as Logistics Manager, Crew Chief and Sample Manager. In his role as Logistics Manager, Mr. Perera is responsible for coordinating daily sample collection and sorting activities. Prior to this study, Mr. Perera has taken part in numerous waste characterization projects.
- Dieter Eckels, Director of Sampling (nights): Mr. Eckels conducts data collection, research, and analysis in support of a number of Cascadia waste characterization projects including

the 2003 and 2004 California Statewide Waste Composition Studies. His background includes collection system design for the University of Washington's program to re-use on-site cooking oil as bio-diesel for the campus fleet. Mr. Eckels was a Sample Manager for the Fall and Winter Sorting Periods, and acted as the Director of Sampling for the Spring Sort.

- Lyndsay Hazen, Sample Manager (nights): Ms. Hazen provides research and analysis in support of waste composition and recycling research projects at Cascadia. Her previous experience includes work with the University of Vermont's Department of Solid Waste and Recycling, and organizing waste audits in the school's dormitories.
- Cat Koehn, Sample Manager (nights): Ms. Koehn brings several years of education and team management experience to Cascadia's field data collection activities. Cat has a background in management systems and non-profit management.
- Momo Savovic, Sample Manager (nights): Mr. Savovic has been an employee of R. W. Beck since 1999. He has over 22 years of national and international experience in consulting engineering with project experience including project management; organization assessments/facilitation services; infrastructure design; and planning, design and construction management. Most recently, Mr. Savovic has worked with R. W. Beck's Florida Emergency Response Team, assisting in the coordination and execution of debris removal.
- Tom Bradbury, Sample Manager (nights): Mr. Beck is a Project Assistant in R. W. Beck's Seattle office, which he joined in 2001. His responsibilities include shop drawing control, preparation and submittal of technical specifications and reports as well as quality control for drawing submittals. He has assisted in the preparation of several major reports.
- Marcie Puskarik, Sample Manager (nights): Ms. Puskarik is an employee of CDM and a Level 2 Environmental Scientist. She is experienced in sampling management, including hazardous materials sampling, and is currently involved in several remedial projects across New Jersey.
- Ramon Swann, Sample Manager (nights): Mr. Swan is an employee of Organics Resources, Inc. ("ORI") and was a Sample Manager during the Fall, Winter and Spring Sorting Periods.
- Ken Marino, Sample Manager (nights) (multi-unit): Mr. Marino has been employed by R. W. Beck for over 25 years and is a Senior Director. He has been involved in solid waste tip fee analysis and waste-to-energy, landfill and materials recovery facility financings.
- Mike Burns, Sample Manager (nights) (multi-unit): Mr. Burns is a Senior Financial Analyst with R. W. Beck and has assisted in the preparation of reports and other documents in connection with financing of cogeneration and solid waste facilities.
- Bernice Siebuhr, Sample Manager (nights) (multi-unit): Ms. Siebuhr is an analyst for R. W. Beck's Electrical Facilities Practice and has worked with a variety of clients in Georgia and Florida. She also did field work for the firm's Disaster Recovery program.

- Walt Davenport, Director of Sorting: Mr. Davenport has over 30 years of experience in the solid waste profession as a private sector hauler/recycler and consultant. His specific areas of expertise include solid waste and recycling collection efficiency; waste composition and generation; and processing efficiency. He has managed numerous waste composition studies including Pennsylvania Statewide; Alameda County, California; and Montgomery County, Maryland Waste Composition studies.
- Tanya Tarnecki, Field Supervisor – Northshore: Ms. Tarnecki manages several waste management projects for Cascadia Consulting, including data collection and reporting waste characterization projects in King County, Washington; and San Bernadino and Orange County, California.
- Don Birnesser, Crew Chief – Northshore: Mr. Birnesser is an employee of R. W. Beck and has over 26 years of experience as a Project Manager and Environmental Engineer in a variety of solid waste, air quality and wastewater sludge management projects. He has managed and participated in projects including recycling collection; resource recovery facilities; MRFs; composting facilities; transfer stations; boiler plants; combined cycle cogeneration plants; and landfills.
- Hilliary Smith, Crew Chief – Northshore: Ms. Smith developed the paper waste management policies for Bowdoin College. She teaches waste reduction, recycling, and environmental stewardship at Island Wood on Bainbridge Island, Washington.
- Mike Rogers, Crew Chief – Northshore: Mr. Rogers, an employee with R. W. Beck, has wide experience in waste compositions studies. Mr. Rogers has worked on Alameda County, California; Georgia Statewide; and Montgomery County, Maryland Waste Composition studies along with many other studies with another Mid-west firm. His specific area of expertise is material identification, data collection, and management of the sort crews.
- Karin Olefsky, Crew Chief – Northshore: Ms. Olefsky supports Cascadia projects through field work, data collection and waste composition analysis. Her recent work at Cascadia includes recycling program analysis for the University of Utah and a statewide waste characterization analysis for California.
- Katie Adkins, Crew Chief – Northshore: Ms. Atkins teaches and develops environmental trainings, and also specializes in conducting waste audits for schools and businesses.
- Katie Kennedy, Crew Chief – Northshore: Ms. Kennedy performs research and analysis in support of waste composition and recycling analysis. Her recent field work includes leading sorting crews for the Tacoma School District and the Sunshine Canyon Waste Composition Studies.
- Marley Shoaf, Crew Chief – Northshore: Ms. Shoaf performs waste and recycling audits of Seattle area businesses and facilitates stakeholder groups on environmental health topics, such as fish consumption and removal of toxic chemicals from school science labs.
- Nick Simons, Crew Chief – Northshore (multi-unit): Mr. Simons is an environmental engineer with CDM, with a variety of experience in solid waste management projects

including field work and report preparation. In addition to working as a Crew Chief on the New York City Waste Characterization Study in May 2005, Mr. Simons recently managed sample collection and sorting operations for a waste characterization study of a pilot curbside recycling program in Illinois. Mr. Simons has also worked on a four-season waste characterization study in Bergen County, New Jersey; a two-season waste characterization study in Salina, Kansas; and a waste characterization study of thirteen selected state facilities throughout Illinois. In addition, Mr. Simons has assisted with the development of a solid waste management plan for an Illinois county and is currently working on a Zero Waste Planning project.

- Peter Sander, Crew Chief – Northshore (multi-unit): Mr. Sander represents R. W. Beck as an employee with a wide range of experience in programs associated with debris management from natural disasters. Prior to this assignment, he has been on site in Florida with the R. W. Beck Disaster Recovery Team. During this time, his roles have included Crew Monitor, Tower Monitor, Debris Removal Supervisor, and Administrator, where he managed the daily collection of records. Prior to this study, Mr. Rogers has taken part in numerous waste characterization projects.
- Rory Tipton, Field Supervisor – Greenpoint: Mr. Tipton has more than two years of civil engineering experience working as a project engineer on solid waste projects. He has been responsible for engineering design, documentation, cost estimating and production coordination for projects of varying size and complexity. He received waste characterization training in R. W. Beck’s Georgia Waste Characterization Study.
- Byron Jones, Crew Chief – Greenpoint: Mr. Jones is employed by R. W. Beck and has extensive experience in debris management associated with natural disasters. Most recently, he has been on site with R. W. Beck’s Florida Disaster Recovery Team working variously as a Crew Monitor, Tower Monitor, Debris Removal Supervisor, and as an Administrator, managing the daily collection of records. Prior to this study, Mr. Jones has taken part in numerous waste characterization projects.
- Eric Harrison, Crew Chief – Greenpoint: Mr. Harrison is an engineer with R. W. Beck’s management consulting practice. Since joining the firm in 2001, he has assisted on various power flow studies; generation interconnection evaluations; transmission deliverability evaluations; product cost modeling; and the Disaster Relief projects in Florida.
- Kerri Genden, Crew Chief – Greenpoint: Ms. Genden is a Financial Analyst with R. W. Beck and holds a Finance Major from the University of Central Florida. She has assisted with several solid waste system analyses and assisted with disaster debris and monitoring for various communities in Florida.
- Mary Chamberlain, Crew Chief – Greenpoint: Ms. Chamberlain has been with R. W. Beck since 2001 and is an Environmental Analyst with R. W. Beck’s Minneapolis office. Much of her work has been in the areas of solid waste and recycling collection feasibility and efficiency. She has assisted state and local agencies in conducting waste and recycling composition studies. Ms. Chamberlain recently assisted with the Multi-Unit Building Recycling Survey for the New York Department of Sanitation.

- Raymond Randall, Crew Chief – Greenpoint: Mr. Randall is a Senior Consultant and Project Manager with R. W. Beck, and has been with the firm for 13 years. Mr. Randall has conducted waste characterization studies throughout Florida; Georgia; Pennsylvania; Montgomery County, Maryland; and Phoenix, Arizona. Mr. Randall also has extensive experience in solid waste collection efficiency studies.
- Wade Kilpatrick, Crew Chief – Greenpoint: Mr. Kilpatrick is employed by R. W. Beck and has extensive experience in debris management associated with natural disasters. Most recently, he has been on site with R. W. Beck’s Florida Disaster Recovery Team working variously as a Debris Removal Supervisor, Crew and Tower Monitor, and as an Administrator, where he managed the daily collection of records. Prior to this study, Mr. Kilpatrick has taken part in numerous waste characterization projects.
- Sandy Childs, Crew Chief – Greenpoint (multi-unit): Ms. Childs joined the firm in August of 2004 after over 15 years in the plastics recycling industry. She specializes in technical assistance for recycling programs in the areas of plastics identification, collection, processing and marketing. She also develops recycling programs for venues and events, and is an expert trainer, facilitator, technical writer and editor.

During the Summer Sort, other professional staff may join those listed above.

D. Staff Training

Wednesday, August 3, and Monday, August 8, 2005 will be devoted to staff training. The training of Crew Chiefs will be conducted by Walt Davenport, the Director of Sorting. Training for the Sample Managers will be conducted by Tom Jones, Project Manager, and Dieter Eckels, Director of Sampling.

Training will include an introduction to the Phase I Study, a discussion of health and safety policies and practices, and an explanation of sampling, sorting and weighing procedures. The first couple of samples to be sorted will be used as means of teaching material categories, proper sorting technique, and safe practices.

E. Equipment

The safety equipment for each sorter is described in Appendix F, the HASP. Other equipment being used includes:

- Sample acquisition: 96-gallon totes, a battery-operated H&V scale, brooms, shovels, rakes, and trucks with lift gates. All members of the Sampling teams will be equipped with hard hats, reflective vests, safety goggles, and gloves.
- Sample sorting: A sorting table, bins for sorted materials, a battery-operated H&V scale, hand rakes and small brooms. All members of the sorting crews will be equipped with Tyvek suits, safety goggles, and protective gloves.

F. Post-Sort Disposal and Recycling

i. Post-Sort Disposal of Refuse

DSNY has agreed to provide roll-off containers for disposing of the sorted refuse and to remove the containers when they are full.

ii. Post-Sort Recycling

DSNY has agreed to provide roll-off containers for disposing of the sorted recyclables and to remove the containers when they are full.

V. Data Recording and QA/QC

Three types of data will be developed during the Phase I Study. The first type will be the Sample Management Form. As each sample is acquired, as described in the Sampling Plan above, information on the borough of origin, route, and truck number, will be recorded on a Sample Management Form filled out by the Sample Manager. The Sample Management Form will include the following information:

- The date on which the sample was acquired;
- The name of the transfer station from which the sample was acquired;
- The name of the Sample Manager and assistant;
- The Sample Number, which is the number of the sample acquired on that day;
- The count of the toters (i.e., 1 of 3);
- The Sample Code, which shows the borough, district, section and route of the truck from which the sample was taken. For example, Manhattan 1, Sec.12, Route 3 indicates that the truck route from which this sample was taken was in Manhattan District 1, Section 1, Route 3;
- The truck number, which will be provided by DSNY when they assign a truck to the selected route;
- The weight of each toter in the sample; and
- The weight and description of any bulky waste items that are part of the sample. These will not be transported to the Sorting Site.

A copy of the Sample Management Form will be affixed to the sample when it is transported from the private transfer station to the Sorting Site. It will remain with the documentation for that sample.

The second type of data will be the material weight data recorded by the Crew Chief when the sorting of each sample is completed. This form, called the Sample Sort Form, will include the net weight of each category of waste that has been sorted and, in the case of some materials, a count of the items in the category (e.g., small appliances).

When the sample has been sorted the Crew Chief and the Field Supervisor will review the forms for completeness and accuracy and sign them. At the end of the day, the Crew Chiefs, Field Supervisor, and Project Manager will review all the forms again and note any unusual samples or circumstances that may have affected the data.

