**To:** NYCDCP  
**From:** STV Incorporated  
**Date:** August 29, 2016  
**Project:** Jerome Avenue Rezoning EIS  
**Reference:** Transportation Planning Factors and Travel Demand Forecast

---

This memorandum summarizes the transportation planning factors to be considered for analyses of traffic, parking, transit, and pedestrian conditions for the *Jerome Avenue Rezoning EIS*. Estimates of the peak travel demand for the Proposed Actions' reasonable worst-case development scenario (RWCDS) are provided, along with a discussion of trip assignment methodologies and study area definitions.

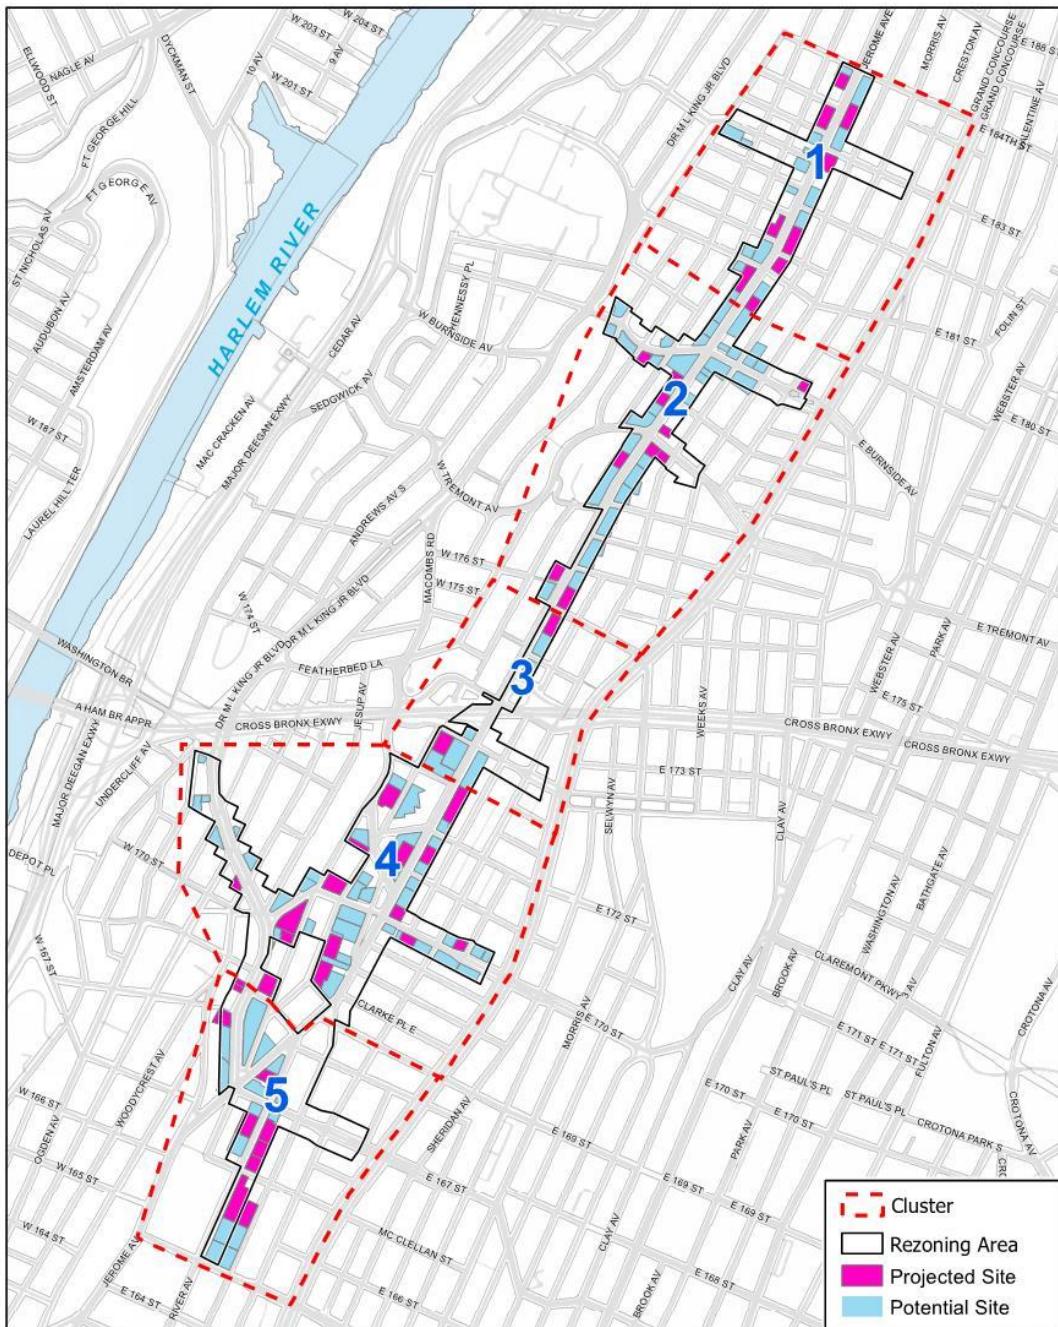

## **PROPOSED ACTIONS**

The Proposed Actions include zoning map amendments and zoning text amendments affecting approximately 73 blocks in the Bronx. The rezoning area includes portions of the University Heights, Fordham, Morris Heights, Mount Hope, Mount Eden, and Highbridge neighborhoods in Community Districts 4, 5, and 7, along an approximately two-mile street of Jerome Avenue between Fordham Road to the north and Mullaly Park to the south (see **Figure 1**). The rezoning area is currently zoned with a mix of residential, commercial, and light manufacturing zoning districts.

## **THE REASONABLE WORST CASE DEVELOPMENT SCENARIO (RWCDS)**

A RWCDS for both “future without the proposed actions” (No-Action) and “future with the proposed actions” (With-Action) conditions is analyzed for an analysis year of 2026 in order to assess the potential effects of the Proposed Actions. Likely development sites were identified and divided into two categories: projected development sites and potential development sites to develop a reasonable estimate of future growth. The projected development sites are those considered more likely to be developed within the ten-year analysis period for the Proposed Actions (i.e., by the 2026 analysis year), while potential sites are considered less likely to be developed over the same period. Only projected development sites are considered for the purposes of the transportation analyses. **Table 1** lists the total anticipated No-Action and With-Action land uses on projected development sites in 2026 under the RWCDS.

Overall, the rezoning area encompasses approximately 73 blocks and includes a total of 45 projected development sites (see **Figure 1**). The projected development sites were grouped into a total of five “clusters” for travel demand forecasting and trip assignment purposes. These clusters were defined based on the rezoning area roadway network characteristics and the likely travel routes of vehicle trips to and from the development sites. The location of each cluster is shown on **Figure 1**, and the projected development sites included in each cluster are listed in **Table 2**.

## PRELIMINARY TRANSPORTATION PLANNING FACTORS

The transportation planning factors proposed for use in forecasting travel demand for the Proposed Actions (expressed as land uses) are summarized in **Table 3** and discussed below<sup>1</sup>. The trip generation rates, temporal distributions, modal splits, vehicle occupancies, and truck trip factors for each of the land uses were based on those cited in the 2014 *CEQR Technical Manual*, factors developed for recent environmental reviews, 2010-2014 American Community Survey ("ACS") journey-to-work data, and American Association of State Highway and Transportation Officials Census Transportation Planning Products (AASHTO CTPP) data. Factors are shown for the weekday AM and PM peak hours (typical peak periods for commuter travel demand) and the weekday and Saturday midday peak hours (typical peak periods for retail demand).

