

NYC Waste Characterization Study
Final Report, Volume 1
PWCS and WCS Results

**VOLUME 1 – PWCS AND WCS RESULTS
TABLE OF CONTENTS**

GLOSSARY	GL-1
1.1 INTRODUCTION	1
1.2 BASIS FOR SAMPLING	3
1.2.1 PWCS.....	3
1.2.2 WCS Residential Study.....	3
1.2.3 WCS Street Basket Study.....	3
1.3 NEW YORK CITY DEMOGRAPHICS	4
1.3.1 Maps of Study Area.....	5
1.4 IDENTIFYING “PURE” COLLECTION ROUTES	24
1.5 DETERMINING THE NUMBER OF SAMPLES	26
1.6 RESIDENTIAL WASTE SORTING	28
1.6.1 Overview of Material Sort Categories.....	28
1.7 WASTE GENERATION	30
1.8 SUMMARY RESULTS	35
1.8.1 Citywide Results at a Glance, PWCS and Annual WCS Results.....	35
1.8.2 Housing Density and Income Details.....	42
1.8.3 Diversion Rates and Capture Rates.....	58
2.1 INTRODUCTION	1
2.2 CITYWIDE RESULTS ACROSS SEASONS	1
2.3 HOUSING DENSITY AND INCOME DETAILS	29
2.4 DETAILS ON DRINK CONTAINERS	90
3.1 INTRODUCTION	1
3.2 ADJUSTMENTS TO 2004/2005 FROM 1989/1990 MATERIAL CATEGORIES	2
3.3 SEASONAL COMPARISONS 2004/2005 TO 1989/1990	7
3.4 DETAILS ON RESULTS WITHOUT BULK	18
4.1 INTRODUCTION	1
4.2 BOROUGHWISE RESULTS AT A GLANCE, PWCS	1
4.3 BOROUGHWISE RESULTS AT A GLANCE, WCS SEASONAL	17
4.4 BOROUGHWISE RESULTS AT A GLANCE, WCS ANNUAL	78
4.5 DETAILS ON DRINK CONTAINERS BY BOROUGH	94
4.6 HISTORICAL COMPARISONS BY BOROUGH	104
5.1 INTRODUCTION	1
5.2 DEDICATED STREET BASKET ROUTES	1
5.3 STREET BASKET WASTE COMPOSITION	1
5.4 STREET BASKET ILLEGAL USE	5
5.5 STREET BASKET CONTAINER SORTS	8
6.1 INTRODUCTION	1
6.2 BULK ITEMS	1
6.3 DURABLE ITEMS	40

VOLUME 1 – PWCS AND WCS RESULTS
TABLE OF CONTENTS
(continued)

7.1	INTRODUCTION	1
7.2	MOISTURE AND PARTICULATE TESTING AND RESULTS	3
7.3	COMPARISON OF MOISTURE AND PARTICULATE TESTING – WCS AND THE 1989/1990 STUDY	6
8.1	INTRODUCTION	1
8.2	STATISTICAL RESULTS BY MATERIAL	1
8.3	ANALYSIS OF VARIABILITY – PWCS AND WCS	87
9	COMPARISON WITH OTHER JURISDICTIONS	1
9.1	INTRODUCTION	1
9.2	COMPARISON OF OTHER JURISDICTIONS: A SUMMARY	2
9.3	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF LOS ANGELES	10
9.3.1	Introduction.....	10
9.3.2	Adjustments to the Studies and Study Results.....	14
9.3.3	Most Prevalent Materials	20
9.4	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF PHILADELPHIA, PENNSYLVANIA	22
9.4.1	Introduction.....	22
9.4.2	Adjustments to the Studies and Study Results.....	24
9.4.3	Most Prevalent Materials	30
9.5	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF PHOENIX	32
9.5.1	Introduction.....	32
9.5.2	Adjustments to the Studies and Study Results.....	34
9.5.3	Most Prevalent Materials	41
9.6	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF SAN DIEGO	43
9.6.1	Introduction.....	43
9.6.2	Adjustments to the Studies and Study Results.....	46
9.6.3	Most Prevalent Materials	52
9.7	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF SAN FRANCISCO	54
9.7.1	Introduction.....	54
9.7.2	Adjustments to the Studies and Study Results.....	56
9.7.3	Most Prevalent Materials	62
9.8	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE CITY OF SEATTLE	64
9.8.1	Introduction.....	64
9.8.2	Adjustments to the Studies and Study Results.....	67
9.8.3	Most Prevalent Materials	77

VOLUME 1 – PWCS AND WCS RESULTS
TABLE OF CONTENTS
(continued)

9.9	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR ALAMEDA COUNTY, CALIFORNIA	80
9.9.1	Introduction.....	80
9.9.2	Adjustments to the Studies and Study Results.....	83
9.9.3	Most Prevalent Materials	89
9.10	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE STATE OF PENNSYLVANIA	91
9.10.1	Introduction.....	91
9.10.2	Adjustments to the Studies and Study Results.....	93
9.10.3	Most Prevalent Materials	99
9.11	CHARACTERIZATION OF MUNICIPAL SOLID WASTE FOR THE STATE OF GEORGIA	101
9.11.1	Introduction.....	101
9.11.2	Adjustments to the Studies and Study Results.....	103
9.11.3	Most Prevalent Materials	110

TABLES

Glossary of Abbreviations and Definitions

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
1989/1990 WCS	The waste characterization study conducted by the New York City Department of Sanitation in 1989 and 1990.
Absolute Variability	The variability from sampling unit to sampling unit, which is measured by the Standard Deviation.
Borough	The five political/geographic areas of New York City: Manhattan, Brooklyn, Bronx, Queens, and Staten Island.
Bulk Item	As defined for the NYC WCS, any item of waste that will not fit into a 96-gallon container.
BWPRR	Bureau of Waste Prevention, Reuse and Recycling
C&D	An abbreviation of construction and demolition debris, a material group in the NYC WCS.
Capture Rate	The amount of materials set out for residential recycling collection as a percentage of designated recyclable materials in both recycling and refuse streams. This ratio measures how much of the targeted materials are actually being recycled, which is a measure of how successfully such materials are recycled.
Census Tracts	Census tracts are small, relatively permanent statistical subdivisions of a county. New York City includes 2,217 census tracts containing on average about 4,000 inhabitants.
City	New York City
Confidence Interval	A range within which the true Mean of the population is believed to lie with the given confidence level.
Confidence Level	The certainty with which the true Mean lies within the interval determined. For the NYC WCS, a 90 percent confidence level is used. A 90 percent confidence level is the industry standard for Waste Characterization Studies. Note that the use of a 90 percent level instead of a 95 percent level (the standard for scientific research) does not (a) affect the calculation of means, only the width of intervals around the means or (b) preclude the application of a 95 percent confidence level to results if such an analysis is of interest.
Contamination Rate	The percentage of material that is found in the containers set out for residential recycling collection that is not accepted in New York City's curbside recycling program.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Correlation, negative	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A negative correlation occurs when one variable increases and the other variable decreases.
Correlation, positive	A statistical measure referring to the relationship between two or more variables suggesting a causal relationship between these variables. A positive correlation occurs when one variable increases and the other variable also increases.
Count	The process of counting the individual items that were subsorted.
Curbside Collection	The collection of residential refuse or recycling in bins or bags set out in proximity to residences that generate these types of waste. DSNY provides curbside refuse collection to all residents two or three times per week and recycling curbside collection once per week.
Density/Income Strata	Divisions of New York City's population based on median housing density and median household income.
Deposit (containers)	Beverage containers for which, under the New York State Redeemable Container Law, the purchaser is required to pay a deposit. The deposit may be redeemed when the empty containers are returned to a retailer or authorized redemption center.
District	The 59 areas within New York City used by the Department of Sanitation to administer the City's waste management program. These districts are co-terminus, or identical, to the 59 Community Districts.
Diversion Rate	The amount of materials set out for recycling collection as a percentage of the total residential waste collected.
DSNY	Department of Sanitation of New York City
Dual-bin Trucks	DSNY collection trucks with two compartments used for the simultaneous collection of curbside residential Paper and MGP.
Durable	An item of residential waste that is not putrescible, packaging, or unfinished material, but is a durable object, such as an appliance, piece of furniture, or other household item.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Film (Plastic)	A category of flexible plastic materials used for packaging, trash bags and other applications, typically made of polyethylene or polypropylene.
HDPE	An abbreviation for high density polyethylene; a plastic denoted by a #2 inside the chasing arrows recycling symbol.
HHW	An abbreviation for Household Hazardous Waste, one of the material groups in the NYC WCS.
H/H	An abbreviation for the high housing density and high income stratum.
H/L	An abbreviation for the high housing density and low income stratum.
H/M	An abbreviation for the high housing density and medium income stratum.
Illegally Disposed Street Basket Waste	Residential or commercial waste that is illegally disposed of in street baskets (e.g. home-use products, such as large detergent bottles, cereal boxes, or personal mail; construction materials, etc.).
L/H	An abbreviation for the low housing density and high income stratum.
L/M	An abbreviation for the low housing density and medium income stratum.
Late Week/Early Week	A criterion used in the PWCS based on the idea that the composition of the waste discarded during the latter part of a week differs significantly from the composition of waste discarded during the early part of a week.
LDPE	An abbreviation for low density polyethylene, a plastic denoted by #4 inside the “chasing arrows” recycling symbol.
Lower Boundary	For a given material, the lowest average percentage of that material expected in the population consistent with the sample, at the confidence level specified.
M/H	An abbreviation for the medium housing density and high income stratum.
M/L	An abbreviation for the medium housing density and low income stratum.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
M/M	An abbreviation for the medium housing density and medium income stratum.
Material Categories	The classification of all materials in the waste stream into categories for sorting, weighing, and counting purposes. In the NYC WCS, 91 Material Categories were used to characterize the City's waste stream.
Material Groups	Groupings of material categories used to simplify or generalize results. The Material Groups used in the NYC WCS are: Paper, Plastic, Glass, Metal, Organics, Appliances/Electronics, Construction and Demolition Debris, Miscellaneous Inorganics, and Household Hazardous Waste.
Mean	The sum of the values of all observations divided by the number of observations, also known as average. In analyzing the composition of samples of waste, refuse, recycling, and the contents of street baskets, the best estimate of the true percentage of each material in the population is the Mean percentage of that material from all of the samples.
MGP	An abbreviation for Metal, Glass, and Plastic. One of the two streams of recycling collected by the DSNY consisting of plastic bottles and jugs; glass bottles and jars; metal cans and household objects; aluminum foil, trays and cans, and gable top beverage cartons. The other stream of recycling collected by DSNY is Paper.
Mixed Cullet	Broken glass in small pieces (under 3" x 3") of mixed color.
Moisture and Particulate Test	A laboratory test that determines the amount of moisture in a sample of material and determines the amount of fugitive or foreign material adhering to the sample.
Multiserve (containers)	Beverage containers with a capacity of more than 24 ounces of liquid.
Multi-Unit Apartment Study or Multi-Unit Study (MUS)	The component of the 2004/2005 waste characterization study that examined the correlation between the physical and operational characteristics of multi-unit buildings (those buildings with 6 or more residential units) and recycling success.
Non-deposit (containers)	Beverage containers which are not designated as deposit containers under the New York State Redeemable Container Law.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
NYC	New York City
NYC WCS	New York City Waste Characterization Study
Observation	The value(s) associated with a given sampling unit.
OCC	An abbreviation for old corrugated cardboard, one of the material categories in the PWCS and the NYC WCS.
ONP	An abbreviation for old newspaper, one of the material categories in the PWCS and the NYC WCS.
Paper	The second of two streams of recyclable materials collected by DSNY consisting of newspapers; magazines; catalogues; junk mail; white office paper; mixed paper; and gray and corrugated cardboard/paperboard. The other stream of is Metals/Glass/Plastic (MGP).
PET	An abbreviation for polyethylene terephthalate, a plastic denoted by #1 inside the “chasing arrows” recycling symbol.
Population (Statistics)	The entire aggregation of items from which a sample can be drawn. In the NYC WCS, the population was all of the residential waste collected at the curb by DSNY.
PP	An abbreviation for polyethylene propylene, a plastic denoted by #5 inside the “chasing arrows” recycling symbol.
Potential Deposit	Beverage containers which are not currently designated as deposit containers under the New York State Redeemable Container Law, but which may be designated in future legislation.
PS	An abbreviation for polystyrene, a plastic denoted by #6 inside the “chasing arrows” recycling symbol.
Pure Routes	DSNY Refuse and Recycling collection routes that include only residences from a single housing density and income stratum.
PWCS	The preliminary waste characterization study conducted by the New York City Department of Sanitation in 2004.
PVC	An abbreviation for polyvinyl chloride, a plastic denoted by #3 inside the “chasing arrows” recycling symbol.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Recycling	The act of recovering items or materials that might have been discarded and, usually after processing, returning them to the stream of commerce. Also, the materials that are set out for recycling collection.
Recycling Subindicators	A set of abbreviations used to indicate; i) those materials designated for recycling under New York City’s current curbside recycling program during the study period (“R”); ii) those materials for which markets exist and which could be added to a future New York City curbside program (“PR”); and iii) those materials that are not designated for recycling under New York City’s curbside recycling program because established or emerging markets do not presently exist (“NR”).
Refuse	Items or materials that are discarded and disposed.
Relative Variability	The variability from Sampling Unit to Sampling Unit in relation to the Mean. This is calculated by dividing the Standard Deviation by the Mean.
Residential Study	The component of the 2004/2005 waste characterization study that addressed the generation and composition of the curbside residential waste.
Sample	A portion of a population used to estimate the composition of the population as a whole. The Sample is made up of multiple Sampling Units.
Sample Acquisition, or Sampling	The procedure for selecting Sampling Units from the population.
Sample Number	The number of sampling units in a sample.
Sample Weight	The weight of a sampling unit. In the WCS, each refuse sampling unit was between 200 and 300 pounds.
Sampling Unit	A single elementary unit used as the basis for estimating the composition of the population.
Section	Each of the City’s 59 Sanitation Districts is divided into 3 to 5 Sanitation District Sections within which routes are designed and tonnage data collected daily.
Single-serve (containers)	Beverage containers with a capacity of less than 24 ounces of liquid.

Glossary of Abbreviations and Definitions

(continued)

The first time that a term or abbreviation defined in the glossary appears in the text, it is printed in bold.

TERM	DEFINITION
Sorting	The procedure for separating a heterogeneous amount of material, such as a 200 pound Sampling Units of refuse, into its constituent material categories.
Sorting Period	The days or weeks when the sampling and sorting of waste took place during the NYC WCS.
Standard Deviation	A measure of the dispersion or variability around the Mean of the weights of a group of Sampling Units of New York City waste.
Street Basket Waste Study	The component of the 2004/2005 waste characterization study that addressed the composition of the street basket waste.
Subsorts	The process of sorting a particular material into smaller constituent components (e.g. drinking containers were subsorted into deposit and non-deposit containers).
Upper Boundary	For a given material, the highest average percentage of that material expected in a population consistent with the sample, at the confidence level specified.
Waste	The combination of Refuse and Recycling
Waste Generation	The rate at which waste is set out for collection, typically reported in terms of amounts per generator per time period (e.g. pounds per capita per week).
WCS	The waste characterization study conducted over four seasons by the New York City Department of Sanitation in 2004 and 2005.