The forms will put into the project's Access database by the Data Manager and her staff on-site. The Data Manager and her staff will check the data for completeness and accuracy. Once this procedure has been completed, the Data Manager will confer with the Project Manager and if they are satisfied that the data for that day of sampling is complete, it will be provided to the DSNY Project Manager.

The third type of data will be the results of the moisture and particulate testing that will be conducted by the Woods End Laboratory ("Woods End"). Small (three pound to five pound) portions of selected materials will be double-bagged and sent by courier to Woods End for analysis. This data resulting from the analysis will be sent directly from Woods End to the Project Manager and Data Manager. The Data Manager will enter it into the database as it is received.

This procedure for recording and checking the data will be reviewed during the Phase I Study and, if R. W. Beck believes that changes will make the procedures more efficient, without compromising completeness and accuracy, or more accurate and complete, we will recommend these changes to DSNY.

Sample Management Forms

[This page intentionally left blank.]

New York Waste Characterization Study Phase I – Multi-Unit Apartment Study

Sampling Protocol

The following protocol describes the procedures for taking samples of refuse and recycling materials for the Multi-Unit Study (“MUS”).

During the Summer Sorting Period, 94 buildings have been targeted for sampling. The DSNY will arrange special collections for each of the 94 buildings which will provide one-week’s refuse and recycling from each building. We will acquire two or three refuse samples (depending on the building’s normal collection schedule) and one recycling sample from each building.

A different protocol will be used to collect samples of refuse and recycling.

MUS samples will be collected by the R. W. Beck Sampling Teams six days per week (Monday through Saturday) from 4:00 am to 4:00 pm at Harlem River Yards (“HRY”) and Varick.

The R. W. Beck Sampling Team (the “Sampling Team”) will receive the numbers of the DSNY trucks delivering Multi-Unit refuse and recycling from the BWRRR Staff on site. The protocol for receiving and distributing truck ID numbers has already been approved.

The DSNY will deliver their loads in dual-bin trucks, and, in most cases, refuse from two buildings will be delivered in a single truck (one building’s refuse in each bin). In other cases, the dual-bin truck may include refuse and recycling from a single building or, in rare cases, only refuse from a single building. The Sample Manager must get the address of the building(s) from which the refuse and/or recycling has come from the truck driver. If refuse from two buildings is delivered, the Sample Manger must find out the correct address for each compartment of refuse.

Collection of MUS Refuse Samples

Each day, the R. W. Beck Sampling Teams will be given the numbers of the DSNY trucks that are scheduled to deliver refuse samples. The DSNY trucks will deliver their loads in dual-bin trucks and, in most cases, refuse from two buildings will be in a single truck (one building’s refuse in each bin). In other cases, the dual-bin truck will include both refuse and recycling from a single building.

The DSNY driver will empty one bin on to the tipping floor of the transfer station. From the DSNY driver, the Sample Manager must get the address of the building from which the waste on the floor was collected. Once the load from the first buildings has been tipped, a front-end loader from the transfer station will pick-up a portion of the tipped load that has been designated by the Sample Manager. The Sample Manager and his/her assistant will then pull 215 pounds to 250 pounds of refuse from the FEL bucket into one or two toters. The toters should be weighed to be sure that the minimum weight (215 pounds) has been collected. The toters should then be marked

(see below) and, when all refuse samples are collected, they should be taken to North Shore MTS.

If the portion of the tipped load selected by the Sample Manager includes one or more bulky items (e.g., a sofa or chair), that item must be weighed and the weight recorded on the Sample Management form. The bulky item should be left at the transfer station and not taken to the North Shore MTS. The refuse sample should consist of at least 215 pounds of refuse – no bulky items.

Refuse Sample Labels

Each refuse sample should have the following information marked on each toter in the sample:

- Date on which the sample was collected;
- Address of the building from which the sample was taken;
- Note that the sample is refuse;
- The truck number from which the sample was taken; and
- The number of toters comprising the sample (e.g., “1 of 1” or 1 of 2”).

The labels should be accurate, complete, and legible. PLEASE PRINT.

Collection of MUS Recycling Samples

The recycling material from each building in the MUS will be delivered in the same dual-bin truck that delivers that building’s refuse for that day. However, the procedure for collecting the recycling materials will be quite different.

The Sampling Team must take all recycling material that is delivered from each building. Once the truck has tipped its load of recycling materials, any bulk items (e.g., refrigerators, stoves) must be weighed, the weight noted on the Sample Management Form, and set aside.

The remaining paper, bottles and cans should be placed in special plastic bags. Broken glass or sharp metal items may be placed in a toter. Each bag or toter should be labeled (see below), weighed and the weight noted on the Sample Management Form. The entire amount of recycling material from a building is the recycling sample.

The bags and toters of recycling samples, as well as the bulk items, should be loaded into the Ryder truck, and taken to Greenpoint MTS.

Each recycling sample should have the following information marked on each bag, toter, and bulk item in the sample:

- Date on which the sample was collected;
- Address of the building from which the sample was taken;
- Note that the sample is recycling; and
- The truck number from which the sample was taken.

The labels should be accurate, complete, and legible. PLEASE PRINT.

Truck Weights

In order to estimate the level of recycling, the net weight of all materials delivered by DSNY must be determined. Below are the three possible cases and how the estimates should be calculated. In all cases, the Sample Manager must obtain the gross weight of the truck entering the transfer station and the weight of the empty truck after it has tipped its load.

- Dual-bin truck with refuse from one building: The difference between the gross weight of the truck entering the transfer station and the weight of the empty truck will be the net weight of the refuse in the truck.
- Dual-bin truck with refuse from two buildings: The DSNY driver will tip the contents of one compartment, then go out and have the truck re-weighed with only one compartment full. The Sample Manager will take a sample from the tipped load. When the truck returns, the driver will tip the contents of the second compartment and weigh out. The Sample Manager will take a sample from the second compartment. The Sample Manager will then obtain three weights for this truck: (1) the gross weight of the full truck; (2) the weight of the truck with one compartment full; and (3) the weight of the empty truck. To calculate the net weight of the refuse in the first compartment, subtract weight (2) from weight (1). To calculate the net weight of the refuse from the second compartment, subtract weight (3) from weight (2).
- Dual-bin truck with refuse and recycling from a single building: The DSNY driver may tip either compartment. If the compartment contains refuse, the Sample Manager will take a sample. The DSNY driver will then tip the second compartment and the Sampling Team will take all recycling materials including bulky items and weigh them. The Sample Manager will then have three weights for this truck: (1) the gross weight of the full truck; (2) the total weight of the recycling materials; and (3) the weight of the empty truck. To calculate the net weight of the refuse in the first compartment, subtract the combined weights of (2) and (3) from weight (1).

An example of the Sample Management Form is attached.

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I - SUMMER SORT**

MATERIAL CATEGORIES

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P	Sampl.
Paper	1	Newspaper	Printed ground wood newsprint (Advertising "slicks"-glossy paper - if found mixed with newspaper; otherwise, ad slicks are included with mixed low grade.).					✓
	2	Plain OCC/Kraft Paper	Old unwaxed/uncoated corrugated container boxes, and Kraft paper other than paper bags					✓
	3	High Grade Paper	White and lightly colored bond, rag, or stationary grade paper. This includes white or lightly colored sulfite/sulfate bond, copy papers, notebook paper, envelopes, Continuous-feed sulfite/sulfate computer printouts and forms of all types.					✓
	4	Mixed Low Grade Paper	Includes junk mail, magazines, colored papers, bleached Kraft other than bags, boxboard, mailing tubes, carbonless copy paper, ground wood computer printouts					✓
	5	Phone Books/Paperbacks	Paperback books and telephone directories					✓
	6	Paper Bags	White, brown or other colored paper bags					✓
	7	Polycoated Paper Containers	Beverage containers made of bleached and unbleached paperboard coated with HDPE film. This includes polycoated milk and juice containers, and aseptic juice containers, including those with plastic spouts attached. Excludes juice concentrate cans, ice cream containers.					✓
	8	Compostable/Soiled Paper/Waxed OCC/Kraft	Waxed papers and cardboards; other papers that were soiled with food during use (e.g., pizza boxes & inserts); paper towels, wipes and napkins. Excludes paper plates, platters, cups, and bowls.					✓
	9	Single Use Paper Plates, Cups	Paper plates, platters, cups and bowls					✓
	10	Other Nonrecyclable Paper	Polycoated frozen food and ice cream containers/packaging (excluding cups, plates, bowls and platters; milk/juice cartons, and aseptic packaging); paper with other materials attached (e.g. orange juice cans, cigarette packs, nut cans, ajax/comet containers)					✓
Plastic	11	PET Bottles	#1 Polyethylene terephthalate translucent bottles and jars.	D/N/P	✓	✓	✓	
	12	HDPE Bottles: Natural	High-density translucent polyethylene (#2) milk, juice, beverage, oil, vinegar, distilled water bottles with necks and jars	N/P	✓	✓	✓	
	13	HDPE Bottles: Colored	High-density colored polyethylene (#2) bottles. Liquid detergent bottles, some hair care bottles with necks and jars	N/P	✓	✓	✓	
	14	#1 PET Tubs (delete: /Trays/Other Containers)	Injection molded wide mouth tubs without a neck, such as yogurt, cottage cheese, and margarine embossed with #1.					
	15	#2 HDPE Tubs (delete: /Trays/Other Containers)	Injection molded wide mouth tubs without a neck, such as yogurt, cottage cheese, and margarine embossed with #2.					
	16	#3 PVC Bottles	Plastic bottles displaying a #3	N/P	✓	✓		
	17	#4 LDPE Bottles	Plastic bottles displaying a #4	N/P	✓	✓		
	18	#5 PP Bottles	Plastic bottles displaying a #5	N/P	✓	✓		
	19	#7 Other Bottles	Plastic bottles displaying a #7 or bottles without a number	N/P	✓	✓		
	20	#3 PVC Tubs	#3 injection molded tubs and flower pots					
	21	#4 LDPE Tubs	#4 injection molded tubs and flower pots					
	22	#5 PP Tubs	#5 injection molded tubs and flower pots					
	23	#7 Other Tubs	#7 injection molded tubs and flower pots					
	24	Soda Crates & Bottle Carriers	Large durable soda crates and carriers. DOES NOT INCLUDE 6-PACK RINGS.					
	25	Other PVC	Plumbing pipe, identifiable PVC packaging other than PVC bottles/tubs					
	26	Rigid Polystyrene Containers and Packaging	#6 clear or colored trays, salad containers/trays, clamshells, cookie tray inserts, dairy tubs, CD Boxes					✓
	27	Expanded Polystyrene Containers and Packaging	Includes packaging and finished products made of expanded polystyrene. DOES NOT INCLUDE STYROFOAM PLATES, CUPS, BOWLS, TAKEOUT CLAMSHELLS, OR PLATTERS.					
	28	Other Rigid Containers/Packaging	Packaging that is not identifiable as #1-6, including containers of all types, toothpaste tubes, and plastic spools. Also: thermaformed/press molded rigid plastics with 1,2,3,4,5 or 7 IPC code, and non-injection molded flower pots.					✓

Plastic - Cont.	29	Plastic Bags: Shopping Bags	Plastic bags, including labeled grocery and merchandise film bags not heavily soiled with food.					✓	
	29.1	Plastic Bags: Dry Cleaning & Newspaper Bags	Plastic dry cleaner bags and newspaper polyethylene film bags not heavily soiled with food.					✓	
	30	Film: Other	Film packaging not defined above or below; is woven together (e.g., grain bags); 6-pack rings, contains multiple layers of film, shrink wrap, packaging film, or other materials that have been fused together (e.g., potato chip bags).					✓	
	30.1	Film: Garbage/Recycling Bags	Garbage or recycling bags					✓	
	31	Single Use Plastic Plates, Cups, Cutlery, Etc.	Plastic spoons, forks, knives, plates, cups, bowls, and platters of various resins, including styrofoam. Includes cup lids & plastic straws.					✓	
	32	Plastic Materials: Other	Items that are predominately plastic with other materials attached - pens, lighters, toys, and 3-ring binders, single use cameras. Finished plastic products made entirely of plastic such as vinyl hose disposalable cleaning or kitchen implements -- DOES NOT INCLUDE PLASTIC CRATES AND SODA BOTTLE CARRIERS.						
	32.1	Plastic Materials: Personal Hygiene	Personal hygiene items that are predominately plastic with other materials attached - razors, toilet seats, brushes, hair accessories, feminine hygiene items, toothbrushes, shower curtains/mats, soap holders, anything that comes into contact with a body part or is bathroom related.						
	32.2	Plastic Materials: Toys/Housewares	Toy and houseware items that are predominately plastic with other materials attached. Examples: racks, kitchen implements, trays, jewelry, statues, bric-a-brac, office supplies, brooms, mops -- BUT NOT DISPOSABLE CLEANING OR KITCHEN IMPLEMENTS						
Glass	33	Clear Container Glass	Manually sortable CLEAR glass that is greater than 3" x 3"; Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces.	D/N/P				✓	
	34	Green Container Glass	Manually sortable GREEN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces.	D/N/P				✓	
	35	Brown Container Glass	Manually sortable BROWN glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces.	D/N/P				✓	
	36	Mixed Cullet	Clear, green or brown glass not manually sortable (under 3" x 3"); glass shards.						
	37	Blue, Red, Yellow Container Glass	Manually sortable BLUE, RED, or YELLOW glass that is greater than 3" x 3" Classify containers as "deposit" or "potential deposit" only if intact or with neck missing; not if in pieces.	D/N/P				✓	
	38	Other Glass	Window glass, mirrors, light bulbs (except fluorescent tubes), glassware, glass ash trays, perfume and nail polish bottles, etc.						
Metal	39	Aluminum Cans	Aluminum beverage cans (UBC) and bi-metal cans made mostly of aluminum.	D/N/P				✓	✓
	40	Aluminum: Foil/Containers	Aluminum food containers, trays, pet food cans and foil.						✓
	41	Aluminum: Other	Aluminum products and scrap that are 50% or more aluminum, that do not fit in one of the other aluminum categories. DOES NOT INCLUDE ALUMINUM APPLIANCES. May include nail files and other personal hygiene related and aluminum wire hangers.						