### *Residential*

The residential travel demand forecasts are based on person trip and truck trip generation rates and temporal distributions cited in the *CEQR Technical Manual* and approved for use. The directional in/out splits are based on data from the *Webster Avenue Rezoning EIS*, which relates to a nearby rezoning.

It is noted that ACS vehicle occupancy data reflect the average vehicle occupancy for personal auto trips to and from work, and therefore do not present the complete picture of average vehicle occupancy for other purposes (e.g., shopping, errands, social and recreational activities, school trips, etc.). In general, vehicle occupancy rates for non-work-related trips have been found to be higher than vehicle occupancy rates for work-related trips. As documented in the *East New York Rezoning EIS*, both national data from USDOT-FHWA's *Summary of Travel Trends: 2009 National Household Travel Survey* and regional data from the *Regional Travel-Household Interview Survey* prepared for the New York Metropolitan Transportation Council and the North Jersey Transportation Planning Authority indicate that average vehicle occupancy rates for all auto trips are more than 1.4 times the average vehicle occupancy rates for auto trips to and from work. As such, the weekday AM/PM peak hour vehicle occupancy rates derived from the ACS data are adjusted by a multiplicative factor of 1.4 for the weekday midday peak hour to reflect the predominance of non-work-related trips during these periods. While not all AM and PM peak hour trips are work-related, the lower vehicle occupancy rates for trips to and from work are conservatively applied to all auto trips in these peak travel hours.

---

<sup>1</sup> The No-Action garage floor area is an accessory to other uses and is not expected to generate additional vehicle trips independent of these uses. It is, therefore, not reflected in the travel demand forecast as an independent use.

- (2) Based on data from Webster Avenue Rezoning EIS, 2011.
- (3) Based on data from East Fordham Road Rezoning EIS, 2013.
- (4) RJTW based on CTPP 2006-2010 data for census tracts 197, 199, 209, 211, 213.02, 217, 219, 221.01, 223, 227.01, 227.02, 233.01, 239, 241, 243, and 251.
- (5) JTW based on CTPP 2010-2014 data for census tracts 197, 199, 209, 211, 213.02, 217, 219, 221.01, 223, 227.01, 227.02, 233.01, 239, 241, 243, and 251.
- (6) Midday and Saturday auto occupancy determined by applying a multiplier (1.4) to the AM/PM rate based on East New York Rezoning EIS.
- (7) Based on data from East New York Rezoning EIS, 2015.
- (8) Based on ITE's Trip Generation Manual rate for High-Turnover (Sit-Down) Restaurant (932) & Fast-Food Restaurant with Drive-Through (934).
- (9) Based on data from Lower Concourse Rezoning EIS, 2009.
- (10) Crotona Park East / West Farms Rezoning EIS, 2011.
- (11) Saturday rate based on ITE's Trip Generation Manual (8<sup>th</sup> Edition) average rate proportion between weekday and Saturday.
- (12) Assumes weekday midday temporal distribution and in/out splits for Saturday.
- (13) Assumes 5 percent of weekday truck trip generation rate (consistent with Lower Concourse Rezoning EIS assumptions for Manufacturing and Warehousing land).
- (14) Assumed to be the same as Restaurant land use for Webster Avenue Rezoning EIS, 2011.
- (15) Based on data for Covenant House from NYCT - Number 7 Extension Project EIS, 2003.
- (16) Saturday trip rate based on ration between Saturday and weekday rates for Residential lane use. Similarly, Saturday temporal distribution based on weekday versus Saturday midday Residential.
- (17) Based on data from Pier 57 Redevelopment Project EIS, 2013.
- (18) Based on ITE's Trip Generation Manual rate for Auto Dealership (841).
- (19) Based on ITE's Trip Generation Manual rate for Warehousing (150).

Residential-based trips in the weekday midday peak hour more likely would be local, compared to non-local trips made during the commuter peak hours (and local trips would be expected to have a higher walk share, for example). However, modal splits based on the ACS journey-to-work data are conservatively assumed for all periods.

### *Local Retail*

The trip generation rates and temporal distributions for local retail uses are based on data from the *CEQR Technical Manual*. The modal and directional in/out splits and vehicle occupancy rates are based on data from the *Webster Avenue Rezoning EIS*. Truck trip generation rates and temporal distributions are based on data from the *CEQR Technical Manual*. For the purposes of the travel demand forecast, it is assumed that ten percent of all local retail trips would be linked trips, with multiple destinations within the rezoning area, as permitted according to the *CEQR Technical Manual*. FRESH supermarkets are proposed for the rezoning area and the trip generator factors were based on the *East New York Rezoning EIS*. The gas station trip generator factors were based on the *Lower Concourse Rezoning EIS*.

### *Regional Retail*

The trip generation rates and temporal distributions for regional retail uses are based on data from the *CEQR Technical Manual*. The modal splits are based on reverse journey-to-work data and directional in/out splits, and vehicle occupancy rates are based on data from the *East Fordham Road Rezoning EIS*. Truck trip generation rates and temporal distributions were also based on data from the *East Fordham Road Rezoning EIS*.

### *Non-Retail Commercial Uses*

Non-retail commercial land uses within the rezoning area in the No-Action and/or With-Action conditions include office, restaurant, and auto-related uses (auto repair, auto sales, gas station). As shown in **Table 3**, the factors used to forecast travel demand from these uses were developed from a variety of sources, including the *CEQR Technical Manual*, ITE's *Trip Generation Manual* (8<sup>th</sup> Edition), the *Webster Avenue Rezoning EIS*, *East New York Rezoning EIS*, *Lower Concourse Rezoning EIS*, and AASHTO CTPP reverse journey-to-work data for workers in the census tracts in the study area (Bronx Census Tracts 195, 197, 199, 209, 211, 213.02, 217, 219, 221.01, 221.02, 223, 227.01, 227.02, 233.01, 235.01, 237.03, 237.04, 239, 241, 243, 251, 253.) A 25-percent linked-trip “credit” is assumed for the restaurant use, consistent with the *Webster Avenue Rezoning EIS*.

## Community Facility

The types of community facility uses that would be considered within the rezoning area for the RWCDS in the No-Action and With-Action conditions include medical office, pre-K school, day care center, community center, transitional housing, and religious uses. The factors used to forecast travel demand from these land uses were developed from a variety of sources, including the *CEQR Technical Manual*, the *Webster Avenue Rezoning EIS, East New York Rezoning EIS, Number 7 Extension Project EIS*, and journey-to-work/reverse journey-to-work census data.

## Light Industrial / Warehouse

The trip generation rates, temporal distributions, in/out splits, and vehicle occupancies for light industrial lane uses were primarily based on data from the *Crotona Park East / West Farms Rezoning EIS*. Saturday trip generation rates were estimated based on ITE *Trip Generation Manual* data. The trip generation rates, temporal distributions, in/out splits, and vehicle occupancies for warehouse lane uses were primarily based on data from the *Lower Concourse Rezoning EIS* and ITE's *Trip Generation Manual*.

## TRIP GENERATION

The person and vehicle trips expected to result from the Proposed Actions are expressed as an “incremental change” or “net change” in trips. This incremental change is calculated by comparing the estimated numbers of trips resulting from the Proposed Actions (in the 2026 analysis year) to the numbers of trips estimated to be occurring in the vicinity of the rezoning area without the Proposed Actions. Trips are calculated based on the transportation planning factors shown previously in **Table 3: Transportation Planning Factors**

Land Use	Local Retail	Regional Retail	Office	Residential	Restaurant (sit-down)	Light Industrial	Auto Repair	Auto Dealership	Warehouse

(1) Ten-percent linked trips for local retail.