NYC Waste Characterization Study
Final Report, Volume 1

Section 1: Study Overview

[This page intentionally left blank.]

Section 1 Study Overview

1.1 Introduction

Volume 1 of the Final Report presents the results of the **PWCS**¹, conducted in May and June 2004, and the **WCS**, conducted from October 2004 through August 2005. Both of these studies were conducted under a contract (PIN #82702BR00015) between the **DSNY** and R. W. Beck, Inc. (“R. W. Beck”).

The purpose of both the PWCS and WCS was to characterize **the City’s residential Waste**. Both studies involved taking **samples of Refuse and Recycling (MGP and Paper)** and then **sorting** and weighing the materials in those Samples to arrive at an estimate of the composition of the Waste.

The PWCS took place in May and June 2004. The goal of the PWCS was to develop a snapshot of the City’s curbside residential Waste. The PWCS was conducted in two phases. The PWCS Refuse Sort, designed to characterize curbside residential Refuse, took place from May 15 through May 28, 2004. The PWCS Recycling Sort, designed to characterize the Paper and MGP set out for Recycling collection, took place from June 7 through June 12, 2004.

The WCS took place from October 2004 through August 2005. It included the following components:

- A **Residential Study**, to characterize curbside-collected residential Waste by housing density and income strata over four seasons and estimate generation rates;
- A **Street Basket Waste Study** to characterize the Waste collected from the City’s street baskets; and
- A **Multi-Unit Apartment Study** to identify correlations between Recycling success and the physical, operational, and demographic characteristics of the buildings.

The WCS included four seasonal **Sorting Periods**, the dates of which are shown in Table 1-1. Table 1-1 summarizes the structure of the PWCS and the WCS and some of the key differences such as the number and type of study components, the **Sampling** criteria, and the number of **Sampling Units** sorted. Volume 1 will report Residential results from the PWCS and the Residential/Street Basket results from the WCS. Volume 2 will cover methodology for the PWCS and Residential and Street Basket methodology for the WCS. Results and methodology for the **MUS** will be reported separately in Volume 3.

¹ Terms and abbreviations defined in the glossary are printed in bold the first time they appear in each Volume.

(1) The standard used to determine how study samples were selected. The sampling criteria used for the PWCS were the borough in which the waste was collected and late-week/early week collection; the sampling criterion used for the WCS Residential Study was Housing Density and Income Strata in which the waste was collected.

1.2 Basis for Sampling

1.2.1 PWCS

The number of Refuse and Recycling samples taken for analysis in the PWCS was distributed among the five **Boroughs** according to the amount of Refuse and Recycling, respectively, that each Borough contributes to the total Waste Stream, using tonnage data averaged over 2003 and 2004, accounting for the temporary suspension of glass and plastics recycling that concluded in April 2004.

Samples were also selected based on early in the week or late in the week collection days. This criteria was used to examine the hypothesis that the composition of Refuse set out for collection early in the week (i.e., Monday or Tuesday) would be significantly different from Refuse set out late in the week (i.e., Wednesday through Saturday). This issue is discussed in more detail in Volume 2, Section 2. All Samples were randomly selected after determining the number of Samples targeted based on these two criteria.

1.2.2 WCS Residential Study

Sampling for the WCS Residential Study was based on housing density and income strata. There are two reasons for using these criteria as a basis for Sampling. First, published data indicates that these demographic criteria affect **Waste Generation**, Recycling compliance, and/or Waste composition. The following documents, listed in Appendix P in Volume 4, are examples of studies that demonstrate this:

- Waste Composition Analysis for the State of Washington; Green Solutions, 2003;
- Waste Prevention, Recycling and Composting Options: Lessons from 30 U.S. “Communities” Demographic and Materials Generation and Recovery Levels”; U.S. EPA, 1994; and
- Katzev, Blake, Messer; “Determinants of Participation in Multi-Family Recycling Programs”, Journal of Applied Social Psychology, 1993.

Second, the City’s **1989/1990 WCS** study used density and income as a basis for Sampling. In order to compare the results of that study with the results of the WCS, density and income were also used in the WCS.

The City’s **Census Tracts** were originally divided into nine **Density/Income Strata** as defined in Table 1-2. Given the small number of Census Tracts in the low density/low income stratum, the dispersion of those Census Tracts, and the small number of residents in those Census Tracts (fewer than 3,000), it was decided to eliminate this stratum from the Study and focus resources on the remaining eight strata.

1.2.3 WCS Street Basket Study

Sampling for the WCS Street Basket Study was based on the DSNY’s dedicated street basket routes. These are routes that collect only street basket Waste and do not collect residential or

institutional Waste on the same route. Samples of street basket Waste were selected at random from these routes.

The 1989/1990 Study did not include a study of street basket Waste.

1.3 New York City Demographics

Tables 1-2 through 1-5 present the definition of Density and Income Strata; the distribution of Census Tracts among Density/Income Strata; and the distribution of the **Population** of New York City among the Density/Income Strata, respectively.

**Table 1-2
Definition of Density and Income Strata**

	Housing Density Census Tracts	Income Census Tracts
High	67% of residential structures contain 10 or more units	Median Household Income \$46,193 or greater
Medium	Census tracts not in High or Low Group	Median Household Income less than \$46,193 and greater than \$30,763
Low	67% of residential structures contain 2 or fewer units	Median Household Income \$30,763 or less

1.4 Identifying “Pure” Collection Routes

Typically, each DSNY collection route serves an area larger than a single Census Tract. However, there are some areas where a group of Census Tracts from the same stratum are adjacent to one another. In some of these cases, it was possible to identify “pure” routes, (i.e., routes that collect from a single density/income stratum). A list of the weekly “pure” routes within each of the eight Density/Income Strata was provided by DSNY.

The list of **Pure Routes** was used to develop a universe of Pure Routes from which Sample routes would be randomly selected, taking into account a three-week Sampling period, a Refuse collection frequency of two or three times per week, and a Recycling collection frequency of once per week. The universe of collection routes for the PWCS was larger than the universe of collection routes for the WCS because the PWCS did not seek to develop results based on Density/Income Strata. Table 1-6 presents the universe of pure collection routes.

The universe of collection routes for the Street Basket Study included only those routes that were dedicated to street basket collection. Some DSNY routes collect from street baskets, as well as residences. These mixed routes were excluded from the Street Basket Study.

(1) Pure collection routes are those where all waste is generated by a single housing density/income stratum. Routes where waste is collected from multiple strata are considered "impure".

(2) Housing density/income strata are not used in the PWCS.

(3) Dual routes are those on which both paper and MGP are collected simultaneously but kept separate in trucks with two different compartments.

(4) For each dual route, two routes are counted -- one route for paper plus one route for MGP.

(5) This study uses socioeconomic factors of housing density and income for the residential component only. The street basket analysis was designed to look strictly at the overall composition.

(6) Total number of routes vary by season due to fluctuations in waste generation. Total number of routes vary by stratum due to relative availability of routes in each stratum.

1.5 Determining the Number of Samples

For each stratum, the routes from which Samples were taken were randomly selected, using a random-number generator, from the universe of pure collection routes shown in Table 1-6.

An equal number of Samples were collected from each of the eight strata. Based on the results of the PWCS and other Waste characterization studies, it was decided that 50 Samples of Refuse would be targeted for Sorting in each of the four seasons for each of the eight strata.

Because materials in the Recycling stream show less variability and more consistency than materials in the Refuse stream, it was decided that 40 Samples of MGP and 10 Samples of Paper would be targeted for Sorting in each of the four seasons for each of the eight strata.

Based on academic research and industry practice, it was determined that a representative Sampling Unit of Refuse weighs between 200 pounds and 250 pounds and a representative Sampling Unit of Recycling weighs between 100 pounds and 150 pounds. Table 1-7 shows the average targeted weights and average acquired weights during the PWCS and WCS. Table 1-8 shows the mass of Samples sorted during the PWCS and the WCS. A full discussion of the rationale behind the **Sample Weights** is presented in Volume 2 of the Final Report.

Table 1-9 summarizes the number of Samples acquired during the PWCS and WCS. A full discussion of the Sampling methodology is included in Volume 2 of the Final Report.

(1) This table does not include samples acquired for use in the study of multi unit apartments.

(2) The number of samples acquired may differ from the number of samples targeted. These differences are due to logistical or operational difficulties, and sample availability.

(3) Samples listed under "Dual" may be paper or MGP, thus, the number of paper and MGP samples may be higher than those shown in the paper and MGP columns.

1.6 Residential Waste Sorting

Determining the number of **Material Categories** to be used in Sorting residential Sampling Units was challenging because it involved striking a balance between precision and efficiency. On one hand, a large number of Material Categories provides a more accurate description of the Waste. On the other hand, a large number of Material Categories introduces more instances of potential uncertainty and requires more time to sort accurately. Typically, Waste composition studies use 40 to 60 Material Categories. The WCS used more than 90 categories with additional **Subsorts** and counts. Both product types and materials were used in developing the categories.

1.6.1 Overview of Material Sort Categories

Table 1-10 shows the core 91 Material Categories used in the WCS, organized by the nine **Material Groups**.

(1) More detail on sort categories can be found in Volume 2 , Section 4.2.1 of this report.

1.7 Waste Generation

In addition to determining the composition of the Waste, the WCS Residential Study was designed to estimate the generation of Waste in each of the eight strata. These estimates would suggest how Waste behavior varies by stratum. That is, these estimates would indicate how much Refuse and Recycling is set out for collection weekly by all residents in each stratum, and how these amounts vary by stratum.

Generation estimates can be formulated based on household and on individual (per capita) behavior. Per capita generation rates would provide a widely-accepted metric for purposes of comparison. However, per capita generation rates would also ignore the effect of household size among the strata and the effect that has on estimating generation and **Diversion Rates**. Therefore, both per capita and per household generation rates were developed. Generation amounts by stratum are expressed in tons per week. Per capita and per household generation rates are expressed in tons per year. Per household generation rates are also expressed as pounds per week.

The development of generation rates is explained in some detail in Volume 2, Section 2.2 of the Final Report. The starting point, however, was the weekly curbside tonnages collected during the PWCS and the WCS, as presented in Table 1-11. These tonnages were recorded by DSNY by Sanitation District Section during the three weeks that the Study took place each season and are supplied for reference. The WCS generation estimates were based on averages of actual tonnages generated over longer periods and were attributed to housing density and income strata using a combination of geographic and statistical analytical techniques, which are described in Volume 2. The end product was an estimate of the tonnage of Refuse and Recycling generated by all residents of each housing density and income strata citywide.

The generation rates for the PWCS and the WCS on a per capita basis are shown in Table 1-12 and the generation rates on a per household basis are shown in Table 1-13. Table 1-14 shows estimated average weekly generation. These tables present generation rates for Refuse, Paper, MGP, and Waste.

Note: Tonnage values based on DSNY average weekly curbside tonnages for the months of September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

1.8 Summary Results

Although the PWCS used Borough-based Sampling and the WCS used strata-based Sampling, both results of the two studies were aggregated to provide PWCS and Annual WCS citywide results for Refuse, Recycling and Waste.

1.8.1 Citywide Results at a Glance, PWCS and Annual WCS Results

A summary of the PWCS and Annual WCS citywide results is presented in Tables 1-15 and 1-16. These tables compare Refuse, Paper, MGP, and Waste composition results for each material category. The tables also provide weekly tonnage generation for each stream. These tables are useful for comparing the material composition of different streams at the citywide level. Citywide Results at a Glance for each season (fall, winter, spring, and summer) can be found in Volume 1, Section 3.

**Table 1-15
Citywide Results at a Glance, Preliminary Waste Characterization Study**

Material Group	Material Subgroup	Material Category: Subcategory	Notes	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Aggregated Recycling Stream	% of Waste Stream	Recycling Subindicator

Percent Designated Recycling	22.42%	95.51%	81.32%	89.82%	33.85%

(1) In the PWCS, no distinction was made between #3 through #7 plastic bottles and tubs. PWCS results are shown here in the #3 through #7 bottle categories.

(2) In the PWCS, "Other Container Glass" was grouped with "Other Glass," and is shown here in the "Other Container Glass" category.

(3) In the PWCS, furniture and parts of furniture did not have their own categories. They were included in wood, textiles, or miscellaneous organic categories.

(4) In the PWCS, there was no category for "Appliances: Ferrous." PWCS results are shown here in the "Other Ferrous" category.

(5) In the PWCS, there was no category for "Appliances: Non-Ferrous." PWCS results are shown here in the "Other Non-Ferrous" category.

(6) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from May 2004 through June 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(7) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(8) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Subtotals by Recycling Designation

Recycling Designation	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Aggregated Recycling Stream	% of Waste Stream
Percent Designated Paper	15.03%	94.89%	2.46%	58.19%	22.78%
Percent Designated MGP	8.34%	0.55%	79.89%	32.06%	12.60%
Percent Designated Recycling	23.37%	95.45%	82.35%	90.25%	35.38%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

1.8.2 Housing Density and Income Details

Although the Sampling for the WCS took place over four seasons, the results of the WCS can be aggregated to provide annual estimates of composition for each of the strata for each stream. Tables 1-17 through 1-21 summarize these results. These tables show the percentage of each material in each of the eight Density/Income Strata for Refuse, Paper, MGP, and Waste. They are useful for comparing the composition of the four streams by Density/Income Strata. Each material is identified by its Material Group, Subgroup, Category, and Subcategory. The table also shows the percentage of each material for each stream citywide. The column labeled “**Recycling Subindicator**” indicates those materials currently designated for Recycling by DSNY (“R”), those materials not designated for Recycling by DSNY (“NR”), and those materials that are not designated for Recycling under the City’s current curbside Recycling program, but which might be added to a future curbside program, or potentially recyclable (“PR”).

The far right-hand column shows the possible correlations between the percentage of a given material with housing density and/or income. These possible correlations were developed by visually examining the results for each material category, by strata. For example, to ascertain whether a correlation between “housing density” and “material category” existed, we examined the percentage composition of the material for each density strata, looking to see whether the percentages of the material consistently increased or decreased. If the percentages increased, from the low to the medium to the high density strata, then a positive correlation existed between the material and housing density. If the percentage of material decreased consistently, then a negative correlation between the material and housing density existed. If there was no consistent pattern, then no correlation was evident. For example, in Table 1-17, the percentage of newspaper in the Refuse stream increases from low high density housing to medium density housing to high density housing for each income level, indicating a positive correlation between newspaper and housing density.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

1.8.3 Diversion Rates and Capture Rates

The results of the PWCS and WCS also provide data on the amount of Waste that was diverted from disposal and how much of the material designated for Recycling was collected for Recycling.

The Diversion Rate indicates what portion of the total Waste stream is source-separated and collected for Recycling. Diversion Rates are calculated by dividing the amount of material collected for Recycling, both Paper and MGP, by the total amount of Waste.

Table 1-22 shows the estimate of the percentage of Waste diverted from disposal during the PWCS and WCS by Borough and by Density/Income Strata annually and by season.

**Table 1-22

Table 1-23 shows the estimate of the percentage of material designated for Recycling that was collected for Recycling.