**NEW YORK CITY DEPARTMENT OF SANITATION
WASTE COMPOSITION STUDY - PHASE I - SUMMER SORT**

		MATERIAL CATEGORIES			Deposit	Size Sort	Count	M&P	Sampl.
Grp	Mat. #	Material	Description						
Metal - Cont.	41.1	Aluminum: Toys/Housewares	Aluminum products and scrap that are 50% or more aluminum, such as pots, pans, cutlery, racks, kitchen implements, table lamps, trays, jewelry, statues, collectibles, knickknacks, bric-a-brac, office supplies. DOES NOT INCLUDE ALUMINUM APPLIANCES OR WIRE HANGERS.						
	41.2	Aluminum: Hardware	Aluminum products and scrap that are 50% or more aluminum, such as fixtures, nuts, bolts, screws, nails, knobs, hinges, tools, wall plates, plumbing, pipes, valves, bars, ingots, etc. DOES NOT INCLUDE ALUMINUM APPLIANCES.						
	42	Non-Ferrous: Other	Non-aluminum metals not derived from iron, to which a magnet will not adhere, and which are not significantly contaminated with other metals or materials. May include non-ferrous nail files and other personal hygiene related and wire hangers.						
	42.1	Non-Ferrous: Toys/Housewares	Non-aluminum metals not derived from iron, to which a magnet will not adhere, and which are not significantly contaminated with other metals or materials, such as pots, pans, cutlery, racks, kitchen implements, table lamps, trays, jewelry, statues, collectibles, knickknacks, bric-a-brac, office supplies, scissors. DOES NOT INCLUDE NON-FERROUS APPLIANCES OR WIRE HANGERS.						
	42.2	Non-Ferrous: Hardware	Non-aluminum metals not derived from iron, to which a magnet will not adhere, and which are not significantly contaminated with other metals or materials such as non-ferrous fixtures, nuts, bolts, screws, nails, knobs, hinges, tools, wall plates, plumbing, pipes, valves, bars, ingots, etc.						
	43	Tin Food Cans	Tinned steel food containers, including bi-metal cans mostly of steel.						
	44	Empty Aerosol Cans	Empty, mixed material/metal aerosol cans. (Aerosols that still contain product are sorted according to that material-for instance, solvent-based paint.)						
	45	Ferrous: Other	Ferrous and alloyed ferrous scrap metals to which a magnet adheres and which are not significantly contaminated with other metals or materials. Includes stainless steel although a magnet will not adhere. Does not include ferrous appliances but may include ferrous nail files and other personal hygiene related and wire hangers.						
	45.1	Ferrous: Toys/Housewares	Ferrous and alloyed ferrous scrap metals to which a magnet adheres and which are not significantly contaminated with other metals or materials such as pots, pans, cutlery, racks, kitchen implements, table lamps, trays, jewelry, statues, collectibles, knickknacks, bric-a-brac, office supplies, scissors. DOES NOT INCLUDE FERROUS APPLIANCES OR WIRE HANGERS.						
	45.2	Ferrous: Hardware	Ferrous and alloyed ferrous scrap metals to which a magnet adheres and which are not significantly contaminated with other metals or materials such as ferrous fixtures, nuts, bolts, screws, nails, knobs, hinges, tools, wall plates, plumbing, pipes, valves, bars, ingots, etc. DOES NOT INCLUDE FERROUS APPLIANCES OR WIRE HANGERS.						
	46	Mixed Metals: Other	Items that are predominately metal with other materials attached such as motors, insulated wire, and finished products containing a mixture of metals, or metals and other materials, that are not classified in the "appliances" section below.						
	46.1	Mixed Metals: Toys/Housewares	Items that are predominately metal with other materials attached such as motors, insulated wire, and finished products containing a mixture of metals, or metals and other materials, that are not classified in the "appliances" section below such as pots, pans, cutlery, racks, kitchen implements, table lamps, trays, jewelry, statues, collectibles, knickknacks, bric-a-brac, office supplies, scissors.						
	Metal - Cont.	46.2	Mixed Metals: Hardware	Items that are predominately metal with other materials attached such as motors, insulated wire, and finished products containing a mixture of metals, or metals and other materials, that are not classified in the "appliances" section below such as mixed metal fixtures, nuts, bolts, screws, nails, knobs, hinges, tools, wall plates, plumbing, pipes, valves, bars, ingots, etc

MATERIAL CATEGORIES

Grp	Mat. #	Material	Description	Deposit Sort	Size Sort	Count	M&P	Sampl.
Organics	47	Leaves And Grass	Non-woody plant materials from a yard or garden area, including grass clippings, leaves, weeds, and cut flowers (delete: garden wastes).					
	48	Prunings	Cut prunings, 6" or less in diameter, from bushes, shrubs, and trees.					
	49	Stumps/Limbs	Compostable prunings or stumps 6" or greater in diameter.					
	50	Food	Food wastes and scraps, including bone, rinds, etc. Excludes the weight of food containers, except when container weight is not appreciable compared to the food inside.					
	51	Wood Furniture/Pieces	Furniture or furniture pieces made of wood.					
	52	Non-C&D Untreated Wood	Untreated wood products not associated with C&D activities, popsicle sticks, chopsticks, wooden spoons, and other miscellaneous household wood products. Does not include furniture.					
	53	Non-Clothing Textiles	Non-clothing fabrics made of rag stock fabric materials including natural and synthetic textiles such as cotton, wool, silk, woven nylon, rayon, polyester. Includes handbags, linens, draperies, tablecloths, nylon rope, stuffed toys.					✓
	54	Clothing Textiles	Clothing textiles, DOES NOT INCLUDE SHOES.					✓
	55	Carpet/Carpet Padding	General category of flooring applications and non-rag stock textiles consisting of various natural or synthetic fibers bonded to some type of backing material.					
	56	Disposable Diapers and Sanitary Products	Diapers and sanitary products made from a combination of fibers, synthetic, and/or natural, and made for the purpose of single use. This includes disposable baby diapers, adult protective undergarments, and feminine hygiene products.					
	57	Animal By-Products	Animal carcasses not resulting from food storage or preparation, animal wastes, and kitty litter.					
	58	Rubber Products	Finished products and scrap materials made of natural and synthetic rubber, such as bath mats, inner tubes, rubber hoses, foam rubber, tire pieces, latex gloves. Does not include shoes and boots that are predominantly rubber.					
	59	Shoes	Shoes, sneakers or boots.					
	60	Other Leather Products	Leather jackets, belts, bags, purses, and other non-shoe leather products.					
	61	Fines	Fines smaller than 1/2 inch screen					
62	Upholstered or Other Organic-Type Furniture	Crushed upholstered furniture (if an equal mix of wood, and other organic materials not classified above.) DOES NOT INCLUDE MOSTLY WOOD FURNATURE OR ITEMS THAT WOULD BE INCLUDED UNDER "TEXTILES")						
63	Miscellaneous Organics	Wax, bar soap, cigarette butts, briquettes, and fireplace, burn barrel and fire pit ash, vacuum cleaner bags and contents.						
App. And Elec.	64	Appliances: Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would stick.					
	65	Appliances: Non-Ferrous	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are more than 50% metal to which a magnet would NOT stick.					
	66	Appliances: Plastic	Small electric appliances such as toasters, microwave ovens, power tools, curling irons, and light fixtures that are less than 50% metal.					
	67	Audio/Visual Equip.: Cell Phones	Cell phones. Count all cell phones.				✓	
	68	Audio/Visual Equip.: Other	Telephones, Stereos, radios, tape decks, VCRs, etc.

App. And Elec. - Cont.	69	Computer Monitors	Items other than televisions containing a cathode ray tube (CRT) such as computer monitors.					
	70	Televisions	Television sets containing a cathode ray tube (CRT).					
	71	Other Computer Equipment	Computer items not containing CRTs such as processors, mice and mouse pads, keyboards, disk drives, calculators, laptops etc.					
C & D Debris	73	Untreated Dimension Lumber, Pallets, Crates	Untreated, milled lumber commonly used in construction for framing and related uses. Pallets and wooden crates.					
	74	Treated/Contaminated Wood	Lumber and wood products that have been painted or treated so as to render them difficult to compost (with generally 50% or more of the surface area treated). This includes painted and chemically treated lumber, plywood, strandboard, and particleboard.					
	75	Gypsum Scrap	Calcium sulfate dehydrate sandwiched between heavy layers of Kraft-type paper. Also known as drywall.					
	76	Rock/Concrete/Bricks	Rock gravel larger than 2" diameter, Portland cement mixtures (set or unset), and fired-clay bricks.					
	77	Other Construction Debris	Construction debris (other than wood) that cannot be classified elsewhere, and mixed fine building material scraps. For example, floor sweepings from construction activities containing sawdust, nails, wire, etc. Also: asphaltic roofing and fiberglass insulation.					
Misc.	78	Miscellaneous Inorganics	Wax, sponges and other inorganic materials not classified elsewhere.					
	79	Ceramics	Whole or fragmented ceramic or porcelain products larger than 1/2 inch screen					
HHW	80	Oil Filters	Metal oil filters used in cars and other automobiles.					
	81	Antifreeze	Self Explanatory					
	82	Wet-Cell Batteries	Wet-cell batteries of various sizes and types as commonly used in automobiles.					
	83	Gasoline/Kerosene/Motor Oil/Diesel Fuel	Gasoline, diesel fuel, and fuel oils. Lubricating oils, primarily used in vehicles but including other types with similar characteristics.					
	84	Latex Paints/Water-Based Adhesives/Glues	Water-based paints and similar products.					
	85	Oil-Based Paints/Solvent-Based Adhesives/Glues	Solvent-based paints, varnishes, glues and similar products. Various solvents, including chlorinated and flammable solvents, paint strippers, solvents contaminated with other products such as paints, degreasers and some other cleaners if the primary ingredient.					
	86	Pesticides/Herbicides/Rodenticides	Variety of poisons with the purpose of discouraging or killing insects, weeds, vermin, or microorganisms. Fungicides and wood preservatives, such as pentachlorophenol, are also included.					
	87	Dry-Cell Batteries	Dry-cell batteries of various sizes and types as commonly used in households. Includes cell phone and button cell batteries.					
	88	Fluorescent Tubes	Fluorescent light tubes and compact fluorescent bulbs (CFL).					
	89	Mercury-Laden Wastes	Thermostats, thermometers, and other items containing mercury.					
	90	Compressed Gas Cylinders, Fire Extinguishers	Self Explanatory					
	91	Home Medical Products	Syringes, IV bags, medical tubing, and other home medical products and supplies.					
92	Other Potentially Harmful Wastes	Explosives, Smoke detectors, Asbestos, Caustic acids and bases whose primary purpose is to clean surfaces, unclog drains, or perform other actions; photography chemicals, chemistry sets. Household disinfectants. Pool chemicals.

Health and Safety Plan

[This page intentionally left blank.]

R.W. BECK, Inc.
Health and Safety Plan for Waste Composition Field Sorting

Date: April 29, 2004

Introduction

Corporate Safety Policy

R.W. Beck, Inc. believes that the health and safety of its employees is of paramount importance. The issue of health and safety is particularly important in conducting solid waste composition field sorting. The terms “waste sort,” “waste composition study,” “waste characterization study,” and the like may be used interchangeably, and all relate to any project that requires the manual handling of municipal solid waste (“MSW”) and subsequent sorting and weighing MSW to determine the percentage of different components in the MSW stream.