(2) Twenty-five-percent linked trips for restaurant.

, “Travel Demand Forecast,” lists the estimate of the net incremental change in peak-hour person trips and vehicle trips, respectively (as compared to conditions in the area without the Proposed Actions) that would occur in 2026 with implementation of the Proposed Actions.

The Proposed Actions would be expected to generate a net increase of approximately 4,055 person trips in the weekday AM peak hour, 9,600 person trips in the weekday midday, 7,674 person trips in the weekday PM peak hour, and 8,354 person trips in the Saturday midday peak hour. These person trips can be translated into modal trip “types” for the entire study area as follows:

- Peak hour vehicle trips (including auto, truck, and taxi trips balanced to reflect that some taxis arrive or depart empty) would be expected to result in additional trips – approximately 405, 524, 671, and 617 vehicle trips (“in” and “out” trips, combined) in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Peak hour subway trips would increase by a net total of approximately 1,382, 1,136, 1,748, and 1,649 in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Peak hour bus trips would increase by a net total of approximately 555, 1,037, 935, and 985 in the weekday AM, midday, PM, and Saturday midday peak hours, respectively.
- Walk trips would increase by approximately 1,607, 6,772, 4,143, and 4,787 trips during the respective weekday AM, midday, PM, and Saturday midday peak hours.

The Proposed Actions are not expected to generate substantial numbers of trips by Metro-North Railroad (MNR). MNR’s Morris Heights station is located more than  $\frac{1}{2}$ -mile from the project corridor and the projected development sites (and therefore not within a convenient walking distance). Commuter rail trips generated by the Proposed Actions would likely start or end as on another mode of transit (i.e., subway or bus) and are assumed to be reflected in the forecast for these modes.

**Table 5** presents the net incremental change in peak hour vehicle trips (auto, taxi, and truck) that would be generated by five identified development clusters during the weekday AM, midday, PM, and Saturday midday peak hours. As shown in **Table 5**, Cluster 4, the projected developments centered around 170<sup>th</sup> Street, would account for approximately 40 percent of the total vehicle tips generated in all peak hours.

**Table 5: Incremental Vehicle Trips**

## Analysis Periods

According to *CEQR Technical Manual* guidelines, a quantified traffic analysis is typically required if a proposed action would result in more than 50 peak-hour vehicle trip ends. As listed in **Table 4: Travel Demand Forecast**

- (1) Ten-percent linked trips for local retail.  
 (2) Twenty-five-percent linked trips for restaurant.

, the Proposed Actions are expected to result in more than 50 total vehicle trips during each weekday analysis hour; therefore, all of these periods will be included in the quantified analysis of traffic conditions. The specific hours to be analyzed in each peak period will be determined based on traffic count data collected along the street network in the study area.

Transit analyses generally examine conditions during the weekday AM and PM commuter peak periods, as it is during these times that overall transit demand (and the potential for significant adverse impacts) is typically greatest. Therefore, the quantitative analyses of transit conditions with the Proposed Actions will focus on these two periods.

According to *CEQR Technical Manual* guidelines, a quantified analysis of pedestrian conditions is typically required if a proposed action would result in 200 or more peak hour pedestrian trips. The net increase in pedestrian trips resulting from the Proposed Actions would exceed the 200-trip *CEQR Technical Manual* analysis threshold during the weekday AM and PM commuter peak hours and the weekday midday peak hour for retail demand. Therefore, all three of these peak hours will be included in the analysis of pedestrian conditions. The specific analysis peak hours will be determined based on pedestrian count data in the study area.

## TRAFFIC STUDY AREA

### Area Street Network

As previously shown on **Figure 1**, the rezoning area consists of approximately 35 blocks along a two-mile corridor surrounding Jerome Avenue in the Bronx, and the street network is an irregular grid system. The

primary streets providing access to the rezoning area include Jerome, Sedgwick, Tremont, and Burnside avenues, the Grand Concourse, East 167<sup>th</sup> Street, and Fordham Road. Regional Access is provided by I-95 (Cross-Bronx Expressway) and I-87 (Major Deegan Expressway).

The primary arterial within the rezoning area is Jerome Avenue, which runs north-south within the Bronx from Van Cortlandt Park to the north to the Macombs Dam Bridge at the south end.

The rezoning area is generally bounded by 184<sup>th</sup> Street to the north, Grand Concourse on the East, McClellan Street to the south, and University Avenue to the west. I-95 (Cross-Bronx Expressway) bisects the area, with exit and entrance ramps at Jerome Avenue adjacent to Featherbed Lane and Mt. Eden Avenue. I-87 (Major Deegan Expressway) runs parallel to the site and is approximately half a mile to the west.

## **Primary East-West Corridors**

East 167<sup>th</sup> Street is a major collector that runs east-west through the Bronx, starting at Edward L. Grant Highway to the west, and provides connections to the Grand Concourse, Webster and Third avenues, and Edward A. Stevenson Boulevard to the east. In the project vicinity, there is one travel lane in each direction, bike lanes, and curbside parking on both sides of the road. The segment of East 167<sup>th</sup> Street between River Avenue and Edward L. Grant Highway is a NYCDOT-designated local truck route.

Fordham Road is a principal arterial road that connects Manhattan and the Bronx via the University Heights Bridge and runs east-west through the Bronx until it reaches the Bronx River Parkway, where it transitions to Pelham Parkway. In the vicinity of Jerome Avenue, Fordham Road has two travel lanes and one bus lane per direction. There is no curbside parking while the bus-only lane restrictions are in effect. Fordham Road is a NYCDOT-designated local truck route.

Tremont Avenue is a principal arterial that runs east-west, originating at Sedgwick Avenue to the west and spans the borough to the Throgs Neck section in the southeast corner of the Bronx. In the project vicinity, Tremont Avenue has one travel lane in each direction and curbside parking on both sides.

Burnside Avenue is a minor arterial that runs east-west from University Avenue to the west to Valentine Avenue east of the Grand Concourse. In the project vicinity, Burnside Avenue is a NYCDOT-designated local truck route, has one travel lane in each direction, with curbside parking on both sides of the street.

Cross-Bronx Expressway (I-95) spans the Bronx, originating at I-295 (Throgs Neck) to the east and continuing west across the George Washington Bridge to the New Jersey Turnpike. The expressway has three travel lanes in each direction, provides connections to the Bruckner Expressway (I-278), Hutchinson River Parkway, (I-678), New England Thruway, Sheridan Expressway (I-895), Major Deegan Expressway (I-87), Harlem River Drive, and Henry Hudson Parkway. There are two exits – Exit 2, Jerome Avenue, and Exit 3, Webster Avenue, in the vicinity of the rezoning area. The Cross-Bronx Expressway is a NYCDOT-

designated through truck route (i.e., a through route for trucks who do not have a trip origin or destination within the Bronx).

## **Primary North-South Corridors**

Jerome Avenue is a north-south arterial through the Bronx within the rezoning area. The elevated NYCT 4 subway line runs above Jerome Avenue from East 168<sup>th</sup> Street to the north end of the study corridor at East 184<sup>th</sup> Street. Within the project limits, Jerome Avenue has one travel lane in each direction in the center of the roadway between the subway support columns. Along most of the corridor's length, an auxiliary travel lane is provided in each direction between the subway support columns and curbside parking. At some locations, such as at the Burnside Avenue Station, the curbside parking and travel lanes are closed for pedestrian safety purposes. Jerome Avenue is a designated NYCDOT local truck route.