The **Capture Rate** measures the tonnages of Recycling setouts, as a fraction of all designated recyclables in the Waste stream. Capture Rates are calculated by dividing the amount of material collected for Recycling, both Paper and MGP, by the total amount of material designated for Recycling in the Waste stream.

Table 1-23 shows the estimate of the percentage of Recycling captured in the City's curbside Recycling program during the PWCS and WCS by Borough, and by Density/Income Strata annually and by season.

**Table 1-23

**NYC Waste Characterization Study
Final Report, Volume 1**

Section 2: Detailed Residential Results

[This page intentionally left blank.]

Section 2 Detailed Residential Results

2.1 Introduction

This section of Volume 1 presents more detailed data on the Waste composition and generation for the WCS Residential Study. It includes citywide results across seasons and by stream (Refuse, Paper, MGP, Aggregated Recycling, and Waste), and details on waste composition by density and income strata, and details on drink containers. The tables in this section are useful in making detailed evaluations and comparisons across several dimensions of the Study.

2.2 Citywide Results Across Seasons

Citywide results include two sets of tables. The Citywide Results At A Glance, by season (Tables 1-24 through 1-27) compare Refuse, MGP, Paper, and Waste Composition. These tables are useful in comparing the streams of waste during each season.

Citywide Results Across Seasons (Tables 1-28 through 1-32) compare the individual streams over the four seasons, and annually. These tables also provide weekly tonnage generation for each stream, each season. This enables one to track how compositions vary within a stream by season.

Recycling Designation	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Aggregated Recycling Stream	% of Waste Stream
Percent Designated Paper	14.64%	95.79%	2.37%	60.47%	23.02%
Percent Designated MGP	7.72%	0.48%	80.05%	30.56%	11.90%
Percent Designated Recycling	22.36%	96.28%	82.42%	91.04%	34.93%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Recycling Designation	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Aggregated Recycling Stream	% of Waste Stream
Percent Designated Paper	16.17%	95.53%	2.63%	59.83%	24.32%
Percent Designated MGP	8.79%	0.90%	80.71%	31.58%	13.04%
Percent Designated Recycling	24.95%	96.43%	83.34%	91.40%	37.37%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Percent Designated Recycling	22.36%	24.95%	21.67%	24.72%	23.37%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Percent Designated Paper	95.79%	95.53%	94.01%	94.14%	94.89%
Percent Designated MGP	0.48%	0.90%	0.42%	0.40%	0.55%
Percent Designated Recycling	96.28%	96.43%	94.43%	94.55%	95.45%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Subtotals by Recycling Designation

Recycling Designation	Fall 2004	Winter 2005	Spring 2005	Summer 2005	Annual
Percent Designated Paper	23.02%	24.32%	21.48%	22.46%	22.78%
Percent Designated MGP	11.90%	13.04%	12.10%	13.43%	12.60%
Percent Designated Recycling	34.93%	37.37%	33.57%	35.90%	35.38%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

2.3 Housing Density and Income Details

Housing Density and Income Details tables, Tables 1-33 through Table 1-52, compare each strata to the others and to citywide results, for Refuse, MGP, Paper, and Waste. There is one table per season and per stream. This type of table is useful in comparing the composition and generation of different strata against each other. These tables also indicate possible correlations between the percentage of each material and housing density and/or income, developed by identifying patterns of relationships between these two variables. These possible correlations were developed by visually examining the results for each material category, by strata. For example, to ascertain whether a correlation between “housing density” and “material category” existed, we examined the percentage composition of the material for each density strata, looking to see whether the percentages of the material consistently increased or decreased. If the percentages increased, from the low to the medium to the high density strata, then a positive correlation existed between the material and housing density. If the percentage of material decreased consistently, then a negative correlation between the material and housing density existed. If there was no consistent pattern, then no correlation was evident. For example, in Table 1-33, the percentage of newspaper in the Refuse stream increases from low high density housing to medium density housing to high density housing for each income level, indicating a positive correlation between newspaper and housing density.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside refuse tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside paper tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside MGP tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside recycling tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

2.4 Details on Drink Containers

The Sorting of Refuse and MGP in the PWCS and the WCS included subsorting of drink containers by type. This extra research was performed in order to better understand the presence of certain types of containers in the waste stream. This understanding focuses on containers in the waste stream in terms of their function or use, as opposed to constituent materials.

During the WCS, **Subsorts** and **Counts** were conducted on certain materials in the Refuse and MGP Samples. The results of the subsorts were used to determine the material's contribution to the overall composition of the streams. The Counts were used to determine the actual number of containers or products in each category.

The categories used in subsorting containers were:

- **Deposit Status**
 - Deposit containers under the New York State Redeemable Container Law;
 - **Non-deposit**; and
 - **Potential deposit**, a designation referring to containers under consideration for inclusion in an expanded New York State Redeemable Container Law.

- **Size/Function**
 - **Single-serve**, referring to beverage containers of 24 ounces or less;
 - **Multi-serve**, referring to beverage containers of more than 24 ounces; and
 - Non-beverage containers.

A container's deposit status and size are not mutually exclusive. For example, a 12-ounce Pepsi bottle is both a deposit container and a single serve container.

As an illustration, during the sorting of Refuse and MGP, a 32-ounce **PET** plastic water bottle would undergo a primary sort and two secondary sorts.

- The primary sort would be based on what the bottle was made of. In this case, it would be sorted and weighed as a part of the PET plastic materials.

- The first secondary sort would be based on the container's deposit status. The water bottle would be sorted as a potential-deposit container because water bottles were to be part of the expanded New York State Redeemable Container Law. It would be aggregated with other potential-deposit containers. The aggregated containers would be weighed and the individual containers counted.

- The final secondary sort would be based on size/function. The water bottle would be classified as a multi-serve container and aggregated with other multi-serve containers. The aggregated multi-serve containers would be weighed and the individual containers counted.

This procedure was followed for all samples of Refuse and MGP.

Tables 1-53 through 1-80 show the results of the container subsorts and counts by stream, by strata, and citywide. Results are shown for three streams: Refuse, MGP, and Waste. Results are not shown for Paper because there were very few containers in the Paper stream. However, the results for Waste reflect the weighted sum of Refuse, MGP, *and* Paper streams.

The tables present the data for the eight Density/Income Strata and citywide in three ways: (1) as a percent of the stream, (2) the count in the stream, by season and annually, and (3) as a percent of the container stream. These tables are useful for understanding how much of all Refuse, MGP, and waste generated consist of containers that are deposit vs. non-deposit vs. potentially a deposit under future legislation; and how many are single-serve vs. multi-serve containers.

For example, in Table 1-53, “High Density/High Income Drink Container Counts and Sorts – Refuse”, deposit PET bottles make up 0.28 percent of the total Refuse stream for that strata in the fall season. In other words, out of all Refuse that the High Density/High Income areas generated in the fall, 0.28 percent consisted of deposit PET bottles. The same table shows that out of all the samples of Refuse generated by High Density/High Income residents in the fall, 301 deposit PET bottles were found. It should be noted that the percentage 0.28 estimates the fraction of all High Density/High Income Fall Refuse generated in the City that is PET deposit bottles, in addition to measuring the actual fraction of all High Density/High Income Fall Refuse samples. The counts, however, only measure the number of containers found in all High Density/High Income Refuse samples. Counts can be extrapolated citywide by dividing them by the weight of all High Density/High Income Fall Refuse samples sorted, and then applying a count per pound estimate to the total High Density/High Income Fall Refuse stream. This same explanation applies to aggregated results across seasons and strata.

Table 1-80 presents citywide data in a different way. Here we see that citywide (across strata) deposit PET bottles make up 7.58 percent of all drink containers in the Fall Refuse stream citywide. In other words, out of all drink containers that residents citywide throw out with Refuse, 7.58 percent are deposit PET bottles. This alternate calculation was made only for citywide data, and not by strata.

During the PWCS, a more limited set of subsorts and counts were used. Glass containers, PET bottles and aluminum cans were sorted into deposit and non-deposit categories. There were also a number of “product” counts, including shoes, disposable razors, single-use cameras, and cell phones. These are shown in Tables 1-154 through 1-156.

(1) Values shown are the total number of containers observed in the Low Density/Medium Income stratum refuse samples sorted.

(2) The sum of the deposit type totals and the sum of the container size totals may vary due to differences in tare weights, inconsistencies in scale weights, or human error. None of the differences observed in the study materially effect the statistical calculations or conclusions.

(1) Values shown are the total number of containers observed in the Medium Density/Medium Income stratum refuse and recycling samples sorted.

(2) The sum of the deposit type totals and the sum of the container size totals may vary due to differences in tare weights, inconsistencies in scale weights, or human error. None of the differences observed in the study materially effect the statistical calculations or conclusions.

(1) Values shown are the total number of containers observed in the Low Density/Medium Income stratum refuse and recycling samples sorted.

(2) The sum of the deposit type totals and the sum of the container size totals may vary due to differences in tare weights, inconsistencies in scale weights, or human error. None of the differences observed in the study materially effect the statistical calculations or conclusions.

NYC Waste Characterization Study

Final Report, Volume 1

Section 3: Residential Historical Comparisons

[This page intentionally left blank.]

Section 3 Residential Historical Comparisons

3.1 Introduction

Comparing past and present Waste composition results is useful in several ways. First, such comparisons highlight trends over time. The generation and composition of Waste is influenced by many factors, including changes in Population size, demographics, economic conditions, and technology. Changes in these factors are reflected in the character of the Waste. For example, over the past ten years, the use of plastics has increased and this is evident in comparing the City's Waste in 1989/1990 and 2004/2005.

Second, the 1989/1990 WCS was conducted at a time when the City's Recycling program was just beginning. Relatively few areas of the City had Recycling collection in 1989, and sampling was not carried out in those areas. By 2004/2005, when the PWCS and the WCS took place, Recycling was well-established citywide. A comparison of the studies from these two periods shows the amount that is now being diverted from disposal and how much more material might be diverted. It also shows that there are limits to diversion, at least under the present program.

The methodologies used in the 1989/1990 Study and the WCS were similar in a number of ways. Both studies used two demographic criteria as a means of characterizing the City's residential Waste and developed nine demographic strata based on these criteria. Both studies examined seasonality by including four seasonal sorts and sorted Refuse Samples of 200 pounds to 300 pounds.

However, comparisons between the two studies are complicated by certain differences in methodology and logistical procedures. The 1989/1990 Study sorted more than 1,300 residential Refuse samples and no Recycling samples; the WCS sorted more than 3,400 Refuse and Recycling samples. Because citywide Recycling was in its nascent stage in 1989, the 1989/1990 Study excluded any Census Tracts for which a curbside Recycling program was in operation or planned for implementation. Therefore, only residential Refuse samples were characterized. In 2004/2005, Recycling collection was citywide and the WCS characterized Refuse and Recycling, both Paper and MGP.

While both studies used median household income as one of the demographic criteria, the 1989/1990 Study used population density and the WCS used housing density. The 1989/1990 Study excluded the 10 percent of the population in Census Tracts with the highest and lowest densities and incomes. Because the WCS was designed to randomly sample Census Tracts, giving an equal opportunity for every Census Tract to be selected, none of the Census Tracts were excluded from the WCS.

In estimating the composition of the Refuse, the 1989/1990 Study specifically excluded bulk waste. Therefore, in order to make comparisons between the WCS and the 1989/1990 Study, the results of the WCS were calculated without Bulk Items and these results are presented in Section 3.4.

Finally, the Refuse samples in the 1989/1990 Study were sorted into 45 Material Categories. The PWCS Refuse samples were sorted into 87 Material Categories and the WCS Refuse samples were sorted into 91 Material Categories. Therefore, certain adjustments had to be made to reconcile the differences in the Material Categories used in the two studies. For example, the “non-recyclable paper” category in the PWCS and WCS is included in “Other Paper” in the 1989/1990 Study.

3.2 Adjustments to 2004/2005 from 1989/1990 Material Categories

Tables 1-81 and 1-82 summarize the adjustments in the Material Categories that were made to arrive at the comparisons of the studies. These tables are useful in understanding the modifications in the Material Categories that were necessary to make a comparison of the results possible.

(1) The number of materials examined during the WCS was less than those in the PWCS. Materials within a material group were combined if they were infrequently - or never - seen in the PWCS.

(2) Materials shown in bold were subdivided into more specific categories during the Summer sort. This subdivision was done to gather more detailed information of the materials.

3.3 Seasonal Comparisons 2004/2005 to 1989/1990

Comparisons in Refuse composition between these two periods, 1989/1990 and 2004/2004, are shown in Tables 1-83 through 1-87.

Table 1-83 compares the results of the PWCS with results of the 1989/1990 Study. Because the PWCS was taken place in May and June (2004) and involved a single Sorting Period, it was deemed a “spring” event. For this reason, the results of the PWCS are compared with the results of the Spring Sorting Period of the 1989/1990 Study. Annual comparisons with the PWCS are not possible because the PWCS was conducted during only one season.

Tables 1-84 through 1-87 present the results of the 2004/2005 WCS and 1989/1990 Study each season and annually. These comparisons are presented in a condensed format so that comparisons with the 1989/1990 Study can be made. These types of reports are useful in looking at changes in the Waste stream over time.

			Spring 1990	PWCS 2004
APPL/ELECT.	Appliances and Electronics	8	0.00%	0.83%
APPL/ELECT. Total			0.00%	0.83%
GRAND TOTAL			100.00%	100.00%

Percent of Waste that is Designated as Recyclable Material 10 **44.32%** **33.71%**

1. For 1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation Control (OPEC)'s "New York City Waste Composition Study". In some instances, indicated in these footnotes, 2004 data, Material Groups, Material Categories, and percentage figures were combined for comparison to 1990 data.
2. 1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
3. 1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
4. 1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
5. 1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004 data does not.
6. 2004 "Other Metal" data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1990's "Other Metal" ("Other Ferrous Metal" in the 1990 OPEC report).
7. 1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
8. This category was not assessed in 1990.
9. In some cases, the 1990 percentage figures do not add up to exactly 100% due to rounding.
10. This is the sum of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1990 data, this includes all Paper and Metal, as well as Container Glass and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissue, waxed, coated) was included in the 1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, 1990 figures overcount designated recyclable paper. For 2004 data, totals reflect designated recyclable materials only.

- For 1989 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation Control (OPEC)'s "New York City Waste Composition Study". Percentage figures by stratum, unless otherwise noted in these footnotes, are as reported in Volume 2, Exhibits 3-4 through 3-12, (pages 3-6 through 3-14), of the OMD version of the DSNY OPEC's "New York City Waste Composition Study". In some instances, indicated in these footnotes, 2004 data, Material Groups, Material Categories, and percentage figures were combined for comparison to 1989 data.
- 1989 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004 data does not.
- 2004 "Other Metal" data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989's "Other Metal" ("Other Ferrous Metal" in the 1989 OPEC report).
- 1989 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989.
- In some cases, the 1989 percentage figures do not add up to exactly 100% due to rounding.
- This is the sum of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989 data, this includes all Paper and Metal, as well as Container Glass and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissue, waxed, coated) was included in the 1989 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, 1989 figures overcount designated recyclable paper. For 2004 data, totals reflect designated recyclable materials only.
- Results are presented here excluding bulk items because Volume 2 of the New York City Waste Composition Study, 1989-1990, OMD Version presented strata-specified results without bulk.