To address this issue, the following Health and Safety Plan (“HASP”) has been developed to provide guidelines to Project Managers, Field Supervisors, Crew Chiefs, and other field workers (“Field Personnel”) involved in R.W. Beck’s waste characterization studies. This Plan has also been prepared for distribution to third parties, such as R. W. Beck’s clients who are commissioning the waste composition study, solid waste management facility managers who may be hosting a waste composition study, and subconsultants retained by the firm to assist with the performance of any of the on-site activities of a waste composition study.

Objectives of the Plan

R.W. Beck’s HASP for Waste Characterization Field Sorting has the following four objectives:

- To align R. W. Beck’s health and safety efforts with policies and procedures that are already in place at the solid waste management facilities that host waste composition studies,
- To describe the roles and responsibilities of professional staff regarding health and safety,
- To describe the personal and site safety equipment that must be provided at all waste sorting sites,
- To provide field personnel with a description of the safety procedures to be followed in waste sorting,
- To describe the training and monitoring that R. W. Beck field personnel, subconsultants, and temporary workers must undergo before engaging in waste sorting activities.

Host Facility Health and Safety Coordination

Facilities at which R.W. Beck will sort waste may be owned and operated by third parties that have their own health and safety plans and procedures. It is important that, as guests at the facility, R.W. Beck's workers understand and adhere to the facility's health and safety plan. Adherence to the facility plan may include:

- Confining our waste sorting activities to the areas designated by the facility's owner/operator
- Wearing safety equipment required by the facility's owner/operator, and
- Understanding emergency plans and procedures.

It is important that the Field Supervisor or Project Manager work closely with the facility's owner/operator to integrate operations, including training staff regarding health and safety planning. Specific hold harmless or indemnification requirements by the Host Facility should be reviewed in accordance with the firm's Authorization Policy.

Staff Roles and Responsibilities

Every waste characterization study is unique in some way. Differences in the scope of work, size of the project, and sorting sites, for example, will require different configurations of staffing. However, for the purposes of this Health and Safety Plan, the responsibilities of four types of professionals are described here: (1) Safety Manager, (2) Project Manager, (3) Field Supervisor, and (4) Crew Chief. Some of these roles may overlap in practice. Their roles and responsibilities in the safety effort are described below.

Safety Manager

The Safety Manager is an R. W. Beck employee who is responsible for overseeing the health and safety policies and practices for all waste characterization projects across the firm. This responsibility includes seeing that the HASP is up-to-date, that an appropriate level of safety training for professional staff and temporary workers is maintained, that the most appropriate safety equipment is available to sorting crews, and that issues relating to the health and safety on waste characterization projects have been addressed. The Safety Manager is also responsible for communicating significant HASP changes or updates, newly acquired waste composition-related projects, and any health or safety-related events that occur while performing a waste composition study to R. W. Beck's Risk Management Department so that the firm can comprehensively and accurately monitor the success of the Plan.

Project Manager

The Project Manager of a waste characterization study has overall responsibility for the safety and health of all members of his Project Team. Although he/she will delegate some

of these responsibilities to the Field Supervisor and Crew Chief(s), the Project Manager remains the primary responsible party. The Project Manager must be an R. W. Beck employee.

The Project Manager is responsible for developing a project budget, schedule, and scope of work that provides the time and funds for conducting a safe waste sort. Proper safety equipment (see the Safety Equipment Section) must be obtained and issued to workers, and the training of the professional staff and temporary workers must take place before any actual sorting begins. This training is discussed in more detail below. The Project Manager must instill in his/her Project Team an attitude of prudence and care in carrying out the sort.

The Project Manager is also responsible for coordinating with host facility management regarding risk management issues such as waivers, indemnification, and/or adding the host facility as an additional insured to Beck's insurance policy(s), if required.

The Project Manager is not required to participate in any phases of the on-site waste sorting. However, when less experienced Field Supervisors or Crew Chiefs may be involved, the Project Manager should use professional judgment in deciding whether to observe and/or participate on the initial day of field sorting to assure that health and safety practices are being followed, and to communicate to the client, host facility manager, or other parties in the event of any problems. The Project Manager is also responsible for performing periodic observations, as appropriate, to assure that HASP standards are met.

Field Supervisor

The Field Supervisor is generally the most experienced and knowledgeable member of the field sorting team. The Field Supervisor will be the primary contact with the sorting site owner/operator, coordinating sorting activities with other site activities, and supporting any incidents that may occur.

The Field Supervisor has overall responsibility for the sorting site, including the designation of the area where the sorting will take place. In addition to securing the sorting site (i.e. identifying and marking the boundaries of the sorting site), the Field Supervisor should ensure that the sort workers are protected from other equipment and activities on the site. Typically, the Field Supervisor will oversee the selection, delivery, and queuing of samples. The Field Supervisor has the authority to reject any samples and/or immediately terminate any staff who have not following appropriate health and safety practices.

Crew Chief

The Crew Chief is the individual most directly responsible for the health and safety of the individuals sorting waste. The Crew Chief does not have to be an R. W. Beck employee.

He/She should take a leading role in pre-sort training, be sure that sorting workers have proper personal protective equipment, and that safe sorting procedures are followed throughout the project. As the supervisor working most closely with sorters, the Crew Chief must be alert to unsafe practices (e.g. shoving a hand into the middle of a pile of waste) and warn workers about these practices when they occur. The Crew Chief may be the first person to see an accident and must take appropriate action immediately. The Crew Chief has the authority to immediately terminate sort employees not following appropriate health and safety practices.

Sorter

Sort laborers for waste composition studies may be acquired from multiple organizations, including temporary staffing companies, subconsultants, college or high school internship programs, prison labor programs, professional solid waste trade association membership, and volunteers from numerous other sources (including the client organization and from within R. W. Beck during waste sort training). Regardless of the labor source, sorters are responsible for observing the training provided at the outset of a sort, adhering to the proper health and safety practices throughout the sort, wearing the appropriate personal protective equipment while engaged in sorting, and following the directions provided by the Crew Chief and Field Supervisor at all times. Any sorter not following directions may be terminated immediately without cause.

All MSW site employees, regardless of their level of authority, have the responsibility to report unsafe conditions immediately to their supervisor or to the clients on-site representative.

Safety Equipment

Personal Protection Equipment (“PPE”)

The selection of Personal Protective Equipment is based upon a thorough analysis of anticipated and actual hazards on the MSW site.

PPE is broken down into two classes: (1) PPE that must be worn at all times during any sorting of MSW, and (2) PPE that may be required in addition to the required PPE, depending on local host facility requirements and/or work conditions.

The following safety equipment may be provided for each member of the sorting crew (both professional staff and temporary workers), depending on the host facility requirements and comfort.

- Protective coveralls
- Protective eyewear
- Ear plugs
- Dust mask

- Hard hat
- Reflective vest
- Puncture-resistant gloves, and
- Back-support belts
- Would traffic vests be appropriate in some cases?

We require all workers to wear a sturdy work boot, although we do not supply these. A more detailed description of the personal safety equipment is presented in Appendix A. At a minimum, the following equipment must be worn at all times by all members of the sorting crew.

- Protective coveralls
- Protective eyewear
- Puncture-resistant gloves
- Boots

Other PPE may be required depending on the policy of the facility operator or the judgment of the Crew Chief and/or Field Supervisor.

Site Safety Equipment

In addition to the personal safety equipment provided to each worker, each sorting site will have the following equipment,

- A Industrial First Aid Kit
- An Eye-Wash kit or five eye wash bottles per crew person
- Moist towelettes
- Traffic cones
- Yellow caution tape
- A fire extinguisher
- A cell phone or facility-maintained two-way radio
- Insect Repellent
- Ice chest with drinks
- Tent, if appropriate
- Heaters, if necessary
- Emergency notification information

A more detailed description of the site safety equipment is provided in Appendix B.

Field Sorting Safety Procedures

Site Layout

Waste sorting may take place at a variety of venues – landfills, transfer stations, or other facilities. Before any sorting takes place, an R.W. Beck supervisor must inspect the site for the following::

1. Sorting activities will be well away from other activities, such as equipment and vehicle operations, that might endanger or impede waste sorting work.
2. There is adequate room to carry out the sorting activities, including the receiving and queuing samples and the disposal and recycling of sorted waste. This includes safety precautions in the refuse trucks being used.
3. If the site is outside and extreme weather may be encountered, provisions should be made for a tent or other temporary shelter to be erected.
4. Arrangements for toilet facilities and a “break” area have been made, and;
5. Access to the site by a vehicle moving the sorting equipment and crew on and off the site is available. Or: Transportation of equipment and sort personnel to and from the site is available.

Once a suitable site has been located, the Project Manager or the Field Supervisor will schedule the sort at a time agreed to by the Client and the site owner/operator. When the schedule has been determined, arrangements will be made to deliver sorting and safety equipment to the site.

If the Sorting Site is close to operational activities at the facility, it should be marked with traffic cones or high visibility warning tape so that it is clear to all Field Personnel, subconsultants, temporary workers, and facility workers exactly what area is designated for the sorting activities. It must be made clear that all areas which are not designated for sorting activities are strictly off-limits. See Appendix C for a typical sorting site layout.

MSW Facility Safety Procedures

If the sorting site is located at a facility that disposes, transfers, or otherwise processes MSW, R.W. Beck’s Project Manager or Field Supervisor should meet with the Site Owner/Operator to coordinate the safety procedures at the site with R.W. Beck’s safety procedures. For example, the site may require the wearing of reflective vests and this must become a requirement for the sorting crew on this project. This meeting must take place before any sorting commences.

The Site Manager should outline the facility's health and safety plan and explain the facility's emergency procedures. The location of the nearest hospital, emergency services, and poison control offices should be obtained from the Site Owner/Operator.

R.W. Beck's Supervisor should provide the Site Owner/Operator with a copy of our Health and Safety Plan, explain our safety procedures, and provide documentation of safety training for the Field Personnel, subconsultants, and temporary workers on the waste sort. During this exchange of information, any potential conflicts in approach or procedures should be resolved and both parties should be clear regarding safety and health issues.

The Project Manager should be prepared to sign an indemnification form, and possibly to add the host landfill as an additional insured on R. W. Beck's general liability policy.

Communications

It is important that supervisory staff be able to communicate with each other at all times. If one of the professional staff must leave the site for some reason, he/she should make it clear where they are going, when they will return, and what steps should be taken in case of an emergency. If, for example, the Crew Chief must leave the site, the Field Supervisor should take over the Crew Chief's duties at the sorting table. Either the Field Supervisor or Crew Chief, or both, should have a working cell phone or a facility-managed two-way radio (a standard item in the Site Safety Equipment) in case of an emergency.

Site Control

The integrity of the sorting site must be maintained at all times. Where appropriate, the area boundaries should be marked. Workers should understand that they must remain within the sort site and that other are on the site are prohibited. Both the Field Supervisor and the Crew Chief are responsible to see that sorting activities and workers stay within the sorting area.

There should be no smoking, eating, or drinking during sorting activities. Food and non-alcoholic liquids must be consumed away from the sorting area. Drinks should be taken in single-use disposable cups or from the original single serve containers. Personal hygiene practices such a hand washing and removal of contaminated coveralls should be conducted prior to eating, drinking or smoking.

Ergonomics

Waste sorts often involve moving and lifting containers of waste that may weigh 100 lbs or more. To prevent back strain and pulled muscles, staff must be trained in proper lifting techniques as part of the pre-sort training. When heavy containers must be moved or

lifted, the Crew Chief should assign an appropriate number of workers and material handling equipment to the job.

Environmental Conditions

Extreme Heat

The risk of heat stress can be significant in summer sorts where the temperature and humidity are high. In these conditions, Crew Chiefs should monitor workers for signs of fatigue and listlessness. Breaks in the work schedule, plenty of fluids, and clothing which allows sweat to evaporate can all help to alleviate the dangers of heat stress.

Extreme Cold

Winter sorts may take place at sites with very low temperatures and high winds. Protection from the cold should include proper clothing, walls on the tent to lessen the effects of wind, and electric or gas heaters (properly ventilated). Crew Chiefs should be alert for indications of cold-effects, such as shivering and fatigue.