The Grand Concourse is a major arterial that runs north-south through the Bronx and generally provides two mainline travel lanes, one service road lane, and one bike lane within the service roadways in each direction. The mainline roadway is separated from the service roadway by a raised median and curbside parking is provided along the service road.

Bounding the study area to the west is Dr. Martin Luther King Jr. Boulevard, which is also signed as University Avenue in the vicinity of the Bronx Community College and Edward L. Grant Highway below West 174<sup>th</sup> Street. The boulevard is a principal arterial roadway that has two moving lanes and a curbside lane in each direction and runs approximately parallel to Jerome Avenue for its length. South of Tremont Avenue, a raised median divides the travel directions. University Avenue is a NYCDOT-designated local truck route and provides a combination of bike lanes and shared bike lanes.

Sedgwick Avenue runs parallel to Jerome Avenue, from Moshulu Parkway in the north to the Macombs Dam Bridge in the south. Sedgwick Avenue is a minor arterial that serves as a service road for the Major Deegan Expressway for the majority of its length in the study area, and becomes a primary thoroughfare for the area near the Bronx Community College.

The Major Deegan Expressway (I-87) is an interstate highway that parallels the Harlem River on the west side of the Bronx. The expressway is a NYCDOT-designated through truck route and connects the Bruckner Expressway in the southeastern portion of the Bronx to Westchester and destinations north and west. The expressway has five access points within the vicinity of the rezoning area – Exit 5 - East 161<sup>st</sup> Street, Exit 6 - East 153<sup>rd</sup> Street, Exit 7 - I-95 to the Cross Bronx Expressway and George Washington Bridge, Exit 8 - West 179<sup>th</sup> Street and Exit 9 - West Fordham Road.

## *Traffic Assignment and Analysis Locations*

The assignments of vehicle trips will be based on the location of the projected development and the anticipated origins and destinations of vehicle trips associated with the different uses projected for the

rezoning area (e.g., commercial, residential, etc.). The origins/destinations of residential and non-retail commercial trips used for the assignments are based on 2006-2010 US Census journey-to-work and reverse journey-to-work data, respectively. Retail trip origins/destinations are based on population density in proximity to the rezoning area. **Table 6** presents the directional distributions of auto and taxi trips by land use based on the origin/destination data. Using these distributions, auto and taxi trips were first assigned to various portals on the perimeter of the rezoning area and then assigned via the most direct route to trip nodes located within each cluster or in proximity to an outlier development site.

Truck trips en route to and from each cluster/outlier site were assigned to designated through and local truck routes and then to the most direct paths to and from trip nodes. The majority of truck trips were assigned to the through truck route along the Cross Bronx Expressway and to local truck routes along Jerome Avenue, Fordham Road, and Burnside Avenue.

**Table 6: Directional Distributions of Auto/Taxi Trips by Land Use**

Land Use	Bronx				Manhattan	Brooklyn	Queens	Long Island	Upstate/CT	Staten Island/NJ/PA
	North	East	South	West						
Non-Retail Commercial	509	2,198	469	274	334	164	666	371	1,552	649
Non-Retail Commercial <sup>1</sup>	7%	31%	7%	4%	5%	2%	9%	5%	22%	9%
Residential	498	1,783	956	280	2,197	213	704	30	1,339	798
Residential <sup>2</sup>	6%	20%	11%	3%	25%	2%	8%	0%	15%	9%
Local Retail/Community Uses	66,680	93,365	62,675	51,800	-	-	-	-	-	-
Local Retail/Community Uses <sup>3</sup>	24%	34%	23%	19%	-	-	-	-	-	-

Notes:

1. Vehicle (auto/taxi) trip distribution for office and light industrial trips for the proposed rezoning area.

This distribution was based on reverse journey-to-work trips using 2006-2010 US Census data for tracts 197, 199, 209, 211, 213.02, 217, 219, 221.01, 223, 227.01, 227.02, 233.01, 239, 241, 243, and 251.

2. Vehicle (auto/taxi) trip distribution for market-rate and affordable residential.

This distribution was based on reverse journey-to-work trips using 2006-2010 US Census data for tracts 197, 199, 209, 211, 213.02, 217, 219, 221.01, 223, 227.01, 227.02, 233.01, 239, 241, 243, and 251.

3. Trip distribution for all other uses in the proposed rezoning area (local retail, destination retail, restaurant, auto repair, auto dealership, warehouse, supermarket, pre-K school, day care center, community center, and medical office).

This distribution was based population density for census tracts within an approximate 1/2-mile distance of the proposed rezoning area.

As noted previously, the Proposed Actions would be expected to generate a net increase of 405 vehicle trips during the weekday AM peak hour, 524 vehicle trips during the weekday midday peak hour, 671 vehicle trips during the weekday PM peak hour, and 617 vehicle trips during the Saturday midday peak hour. As these traffic volumes would exceed 50 trips in each peak hour (the *CEQR Technical Manual* Level 1 screening threshold for a detailed analysis), a preliminary assignment of net increment traffic volumes has been prepared to identify critical intersections that would potentially exceed 50 trips per hour (a Level 2 screening assessment). **Figure 2** shows the locations of the 36 that were selected for detailed analysis. Net incremental peak hour vehicle trips are assigned to intersections to be analyzed within the traffic study area, as summarized in **Table 7**.

## TRANSIT

The rezoning area is served by three subway lines – the elevated 4 (IRT) line on Jerome Avenue and the B/D (IND) lines along the Grand Concourse to the east.