- For 1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation Control (OPEC)'s "New York City Waste Composition Study". Percentage figures by stratum, unless otherwise noted in these footnotes, are as reported in Volume 2, Exhibits 4-4 through 4-12, (pages 4-6 through 4-14), of the OMD version of the DSNY OPEC's "New York City Waste Composition Study". In some instances, indicated in these footnotes, 2005 data, Material Groups, Material Categories, and percentage figures were combined for comparison to 1990 data.
- 1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2005 data does not.
- 2005 "Other Metal" data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1990's "Other Metal" ("Other Ferrous Metal" in the 1990 OPEC report).
- 1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1990.
- In some cases, the 1990 percentage figures do not add up to exactly 100% due to rounding.
- This is the sum of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1990 data, this includes all Paper and Metal, as well as Container Glass and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissue, waxed, coated) was included in the 1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, 1990 figures overcount designated recyclable paper. For 2005 data, totals reflect designated recyclable materials only.
- Results are presented here excluding bulk because Volume 2 of the New York City Waste Composition Study, 1989-1990, OMD Version presented strata-specified results without bulk.

- For 1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation Control (OPEC)'s "New York City Waste Composition Study". Percentage figures by stratum, unless otherwise noted in these footnotes, are as reported in Volume 2, Exhibits 5-4 through 5-12, (pages 5-6 through 5-14), of the OMD version of the DSNY OPEC's "New York City Waste Composition Study". In some instances, indicated in these footnotes, 2005 data, Material Groups, Material Categories, and percentage figures were combined for comparison to 1990 data.
- 1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2005 data does not.
- 2005 "Other Metal" data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1990's "Other Metal" ("Other Ferrous Metal" in the 1990 OPEC report).
- 1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1990.
- In some cases, the 1990 percentage figures do not add up to exactly 100% due to rounding.
- This is the sum of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1990 data, this includes all Paper and Metal, as well as Container Glass and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissue, waxed, coated) was included in the 1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, 1990 figures overcount designated recyclable paper. For 2005 data, totals reflect designated recyclable materials only.
- Results are presented here excluding bulk items because Volume 2 of the New York City Waste Composition Study, 1989-1990, OMD Version presented strata-specified results without bulk.

- For 1989 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation Control (OPEC)'s "New York City Waste Composition Study". Percentage figures by stratum, unless otherwise noted in these footnotes, are as reported in Volume 2, Exhibits 2-4 through 2-12, (pages 2-7 through 2-15), of the OMD version of the DSNY OPEC's "New York City Waste Composition Study". In some instances, indicated in these footnotes, 2005 data, Material Groups, Material Categories, and percentage figures were combined for comparison to 1989 data.
- 1989 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2005 data does not.
- 2005 "Other Metal" data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989's "Other Metal" ("Other Ferrous Metal" in the 1989 OPEC report).
- 1989 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989.
- In some cases, the 1989 percentage figures do not add up to exactly 100% due to rounding.
- This is the sum of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989 data, this includes all Paper and Metal, as well as Container Glass and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissue, waxed, coated) was included in the 1989 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, 1989 figures overcount designated recyclable paper. For 2005 data, totals reflect designated recyclable materials only.
- Results are presented here excluding bulk items because Volume 2 of the New York City Waste Composition Study, 1989-1990, OMD Version presented strata-specified results without bulk.

3.4 Details on Results without Bulk

The results of the WCS included Bulk Items that were acquired as a part of the samples. However, the 1989/1990 Study specifically excluded bulk waste. Therefore, in order to make comparisons between the WCS and the 1989/1990 Study, the results of the WCS were calculated without Bulk Items. Further details on bulk composition, methodology, itemized lists and comparisons to the 1989-1990 Study can be found in Section 6, Bulk and **Durable** Results, in this Volume.

Most Bulk Items acquired in the WCS sample units were appliances and furniture. When Bulk Items are excluded from the composition calculations, the average percent composition of a particular material category changes slightly. The average percent composition of Material Categories which include Bulk Items, such as “Wood Furniture/Pieces of Furniture” or “Appliances: Ferrous” decreases when bulk is excluded. Because the sum of the percentages must add to 100 percent, percentages of materials with no bulk, such as “Paper” and “Food Waste” increase. Tables 1-88 through Table 1-93 summarize the results of the PWCS and WCS without Bulk Items.

The results without bulk are only shown for Waste, and not the other streams, because the purpose of this analysis was to compare the results of the PWCS and WCS with the 1989/1990 Study. The 1989/1990 Study did not include the sampling and sorting of Recycling because the City’s Recycling program was just getting underway.

These tables are useful for understanding the calculations for comparisons with the 1989/1990 Study (which did not include bulk calculations), and for understanding the composition of the non-bulk waste stream.

(1) In the PWCS, no distinction was made between #3 through #7 plastic bottles and tubs. PWCS results are shown here in the #3 through #7 bottle categories.

(2) In the PWCS, "Other Container Glass" was grouped with "Other Glass," and is shown here in the "Other Container Glass" category.

(3) In the PWCS, furniture and parts of furniture did not have their own categories. They were included in wood, textiles, or miscellaneous organic categories.

(4) In the PWCS, there was no category for "Appliances: Ferrous." PWCS results are shown here in the "Other Ferrous" category.

(5) In the PWCS, there was no category for "Appliances: Non-Ferrous." PWCS results are shown here in the "Other Non-Ferrous" category.

(6) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period of May and June 2004 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(7) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(8) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

For further information about revisions to the Material Sort Categories, refer to Section 3 of this Volume, Tables 1-87 and 1-88.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through November 2004 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from January 2005 through March 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from April 2005 through June 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from July 2005 through September 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside waste tonnages over the period from September 2004 through September 2005 less the percentage of bulk items as determined in the study. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Final Report, Volume 1**

Section 4: Results and Comparisons by Borough

[This page intentionally left blank.]

Section 4 Results and Comparisons by Borough

4.1 Introduction

Another way to examine the character of the Waste is to compare the composition of Waste among the City's five Boroughs. It has already been pointed out that the Populations of the Boroughs vary by housing density and income. However, most of the Waste management planning for the City is carried out at the Borough level. The WCS does not classify Boroughs by housing density and income, although Staten Island, Manhattan, and the Bronx, are relatively more homogeneous than Brooklyn and Queens.

The PWCS, which used the Boroughs as the primary criterion for sampling, provides a single-season comparison of the Boroughs.

The WCS used strata based on housing density and income as the criterion for sampling. However, Borough by Borough comparisons can be calculated by multiplying composition estimates by the generation rates for each strata, and weighting these by each Borough's mix of strata.

This section of Volume 1 reports the residential results of the PWCS and WCS for each of the City's Borough in five ways.

4.2 Boroughwide Results at a Glance, PWCS

Tables 1-94 through 1-98 present the results of the PWCS for New York City's five Boroughs. Each table shows the percentage of each material in the Refuse, MGP, Paper, and Waste streams for a Borough. These tables are useful for comparing the material composition of different streams at the Borough level.

(1) In the PWCS, no distinction was made between #3 through #7 plastic bottles and tubs. PWCS results are shown here in the #3 through #7 bottle categories.

(2) In the PWCS, "Other Container Glass" was grouped with "Other Glass," and is shown here in the "Other Container Glass" category.

(3) In the PWCS, furniture and parts of furniture did not have their own categories. They were included in wood, textiles, or miscellaneous organic categories.

(4) In the PWCS, there was no category for "Appliances: Ferrous." PWCS results are shown here in the "Other Ferrous" category.

(5) In the PWCS, there was no category for "Appliances: Non-Ferrous." PWCS results are shown here in the "Other Non-Ferrous" category.

(6) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from May 2004 through June 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(7) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(8) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) In the PWCS, no distinction was made between #3 through #7 plastic bottles and tubs. PWCS results are shown here in the #3 through #7 bottle categories.

(2) In the PWCS, "Other Container Glass" was grouped with "Other Glass," and is shown here in the "Other Container Glass" category.

(3) In the PWCS, furniture and parts of furniture did not have their own categories. They were included in wood, textiles, or miscellaneous organic categories.

(4) In the PWCS, there was no category for "Appliances: Ferrous." PWCS results are shown here in the "Other Ferrous" category.

(5) In the PWCS, there was no category for "Appliances: Non-Ferrous." PWCS results are shown here in the "Other Non-Ferrous" category.

(6) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from May 2004 through June 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(7) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(8) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) In the PWCS, no distinction was made between #3 through #7 plastic bottles and tubs. PWCS results are shown here in the #3 through #7 bottle categories.

(2) In the PWCS, "Other Container Glass" was grouped with "Other Glass," and is shown here in the "Other Container Glass" category.

(3) In the PWCS, furniture and parts of furniture did not have their own categories. They were included in wood, textiles, or miscellaneous organic categories.

(4) In the PWCS, there was no category for "Appliances: Ferrous." PWCS results are shown here in the "Other Ferrous" category.

(5) In the PWCS, there was no category for "Appliances: Non-Ferrous." PWCS results are shown here in the "Other Non-Ferrous" category.

(6) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from May 2004 through June 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(7) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(8) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

4.3 Boroughwide Results at a Glance, WCS Seasonal

Tables 1-99 through 1-118 present the results of the WCS for New York City's five Boroughs by season. They show the percentage of each material in the Refuse, MGP, Paper, and Waste streams in each of the four seasons (fall, winter, spring, and summer). These tables are useful for comparing the material composition of different streams at the Borough level from season to season.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Recycling Designation	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Waste Stream
Percent Designated Paper	12.71%	95.26%	2.55%	20.34%
Percent Designated MGP	8.20%	0.55%	79.63%	12.19%
Percent Designated Recycling	20.91%	95.81%	82.18%	32.53%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through November 2004. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through November 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from January 2005 through March 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Percent Designated Paper	20.54%	97.22%	1.87%	29.96%
Percent Designated MGP	8.42%	0.19%	81.16%	12.45%
Percent Designated Recycling	28.96%	97.41%	83.03%	42.41%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from April 2005 through June 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Percent Designated Paper	21.67%	94.45%	1.74%	29.88%
Percent Designated MGP	9.87%	0.36%	78.10%	13.57%
Percent Designated Recycling	31.53%	94.81%	79.84%	43.45%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from July 2005 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

4.4 Boroughwide Results at a Glance, WCS Annual

Tables 1-119 through 1-123 present the annualized results (four seasons aggregated into one figure) of the WCS for each of New York City's five boroughs for the Refuse, MGP, Paper, and Waste streams. Because the WCS was designed to determine Waste composition by housing density and income, the process of deriving annualized results by borough required a separate, complex analysis. (For more detail on the methodology and calculations, see Volume 2, Section 2.)

The data in this form provides a straightforward presentation of the composition of each borough's Refuse, Paper, MGP, and Waste streams, and makes simple borough comparisons and trends possible.

**Table 1-119

Percent Designated Recycling	30.39%	96.49%	82.44%	43.43%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

Subtotals by Recycling Designation

Recycling Designation	% of Refuse Stream	% of Paper Stream	% of MGP Stream	% of Waste Stream
Percent Designated Paper	12.44%	94.48%	3.06%	22.72%
Percent Designated MGP	6.77%	0.75%	79.99%	11.47%
Percent Designated Recycling	19.21%	95.24%	83.05%	34.19%

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

4.5 Details on Drink Containers by Borough

Tables 1-124 through 1-126 present the results of the WCS Drink Container Sorts and Counts for each of New York City's five Boroughs. These tables show the percentage of each type of containers in the Refuse, MGP, and Waste streams in each Borough on an annual basis. In addition, the tables show the number of each type of container in the Refuse, MGP, Paper, and Waste streams in each Borough. These tables are useful in understanding and comparing the generation of containers by Borough.

(1) Values shown are the total number of containers observed in all refuse samples sorted.

(2) The sum of the deposit type totals and the sum of the container size totals may vary due to differences in tare weights, inconsistencies in scale weights, or human error. None of the differences observed in the study materially effect the statistical calculations or conclusions.

(1) Values shown are the total number of containers observed in all refuse and recycling samples sorted.

(2) The sum of the deposit type totals and the sum of the container size totals may vary due to differences in tare weights, inconsistencies in scale weights, or human error. None of the differences observed in the study materially effect the statistical calculations or conclusions.

4.6 Historical Comparisons by Borough

Tables 1-127 through 1-132 present a comparison of the results of the PWCS and WCS with the 1989/1990 Study in New York City's five Boroughs. The tables compare the percentage of each material in the Waste stream in five pairs of seasonal Sorting Periods, and annually:

- Spring 1990 and spring 2004 (PWCS)
- Fall 1989 and fall 2004 (WCS)
- Winter 1990 and winter 2005 (WCS)
- Spring 1990 and spring 2005 (WCS)
- Summer 1989 and summer 2005 (WCS)
- Annual 1989/1990 and annual 2004/2005 (WCS)

The citywide composition results in the 1989/1990 Study did not include Bulk items as a part of the material categories. However, in the Boroughwide composition results, the 1989/1990 Study included Bulk items as a single, separate line item. To make the historical comparison with the 1989/1990 Study in the following tables, the Bulk items in the WCS were extracted from the material categories and placed in a separate line item.

These tables are useful for comparing the material composition of Waste at the Borough level over time.

- For 1989/1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and Citywide percentage figures are as reported in Volume 2, Exhibit 8-1 (page 8-4) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". Percentage figures by borough are as reported in Volume 1, Exhibit 5-2 (page 5-11) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". In some instances, noted in these footnotes, Material Groups and Material Categories for 2004/2005 NYC WCS have been reconfigured for comparison to the 1989/1990 data.
- 1989/1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004/2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004/2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989/1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989/1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004/2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989/1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004/2005 data does not.
- 2004/2005 data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989/1990's "Other Metal" ("Other Ferrous Metal" in the 1989/1990 OPEC report).
- 1989/1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989/1990.
- In some cases, the 1989/1990 data did not sum to 100% in the OPEC "New York City Waste Characterization Study Report" due to rounding.
- This is the sum total of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989/1990 data, this includes all Paper, Metal, Container Glass, and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissues, waxed, coated) was included in the 1989/1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, the 1989/1990 figures overcount designated paper. For 2004/2005 data, all totals reflect designated materials only.
- Results are presented here excluding bulk items because Volumes 1 and 2 of the New York City Waste Composition Study, 1989-1990, OMD Version presented waste composition results without bulk.

- For 1989/1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and seasonal and annual percentage figures are as reported in Volume 1, Exhibit 5-2 (pages 5-7 through 5-11) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". In some instances, 2004/2005 data, Material Groups, Material Categories, and percentage figures were adjusted, as indicated in these footnotes, for comparison to the 1989/1990 data.
- 1989/1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004/2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004/2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989/1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989/1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004/2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989/1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004/2005 data does not.
- 2004/2005 data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989/1990's "Other Metal" ("Other Ferrous Metal" in the 1989/1990 OPEC Report).
- 1989/1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989/1990.
- In some cases, the 1989/1990 percentage figures do not sum to 100% in the OPEC "New York City Waste Composition Study" report due to rounding.
- This is the sum total of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989/1990 data, this includes all Paper, Metal, Container Glass, and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissues, waxed, coated) was included in the 1989/1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, the 1989/1990 figures overcount designated paper. For 2004/2005 data, all totals reflect designated materials only.
- Results are presented here excluding bulk items because Volume 1 of the New York City Waste Composition Study, 1989-1990, OMD Version presented waste composition results without bulk.

