

# Report on NYC 2020 Census Self-Response

---

Rates Issued on July 23<sup>rd</sup>, 2020

New York City Department of City Planning  
Population Division

**Report on NYC 2020 Census Self-Response (Rates Issued on July 23<sup>th</sup>)  
New York City Department of City Planning—Population Division**

The self-response rate measures the percentage of housing units that self-responded to the 2020 Census either online, by mail, or by phone.

**Why We Care and the Task at Hand**

If an area has a low self-response rate, it means census enumerators will need to knock on more doors to count residents in-person, and it is likely that people in the area may be missed or counted inaccurately.

With the Census Bureau set to start in-person visits on August 11<sup>th</sup> as part of the Nonresponse Follow-up (NRFU) operation, it is more important than ever to increase response rates. High self-response is the best way of ensuring a complete count, with data that truly reflect the neighborhoods of our city. Conducting a census in the middle of a pandemic continues to be an unprecedented challenge, all but eliminating events that build a critical mass of awareness and curbing on-the-ground personal appeals that have proven to be effective in the past.

Yet, in the midst of this very constrained environment, there are opportunities. The self-response period has been extended well beyond the original schedule, allowing us to gain some ground on what could have been a catastrophically low level of self-response. The phased re-opening of the city may now permit a limited level of on-the-ground outreach – the physical neighborhood presence of community organizations and other trusted voices can make all the difference in boosting self-response. This is now the task at hand.

The new format of DCP's *Report on NYC 2020 Census Self-Response* is intended to support this next phase of outreach by moving the focus entirely to neighborhoods with the lowest levels of self-response, where targeted outreach efforts are most needed. We identify places where the current level of self-response is likely to have deleterious effects on the quality of data and on the count itself. With NRFU, the Census Bureau tries to fill the gap in data produced by low self-response. However NRFU and post-NRFU operations can introduce errors that compromise the enumeration. These include the use of responses from neighbors (i.e., proxy

respondents), the use of administrative records (e.g., Social Security, IRS tax records), and the creation of data through statistical means (i.e., imputation), none of which are good substitutes for self-response.

### How Does New York City Compare to New York State and the U.S.?

New York City’s response rate stands at 53.7 percent, compared to 57.9 percent for New York State, and 62.3 percent for the U.S. (see Figure 1). Over the past week (July 16<sup>th</sup> – July 23<sup>rd</sup>), New York City was up 0.3 percentage points, compared to 0.2 for New York State and the nation. Over the past two weeks (July 9<sup>th</sup> – July 23<sup>rd</sup>), New York City was up 0.5 percentage points, compared to 0.4 for New York State, and 0.3 for the nation.