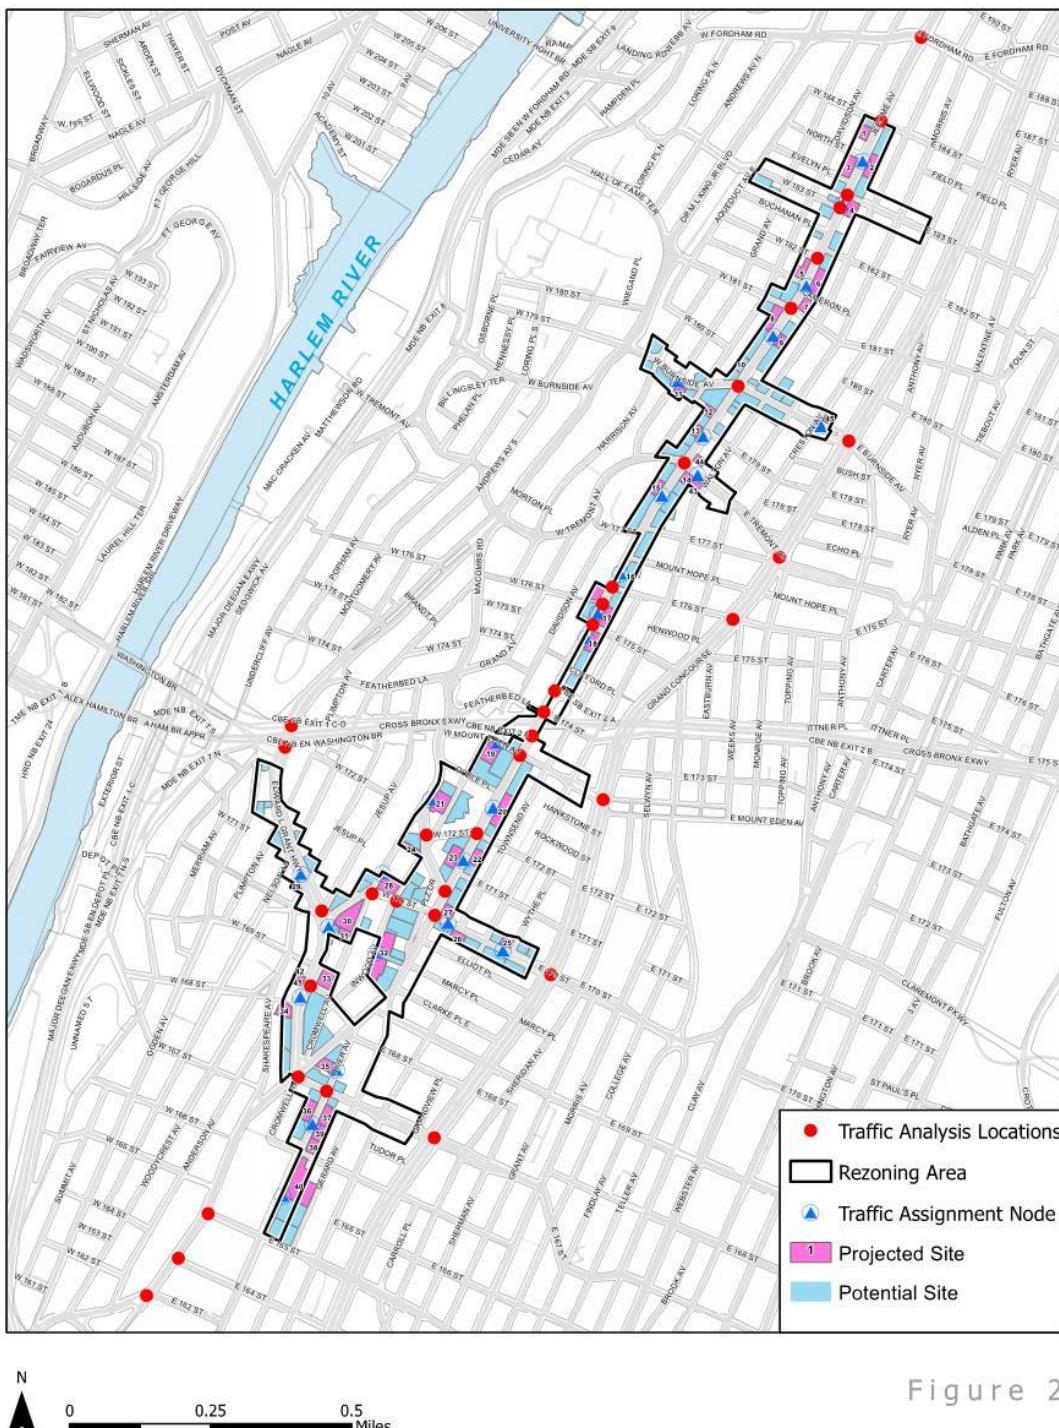

According to the general thresholds used by the MTA and specified in the *CEQR Technical Manual*, detailed transit analyses are required if a proposed action is projected to result in greater than 200 peak hour rail or bus transit riders. If a proposed action would result in 50 or more bus passengers being assigned to a single bus line (in one direction), or if it would result in an increase of 200 or more passengers at a single subway station or on a single subway line, a detailed bus or subway analysis would be warranted.

The Proposed Actions are expected to generate over 200 peak hour rail on a single line, and likely will also result in greater than 50 bus passengers being assigned to a single bus line in one direction. Therefore, a detailed bus and subway analysis is warranted.

## *Subway Analysis*

### **Subway Stations**

There are a total of eleven NYCT subway stations within, or in close proximity to, the rezoning area. These stations are presented on **Figure 3** along with the subway routes serving each facility. The 4 line operating along Jerome Avenue serves six elevated stations above Jerome Avenue within the rezoning area, including, 183<sup>rd</sup> Street, Burnside Avenue, 176<sup>th</sup> Street, Mt. Eden Avenue, 170<sup>th</sup> Street, and 167<sup>th</sup> Street. Five underground stations (182<sup>nd</sup>-183<sup>rd</sup> Streets, Tremont Avenue, 174<sup>th</sup>-175<sup>th</sup> Streets, 170<sup>th</sup> Street, and 167<sup>th</sup> Street) are served by the B/D subway lines operating on the Grand Concourse to the east of the rezoning area. Nearly all the projected development sites are closer to the Jerome Avenue 4 stations than the Grand Concourse B/D stations; consequently, all subway trips were assigned to Jerome Avenue stations except for one projected development site that was closer to the 170<sup>th</sup> Street B/D station.