Percent of Waste that is Designated as Recyclable Material		10	41.90%	30.49%	44.70%	30.23%	43.20%	31.28%	41.90%	29.08%	43.10%	31.81%	43.10%	30.58%

- For 1989/1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and seasonal and annual percentage figures are as reported in Volume 1, Exhibit 5-2 (pages 5-7 through 5-11) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". In some instances, 2004/2005 data, Material Groups, Material Categories, and percentage figures were adjusted, as indicated in these footnotes, for comparison to the 1989/1990 data.
- 1989/1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004/2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004/2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989/1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989/1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004/2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989/1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004/2005 data does not.
- 2004/2005 data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989/1990's "Other Metal" ("Other Ferrous Metal" in the 1989/1990 OPEC Report).
- 1989/1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989/1990.
- In some cases, the 1989/1990 percentage figures do not sum to 100% in the OPEC "New York City Waste Composition Study" report due to rounding.
- This is the sum total of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989/1990 data, this includes all Paper, Metal, Container Glass, and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissues, waxed, coated) was included in the 1989/1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, the 1989/1990 figures overcount designated paper. For 2004/2005 data, all totals reflect designated materials only.
- Results are presented here excluding bulk items because Volume 1 of the New York City Waste Composition Study, 1989-1990, OMD Version presented waste composition results without bulk.

- For 1989/1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and seasonal and annual percentage figures are as reported in Volume 1, Exhibit 5-2 (pages 5-7 through 5-11) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". In some instances, 2004/2005 data, Material Groups, Material Categories, and percentage figures were adjusted, as indicated in these footnotes, for comparison to the 1989/1990 data.
- 1989/1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004/2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004/2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".
- 1989/1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.
- 1989/1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004/2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".
- 1989/1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004/2005 data does not.
- 2004/2005 data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989/1990's "Other Metal" ("Other Ferrous Metal" in the 1989/1990 OPEC Report).
- 1989/1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.
- This category was not assessed in 1989/1990.
- In some cases, the 1989/1990 percentage figures do not sum to 100% in the OPEC "New York City Waste Composition Study" report due to rounding.
- This is the sum total of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989/1990 data, this includes all Paper, Metal, Container Glass, and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissues, waxed, coated) was included in the 1989/1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, the 1989/1990 figures overcount designated paper. For 2004/2005 data, all totals reflect designated materials only.
- Results are presented here excluding bulk items because Volume 1 of the New York City Waste Composition Study, 1989-1990, OMD Version presented waste composition results without bulk.

1. For 1989/1990 data, unless otherwise indicated in these footnotes, Material Groups, Material Categories, and seasonal and annual percentage figures are as reported in Volume 1, Exhibit 5-2 (pages 5-7 through 5-11) of the OMD version of the DSNY Operations Planning Evaluation and Control (OPEC)'s "New York City Waste Composition Study". In some instances, 2004/2005 data, Material Groups, Material Categories, and percentage figures were adjusted, as indicated in these footnotes, for comparison to the 1989/1990 data.

2. 1989/1990 tonnage data for "Magazines/Glossy", "Non-Corrugated Cardboard", and "Mixed" categories of paper have been combined and labeled "Other Paper". For clarity in comparison to the 2004/2005 tonnage data, a similar category, also labeled "Other Paper", has been created with the 2004/2005 data, combining "Mixed Low Grade Paper", "Paper Bags", "Polycoated Containers", "Compostable/Soiled/Waxed OCC", "Single Use Paper Plates, Cups" and "Other Nonrecyclable Paper".

3. 1989/1990 tonnage data for Clear and Green "PET" plastic have been combined for clarity of comparison.

4. 1989/1990 tonnage data for "Miscellaneous Glass" does not include mixed cullet. 2004/2005 "Miscellaneous Glass" tonnage data includes "Mixed Cullet" and "Miscellaneous Glass".

5. 1989/1990 data includes mixed cullet in "Fines" and "Miscellaneous Inorganics". 2004/2005 data does not.

6. 2004/2005 data combines "Empty Aerosol Cans", "Other Ferrous", "Other Non-Ferrous", "Mixed Metals", "Appliances-Ferrous", and "Appliances-Non-Ferrous" to correspond with 1989/1990's "Other Metal" ("Other Ferrous Metal" in the 1989/1990 OPEC Report).

7. 1989/1990 tonnage data for "Non-Pesticide Poisons" has been added to "Miscellaneous HHW" tonnage total.

8. This category was not assessed in 1989/1990.

9. In some cases, the 1989/1990 percentage figures do not sum to 100% in the OPEC "New York City Waste Composition Study" report due to rounding.

10. This is the sum total of designated Paper, Metal, Glass, Plastic and Beverage Cartons in all Waste (Refuse + Recycling). For 1989/1990 data, this includes all Paper, Metal, Container Glass, and HDPE/PET bottles/jugs. Because some paper that is not designated recyclable (tissues, waxed, coated) was included in the 1989/1990 "Mixed" paper category, it cannot now be excluded when calculating the sum of designated paper. Thus, the 1989/1990 figures overcount designated paper. For 2004/2005 data, all totals reflect designated materials only.

11. Results are presented here excluding bulk items because Volume 1 of the New York City Waste Composition Study, 1989-1990, OMD Version presented waste composition results without bulk.

Final Report, Volume 1**

Section 5: WCS Street Basket Results

[This page intentionally left blank.]

Section 5 WCS Street Basket Results

5.1 Introduction

The DSNY collects waste from pedestrian litter baskets (referred to as street baskets in this study) throughout the City. Some of these collections are made on dedicated routes on which only street basket waste is collected and some collections are made on mixed routes on which institutional, residential and street basket waste is collected in the same truck.

5.2 Dedicated Street Basket Routes

One facet of the WCS was a study of the composition of street basket waste from dedicated street basket routes. The number of dedicated street basket routes, as provided by DSNY, varies by season, ranging from 644 routes in the fall of 2004 to 701 routes in the summer of 2005. In areas with high pedestrian traffic, dedicated routes may be collected several times per day. The list of dedicated street basket routes during the WCS is presented in Volume 2, Section 3.

5.3 Street Basket Waste Composition

New York City does not have street basket recycling, so, for the purposes of this study, all material collected in the street basket waste is refuse. Table 1-133 shows the citywide composition of street basket waste from the WCS across the four seasons, and annually. This table is useful in comparing the composition of street basket waste over the year.

The weekly generation tonnages of street basket waste were calculated by taking the average weekly tonnages provided by DSNY, by season, for the period from September 2004 through September 2005. The schedule for the collection of street basket waste is complex because it is based on the use and capacity of the street baskets. In areas of high pedestrian traffic where street baskets are likely to fill quickly, the street baskets may be collected several times a day. In other areas, street basket waste may be collected once a day, or less frequently. For this reason, it was not possible to estimate a per-basket generation rate.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from September 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

(2) The paper, plastic, and glass tonnages include the weight of materials both designated and non-designated for recycling.

(3) The metal tonnages do not include the weight of metals found within the appliance/electronic material group.

5.4 Street Basket Illegal Use

One area of investigation in the Street Basket Waste Study was **illegally disposed** residential or commercial waste. Street baskets provide refuse disposal for pedestrians in commercial areas in the City. It is illegal to use street baskets for household or commercial waste disposal. Nevertheless, these types of refuse are routinely dropped in street baskets.

The WCS provided an opportunity to determine how much of the refuse in the street baskets might be illegal and whether there was a clear preponderance of suspected residential or commercial illegal use of the street baskets. In this study, the illegally disposed waste was determined using the following guidelines:

- Suspected illegal residential waste: addressed mail, substantial amounts of home-use products such as family-size drink containers, home and beauty aids, or other residential material, as determined by the Crew Chief of the sorting crew. (See Volume 2, Section 4.2.2.7 for a more detailed description of this procedure.)
- Suspected illegal commercial waste: retail food preparation waste (industrial-sized food or liquid containers), construction materials, substantial amounts of office paper or cardboard boxes, or other commercial material as determined by the Crew Chief of the sorting crew. (See Volume 2, Section 4.2.2.7 for a more detailed description of this procedure.)

To carry out this investigation, a special sorting protocol was developed and implemented to identify illegally disposed material in street basket waste. The protocol is described in detail in Volume 2 of the Report. Suspected illegal residential and commercial waste was found both as loose material and in bags. Bags of waste that were suspected to be illegally placed in street baskets were weighed and counted as a part of the sorting protocol. Bulk items in street basket waste, such as appliances or furniture, that were suspected of being illegally placed in street baskets were weighed and counted.

The results of this investigation are presented in Table 1-134 and include the following sections:

1. The total weight of suspected illegal residential waste, suspected illegal commercial waste, and legally disposed waste sorted during each season of the WCS, and annually.
2. The percentage of total weight of suspected illegal residential waste, suspected illegal commercial waste, and legally disposed waste sorted during each season of the WCS, and annually.
3. The total weight of only bagged waste of suspected illegal residential waste and suspected illegal commercial waste.
4. The total number of bags of suspected illegal residential waste and suspected illegal commercial waste.

5. The percentage of bags of suspected illegal residential waste and suspected illegal commercial waste.
6. The total weight of bulk items that were suspected illegal residential waste and suspected illegal commercial waste.
7. The number of bulk items that were suspected illegal residential waste and suspected illegal commercial waste.
8. The percentage of bulk items that were suspected illegal residential waste and suspected illegal commercial waste.
9. The number of samples with illegal residential waste only, with illegal commercial waste only, with a mix of illegal residential and illegal commercial waste, and with no illegal residential or illegal commercial waste.
10. The percentage of samples with illegal residential waste only, with illegal commercial waste only, with a mix of illegal residential and illegal commercial waste, and with no illegal residential or illegal commercial waste.

5.5 Street Basket Container Sorts

The same subsorts and counts for drink containers were used for this waste stream that were used for the residential refuse. The results of the street basket subsorts and counts are shown in Table 1-135 and Table 1-136. More information about other drink container research and data can be found in this section in Volume 1, Section 2.

**NYC Waste Characterization Study
Final Report, Volume 1**

Section 6: Bulk and Durable Results

[This page intentionally left blank.]

Section 6 Bulk and Durables Results

6.1 Introduction

The sampling and sorting protocols of the WCS provided for the separate weighing, material categorization, and description of Bulk items, defined as items too large to fit into a 96 gallon container. The majority of such Bulk items are “durables” (such as appliances, pieces of furniture, or other household items) and other waste items such as packaging, unfinished materials, and non-putrescible waste

In addition, because the sort categories of the WCS were designed on the basis of both material and product characteristics, materials that did not qualify as “Bulk” could also be identified as durable or non-durable. For example, plastic containers, bags, and other packaging were non-durable, while “other plastics materials” were largely comprised of durable items like toys, housewares, office supplies, or hardware.

The results of the WCS therefore enable some comment on what fraction of the waste stream consists of durable goods. It should be noted that this assessment does not take into account the following additional dimensions of durables in waste:

- The extent of pre-collection scavenging;
- The reusability, reparability, or suitability of durables for spare parts.

6.2 Bulk Items

The bulk items consisted of any items that were too large to fit into the 96-gallon containers used to collect samples. They included items such as bicycles, water heaters, and furniture that are collected with the regular collection of refuse and MGP. Special care was taken in developing the sampling and sorting protocols to account for bulk items without having them skew the results of the study.

Because of the size of the sampling units of refuse and MGP, the presence of one or more bulk items in the load had the potential to dominate certain samples. To account for this, Sample Managers could estimate the percentage of a bulk item in a sample and record this on the Sample Management Form. A full discussion of the protocol is included in Volume 2 of the Report.

In sorting bulk items in each sample, the Crew Chief recorded the type of bulk item and its weight. Therefore, a list of bulk items was developed for refuse, MGP, and waste. This research was not conducted on Paper because very few bulk items are found in the Paper stream. The Street Basket Waste sorting protocol did include the weighing and counting of bulk items and the results of this research is presented in Section 5 of this volume.

Tables 1-137 through 1-142 present the summary of residential bulk items from the PWCS and each season of the WCS. The data is organized into three sections (from left to right):

- The weight (in pounds) of bulk items in each of the three streams that were examined for bulk – Refuse, MGP, and Waste. (There is virtually no bulk waste in the Paper stream),
- That weight as a percentage of the total weight of all of that particular material estimated to exist in that stream.
- The same weight as a percentage of the weight of all materials in that stream.

For example, Table 1-137 shows that, in the PWCS, there were 608.8 lbs of Other Ferrous in the MGP stream and 32.10 lbs of Other Ferrous in the Refuse Stream for a total of 640.90 in the Waste stream. Bulk items made up 29.88 percent of Other Ferrous in the MGP stream, 6.74 percent in the Refuse stream, and 25.47 percent of the Waste stream. Finally, 6.04 percent of the MGP stream was comprised of Other Ferrous bulk items, 0.07 percent of the Refuse stream was comprised of Other Ferrous bulk items, and 0.57 percent of the Waste stream was comprised of Other Ferrous.

These tables are useful in comparing the impact of bulk items of various materials on the City's waste stream.

(1) (Weight of the material category that is considered bulk) / (total weight of the material category)

(2) "% of Material that is Bulk" refers to how much of a particular material category in the refuse, MGP or waste stream consists of bulk items. For example, in refuse 2.49% of all Plain OCC/Kraft Paper is bulk Plain OCC/Kraft Paper. Totals for these percentages are not meaningful as they refer to the subset of material categories in which bulk items were found. They are therefore not shown here.

(3) (Weight of the material category that is considered bulk) / (total weight of all material in the stream)

(1) (Weight of the material category that is considered bulk) / (total weight of the material category)

(2) "% of Material that is Bulk" refers to how much of a particular material category in the refuse, MGP or waste stream consists of bulk items. For example, in refuse 2.30% of all Plain OCC/Kraft Paper is bulk Plain OCC/Kraft Paper. Totals for these percentages are not meaningful as they refer to the subset of material categories in which bulk items were found. They are therefore not shown here.

(3) (Weight of the material category that is considered bulk) / (total weight of all material in the stream)

A description, including material type, and weight of each bulk item was also recorded during the PWCS and WCS, along with the stream in which the item was found and, in the WCS, the Density/Income strata from which it came. Tables 1-143 through 1-147 present the list of bulk items found in the PWCS and each season of the WCS. These detailed tables are helpful in understanding the types of bulk items disposed and recycled each season.