Figure 1. Comparison of 2020 Census Self-Response Rates

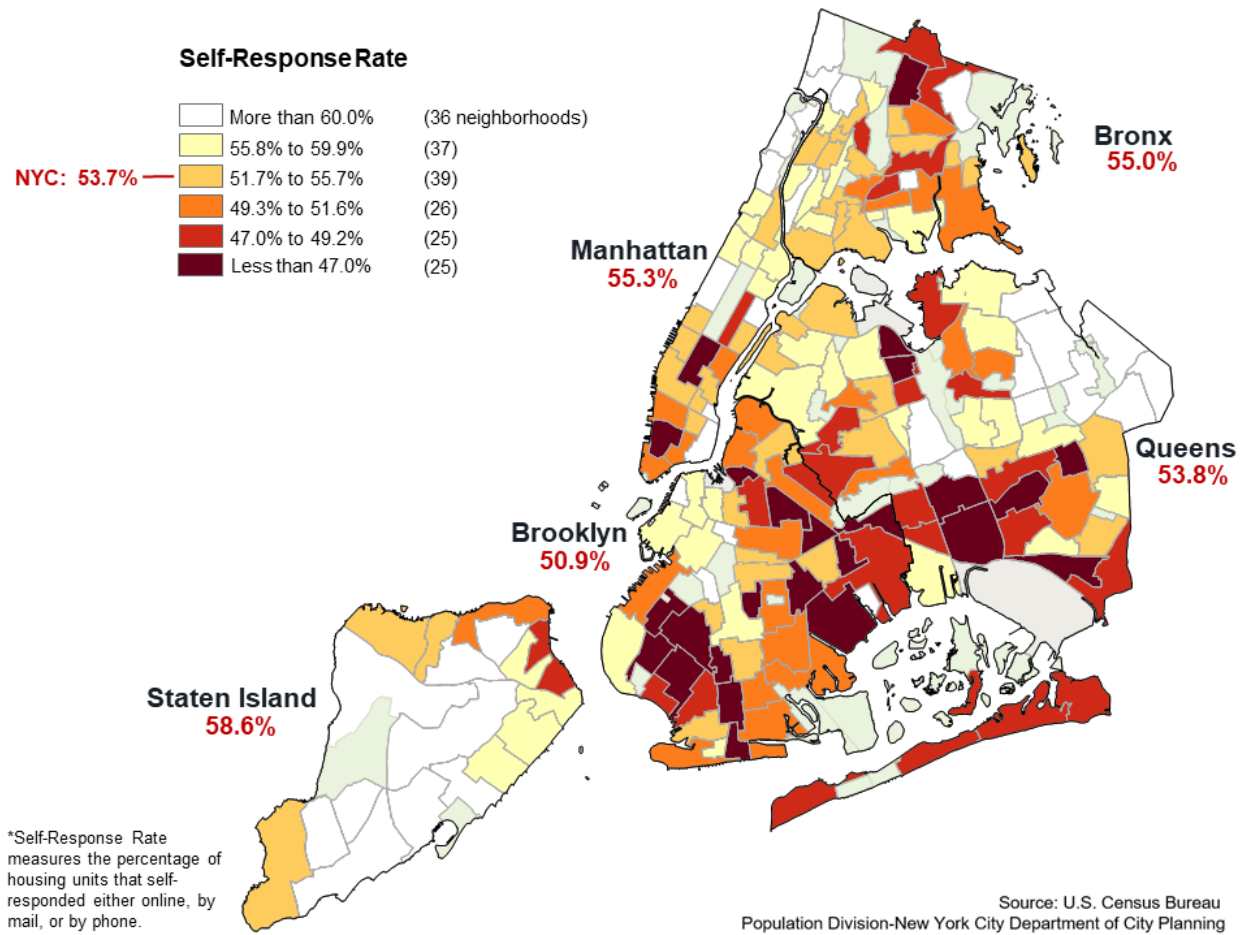

The city’s self-response rate is 8.6 percentage points lower than that of the nation. Growth in New York City’s self-response rate outpaced that of the U.S. throughout April and May, then in June was approximately the same as that for the nation. Throughout July, growth in the response rate has been greater for the city than for the nation, though the increases in response rates are small. New York City’s response rate now stands at 86.2 percent of U.S. self-response (see Figure 2).

**Figure 2. NYC Self-Response as a Percentage of U.S. Response Rate in 2020**

Within New York City, Staten Island has the highest self-response rate, with 58.6 percent of housing units responding, while Brooklyn has the lowest, at 50.9 percent (see Figure 3). Response rates for Manhattan, the Bronx, and Queens stand at 55.3, 55.0, and 53.8 percent, respectively.

Figure 5. New York City Self-Response Rates\* as Issued on July 23<sup>rd</sup> by Census Tract