Jerome Avenue Rezoning Proposal

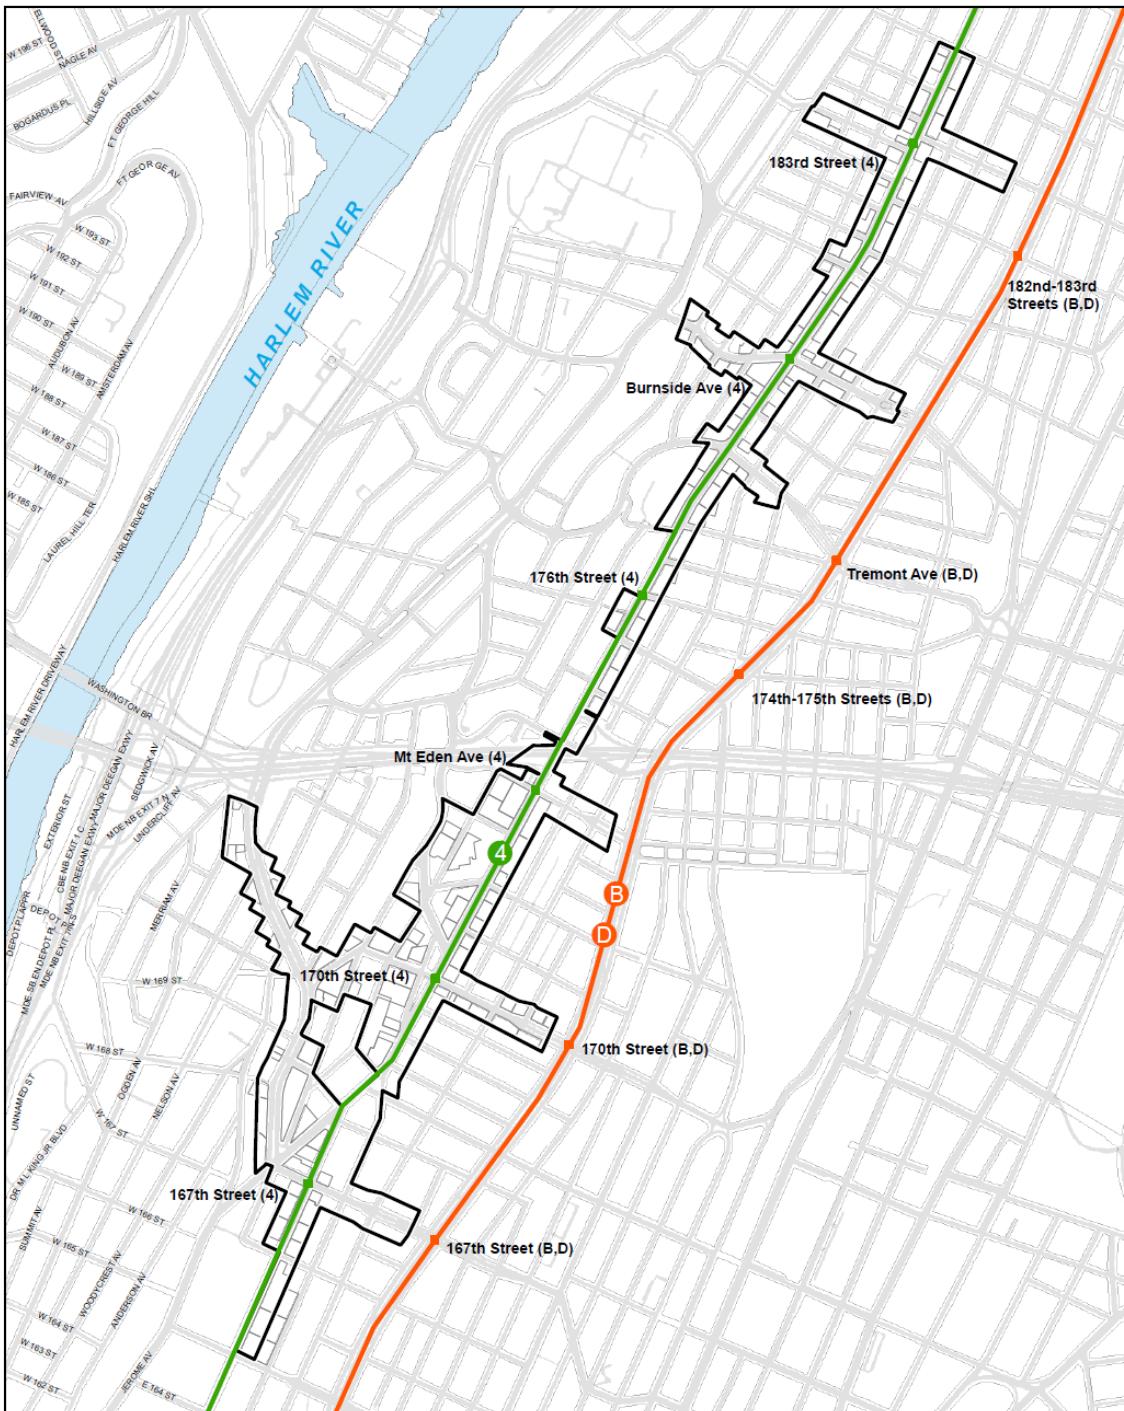

#### TRAFFIC ANALYSIS LOCATIONS

Figure 2

**Table 7: RWCDs Net Incremental Peak Hour Vehicle Trips by Intersection**

Intersection	Incremental Peak Hour Trips

*Jerome Avenue Rezoning Proposal*

Figure 3

## Subway Assignment and Analyzed Stations

As shown in **Table 4**, under the RWCDS, the Proposed Actions would generate a net increment of approximately 1,382 and 1,748 subway trips during the weekday AM and PM commuter peak hours, respectively. Trips from each development cluster or outlier site were assigned to the individual stations serving the rezoning area based on proximity to projected development sites. **Table 8** shows the estimated net incremental subway trips generated by the Proposed Actions during the weekday AM and PM peak hours at each of the subway stations serving the rezoning area. As shown in **Table 8**, the highest number of peak hour subway trips are expected to occur at the 170<sup>th</sup> Street station on the Jerome Avenue 4 Line, which would experience approximately 613 incremental trips (in and out combined) in the AM peak hour and 728 in the PM peak hour.

**Table 8: RWCDS Net Incremental Peak Hour Subway Trips by Station**

Subway Station (Line)	AM Peak Hour Trips			PM Peak Hour Trips		
	Boarding	Alighting	Total	Boarding	Alighting	Total
167 <sup>th</sup> Street (4)	143	30	173	78	150	228
170 <sup>th</sup> Street (4)	522	91	613	228	500	728
Mt. Eden Avenue (4)	72	15	87	38	72	110
176 <sup>th</sup> Street (4)	118	22	140	62	124	186
Burnside Avenue (4)	115	49	164	98	136	234
183 <sup>rd</sup> Street (4)	154	30	184	72	157	229
170 <sup>th</sup> Street (B, D)	17	3	20	7	25	32

The analysis of subway station conditions focuses on a total of four subway stations at which incremental demand from the Proposed Actions would exceed the 200-trip CEQR Technical Manual analysis threshold in one or both peak hours. As shown in **Table 8**, these subway stations include:

- 167<sup>th</sup> Street (4)
- 170<sup>th</sup> Street (4)
- Burnside Avenue (4)
- 183<sup>rd</sup> Street (4)

For each of these facilities, key circulation elements (e.g., street stairs and fare arrays) expected to be used by concentrations of new demand from the Proposed Actions are analyzed.