Fatigue

Most projects have tight schedules and the uncertainties associated with the delivery of solid waste to a landfill or transfer station can interrupt this schedule. As a result, there is usually pressure to work as long and as quickly as possible. This, in turn, can lead to carelessness and worker fatigue. Regular breaks in sorting should be built into the schedule to provide for rest and recuperation. Typically these breaks include 15 minute breaks in the morning and afternoon and a 30-60 lunch break. If sorting goes beyond 8 hours, additional breaks should be scheduled. The judgment of the Crew Chief is critical. Workers showing signs of fatigue should be given an opportunity to rest, especially if they are becoming careless or tired.

Injury Prevention

Three of the most common sources of potential injury in waste sorting are:

- Careless handling of waste
- Lifting heavy objects, including containers of materials
- Walking into areas where heavy equipment is operating

Risks associated with handling mixed solid waste can include contact with hazardous materials, sharps, and other potentially dangerous objects. Controls against injury associated with those risks are:

- (1) Wear proper safety equipment at all times and
- (2) Know what you are picking up. Never reach into the middle of a pile of waste to pull out material. Always select only material or objects you can see. Hand rakes can be used

to spread out a pile of waste; hands or arms should never be used. Using the puncture-resistant gloves provided to the crew, sorters can more safely remove needles, broken glass, and sharpened metal from a pile of waste, if the sorter sees what he/she is removing and handles it with care.

Unidentifiable Liquids, Powders, or Medical Waste

Unidentifiable liquids or powders should be treated as hazardous. If there is any question about any material or object, the sorter should immediately stop sorting and notify the Crew Chief. If, at any time, the Crew Chief believes that the sample being sorted includes institutional medical waste or a significant amount of hazardous materials, the crew should stop sorting. The Crew Chief and Field Supervisor should confer and determine if that sample should be discarded without further sorting. The sorting of institutional medical waste and commercial hazardous waste is not performed by R. W. Beck, and the responsibility for handling this material shall be solely with the host facility in the event such material is encountered. It is the responsibility of the Field Supervisor to alert the host facility management.

Lifting Controls

The Crew Chief direct lifting activities at all times. Specifically, the Crew Chief should be sure workers asked to move or lift heavy containers of waste have help available from other members of the crew. Items that cannot be lifted safely by multiple sort laborers shall not be manually weighed and shall be removed by other means. If back injuries or muscle pulls do occur, the Crew Chief should have the worker rest and decide if the injury is severe enough to warrant medical attention.

Both the Field Supervisor and the Crew Chief must see that the sorting area is clearly marked and that the sorting crew understands where the boundaries are. Moving through the area outside the sorting area should be done only with the permission and guidance of the Crew Chief.

Bloodborne Pathogens

Injuries involving cuts and puncture wounds can potentially offer an entry-point for bloodborne pathogens, such as those carrying Hepatitis and HIV. Every cut and puncture wound should be treated and the following steps should be taken by the Crew Chief or Field Supervisor:

- Using sterile gloves, immediately clean the wound with antiseptic and wrap in gauze;
- Place the needle or object causing the wound in a plastic bag;
- If, in the judgment of the Crew Chief and Field Supervisor, the wound caused by a hypodermic needle or a metal object, poses a health or safety risk to the worker, the worker will be taken to the nearest hospital or clinic for evaluation and treatment;

- Notify the Site owner/operator, the Employment Agency (if the patient is a temporary worker), and the Project Manager, who in turn should alert the Safety Manager; and the R.W. Beck Risk Manager.
- Document the incident on an accident report form and submit the completed form to the Safety Manager.

Similar steps should be taken if the worker has been exposed to potentially hazardous material and shows abnormal or unusual symptoms.

Accident Reporting & Investigation

As a part of the Site Training of the crew, the Field Supervisor should educate workers so they are familiar with the Emergency Contact Information Sheet (see Appendix D) and that it is clearly posted in the sorting area.

All accidents must be reported in writing by the Crew Chief or Field Supervisor, using the Accident Report Form shown in Appendix E. A copy of the completed form should be provided to the Site Owner/Operator, the Employment Agency (if the patient is a temporary worker), the Project Manager, who in turn notifies the Safety Manager.

It is the responsibility of the Safety Manager to maintain a file of completed accident report forms and to see that the “lessons learned” for accidents are incorporated into the HASP. Root cause analysis should be the goal of all accident/incident investigations.

Health and Safety Training

All members of a crew responsible for sorting waste must undergo, at a minimum, the training outlined below.

Professional Staff Training

R.W. Beck’s professional staff should, at a minimum, have 8 hours of pre-sort training and serve a 2-day apprenticeship before taking on the role of Crew Chief. The pre-sort training must include review and understanding of the HASP and viewing R.W. Beck’s safety videos. Training related to other aspects of the sort, such as material identification can also be done during this 8-hour period. Professional staff should have a current tetanus booster.

A Crew Chief should work for at least one full week before being considered for the position of Field Supervisor.

Sorter Training

Before any waste sorting takes place, the Crew Chief and/or Field Supervisor must review relevant sections of the R.W. Beck HASP with temporary workers, be sure that all

safety procedures are clear, and that all questions from the sorters have been answered. A Sorter Training Acknowledgment Form is presented in Appendix E.

Next, a “test sort” should be run at a very slow pace to be certain that all safety equipment is being worn properly and that sorters understand the safe and proper way to sort samples of waste.

At the beginning of each day of the sort, the Crew Chief should take a few minutes to check that all safety equipment is being worn and is in good shape. The Crew Chief should also remind the crew about safe sorting and go over the lessons learned from any accidents, or near accidents that have occurred.

Appendix A: Personal Protection Equipment

Personal Protection Equipment (“PPE”) will be supplied to all workers sorting waste to protect them from the various hazards that might be encountered in carrying out their work. Some of the PPE is mandatory and must be worn at all times by all workers. Other PPE may be worn depending on the weather, site conditions, policy of the sorting site, and judgment of the Crew Chief and Field Supervisor.

The mandatory PPE include:

- Protective coveralls – Tyvek or cotton coveralls must be worn at all times to protect worker’s clothing from accidental spills, offer an added layer of warmth in cold weather conditions, and provide added visibility to worker’s on the site.
- Puncture-resistant gloves – Rubber, plastic, or leather gloves must be worn while sorting waste. They are designed to protect sorters from accidental cuts or punctures from needles, broken glass, and sharpened metal. A latex or cotton inner glove will also be provided.
 - Our preferred gloves are MAPA Stanzoil Heavy-Duty Neoprene Gloves
 - Also, recommended are Wells Lamont Puncture- and cut-resistant gloves and Wells Lamont Drivers gloves.
- Protective Eyewear – to provide splash/spatter protection for the sorters
 - Our preferred eyewear protection is the Uvex Astro 3001 for “over the glasses” style for sorters who need to wear their own glasses and Crews Klondike for others.
- Sturdy work boots in good repair

PPE which may be worn, at the discretion of the Crew Chief or Field Supervisor include:

- Back-support belts

- Dust Masks – a dust mask should provide protection from dust and MSW particulates.
 - Our preferred dust mask is the 3M 3-panel disposable Respirator
 - Also recommended are the AOSafety “Pleats Plus” and the Wilson Saf-T-FIT N95 Respirators.
- Ear plugs
- Hard hat
- Reflective vest
- Steel-toed boots

All pieces of equipment listed above will be available to all crew members at any time.

Appendix B: Site Safety Equipment

Site Safety Equipment (“SSE”) will be available at all times on the sorting site to protect workers from hazards and provide emergency first aid. The standard SSE includes:

- A Industrial First Aid Kit – an OSHA-rated 25-person first aid kit or better
- An Eye-Wash kit or five eye wash bottles per crew.
- Moist towelettes
- Traffic cones – four cones to help demarcate the sorting area
- Yellow caution tape – to mark the sorting area.
- A fire extinguisher – a multi-purpose extinguisher that can be used on ordinary combustibles, flammable liquids, and electrically energized fires.
- A cell phone or facility-managed two-way radio
- Insect Repellent
- Ice chest with drinks

If site conditions and weather warrant, a tent will be provided to protect against sun, rain, and wind. Side flaps may also be installed if the weather is cold and/or windy. For very cold conditions, a gas or electric heater may be used. If a gas heater is used, adequate ventilation must be arranged.

Appendix E: Sorter Training Acknowledgment Form

A critical element of training personnel to sort refuse is health and safety training. Before any work can begin, all sorting personnel are trained in safe procedures for handling and sorting waste. This training includes the following topics.

- Purpose of the waste sort
- Site layout – Landfill hazards
- Introduction to professional staff roles and responsibilities
- Sorters responsibilities
 - Punctuality
 - Rest
 - No drugs or alcohol
 - No smoking
 - Prescribed medications

- Sort Safety Procedures
 - Waste handling
 - Use of Personal Protective Equipment
 - Site Safety Equipment
 - Designated work and break areas
- Ergonomics
 - Safe lifting to avoid back stress
- Environmental Conditions
 - Heat Stress
 - Cold
 - Fatigue
- Injury Prevention
- Hazardous Wastes
- Bloodborne Pathogens
- Emergency Procedures
- Accident Reporting
- Training Sort

Acknowledgement

I acknowledge that the professional staff from R.W. Beck has discussed and explained the topics listed above, addressed any question I have about these topics, and conducted a training sort to demonstrate the safe handling and sorting of waste.

**NYC Waste Characterization Study
Final Report, Volume 4**

Appendix D: Health and Safety Plan

R.W. BECK, Inc.
Health and Safety Plan for Waste Composition Field Sorting

Date: April 29, 2004

Introduction

Corporate Safety Policy

R.W. Beck, Inc. believes that the health and safety of its employees is of paramount importance. The issue of health and safety is particularly important in conducting solid waste composition field sorting. The terms “waste sort,” “waste composition study,” “waste characterization study,” and the like may be used interchangeably, and all relate to any project that requires the manual handling of municipal solid waste (“MSW”) and subsequent sorting and weighing MSW to determine the percentage of different components in the MSW stream.

To address this issue, the following Health and Safety Plan (“HASP”) has been developed to provide guidelines to Project Managers, Field Supervisors, Crew Chiefs, and other field workers (“Field Personnel”) involved in R.W. Beck’s waste characterization studies. This Plan has also been prepared for distribution to third parties, such as R.W. Beck’s clients who are commissioning the waste composition study, solid waste management facility managers who may be hosting a waste composition study, and subconsultants retained by the firm to assist with the performance of any of the on-site activities of a waste composition study.

Objectives of the Plan

R.W. Beck’s HASP for Waste Characterization Field Sorting has the following four objectives:

- To align R.W. Beck’s health and safety efforts with policies and procedures that are already in place at the solid waste management facilities that host waste composition studies,
- To describe the roles and responsibilities of professional staff regarding health and safety,
- To describe the personal and site safety equipment that must be provided at all waste sorting sites,
- To provide field personnel with a description of the safety procedures to be followed in waste sorting,
- To describe the training and monitoring that R.W. Beck field personnel, subconsultants, and temporary workers must undergo before engaging in waste sorting activities.

Host Facility Health and Safety Coordination

Facilities at which R.W. Beck will sort waste may be owned and operated by third parties that have their own health and safety plans and procedures. It is important that, as guests at the facility, R.W. Beck's workers understand and adhere to the facility's health and safety plan. Adherence to the facility plan may include:

- Confining our waste sorting activities to the areas designated by the facility's owner/operator
- Wearing safety equipment required by the facility's owner/operator, and
- Understanding emergency plans and procedures.

It is important that the Field Supervisor or Project Manager work closely with the facility's owner/operator to integrate operations, including training staff regarding health and safety planning. Specific hold harmless or indemnification requirements by the Host Facility should be reviewed in accordance with the firm's Authorization Policy.

Staff Roles and Responsibilities

Every waste characterization study is unique in some way. Differences in the scope of work, size of the project, and sorting sites, for example, will require different configurations of staffing. However, for the purposes of this Health and Safety Plan, the responsibilities of four types of professionals are described here: (1) Safety Manager, (2) Project Manager, (3) Field Supervisor, and (4) Crew Chief. Some of these roles may overlap in practice. Their roles and responsibilities in the safety effort are described below.

Safety Manager

The Safety Manager is an R. W. Beck employee who is responsible for overseeing the health and safety policies and practices for all waste characterization projects across the firm. This responsibility includes seeing that the HASP is up-to-date, that an appropriate level of safety training for professional staff and temporary workers is maintained, that the most appropriate safety equipment is available to sorting crews, and that issues relating to the health and safety on waste characterization projects have been addressed. The Safety Manager is also responsible for communicating significant HASP changes or updates, newly acquired waste composition-related projects, and any health or safety-related events that occur while performing a waste composition study to R. W. Beck's Risk Management Department so that the firm can comprehensively and accurately monitor the success of the Plan.

