daily vehicles used the 20
Manhattan River Crossings
in 2015 (total of both
directions).

Increase of 1.1%

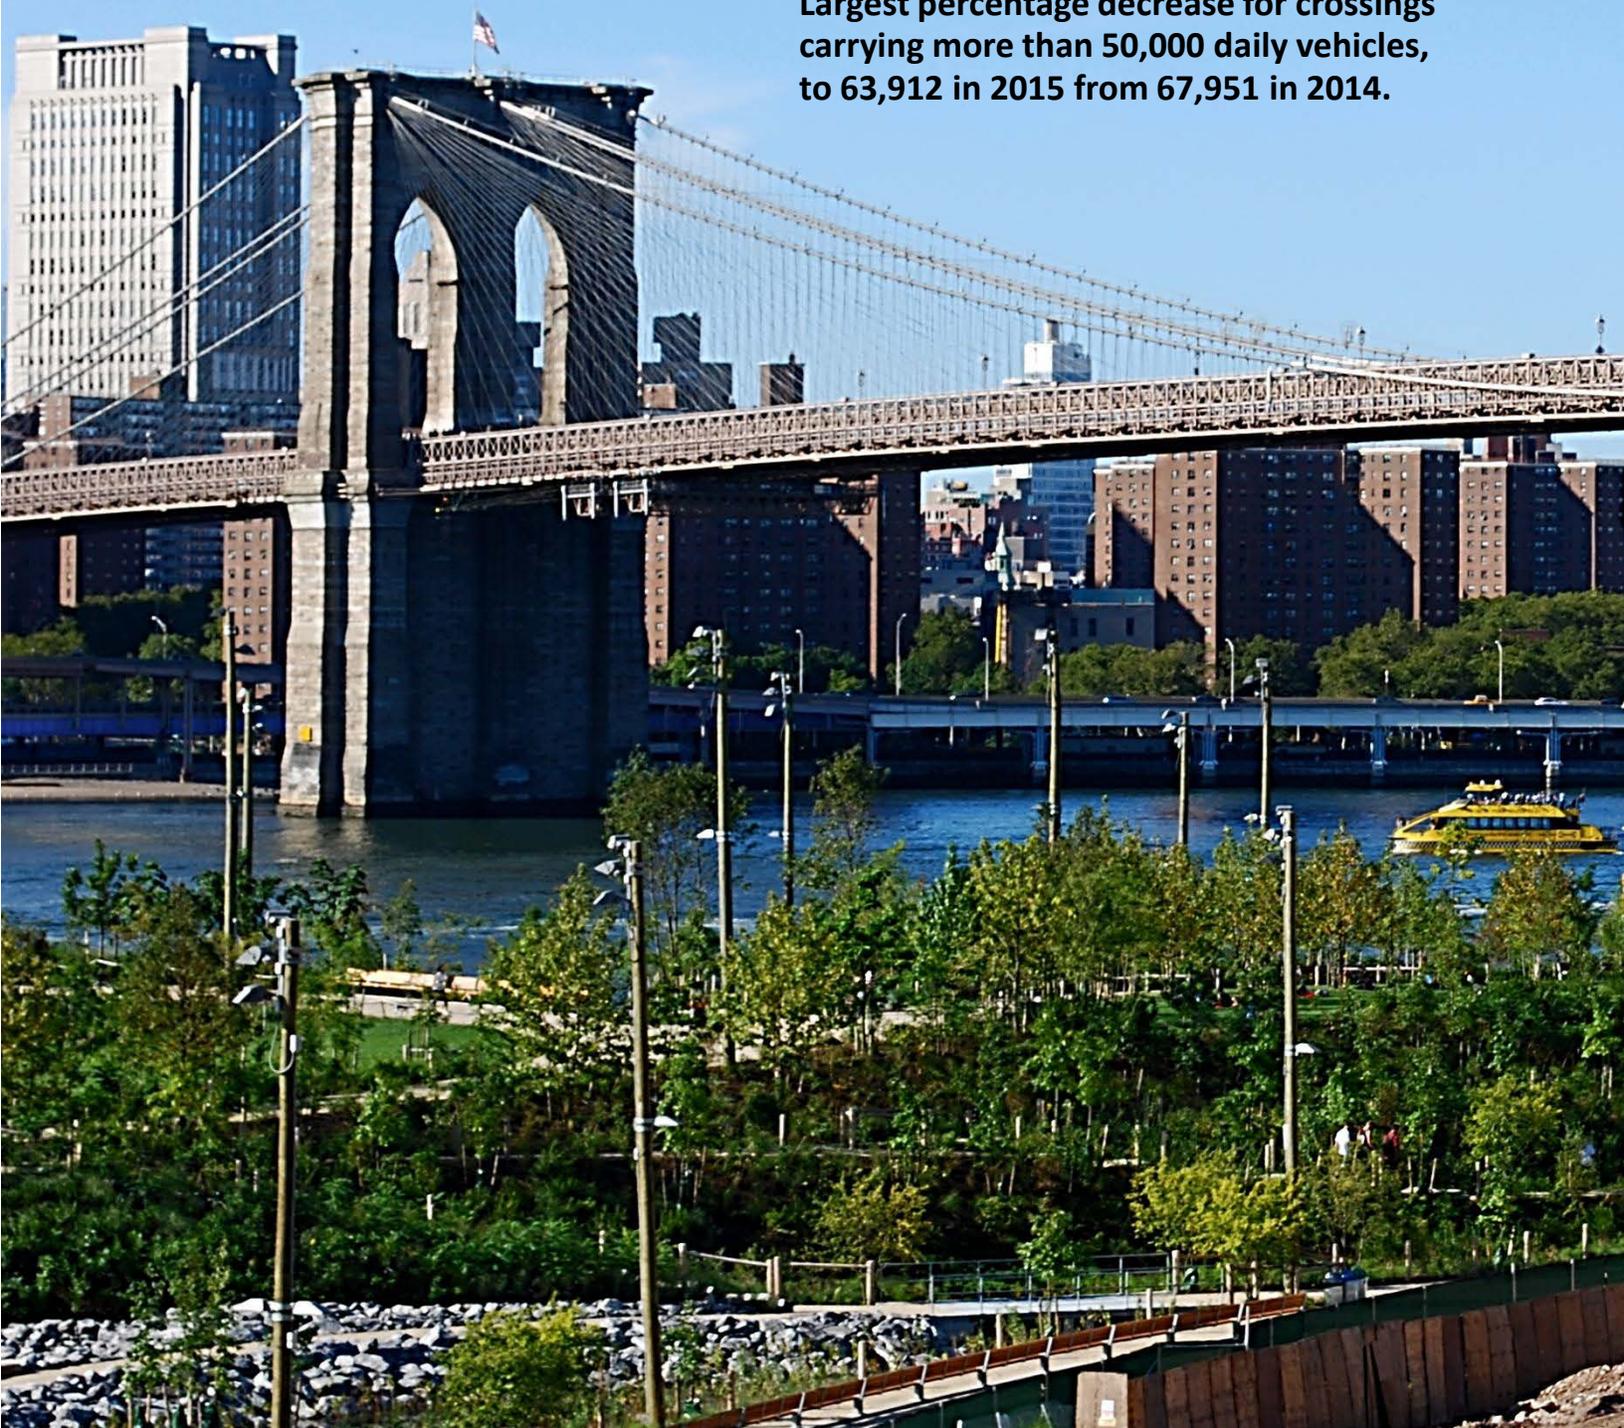

from the 1,776,013 daily
vehicles recorded in 2014
(19,777 more daily vehicles).

6.4% Increase
Henry Hudson Bridge
(Harlem River)

Largest percentage increase for crossings
carrying more than 50,000 daily vehicles,
to 62,554 in 2015 from 58,809 in 2014.

5.1% Decrease
Willis Avenue Bridge
(Harlem River)

Largest percentage decrease for crossings
carrying more than 50,000 daily vehicles,
to 63,912 in 2015 from 67,951 in 2014.