Table 1-143
Bulk Item List by Material Category, PWCS

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
OCC	15.60	Plain OCC/Kraft Paper	Refuse	Citywide
HDPE Colored Container	7.40	HDPE Colored Bottles	Refuse	Citywide
HDPE Container	22.60	HDPE Colored Bottles	Refuse	Citywide
Film Plastic - TARP	10.00	Other Film	Refuse	Citywide
Child Car Seat	9.40	Other Plastics Materials	Refuse	Citywide
Plastic Broom Handle	9.10	Other Plastics Materials	Refuse	Citywide
Plastic Broom/Mop Handles	7.00	Other Plastics Materials	Refuse	Citywide
Plastic Fan	3.70	Other Plastics Materials	Refuse	Citywide
Vacuum Cleaner Part - Plastic	3.60	Other Plastics Materials	Refuse	Citywide
Baby Stroller - Metal	11.10	Other Ferrous	Refuse	Citywide
Metal Bed Frame	4.00	Other Ferrous	Refuse	Citywide
Metal Chair - Ferrous	6.00	Other Ferrous	Refuse	Citywide
Steel Hand-Cart	11.00	Other Ferrous	Refuse	Citywide
2 Metal Bed Frames	20.00	Other Ferrous	MGP	Citywide
Child's Bicycle	28.00	Other Ferrous	MGP	Citywide
Freezer Door (Part)	38.00	Other Ferrous	MGP	Citywide
Metal + Plastic Chair	16.00	Other Ferrous	MGP	Citywide
Metal Appliance Cover	5.00	Other Ferrous	MGP	Citywide
Metal Baby Stroller	22.00	Other Ferrous	MGP	Citywide
Metal Bed Frame	85.70	Other Ferrous	MGP	Citywide
Metal Cabinet	63.80	Other Ferrous	MGP	Citywide
Metal Cart, Plastic Wheels	9.00	Other Ferrous	MGP	Citywide
Metal Ceiling Fan - Parts	14.00	Other Ferrous	MGP	Citywide
Metal Chair	25.30	Other Ferrous	MGP	Citywide
Metal Chair Piece	9.00	Other Ferrous	MGP	Citywide
Metal Container	22.00	Other Ferrous	MGP	Citywide
Metal Curtain Rod	8.00	Other Ferrous	MGP	Citywide
Metal File Drawer	15.00	Other Ferrous	MGP	Citywide
Metal Folding Chair	10.00	Other Ferrous	MGP	Citywide
Metal Frame	60.50	Other Ferrous	MGP	Citywide
Metal Office Chair	20.00	Other Ferrous	MGP	Citywide

Bulk Item List by Material Category, Spring 2005, WCS**

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
Bound Cardboard Boxes	80.00	Plain OCC/Kraft Paper	Refuse	High Density / High Income
Folded White Cardboard Boxes	16.50	Plain OCC/Kraft Paper	Refuse	Low Density / High Income
Brown Corrugated Paper	24.20	Plain OCC/Kraft Paper	Paper	High Density / Low Income
Brown Heavy Card Board 6X8 Could Not Be Bent	35.10	Plain OCC/Kraft Paper	Paper	Medium Density / Low Income
Standard Brown Cardboard Tied Together	37.60	Plain OCC/Kraft Paper	Paper	High Density / Low Income
White Cardboard Boxes/Moving Boxes	17.60	Plain OCC/Kraft Paper	Paper	Medium Density / High Income
White Paper Box (Holds Chair)	26.20	Plain OCC/Kraft Paper	Paper	Low Density / Medium Income
Corrugated Cardboard	27.60	Plain OCC/Kraft Paper	Street Basket	N / A
Coleman Cooler	6.50	Other PVC	Refuse	Low Density / High Income
Baby Car Seat	3.10	Other Plastics Materials	Refuse	Low Density / Medium Income
Bowling Ball	9.00	Other Plastics Materials	Refuse	High Density / High Income
Foam Twin Size Mattress Cover	12.20	Other Plastics Materials	Refuse	Medium Density / Medium Income
Hard Plastic Dog House	7.35	Other Plastics Materials	Refuse	Low Density / High Income
Ice Cooler (Plastic, Styrofoam)	2.30	Other Plastics Materials	Refuse	Low Density / Medium Income
Milk Can (Plastic)	7.00	Other Plastics Materials	Refuse	High Density / High Income
Plastic "Little Tike" Play Set Piece (Ladder)	7.50	Other Plastics Materials	Refuse	High Density / High Income
Plastic Bread Delivery Crate	25.50	Other Plastics Materials	Refuse	High Density / Medium Income
Plastic Bread Tray 16"X16"	3.40	Other Plastics Materials	Refuse	High Density / Low Income
Plastic Crates	6.20	Other Plastics Materials	Refuse	Medium Density / Medium Income
Plastic Gas Can (30-Gallon)	8.00	Other Plastics Materials	Refuse	High Density / Low Income
Plastic Gas Can (5-Gallon)	5.00	Other Plastics Materials	Refuse	High Density / Low Income
Plastic Luggage	13.60	Other Plastics Materials	Refuse	Medium Density / Low Income
Plastic Trash Can (Plastic)	2.60	Other Plastics Materials	Refuse	High Density / High Income
Portable Kennel (Plastic)	9.40	Other Plastics Materials	Refuse	Low Density / Medium Income
Trash Can (Plastic)	7.00	Other Plastics Materials	Refuse	High Density / Medium Income
Plastic Garbage Can	12.00	Other Plastics Materials	MGP	Medium Density / High Income
Plastic Refrigerator Interior Shelving	18.00	Other Plastics Materials	MGP	Medium Density / Low Income
5-Gallon Bucket (Plastic, Ferrous Metal)	2.40	Other Plastics Materials	Street Basket	N / A
Vinyl Hard Side Suitcase	26.20	Other Plastics Materials	Street Basket	N / A
Baby Crib Aluminum Frame	9.70	Other Aluminum	Refuse	High Density / Low Income
Ferrous Metal Siding	61.00	Other Aluminum	MGP	High Density / Low Income
Metal Siding	5.12	Other Aluminum	Street Basket	N / A
Black Luggage Bag	9.00	Other Non-Ferrous	Refuse	High Density / High Income
Metal Container, Possible Small Fridge	18.50	Other Non-Ferrous	Refuse	High Density / Medium Income
Work Out Bench - Nonferrous Metal	47.00	Other Non-Ferrous	Refuse	Medium Density / High Income
Large Black Suit Case	16.30	Other Non-Ferrous	Street Basket	N / A
"L" Channel Iron 2"X4" 4"L Rusted No Paint	38.40	Other Ferrous	Refuse	Low Density / Medium Income
Baby Stroller	17.60	Other Ferrous	Refuse	Low Density / Medium Income
Baby Stroller (Metal, Plastic, Cloth)	6.00	Other Ferrous	Refuse	High Density / Medium Income
Ferrous Metal	3.50	Other Ferrous	Refuse	Medium Density / Medium Income
Ferrous Metal Cart	18.50	Other Ferrous	Refuse	Low Density / Medium Income
Ferrous Metal Pipe	6.00	Other Ferrous	Refuse	Medium Density / Low Income

**Table 1-146
Bulk Item List by Material Category, Spring 2005, WCS (continued)**

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
Ferrous Metal Shelf Piece	10.40	Other Ferrous	Refuse	Low Density / Medium Income
Half Of Metal Hand Wagon Or Hand Truck	68.10	Other Ferrous	Refuse	Medium Density / High Income
Light Fixture, Wood And Metal	20.60	Other Ferrous	Refuse	Low Density / Medium Income
Metal Pole - Ferrous Metal	1.80	Other Ferrous	Refuse	Medium Density / Medium Income
Mini Steel Shopping Cart W/ Wheels	12.10	Other Ferrous	Refuse	High Density / Medium Income
Old Fan (HVAC/Commercial Size)	41.35	Other Ferrous	Refuse	Low Density / High Income
Painted Metal Decorative Tubing	7.20	Other Ferrous	Refuse	Low Density / High Income
Rubber Tire With Metal Wheel Base	28.40	Other Ferrous	Refuse	Medium Density / Low Income
Seat Of A Chair W/ Rotating Seat	8.80	Other Ferrous	Refuse	High Density / Low Income
Sheet Metal	41.90	Other Ferrous	Refuse	High Density / Low Income
Some Sort Of Metal Bar (Ferrous Metal)	1.90	Other Ferrous	Refuse	Medium Density / Medium Income
Steel Folding Chair With Cushion Seat	12.10	Other Ferrous	Refuse	Medium Density / Medium Income
Stroller	5.10	Other Ferrous	Refuse	High Density / Low Income
Tin Siding (Ferrous Metal)	7.70	Other Ferrous	Refuse	High Density / High Income
Tin Siding (Ferrous Metal)	10.70	Other Ferrous	Refuse	Low Density / Medium Income
Ferrous Bed Frame	25.00	Other Ferrous	MGP	High Density / High Income
Ferrous Bed Frame	30.00	Other Ferrous	MGP	High Density / Medium Income
Ferrous Cabinet	16.00	Other Ferrous	MGP	Medium Density / Medium Income
Ferrous Folding Chair	10.00	Other Ferrous	MGP	Low Density / High Income
Ferrous Metal	8.00	Other Ferrous	MGP	High Density / Low Income
Ferrous Metal Bed Frame	31.00	Other Ferrous	MGP	Low Density / Medium Income
Ferrous Metal Bed Frame	19.00	Other Ferrous	MGP	Medium Density / Medium Income
Ferrous Metal Cabinet	10.00	Other Ferrous	MGP	High Density / High Income
Ferrous Metal Cabinet	54.00	Other Ferrous	MGP	Low Density / High Income
Ferrous Metal Cabinet	20.00	Other Ferrous	MGP	Medium Density / High Income
Ferrous Metal Shelving	25.00	Other Ferrous	MGP	Low Density / High Income
Ferrous Metal Table	40.00	Other Ferrous	MGP	Medium Density / High Income
Ferrous Metal Tank	160.00	Other Ferrous	MGP	High Density / Low Income
Ferrous Metal Tubular Bed Frame	30.00	Other Ferrous	MGP	Medium Density / Low Income
Ferrous Oven Door	45.00	Other Ferrous	MGP	High Density / Low Income
Ferrous Sheet Metal	25.00	Other Ferrous	MGP	High Density / Low Income
Ferrous Shelving	10.00	Other Ferrous	MGP	Low Density / High Income
Ferrous Tubing	20.00	Other Ferrous	MGP	Medium Density / Low Income
Ferrous Tubing (Framing)	18.00	Other Ferrous	MGP	Medium Density / Medium Income
Ferrous Tubing (Square)	9.00	Other Ferrous	MGP	Medium Density / Low Income
Metal Cabinet	40.00	Other Ferrous	MGP	Low Density / Medium Income
Metal Shelving	40.00	Other Ferrous	MGP	Medium Density / Low Income
Plastic Ferrous Metal Refrigerator Door	16.00	Other Ferrous	MGP	Medium Density / Medium Income
Bike Frame (Ferrous Metal, Rubber)	16.20	Other Ferrous	Street Basket	N / A
Bottom Half Of Shopping Cart, Front Half Only	10.00	Other Ferrous	Street Basket	N / A
Desk (Ferrous Metal, Wood)	31.40	Other Ferrous	Street Basket	N / A
Metal Shelves	30.10	Other Ferrous	Street Basket	N / A

**Table 1-146
Bulk Item List by Material Category, Spring 2005, WCS (continued)**

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
Office Chair With Wheels	13.20	Other Ferrous	Street Basket	N / A
Shopping Cart - Plastic, Ferrous Metal	57.60	Other Ferrous	Street Basket	N / A
Baby Stroller	16.50	Mixed Metals	Refuse	Low Density / Medium Income
Small Metal Chair	13.20	Mixed Metals	Refuse	Low Density / High Income
Branches (Wood)	12.60	Prunings	Refuse	High Density / Medium Income
Branches From Bushes (Vegetation, Organic)	130.90	Prunings	Refuse	Low Density / High Income
Branches/Bush Clippings	28.10	Prunings	Refuse	Medium Density / Medium Income
Tree Branches With Leaves (Still Green)	6.00	Prunings	Refuse	Low Density / High Income
Tree Trimmings Branches	20.10	Prunings	Refuse	High Density / Low Income
Artificial Tree (Made From 2 Tree Limbs)	15.80	Stumps/Limbs	Refuse	Low Density / Medium Income
Log (Wood)	4.40	Stumps/Limbs	Refuse	Low Density / Medium Income
Tree Branch (Trimmed)	13.60	Stumps/Limbs	Refuse	Low Density / High Income
Tree Limb	30.00	Stumps/Limbs	Refuse	Low Density / Medium Income
Tree Limbs	40.45	Stumps/Limbs	Refuse	Low Density / Medium Income
Tree Limbs (2)	14.00	Stumps/Limbs	Refuse	Medium Density / High Income
1/2 Bed Frame (Wood, Cloth)	17.10	Wood Furniture/Furniture Pieces	Refuse	Low Density / High Income
1/2 Of A Couch Frame	40.90	Wood Furniture/Furniture Pieces	Refuse	High Density / Medium Income
Box Spring Mattress	38.50	Wood Furniture/Furniture Pieces	Refuse	High Density / Low Income
Chair (Wood, Ferrous Metal, Plastic/Vinyl)	11.40	Wood Furniture/Furniture Pieces	Refuse	Low Density / Medium Income
Chair Ferrous Metal, Fabric, Wood	26.60	Wood Furniture/Furniture Pieces	Refuse	High Density / High Income
Fabric, Wood, Cardboard Ferrous Metal (Part Of Cha	7.10	Wood Furniture/Furniture Pieces	Refuse	Medium Density / Medium Income
Foot Rest (Fabric, Wood)	31.20	Wood Furniture/Furniture Pieces	Refuse	High Density / Medium Income
Part Of A Couch	76.20	Wood Furniture/Furniture Pieces	Refuse	Low Density / Medium Income
Part Of Armchair Wood	11.40	Wood Furniture/Furniture Pieces	Refuse	Medium Density / Low Income
Recliner Leather And Wood	28.20	Wood Furniture/Furniture Pieces	Refuse	High Density / Medium Income
Small Wooden Table (Varnish)	14.50	Wood Furniture/Furniture Pieces	Refuse	Low Density / Medium Income
Table Top (Wood, Plastic)	17.00	Wood Furniture/Furniture Pieces	Refuse	High Density / Low Income
Twin Size Box Spring, Wood Frame With Upholstery	60.00	Wood Furniture/Furniture Pieces	Refuse	Low Density / High Income
Wood Table Top With Plastic Top/Cover	16.40	Wood Furniture/Furniture Pieces	Refuse	Medium Density / Low Income
Bamboo Poles	11.60	Non-C&D Untreated Wood	Refuse	High Density / Medium Income
Particle Board	7.30	Non-C&D Untreated Wood	Refuse	Medium Density / Low Income
Seat Pad (Fabric, Wood)	6.00	Non-C&D Untreated Wood	Refuse	High Density / Medium Income
Wood Step Ladder (3' Tall)	10.00	Non-C&D Untreated Wood	Refuse	Low Density / High Income
Wood Taboggan With Metal Sliders	9.00	Non-C&D Untreated Wood	Refuse	Low Density / Medium Income
1/4" Peg Board - Particle Board (Wood)	36.20	Non-C&D Untreated Wood	Street Basket	N / A
Black Travel Bag "Wheelie"	7.00	Non-Clothing Textiles	Refuse	High Density / Low Income
Cloth, Luggage, Wheelie	9.40	Non-Clothing Textiles	Refuse	High Density / High Income
Green Luggage Bag - Fabric Plastic	26.75	Non-Clothing Textiles	Refuse	High Density / Medium Income
Plastic Nylon Luggage	13.40	Non-Clothing Textiles	Refuse	Medium Density / High Income
Suitcase	10.80	Non-Clothing Textiles	Refuse	Medium Density / Medium Income
Suitcase (Fabric, Plastic, Nonferrous Metal)	8.80	Non-Clothing Textiles	Refuse	Low Density / High Income
Travel Bag	9.80	Non-Clothing Textiles	Refuse	Medium Density / Medium Income