Project Manager

The Project Manager of a waste characterization study has overall responsibility for the safety and health of all members of his Project Team. Although he/she will delegate some

of these responsibilities to the Field Supervisor and Crew Chief(s), the Project Manager remains the primary responsible party. The Project Manager must be an R. W. Beck employee.

The Project Manager is responsible for developing a project budget, schedule, and scope of work that provides the time and funds for conducting a safe waste sort. Proper safety equipment (see the Safety Equipment Section) must be obtained and issued to workers, and the training of the professional staff and temporary workers must take place before any actual sorting begins. This training is discussed in more detail below. The Project Manager must instill in his/her Project Team an attitude of prudence and care in carrying out the sort.

The Project Manager is also responsible for coordinating with host facility management regarding risk management issues such as waivers, indemnification, and/or adding the host facility as an additional insured to Beck's insurance policy(s), if required.

The Project Manager is not required to participate in any phases of the on-site waste sorting. However, when less experienced Field Supervisors or Crew Chiefs may be involved, the Project Manager should use professional judgment in deciding whether to observe and/or participate on the initial day of field sorting to assure that health and safety practices are being followed, and to communicate to the client, host facility manager, or other parties in the event of any problems. The Project Manager is also responsible for performing periodic observations, as appropriate, to assure that HASP standards are met.

Field Supervisor

The Field Supervisor is generally the most experienced and knowledgeable member of the field sorting team. The Field Supervisor will be the primary contact with the sorting site owner/operator, coordinating sorting activities with other site activities, and supporting any incidents that may occur.

The Field Supervisor has overall responsibility for the sorting site, including the designation of the area where the sorting will take place. In addition to securing the sorting site (i.e. identifying and marking the boundaries of the sorting site), the Field Supervisor should ensure that the sort workers are protected from other equipment and activities on the site. Typically, the Field Supervisor will oversee the selection, delivery, and queuing of samples. The Field Supervisor has the authority to reject any samples and/or immediately terminate any staff who have not following appropriate health and safety practices.

Crew Chief

The Crew Chief is the individual most directly responsible for the health and safety of the individuals sorting waste. The Crew Chief does not have to be an R. W. Beck employee.

He/She should take a leading role in pre-sort training, be sure that sorting workers have proper personal protective equipment, and that safe sorting procedures are followed throughout the project. As the supervisor working most closely with sorters, the Crew Chief must be alert to unsafe practices (e.g. shoving a hand into the middle of a pile of waste) and warn workers about these practices when they occur. The Crew Chief may be the first person to see an accident and must take appropriate action immediately. The Crew Chief has the authority to immediately terminate sort employees not following appropriate health and safety practices.

Sorter

Sort laborers for waste composition studies may be acquired from multiple organizations, including temporary staffing companies, subconsultants, college or high school internship programs, prison labor programs, professional solid waste trade association membership, and volunteers from numerous other sources (including the client organization and from within R. W. Beck during waste sort training). Regardless of the labor source, sorters are responsible for observing the training provided at the outset of a sort, adhering to the proper health and safety practices throughout the sort, wearing the appropriate personal protective equipment while engaged in sorting, and following the directions provided by the Crew Chief and Field Supervisor at all times. Any sorter not following directions may be terminated immediately without cause.

All MSW site employees, regardless of their level of authority, have the responsibility to report unsafe conditions immediately to their supervisor or to the clients on-site representative.

Safety Equipment

Personal Protection Equipment (“PPE”)

The selection of Personal Protective Equipment is based upon a thorough analysis of anticipated and actual hazards on the MSW site.

PPE is broken down into two classes: (1) PPE that must be worn at all times during any sorting of MSW, and (2) PPE that may be required in addition to the required PPE, depending on local host facility requirements and/or work conditions.

The following safety equipment may be provided for each member of the sorting crew (both professional staff and temporary workers), depending on the host facility requirements and comfort.

- Protective coveralls
- Protective eyewear
- Ear plugs
- Dust mask

- Hard hat
- Reflective vest
- Puncture-resistant gloves, and
- Back-support belts
- Would traffic vests be appropriate in some cases?

We require all workers to wear a sturdy work boot, although we do not supply these. A more detailed description of the personal safety equipment is presented in Appendix A. At a minimum, the following equipment must be worn at all times by all members of the sorting crew.

- Protective coveralls
- Protective eyewear
- Puncture-resistant gloves
- Boots

Other PPE may be required depending on the policy of the facility operator or the judgment of the Crew Chief and/or Field Supervisor.

Site Safety Equipment

In addition to the personal safety equipment provided to each worker, each sorting site will have the following equipment,

- A Industrial First Aid Kit
- An Eye-Wash kit or five eye wash bottles per crew person
- Moist towelettes
- Traffic cones
- Yellow caution tape
- A fire extinguisher
- A cell phone or facility-maintained two-way radio
- Insect Repellent
- Ice chest with drinks
- Tent, if appropriate
- Heaters, if necessary
- Emergency notification information

A more detailed description of the site safety equipment is provided in Appendix B.

Field Sorting Safety Procedures

Site Layout

Waste sorting may take place at a variety of venues – landfills, transfer stations, or other facilities. Before any sorting takes place, an R.W. Beck supervisor must inspect the site for the following::

1. Sorting activities will be well away from other activities, such as equipment and vehicle operations, that might endanger or impede waste sorting work.
2. There is adequate room to carry out the sorting activities, including the receiving and queuing samples and the disposal and recycling of sorted waste. This includes safety precautions in the refuse trucks being used.
3. If the site is outside and extreme weather may be encountered, provisions should be made for a tent or other temporary shelter to be erected.
4. Arrangements for toilet facilities and a “break” area have been made, and;
5. Access to the site by a vehicle moving the sorting equipment and crew on and off the site is available. Or: Transportation of equipment and sort personnel to and from the site is available.

Once a suitable site has been located, the Project Manager or the Field Supervisor will schedule the sort at a time agreed to by the Client and the site owner/operator. When the schedule has been determined, arrangements will be made to deliver sorting and safety equipment to the site.

If the Sorting Site is close to operational activities at the facility, it should be marked with traffic cones or high visibility warning tape so that it is clear to all Field Personnel, subconsultants, temporary workers, and facility workers exactly what area is designated for the sorting activities. It must be made clear that all areas which are not designated for sorting activities are strictly off-limits. See Appendix C for a typical sorting site layout.

MSW Facility Safety Procedures

If the sorting site is located at a facility that disposes, transfers, or otherwise processes MSW, R.W. Beck’s Project Manager or Field Supervisor should meet with the Site Owner/Operator to coordinate the safety procedures at the site with R.W. Beck’s safety procedures. For example, the site may require the wearing of reflective vests and this must become a requirement for the sorting crew on this project. This meeting must take place before any sorting commences.

The Site Manager should outline the facility's health and safety plan and explain the facility's emergency procedures. The location of the nearest hospital, emergency services, and poison control offices should be obtained from the Site Owner/Operator.

R.W. Beck's Supervisor should provide the Site Owner/Operator with a copy of our Health and Safety Plan, explain our safety procedures, and provide documentation of safety training for the Field Personnel, subconsultants, and temporary workers on the waste sort. During this exchange of information, any potential conflicts in approach or procedures should be resolved and both parties should be clear regarding safety and health issues.

The Project Manager should be prepared to sign an indemnification form, and possibly to add the host landfill as an additional insured on R. W. Beck's general liability policy.

Communications

It is important that supervisory staff be able to communicate with each other at all times. If one of the professional staff must leave the site for some reason, he/she should make it clear where they are going, when they will return, and what steps should be taken in case of an emergency. If, for example, the Crew Chief must leave the site, the Field Supervisor should take over the Crew Chief's duties at the sorting table. Either the Field Supervisor or Crew Chief, or both, should have a working cell phone or a facility-managed two-way radio (a standard item in the Site Safety Equipment) in case of an emergency.

Site Control

The integrity of the sorting site must be maintained at all times. Where appropriate, the area boundaries should be marked. Workers should understand that they must remain within the sort site and that other are on the site are prohibited. Both the Field Supervisor and the Crew Chief are responsible to see that sorting activities and workers stay within the sorting area.

There should be no smoking, eating, or drinking during sorting activities. Food and non-alcoholic liquids must be consumed away from the sorting area. Drinks should be taken in single-use disposable cups or from the original single serve containers. Personal hygiene practices such a hand washing and removal of contaminated coveralls should be conducted prior to eating, drinking or smoking.

Ergonomics

Waste sorts often involve moving and lifting containers of waste that may weigh 100 lbs or more. To prevent back strain and pulled muscles, staff must be trained in proper lifting techniques as part of the pre-sort training. When heavy containers must be moved or

lifted, the Crew Chief should assign an appropriate number of workers and material handling equipment to the job.

Environmental Conditions

Extreme Heat

The risk of heat stress can be significant in summer sorts where the temperature and humidity are high. In these conditions, Crew Chiefs should monitor workers for signs of fatigue and listlessness. Breaks in the work schedule, plenty of fluids, and clothing which allows sweat to evaporate can all help to alleviate the dangers of heat stress.

Extreme Cold

Winter sorts may take place at sites with very low temperatures and high winds. Protection from the cold should include proper clothing, walls on the tent to lessen the effects of wind, and electric or gas heaters (properly ventilated). Crew Chiefs should be alert for indications of cold-effects, such as shivering and fatigue.

Fatigue

Most projects have tight schedules and the uncertainties associated with the delivery of solid waste to a landfill or transfer station can interrupt this schedule. As a result, there is usually pressure to work as long and as quickly as possible. This, in turn, can lead to carelessness and worker fatigue. Regular breaks in sorting should be built into the schedule to provide for rest and recuperation. Typically these breaks include 15 minute breaks in the morning and afternoon and a 30-60 lunch break. If sorting goes beyond 8 hours, additional breaks should be scheduled. The judgment of the Crew Chief is critical. Workers showing signs of fatigue should be given an opportunity to rest, especially if they are becoming careless or tired.

Injury Prevention

Three of the most common sources of potential injury in waste sorting are:

- Careless handling of waste
- Lifting heavy objects, including containers of materials
- Walking into areas where heavy equipment is operating

Risks associated with handling mixed solid waste can include contact with hazardous materials, sharps, and other potentially dangerous objects. Controls against injury associated with those risks are:

- (1) Wear proper safety equipment at all times and
- (2) Know what you are picking up. Never reach into the middle of a pile of waste to pull out material. Always select only material or objects you can see. Hand rakes can be used

to spread out a pile of waste; hands or arms should never be used. Using the puncture-resistant gloves provided to the crew, sorters can more safely remove needles, broken glass, and sharpened metal from a pile of waste, if the sorter sees what he/she is removing and handles it with care.

Unidentifiable Liquids, Powders, or Medical Waste

Unidentifiable liquids or powders should be treated as hazardous. If there is any question about any material or object, the sorter should immediately stop sorting and notify the Crew Chief. If, at any time, the Crew Chief believes that the sample being sorted includes institutional medical waste or a significant amount of hazardous materials, the crew should stop sorting. The Crew Chief and Field Supervisor should confer and determine if that sample should be discarded without further sorting. The sorting of institutional medical waste and commercial hazardous waste is not performed by R. W. Beck, and the responsibility for handling this material shall be solely with the host facility in the event such material is encountered. It is the responsibility of the Field Supervisor to alert the host facility management.

Lifting Controls

The Crew Chief direct lifting activities at all times. Specifically, the Crew Chief should be sure workers asked to move or lift heavy containers of waste have help available from other members of the crew. Items that cannot be lifted safely by multiple sort laborers shall not be manually weighed and shall be removed by other means. If back injuries or muscle pulls do occur, the Crew Chief should have the worker rest and decide if the injury is severe enough to warrant medical attention.

Both the Field Supervisor and the Crew Chief must see that the sorting area is clearly marked and that the sorting crew understands where the boundaries are. Moving through the area outside the sorting area should be done only with the permission and guidance of the Crew Chief.

Bloodborne Pathogens

Injuries involving cuts and puncture wounds can potentially offer an entry-point for bloodborne pathogens, such as those carrying Hepatitis and HIV. Every cut and puncture wound should be treated and the following steps should be taken by the Crew Chief or Field Supervisor:

- Using sterile gloves, immediately clean the wound with antiseptic and wrap in gauze;
- Place the needle or object causing the wound in a plastic bag;
- If, in the judgment of the Crew Chief and Field Supervisor, the wound caused by a hypodermic needle or a metal object, poses a health or safety risk to the worker, the worker will be taken to the nearest hospital or clinic for evaluation and treatment;

- Notify the Site owner/operator, the Employment Agency (if the patient is a temporary worker), and the Project Manager, who in turn should alert the Safety Manager; and the R.W. Beck Risk Manager.
- Document the incident on an accident report form and submit the completed form to the Safety Manager.