George Washington Bridge (Hudson River)

295,120 vehicles per day, the most heavily utilized Manhattan river crossing.

Alexander Hamilton Bridge (Harlem River)

178,407 vehicles per day, the most heavily utilized Harlem River crossing.

Ed Koch Queensboro Bridge (East River)

174,447 vehicles per day, the most heavily utilized East River crossing.

Annual Citywide Subway Ridership

0.6% increase to 1,762,565,419 annual riders in 2015 from 1,751,287,624 in 2014.

During the past ten years, subway ridership increased 21.6% to 1,762,565,419 annual riders in 2015 from 1,449,100,000 in 2005. During the same period, Manhattan vehicular river crossings decreased 6.9% to 1,795,790 daily vehicles in 2015 from 1,884,733 in 2005.

Introduction

**University Heights Bridge over the Harlem River
Between Manhattan and Bronx**

INTRODUCTION

The 2015 *Manhattan River Crossings* report is an annual publication prepared by the New York City Department of Transportation (NYCDOT), and funded by the Unified Planning Work Program (UPWP) under the Planning Program of the Moving Ahead for Progress (MAP-21) Act.

Since 1948, the City of New York has been monitoring traffic flow over the 20 bridges and tunnels serving Manhattan. The *Manhattan River Crossings* report, published annually by the New York City Department of Transportation (NYCDOT) since 1972, presents vehicular volumes, classification, and trends for all bridges and tunnels serving Manhattan. All toll-free bridges are monitored with automatic traffic recording (ATR) machines during the fall season.

The average hourly volumes by direction for 2015 are presented in histograms for each facility. The total vehicular flow to and from Manhattan has been summarized similarly with hourly histograms, and a graph of vehicle accumulation in Manhattan. The analysis presented in the report was performed by Subregional Transportation Planning Program staff of NYCDOT during the 2015-2016 and 2016-2017 program years.

NYCDOT extends its appreciation to the Port Authority of New York and New Jersey (PANYNJ), the Metropolitan Transportation Authority Bridges and Tunnels (MTABT), the New York City Department of City Planning (NYCDCP), and the New York Metropolitan Transportation Council (NYMTC) for their assistance in the data collection process.

Note: NYCDOT uses the averages of vehicular volumes from selected representative weekdays. Publications from other sources may be based on alternative computation methodologies for some facilities, most notably the tolled bridges and tunnels, possibly yielding different results for those facilities.

The Harlem River and East River Bridges, as well as the MTABT and PANYNJ facilities, have been classified under a highway functional classification system. Functional classification is the process by which streets and highways are grouped into classes, or systems, according to the character of service each roadway provides.

The five functional classifications are defined as follows:

1. Interstate - connects population centers across state lines.
2. Principal Arterial - serves major centers of activity of an urban area and carries a high proportion of the total urban area travel on a minimum of mileage.
3. Minor Arterial - interconnects with and augments urban principal arterials; provides service for trips of moderate length at a somewhat lower level of travel mobility than principal arterials; distributes travel to geographic areas smaller than those identified with the higher system.
4. Collector Street - provides both land access service and traffic circulation within residential neighborhoods, and commercial and industrial areas. Differs from the arterial systems in that facilities on the collector system may penetrate residential neighborhoods, distributing trips from arterials to the ultimate destination.

Conversely, collector streets also collect traffic from local streets in residential neighborhoods and channel it into the arterial system.

5. Local Street - comprises all facilities not on one of the higher systems. Serves primarily to provide direct access to abutting land and access to the higher order systems. Offers the lowest level of mobility and usually contains no bus or truck routes.

