

Weekly Report on NYC 2020 Census Self-Response

Rates as Issued on June 25th, 2020

New York City Department of City Planning
Population Division

Weekly Report on NYC 2020 Census Self-Response (Rates Issued on June 25th)
New York City Department of City Planning—Population Division

The self-response rate measures the percentage of housing units that self-responded to the 2020 Census either online, by mail, or by phone.

Why We Care and the Task at Hand

If an area has a low self-response rate, it means census enumerators will need to knock on more doors to count residents in-person, and it is likely that people in the area may be missed or counted inaccurately.

With the Census Bureau set to start knocking on doors on August 11th as part of the Nonresponse Follow-up (NRFU) operation, it is more important than ever to increase response rates. High self-response is the best way of ensuring a complete count, with data that truly reflect the neighborhoods of our city. Conducting a census in the middle of a pandemic continues to be an unprecedented challenge, virtually eliminating events that build a critical mass of awareness and curbing on-the-ground personal appeals that have proven to be effective in the past.

Yet, in the midst of this very constrained environment, there are opportunities. The self-response period has been extended well beyond the original schedule, allowing us to gain some ground on what could have been a catastrophically low level of self-response. The phased re-opening of the city may now permit a limited level of on-the-ground outreach – the physical neighborhood presence of community organizations and other trusted voices can make all the difference in boosting self-response. This is now the task at hand.

The new format of DCP's *Weekly Report on NYC 2020 Census Self-Response* is intended to support this next phase of outreach by moving the focus entirely to neighborhoods with the lowest levels of self-response, where targeted outreach efforts are most needed. We identify places where the current level of self-response is likely to have deleterious effects on the quality of data and on the count itself. With NRFU, the Census Bureau tries to fill the gap produced by low self-response. However NRFU and post-NRFU operations can introduce errors that compromise the enumeration. These include the use of responses from neighbors (i.e., proxy

respondents), the use of administrative records (e.g., Social Security, IRS tax records), and the creation of data through statistical means (i.e., imputation), none of which are good substitutes for self-response.

How Does New York City Compare to New York State and the U.S.?

New York City’s response rate stands at 52.6 percent, compared to 57.1 percent for New York State, and 61.7 percent for the U.S. (see Figure 1). Over the past week (June 18th – June 25th), New York City was up 0.3 percentage points, compared to 0.3 for New York State, and 0.2 for the nation. Over the past two weeks (June 11th – June 25th), New York City was up 0.8 percentage points, compared to 0.9 for New York State, and 0.8 for the nation.