Piece Of A Pallet	17.70	Untreated Dimension Lumber, Pallets, Crates	Street Basket	N / A
Plywood Pieces	52.95	Untreated Dimension Lumber, Pallets, Crates	Street Basket	N / A
Board With Latex On Top	12.40	Treated/Contaminated Wood	Refuse	Low Density / Medium Income
Fence Posts, Wood	54.10	Treated/Contaminated Wood	Refuse	Low Density / Medium Income
Ironing Board (Particle Board)	7.50	Treated/Contaminated Wood	Refuse	Low Density / High Income
Mattress, Wood	36.40	Treated/Contaminated Wood	Refuse	Low Density / High Income
Painted 2 X 4	28.20	Treated/Contaminated Wood	Refuse	Low Density / Medium Income
Painted 2X4'S	19.40	Treated/Contaminated Wood	Refuse	High Density / Medium Income
Painted Wood (Shelving)	54.00	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Partial Wooden Bed Frame - Particle Board	17.40	Treated/Contaminated Wood	Refuse	High Density / Low Income
Stained Pieces Of Wood 1/2"X3"X36 Wood	16.50	Treated/Contaminated Wood	Refuse	High Density / Medium Income
Trimmed Tree Branch	18.20	Treated/Contaminated Wood	Refuse	Low Density / High Income
Wood 2X4	21.20	Treated/Contaminated Wood	Refuse	Medium Density / Low Income
Wood 2X4 4X4 Ply	28.40	Treated/Contaminated Wood	Refuse	Low Density / High Income
Wood Case	11.80	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Wood Foot Of Bed Frame	9.90	Treated/Contaminated Wood	Refuse	Medium Density / Low Income
Wood Screen Door, Metal	60.41	Treated/Contaminated Wood	Refuse	Low Density / High Income
Wood Trim & Molding For Interior Finish Work	35.20	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Wooden Cabinet Door	8.80	Treated/Contaminated Wood	Refuse	Medium Density / Low Income
Wooden Cabinet Doors (Varnish)	16.30	Treated/Contaminated Wood	Refuse	Low Density / High Income
Wooden Planks W/ Nails (Wood, Ferrous Metal)	25.50	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
2X4 W/ Nails - Wood, Ferrous Metal	2.80	Treated/Contaminated Wood	Street Basket	N / A
Wooden Plank W/ Nails (Ferrous Metal)	12.10	Treated/Contaminated Wood	Street Basket	N / A
Drywall	39.20	Gypsum Scrap	Refuse	Medium Density / Medium Income
Closet Doors (Wood, Ferrous Metal)	31.00	Other Construction Debris	Refuse	High Density / Medium Income
Part Of Toilet	30.20	Other Construction Debris	Refuse	Low Density / High Income
Ferrous Sink	31.00	Other Construction Debris	MGP	High Density / Low Income
Foam Boogie-Board	2.10	Miscellaneous Inorganics	Refuse	Low Density / High Income

**Table 1-147
Bulk Item List by Material Category, Summer 2005, WCS**

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
4 Bundles Of Brown Cardboard	37.40	Plain OCC/Kraft Paper	Paper	High Density / Low Income
Brown Cardboard Bowflex Box	9.70	Plain OCC/Kraft Paper	Paper	High Density / Low Income
Misc Cardboard From Moving Boxes	15.10	Plain OCC/Kraft Paper	Paper	High Density / Low Income
Plain OCC Kraft Paper Brown Cardboard	17.90	Plain OCC/Kraft Paper	Paper	Low Density / Medium Income
Thick Cardboard	25.20	Plain OCC/Kraft Paper	Paper	High Density / Low Income
Boxes (Cardboard)	25.00	Plain OCC/Kraft Paper	Street Basket	N / A
White Piping (PVC)	12.80	Other PVC	Refuse	High Density / Low Income
30 Gal Rubbermaid Garbage Can	12.00	Other Rigid Containers/Packaging	Refuse	Low Density / Medium Income
Milk Crate (Plastic)	3.80	Other Rigid Containers/Packaging	Refuse	Medium Density / Medium Income
5 Gallon Pail (Plastic)	10.00	Plastic Materials: Other	Refuse	Medium Density / High Income
Bathroom Sink (Plastic)	13.14	Plastic Materials: Other	Refuse	Low Density / Medium Income
Blinds (Plastic)	25.10	Plastic Materials: Other	Refuse	High Density / Medium Income
Car Seat	10.00	Plastic Materials: Other	Refuse	Medium Density / High Income
Chair Back Cushion (Foam, Plastic)	14.60	Plastic Materials: Other	Refuse	Medium Density / Medium Income
Cooler (Plastic)	3.00	Plastic Materials: Other	Refuse	Low Density / Medium Income
Crushed Crate (Plastic)	30.55	Plastic Materials: Other	Refuse	Low Density / High Income
Freezer Door (Plastic)	7.84	Plastic Materials: Other	Refuse	High Density / Low Income
Garden Hose	4.00	Plastic Materials: Other	Refuse	Low Density / High Income
Hard Rug (Plastic)	6.00	Plastic Materials: Other	Refuse	High Density / Medium Income
Large Barrel, No Lid (Plastic)	12.80	Plastic Materials: Other	Refuse	High Density / Low Income
Milk Crate	6.60	Plastic Materials: Other	Refuse	Medium Density / Medium Income
Office Chairs Plastic + Foam Padding - 3 Office Chairs	51.00	Plastic Materials: Other	Refuse	High Density / High Income
Plastic Barrel/Container	17.58	Plastic Materials: Other	Refuse	High Density / Medium Income
Plastic Child Table	7.00	Plastic Materials: Other	Refuse	High Density / Low Income
Plastic Lawn Chair	10.00	Plastic Materials: Other	Refuse	High Density / Low Income
Plastic Storage Container (Clothes Or Dried Goods)	12.90	Plastic Materials: Other	Refuse	High Density / Low Income
Rubber Tub (Plastic)	9.80	Plastic Materials: Other	Refuse	High Density / Medium Income
Siding (Plastic)	36.60	Plastic Materials: Other	Refuse	Low Density / Medium Income
Stroller (Plastic, Rubber Wheels)	26.60	Plastic Materials: Other	Refuse	Low Density / Medium Income
Suitcase (Cloth, Plastic)	16.00	Plastic Materials: Other	Refuse	High Density / Medium Income
Suitcases (Plastic)	27.60	Plastic Materials: Other	Refuse	High Density / Medium Income
Traffic Cone	7.60	Plastic Materials: Other	Refuse	High Density / High Income
Water Dispenser (Plastic)	18.00	Plastic Materials: Other	Refuse	Medium Density / High Income
Bucket (For Mopping) Plastic, W/ Metal Handle	7.40	Plastic Materials: Other	Street Basket	N / A
Front Car Bumper (Plastic)	10.00	Plastic Materials: Other	Street Basket	N / A
Small Crate (Plastic)	3.60	Plastic Materials: Other	Street Basket	N / A
Suitcase (Cloth, Plastic Frame)	9.40	Plastic Materials: Other	Street Basket	N / A
Suitcase (Poly Vinyl)	12.80	Plastic Materials: Other	Street Basket	N / A
Childs Big Wheel Tricycle (Plastic)	5.60	Plastic Materials: Toys/Housewares	Refuse	High Density / Low Income
Childs Play House Door (Plastic)	12.80	Plastic Materials: Toys/Housewares	Refuse	Low Density / Medium Income
Kitchen Trash Can (Plastic)	2.60	Plastic Materials: Toys/Housewares	Refuse	Low Density / High Income
Power Wheel Toy Plastic W/ Metal	49.80	Plastic Materials: Toys/Housewares	Refuse	Low Density / High Income

**Table 1-147
Bulk Item List by Material Category, Summer 2005, WCS (continued)**

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
Spring Board Child	12.00	Plastic Materials: Toys/Housewares	Refuse	Low Density / High Income
Trash Can (Wicker, Plastic)	7.80	Plastic Materials: Toys/Housewares	Refuse	High Density / Low Income
Clothing Rack (Metal)	12.20	Non-Ferrous: Other	Refuse	Low Density / High Income
Piping (Copper)	2.60	Non-Ferrous: Other	Refuse	High Density / Medium Income
Charcoal Grill (Non Ferrous)	0.72	Non-Ferrous: Other	MGP	Low Density / High Income
Helium Balloon Tank (Non Ferrous)	8.30	Non-Ferrous: Other	MGP	Low Density / Medium Income
Window Screening (Non Ferrous)	3.82	Non-Ferrous: Other	MGP	High Density / High Income
Kids Bike (Rubber Wheels, Non Ferrous Frame)	0.87	Non-Ferrous: Toys/Housewares	MGP	High Density / Low Income
Kids Mountain Bike (Non Ferrous Frame, Rubber Tire)	20.40	Non-Ferrous: Toys/Housewares	MGP	High Density / Low Income
18 Speed Bike (Metal, Plastic)	32.00	Ferrous: Other	Refuse	Low Density / Medium Income
Baby Stroller	21.20	Ferrous: Other	Refuse	Medium Density / Medium Income
Bed Frame, One Side (Metal, Cloth)	8.52	Ferrous: Other	Refuse	High Density / High Income
Bottom Of Sofa Poly W/ Metal	25.60	Ferrous: Other	Refuse	Medium Density / Low Income
Car Brake (Metal)	42.43	Ferrous: Other	Refuse	Medium Density / Medium Income
Chair (Metal, Foam)	8.01	Ferrous: Other	Refuse	Low Density / High Income
Chair Base (Metal, Foam)	12.40	Ferrous: Other	Refuse	Medium Density / Medium Income
Childs Chair W/ Cushion Seat Covered In Vinyl	48.00	Ferrous: Other	Refuse	High Density / Medium Income
Cover To AC Vent (Ferrous Metal)	4.50	Ferrous: Other	Refuse	High Density / High Income
Cross Ream (Metal)	10.60	Ferrous: Other	Refuse	Medium Density / High Income
Folding Chair (Metal)	7.60	Ferrous: Other	Refuse	High Density / Medium Income
Gate (Metal)	65.00	Ferrous: Other	Refuse	Low Density / Medium Income
Golf Bag Caddy (Metal, Plastic Wheels)	7.56	Ferrous: Other	Refuse	Low Density / Medium Income
Ironing Board - Wooden Table, Ferrous Legs Cloth	10.00	Ferrous: Other	Refuse	High Density / Medium Income
Lawn Mower (Metal, Plastic)	53.40	Ferrous: Other	Refuse	Low Density / Medium Income
Light Table, Box With Light Fixtures (Metal)	7.20	Ferrous: Other	Refuse	Low Density / Medium Income
Metal (Crushed Up Filing Cabinet)	81.08	Ferrous: Other	Refuse	Low Density / Medium Income
Metal Gate	53.00	Ferrous: Other	Refuse	Low Density / High Income
Metal Piping	51.20	Ferrous: Other	Refuse	Low Density / Medium Income
Office Chair (Metal, Wool)	21.30	Ferrous: Other	Refuse	Medium Density / Low Income
Shopping Cart (Ferrous Metal)	8.76	Ferrous: Other	Refuse	Medium Density / High Income
Shopping Cart (Metal, Plastic)	61.00	Ferrous: Other	Refuse	Low Density / High Income
Small Chair Metal Foam/Vinyl Cushion	7.70	Ferrous: Other	Refuse	Low Density / Medium Income
Stroller Med Size Metal + Cloth Seating	10.80	Ferrous: Other	Refuse	Medium Density / Medium Income

Various Wood Pieces, Board In String	18.30	Untreated Dimension Lumber, Pallets, Crates	Refuse	High Density / Low Income
Wood Board	2.10	Untreated Dimension Lumber, Pallets, Crates	Refuse	Low Density / High Income
Wood Plank (Plywood)	8.20	Untreated Dimension Lumber, Pallets, Crates	Refuse	Low Density / High Income
Wood Slabs	32.60	Untreated Dimension Lumber, Pallets, Crates	Refuse	Medium Density / Low Income
Wooden Pallets	73.40	Untreated Dimension Lumber, Pallets, Crates	Refuse	Low Density / High Income
Pallet With Nails (Wood)	17.10	Untreated Dimension Lumber, Pallets, Crates	Street Basket	N / A
Ply Wood	6.45	Untreated Dimension Lumber, Pallets, Crates	Street Basket	N / A
Various Pieces Of Wood	7.75	Untreated Dimension Lumber, Pallets, Crates	Street Basket	N / A
2 Wood Panels	26.04	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
3 Pieces(2'X2' Particle Board W/ Black Veneer)	28.90	Treated/Contaminated Wood	Refuse	High Density / High Income
3 Varnished Wood Pieces	6.20	Treated/Contaminated Wood	Refuse	High Density / High Income
Cabinet (Wood Panel)	8.40	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Cabinet Board 1Ft X 2Ft - Treated Wood	5.00	Treated/Contaminated Wood	Refuse	High Density / Medium Income
Door Pieces W/ Hanger Metal	15.40	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Door Solid Wood Painted	29.40	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Fence (Wood)	24.60	Treated/Contaminated Wood	Refuse	Low Density / High Income
Fence Post (Wood)	36.00	Treated/Contaminated Wood	Refuse	Low Density / Medium Income
Painted Piece Of Wood	4.00	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Painted Wood	6.20	Treated/Contaminated Wood	Refuse	Low Density / Medium Income
Particle Board	51.80	Treated/Contaminated Wood	Refuse	High Density / High Income
Particle Board	17.00	Treated/Contaminated Wood	Refuse	High Density / Medium Income
Particle Board	7.60	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Particle Board Doors	27.20	Treated/Contaminated Wood	Refuse	High Density / Medium Income
Particle Board Pieces	26.70	Treated/Contaminated Wood	Refuse	High Density / Low Income
Particle Board Scraps	64.00	Treated/Contaminated Wood	Refuse	Medium Density / Medium Income
Set Of Doors - Wood (Composite(Particle) W/ Metal	97.70	Treated/Contaminated Wood	Refuse	High Density / Medium Income
White Under Covered Party Board	17.10	Treated/Contaminated Wood	Refuse	High Density / Low Income
Wood Cabinet	42.80	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Wood Pieces-Baseboards	16.00	Treated/Contaminated Wood	Refuse	High Density / Low Income
Wood Slats	10.00	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Wood Slats	43.00	Treated/Contaminated Wood	Refuse	Medium Density / Low Income
Wooden Door	40.00	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Wooden Platform	20.00	Treated/Contaminated Wood	Refuse	Medium Density / High Income
Insulation (For A House)	8.32	Other Construction Debris	Refuse	Low Density / High Income
Pieces Of Cabinet Top - Particle Board + Laminated	17.70	Other Construction Debris	Refuse	High Density / Medium Income
Sink (Stainless Steel)	7.00	Other Construction Debris	Refuse	Low Density / High Income
Toilet	23.80	Other Construction Debris	Refuse	Low Density / Medium Income

Table 1-147
Bulk Item List by Material Category, Summer 2005, WCS (continued)

Bulk Item	Total Bulk Weight (lbs)	Category	Stream	Density / Income Stratum
Bath Tub	21.75	Other Construction Debris	MGP	High Density / Low Income
2 Window Frames, 1 With Glass (Aluminum)	18.45	Other Construction Debris	Street Basket	N / A
Porcelain Sink With Metal Hardware	84.20	Other Construction Debris	Street Basket	N / A
Artificial Christmas Tree Inside Of A Cardboard Box	31.52	Miscellaneous Inorganics	Refuse	Low Density / High Income
Cardboard Boxes Filled With Fluorescent Light	32.80	Fluorescent Tubes	Refuse	High Density / Medium Income

6.3 Durable Items

For the purposes of the WCS, durables included the following categories of waste, whether or not they fit the definition of “bulk” (i.e., whether they were able to fit into a 96-gallon container or not).