Similar steps should be taken if the worker has been exposed to potentially hazardous material and shows abnormal or unusual symptoms.

Accident Reporting & Investigation

As a part of the Site Training of the crew, the Field Supervisor should educate workers so they are familiar with the Emergency Contact Information Sheet (see Appendix D) and that it is clearly posted in the sorting area.

All accidents must be reported in writing by the Crew Chief or Field Supervisor, using the Accident Report Form shown in Appendix E. A copy of the completed form should be provided to the Site Owner/Operator, the Employment Agency (if the patient is a temporary worker), the Project Manager, who in turn notifies the Safety Manager.

It is the responsibility of the Safety Manager to maintain a file of completed accident report forms and to see that the “lessons learned” for accidents are incorporated into the HASP. Root cause analysis should be the goal of all accident/incident investigations.

Health and Safety Training

All members of a crew responsible for sorting waste must undergo, at a minimum, the training outlined below.

Professional Staff Training

R.W. Beck’s professional staff should, at a minimum, have 8 hours of pre-sort training and serve a 2-day apprenticeship before taking on the role of Crew Chief. The pre-sort training must include review and understanding of the HASP and viewing R.W. Beck’s safety videos. Training related to other aspects of the sort, such as material identification can also be done during this 8-hour period. Professional staff should have a current tetanus booster.

A Crew Chief should work for at least one full week before being considered for the position of Field Supervisor.

Sorter Training

Before any waste sorting takes place, the Crew Chief and/or Field Supervisor must review relevant sections of the R.W. Beck HASP with temporary workers, be sure that all

safety procedures are clear, and that all questions from the sorters have been answered. A Sorter Training Acknowledgment Form is presented in Appendix E.

Next, a “test sort” should be run at a very slow pace to be certain that all safety equipment is being worn properly and that sorters understand the safe and proper way to sort samples of waste.

At the beginning of each day of the sort, the Crew Chief should take a few minutes to check that all safety equipment is being worn and is in good shape. The Crew Chief should also remind the crew about safe sorting and go over the lessons learned from any accidents, or near accidents that have occurred.

Appendix A: Personal Protection Equipment

Personal Protection Equipment (“PPE”) will be supplied to all workers sorting waste to protect them from the various hazards that might be encountered in carrying out their work. Some of the PPE is mandatory and must be worn at all times by all workers. Other PPE may be worn depending on the weather, site conditions, policy of the sorting site, and judgment of the Crew Chief and Field Supervisor.

The mandatory PPE include:

- Protective coveralls – Tyvek or cotton coveralls must be worn at all times to protect worker’s clothing from accidental spills, offer an added layer of warmth in cold weather conditions, and provide added visibility to worker’s on the site.
- Puncture-resistant gloves – Rubber, plastic, or leather gloves must be worn while sorting waste. They are designed to protect sorters from accidental cuts or punctures from needles, broken glass, and sharpened metal. A latex or cotton inner glove will also be provided.
 - Our preferred gloves are MAPA Stanzoil Heavy-Duty Neoprene Gloves
 - Also, recommended are Wells Lamont Puncture- and cut-resistant gloves and Wells Lamont Drivers gloves.
- Protective Eyewear – to provide splash/spatter protection for the sorters
 - Our preferred eyewear protection is the Uvex Astro 3001 for “over the glasses” style for sorters who need to wear their own glasses and Crews Klondike for others.
- Sturdy work boots in good repair

PPE which may be worn, at the discretion of the Crew Chief or Field Supervisor include:

- Back-support belts

- Dust Masks – a dust mask should provide protection from dust and MSW particulates.
 - Our preferred dust mask is the 3M 3-panel disposable Respirator
 - Also recommended are the AOSafety “Pleats Plus” and the Wilson Saf-T-FIT N95 Respirators.
- Ear plugs
- Hard hat
- Reflective vest
- Steel-toed boots

All pieces of equipment listed above will be available to all crew members at any time.

Appendix B: Site Safety Equipment

Site Safety Equipment (“SSE”) will be available at all times on the sorting site to protect workers from hazards and provide emergency first aid. The standard SSE includes:

- A Industrial First Aid Kit – an OSHA-rated 25-person first aid kit or better
- An Eye-Wash kit or five eye wash bottles per crew.
- Moist towelettes
- Traffic cones – four cones to help demarcate the sorting area
- Yellow caution tape – to mark the sorting area.
- A fire extinguisher – a multi-purpose extinguisher that can be used on ordinary combustibles, flammable liquids, and electrically energized fires.
- A cell phone or facility-managed two-way radio
- Insect Repellent
- Ice chest with drinks

If site conditions and weather warrant, a tent will be provided to protect against sun, rain, and wind. Side flaps may also be installed if the weather is cold and/or windy. For very cold conditions, a gas or electric heater may be used. If a gas heater is used, adequate ventilation must be arranged.

Appendix E: Sorter Training Acknowledgment Form

A critical element of training personnel to sort refuse is health and safety training. Before any work can begin, all sorting personnel are trained in safe procedures for handling and sorting waste. This training includes the following topics.

- Purpose of the waste sort
- Site layout – Landfill hazards
- Introduction to professional staff roles and responsibilities
- Sorters responsibilities
 - Punctuality
 - Rest
 - No drugs or alcohol
 - No smoking
 - Prescribed medications

- Sort Safety Procedures
 - Waste handling
 - Use of Personal Protective Equipment
 - Site Safety Equipment
 - Designated work and break areas
- Ergonomics
 - Safe lifting to avoid back stress
- Environmental Conditions
 - Heat Stress
 - Cold
 - Fatigue
- Injury Prevention
- Hazardous Wastes
- Bloodborne Pathogens
- Emergency Procedures
- Accident Reporting
- Training Sort

Acknowledgement

I acknowledge that the professional staff from R.W. Beck has discussed and explained the topics listed above, addressed any question I have about these topics, and conducted a training sort to demonstrate the safe handling and sorting of waste.

Final Report, Volume 4**

Appendix F: Photographs

Note to readers:

Appendix F contains photographs of the sampling and sorting activities of each season of the WCS, as well as photographs documenting each instance of suspected illegal use of street baskets.

Due to the extremely large file size, only a few extracted pages of this Appendix are posted here on the web. The full Appendix F - Photographs will be available on CD at the same time as the WCS raw dataset is made available on CD. Both data products (Appendix F and the raw dataset) will be available for non-commercial use only; will require an application for a license, subject to review and approval by DSNY; and will entail a processing fee. Check back at www.nyc.gov/nycwasteless for full details on the posting of these products later this year.

Appendix F2: Fall Street Basket Photographs

Introduction

This appendix presents information obtained during the sorting of street basket waste during the fall sorting period of the New York Waste Characterization Study. The protocol for sorting street basket waste called for the Crew Chief of the sorting team to identify bags of suspected illegal residential and commercial waste within each street basket sample and this is the focus of this appendix.

The appendix is organized by borough and route and based on information provided by Crew Chief on the Sample Detail Form for each sample of street basket waste that was sorted.

For each street basket waste sample, the borough, collection route, and date of sorting is noted, as well as the number of bags of illegal residential and commercial waste found in the sample.

Typically, bags containing postmarked mail, food waste, construction debris, household products, or yard waste were classified as illegal residential waste. Bags containing office paper, large numbers of a single product, or office equipment were classified as illegal commercial waste. In all cases, the classification was based on the judgment of the Crew Chief at the time of sorting.

Photographs of many of the bags of illegal waste were taken and are included below. In some cases, the Crew Chief noted the specific material(s) which led to the classification of the bags as illegal commercial or residential waste and these materials are included in the captions of the photographs.

Bronx Street Basket Waste

Route BX-4-1-2

Route BX-4-1-2 collected on October 19, 2004 contained 7 bags of illegal residential waste and no bags of illegal commercial waste. No photos are available for examples of illegal residential and illegal commercial waste from this route.

Route BX-4-2 (multiple sections and routes)

Route BX-4-2 collected on October 22, 2004 contained 5 bags of illegal residential waste and no bags of illegal commercial waste. No photos are available for examples of illegal residential and illegal commercial waste from this route.

Route BX-7-7_1-1

Route BX-7-7_1-1 collected on October 28, 2004 contained 5 bags of illegal residential waste and no bags of illegal commercial waste. The photos below are examples of suspected illegal waste from this route.

Residential

Figure 1 from BX-7-7_1-1 on 10/28/04 classified as illegal residential waste.

Figure 2 from BX-7-7_1-1 on 10/28/04 classified as illegal residential waste.

Figure 3 from BX-7-7_1-1 on 10/28/04 classified as illegal residential waste because of curtains.

Figure 4 from BX-7-7_1-1 on 10/28/04 classified as illegal residential waste.

Figure 5 from BX-7-7_1-1 on 10/28/04 classified as illegal residential waste.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

Subtotals by Recycling Designation

Recycling Designation	Citywide Refuse Weekly Tonnages	Citywide Paper Weekly Tonnages	Citywide MGP Weekly Tonnages	Citywide Waste Weekly Tonnages	Citywide Waste Weekly Tonnage without Bulk Items, for 1989 Comparison
Designated Paper	7,895.76	7,198.10	108.29	15,202.15	13,449.04
Designated MGP	4,165.42	36.31	3,656.42	7,858.15	6,785.42
Designated Recycling	12,061.18	7,234.41	3,764.71	23,060.30	20,234.45

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

Subtotals by Recycling Designation

Recycling Designation	Citywide Refuse Weekly Tonnage	Citywide Paper Weekly Tonnage	Citywide MGP Weekly Tonnage	Citywide Waste Weekly Tonnage	Citywide Waste Weekly Tonnage without Bulk Items, for 1989 Comparison
Designated Paper	8,333.39	6,185.44	106.20	14,625.03	12,960.09
Designated MGP	4,962.30	26.59	3,757.28	8,746.16	7,094.75
Designated Recycling	13,295.68	6,212.03	3,863.48	23,371.19	20,054.84

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

Total	153.50	174.00	327.50				1.67%	7.17%	2.14%

(1) (Weight of the material category that is considered bulk) / (total weight of the material category)

(2) "% of Material that is Bulk" refers to how much of a particular material category in the refuse, MGP or waste stream consists of bulk items. For example, in refuse 37.51% of all Non-Clothing Textiles is bulk Non-Clothing Textiles. Totals for these percentages are not meaningful as they refer to the subset of material categories in which bulk items were found. They are therefore not shown here.

(3) (Weight of the material category that is considered bulk) / (total weight of all material in the stream)

**Table I-27
Residential Bulk Item Summary, Bronx, PWCS**

Material Category	Total Bulk Weight (lbs)			% of Material Category that is Bulk ^{(1) (2)}			% of Stream that is Bulk ⁽³⁾

(2) "% of Material that is Bulk" refers to how much of a particular material category in the refuse, MGP or waste stream consists of bulk items. For example, in refuse 13.34% of all Other Plastics Materials is bulk Other Plastics Materials. Totals for these percentages are not meaningful as they refer to the subset of material categories in which bulk items were found. They are therefore not shown here.

(3) (Weight of the material category that is considered bulk) / (total weight of all material in the stream)

**Table I-33

Appendix K: Capture Rate Data

[This page intentionally left blank.]

Table K-1
Capture Rate, Weekly Tonnages and Percentages, Citywide, Fall 2004 ⁽¹⁾

Average Weekly Tonnage Collected

Refuse	53,943.84
Paper	7,514.09
MGP	4,567.83
Total Waste	66,025.76

Estimated Weekly Tonnage of Materials Designated for Recycling in Total Waste Stream

Designated Paper	23.02%	of waste	15,202.15
Designated MGP	11.90%	of waste	7,858.15
Total	34.93%		23,060.30

Capture Rates

Paper	49.43%
MGP	58.13%
Total	52.39%

NOTES

1. Section-level data on refuse and recycling provided by the Department of Sanitation's Operation Management Division for September, October and November 2004.

Table K-2
Capture Rate, Weekly Tonnages and Percentages, High Density/High Income Strata, Fall 2004 ⁽¹⁾

Average Weekly Tonnage Collected

Refuse	5,832.85
Paper	1,697.71
MGP	622.44
Total Waste	8,153.01

Estimated Weekly Tonnage of Materials Designated for Recycling in Total Waste Stream

Designated Paper	39.72%	of waste	3,238.39
Designated MGP	11.83%	of waste	964.44
Total	51.55%		4,202.83

Capture Rates

Paper	52.42%
MGP	64.54%
Total	55.20%

NOTES

1. Section-level data on refuse and recycling provided by the Department of Sanitation's Operation Management Division for September, October and November 2004.

