## Physical Activity and Transit Survey: Summary Data

From the New York City Department of Health and Mental Hygiene

November 2013

## OVERVIEW

The 2008 Health and Human Services (HHS) Physical Activity Guidelines for Americans described the health benefits of physical activity as follows ${ }^{1}$ :

- Regular physical activity reduces the risks of many adverse outcomes such as cardiovascular disease, depression, diabetes, obesity and some cancers.
- Some physical activity is better than none for caloric burn.
- For most health outcomes, additional benefits occur as the amount of physical activity increases.
- Most health benefits occur with at least 150 minutes ( 2 hours and 30 minutes) per week of moderate intensity or greater physical activity such as brisk walking.
- The health benefits of physical activity occur in all age, racial and ethnic groups and far outweigh the risks.
To assess the level and conditions of physical activity of New Yorkers, the Physical Activity and Transit (PAT) Survey was conducted in 2011. Funding came from the Department of Health and Human Services through the Communities Putting Prevention to Work grant and the subsequent Obesity Supplemental Evaluation Activities grant.

This report presents both self-reported and accelerometer data from the PAT Survey.

## PAT METHODOLOGY

The PAT survey included a comprehensive survey of self-reported physical activity with a biometric portion where a subsample wore both accelerometers and Global Positioning System (GPS) devices for seven days. The survey consisted of a Random Digit Dial dual frame telephone (both cell and landline) survey of adult New Yorkers. The survey was stratified by borough and oversampled four areas with the highest rates of obesity. Participants were asked about activity in three domains using the Global Physical Activity Questionnaire (GPAQ) ${ }^{2}$ : work (labor and housework), transportation, and recreation. Participants were also asked additional questions on neighborhood characteristics and patterns of physical activity. Participation was restricted to those who were able to walk at least 10 feet. A total of 3,806 interviews were completed.

A subsample of survey participants were also asked to wear accelerometers and GPS devices for seven days. Accelerometers are small devices that measure moment to moment acceleration or the intensity of movement and are best at capturing aerobic activity throughout the day. In the device follow-up portion, 679 participants provided usable accelerometer data (at least 4 days of 10 or more hours of wear time). We present the data both in all minutes of activity for overall health and caloric burn, and also in 10-minute bouts for activity related to cardiovascular health. GPS data are not presented as part of this report.

## IN THIS REPORT

This report presents both self-reported GPAQ and accelerometer data. The data include estimates of activity overall and by demographic group. It includes data such as: mean and median minutes of physical activity, percent meeting national guidelines, median minutes of activity by exercise type, activity by domains (work, recreation, and transportation), with transportation including both walking and biking, and sedentary behavior. The following index provides a detailed list of 21 tables and 15 figures.

[^0]
## INDEX OF TABLES

| TABLES |  | Page \# |
| :---: | :---: | :---: |
| Table 1a. | Median minutes of self-reported and accelerometer measured activity, overall and by demographic group | 5 |
| Table 1b. | Mean and median self-reported activity, overall and by demographic group | 6 |
| Table 2. | Percent meeting activity guidelines by self-reported GPAQ data, overall and by demographic group | 7 |
| Table 3a. | Mean minutes of self-reported activity for individual domains: work, transportation, and recreation | 8 |
| Table 3b. | Mean and median minutes of self-reported activity for specific types of activity | 9 |
| Table 4a. | Rode bicycle in past year by self-report, overall and by demographic group | 10 |
| Table 4b. | Frequency of bicycle riding in past year by self-report: overall and by demographic group | 11 |
| Table 5. | Frequency of bicycle riding on different types of roads/bike lanes by self-report | 12 |
| Table 6a. | Mean daily sedentary minutes (time spent sitting) by self-report | 13 |
| Table 6b. | Mean daily hours of TV/computer screen time by self-report | 14 |
| Table 7. | Main mode of transportation to work by self-report | 15 |
| Table 8a. | Mean and median minutes of one-way commute to work by self-report, overall and by primary mode of transit | 16 |
| Table 8b. | Mean and median total minutes walking during one-way commute to work by self-report, overall and by primary mode of transit | 17 |
| Table 9. | Mean and median minutes of physical activity by self-report, overall and by primary mode of transit | 18 |
| Table 10a. | Stair climbing (walked up), overall and by demographic group by selfreport | 19 |
| Table 10b. | Stair climbing (walked down), overall and by demographic group by self-report | 20 |
| Table 10c. | Total mean and median minutes of activity, by floors of stairs climbed per day (walked up) by self-report | 21 |
| Table 11a. | Mean minutes of accelerometer measured activity, in 10 minute bouts and all minutes, overall and by demographic group | 22 |
| Table 11b. | Mean minutes of accelerometer measured activity, in 10 minute bouts and all minutes, by self-reported activity questions | 23 |
| Table 11c. | Median minutes of accelerometer measured activity, in 10 minute bouts and all minutes, overall and by demographic group | 24 |
| Table 11d. | Median minutes of accelerometer activity, in 10 minute bouts and all minutes, by self-reported activity questions | 25 |