Summary ~ 2015 Daily Traffic

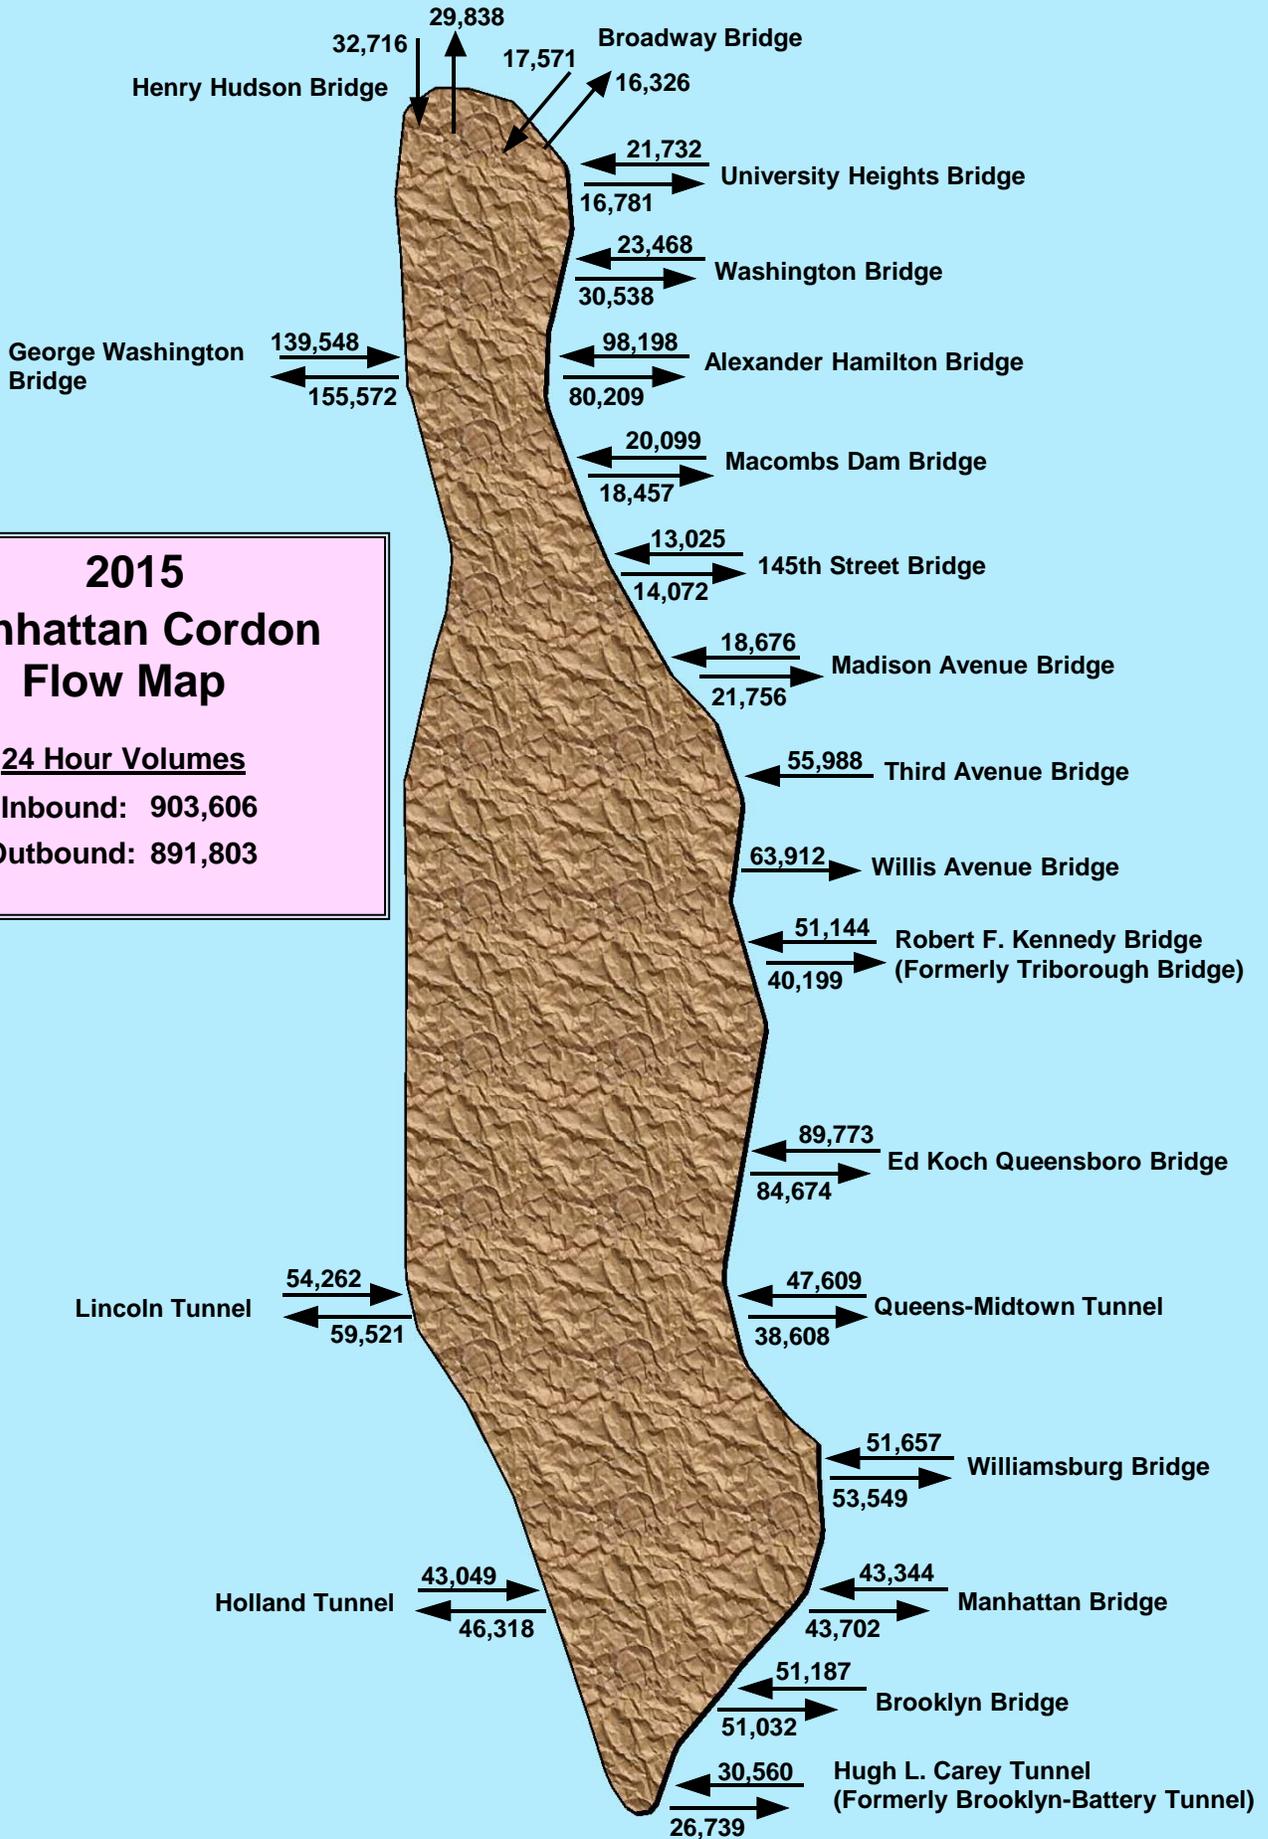

**Brooklyn Bridge over the East River
between Manhattan and Brooklyn**

SUMMARY

- Daily Manhattan river crossings increased 1.1%, to 1,795,790 daily vehicles in fall 2015 from 1,776,013 in fall 2014, an increase of 19,777 daily vehicles.
- The busiest river crossings are the following.
 - For the 53rd consecutive year, the George Washington Bridge carried more traffic than any other Manhattan river crossing. A two-way total of 295,120 daily vehicles used this bridge in fall 2015, which was 5.1% more than the average daily volume of 280,78 in fall 2014.
 - The Alexander Hamilton Bridge was second busiest, serving 178,407 daily vehicles in fall 2015, which was 0.2% less than its fall 2014 daily volume of 178,809.
 - The Ed Koch Queensboro Bridge was third busiest with its fall 2015 daily volume of 174,447 daily vehicles, a slight increase from the 174,809 recorded in fall 2014.
- The average automobile entering Manhattan during the morning peak period carried 1.34 persons including the driver. A total of 78.3% of peak period automobiles were occupied only by the driver.
- The peak accumulation of motor vehicles in Manhattan on an average weekday occurred at about 2 pm when an estimated 369,569 vehicles were either moving or parked on the island. This includes vehicles operating only within Manhattan as well as those entering via the river crossings.
- Annual subway ridership citywide increased 0.64% to 1.763 billion in 2015 from 1.751 billion in 2014. This was the highest level of subway ridership since 1949.