- Audio visual equipment/cell phones
- Televisions
- Computer monitors
- Other computer equipment
- Small appliances: plastic, ferrous, and non-ferrous
- Other plastic materials
- Wood furniture/furniture pieces
- Non **C&D** untreated wood
- Upholstered/Other organic type furniture

Tables 1-148 through 1-153 present a summary of the composition of the durables in the PWCS and the WCS citywide and by borough. Each table shows the percentage of durable items for the Refuse, MGP, and Waste streams for the PWCS and each season and annually for the WCS. They also include tonnage projections by material group – plastic, metal, organic, appliance/electronics, and miscellaneous durables. These tables are useful in comparing the disposal and recycling of durable items, by material, through the seasons.

(1) Tonnage values calculated using DSNY average weekly curbside tonnages over the period from May 2004 through September 2005. More detail on how and why tonnages from this period were used to estimate generation can be found in Section 2.2.6 in Volume 2.

In the Summer Sort, a more detailed assessment of durables was carried out, with the number of sort categories increased from 91 to 103, with the additional categories reflecting functional subsets of durables and film. Data from this exercise in comparison to less detailed data from prior seasons is presented in Tables 1-154 through 1-156. These tables identify the durable items citywide by material category for Refuse, MGP, and Waste. Each table identifies the percentage of durable items in each material category, accounting for the changes in material categories in the PWCS, WCS (fall, winter, spring), and WCS (summer). In addition, information on product counts conducted in the PWCS is presented in these tables as well. These tables are helpful in making detailed comparisons of durable items across the material categories by season, citywide.

Section 7: Moisture and Particulate Testing Results

[This page intentionally left blank.]

Section 7 Moisture and Particulate Testing Results

7.1 Introduction

One factor that can influence the composition of waste is the presence of moisture or particulates. For example, the weight of a wet newspaper can be 20 percent more than the weight of a dry newspaper. Because the composition estimates in the WCS are based on weight, the presence of moisture can skew the results. Similarly, if food waste or pieces of broken glass adhere to paper or other materials, they can obscure the true percentage of that material in the waste stream.

To account for the presence of moisture or particulates, certain materials in the PWCS and the WCS were tested. Those materials for which moisture or particulates might affect their weight were selected for testing by DSNY. These materials, for the PWCS and WCS, are shown in Table 1-157. Not all materials to be tested were present in every sample.

7.2 Moisture and Particulate Testing and Results

During the sorting process, sampling units of Refuse and Recycling (both MGP and Paper) were randomly selected for moisture and particulate testing. For the PWCS and each season of the WCS, the samples to be tested were pre-selected using a random number generator. A list of the randomly selected samples was given to the Field Supervisors and they, in turn, notified Crew Chiefs when a selected sample was scheduled to be tested.

After all materials in the sample selected for testing had been sorted and weighed, the materials to be tested (see Table 1-157) were set aside. A one pound to two pound quantity of each material to be tested was double-bagged in plastic. These quantities were called “Moisture Testing Units” or “MTUs”. MTUs were shipped overnight to a laboratory experienced in this type of analysis and tested. During the PWCS, 641 MTUs from 41 samples were tested. During the WCS, 552 MTUs from 33 samples were tested.

To assess the presence of moisture, each material was weighed as received, dried, and weighed again. To assess the presence of particulates, after moisture testing each material was carefully brushed and cleaned to separate any foreign material. Both the target material and the foreign substances were weighed.

The results of the moisture and particulate testing for the PWCS and the WCS are presented in Tables 1-158 and 1-159. These tables show the average percentage of moisture, particulates, and material for each material tested during the PWCS and the WCS. This information is useful in understanding the affect of moisture and particulates on the weight of the materials tested in the Refuse and Recycling streams.

7.3 Comparison of Moisture and Particulate Testing – WCS and the 1989/1990 Study

Although both the WCS and the 1989/1990 Study tested samples of waste for moisture, differences in the methodology used in each study make a comprehensive comparison of the results problematic. Their differences include:

- Analysis: The 1989/1990 Study included a series of laboratory analyses on samples of waste in order to estimate the physical and chemical properties of the materials. This analysis included an estimate of the moisture content, along with estimates of volatiles, ash, fixed carbon, and other chemical constituents. The WCS included laboratory tests on selected materials to estimate moisture content and particulates. The 1989/1990 Study did not test for particulates.
- Materials Selected for Testing: The 1989/1990 Study selected 12 materials for testing. Six of these materials were material *categories*: Lumber, Textiles, Rubber, Diapers, Fines, and Ceramics. The other six of these materials were material *groups*: Paper, Plastic, Organics, Glass, Metal, and Inorganics. In these cases, the composition of the material group was determined by taking the representative percentage of material from each material category in the group. For example, the paper sample was composed of 10 percent corrugated cardboard, 35 percent newspaper, 5 percent office paper, 10 percent magazines, 5 percent books, 10 percent cardboard, and 25 percent mixed paper.

The WCS selected 21 materials categories, most of which were not specifically tested in the 1989/1990 Study. For example, the WCS tested all paper categories individually, but did not aggregate them into a single “Paper” group.

- MTU Testing: The 1989/1990 Study tested a total of 42 MTUs each season (5 MTUs of each of the material Paper, Plastic, and Organics; 3 MTUs of each of the other 9 materials). The MTUs were tested for moisture and then tested for physical and chemical constituents. Over the four seasons, a total of 168 MTUs were tested for moisture in the 1989/1990 Study.

As noted above, during the PWCS, 641 MTUs were tested for moisture and particulates. In the WCS, a total of 552 MTUs were tested for moisture over the four seasons. The number of MTUs tested each season in each study is presented in Table 1-160.

Table 1-160
Number of Samples Tested for Moisture Content in the 1989/1990 Study and the WCS

Season	1989/1990 Study	WCS
PWCS	NA ⁽¹⁾	385
Fall	42	88
Winter	42	183
Spring	42	171
Summer	42	69
Total	168	511

(1) The 1989/1990 Study did not include a study comparable to the PWCS

As noted above, the 1989/1990 Study did not include particulate testing; nor did the WCS test for physical and chemical constituents. Therefore the two studies can only be compared in terms of moisture content.

The materials tested in the 1989/1990 Study and those tested in the WCS were not the same. Table 1-161 shows the materials tested in each study.

Table 1-161
Materials Tested for Moisture Content in the 1989/1990 Study and the WCS

1989/1990 Study	WCS ⁽¹⁾
Paper	Newspaper (Paper)
Plastics	Plain OCC/Kraft Paper (Paper)
Organics	Mixed Low Grade Paper (Paper)
Lumber	Phone Books/Paperbacks (Paper)
Textiles	Paper Bags (Paper)
Rubber	Polycoated Paper Containers (Paper)
Diapers	Compostable/Soiled Paper/Waxed OCC (Paper)
Fines	Single Use Paper Cups, Plates (Paper)
Ceramics	Other Non-Recyclable Paper (Paper)
Glass	PET Bottles (Plastic)
Metal	HDPE Bottles – Natural (Plastic)
Inorganics	Rigid Polystyrene Containers and Packaging (Plastic)
	Other Rigid Containers/Packaging (Plastic)
	Plastic Bags (Plastic)
	Other Film (Plastic)
	Single Use Plastic Plates, Cups, Cutlery (Plastic)
	Aluminum Cans (Metal)
	Aluminum Foil/Containers (Metal)
	Non-Clothing Textiles (Organics)
	Clothing Textiles (Organics)

(1) Material Group to which category belongs is shown in parentheses

Both studies tested Paper and Plastics. However, the 1989/1990 Study combined the specific types of paper into a single sample, as described above. The WCS tested the specific types of materials individually. To adjust for these differences the average moisture content of Paper in the 1989/1990 Study is compared with the weighted average of the paper categories in the WCS Annual Residential Refuse. That is, the average moisture content of each of the ten WCS paper categories is weighted by its percentage contribution to the total percentage of Paper. For example, Paper represents an estimated 23.32 percent of the annual citywide residential refuse in the WCS. Newspaper represents 3.65 percent of the refuse, or 16 percent of the Paper. Therefore, the average moisture content of newspaper is given a 16 percent weighting. A similar calculation is made for the other paper categories and the total summed. A similar procedure is used for Plastics.

Textiles were also tested in both studies. The WCS tested two textile materials for moisture content, Clothing and Non-Clothing. In this case, each material is given proportional weighting. Clothing and Non-Clothing Textiles represent an estimated 4.67 percent of the refuse. Clothing represents 3.03 percent and Non-Clothing represents an estimated 1.64 percent. To combine them, the average moisture content of Clothing Textiles is given a 65 percent weight ($3.03/4.67 = 65$ percent) and Non-Clothing is given a 35 percent weight.

Table 1-162 summarizes the way in which the results of the two studies have been adjusted to compare moisture content.

Table 1-162
Adjustments to Material Groups and Categories in the 1989/1990 Study and the WCS

1989/1990 Study	WCS
Paper	Combine 10 Paper categories ⁽¹⁾
Plastic	Combine 7 Plastics categories ⁽¹⁾
Textiles	Combine Clothing and Non-Clothing Textiles ⁽²⁾

(1) Combined by using the weighted percentages from the WCS Annual Citywide Refuse results for Paper and applying the weighted percentage to the estimated moisture content.
(2) Combined by applying the weighted composition percentage of Clothing Textiles and Non-Clothing Textiles to moisture content of each category and summing the two.

Table 1-163 compares the moisture content of Paper, Plastic, Metals, and Textiles from the 1989/1990 Study and the WCS.

Table 1-163
Comparison of Moisture Content between 1989/1990 Study and WCS Refuse

Material Group/Category	2004/2005 Moisture %	1989/1990 Moisture %
Paper	33%	18%
Plastic	21%	13%
Metal	26%	12%
Textiles	19%	15%

The differences in the procedures for sampling and analysis may account for the differences in moisture content shown in Table 1-163.

Section 8 Statistical Results

8.1 Introduction

The results of the PWCS and WCS present an estimate of the composition of the City's refuse and recycling. Because it is not possible to know the true percentage of each material, unless every ounce of the City's waste was sorted, the percentage is estimated using statistical analysis. This analysis results in four metrics.

The estimated percentage of each material in the waste is the statistical **Mean**. The Mean is the best, single point estimate of the true percentage of each material. For example, the Mean for newspaper in the PWCS refuse is 3.71 percent.

The **Standard Deviation** is a measure of the dispersion around the Mean. In all refuse sampling units sorted during the PWCS, newspaper was 3.71 percent in few, if any, of the sampling units. In some sample units, the percentage of newspaper was higher than 3.71 percent; in some sample units, the percentage of newspaper was lower than 3.71 percent. The Standard Deviation quantifies the "spread" of the percentage of newspaper in all samples.

The **Confidence Interval**, with its **Upper Boundary** and **Lower Boundary**, presents the range within which there is a 90 percent certainty that the true Mean (i.e., the true percentage of the material in the waste stream) resides. In the example of newspaper in the PWCS refuse, the best single estimate of the percentage of newspaper is 3.71 percent and there is 90 percent certainty that the true percentage is between 3.33 percent and 4.10 percent. Confidence Intervals can be calculated for any level of certainty, but the 90 percent level is an accepted industry standard. The use of a 90 percent confidence level instead of a 95 percent level (the standard for scientific research) does not affect the calculation of means, only the width of intervals around the means. So, for example, a mean of 5 percent for the composition of a particular material category might have a confidence interval of 4 percent to 6 percent at a 90 percent level and 3 percent to 7 percent at a 95 percent level. In reference to each statistic, we would correspondingly say that we are confident that the true mean for that material – if we were able to sample all the waste in New York City – would fall 90 percent of the time between 4 percent and 6 percent and 95 percent of the time between 3 percent and 7 percent.

For this reason, it is not applicable to say that a 95 percent confidence level is "better" than a 90 percent level; nor to expect that the results in terms of means – the statistics that primarily inform us about the make up of New York City waste – would change if a different level were applied.

8.2 Statistical Results by Material

Tables 1-164 through 1-191 present the statistical results for the PWCS and the WCS by material category for Refuse, Paper, and MGP. Each table shows the Mean, Standard Deviation, and Upper and Lower Boundaries for the PWCS and the WCS across seasons for each of the eight density/income strata, for Refuse, MGP, and Waste Streams, as well as Street Basket Waste. These results are based on the direct **observation** during the sampling and sorting of

these streams. These tables are useful for understanding the statistical basis for the composition estimates.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

(1) When none of a particular material was found in any of the samples, the mean, standard deviation, and confidence interval boundaries are listed as zero percent. However, it is possible for these materials to exist in the waste stream. The level at which they may exist was not determined in this study.

8.3 Analysis of Variability – PWCS and WCS

In understanding the composition of the waste stream, it is useful to know something about the variability of each material in the waste stream. The percentage of a material may be relatively consistent across density/income strata and seasons or it may fluctuate significantly. The variability of each material is indicated by the statistical results. There are two kinds of variability that we may be concerned with in the statistical results.

The first kind is the variability that a material exhibits from sampling unit to sampling unit. For example, the percentage of newspaper in three samples may vary from 2 percent to 5 percent to 3 percent. This kind of “absolute” variability is measured by the Standard Deviation. For example, in the PWCS Refuse, the Standard Deviation of Food Waste was 8.13 percent and the Standard Deviation of Latex Paints was 0.57 percent, as shown in Table 1-164. A high Standard Deviation indicates that the percentage of a material in one sample varied significantly from percentage of that material in the next sample. This measure of variability, the Standard Deviation, for each stream, material, season, and strata, is shown in Tables 1-164 through 1-191.

The second kind of variability, “relative” variability (also called the “coefficient of variation”) shows the variation from one sampling unit to the next compared to the Mean. The coefficient of variation is calculated by dividing the Standard Deviation by the Mean. The coefficient of variation for Food Waste in the PWCS refuse was 51 percent ($8.13 \text{ percent} / 15.93 \text{ percent} = 51 \text{ percent}$) and the coefficient of variation for Latex Paints was 1140 percent ($0.57 \text{ percent} / 0.05 \text{ percent} = 1140 \text{ percent}$). A high coefficient of variation indicates that, in relation to the Mean, the percentage of a material in one sample varied significantly from the percentage of that material in the next sample.

Tables 1-192 to 1-224 list the refuse materials in the PWCS and the WCS with the greatest and smallest coefficient of variation by season and strata. Each table presents three rankings of variability:

- The coefficient of variation for each of the nine material groups, from highest to lowest;
- The ten material categories with the greatest coefficient of variation; and
- The ten material categories with the smallest coefficient of variation.