Note: All data are from the Physical Activity and Transit Survey (PAT) NYC Health Department 2011

## INDEX OF FIGURES

Notes: (1) Moderate-equivalent minutes are a sum of all moderate and vigorous minutes of physical activity (with each vigorous minute counting as two moderate minutes).
(2) The Global Physical Activity Questionnaire (GPAQ) is a physical activity questionnaire developed by the World Health Organization (WHO), and has been used worldwide to measure physical activity;
(3) Accelerometer minutes can expressed either in 10 minute bouts, or as all minutes of physical activity
(4) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(5) P-values for medians were calculated using a Wilcoxon score test in SUDAAN (using CITRIX).
(6) Not all categories for cell totals sum to 3806 for GPAQ or 679 for accelerometer, due to missing data for some items
(7) Income is presented as a percentage of the federal poverty line (FPL) based on household income;
(8) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work
(9) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision) is greater than 30\% or the sample size is too small, making the estimate potentially unreliable.
$\left.\begin{array}{lllllll}\hline \text { Table 1b - Mean and median self-reported activity, overall and by demographic group } \\ \text { Mean weekly moderate- } \\ \text { equivalent minutes } \\ \text { via } \text { GPAQ }^{1,2}\end{array}\right]$

Notes: (1) Moderate-equivalent minutes are a sum of all moderate and vigorous minutes of physical activity (with each vigorous minute counting as two moderate minutes).
(2) The Global Physical Activity Questionnaire (GPAQ) is a physical activity questionnaire developed by the World Health Organization (WHO), and has been used worldwide to measure physical activity; (3) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(4) P-values for means were calculated in SUDAAN to account for complex survey design and clustering; $p$-values for medians were calculated
using a Wilcoxon score test in SUDAAN (using CITRIX). (5) Not all categories for cell totals sum to 3806 for GPAQ, due to missing data for some items
(6) Income is presented as a percentage of the federal poverty line (FPL) based on household income;
(7) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work
(8) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision) is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable.

Notes: (1) The 2008 Physical Activity Guidelines for Americans (PAGA) recommend at least 150 minutes of moderate physical activity per week. (2) The Global Physical Activity Questionnaire (GPAQ) is a physical activity questionnaire developed by the World Health Organization (WHO), and has been used worldwide to measure physical activity (3) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate. (4) The GPAQ contains 3 domains: Work, Recreation and Transit; we separate Recreation and Transit domains as they are most consistent with other data (5) P-values were calculated in SUDAAN to account for complex survey design and clustering; $p$-values for medians were calculated using a Wilcoxon score test in SUDAAN (using CITRIX). (6) Not all categories for cell totals sum to 3806 for GPAQ, due to missing data for some items (7) Income is presented as a percentage of the federal poverty line (FPL) based on household income; (8) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work (9) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision) is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable.