- According to census data, 38% of automobile work trips to Manhattan originated in the other four boroughs, 53% came from outside the city, and the remaining 9% originated within Manhattan.
- Origin and Destination (O & D) surveys conducted by PANYNJ in 2006 at its trans-Hudson crossings show that 44% of automobiles entering Manhattan from New Jersey each day have final destinations outside Manhattan. These figures indicate that approximately 100,000 autos entering Manhattan from New Jersey in 2015 each day were simply passing through.
- Similar surveys conducted in 2009 showed that some 70% of trucks entering from New Jersey had final destinations outside Manhattan at that time. However, the Holland Tunnel was closed to all Manhattan-bound trucks during that time. It was reopened to Manhattan-bound 2-axle and 3-axle single unit trucks as of January 3, 2010. Therefore the applicability of the 2009 surveys is uncertain under the present operating conditions since diversion would have been occurring during those 2009 surveys.
- PANYNJ reports show that 66% of morning peak period (7-10 am) automobiles entering from New Jersey have final destinations in Manhattan.

Bicycle and pedestrian access was maintained during all times. From March 26, 2015, through December 2015, the promenade for pedestrians and bicyclists was reduced in width at various locations. Pedestrians and bicyclists were directed to cautiously share the narrowed pathway.

The northbound FDR Drive exit to the bridge was closed during these times.

The Brooklyn–Queens Expressway eastbound exit onto the bridge was closed 30 minutes earlier during these times, the northbound FDR Drive exits were closed up to an hour earlier, and other Brooklyn ramps onto the bridge were closed 5-15 minutes earlier.