Figure 1. Comparison of 2020 Census Self-Response Rates

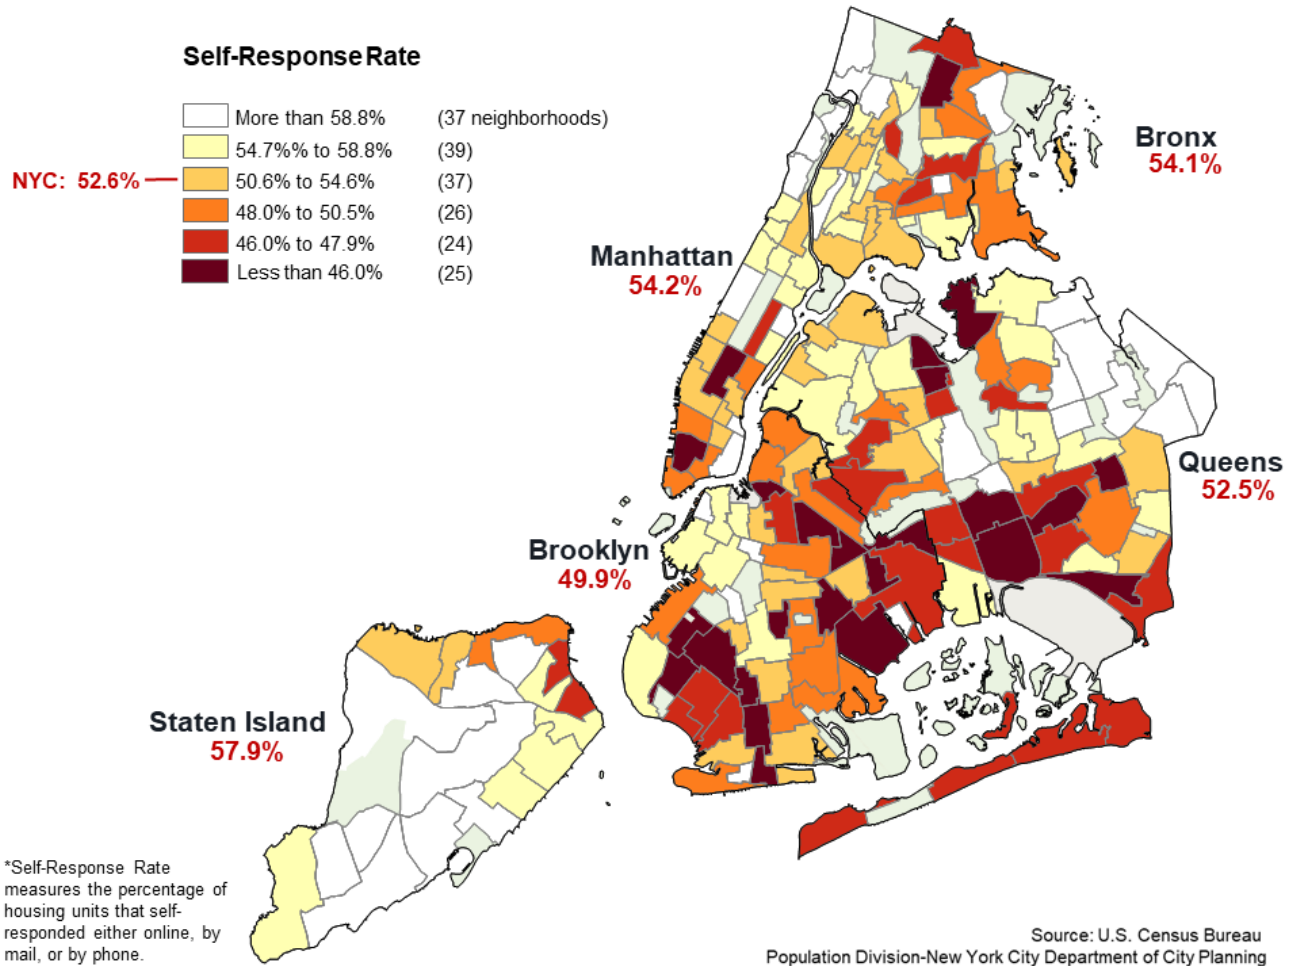

The city’s self-response rate is 9.1 percentage points lower than that of the nation. While the growth in New York City’s self-response rate outpaced that of the U.S. throughout April and May, growth in the city’s self-response is now approximately the same as for the nation. New York City’s response rate now stands at 85.3 percent of U.S. self-response (see Figure 2).

Figure 2. NYC Self-Response as a Percentage of U.S. Response Rate in 2020

Within New York City, Staten Island has the highest self-response rate, with 57.9 percent of housing units responding, while Brooklyn has the lowest, at 49.9 percent (see Figure 3). Response rates for Manhattan, the Bronx, and Queens stand at 54.2, 54.1, and 52.5 percent, respectively.

Figure 5. New York City Self-Response Rates* as Issued on June 25th by Census Tract

Low Response Clusters

Neighborhood Tabulation Areas (NTA), while a very useful neighborhood template, may encompass census tracts across the self-response spectrum. To better focus outreach, this analysis identifies contiguous census tracts with low self-response in an effort to identify clusters of interest. Some clusters include portions of multiple NTAs. There are 28 clusters that we have identified as the highest risk targets in the five boroughs. These designations build upon the *Borough Spotlights* done over the past weeks, where subsets of areas of very low response were identified. Our goal now is to track these clusters over the next several weeks, in an effort to inform outreach that may now have on-the-ground components. Not all of the lowest response areas are included in this template. Areas where we suspect low rates are due to the temporary relocation of students or where a large number of housing units are seasonally or occasionally occupied are cases in point. Resolution of low rates in these areas will likely come by way of NRFU visits and the selective use of administrative records from colleges and universities, and thus are not likely to benefit from increased outreach at the present time.

It is our hope that increased contact with households that have not yet responded to the census will make a real difference in boosting response. The clusters identified in this analysis are the places where this outreach, in all its forms, is most needed. Communicating key messages about the census via trusted community partners can make all the difference, and now is the time to do it.

Maps of low response clusters by borough, and one- and two-week changes in response rates for these clusters, are shown below. To identify the 2020 Census tracts in these clusters and place them in their neighborhood context, a reference map showing these clusters with major street names is available [here](https://arcg.is/X5miS) (<https://arcg.is/X5miS>).

Appendix A

New York City Neighborhood Tabulation Areas Reference Map

New York City Neighborhood Tabulation Areas*

* Neighborhood Tabulation Areas or NTAs, are aggregations of census tracts that are subsets of New York City's 55 Public Use Microdata Areas (PUMAs). Primarily due to these constraints, NTA boundaries and their associated names may not definitively represent neighborhoods.