Table K-3
Capture Rate, Weekly Tonnages and Percentages, High Density/Medium Income Strata, Fall 2004 ⁽¹⁾

Average Weekly Tonnage Collected

Refuse	3,866.34
Paper	476.10
MGP	290.93
Total Waste	4,633.37

Estimated Weekly Tonnage of Materials Designated for Recycling in Total Waste Stream

Designated Paper	23.77%	of waste	1,101.15
Designated MGP	11.02%	of waste	510.49
Total	34.78%		1,611.64

Capture Rates

Paper	43.24%
MGP	56.99%
Total	47.59%

NOTES

1. Section-level data on refuse and recycling provided by the Department of Sanitation's Operation Management Division for September, October and November 2004.

Table K-4
Capture Rate, Weekly Tonnages and Percentages, High Density/Low Income Strata, Fall 2004 ⁽¹⁾

Average Weekly Tonnage Collected

Refuse	10,036.73
Paper	483.95
MGP	591.45
Total Waste	11,112.13

Estimated Weekly Tonnage of Materials Designated for Recycling in Total Waste Stream

Designated Paper	17.16%	of waste	1,906.95
Designated MGP	13.27%	of waste	1,474.75
Total	30.43%		3,381.70

Capture Rates

Paper	25.38%
MGP	40.10%
Total	31.80%

NOTES

1. Section-level data on refuse and recycling provided by the Department of Sanitation's Operation Management Division for September, October and November 2004.

Table K-5
Capture Rate, Weekly Tonnages and Percentages, Medium Density/High Income Strata, Fall 2004 ⁽¹⁾

Average Weekly Tonnage Collected

Refuse	2,117.45
Paper	680.96
MGP	258.91
Total Waste	3,057.33

Estimated Weekly Tonnage of Materials Designated for Recycling in Total Waste Stream

Designated Paper	32.67%	of waste	998.75
Designated MGP	12.41%	of waste	379.39
Total	45.08%		1,378.14

Capture Rates

Paper	68.18%
MGP	68.24%
Total	68.20%

NOTES

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through November 2004 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from January 2005 through March 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from April 2005 through June 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from July 2005 through September 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

Units from a Single Truck**

Volume 4, Appendix M

Statistical Validity of Multiple Sampling Units from a Single Truck

During the NYC WCS, it was necessary, in some instances, to acquire multiple sampling units from a single truck. The statistical validity of taking multiple sampling units of waste from a single truck rests on the definition of a sampling unit for refuse and recycling used in planning the PWCS and WCS. For these studies, a sampling unit of refuse was defined as 200 to 250 pounds of refuse and a sampling unit for recycling was defined as 100 to 150 pounds of MGP or Paper (Volume 1, Section 2.1.2). Each season's sampling units were randomly selected from a list of DSNY collection routes.

The Residential Study examined the City's waste in eight housing density/income strata. In order to achieve the required level of statistical precision for the WCS, the number of sampling units targeted for acquisition was established. For each stratum during each season, a target was established for the number of sampling units: 50 for Refuse, 10 for Paper, and 40 for MGP.

For each stratum, a list of routes that collected only from that stratum (called "pure routes") was compiled (Volume 2, Section 2.1.3.2). These pure routes were used to randomly select the sampling units that were to be sorted during each season. The number of times that each pure route was collected during the sorting period was provided by DSNY. Each day during the sorting period that collection on a pure route took place was called a "Route Occurrence". The DSNY collects refuse two or three times a week and collects recycling once a week. Therefore, there might be six or nine refuse Route Occurrences for each pure route during a three-week sampling period but only three recycling Route Occurrences for each pure route during the same period.

The number of pure routes available for each stratum during each season varied and, in some cases, the number of pure routes available was limited (Volume 1, Table 1-6). For example, there were three (3) MGP collection routes for the Medium Density/High Income stratum during the fall sorting period. This means that during the three-week fall sorting period, the Medium Density/High Income stratum had nine Route Occurrences.

With only nine MGP Route Occurrences for the Medium Density/High Income stratum and 40 MGP sampling units to be acquired, it was inevitable that a random selection of sampling units would select a Route Occurrence more than once, meaning that more than one sampling unit would have to be acquired from the same Route Occurrence. However, given the definition of a sampling unit, it is clear that each Route Occurrence held multiple sampling units. A typical Route Occurrence (full refuse truck with a seven-ton capacity) would hold about 56 sampling units of 250 pounds each ($7 \times 2000 = 14,000/250 \text{ lbs} = 56$). The goal of the PWCS/WCS sampling plan was to give each sampling unit of waste an equal opportunity to be selected and sorted. Given the definition of a sampling unit, taking more than one sampling unit from a truck was statistically valid.

Appendix N: Bulk Metal in the MGP Stream

Volume 4, Appendix N Bulk Metal in the MGP Stream

MGP Sample Acquisition

The protocol for the acquisition of Metal, Glass, and Plastic (“MGP”) was modified during the PWCS to more accurately reflect the amount of bulk metal items present in the MGP stream. This appendix discusses the sampling methodology initially used during the MGP sort, the modified sample acquisition approach, and the reasoning behind the change in sampling methodology.

Development of Initial MGP Sampling Protocol

On May 7, 2004, a field visit was made to the Hugo Neu processing facility located in Long Island City. The purpose of the site visit was to observe the MGP collected by DSNY collection vehicles and determine the best approach to acquiring 100 pound to 125 pound samples from the collected MGP loads.

Based on the on-site review, it was determined that a front-end loader (“FEL”) equipped with a ½-cubic yard bucket with a grab-arm would be suitable for taking a sample from the tipped MGP loads. The random selection of a portion of the tipped load in which to “grab” the sample would be made by the Sample Manager prior to the dumping of the load. The FEL operator would then grab a bucket-load from that section of the load. The bucket would be lowered so that the Sample Manager could pull material from the bucket into a 96-gallon toter.

After each toter had been weighed, it would be marked with the date, sample number, a sample code, and the truck number. Once the MGP sample’s weight had been confirmed, the remainder of the tipped load would be managed as it normally would in the course of facility operations. In addition, the Sample Manager would complete a Sample Management Form for each sample. An example of a Sample Management Form is shown in Volume 2, Section 4 of the Report.

After all the MGP samples were weighed and labeled, they would be loaded on a rental truck and transported to the Greenpoint Marine Transfer Station (“MTS”) where they would be unloaded and positioned for sorting.

This methodology has been successfully used by R. W. Beck Project Team staff in prior studies for other local and state government and private sector clients for the purposes of sampling commingled recycling containers. Based on the review of the MGP loads on the day of the site visit, it was believed that this methodology would also prove suitable for MGP sampling at the Hugo Neu processing facility.

Modification of MGP Sampling Protocol

Sampling of the MGP at the Hugo Neu facility began on Monday, June 7, 2004 and was completed on Saturday, June 12, 2004. Sampling was initiated using the protocol developed in conjunction with the May site visit.

MGP sampling proceeded as planned over the initial three days of the MGP sort. During these three days, a number of over-sized metal bulky items were observed in the MGP loads delivered

to the Hugo Neu facility by the DSNY collection vehicles. However, relatively few of the items were located in the random section of the loads selected for sampling. In cases where an item was too large to fit inside the 96-gallon toter, (e.g., a bed frame or metal cabinet), the item was weighed separately on-site, the weight recorded on the MGP Sampling Form, and the item returned to the tipped load for normal processing.

As the MGP sort progressed, the number and size of metal bulk items present in the incoming loads of MGP called into question the sampling protocol. Many of these items were too large to handle using the FEL. Due to the physical dimensions of many of these bulk metal items (including durable products such as ranges, water heaters, air conditioner units, bed frames, refrigerators, bicycles, etc.), the Sampling Team was concerned that such items were not being appropriately sampled from the MGP stream. In many instances, bulk items in the area from which the MGP sample was taken did not get captured by the FEL due to their large dimension. On one occasion, for example, the area from which the MGP sample was to be taken consisted of a twisted pile of metal bed frames and bicycles which the loader was unable to grab. The sampling protocol used during the early part of the week required that a bulk item be included in a sample if the bulk item was scooped up by the FEL. If the bulk item either remained in the bucket of the loader or fell out of the bucket as it pulled away from the load from which the MGP sample was being taken, it was not included in the sample.

To ensure that over-size bulk materials were appropriately included in the sampling process, it was decided to make two modifications to the MGP sampling protocol. First, due to the significant size of many of these large bulky metal items, the FEL was replaced with a much larger front end loader, with a 5 cubic-yard bucket. Second, a procedural change was made in the MGP sampling protocol to allow the Sample Manager to include any bulk items in the sample, if the Sample Manager believed the items would have been selected for sampling except for the fact that the item's dimensions precluded it from being grabbed by the FEL for sampling.

As before, bulk items included in the sample were weighed by the Sample Manager and the weight recorded directly on the Sample Management Form. The bulk items were then discarded at the facility for processing, and were not transported to the MTS for further sorting. After pre-weighing the bulky item(s) and subtracting the weight of the bulk item(s) from the 100 to 125 pound target sample size, the Sample Manager sampled from the remainder of the grab sample until the total weight fell within the targeted range. By pre-weighing the bulk items during the sample acquisition process, the remaining quantity of material requiring physical sorting at the MTS was reduced for some samples. The Project Team believes this methodology most accurately captures representative samples that include both bulk and non-bulk items in the MGP stream.

These methodological changes were implemented beginning on the morning of Thursday, June 10, 2004. As a consequence, the results of the MGP sampling reflected in the PWCS Report probably under-estimated the amount of bulk metal items in the MGP samples taken during the week-long study period, primarily as a result of potentially under-reporting bulk metal items early in the week. However, for purposes of remaining conservative (i.e., under-reporting metal content), the full-week results have been reported. The revised methodology was used during the WCS for MGP sampling.

A listing of the bulky metal items separated from the MGP loads, along with the weight of each item, the date the item was sampled, the borough of origin, a description of each item, and the material category into which the items was recorded is provided in Table N-1.

Results of Methodological Changes

As a result of the methodological change in MGP Sampling, the Project Team expected to obtain greater percentages of metals, from both appliances and other bulk items that had been inappropriately excluded by the original sampling protocol. A comparison of the material groups for the first and second half of the MGP sort, as shown in Table N-2, confirm this.

**Table N-2
Comparison of Material Group Results for First Half and
Second Half of MGP Sort**

Material	First Half			Second Half		
	Average	Lower Boundary	Upper Boundary	Average	Lower Boundary	Upper Boundary
Paper	5.10%	4.35%	5.91%	4.30%	3.50%	5.19%
Plastic	21.90%	20.04%	23.81%	19.79%	18.02%	21.61%
Glass	39.93%	35.46%	44.48%	27.86%	24.24%	31.63%
Metal	25.47%	22.67%	28.27%	38.63%	34.21%	43.05%

Misc.	1.22%	0.75%	1.80%	0.43%	0.27%	0.64%
HHW	0.08%	0.04%	0.12%	0.16%	0.09%	0.26%
Total	100.00%			100.00%		

Total may not add due to rounding

The results shown in Table N-2 show that Appliances & Electrical Material rose from two percent to six percent, and Metal Material rose from 25 percent to 39 percent. Glass Material was the primary group that was significantly reduced as a consequence of changing the bulk metal sampling protocol, falling from 40 percent to 28 percent.

The results for individual materials show that within the Appliance & Electrical Group, Small Appliances changed from 0.88 percent to 4.56 percent. Within the Metal Group, Other Ferrous increased from 14.08 percent to 29.01 percent. In the Glass Group, Mixed Cullet decreased from 27 percent to 16 percent.

Given the nature of the protocol modifications, these are precisely the material categories and groups which would be expected to reflect significant changes. Table N-3 contains results for material sub-categories of the three groups highlighted in Table N-2.

**Table N-3

Conclusions

The results of the PWCS indicated that the original protocol for acquiring MGP samples was inappropriate in terms of accounting for bulk items. The FEL was too small to handle the oversized items found in the recyclables stream. However, overall protocol and QA/QC procedures highlighted this issue relatively early in the sampling period. DSNY and the Project Team took quick and appropriate actions to modify the sampling protocol to accurately reflect the character of the MGP stream.

The statistical analysis of the samples obtained both before and after the change in MGP sampling protocol supports the conclusions regarding the potential under-reporting of bulk metal items. The use of larger FELs in conjunction with an improved protocol with respect to oversized items helped to ensure that such items were appropriately included in the results of the WCS.

The statistical analysis contained in the PWCS results may reflect an under-reporting of the metals contained in the MGP stream, since the results are based on the entire week's sampling. But given the nature of a preliminary study and the *a priori* skepticism that would meet relatively high metal percentages in the MGP stream, we believe it is better to err on the side of under-reporting metals.