## Subway Line Haul

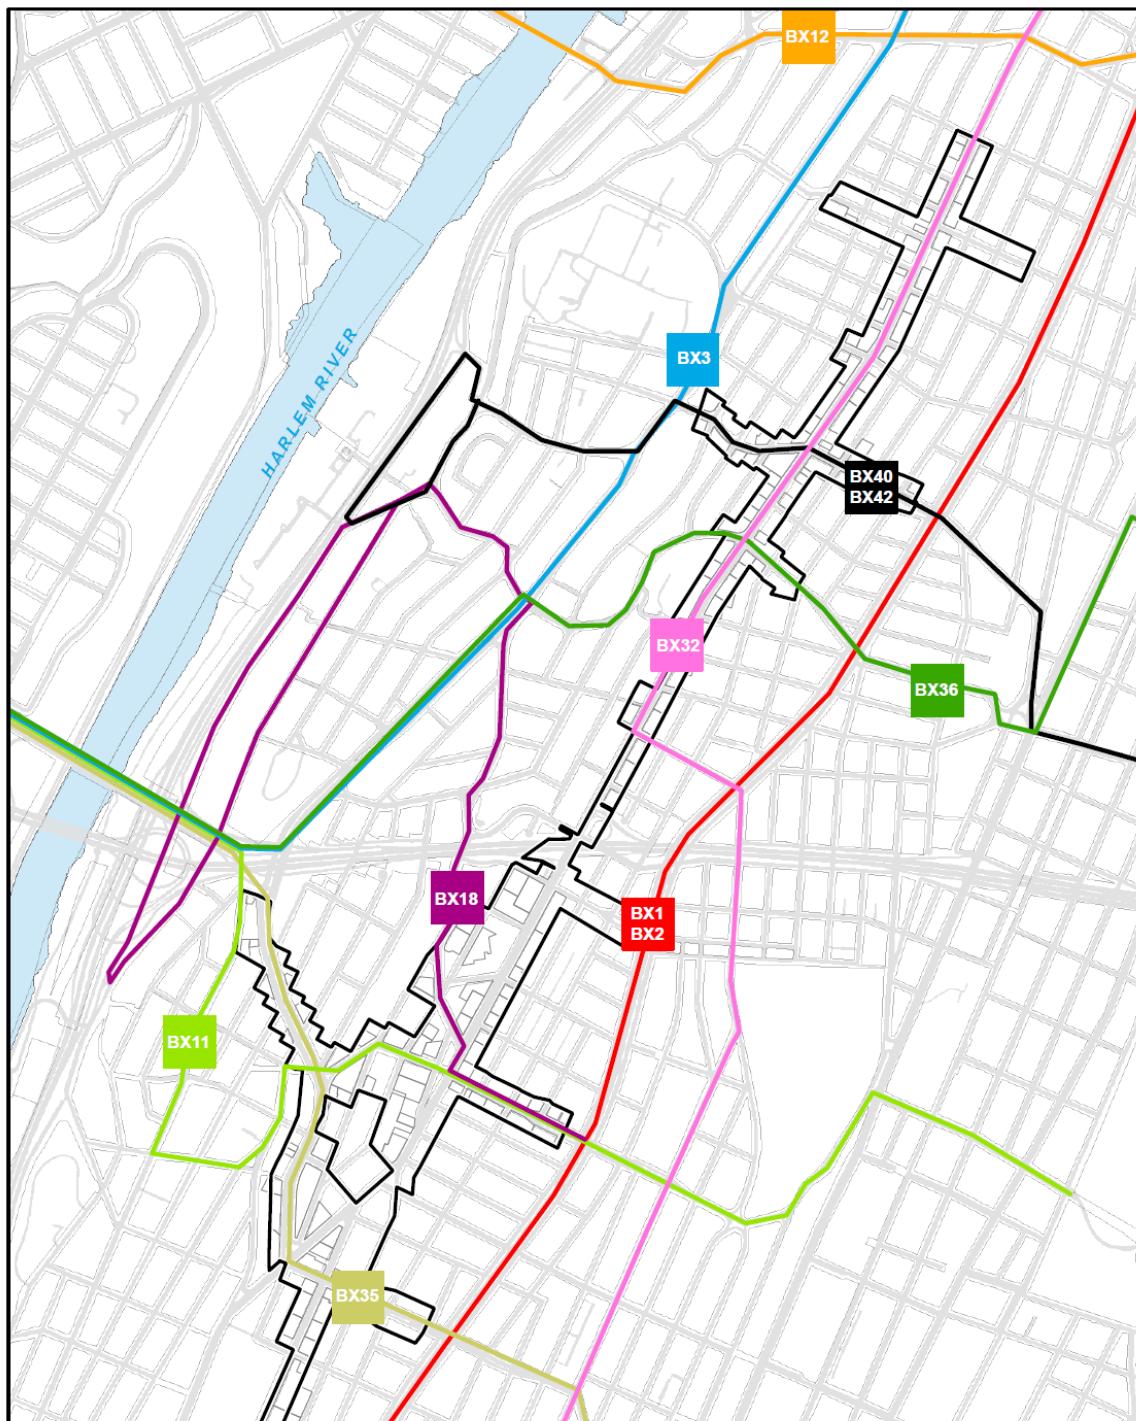

As discussed above, the rezoning area is served by three NYCT subway routes, including the 4, B, and D lines. As the Proposed Actions are expected to generate 200 or more new subway trips in one direction on one or more of these routes, an analysis of subway line haul conditions is included in the EIS. The analysis uses existing maximum load point subway service and ridership data provided by NYCT to assess existing, future No-Action, and future With-Action conditions at the peak load points of the respective subway lines during the weekday AM and PM peak hours.

## Bus Analysis

### Bus Routes

The rezoning area is served by nine local NYCT bus routes (see **Figure 4**) and include the following:

- Bx1 connects Riverdale to Mott Haven along the Grand Concourse adjacent to the site
- Bx2 connects Kingsbridge to Mott Haven along the Grand Concourse adjacent to the site
- Bx11 operates between Longwood in the Bronx and the George Washington Bridge Bus Terminal in Manhattan via Claremont Parkway and 170<sup>th</sup> Street
- Bx18 operates between Morris Heights and Morrisania via Macombs Road. The Bx18 primarily serves as a connection between the Morris Heights neighborhood and the 4 Line subway station at Jerome Avenue and 170<sup>th</sup> Street within the rezoning area. The Bx18 has the lowest peak hour ridership and service frequency of the bus routes within the rezoning area and would not likely be used by new bus trips generated by the rezoning project; therefore, no new trips were assigned to this route.
- Bx32 operates between the Bronx VA Medical Center and Mott Haven via Morris and Jerome avenues
- Bx35 connects Hunts Point in the Bronx to Washington Heights via East 167<sup>th</sup> and West 181<sup>st</sup> streets
- Bx36 connects Soundview in the Bronx to Washington Heights in Manhattan via East 174<sup>th</sup> and East 180<sup>th</sup> streets
- Bx40 operates between Morris Heights and Fort Schuyler via East Tremont Avenue
- Bx42 operates between Morris Heights and Throgs Neck via East Tremont Avenue

*Jerome Avenue Rezoning Proposal*

Figure 4

**NYCT Bus Routes in  
the Rezoning Area**

## Bus Assignment and Analyzed Routes

As presented in **Table 4**, the projected development sites are expected to generate a net total of approximately 555 and 935 incremental trips by bus during the weekday AM and PM peak hours, respectively. These local bus trips were assigned to each route based on proximity to individual projected development sites or clusters and current ridership patterns. **Table 9** presents the anticipated number of new riders expected on each bus route in the AM and PM peak hours. According to the general thresholds used by the MTA and specified in the *CEQR Technical Manual*, a detailed analysis of bus conditions is generally not required if a proposed action is projected to result in fewer than 50 peak hour trips being assigned to a single bus route (in one direction), as this level of new demand is considered unlikely to result in significant adverse impacts. As listed in **Table 9**, several of these bus routes are expected to carry 50 or more new trips in one direction in at least one peak hour and will be analyzed in the EIS.

**Table 9: RWCDS Net Incremental Peak Hour Bus Trips by Route and Direction**

Route	Direction	AM Peak Hour			PM Peak Hour

Notes:

**Bold** - denotes greater than 50 incremental trips per direction

## PEDESTRIANS

Per the *CEQR Technical Manual*, detailed pedestrian analyses are generally warranted if a proposed action is projected to result in 200 or more new peak hour pedestrians at any sidewalk, corner reservoir area, or crosswalk. As shown previously in **Table 4: Travel Demand Forecast**

(1) Ten-percent linked trips for local retail.  
 (2) Twenty-five-percent linked trips for restaurant.

, the proposed project is expected to generate approximately 1,607 walk-only trips in the weekday AM peak hour, 6,772 in the midday peak hour, 4,143 in the PM peak hour, and 4,787 in the Saturday midday peak hour. Persons en route to and from subway station entrances and bus stops would add

