2022 Health Alert #14

Please distribute to all clinical staff in primary care, family medicine, geriatrics, internal medicine, psychiatry, pharmacy and emergency medicine.

Dear Colleagues,

A heat advisory is in effect for Wednesday, July 20 and Thursday, July 21, with heat indices forecasted in the upper 90s. Hot weather may continue through the weekend.

Extreme heat is the deadliest type of extreme weather. It can cause hyperthermia and worsen existing medical conditions and mental health problems. Structural racism and the resulting social and economic inequities increase the risk of heat stress for Black New Yorkers, who are twice as likely to die from heat than White New Yorkers. Most people who die of heat stroke in New York City did not have or use air conditioners and were overcome by heat in their homes. Fans do not provide sufficient cooling during extreme heat. Air conditioning (AC) is the most effective protection.

Recommendations for Providers
- Remind people to use AC during and for a few days after extreme heat and limit outdoor activity.
  - Encourage people who do not have or use AC to visit others with AC or a cooling center, even for a couple of hours. Call 311 or go to maps.nyc.gov/oem/cc to find a cooling center.
  - Suggest setting ACs to 78°F to provide comfort, save on electricity bills, and conserve energy.
- Review medications that may impact thermoregulation with patients.
- Engage caregivers and other support networks to help friends, family and neighbors to stay cool.
- Discuss symptoms of heat-related illness and risk of exacerbating chronic health conditions.
- Advise increased fluid intake when medically appropriate. Recommend self-monitoring, such as bodyweight measurement, to monitor hydration for patients with health conditions sensitive to fluid balance or among people using medications that can impair thermoregulation or cause dehydration.

People most at risk.
People who do not have or use AC and have one or more of these factors:
- Chronic health conditions (cardiovascular/renal disease, respiratory conditions, obesity, diabetes)
- Mental health problems including but not limited to depression, anxiety, and schizophrenia
- Dementia, cognitive difficulty, difficulty with self-care, or difficulty thermoregulating
- Use of diuretics, anticholinergics, psychotropics, or any medications affecting thermoregulation
- Substance use disorder or excessive alcohol consumption
- Social isolation or limited mobility.

A combination of these risk factors is also more likely to be found among older adults (age ≥ 60).

Immediately report deaths where heat exposure is suspected as a direct or contributing cause to the New York City Office of Chief Medical Examiner at 212-447-2030.

Sincerely,

Carolyn Olson, MPH
Assistant Commissioner
Bureau of Environmental Surveillance and Policy

Madhury Ray, MD, MPH
Director, Child Care Data Analytics