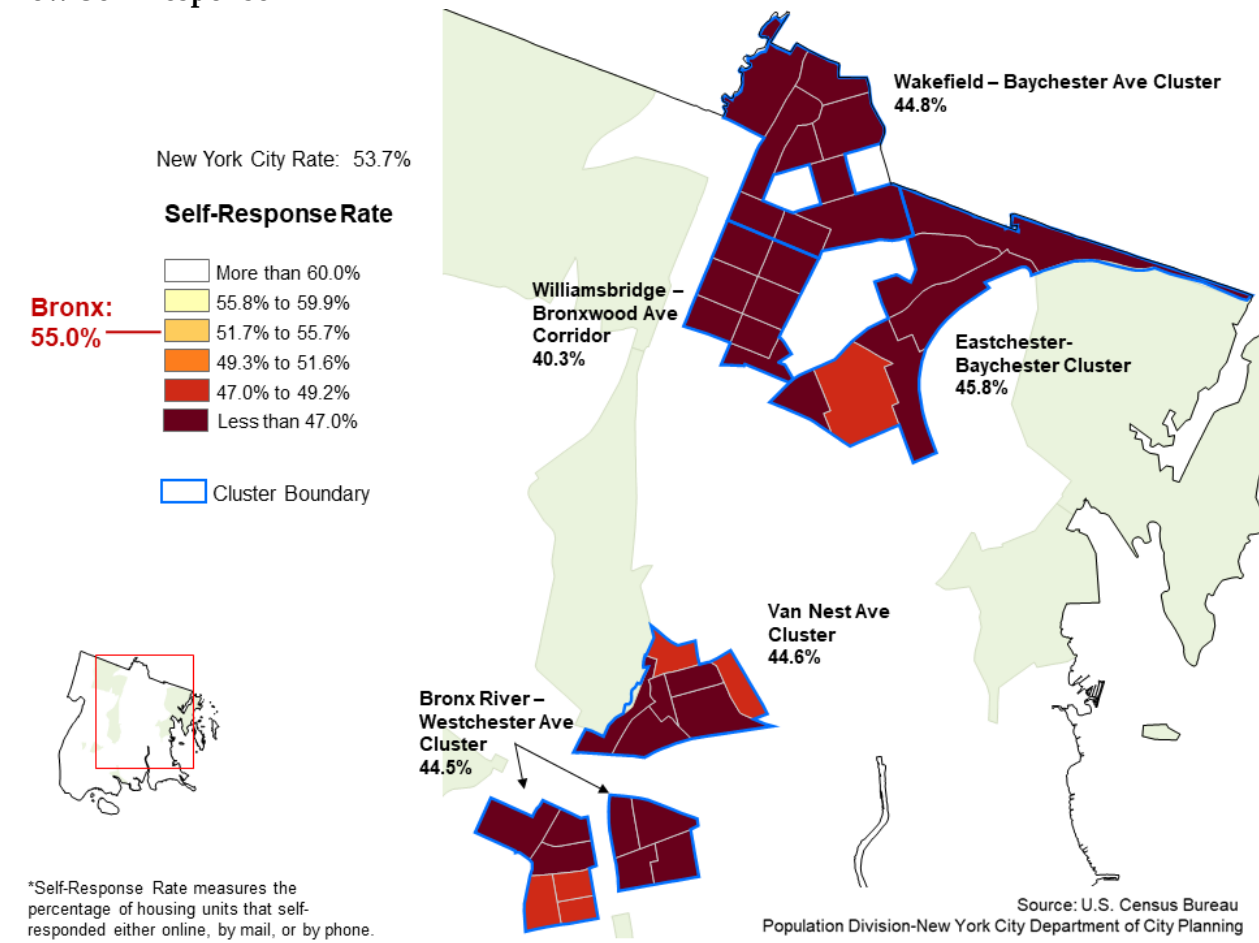

## Low Response Clusters

Neighborhood Tabulation Areas (NTA), while a very useful neighborhood template, may encompass census tracts across the self-response spectrum. This analysis identifies contiguous groupings of census tracts with low self-response in an effort to identify clusters of interest for outreach efforts. We have identified 28 clusters, some of which cross NTA boundaries, as the highest risk targets in the five boroughs. These designations build upon the *Borough Spotlights* presented in previous reports, where we identified subsets of areas of very low response. Our goal now is to track these clusters over the next several weeks, in an effort to inform outreach, and particularly on-the-ground outreach. Only areas that are likely to benefit from increased outreach efforts at the present time are included in this template. Areas where we suspect low rates are due to the temporary relocation of students or where a large number of housing units are seasonally or occasionally occupied are not included. Resolution of low rates in these areas will likely come by way of NRFU visits and the selective use of administrative records from colleges and universities, and thus are not included here as areas of interest for outreach efforts.

It is our hope that increased engagement with households that have not yet responded to the census will make a real difference in boosting response. The clusters identified in this analysis are the places where this outreach, in all its forms, is most needed. In the last weeks of the self-response period, communicating key messages about the census via trusted community partners can make all the difference.

Maps of low response clusters by borough, and one- and two-week changes in response rates for these clusters, are shown below. To identify the 2020 Census tracts in these clusters and place them in their neighborhood context, a reference map showing these clusters with major street names is available [here](https://arcg.is/X5miS) (<https://arcg.is/X5miS>).

**New York City Neighborhood Tabulation Areas Reference Map**

# New York City Neighborhood Tabulation Areas\*

\* Neighborhood Tabulation Areas or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods.