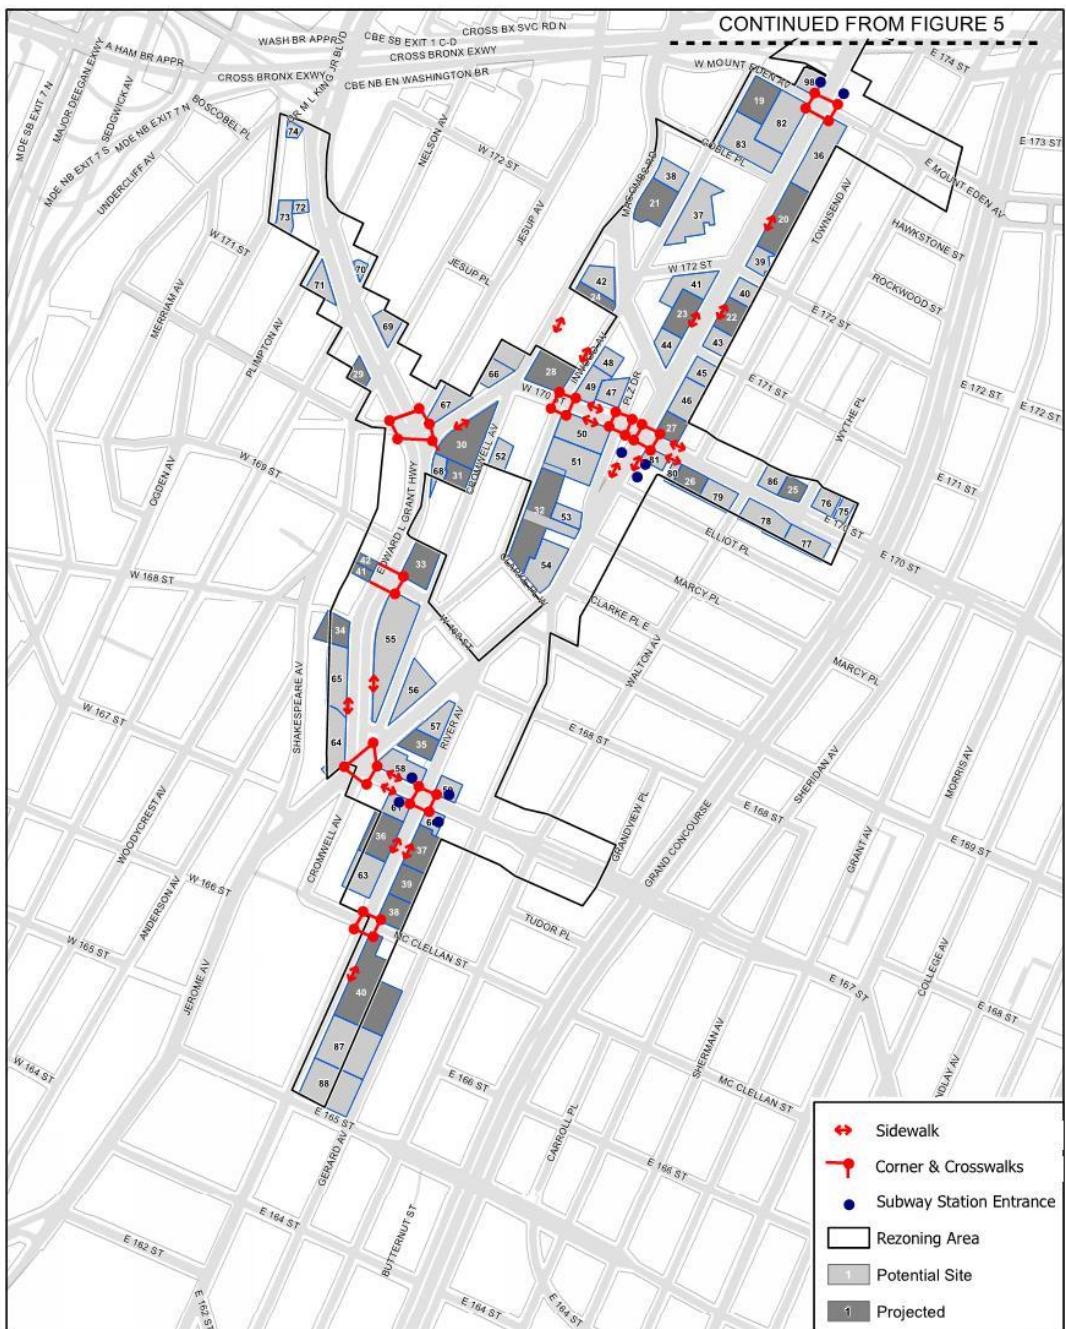

approximately 1,937, 2,137, 2,683, and 2,634 additional pedestrian trips to rezoning area sidewalks and crosswalks during these same periods, respectively.

The analysis will focus on sidewalks, corner areas, and crosswalks where new pedestrian demand would be most concentrated and most likely to result in significant adverse impacts. It is expected that during the AM and PM peak periods, pedestrian trips attributable to the Proposed Actions would be concentrated on sidewalks and crosswalks adjacent to the development sites within the rezoning area and along routes to and from the bus stops and subway stations. During the midday period, pedestrian trips would be expected to be dispersed, as people travel throughout the area for lunch, shopping, or errands. As shown in **Figures 5 and 6**, the analysis locations include a total of 33 sidewalks, 37 corner reservoir areas, and 41 crosswalks.

## PARKING

Peak parking demand from commercial and retail uses typically occurs in the weekday midday period and declines during the afternoon and evening. In contrast, peak parking demand associated with residential uses typically occurs during the overnight period.

On- and off-street parking inventory and utilization surveys will be conducted for the weekday overnight period (when residential parking demand typically peaks), the weekday midday period (when parking in a business area is frequently at peak occupancy), and the Saturday midday peak period to document the existing supply and demand for each period. The parking analyses will document the parking supply and utilization within a quarter-mile radius (an acceptable walking distance) of the rezoning area, both with and without the Proposed Actions.

Parking demand generated by the residential component of the Proposed Actions would be forecasted based on 2010-2014 five-year ACS data on average vehicles per household for units. Parking demand generated from all other uses will be derived from the forecasts of daily auto trips from these uses. The forecast of new parking supply with the Proposed Actions will be based on the net change in parking spaces on projected development sites.

This figure is a heatmap illustrating monthly data across 52 different sites from 2018 to 2026. The columns represent the months of the year (January, February, March, April, May, June, July, August, September, October, November, December), and the rows represent the individual sites.

The color scale indicates the magnitude of the data values. The legend at the bottom shows a gradient from light yellow (representing the lowest values) through green and blue to dark blue (representing the highest values).

Key observations from the heatmap:

- Site 1:** Shows a steady increase in value over time, reaching the highest level by 2026.
- Site 2:** Remains relatively stable with low values throughout the period.
- Site 3:** Starts with moderate values, peaks around 2020, and then stabilizes.
- Site 4:** Shows a gradual increase, reaching high values by 2026.
- Site 5:** Remains low and stable throughout the period.
- Site 6:** Shows a steady increase, reaching high values by 2026.
- Site 7:** Remains very low throughout the period.
- Site 8:** Shows a steady increase, reaching high values by 2026.
- Site 9:** Remains low throughout the period.
- Site 10:** Shows a steady increase, reaching high values by 2026.
- Site 11:** Remains low throughout the period.
- Site 12:** Shows a steady increase, reaching high values by 2026.
- Site 13:** Remains low throughout the period.
- Site 14:** Shows a steady increase, reaching high values by 2026.
- Site 15:** Remains low throughout the period.
- Site 16:** Shows a steady increase, reaching high values by 2026.
- Site 17:** Shows a steady increase, reaching high values by 2026.
- Site 18:** Remains low throughout the period.
- Site 19:** Remains low throughout the period.
- Site 20:** Remains low throughout the period.
- Site 21:** Remains low throughout the period.
- Site 22:** Shows a steady increase, reaching high values by 2026.
- Site 23:** Shows a steady increase, reaching high values by 2026.
- Site 24:** Remains low throughout the period.
- Site 25:** Shows a steady increase, reaching high values by 2026.
- Site 26:** Shows a steady increase, reaching high values by 2026.
- Site 27:** Remains low throughout the period.
- Site 28:** Shows a steady increase, reaching high values by 2026.
- Site 29:** Remains low throughout the period.
- Site 30:** Shows a steady increase, reaching high values by 2026.
- Site 31:** Shows a steady increase, reaching high values by 2026.
- Site 32:** Shows a steady increase, reaching high values by 2026.
- Site 33:** Shows a steady increase, reaching high values by 2026.
- Site 34:** Shows a steady increase, reaching high values by 2026.
- Site 35:** Shows a steady increase, reaching high values by 2026.
- Site 36:** Shows a steady increase, reaching high values by 2026.

This figure is a heatmap illustrating monthly data across 52 different sites from 2018 to 2026. The columns represent the months of the year (January, February, March, April, May, June, July, August, September, October, November, December), and the rows represent the individual sites. Each cell in the grid contains a colored square, where the color intensity represents the magnitude of the data for that specific site and month. The color scale ranges from light blue (representing lower values) to dark red (representing higher values). The patterns in the heatmap show distinct seasonal trends and variations between different sites.