Notes: (1) Moderate-equivalent minutes are a sum of all moderate and vigorous minutes of physical activity (with each vigorous minute counting as two moderate minutes) .
(2) The Global Physical Activity Questionnaire (GPAQ) is a physical activity questionnaire developed by the World Health Organization (WHO), and has been used worldwide to measure physical activity; (3) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(4) P-values were calculated in SUDAAN to account for complex survey design and clustering; $p$-values for medians were calculated
using a Wilcoxon score test in SUDAAN (using CITRIX). (5) Not all categories for cell totals sum to 3806 for GPAQ, due to missing data for some items
(6) Income is presented as a percentage of the federal poverty line (FPL) based on household income;
(7) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work
(8) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision) is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable.

Notes: (1) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(2) Not all categories for cell totals sum to 3806 for GPAQ, due to missing data for some items
(3) Income is presented as a percentage of the federal poverty line (FPL) based on household income;
(4) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work'
(5) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision)
is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable
(6) Data are presented as row percents in which the values across one row sum to $100 \%$.

Notes:
(1) Specific question asks for weekday: "On an average day from Monday to Friday, how many hours per day do you watch television
or use a computer at home for recreation?" (2) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate (3) P-values were calculated in SUDAAN to account for complex survey design and clustering
(4) Of 3806 survey participants, 3673 answered questions on TV/Computer Screen time, not all categories for cell totals sum to 3673 due to missing data for some items; (5) Income is presented as a percentage of the federal poverty line (FPL) based on household income; (5) Not in labor force includes: retirees, students, homemakers
and individuals reporting that they are unable to work (7) * Estimate should be interpreted with caution. Estimate's Relative Standard Error
(a measure of estimate precision) is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable

Notes: (1) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(2) P-values were calculated in SUDAAN to account for complex survey design and clustering;
(3) Of 3806 GPAQ participants, 3536 participants answered questions on climbing up stairs, not all cell categories sum to 3536 due to missing data for some items
(4) Income is presented as a percentage of the federal poverty line (FPL) based on household income;
(5) Not in labor force includes: retirees, students, homemakers and individuals reporting that they are unable to work;
(6) Data presented include the number of floors walked up on a typical weekday (not including subway stairs);
(7) Data are presented as a row percent in which all numbers across one row sum to $100 \%$; (8) Data are asked only of those physically able to use the stairs

| 6+ floors | 992 | 973 | 833-1112 | (Ref) | 592 | 508-637 | (Ref) |

Notes: (1) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(2) P-values were calculated in SUDAAN to account for complex survey design and clustering; p-values for medians were calculated using a Wilcoxon score test in SUDAAN (using CITRIX).
(3) Not all categories for cell totals sum to 3806 for GPAQ, due to missing data for some items;
(4) Data presented include the number of floors walked up on a typical weekday (not including subway stairs);
(5) Data are presented as a row percent in which all numbers across one row sum to 100\%; (5) Data are asked only of those physically able to use the stairs

Notes: (1) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(2) P-values were calculated in SUDAAN to account for complex survey design and clustering
(3) Not all categories for cell totals sum to 679 for accelerometer data, due to missing data for some items
(4) Income is presented as a percentage of the federal poverty line (FPL) based on household income; reporting that they are unable to work
(5) Not in labor force includes: retirees, students, homemakers and individuals
(6) * Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision)
is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable
(7) A valid accelerometer case had to have at least 10 hours of wear time on 4 or more days; data are scaled to represent 7 days.

| Personal car/taxi | 144 | 48* | 8-89 | 0.01 | 203 | 143-329 | <0.01 |

Notes: (1) $95 \%$ Confidence Intervals are a measure of estimate precision. The wider the interval, the more imprecise the estimate.
(2) P-values were calculated in SUDAAN to account for complex survey design and clustering
(3) Not all categories for cell totals sum to 679 for accelerometer data, due to missing data for some items
(4) NA indicates that data was not available or not applicable, either due to small sample size or data suppression due to unreliability
(5) Income is presented as a percentage of the federal poverty line (FPL) based on household income; reporting that they are unable to work
(6) Not in labor force includes: retirees, students, homemakers and individuals
(7) *Estimate should be interpreted with caution. Estimate's Relative Standard Error (a measure of estimate precision)
is greater than $30 \%$ or the sample size is too small, making the estimate potentially unreliable
(8) A valid accelerometer case had to have at least 10 hours of wear time on 4 or more days; data are scaled to represent 7 days.