The Manhattan Bridge Lower Roadway was operated Manhattan-bound weekdays from 9:30pm to 3:00pm.

Throughout 2015, there were additional closures of single lanes in each direction on the Brooklyn Bridge during off–peak hours.

Ed Koch Queensboro Bridge (East River between Queens & Manhattan)

This bridge was officially renamed on April 11, 2011, when the mayor signed the legislation which had been passed by the City Council on March 23, 2011.

Throughout 2015, a High Occupancy Vehicle (HOV) facility was in effect on the Ed Koch Queensboro Bridge. The normally Queens–bound South Upper Roadway was reversed between 6:00am and 9:30am on weekdays to accommodate Manhattan–bound HOVs (no trucks) carrying two or more occupants.

Ed Koch Queensboro Bridge Operation (All 2015):

- North Inner Roadway: W/B all times; W/B trucks required to use this roadway.
South Inner Roadway: E/B all times; E/B trucks required to use this roadway.
North Upper Roadway: W/B all times.
South Upper Roadway: Closed for reversal 5:30–6:00am weekdays,
W/B HOVs 6:00–9:30am weekdays,
Closed for reversal 9:30–10:00am weekdays,
E/B all other times.
North Outer Roadway: Reserved for bicyclists and pedestrians at all times.
South Outer Roadway: E/B for passenger cars only.
Closed nightly from 9:00pm to 6:00am.

Throughout 2015, there were intermittent closings of single lanes on individual roadways of the Ed Koch Queensboro Bridge during off-peak hours.

Manhattan Bridge (East River between Brooklyn & Manhattan)

Note: *During 2015, the nearby Brooklyn Bridge was closed to Manhattan-bound traffic during overnight hours.*

Manhattan Bridge Operation: January 1, 2015 To March 27, 2015
